FIGHTING ECONOMIC CRIME IN THE EUROPEAN ARENA

Anghel Cristian

Academy of Economic Studies, Bucharest

The present paper tries to put together a modest study on the actions taken at EU level in order to fight economic crime. A series of measures have been implemented at national and European level to create a framework for fighting criminality. The European institutions and the national authorities are improving their cooperation in order to fight the increasing number of economic crimes committed both in the private and public sector, while Member States are approximating their legislation to the provisions of the Community acquis. We have divided these efforts into five categories corresponding to the five main areas of economic crime identified at EU level: fight against fraud, which affects the financial interests of the European Union and mainly comprises fraudulent practices in the use of EU funds and in taxation, fight against piracy and counterfeiting, public and private corruption, money laundering and organised crime. In order to combat the negative influence criminality exerts on the development of the economy and of the overall society, for each of the above mentioned areas legislative, institutional, technical and administrative measures have been adopted. We have presented these measures considering their efficiency in meeting the targets set out and the role played in their implementation by the European and national institutions.

Key words

Economic criminality, European cooperation, legislative framework, fraud, organised crime

JEL classification

K42 Illegal behaviour and enforcement of law

F53 International agreements and observance; international organisations

With the creation of an area of free movement for persons, goods, services and capitals the European Union has managed to improve both the economic and social climate but also to create a borderless area for criminals to move and act. In order to solve this new problem the transformation of the area of free movement into an area of liberty, security and justice was need. The transformation began with the signing of the Maastricht Treaty in February 7th, 1992, which entered into force on November 1st, 1993. The Treaty managed to present a European perspective on what has previously been just a series of bilateral or multilateral agreements and conventions between the Member States on justice and home affaires issues. The legal basis of this area of cooperation is represented by the Title IV of the Treaty establishing the European Communities and Title VI of the Treaty on European Union (Maastricht Treaty). Since 1999, the year the Amsterdam Treaty has entered into force, the area of freedom, security and justice has been regulated both by the first – the Community Pillar and by the third Pillar – Justice and police cooperation in criminal matters – the intergovernmental cooperation Pillar. For the time being the area is guided by the Hague Program, which recommends strengthening up the cooperation at European level in justice and home affaires related issues for 2005 - 2010 period. The programme contains a series of measures to be implemented at national levels in order to improve the cooperation between Law enforcement authorities in the area: improving the information exchange and availability, increasing the attention paid to the spreading of religious fundamentalism and citizens involvement with terrorist acts and increasing the role of Europol (European Police Office) and Eurojust (European network for judicial cooperation, which facilitates civil and criminal cross border cooperation and also the application of the principle of mutual recognition). Fighting economic criminality and organised economic criminality is part of this EU policy and is divided into five main areas of action: fight against fraud, counterfeiting and piracy, corruption, money laundering and organised crime.

1.Fight against fraud

All European policies, irrespective of the area of action, are financed from the Community budget, which in its turn is made up of custom duties, value added taxes (VAT) and a quota of the National Domestic Product of the Member States. It is estimated that around 1% of the EU budget, which means more than 1 billion EUR, is being misappropriated every year. The legal basis for fighting this phenomenon is set out in the Article 280 of the Treaty establishing the European Communities. The actions taken in order to fight this problem are concentrated on the protection of the financial interests of the Union and consist of fighting fraudulent practices in the use of EU funds, fighting tax or VAT related fraud, signing agreements with commercial partners and establishing European institutions responsible with fighting fraud.

1.1.Protecting the financial interests of the European Union

Protecting the financial interests of the European Union is mainly ensured by means of internal controls, enforcement of criminal Law, administrative cooperation and agreements with third countries that benefit from the financial support of the Union. **A general legal framework is provided by the following acts:**

Communication from the Commission to the Council, European Parliament and the European Court of Auditors of 17 January 2006 entitled “Commission Action Plan towards an Integrated Internal Control Framework”. It contains the guidelines to be considered in the creation of an integrated framework for internal control at European level: simplification of the legislation for the 2007 – 2013 period, integration of the common internal control principles in the proposal for the revised Financial Regulation [1], establishment and harmonisation of the presentation of control strategies and evidence providing reasonable assurance, initiation of inter-institutional dialogue on risks to be tolerated in transactions, promotion of the operational level management declarations and synthesis reports at national level, examination of the utility of management declarations outside shared and indirect centralised management mode, promotion of best practices for increasing the cost-benefit of audits at project level, construction of effective tools for sharing audit and control results and promotion of the single audit approach, initiation of pilot projects on evaluating benefits, analyzing the controls under shared management (in particular Structural Funds) at regional level and the value of existing statements, providing greater guidance for Structural Funds on managing the risk of error [2]. For 80% of its budget the Commission shares the implementation with the Member States. This is the reason why it is of outmost importance that Member States have a legal framework suited for making controls and, more important, that this framework is properly observed. Member States need to make sure that the administration of EU funds is without fault and subsequently to reduce the risk of irregular expenditure to an acceptable risk and also to be able to demonstrate this to national and European auditors. A Report from the Commission to the Council, European Parliament and the European Court of Auditors on the implementation of the Action Plan has been published in 2007, with positive conclusions.

Council Regulation (EC, EURATOM) No 2988/95 of 18 December 1995 on the protection of the European Communities financial interests [3] establishes a set of rules to be applied in all EU policies to fight fraud. The act provides for administrative measures and penalties to be implemented in order to protect the financial interests of the EU. It contains measures to harmonize controls in all Member States and administrative measures and penalties to be applied in case of irregularities related to the observance of the community acquis. The Regulation defines these irregularities (as the prejudice caused by the economic operators to the community budget), sets out a general set of rules for all community policies and defines the framework for carrying out national and European controls.

Council Act of 26 July 1995 drawing up the Convention on the protection of the European Communities' financial interests [4]. According to the Convention fraud affects both expenditures and revenues of the Communities and has to be discouraged by means of efficient, proportional and dissuasive penalties. Managers of companies or any other person with decision power or a person who exercises control within a company has to be liable for criminal prosecution, in accordance with the national legislation concerning fraud affecting the financial interests of the European Communities. Member States have to cooperate effectively during the investigation, prosecution and enforcement of the penalties by means of judicial assistance, extradition and transfer of proceedings or enforcement of sentences passed in another Member State. The act defines fraud affecting expenditures and revenues. Two additional protocols to this act have been signed in 1996 and 1997.

Communication from the Commission of 28 June 2000 on an overall strategic approach to the protection of the Communities financial interests. It was adopted by the Council on 17 July 2000 and approved by the European Parliament on 13 December 2000. The purpose of this Communication is to elaborate a general antifraud strategy, based on four main challenges: development of an overall anti-fraud policy, enhancement of a culture of cooperation amongst all the competent authorities, an interinstitutional initiative to prevent and combat fraud, strengthening of the penal judicial dimension

Decision No 804/2004/EC of the European Parliament and of the Council of 21 April 2004 establishing a Community action programme to promote activities in the field of the protection of the Community's financial interests (Hercule programme)[5]. The programme has initially been created for the 2004 -2006 period and subsequently extended for the 2007 -2013 period. It promotes activities related to the protection of the financial interests of the European Union and is focused on training the personnel, organizing seminars, offering technical assistance, exchange of information and coordination of the activities related to protecting of the financial interests of the Communities. The overall budget for this programme is EUR 110.5 millions.

In this general framework a series of strategies are used in order to fight frauds related to the use of European funds:

Together with improving the legislation and the management of contracts, in order to make them less permissive to fraud, a set of **controls and inspections** on the premises of economic operators are carried out by the European Commission in close cooperation with the authorities of the Member States for the purpose of fighting economic criminality related to the Community budget. The legal framework for these measures is provided by the *Council Regulation (Euratom, EC) No 2185/96 of 11 November 1996 concerning on-the-spot checks and inspections carried out by the Commission in order to protect the European Communities' financial interests against fraud and other irregularities [6].* Controls are carried out by Commission inspectors and focus on studying budgetary and accounting files, electronic information contained in computers and financial and technical implementation of subsidised projects. At the end of such an inspection a report is elaborated and presented to the Member State; it can then be used as proof in an eventual administrative or judicial investigation.

The fight against fraud in the financing of the Common Agricultural Policy is achieved by continuously improving the cooperation between the Member States and the Commission in order to create a set of rules for protecting the financial interests of the Communities; the application of these rules has to be ensured. The main piece of *acquis* governing this area is *Council Regulation (EEC) No 595/91 of 4 March 1991 concerning irregularities and the recovery of sums wrongly paid in connection with the financing of the common agricultural policy and the organization of an information system in this field and repealing Regulation (EEC) No 283/72 [7].* According to this act Member States have to communicate to the Commission the national legal provisions, regulations and administrative measures taken in order to make sure that the transactions financed by the European Agricultural Guidance and Guarantee

Fund (EAGGF) are properly managed, as well as the national authorities responsible with the accurate enforcement of these measures. Member States have to report to the Commission any irregularities which have been the subject of a criminal or administrative investigation. Other measures adopted with a view to facilitating the fight against fraud in the functioning of the Common Agricultural Policy are:

- monitoring the expenditures of the European Agricultural Guarantee Fund (EAGF). In 2007 the Guarantee Section of the European Agricultural Guidance and Guarantee Fund (EAGGF) was replaced by the European Agricultural Guarantee Fund (EAGF). Member States are responsible for preventing and detecting the irregularities as well as for recovery of the funds lost due to such irregularities and negligence in transactions financed by the Fund. *Council Regulation (EEC) No 4045/89 of 21 December 1989 on scrutiny by Member States of transactions forming part of the system of financing by the Guarantee Section of the European Agricultural Guidance and Guarantee Fund and repealing Directive 77/435/EEC* and the amending acts *Commission Regulation (EC) No 4/2004 of 23 December 2003 laying down detailed rules for the application of Council Regulation (EEC) No 4045/89 on scrutiny by Member States of transactions forming part of the system of financing by the Guarantee Section of the European Agricultural Guidance and Guarantee Fund* and *Commission Regulation (EC) No 2311/2000 of 18 October 2000 establishing the list of measures to which Council Regulation (EEC) No 4045/89 does not apply and repealing Decision 96/284/EC* are designed to help Member States prevent and fight irregularities by checking the documents concerning payments to or from European Agricultural Guarantee Fund. These legislative acts form the legal framework for the checks carried out with the purpose of ruling whether the transactions related to EAGF financing are or are not carried out according to provisions of the Law. The Commission can coordinate joint actions involving mutual assistance between two or more Member States;
- introducing a community system which allows the national authorities to identify economic operators who have committed or are suspected for having committed irregularities that brought prejudice to the community funds. This system is governed by the *Council Regulation (EC) No 1469/95 of 22 June 1995 on measures to be taken with regard to certain beneficiaries of operations financed by the Guarantee Section of the EAGGF* [8]. According to this act, Member States can take the following measures against an economic operator: reinforced checking of all operations performed, suspension, until the administrative determination of the existence of an irregularity, of payment of amounts relating to current operations and their exclusion for a period of time from operations;
- introducing the Single Farm Payment System, considered to be a reform of the Common Agricultural Policy. The act making possible this reform is the *Council Regulation (EC) No 1782/2003 of 29 September 2003 establishing common rules for direct support schemes under the common agricultural policy and establishing certain support schemes for farmers and amending Regulations (EEC) No 2019/93, (EC) No 1452/2001, (EC) No 1453/2001, (EC) No 1454/2001, (EC) No 1868/94, (EC) No 1251/1999, (EC) No 1254/1999, (EC) No 1673/2000, (EEC) No 2358/71 and (EC) No 2529/2001*. The two main improvements it brought are the decoupling of direct aid to producers by means of cutting the link between support and production and the introduction of the single payment scheme. The result of the decoupling of the aid to producers is that the aid does not depend on the type of production. Farmers can receive direct payments if they maintain a good health of the land and if they meet the public health standards for plants and animals and the environmental and animal protection norms mentioned in the Regulation. The amount of payments is decreasing on a yearly basis and the money saved is assigned to rural development measures. According to the single payment scheme farmers are granted aids irrespective of the nature of their production in order to ensure them a stable income [9].

Another area of great importance for the protection of the financial interests of the Union is based on the measures taken in order to protect the resources of the Community budget; the most important ones are the **measures taken in order to fight tax related frauds**. Because of the increasing number and seriousness of tax related frauds Member States need to cooperate in order to improve European legislation on taxation and in order to increase the number and the efficiency of the actions taken against taxation frauds. The European Commission supports this strategy in its *Communication, dated 31 May 2006, to the Council, the European Parliament and the European Economic and Social Committee concerning the need to develop a coordinated strategy to improve the fight against fiscal fraud*. In order to ensure the proper application of the Value Added Tax (VAT) and fight against fraud, the European Union introduced a system for mutual administrative cooperation and information exchange between the Member States. *Council Regulation (EC) No 1798/2003 of 7 October 2003 on administrative cooperation in the field of value added tax and repealing Regulation (EEC) No 218/92* provides for the conditions and terms of cooperation between national authorities responsible with the **enforcement of the legislation on VAT** on goods and services, intracommunity acquisition of goods and import of goods. The Regulation provides for the framework for cooperation between Member States and the Commission, for the rules and procedures which support national authorities to cooperate with each other and exchange information in order to accurately evaluate the VAT [10].

The deficiencies of the legislation related to customs activities and operations that breach customs legislation, including infringement of the intellectual property rights, bring prejudices to the economic, fiscal, social, cultural and commercial interests of the Member States and the Community. For this reason European Union has signed a series of **agreements with commercial partners all over the world** in order to fight fraud and other criminal activities affecting its financial interests.

1.2 Institutional development

For the best results in fighting fraud, together with setting up a legal framework, several **institutions** have been created at European level.

In order to improve the means for preventing and fighting fraud, the European Commission has set up the **European Anti-Fraud Office (OLAF)**. The official act establishing the Office is *Commission Decision of 28 April 1999 establishing the European Anti-Fraud Office (OLAF)*. The office has responsibilities in carrying out administrative investigations and has been granted a special status. It began its activity on June 1st, 1999. OLAF enjoys all investigative powers granted to the Commission by the Community acquis and by the agreements with third countries for fighting fraud, corruption and other illegal activities affecting the financial interests of the European Community. The Office has over 400 employees. Together with protecting Community's financial interests, the responsibility of the Office concerns all the activities connected to safeguarding Community interests against irregular behaviour likely to lead to administrative or penal proceedings. In order to coordinate the actions of the Member States in their fight against fraud detrimental to the interests of the Community, OLAF provides them with the support of the Commission, aimed at organising close and regular cooperation between the competent national authorities. Additionally, the Office, as a Commission service, contributes to the planning and the development of prevention and anti-fraud methods. [11]

The Advisory Committee for the Coordination of Fraud Prevention (COCOLAF). This Committee coordinates the actions of the Member States and the Commission in the fight against fraud affecting the financial interests of the Community. The legal basis for its functioning is the *Commission Decision 94/140/EC of 23 February 1994 setting up an advisory committee for the coordination of fraud prevention*. The Committee may be consulted by the Commission on any matter related to the protection of the financial interests of the Community and the protection of Euro notes and coins against counterfeiting.

The European Court of Auditors. It was established in 1975, with the headquarters in Luxembourg. The Court sees that the Community budget is properly implemented, which means that the funds are properly collected from the taxpayers and that they are legally economically spent. It is made up of 27 members, one for every Member State, and supported by 800 auditors. It sets its own Rules of Procedure, which are approved by the European Council. The Court can not impose sanctions, it does not have judicial powers; instead it drafts annual reports which are then published in the Official Journal. The audit carried out is meant to improve the financial management of the European institutions and to show European citizens the way their money is spent. The irregularities observed are then transmitted to the competent authorities, including OLAF.

2.Fight against counterfeiting and piracy

Counterfeiting and piracy is seriously affecting the functioning of the common European market and has a negative impact over the public safety and security. Both economic and social life is affected as commerce is hampered and the free competition is inhibited, leading to the loss of confidence in the economy by the economic operators and to the reduction of investments.

It is estimated that these activities represent between 5% and 7% of the international trade and are responsible for the loss of over 200,000 jobs. Moreover, European companies with activities outside community area are losing between 400 and 800 million US Dollars on the European market and around 2000 million US Dollars on the global market every year. The software market is mainly affected by this distress. One of the worst aspects of this phenomenon is the high risk for European consumers presented by the dangerous counterfeited goods such as medicines, auto parts and food.

Due to the important role it gained on the international economic arena the Euro has become a preferred target for the international counterfeiting organisations, both in European Union and in third countries. In order to **protect the Euro against counterfeiting** European institutions have adopted legislative, technical and institutional measures. A series of legislative acts have been adopted for this reason out of which we mention the following: *Council Decision 2001/887/JHA of 6 December 2001 on the protection of the Euro against counterfeiting* provides a general, cohesive and efficient system to protect the Euro against counterfeiting. In order to ensure that the Euro is appropriately protected against counterfeiting by the criminal laws of all Member States, the *Council Framework Decision 2000/383/JHA of 29 May 2000 on increasing protection by criminal penalties and other sanctions against counterfeiting in connection with the introduction of the Euro* has been adopted.

Council Regulation (EC) No 1338/2001 of 28 June 2001 laying down measures necessary for the protection of the Euro against counterfeiting sets up the legal framework for the cooperation between Member States, the Commission, the European Central Bank and Europol. The cooperation implies exchange of information and mutual assistance in preventing and fighting counterfeiting of Euro notes and coins [12]. The **European Technical and Scientific Centre (ETSC)** has been created, with the role of analysing counterfeit Euro coins and assists the national authorities in their efforts. The Centre functions within the European Commission in Brussels and is attached to the European Anti-Fraud Office. The legal basis for its functioning is the *Commission Decision 2005/37/EC of 29 October 2004 establishing the European Technical and Scientific Centre (ETSC) and providing for coordination of technical actions to protect Euro coins against counterfeiting* [13]. In the *Council Decision 2005/511/JHA of 12 July 2005 on protecting the Euro against counterfeiting, by designating Europol as the Central Office for combating Euro counterfeiting*, the Council designated **Europol** as the central European office for combating Euro counterfeiting and for stepping up cooperation among Member States, Europol and third countries. The main role of Europol in this field of activity is to centralise and

processes all information of a nature to facilitate the investigation, prevention and combating of Euro counterfeiting and to forward it to the national central offices of the Member States.

Together with fighting counterfeiting of notes and coins, **counterfeiting of non cash means of payment** is dealt with at European level. According to the *Council framework Decision of 28 May 2001 on combating fraud and counterfeiting of non-cash means of payment* [14] fraud involving any form of non-cash means of payment is recognised as a criminal offence that is punishable by effective, proportionate and dissuasive penalties in all EU Member States. It defines criminal behaviour concerning offences related to payment instruments, such as cards or cheques, offences related to computers and offences related to specifically adapted devices. According to this act each Member State has to take the necessary measures to ensure that legal persons can be held liable for criminal conduct committed for their benefit by any person, acting either individually or as part of an organ of the legal person.

Together with legislative and institutional measures, technical measures have also been taken. The **Pericles programme** promotes cooperation between the national, European and international authorities responsible for combating counterfeiting of the Euro. The measures envisaged include exchanges of best practices in seminars, workshops, meetings and conferences, training, exchanges of staff and technical, scientific and operational assistance. The act setting up this programme is *Council Decision 2001/923/EC of 17 December 2001 establishing an exchange, assistance and training programme for the protection of the Euro against counterfeiting (Pericles programme)*. The aim of the Pericles programme is to raise awareness of the Community dimension of the Euro among all those concerned, to encourage a climate of mutual trust by way of practical measures such as training, specialist workshops and staff exchanges or to make known the results attained as part of the exchange of information, experience and best practices [15].

In order to ensure an equivalent level of **protection for intellectual property** in the Member States the *Directive 2004/48/EC of the European Parliament and of the Council of 29 April 2004 on the enforcement of intellectual property rights* has been adopted. The main objectives of this Directive are to promote innovation and business competitiveness, to safeguard employment in Europe, to prevent tax losses and destabilisation of the markets, to ensure consumer protection and to maintain the public order [16].

Customs controls have been tightened in order to help combat counterfeiting and piracy in the Community. *Council Regulation (EC) No 1383/2003 of 22 July 2003 concerning customs action against goods suspected of infringing certain intellectual property rights and the measures to be taken against goods found to have infringed such rights* clarifies the means and conditions for customs action against goods suspected of infringing intellectual property rights [17].

3.Fight against corruption

The European Commission considers that it is vitally important to address corruption wherever it occurs, be it in the public or in the private sector. In the public sector, corruption means prejudices to the local, national or European budgets as well as to economic environment, by offering unfair advantages to few while being detrimental to society at large. Corruption in the private sector has a direct impact on competitiveness and economic development. By tackling private sector corruption, Member States are reinforcing the internal market and strengthening their economies. Furthermore, these measures have a positive impact on relations with the European Community's external trade partners.

On the basis of the Council Act of 26 May 1997 drawing up the Convention made on the basis of Article K.3 (2) (c) of the Treaty on European Union, on the fight against corruption involving officials of the European Communities or officials of Member States of the European Union Member States must take the necessary measures to ensure that conduct constituting an act of passive corruption or active corruption by officials is a punishable criminal offence.

Council Framework Decision 2003/568/JHA of 22 July 2003 on combating corruption in the private sector requires Member States to penalise acts intentionally carried out as part of business activities and corrupting a person or demanding an undue advantage. The aim of this Framework Decision is to involve the liability not only of natural persons in the capacity of employees but also of legal persons such as firms [18].

On 15 September 2005 the European Commission and the Council Presidency **signed the United Nations Convention against Corruption** on behalf of the European Community. The purpose of the Convention is to promote and strengthen measures to prevent and combat corruption more efficiently and effectively, to promote, facilitate and support international cooperation and technical assistance and to promote integrity, accountability and proper management of public affairs and public property. The Convention lays down the preventive anti-corruption measure to be taken by the signing states in both public and private sector, measures for criminalisation and Law enforcement, international cooperation, asset recovery, technical assistance and exchange of information and the mechanisms for its implementation. The Convention recommends the States Parties to adopt legislative and other measures as may be necessary to establish a whole series of criminal offences, such as: corruption of national or foreign public officials and officials of public international organisations, embezzlement, misappropriation or other diversion by a public official of any public or private property, trading in influence, abuse of functions and illicit enrichment.

4.Fight against money laundering

Because of the need to protect the financial system from abuse and in order to support the efforts to fight organized criminality in the financial system, the fight against money laundering became a top priority for the European Union. In the conclusions of the Tampere Summit the European Council stated that money laundering is at the very heart of organised crime and that it should be rooted out wherever it occurs and concrete steps must be taken to trace, seize, freeze and confiscate the proceeds of crime. This means employing several strategies such as preventing the use of financial system for money laundering or terrorism financing and preventing money laundering through customs cooperation by making everyone who enters or leaves EU to declare any amount of money greater than 10,000 EUR.

In order to **prevent the financial system from being used for money laundering and terrorist financing**, the Directive 2005/60/EC of the European Parliament and of the Council of 26 October 2005 on the prevention of the use of the financial system for the purpose of money laundering and terrorist financing has been adopted; subsequently amended in 2007, 2008. The Directive applies to credit and financial institutions and to natural or legal persons working as auditors, external accountants and tax advisers, notaries and other legal professions, real estate agents. It describes money laundering as the conversion or transfer of property derived from criminal activity or from an act of participation in such an activity, for the purpose of concealing or disguising the illicit origin of the property, assisting any person who is involved in the commission of such activity to evade the legal consequences of his action, the concealment or disguise of the true nature, source, location, disposition, movement, rights with respect to, or ownership of property or the acquisition, possession or use of property, knowing, at the time of receipt, that such property was derived from criminal activity. Credit and other financial institutions are forbidden to keep anonymous accounts or anonymous passbooks. Each Member State is required to set up a **Financial Intelligence Unit (FIU)** which has to be responsible for receiving, requesting, analysing and disseminating to the competent authorities disclosures of information which concern potential money laundering or potential terrorist financing. The institutions and persons covered by the Directive are required to inform the FIU as quickly as possible when they know, suspect or have reasonable grounds to suspect that money laundering or terrorist financing is being or has been committed or attempted. At the FIU's request, they

must furnish all necessary information in accordance with legislation. Where money laundering or terrorist financing is suspected, the institutions and persons covered by the Directive are required to refrain from carrying out transactions until they have informed the FIU of them. [19] In addition to the above mentioned Directive, in order to introduce preventive action to **combat money laundering and terrorist financing through more effective customs cooperation**, the European Parliament and the Council adopted the *Regulation (EC) No 1889/2005 of 26 October 2005 on controls of cash entering or leaving the Community*. The Regulation places an obligation on any natural person entering or leaving the Community and carrying cash of a value of EUR 10,000 or more to declare that sum to the competent authorities. The authorities may check the compliance with the obligation to declare the money by carrying out controls on natural persons [20].

5.Fight against organised crime

Organised financial crime undermines legitimate economic actors and strengthens the shadow economy, thus inhibiting economic growth and reducing public resources. Reducing the organised financial crime has a broader impact on the fight against organised crime in general as money is the lifeblood of organised crime. Removing access by organised crime groups to money is bound to erode their power base. Fighting organised crime includes prevention and fight against organised crime in the financial sector. It covers a range of illegal activities, including money laundering, financial fraud and counterfeiting of the Euro when they are committed by criminal organisations. Another line of action is fighting corporate and financial malpractice, which can be achieved by four means: internal control in a company and corporate governance, help from independent third parties, supervision by specialised institutions and Law enforcement. Identification and confiscation of the proceeds of organized economic crime is also used in order to discourage criminal organisations. A European framework for mutual recognition and cooperation between Asset Recovery Offices in the Member States has been created to help.

In its Communication to the Council and the European Parliament of 27 September 2004 on preventing and combating corporate and financial malpractice the Commission identifies four lines of "defence" against **corporate malpractice** that focus on a series of measures divided into four lines of defence: the internal control in companies and corporate governance, the use of independent third parties, such are auditors, accounting firms, banks, lawyers, rating agencies and financial analysts, the supervision, conducted by specialised institutions of the Member States and by European supervisory authorities, such are the Committee of European Securities Regulators, the European Banking Committee, the European Insurance and Pension Committee, the Committee of Insurance and Occupational Pension Supervisors and the Committee of Banking Supervisors. The fourth line of defence is enforcement of the Law and is provided by police and judicial authorities responsible with investigations and prosecutions that may have both a preventive and a repressive effect [21]. According to the Commission, several improvements have to be made in order to prevent and fight corporate and financial malpractice: exchange of information between national authorities and European institution such are Europol and Eurojust has to be improved, cooperation between financial and other business sectors and law-enforcement authorities has to be increased and traceability of financial flows for the recording of electronic payments has to be introduced. This communication is part of the EU framework for dealing with financial issues, made up of the Financial Services Action Plan, implementing the framework for financial markets and the Action Plan on Modernising Company Law and Enhancing Corporate Governance in the European Union.

According to the Joint Action 98/699/JHA of 3 December 1998 adopted by the Council on the basis of Article K.3 of the Treaty on European Union, on money laundering, the identification, tracing, freezing, seizing and confiscation of instrumentalities and the proceeds from crime [22] each Member State must ensure that its legislation and procedures enable it to permit the

identification and tracing of suspected proceeds from crime at the request of another Member State where there are reasonable grounds to suspect that a criminal offence has been committed. Such legislation and procedures enable assistance to be given at the earliest possible stages in an investigation. Member States must encourage direct contact between investigators, investigating magistrates and prosecutors of Member States to ensure that requests for assistance through formal channels are not made unnecessarily. Member States must take all necessary steps to ensure that assets which are the subject of a request from another Member State can be frozen or seized expeditiously, so that a later confiscation request is not frustrated. Member States must harmonise their activities with the best practices in international cooperation in the **identification, tracing, freezing or seizing and confiscation of instrumentalities and the proceeds from crime** and must provide appropriate training to all officials concerned with international cooperation in this area. Several acts have taken this action further: Council Framework Decision 2001/500/JHA of 26 June 2001 on money laundering, the identification, tracing, freezing, seizing and confiscation of instrumentalities and the proceeds of crime [23], Council Framework Decision 2003/577/JHA of 22 July 2003 on the execution in the European Union of orders freezing property or evidence [24], Council Framework Decision 2006/783/JHA of 6 October 2006 on the application of the principle of mutual recognition to confiscation order [25] and Council Decision 2007/845/JHA of 6 December 2007 concerning cooperation between Asset Recovery Offices of the Member States in the field of tracing and identification of proceeds from, or other property related to crime [26].

Fighting criminality by means of confiscating and recovery of the assets resulted from crime requires the establishment of national structures that can facilitate the tracing of criminal assets, participate in confiscation procedures, ensure the proper management of the seized assets and act as central contact points for confiscation activities at national level. In order to meet these needs **Asset Recovery Offices** have been set up in the Member States, but fully operational structures can only be found in several Member States (Austria, Belgium, Estonia, France, Germany, Ireland, The Netherlands and the United Kingdom) and even these present large differences in structure, powers and practices one from another. From the experience gathered by the functioning Asset Recovery Office several **best practices and recommendations** are to be followed when setting up a national structure: it should have a multidisciplinary structure comprising expertise from law enforcement, judicial authorities, tax authorities, social welfare, customs and other relevant services. The representatives of these authorities should be able to exercise their usual powers and to disclose information within the Asset Recovery Offices without being bound by professional secrecy. Asset Recovery Offices should be adequately resourced and provide a central point for all incoming requests of assistance from other countries. They should collect all relevant statistics on asset freezing and confiscation. Where Asset Recovery Offices do not directly manage seized assets, they should at least collect information on seized assets from the authorities managing them. They should exchange information rapidly, possibly within the time limits foreseen by the Council Framework Decision 2006/960/JHA of 18 December 2006 on simplifying the exchange of information and intelligence between law enforcement authorities of the Member States of the European Union. The legal possibilities for each Asset Recovery Office to spontaneously exchange information should be further analysed. The information that can be obtained from each Asset Recovery Office without resorting to mutual legal assistance procedures should be clarified. The certificates to request the execution of freezing orders and confiscation orders in another Member State, as well as the mutual legal assistance forms, should be revised in order to make them easier to use. Detailed guidance should be provided on how to complete them. A standardised secure channel of communication between Asset Recovery Offices should be established. Asset Recovery Offices should have access to all relevant databases (both open and closed databases, such as Land Registry, Company Records, Vehicle Registration, Convictions and databases from the financial institutions, the police, tax

authorities, social welfare agencies, etc.) to identify and trace assets, including financial information (ideally to a central bank account registry at national level) and should have coercive powers to obtain such information. They should have the powers to provisionally freeze assets in order to prevent dissipation of the proceeds of crime between the moment when assets are identified and the execution of a freezing or confiscation court order. They should also be able to conduct joint investigations with other authorities

Conclusions

The efforts of the European Union in fighting economic criminality have been directed to five areas, corresponding to those crimes severely impacting on the European economic and social environment. The fight against fraud affecting the financial interests of the European Communities is mainly carried out by combating fraudulent use of European funds and by combating tax fraud. It is in this area that the European authorities are most present and visible, having control powers over national and European institutions. Fighting counterfeiting and piracy, as well as corruption, is financially supported by the Commission, while fighting money laundering implies setting up national structures responsible with the exchange of information and best practices between Law enforcement agencies. As far as fighting organised crime is concerned, the accent is on the identification, tracing, freezing, seizing and confiscation of instrumentalities and the proceeds of crime and on the cooperation between national authorities.

As far as fighting economic criminality is concerned, the Law enforcement authorities in the Member States are supported by the European institutions. Moreover, due to the negative effects it has on the economic and social environment, the fight against this phenomenon has become a priority for the European Union. Together with establishing a legal framework for fighting criminality, a series of technical and administrative measures have been taken at European level. One of these measures is setting up specialised structures acting at European level, which, even though without judicial powers, have a very important role in coordinating the efforts of the national authorities and in facilitating the exchange of information and best practices between them.

Nevertheless, although an impressive number of European legislative acts have been adopted, largely elaborated on by the national representatives within Council's working parties, their effect is not the expected one, mainly given the different levels attained in the implementation of their provisions into the Member States national legislation. This, together with the disparities still present in what concerns national legislations and practices, makes it difficult for the Law enforcement authorities to fight economic criminality in the European Union.

CONSIDERATIONS ON THE BANKING PRODUCTS AND SERVICES IN THE GLOBALISATION CONDITIONS

Avram Costin Daniel
University of Craiova, Romania

Avram Veronel
University of Craiova, Romania

The changes occurred in the banking marketing in our country have their origin, firstly, in the changes of the organisational culture which has evolved in the last ten years from the bureaucratic behaviour, categorised excessively, to a specific behaviour for the market economy, based on the knowledge of the clients, on the competition and on the promotion of the mentality of a winner. The organisational culture can be changed in time, as long as the employees are aware of the objectives followed, as long as they are selected and promoted in conformity with these objectives and as long as the feeling of belonging to the organisation has formed which depends essentially on the satisfaction that the employee feels towards the activity he/she enrolls. Due to the stimulation of the own personnel, the banks, through superior wages as for the best paid sectors of the national economy, have managed to attract the interest of the existing professionals, as well as of the young specialists willing to dedicate to a banking carrier. The training programs organised through the means of the Romanian Banking Institute or through distinct programs organised by the banking companies in our country have contributed to the motivation of the personnel, as well as to the consolidation of the new organisational culture.

Key words: globalisation, banking products, banking services
JEL code: A1, E5, G00

Everywhere in the world the card industry is revolutionised constantly. In Holland, the banks are in full process of massive introduction of the electronic wallets, while in Romania, on Sept. 30th, 2008, the number of cards issued exceeded the number of the population (21.8 million cards issued). The application of the "smart cards" technology for the transfer of funds creates the premises for the substantial reduction of the quantity of paper and metal money in circulation. The extension of the payments through the cards has increased in the West, and lately in other parts of the world, fact that determined the reduction of the cash circulation, not exceeding 20% from the transactions volumes. The passing to the Euro currency offers the smart cards the great chance of fulfilling the central place in the fund transfers. The more electronic money is used, the easier the new currency introduction will be. The beginning of the third millennium has meant the début of a new process which will lead, in only a few years, to the total replacement of the magnetic stripe cards with the smart cards, this type of cards offering a higher degree of safety for the users, the information stored on them being impossible to alter or copy. It is designed with a chip and the card will operate as a "bag" previously loaded with money that can be used for payments, and the balance will be reduced in proportion with the purchases. The cards can be funded at the automatic banking desks or at the special terminals within the banks. The microchip technology will continue to become more and more popular. The high degree of safety - the well-known reason of the migration towards the chip cards, is placed into the shade by the optical card performances. The optical card is formed of two layers between which the optical stripe is introduced, based on the CD-ROM technology. This card can be scratched, pierced, but the stored information can still be read. The safety is conferred by the impossibility of data alteration and by the possibility of confronting the card holder's identity with the user's one. Moreover, the optical card disposes of a memory capacity far larger than the one of the chip card. The very large memory of the optical card allows the storage, for example,

of the holder's fingerprint image or the retina, so that the identity theft can become impossible. Moreover, the safety is strengthened by the storage on the card of the user's hologram and of a file which contains the personal identification data.

The necessary investments in such a project are insignificant, in comparison with the advantages that can be obtained. The only necessary change at the level of the banking ATMs and the POSs consists of the installation of an optical stripe reader. Moreover, the high memory capacity will allow banks to offer a wider range of services. However, it is hard to believe that, if, on a world level, the implementation of the chip card has just begun, Visa and MasterCard, the great organisations in the field without which one cannot imagine the generalised implementation of the optical card for the payment solutions, will embrace this project on a short or medium term.

Without a doubt, there is a segment of clients whose needs must be satisfied through the services outside the subsidiary. Taking into account that the clients are subjected to an environment in constant change, the factor time plays an important role in the decision to use a new service or a new product. The holders, because of the long working time, do not find the time to use the banking services, also because the majority of the banks have very limited public hours. The easier the clients access their accounts, the higher the competitive advantage is. Many banks have reached this conclusion, and, consequently, they offer new market products, known under the generic name of home - banking. In this category of products we can find components that serve a single purpose: the possibility offered to the client to access the banking services offer from his/her home, without the necessity of his/her travel to the bank office where he/she has opened the bank account. The globalisation of the banking market through the means of informatics has favoured the movements of capital, eliminating the geographical distances. Thus, the loans, the speculations of any kind have become world activities, "the market barriers" being eliminated. At the same, the changes of technological nature have been accompanied by the appearance of some new financial products and instruments, the banks representing one of the domains with the most intense manifestation of the innovation processes. Thus, the development of the electronic trading makes necessary the adaptation of an afferent system of e-banking, contributing to the creating of some world networks.

The fastest tendency to develop belongs to the electronic trading through the internet and its components internet banking and mobile internet banking. Electronic - banking is the first banking service at distance which has replaced the daily trips to the banks of the business people. The electronic banking allows the user to perform different operations in the bank accounts from the office or from home (home-banking). The instruments like the electronic banking or home-banking are based on a software application of the issuer, installed at the holder's residence, on an individual work plant or in a network. For the companies with an intense activity, the electronic-banking has proved to be really useful. The future of trading is definitely the electronic trading. In such conditions the banks must be ready to allow clients the access to e-banking services for the performance of current operations (the client saves time and reduces the costs and the processing period of the data at the bank). Also, for the clients oriented towards the electronic trading information solutions can be found that once the invoices or the payment orders are issued for the business partner, these must be transmitted at the same time to the bank, the information transmission and processing must be performed in conditions of maximum safety through: the codification and compression of information, code systems, access passwords, limited access competencies, on levels of the system's functions. For the future, it is important that the companies obtain the loans or other funds, by using the e-banking services. Internet-banking must not be seen as a simple extension of the modern products, but also as a way to reduce the transactions costs, doubled by the unlimited geographical coverage. Internet-banking aims at the freedom degree of those who order payments or transfers. They are not tied by the trip to the desk in their relation with the bank, or to be at the company's residence. If in the case of electronic-banking the service can be accessed directly from the computer of the company or

at home, the internet-banking can be used from any computer connected to the internet, wherever this is.

Practically, the service user need not own a personal computer, an internet-café being enough. Moreover, the operations that can be performed are the same as the ones performed with electronic-banking. Banks have started to skip the primary stage of electronic-banking, going straight to the internet banking. There still remains an essential problem which appears in the moment this type of service is implemented: the safety of the communications through the internet. Mobile-banking (the latest technology regarding the financial services supply) promises to revolutionise the way of performing the transactions, offering business people a virtual independence from the contact with the bank. The banking transfers, the payment orders, the transfers, as well as consulting the history of the operations, can be performed directly from the mobile phone. This type of prediction of revolutionising the banking services market at distance is determined by the explosive increase of the GSM telephone users.

According to the estimations, England, Germany, France, Italy and Spain summed up 75% of the European mobile-commerce at the end of 2007. In Italy, which has the highest penetration rate of the mobile telecommunications of the five states and a relatively smaller rate of the internet, it is expected that mobile-banking will exceed the electronic-banking, and the number of users will exceed 2.4 millions. More and more banks from Central and Eastern Europe follow the example of the Western banks in the development of their on-line banking systems. Their motivation is the same: the existing request from the clients for the complete and accessible services, the opportunity to serve more clients without a parallel development, more costly because of the network of subsidiaries, and the surpluses of efficiency in the transaction processing. The financial innovations offer new options in the context of the banking and financial phenomena enrolling at a world level. The last decade the interest for the derived financial products and their afferent markets has increased. Important financial innovations are the mobile values used on the international capital market: the Euro-estimations, Euro-loans, and Euro-bonds etc. These constitute insurance instruments against the financial risk (the so-called hedging), but also a means of speculation. At present, we assist at important reconsideration of the banking operations. Thus, the products dedicated to the capital market have appeared: for example, the GDR - Global Deposit Receipt¹, or of the futures contracts (operations type options, futures or swap on the interest rate, on the exchange rate) - all meant to serve the capital investor, seeking to avoid the risks and to favour the attractive opportunities. The personalised products have been perfected and offered the clients, type private-banking which support the strategy of loyalty of the clients with a high level of incomes, the banker, as a specialist, intervening and identifying with the client, offering him/her the suitable banking products and services for his/her business. The majority of the banks with local and foreign capitals have developed the concept of integrated financial services, offering under the same name, besides the banking products, the insurance, brokerage on the capital market and leasing services.

It is very important to mention the bancassurance phenomenon, which represents the merge between the products and services delivered to the clients by the insurance - reinsurance companies in collaboration with the commercial banks.

The clients benefit from various insurance products, based on the agreement concluded between the insurance company and the bank, the benefit belonging to both parties, the banks becoming the strategic partner of the insurance-reinsurance companies. The dominant form of manifestation has been the sale of life insurances through the bank, accompanied by the cooperation, quite limited in general, in terms of damage insurance or other financial services.

As a consequence of the banks' initiative, this phenomenon has extended to other owners of networks like the post office and the savings banks. In Europe, this phenomenon generalised and

¹ Product destined to the capital market, through which parts of the capital of a bank or a company is purchased.

amplified in the 1990s, due to the considerable increase of the financial market role, of their institutionalisation and , in general, looking for an efficient management of the large active portfolios. The industry of the services is shaped and it gathers the life insurances, the retirement funds, the persons insurances, the consumption loan, the assets management in the third parties account. The more and more important role owned by the bancassurance is underlined by the fact that over 70% of the incomes from bonuses of the insurers specialised on life insurances from Spain come from the sector of bancassurance, and in Belgium and France, this sector has a share of 56%, respectively 62% from the total of the bonuses on the internal market of insurances. In Table 1 and Picture 1, the market rate held by each tip of distribution channel in the main countries of Europe within the bancassurance system is presented:

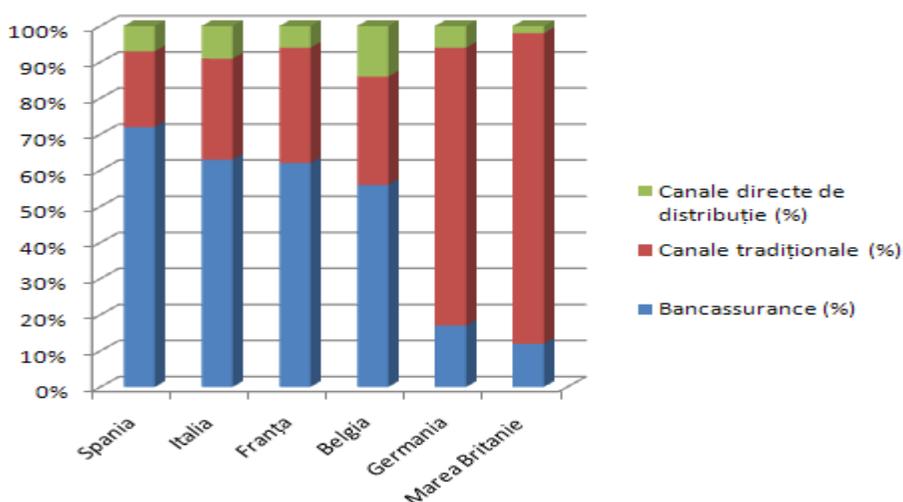

The market rate of the distribution channels within the bancassurance system

Table 2

The country	Bancassurance (%)	Traditional channels (%)	Direct distribution channels (%)
Spain	72	21	7
Italy	63	28	9
France	62	32	6
Belgium	56	30	14
Germany	17	77	6
Great Britain	12	86	2

Source: www.bis.org

Developed through the means of alliances that have formed between the insurance companies and the commercial banks, this modern distribution channels have not had the expected success in countries like the Great Britain, where the life insurance market is structured around the brokerage companies, or in Germany, where the role of the traditional distribution channels is still predominant, approximately 77% from the bonuses coming on this channel. At the level of the European Union, the transition of the banks from the traditional bancassurance deposits is, at the moment, hurried by the competition exercised by the life insurance packages and the programs offered by the private retirement funds. This phenomenon takes place in the countries where the banks have not been traditionally involved in the insurance activities.

Picture 1 The market rate of the distribution channels within the bancassurance system

The collaboration takes the form of crossed distribution of products, the creation of joint companies, the avoidance of a direct competition, the purchase of insurance companies by the banks depending on the legal regulations, which can be more or less favourable for the longer periods, and on the complexity of the products offered, with the mention that the simple ones have more success, especially if the situation addresses to less sophisticated clients.

The strategic alliances with various traders or insurance companies, together with the alternative distribution channels, not only they lead to the diversification of the sale of the banking services, but they change the costs structure as well. The more a bank manages to go towards this direction, the more it is prepared for the future. The banking services are more or less comparable, the most important criterion of competitiveness being the price. The more a bank can control costs, the more its position will be more solid on the market. Due to the severe competition for the clients, the use of new distribution channels is absolutely necessary for the banks to improve the quality standard of the supplied services, to increase the market share, to reduce the costs and increase the profit.

Conclusions

Through diversifying the banking products and services, the banks will have to take into consideration the numerous risks to which they are exposed, which have not been fully evaluated and they have to study the effects on their banking incomes, as a consequence of the expansion of the electronic banking activities. In a near future, the information technologies will completely change the current configuration of the traditional banks. More and more services will become automatic, the clients will prefer to perform themselves the operations through the internet or the telephone, thus the new bank will become more of a business centre. The current traditional bank will transform into a technical work centre, a sort of a bank without physical clients.

The implementation of some marketing and new management techniques and the automation of the majority of the enrolled operations will allow the banks to extend and diversify the activity. The process of continuous improvement of the services and products offered by the banks has favoured a series of factors, among which the evolution of the informational technology which has constituted an important vector. The information technology continues to modify the nature of the banking and financial activity through the new product and services whose purpose is the increase of the banks capacity to serve their clients.

ROMANIA AND SUSTAINABLE DEVELOPMENT. THE STATE OF FACT AND THE DANUBE RIVER AS A KEY-ELEMENT

Benea Ciprian-Beniamin

University of Oradea, Faculty of Economics

Baciu Adrian

Ministry of Transports

This paper is focused on the evolution of economic and social situation in Romania in 1990-2007, and after that it is focalized upon possible paths to follow in order to provide a sustainable development in this geographical area, taking account of the way Romanian society and the political leadership could use the huge potential given by Danube river in order to attain this objective.

Keywords: climate change, Danube, nuclear energy, transport on Danube

Cod JEL: F59; N74; Q54

Put shortly, the period 1990-2007 could be labeled as a chaotic period in Romania's modern history; it is characterized by the absence of a coherent economic, social, and professional policies. The effect could be identified even starting with '90s, and it can be felt very strong today. When the Communism fall down in Europe at the end of '80s, Romania had a unique position among the countries with similar level of economic development, having none external debts, and much more, being international a net creditor, with a global claim of 3 billions USD in relation with USSR, Iraq, and Libya, due to the Romanian investments made in those countries during 1980-1989;² in 2007 Romania had an external debt of 30 billions USD, being on 29-th place in the world from this point of view.³ In the same time, Romania had a very strong industry before 1989. In 2007, the situation was like this: 75% from the industrial capacity of 1989 was totally eliminated, being erased from the economical map of Romania;⁴ the agriculture, and the administration of existing forests and of touristic potential have entered a total collapse. The maintenance and the improvement of *transport and communication networks* – **the cornerstone of economic and social development** – was in 2000 far behind the situation registered in 1970; the strategic industries and factories in steel industry, the aviation, automobiles, and ship's building and the competitive units in the food, leather, furniture, or pharmaceutical industries were shut down, privatized in a fraudulent way, or sold for a penny.⁵

In order to highlight the negative effect of this state of fact, it could be mentioned that a state which intends to have a *position* which can promote its foreign policy and its interests, must have a good *transport policy* (and communication policy), while the energy policy following nearby; this areas must be regarded with the greatest attention and interests by political leadership in each state which intends to have a good position in international affairs, because the *independence* in this areas mean a greater mobility in the foreign policy of that state, the state of fact in Romania being the *best example* for this and for the absence of coherence in these vital areas, with extremely negative impact in the long run. It could be mentioned that the construction and the modernization of roads and railways is made in the most slowly possible way, while the plans

⁴ *Ibidem*, p. 54.

⁵ *Ibidem*, p. 55.

regarding the development in energy sector, having as their aim the reduction Romania's dependency of costly energy imports faced in 1990-2007 the most terrible opposition at domestic level, and international level, too, especially regarding the nuclear power plant at Cernavoda, and regarding the modernization of some hydropower plants, being included here the Iron Gate System I, too.⁶ Great parts of Romanian oil and gas industries were privatized in suspect and strange conditions, reducing in this way the *ability* of Romanian state to take *independent* energy policies, which is a *unique phenomenon in the Romania's modern history*. The economical and social costs have become evident: during last years, the trend was due especially to consume, and not due to production, Romania becoming again importer of finished products, and exporter of raw materials and timber, as during the medieval times. Romania was found in a unique position among European nations: she turned around to a subsistence economy, the percentage of population working in agriculture being 39,7% in 1997, while in 1989 it was only 27,5%,⁷ and this gave predominance to family farms and to migrations from urban areas to rural areas, facts which have never met in Europe since 1800.⁸ During 1990-1996 Romania went back to economic conditions peculiar to Soviet occupation (1945-1958), and there could be identified in this period the most reduced level of *social cohesion* in Romania's entire modern history.⁹ The conclusion in this: after 1990 in Romania there was registered the destruction of the most important part of its economic potential, the setting of social chaos, cultural stagnation, and the scattering on national wealth, all being due to some deficiencies peculiar to Romanian society, well protected by the hesitation or incapacity of Romanian political leadership, which hasn't had the capacity to understand the aims of changes which it had to face.¹⁰

To these negative peculiarities there have been added the consequences of global financial crises starting with the fall of 2007, when evidence of this state of facts could be identified in USA. It could be mentioned that in the past there were economic crises, too, and their effects could be felt in the political area, too. In 2007 USA have been involved in two wars which she carried very far from her territory (for six years in Afghanistan and for four years in Iraq), their economic and political costs being considerable; on the one side, the economic crises in USA is direct connected to these "adventures", as in the past, when the wars determined a radical change in humans' perceptions and behavior.¹¹ The effects of this crises started to be felt in Romania beginning with the second part of the year 2008, bringing with them a general confusion in economic and social areas, although there could be identified beginning with 2007 some coherence due to Romania's integration with EU.

We are today in the first part of the year 2010 and we can question what we have to do in order to have some coherence in the action realized at national level in Romania. One important and wise answer should take account of national interest, and this must comprise the *Danube river*, which together with Black Sea and Carpathian Mountains, are those elements which influence in a crucial manner the life of Romanian state.

Nobody reckoned better this great importance of Danube – and of Romania, where are situated the Mouths of Danube – than King Carol I, when, as an answer to the counsel regarding "its refuse to accept the crown of a country without any future", he looked at the map and showed that here passed the most *straight line* between Europe and Indies, this country having to play a

special role in global trade.¹² Even then the geographical peculiarities were crucial for the direction taken by that great man and organizer of our modern state.

And we should never forget that since the opening of the Suez Canal the Danube has become the shortest way for transporting to the big economic and industrial centers in Central and Western Europe the food and raw materials brought from Asia, and for the export of industrial products from Europe to Asia.¹³ And from economic point of view, although Romania belongs to European family, the geographical space centered on Levant represents Romania's economic *vital space*,¹⁴ due to Danube and its direction of flow.

A strategy adopted at national level having as focal point the Danube river should be the main focal point in Romania, because the role of this river is so great, that in case such a strategy would be crowned with success, it would generate great benefits for Romania on multiple layers, both at domestic level, and in her foreign policy, too. One part of the territory which is the most valuable part given to Romania and which asks from Romanians the greatest dues and skills, in order to provide favorable conditions for development among the other nations on the Earth, is **Danube river**.¹⁵ Danube guarantees us the great future and the prosperity in the great struggle for existence among the nations on the Earth, and the same Danube is the element which dictates the Romania's *special interests*, and guides her policy.¹⁶

From *economic* point of view, Danube river could be used for multiple ends: it has a huge potential for fishing; for reed production; for irrigation systems; for energy (hydro and nuclear); for shipping industry; it is an important „tank” of water, being from this point of view a key-element with geostrategic connotations because it facilitates the human concentration in urban centers situated along its course – creating in this way the social base for economic activities, which are not possible without water; it could be used as a transport artery in European transport system, where there could navigate Romanian cruise ships, promoting the touristic potential in south-western part of Romania, bringing in these ways the greatest benefits for Romanian state and for Romanian people. Only the man's ignorance and silliness make from this natural spring of wealth not to produce the wealth at its potential, toward which we have the right look with confidence.¹⁷

The initiation of projects for fisheries' construction taking account of hydro-biological peculiarities, could create for Romania one of the greatest source of wealth and incomes.¹⁸ The material needs for projects like these wouldn't be a too great obstacle, because they generate incomes which would cover very fast the expenses generated by their construction; they are only necessary much more *seriousness, well intentions and good faith, and fewer petty politics and bureaucracy*. A bad administrated fishery is a forerunner of its bankruptcy, and although on Romanian Danube and in Danube Delta there are very good natural conditions for fish production – which are unique in Europe – the incoherence of Romanian politics sets the stage for scattering of this important natural gift. And as the fishes can't develop in a polluted environment, we could observe the direct connection between the fishing potential of Danube and *sustainable development*.

In the same time, a plethora of plants and animals find a welcome habitat along Danube – especially in Danube Delta – being another source of wealth. Let alone pasture lands and hay places, the reed due to enormous space occupied by them, have a special importance. If there could be identified a beneficial use for reed from Danube Delta, Romania could cover with reed

supply all needs in entire Europe, without fearing of any competition.¹⁹ Together with reed, there could be found huge amounts of rush, and big poplars, willow and alder forests. The profitableness of these forests is very big; even the wood has not the best quality, the forests could be cut at each 8-10 years, and through this short rotation, their exploitation would generate substantial incomes.

But the Danube influences in an overwhelmingly way the life of Romanian people, because this river has the most complex connection with all national and industrial activities. The Romanian Plain is one of the most fertile lands in Europe. The major disadvantage is due to the reduced quantities of water falling in this area (between 300 and 400 mm/year), the droughts generating great damages, especially in case there are consecutive drought years. It could be seen that the improvement of agricultural potential could be obtained through a vast system of *irrigations*. And the necessary amounts of water could be taken directly from the Danube, which in spring time could reach 35000 cubic meters/s.; the amount of water in excess could be stored in special pools, while during summer droughts the water could be used through canals and irrigation systems to agricultural areas, transforming significant areas in Romanian Plain in the wealthiest plains in Europe, reducing in the same time the Romania's dependency by food imports – another key-element with deep implications for foreign policy of the state – transforming Romania from a net food importer in a big cereals and food exporter, as a consequence of light industry development. The cornerstone for attaining this aim is the *association* among people living in this area, having at its base the *trust*. This is the only way for attaining a sustainable solution which could facilitate the reaching of this important aim.

From energy point of view, Danube has exceptional parameters, being the *biggest in Europe*;²⁰ the medium potential in Iron Gate Defile which has a length of 107 km. is 8050 KW/km, in Gura Văii-Sip being 81800 KW/km.²¹ While the construction of these hydro power plants was conditioned by river's peculiarities and its shores in common sector near Iron Gate Defile, the water of Danube river is an inexhaustible source for nuclear generated energy. In this way, in Units I and II at Cernavoda there is obtained 18% of necessary energy at national level; the installed capacity in for each one reactor 706 MW. And when the project was launched 30 years before, there were foreseen five units of electricity generation at Cernavoda.

Linked to the importance of creating at national level an *independence* in energy sector, this giving birth to a greater mobility in foreign policy, Danube could be regarded as the key-element which could provide that mobility for Romanian foreign policy, rising the specter of choices and its foreign policy's flexibility, with all advantages involved by these aspects. In this way, there could be obtained with inexhaustible Danube's water the needed energy in nuclear and hydro power plants – *the water becoming more and more expensive taking account of climate changes consequences* – providing a strong shield against the negative influences which could come from Middle Eastern affairs, OPEC, and Russia, or from non-state actors (as powerful oil and gas companies, companies involved in the supply of oil and gas along routes on sea and pipelines, or pirates,²² as happens near the Somali coasts).

The climate change, far away from international media coverage, is a real fact, with extremely negative consequences, and which could hardly be estimated and quantified. If we look at images taken by satellites, we could observe that in September 2007 the area of ice cap in Arctic zone is much little in comparison with the existing situation in 2001.²³ The reserves of fresh water

²³ Scott G. Borgerson, “Arctic Meltdown. The Economic and Security Implications of Global Warming”, in *Foreign Affairs*, March/April 2008, vol. 87, no. 2, pp. 64-65.

become, in a climate where temperature's risings would be a common thing, much rare and more expensive,²⁴ which made a famous international affairs think-tank to finance a study analyzing the impact of hydro-politics upon international relations.²⁵ The Danube becomes in this context the source of fresh water, so necessary to survive, and the element which could generate the necessary energy for the multiplication of weak human being's power, providing rising of the potential which could be used by Romanians in the great struggle they have to carry among the other Earth's nations. Danube is that important fresh water "reservoir", playing as such a role with strong *geostrategic* connotations.

Taking account of climate changes, nuclear energy becomes a viable alternative; although France hasn't any natural uranium reserves, in 2005 she had 59 nuclear reactors, which covered 78% of its electricity demand.²⁶ And if we look at this example, Romania could learn and use – taking account of her obligations assumed by NPT – the Danube's water to create nuclear energy on a greater scale in comparison with present situation, reducing in the same time the share of energy produced in coal power plants (which create a lot of pollution), oil and gas power plants (which emit gases which hurt the environment, and which create great dependence upon countries where those resources are located). Furthermore, this is in the context of European Union's desire to reduce the emissions which generate greenhouse gases.²⁷

The shipbuilding is another economic activity which is stimulated by Danube's existence, the whole production being export oriented, Romania having the 2-nd position, after Italy in Europe. In order to develop the navigation, it is necessary to develop the activities connected to deposit and transit business in Danube's ports, and to intensify the transit of goods in river and maritime-rivers ports, and the development of cruise navigation on Danube, in the same time with the modernization and development of the fleet for passengers' and goods' transport. Furthermore, Danube is the seventh European Pan-European Transport corridor, having a great importance for EU; the negotiations carried on before the establishing of this route had taken place under the auspices offered by a multilateral institution – UNECE – and they had been carried in parallel with the negotiations regarding the AGTC (1991), and with the negotiations finalized with the AGN (1996). And this is a strong proof for presenting the importance of Danube in Europe, this river being mentioned in all these accords.

Danube has benefitted by international focus, but to fulfill its role and purpose for Romanians, they have to construct a coherent and strong *national strategy* aiming at providing permanent conditions for navigation for ships with draught greater than 2.5 m all over the year, the take over of an important part of the road traffic – which pose great challenges due to its risks and pollution – and heading that part of traffic toward river navigation; and the development of deposits and expedition facilities, the reduction of the fees paid at the passage through Sulina and Danube-Black Sea canals; in the same time, there must be created access on rail and road infrastructures which are direct connected to Danube ports in order to stimulate the river transport; the development of reliable services in Romanian ports; stimulating Romanian ship-owners to develop a strong fleet well adapted to competition which they would face due to European integration process. These things correlated with better facilities regarding combined transport in Danube ports for loading or unloading of goods – and especially containers – could rise the role of Romania, transforming it in a real trade plate in Nord-South, and East-West trade. It could be noted that Danube's water represents in this case *union, energy, food, industry, transport, trade, but man must fight for the creation and development of these achievements.*

²⁷ Mehdi Abbas, "L'Europe face au changement climatique" în *Futuribles*, Fevrier 2009, No. 349, p. 53.

From politic point of view Danube line is the key-element which connects Romania to Western European countries; during history Danube played a “polarizing role for Romanian state”, because a free navigation at the mouths of Danube could be provided only when Romania was strong, the only one county direct interested that navigation on Danube to be free.²⁸ And if we think about the role of communications networks which facilitate not only the movement of persons (and as a consequence, of ideas) and of goods, they are in the same time those elements which create *political bridges* among different nations; and we can observe the great importance on Danube for a healthy Romanian integration with EU. Taking account of Danube flow’s direction from West to East, through the middle of European continent, her importance lays in facilitation of economic, social and political cooperation at European level. And the harmonization of the regime specific to Rhine with the Danube regime would remove the legal and administrative barriers which hinder the traffic between North and Black Seas.

During history, there have been were “two” Danube rivers: one *peaceful* regarded as such by riparian states; and one strategic, regarded as such by European powers. And if the first one is dictated by *economic interests* and by welfare, the second would have as cornerstone *geopolitical* aspects, the mouths of Danube being one of the global red points on military maps.²⁹

Danube, together the Black Sea and Carpathian Mountains are those elements on which depend the Romanian state’s life; and if we want to analyze the way the Romans, Turks, or Austrians, and even the migratory people used Danube as a strategic communication line, being in the same time a way for military, political, and economical penetration, we could remember always how important is this geographical element for Romania and for Romanians.

And we can remember that only through a coherent policy created at national level – but taking account of European interests – a policy emptied by any populist elements in regarding Danube, the Romanian state and nation could play the geopolitical role which it so much desire to have in this part of Europe, with great benefits for Romania, at regional level, but at European, and global stage, too.

University of Oradea, Faculty of Economics, MAs

In this paper we intend to present the new power which is given to Russia upon EU due to her great natural resources and due to her control upon pipelines. Now Moscow can exert influence upon countries in Europe not through its revolutionary zeal and its tanks and army, but through its resources. And she knows how to use them and how make the EU dependent on her will: this is a new geopolitics, a 21-th century geopolitics, which is centered upon the control of gas pipelines in Central Asian states and upon EU states' great dependence on Russian pipeline system.

Keywords: energy independence, gas wars, Nabucco pipeline, pipelines, Russia

Cod JEL: F51, L95, N74

Very few people could say that in their life time they could see a collapsing empire without war. Of course, in the second part of 20-th century there was a war, a Cold War, which had as centerpieces Washington and Moscow; but during the last years of '80s, there could be observed a constant decline in Eastern bloc, precipitated by Chernobyl accident in 1986. The Gorbachev's Glasnost and Perestroika policies³⁰ had played a big role in the disintegration of the Eastern bloc, the fall of Berlin Wall, and which ended with USSR collapse in December 1991. The most important heir of USSR was Russia; but during '90s, it had hardly overcome its domestic problems and crises, the biggest one taking place in 1997. So there disappeared a contender from the "game" without any military contest between him and the other one.

But as it is a well known fact that states never forget, the imperial memories of Moscow couldn't have been erased from collective memory of Russians, and especially, from political leaders incumbent in Moscow. During this period Moscow has shed its empire's loosing, but the biggest problem lays in the fact that Moscow hasn't yet found a new role for it in the world.³¹ In terms of foreign policy, Russia's leaders have failed to forget the legacy of the lost Soviet empire.³² Even the Moscow's behavior provides kinships: he who looks at war in Georgia in August 2008 could see resemblances with what happened in Budapest in 1956, or in Prague in 1968, but which had the peculiarity of instigations of ethnic minorities from different republics against the Georgian state's structure.³³

But what was a constant peculiarity of Russian politics after 1997 crises was the recurrence of Moscow's direct interference in Russia's energy policy, especially regarding control over gas pipelines. And the democracy – even that weak democracy – in Russia slipped into recession; this is partly due to disillusioned and disenfranchised voters, which choose to embrace an authoritarian strongman.³⁴ Of course, this is a special peculiarity of Russian society: "the central

³⁰ Mikhail Gorbachev, *Perestroika. New Thinking for Our Contry and the World*, New York, Harper & Row, Publishers, 1987, pp. 69-84.

and significant reality of Russian politics has been its predominantly autocratic character.”³⁵ As such, there has been perceived in Russia a deep-seated insecurity and – its antidote – willing acceptance of an all-controlling leader, and respect for power and certainty of goals.³⁶

This is a short presentation of Russian policy, and its continuity. But during different historical periods, Moscow used different instruments to spread its influence and to generate fear. Today, there is no more fear of a nuclear attack from Moscow over Europe or USA, but during the cold days of winter Europeans can feel the strong arm of Moscow; repeatedly it has appealed to the energy weapon to make its strong arm felt in countries from European continent.

This is a noteworthy aspect, because already in 1919 at Peace Conference in Versailles, President Wilson asserted that there could be identified “three crucial elements in international relations – international transport, international communications, and oil”, and the influence which a country would have in international affairs would be directly influenced by the position which that country had in these three key areas.³⁷ As the time passed, there appeared another key-element: the natural gas. It is a source of energy and heating, and what is important, it is much friendlier with the environment in comparison with oil and coal; burning gas instead of oil, and especially coal for electricity, means lower greenhouse gas emissions.

As we can observe, in the case of energy resources, it is clear that between transport and energy there are strong connections. It is important to have resources, but the possibility to control their delivery could become much more important. For this reason, the control over transport routes has a special connotation for each government. Each government wants to have independence in two domains: transportation and energy, and when you speak about *pipelines* you can easily note the magnificent combination which results.

But in comparison with oil, which could be transported from different countries due to high mobility of maritime fleet, in the case of gas resources, this mobility is almost nil, the only exception being LNG (liquefied natural gas), but which could create a strong link between a seller and a buyer, due to high costs of terminals for conversion (in export port) and reconversion (in the port of destination).

Taking these aspects into account, there it could be observed that Russia has a unique position. Due to logistic consideration, in the medium and long term, the oil will be traded globally, while gas will be traded regionally; coal due to its large spread, will be traded locally. The special place of Russia is due to its well endowment of oil and gas resources; Russia has almost 30% of the world’s proven gas reserves, and sits *astride* the transport network by which energy flows from the entire post-Soviet zone to the rest of the world.³⁸ In the same time, Russia has proven reserves of oil of 80 billion barrels, almost 7% in world total.³⁹ And it is possible in the future that Russia will seize the control over great parts of untapped reserves in the Arctic, where are about 13-20% of world’s total resources;⁴⁰ this is because of the aggressive way in which it has claimed control over great part of them, aspect which could bring intense tensions with USA, and other riparian states. Already the Russian state-controlled oil company Gazprom has approximately 113000 billion cubic feet of gas under development in the fields it owns in the Barents Sea;⁴¹ and the

resources which could be found in the territory claimed by Moscow could contain as much as 586 billion barrels of oil (bbl).⁴² If this is real, then it is opportune to mention that Saudi Arabia has only 260 bbl. proven reserves.

Only from Caspian Russian region Russian Federation produced in 2005 for example 1008,2 mil. tones oil equivalent.⁴³

But why should we regard Russia as a power with great influence in Europe and in the world? The answer is connected to geo-economic field, and not necessary to the military one. Of course, this country has almost half of nuclear arms in the world, and this has given it great influence at world stage, but nowadays things have changed: if during Cold War Moscow menaced the world with its revolutionary zeal and its atomic weapons; today it looks at the world and sees its needs connected to development, and threat to hinder this process through energy flow's obstruction.

Let's have a closer look at Russian politics regarding energy.

The nationalization of oil and gas industry was one of the pillars of this process. In 1996 Vladimir Putin couldn't even dream that four years later it would be the president of Russian Federation; but immediately he took the office, he engaged to create national champions in Russia – these national champions would put promotion of the state's interest over profit maximization.⁴⁴ But even in June 1997 he, in a dissertation submitted to St. Petersburg Institute, and in an article “*Mineral'no-syr'evye resursy v strategii razvitiia Russiiskoi ekonomiki*” published in 1999 in Zapsiki Gornogo Instituta, presented a plan for Russia's recovery and return to economic and political influence. The main theme was the calling on the Russian government to reassert control over the country's natural resources and raw materials.⁴⁵ The effect of such a policy would be a low energy price in Russia, while outside it means suspending deliveries to countries which refuse to support Moscow's foreign policy.⁴⁶ And in the case that a private company operating in Russia in oil or gas sectors doesn't support the Russian line of policy, it would be denied for it the access to Russia's oil and gas *pipeline monopolies*.⁴⁷

In the same time, the “friendly persuasion” from Moscow hindered Yukos and Sibneft in their business and while preventing their acquisition by foreign companies (especially by American ones); furthermore, through the process, Moscow gained control of 41% of Russia's oil output.⁴⁸ Before the end of second term of Putin's presidency, the most important industries in Russia – the strategic ones – went under state's control through *renationalization*.⁴⁹

But what is more important is the fact that these companies are controlled by *siloviki*; these men are economic nationalists and seek to restore Russia's international greatness.⁵⁰ They are prone to promote the consolidation of political and economic power within an extremely centralized state, well-financed security and defense structures: they sustain a strong state – over the importance of social and economic freedoms – which had to have a strong voice in country's economic life.⁵¹ In order to attain their goal – taking account of Russia's economic profile – these peoples pretend themselves to be economic nationalists, arguing that country's natural resources belong to Russian people, and that state must control them for that reason; the argument of bad years before

Putin's ascension to power being brought as example. These justify the limited access of foreign companies to Russian resources, and a favorite treatment for Russian companies headed by those which are close to Kremlin.

This administrative structure within Russia creates for this country a great bargaining power in economic and political, and even in security areas, because through Kremlin's control over natural resources, and especially the control *over pipelines*, Moscow can influence decision in those countries which are dependent upon Russian resources and access to them. We point here to the fact that Central Asian states are dependent on Russian pipelines, which are controlled by Kremlin through the giant companies Gazprom and Rosneft, and they can have access to markets only if Kremlin facilitates it. In the same time, Moscow fights to limit the access of those countries to the market; the only failure until now is the BTC pipeline, which was built only due to the strong backing given from Washington.

On the other hand, Moscow wants to have important shares in downstream parts of deliveries systems in EU. It fights hard to gain access and to have control in delivery systems in the most important EU countries, making there strong allies in Germany and Italy. This policy is aimed to maintain and increase the European countries' dependency on Russian energy flow, especial gas. For example, six EU member countries depend totally on Russian gas (Bulgaria, Slovakia, Finland, Estonia, Latvia, and Lithuania), while in other European countries Russian gas' share is big enough to create for Moscow the capacity to have a strong voice in European politics.

Moscow monopoly over gas pipelines has a powerful meaning: pipelines are the cheapest and most practical way for delivering gas, but this situation makes Europe extremely vulnerable, European countries being dependent on imported gas from Russia, a dependence that is set to increase.⁵² And if Russia prevents the fulfilling of projects which would create alternative ways for gas deliveries from Central Asian states, than the Moscow's clout in Europe would increase even bigger. It even took steps to prevent such possibilities: in summer of 2007 President Putin succeeded in promoting future collaboration among Turkmenistan, Kazakhstan, and Russia, aiming to sell gas from those two countries in European countries, which would pass as before through Russian build pipelines.

Another aspect which hints at Russian pipeline politics is that which regards the construction of a pipeline under the Baltic Sea – the so called Nord Stream – which would avoid the territory of some states which could create problems for Moscow. For the moment Germany buys 40% of its consumed gas from Russia,⁵³ while Italy 32%;⁵⁴ and through dealings with these two countries Moscow hopes to prevent the diversification of gas supply in Europe. The means are pipelines and the instrument in Moscow's hand is Gazprom. This could be easily identified from Putin's statement: "The gas pipeline system is the creation of the Soviet Union. We intend to retain state control over the gas transport system and over Gazprom. We will not split Gazprom up. And the European Commission should not have any illusions. In the gas sector, they will have to deal with the state."⁵⁵

Nord Stream would enhance Moscow's influence over those countries through which passes gas from Russia to Western Europe; these are as follows: in the northern part of EU there are two pipeline systems: one which passes through Belarus and Poland to Germany, the other which passes through Ukraine, Hungary, Slovakia, Czech Republic and Germany. If there could be build a pipeline which would connect Russia directly to Germany, those countries mentioned above could be influenced by Moscow, creating a very different situation in comparison with that

⁵⁵ Putin's statement quoted in Michael Fredholm, *Gazprom in Crisis: Putin's Quest for State Planning and Russia's Growing Natural Gas Deficit*, Swindon, Conflict Studies Research Centre, 2006.

encountered in 2006 and 2009, when Russia reduced the supply for Ukraine, while this country consumed the gas which was destined to Western European countries instead. This raised strong opposition from different countries in the region, including Sweden which threatened Russia with military actions if they would have started the project.

Regarding the Southern part of Europe, there Russia intends to prevent the construction of Nabucco project, which would increase energy security through Europe. The Moscow's countermeasure could be given by South Stream project. Even the route for gas pipeline in the Western part of Black Sea is almost similar, the great difference lies in the fact that Nabucco is a European project, backed by EU, which would be constructed and operated by Europeans, which in the same time would bring out from isolationism and dependency on Moscow the Central Asian states, while South Stream would be an extension of the already finished Blue Stream pipeline, which carries gas from Russia to Turkey, and which would be filled, maintained, and operated by Russia, while its building would be realized by Gazprom and ENI from Italy. One spur would go via Greece into Southern Italy, while the other to the Northern Italy, through Romania, Hungary, and Slovenia.⁵⁶

We can mention that after Angela Merkel became German Chancellor, the Nord Stream hasn't got the same back up in Germany, but the Nabucco project, even if it got the President Sarkozy's maintenance, as could be identified from President Sarkozy's statement in Romanian Parliament in February 2008, couldn't be realized until 2010.

As a conclusion, Russia has maintained its influence over gas pipelines and deliveries in most countries in Europe, and this influence is expected to grow as in the European countries there will increase gas consumption in the future. This rising is due to the fact that the resources available in Europe will diminish, while the consumption of gas will increase due to both energy needs' increase, and due to reducing of other natural resources used for energy production. The only way to reduce the control which Moscow would be capable to exert in Europe would be connected to a more *coherent* energy policy crafted in Brussels having at its core EU countries' interests, and a unified position from those countries in relation with Moscow. Both need each other, but in order to create a climate which will generate a better environment in EU countries it is needed a greater impudence from Moscow from energy point of view. Of course, Moscow can diversify its deliveries to East Asian countries which are hungry for energy resources, but a policy which will facilitate the gas deliveries from Central Asian states to EU via Nabucco, will generate great benefits for all those which will be part in it, from both ends of the pipeline.

For Central Asian States it would mean the reduction of Moscow's influence in their domestic and foreign politics, for Azerbaijan, Georgia, and Turkey, through which Nabucco would pass, it would mean a closer relationship to Western countries, reducing Moscow's influence in those countries (especially in Georgia and Turkey, due to reducing their dependency of Russian exported energy), while for EU countries it will be a proof of a coherent policy which could be crafted together by all those interested, reducing in the same time their dependence on Russian energy, and Kremlin's will.

ECONOMIC ACTIVITY REGULATION AND COMPETITION ASSESSMENT

Berinde Mihai

University of Oradea

Faculty of Economic Sciences

In a broad sense, the term „competition” defines the relations between economic operators acting on the same market seeking attainment of certain interests in economic freedom conditions.

The need for regulations in the area of competition stems from the nature of free, open market economy which is founded on the existence of fair competition between economic agents, competition which must be observed, maintained and protected by the law.

Public authorities who issue various regulations should be cautious about how far this role is played in the economy and they way adopted regulations affect competition in the market. Hence, the need for prior assessment relating to the potential effect of a regulation on competition.

It was proven in practice that some regulations may lead to measures that may affect competition directly or indirectly by: limiting the number or range of suppliers; limiting supplier capability to compete and reducing interests of suppliers to compete vigorously.

Keywords: competition, regulation, assessment.

Cod JEL: F120

1.Introduction

In a broad sense, the term „competition” defines the relations between economic operators acting on the same market seeking attainment of certain interests in economic freedom conditions.

In economy, competition may be approached on three levels, i.e.

- direct competition (also known as brand or category competition) where products with the same functions compete directly against each other;
- indirect or substitute competition, where products which are close substitutes for one another compete;
- budget competition, which refers to competition between any good or service for which the consumer wants to spend his available money.

It should be noted that in most countries economic and business competition is often limited and restricted. Competition often is subject to legal restrictions. Tariffs, subsidies or other protectionist measures may also be instituted by government in order to prevent or reduce competition. Depending on the respective economic policy, pure competition is to a lesser or greater extent regulated by competition policy or competition laws.

Competition law, described in the United States as “antitrust law”, has three major functions:

- a) it prohibits agreements or cartel type understandings;
- b) it prohibits the existence or abusive behaviour of a company which holds a dominant position in the market ;
- c) it supervises the mergers and acquisitions of large companies.

In all cases the law aims to protect the welfare of consumers by ensuring competition between businesses and by eliminating any restrictive practice.

2. Evolution of competition policy

„Rigorous application of the competition policy is the best way to guarantee economic freedom. Therefore, free competition represents a public liberty which influences not only the economic

environment but also the organization of civil society. In this sense, competition policy is a policy for the citizens”⁵⁷.

The need for regulations in the area of competition stems from the nature of free, open market economy which is founded on the existence of fair competition between economic agents, competition which must be observed, maintained and protected by the law.

Its very reason for being in the area of competition is determined by the fact that the market cannot operate normally by nature and require some external intervention. Nevertheless, the open market principle does not infer passive attitude towards the way markets operate but on the contrary, it calls for keeping constant vigilance, so as to enable market mechanisms to operate properly. This becomes all the more necessary in the current worldwide globalization context distinguished by deepening integration at markets level.

According to economic theory, increased market competition leads to higher efficiency of resource allocation as a result of the fact that prices of goods and services will tend to the level of marginal costs. In perfect competition conditions marginal prices will equal marginal costs, hence profits will be nil. Therefore, producers will try to intervene so as to increase profits by initiating measures resulting in restrained competition. Under a „laissez faire” government one cannot intervene against such a strategic option⁵⁸.

Limited, in the past, to some developed countries, competition policy spread out progressively in various regions of the world, today it constitutes an essential tool in the paraphernalia of regulatory policies⁵⁹. The origins of competition policy as a regulatory tool stem in the United States of America where the first competition regulatory legislative act was adopted in 1890 (Sherman Act).

In Europe, competition policy has developed with the creation of the European Economic Community and has become an integral part of the economic integration project, being comprehended under this title by the Treaty of Rome in articles 85 and 86.

Subsequently, the importance of protecting competition became obvious to most countries, i.e. developed, developing and transition countries (currently, over 80 countries have competition legislation in place).

Reality of the past two or three decades, after the beginning and intensification of the European integration process materialized in a multitude of negative impact developments, which had to be regulated, determined instatement of an European wide legislation meant to strictly regulate competition in all member states.

Based on research conducted on the objectives of competition policies, two distinct views or models can be highlighted:

- the „structural” model inspired by the theses of Harvard school, which focuses on dilution of the economic power;
- the model inspired by the theses of the Chicago school centred upon economic efficiency.

The structural approach, widely spread in the 1950-1970’s by J. Bain and E. Mason, is based on the concept of pure and perfect competition whose existence is conditional upon atomicity, that is the presence in the market of as large numbers of economic agents as possible⁶⁰.

In the opinion of economists R. Posner (1976) and D. Demsetz, proponents of the Chicago school, concentration does not always have negative consequences for consumers⁶¹. On the

⁶⁰ Bain, J.S., *Structure versus Conduct as indicators of market performance: the Chicago school* // Antitrust law and economic review, vol. 18, no.2, 1986, pp. 17-50.

contrary, they say, concentration is merely a selection process of more efficient companies which leads to increasing profits of the companies but also, implicitly, to increasing innovative capability which in turn results in lower production costs and thence improved consumer welfare⁶².

Irrespective of specific conditions in one or another area, the final purpose of competition policy is the same, i.e. development of competition as such. As insisted the classic model proponents, the purpose of competition legislation cannot be brought down exclusively to securing efficiency. *The actual economic purpose of competition policy is threefold: economic efficiency, consumer welfare, and competition between companies.*

Manifest competition is not always fair, based on fair-play principles and aimed to improve competitors' activity. Oftentimes, economic agents make use of numerous anti-competition acts and actions seeking elimination of competition from the market and making as high as possible profits. This has consequences which affect both the competition environment and the overall economy and draws in pretty heavily on the life of citizens. Therefore regulation has been and still is required in the area of competition, which stemmed up the policy in this area or competition policy. This type of policy mainly aims to create real, free and fair competition within the reference market by the instrumentality of measures related to market structures and to the behaviour of economic agents.

3. Commercial policy and competition policy interaction

The so called „new topics“ negotiated within the World Trade Organization⁶³ (WTO) deal with the way instruments related to competition policies on domestic and international markets interact with international trade.

Decisions made at the Singapore Ministerial Conference in 1996⁶⁴, enabled creation of two taskforces intended to examine more in a general manner, the ways trade is linked with investments and competition policies. In addition, ministers acknowledged the importance of the activity of the *United Nations Conference on Trade and Development* (UNCTAD)⁶⁵ and of other international organizations in the matter of competition. The taskforces were encouraged to cooperate with these organizations so as to ensure development issues have been fully taken into consideration.

In our attempt to go into further details relating to the link between commercial policies governing international trade, and competition policy, it is worth highlighting to what extent these two policies are antagonistic or complementary. Thence, commercial policies primarily aim at international trade liberalization by elimination of tariff and non-tariff barriers. Certainly, in a market economy materialization of such an objective is translated into the reduction of marketing costs and decreased retail prices. This means easier consumer access to the concerned product or service. As regards competition policy, it is likewise subordinated to defending consumer interests. This objective is attained by fighting and eliminating practices in restraint of

⁶¹ Pradeep Mehta, *Multilateral Competition Agreement. Looking ahead to Cancun*. WTO, Symposium on trade and competition policy, 22.02.2003, p. 1

⁶² Demsetz, H., *Industry structure, market rivalry an public policy*.// Journal of law and economics, vol.16,1973, p.1-9

⁶³ World Trade Organization (WTO) is an international organization which supervises a large number of agreements which define “commercial rules” between member states. WTO is the successor of the “*General Agreement on Tariffs and Trade*” and operates towards reducing and abolishing international trade barriers.

⁶⁴ Singapore (1996) – within this Conference, developments in international trade and implementation issues and aspects of various WTO Agreements were examined.

⁶⁵ United Nations Conference on Trade and Development. Established in 1964, UNCTAD promotes development of friendly integration of developing countries in the world economy. UNCTAD evolved progressively as a knowledge based authority of institutions whose activity aims to contribute current policy debates and thinking development especially focused on guaranteeing that domestic and international policy actions support each other in achieving sustainable development.

competition which may occur in the market by: understandings between competitors, abuse of dominant position by a company holding an important position on the market, as well as rigorous control of economic concentrations and of authorization and checking of state aids.

It is evident thus, that both policies mentioned above promote protection of consumer interests directly or indirectly. Moreover, they are complementary by their fostered objectives and actions. Indeed, international trade liberalization efforts would be in vain if tariff or non-tariff obstacles were replaced by competition restraining practices of the type shown above. Should strict rules fail to exist ensuring normal market operation competition wise, the consumer will no longer be in a position to take advantage from trade liberalization.

Therefore, both trade liberalization and ensuring normal competition climate occur conditional on states having actual intervention possibilities when the two processes do not unfold under normal conditions.

4. Competition and world economy globalization

One of the most recent trends in world economy is represented by globalization⁶⁶, an intricate and multidimensional process which influences, directly or indirectly, the economies of all countries. Hence, it also influences the constituents of economies, i.e. domestic demand and supply, prices, competition. In this context, it is worth noting a few peculiarities of competition delineated by changes occurring at the level of national economies under the impact of the globalization process, namely:

- enhanced competitiveness as a result of opening national economies to international trade by gaining new outlet markets;
- diversified competition engagement strategies, determined by goods and capital trade liberalization;
- establishment of the intervention capability of states in a market economy. It is more difficult in such circumstances for the state to control market relations extended at global level. This theory should not be absolutized either, since opening borders and international trade liberalization should not be mistaken for creating pandemonium.

International trade liberalization occurs at the sale time with its regulation.

Then, it is evident that also in the economic processes globalization, including at the level of competition, states are attempting to regulate the various activities in order to prevent competition restraining forms and practices from appearing and occurring.

5. Assessment of regulations impact on competition

Public authorities who issue various regulations should be cautious about how far this role is played in the economy and they way adopted regulations affect competition in the market. Hence, the need for prior assessment relating to the potential effect of a regulation on competition.

This is why it not surprising that worldwide concerns with competition assessment have increased in the context of adopting regulations which might affect competition climate. Among international organizations which made themselves conspicuous in this respect is the Organization for Economic Cooperation and Development (OCDE) by the study it conducted relating to its Set of Competition Assessment Instruments.

The starting point in the implementation of such set of competition assessment instruments is represented by the identification of aspects which may be subjected to regulations. It was proven in practice that some regulations may lead to measures that may affect competition directly or indirectly by:

a) Limiting the number or range of suppliers

⁶⁶ Joan Bari, Globalization of Economy, chapters 9 and 13

Limiting the number of suppliers creates the risk for the market power⁶⁷ to appear and for competition reduction. When the number of suppliers decreases, the possibility of collaboration (or understanding) between them increases and the capability of individual suppliers to increase prices may be greater. From a competition perspective, this can lead to lessened interest to satisfy consumer requirements and to long term reduction of economic efficiency. While there are reasonable political grounds based on which political leaders can sometimes limit the number of range of suppliers, the benefits of a market entry limiting policy need to be assessed in consideration of the fact that easy new supplier market entry is apt to prevent existing suppliers from becoming dominant on the market. Market power leads to higher prices, lower quality and little innovation.

Forms in which such limitation may become the subject of a regulation are diverse, and the most important are:

- *Granting exclusive rights.*

Granting an exclusive right to manufacture a certain good or provide a certain service implies establishing a regulated private monopoly. Potentially, exclusive rights may lead to monopoly prices and to other market power related issues.

- *Establishing a license registration system or approvals for carrying on certain activities.*

Licenses or permits required for carrying on activities inevitably limit market entry. Requirements for licenses or approvals are often a lot more stringent than necessary for consumer protection and may reduce consumer's choice uselessly and create an artificial shortage resulting in higher prices. A guiding principle is that restrictions should not lead, more than needed or satisfactory, to the attainment of regulatory objectives.

- *Limiting certain suppliers from supplying a good or providing a service.*

In certain circumstances, governments seek to encourage suppliers from certain regions, small suppliers, or specific featured suppliers by limiting the capability of certain types of suppliers to participate in a commercial activity, especially with regard to public procurement. Such restrictions are excessive since they limit unreasonably the number of suppliers participating in the tender, reducing competition between suppliers and resulting in higher prices or less desirable contractual terms for the government.

- *Significant increase of entry or exit costs.*

Regulations which lead to increased market entry or market exit costs will deter newcomers and will therefore reduce the number of market players.

- *Restricting the flow of goods, services, capital and labour.*

Regulations often limit the flow of goods, services, capital and/or labour across the area determined by borders falling under national jurisdiction, frequently as a regional policy instrument. However, such restrictions will reduce artificially the geographical competition area for supplying a good or providing a service. This can limit the number of suppliers and may potentially allow them to exercise market power and increase prices.

There is also a material risk that „temporary” protections change into semi-permanent arrangements due to the considerable influence exercised by the suppliers who benefit of such restrictions.

b) *Limiting supplier capability to compete*

The main forms whereby a regulation may affect the capability of suppliers to compete are:

- *Controlling prices used to sell goods or services.*

Oftentimes, governments regulate prices in the traditional monopoly sectors, such as for instance in the case of utilities. These types of controls on prices are probably beneficial to consumers and

⁶⁷ Suppliers' market power represents the capability to increase prices profitably, to reduce quality or innovation relating to levels which would prevail on a competitive market.

are used as a counterbalance to the lack of alternatives for them. However, controls on prices are often applied in situations when there are numerous potential suppliers for the same consumer. When minimum prices are set, low priced product suppliers are prevented from gaining a percentage of the market by ensuring better value for the consumers. Similarly, when maximum prices are set, the interest of suppliers in innovations so as to ensure new and/or higher quality products may be significantly low and suppliers may effectively coordinate prices around the maximum price level.

- Limiting advertising and marketing.

Regulations limiting the capability of suppliers to advertise or market products and services exist often for the purpose of restricting false or deceptive advertising.

However, in many cases, restrictions on advertising and marketing are too general and unreasonably limit competition. Restrictions on advertising and marketing may have considerable disadvantages for the newcomers since they limit their capability to inform potential buyers about their presence on the market and about the nature and quality of goods and services they can offer.

- Setting product quality standards beyond the desirable level for well-informed buyers.

Regulations laying down standards often ensure benefits for consumers and may promote new types of products while making sure they are compatible. But setting a standard may also ensure an excessive benefit for certain suppliers against others.

When certain consumers prefer lower costs to higher safety the need for a standard is less justified. Consumer welfare may be reduced by such standards since consumers are prevented from buying less expensive lower quality products which they would prefer even when fully informed about all associated risks.

- Increasing costs for some suppliers compared to others.

In certain periods, regulations determine unintentionally cost increases for some suppliers as compared to others. One of the asymmetry generating sources relating to costs is represented by regulations which unreasonably require using a certain production technology against another one. Another such source is represented by the „seniority clauses” which exempt existing suppliers from being applied a regulation which this way would affect only newcomers. Such arrangements affect competition by increasing costs for some suppliers to a considerably higher extent than for others.

c) Reducing interests of suppliers to compete vigorously

Regulations may affect supplier behaviour not only by changing the capability of a supplier to compete but also by altering the interests of suppliers to act as vigorous rivals. Two of the main reasons suppliers may compete less vigorously are related to the fact that some regulations may result in facilitating coordination between suppliers while other regulations may result in reducing goodwill, capability or means to encourage buyers so as to enable easy selection among the various suppliers.

Forms taken by the reduction of interest in competing are:

- Regulation and self-regulation

When a business or a professional association fully assumes responsibility for regulating the behaviour of its members without being supported from a legislation standpoint by the government (often as requested by the government) the „regulation” term is used. When the government provides the legislation support for regulations developed at least partially by the relevant business/professional association, the „self-regulation” term is used. Regulation and self-regulation structures may produce substantial benefits by ensuring technical standards compliance and their advancement in line with technology.

- Requirements for the publication of information about suppliers' prices, production, and sales.

Regulations requiring market players to publish information about their own prices or their levels of production may significantly facilitate creation of cartels, since a key requirement for a cartel to operate is that its participants are able to effectively monitor their competitors' market behaviour. Cartels appear where there are fewer market players, where entry barriers are raised, where products of the suppliers are relatively unvarying and where information about prices or about production changes are available either before or after the price or production has changed. There are alternatives to collected data publication. When information is originally collected in order to develop a governmental policy it is unlikely that publication of such information should be justified. The purpose however consists in supporting the consumers or supplying general statistics, as aggregate statistics support cartels to a lesser extent than specific statistics relating to suppliers.

- Exemptions from general competition norms.

In many countries, certain suppliers or certain economic sectors benefit of exemptions from general competition norms. In some cases, these sectors are governed by their own legislation in the area of competition specific to every sector. In other cases, there is no restriction relating to anti-competition behaviour in these sectors. Where there is substantial derogation of the general enforcement of competition legislation there is also the obvious risk of cartel formation, of abusive imposition of prices and of the ensuing anti-competition mergers⁶⁸.

- Reducing client mobility by increasing costs associated with changing suppliers.

Regulations may cause the consumers to be less willing to change a supplier for another due to concerns for "transfer costs" – explicit and implicit costs borne by a supplier when changing a supplier. Transfer costs may result due to various reasons, including unreasonable long contractual periods or restricting goods by the suppliers in a manner that makes it uncomfortable to change suppliers, such as restricting access to a telephone number for a certain services supplier. When consumers are faced with high transfer costs, suppliers may impose higher prices for their goods and services. Consequently, suppliers often seek to create high transfer costs, sometimes by promoting regulations which will ensure such transfer costs.

Financing funds are financial instruments working to eliminate economic and social disparities, in order to achieve economic and social cohesion. The participation of the companies to financing funds aimed to support their activity through the financing of the productive sector investments, infrastructure investments or other investments in fields such is: education, employment and human resources development, local development and small and medium sized enterprises, but also to make possible the economic and social conversion of areas facing structural difficulties. This study aims to highlight the advantages and expertise acquired by companies participating in projects compared to those having deferred their enrollment in the project.

Keywords: local development, projects, financing, economic and social conversion

Cod JEL: M21, O12

1. General objectives of projects

The main objective of companies participating in different projects is the training of company's employees to develop skills on innovation, support business competitiveness in the context of adaptation to business requirements. This competitiveness can be achieved only by companies seeking to sustain and develop their work and by participation at various projects (not only in purely technical matters, but also in management, human resources, market policies, etc.).

Projects aim to provide access to techniques, methods, strategies to be followed in order to stimulate creativity. Companies that participate in these projects will gain competitive advantage through which will better exploit the innovative potential of employees and will easily integrate into highly competitive environment given the current context of Romania's EU integration, as well as that of globalization. When elements of innovation and innovation management are not adequately represented in training programs, projects aim to substitute lack of harmonization of the educational system to labor market needs.

Projects are considering also obtaining the individual benefits for employees of companies participating in projects; they will increase their chances of promotion, labor market integration in Europe.

In the context of globalization, the competitiveness is a question of Romanian companies. Projects designed to sustain competitiveness in the Romanian companies aim to define, to design and develop an educational packet for the employees of these

companies responsible for the development and exploitation of innovation. Innovation focuses not only on the idea, the novelty, but also the ability to apply the idea in practice.

2. Motivations of firms participating in projects

Main motivation of participation in projects is related with the possibility to acquire skills and advantages in terms of sustaining a competitive activity. Companies needs related to their staff need to be innovative to cope with competitive business environment, workforce qualification and retraining to meet better the needs of labor market participation are other motivations of firms in projects.

Training through participation in innovative projects will lead to development of managers and employees. Analysis of general needs and specific needs in training employees of small and medium sized enterprises to develop innovative edge, will allow companies to find innovative and creative solutions to business needs.

Therefore, firms will adapt more easily to changing business environment and will be more open to new ideas and change in general.

3. Case Study: small and medium sized enterprises participation in projects

Reasons for the choice of target group - small and medium sized enterprises were:

- in small and medium sized enterprises, especially in Romania, there is less coherent policy to stimulate innovation;
- project results are easier to assess for small and medium sized enterprises than for large companies because small number of employees in a small and medium sized enterprises;
- small enterprises number decreased continuously in recent years (in 1998 there were 295.486 small businesses operating in economically and in 2002 only 285.589), while the number of medium-sized enterprises increased. This trend indicates the maturation of small and medium sized enterprises sector in Romania. Since 1990, Romanian Government, with the EU assistance and other donors and financial institutions, has implemented a series of measures to accelerate growth of the small and medium sized enterprises's sector. These measures led to significant results, in 2002: the contribution of the SME sector to GDP increased to 60%, the share of small and medium sized enterprises in total labor force employed reached 50.5% and 24.4% value of total exports. However, development of SME sector is still a challenge for Romania.

Activities that should be considered in a project involving the participation of small and medium sized enterprises are focused on identifying business needs and employees' needs to respond positively to the challenges of competitive environment. The positive response consists in the possibility of obtaining superior results compared to those of competitors and against prior periods.

To demonstrate the efficiency of small and medium sized enterprises participation in projects and to highlight the skills and advantages acquired, we analyze results of 10 companies (of 50) who benefited from the opportunity to participate in a project (PHARE CBC 2005) held in 2007-2008. Positive results were obtained by correctly identifying the economic needs of various categories under pressure. Opening markets has caused new pressures on businesses, especially in traditional industries and small and medium sized enterprises have been exposed, especially to many changes in business environment due to economic restructuring and preparation for integration. Therefore, they have to make efforts to adapt to structural changes.

This project was designed to foster cooperation in the small and medium enterprises, because only by this population, economic organizations and civil border counties may be integrated into cross-border cooperation. The project aimed to increase the level of training of managers, entrepreneurs and employees among small and medium sized enterprises by developing skills in implementation of projects and funding request. The project proposed also to induce a change in attitude and mindset among small and medium sized enterprises vis-à-vis the European integration process, which is reflected in improvements in the application and interpretation of Community law, the efficient resource management human and material, the awareness of the need and usefulness of a management plan for short and medium business and a development strategy in line with the trends of the European single market. The project has superior economic performance with economic integration, and increased competitive capacity of small and medium sized enterprises with import-export activity from border area.

After finalization of funding under the Phare CBC Program, Centre for Cross-border Business Services - CSAT will provide research and consulting for all companies engaged in foreign trade, and thus affected by the economic integration process.

The sample analyzed was set to include companies operating in the three economic sectors: agriculture, industry and services.

Table 1: Distribution of small and medium sized enterprises (SMEs) participating in the project sectors

Sector of the economy	No. SMEs participating
Agriculture	10
Industry	10
Services:	30
- Commerce	10
- Transport	10
- Tourism	10
Total	50

Figure 1: Distribution of SMEs participating in the project sectors

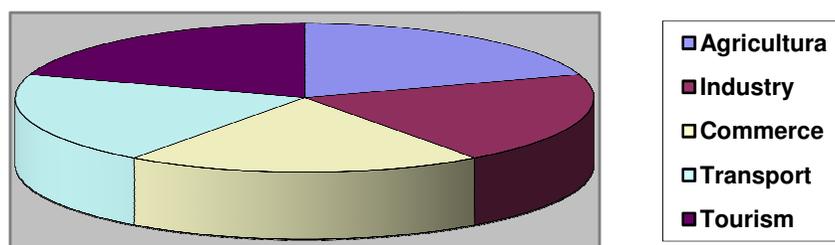

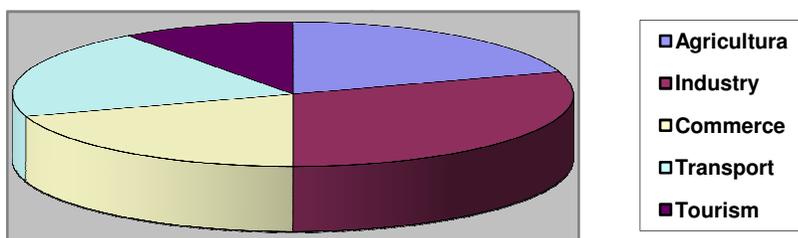

Table 2: Distribution of SMEs by sector analysis

Sector of the economy	No. SMEs examined
Agricultural	2
Industry	3
Services	5
Total	10

Fig 2: Distribution of SMEs by sector analysis

Skills acquired through participation in the project were:

- long term improvement of skills, training and specialization of staff and managers in the firm's problems;
- improve competitive;
- diversification and upgrading of products and services like customer adequate workforce;
- training to use new tools in business;
- ensuring the flexibility of labor in order to value employment opportunities;
- growth performance of small and medium sized enterprises on domestic and foreign market;
- to acquire a European mentality and cultivate partnership opportunity.

Benefits from participation in the project are:

- spread best practices for promoting small and medium sized enterprises in the context of alignment with EU standards;
- promoting innovations in business;
- for managers, will certainly be a way to encourage such investment in human capital of their firms.

Of the 10 small and medium sized enterprises examined, six have applied knowledge gained from participating in the PHARE CBC project compiling projects that have applied for grants to obtain funds national and European programs. These projects dealt with the purchase of equipment for the activities of industry and agriculture, modernization of transport and tourism activities, and creating e-shops. As a result of funding obtained, companies have created new jobs, won higher incomes and obviously, they made a

profit. The current economic crisis has had an impact on their activity, but to a lesser extent.

Competencies and advantages gained by the participants in the project are reflected in the current activity of participating companies is quantified in terms of positive evolution of key economic indicators. To support those assertions, we analyze comparative financial indicators (turnover, profits) and the number of employees. The analysis covers the period 2006-2008, with forecasts for 2009.

company 2	3.376.971	6.184	13	3.380.000	6.200	13
<i>Tourism:</i> company 1	3.977.947	99.654	8	3.500.000	95.000	8

* Statistical data for the study were provided by the companies, according to the balance sheet, for 2009 data were projected by the company.

Forecasting level indicators for 2009 took into account the experience of participation in the project, experience has tried to counter, in a proportion as high as possible, the economic crisis. If it was a realistic forecast data will be there after June 30 (according to the balance sheet).

Table 5: The average rate of increase/decrease of the level indicators on the economic sectors considered from their 2006 level

Sector of the economy	2008/2006			2009*/2006		
	turnover	profit/loss	no. employees	turnover	profit/loss	no. employees
Agriculture	114%	35%	1,7%	114,7%	41,8%	1,7%
Industry	66,7%	-	-23,5%	66,7%	-	-21,2%
Services:						
<i>Commerce</i>	32,3%	-	-37,9%	32,4%	-	-29,4%
<i>Transport</i>	18,5%	-34%	-28,9%	18,5%	-24,1%	-19,1%
<i>Tourism</i>	20,5%	132%	14,2%	6%	121,8	14,2%

The firms that in the period previous to the participation to the project suffered a loss, through the skills acquired, they have managed to cover these negative results and, in some cases, they have had a profit.

4. Conclusions

Note the growth of the considered indicators, a different growth rate from one sector to another, fact that sustains an efficient participation in the project and a good management of the knowledge acquired. In some cases, the factor that had a greater impact on business activity was still the economic crisis. Sure, in the future, companies will improve the situation, given the strong interest for participation in other projects.

EUROPEAN CENTRAL BANK AND ECONOMIC CRISIS MANAGEMENT

Ovidiu Cristian

Babes-Bolyai University Cluj-Napoca

Faculty of Economics and Business Administration

This article aims to describe the response of the European Central Bank to the emergence and development of the current economic crisis. It will present the measures that have been employed since the year 2008 and try to outline the results. The article is structured in three parts: first the regular mechanisms used by the European Central Bank for steering economic development and in particular the monetary policy are listed; next the differences between the European and US economic and financial environments in face of the crisis are outlined; and finally the European Central Bank's strategic measures to battle the crisis are presented, together with the final conclusions.

Keywords: European Central Bank, monetary policy instruments, economic crisis, stability measures

Cod JEL: E58

1. European Central Bank's monetary policy instruments

The European Central Bank (ECB) is the supranational institution mandated by the Treaty to conduct the monetary policy of the European Union. The Article 105 of the Treaty acknowledges that the main objective of the Eurosystem - ECB plus the National Central Banks (NCB) of the member states that have adopted the euro currency – is price stability. As long as the primary objective is not jeopardized, sustainable economic growth and high levels of employment might also be pursued. In fulfilling these objectives, the Eurosystem has developed three main groups of monetary instruments: open market operations, structural operations and minimum reserves.

1.1. Open market operations

These operations play the most important role in steering the interest rates, managing the liquidity situation on the market and signaling the stance of monetary policy. There are five instruments used in this category, and the most important is the reverse transaction. *Reverse transactions* are operations in which the Eurosystem buys or sells eligible assets under repurchase agreements or conducts credit operations against eligible assets pledged as collateral. These are executed through the NCB and involve the use of repurchase agreements – the ownership of the asset is transferred to the creditor, while the parties agree to reverse the transaction through a retransfer of the asset to the debtor at a future point in time; or as collateralized loan – the ownership of the asset is retained by the debtor, but an enforceable security interest is provided over the asset. The interest paid on these types of transactions is simply the difference between the purchase price and the repurchase price in the repurchase agreement; in a collateralized loan, a specified interest rate is applied over the maturity of the loan. Reverse transactions are used for main refinancing operations, for longer-term refinancing operations, for structural and fine-tuning operations.

Outright transactions are open market operations in which the Eurosystem buys or sells eligible assets outright on the market. They imply a full transfer of ownership from the seller to the buyer, without the pledge for the reversal transfer of this ownership. These types of transactions are used only for structural adjustments. *The issuance of debt certificates* is also a structural operation used by Eurosystem for absorbing excess liquidity from the market. They constitute a debt obligation of the ECB towards the holder. The debt certificates do not bear coupon, they are sold

at below nominal value and redeemed at face value, the difference being the interest accrued at the maturity. *Foreign exchange swaps* consists of operations where Eurosystem buys (sells) euro spot against a foreign currency and, at the same time, sells (buys) it back in a forward transaction on a specified repurchase date. As a rule, Eurosystem deals only with internationally recognized currencies. These operations are used for fine-tuning adjustments, to provide/reduce liquidity in the market and steer interest rates. *Collections of fixed term deposits* are deposits placed by different counterparties at the NCB, in the country where these counterparties are located. They are used in fine-tuning operations for absorbing excess liquidity from the market. They are constituted for a fixed term and the counterparties receive a fixed interest for them. The NCB where these deposits are located does not offer any type of collateral in return.

Open market operations are initiated by the ECB in order to fulfill its objectives. The ECB decides also what type of instrument to use from the five above and the conditions for the execution – standard tenders, quick tenders or bilateral procedures. Regarding procedures and regularity, the open market operations can be classified in four categories: main refinancing operations, longer-term refinancing operations, fine-tuning operations and structural operations.

Main refinancing operations have the most important role in fulfilling the objectives of the Eurosystem. They are pursued by the NCB every week, having also a weekly maturity. Their objective is to provide liquidity in the market through reverse transactions and are executed using standard tenders. *Longer-term refinancing operations* are pursued by the NCB every month, having a maturity of three months. Their objective is to provide liquidity on a longer term through reverse transactions and are also executed using standard tenders. *Fine-tuning operations* are executed “on the spot” in order to mitigate unexpected fluctuations of the liquidity on the market and to steer interest rates, having a non-standardized frequency or maturity. They are executed by the NCB on the basis of quick tenders or bilateral procedures, but sometimes they can be initiated directly by the ECB. Mostly they take the form of reverse transactions, but foreign exchange swaps and collection of fixed-term deposits are also used. *Structural operations* are executed by the NCB through standard tenders and involve either reverse transactions (for the provision of liquidity) or issuance of debt certificate (absorption of liquidity). Also they can be executed through bilateral procedures using outright transactions – outright purchases or sales – in a non-regular fashion. Structural operations are used when the ECB wants to modify its structural position towards the financial sector.

1.2. Standing facilities

These operations are executed on a very short time frame (overnight). They are used to influence the overnight market interest rate, to smooth the overnight liquidity and to signal the position of the ECB. The counterparties have access to two types of standing facilities, at their own discretion: the marginal lending facility and the deposit facility. *Marginal lending facility* is employed when the counterparties desire to obtain overnight liquidity and takes the form of overnight reverse transactions. The interest perceived on the eligible assets provides a ceiling for the overnight market interest rate. *Deposit facility* is used when the counterparties desire to set up deposits for their overnight additional liquidity in exchange for an interest rate, which usually provides a floor for the overnight interest rate. Both these two facilities – the marginal lending facility and the deposit facility – are administered in a decentralized manner by the NCB.

1.3. Minimum reserves

This measure is used for absorbing unwanted liquidity from the market. Basically credit institutions in the euro area are required by ECB to maintain a certain amount of reserves at their respective NCB, amount determined in relations to elements in their balance sheet. Deposited reserves are remunerated at the interest rates used by the Eurosystem’s for the main refinancing operations.

A generalized table of the operations used by ECB to conduct its monetary policy can be summarized as follows:

Monetary policy operations	Types of transactions		Maturity	Frequency	Procedure
	Provision of liquidity	Absorption of liquidity			
OPEN MARKET OPERATIONS					
Main refinancing operations	Reverse transactions	-	One week	Weekly	Standard tenders
Longer-term refinancing operations	Reverse transactions	-	Three months	Monthly	Standard tenders
Fine-tuning operations	Reverse transactions Foreign exchange swaps	Reverse transactions Collection of fixed-term deposits Foreign exchange swaps	Non-standardized	Non-regular	Quick tenders Bilateral procedures
Structural operations	Reverse transactions	Issuance of debt certificates	Standardized/non-standardized	Regular and non-regular	Standard tenders
	Outright purchases	Outright sales	-	Non-regular	Bilateral procedures
STANDING FACILITIES					
Marginal lending facility	Reverse transactions	-	Overnight	Access at the discretion of counterparties	
Deposit facility	-	Deposits	Overnight	Access at the discretion of counterparties	

2. Differences between the European and US economic and financial environments

Europe and the USA have significantly opposite economic and financial structures; this is why the crisis has affected them differently. Consequently, ECB and Federal Reserve used divergent measures aimed at stopping the destructive effects that have appeared. Nevertheless, the aims of both Central Banks were to stabilize the economies and to regain the confidence of the market participants, either private or corporate.

Regarding the financial sector, the USA has a market-based financial sector, while the EU has a bank-centered financial sector. At the end of 2007, the stock of outstanding bank loans to the private sector amounted to around 145% of GDP in the euro area. The corresponding proportion of bank loans to GDP in the United States was only 63%. This means that the banking sector is more than twice as important in the euro area as it is in the United States. It also means that to be effective, ECB policy must focus first and foremost on the banking sector.

Moreover, direct debt securities account for 81% of GDP in the euro area. The corresponding proportion in the United States is 168%. This means that market-based financing plays a much smaller role in the euro area and is only half as relevant as in the United States. Therefore, the structures of private credit outstanding in the euro area and the United States are almost mirror images: recourse to banks on EU makes up two-thirds of non-equity external finance. In USA, the equivalent proportion is only around 30%. Against this background, it is natural that the Federal Reserve's "**credit easing**" policies mainly target markets for debt securities, whereas ECB policies of "**enhanced credit support**" focus on banks.

Regarding the economic sector, a key aspect is the important role that SME – small and medium enterprises – play in EU. Because the SME do not have access to credit markets directly, ECB had to establish measures to guarantee them continuous access to bank credit by providing

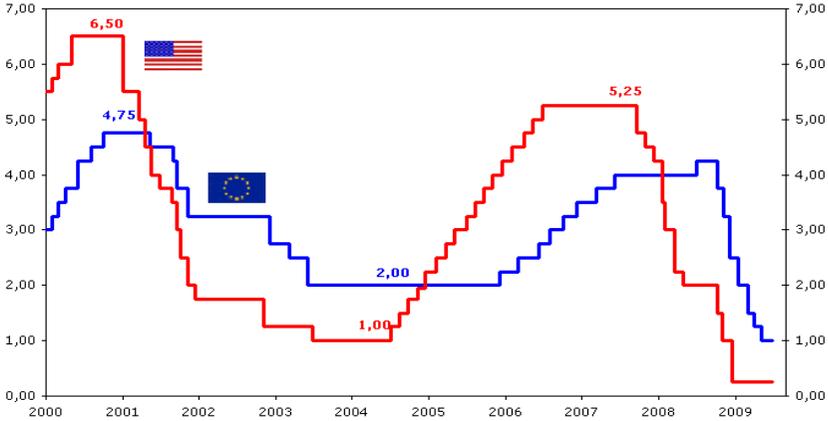

enhanced liquidity to the banks. A second characteristic of the economic sector is the indirect effect that the American housing crisis had on the European markets, while in the US was at the epicenter of the crisis. Toxic assets partly backed by mortgage loans affected primarily the European banks that held them, but did not spill into the real estate sector. Therefore solving the toxic assets problem is vital for restarting the credit offered by these banks.

The last characteristic of the economic sector involves its speed of adjustment. It has been observed that in EU the wages and the prices of the goods and services are slower to adjust than in the US. This trait presents on one hand the disadvantage of a slower adjustment to adverse shocks that appear in the economy. On the other hand, it has a positive aspect of providing a cushion for the private sector expectations. Having a greater inertia, it means that the monetary policies geared towards price stability and fiscal sustainability have somehow better chances of anchoring future expectations, thereby proving on the long run more efficient. On this type of economy, sudden policy moves tend to destabilize the market, because they destroy these expectations.

3. Stability measures employed by European Central Bank

As mentioned before, the first objective of the ECB is to maintain the price stability over the medium term, so average inflation to be below, but close to 2%. This in turn will support the conditions for enduring financial and economic stability. At the beginning of the crisis, the ECB stance was unaltered, keeping interest rates constant at 4%, in order to attain its primary objective. In the same time, the Federal Reserve was slashing aggressively interest rates, in an attempt to flood the markets with liquidity and restart the economic activity.

As the crisis continued, the ECB was faced with the prospect of deflation, signaled by the decrease of HICP – harmonized index of consumer prices – over months. This in turn determined the reduction of interest rates until the current low level. Also the reduction of the key interest rate was used in order to increase the liquidity of the banks so as to stimulate the credit. A historic graph of the evolution of the two key interest rates (US in red and EU in blue) is presented subsequently:

Besides the direct measure of cutting interest rates, ECB used other non-standard measures. The first measure was intended to maintain the availability of credit for households and companies at reasonable rates. In this respect, the ECB changed its “fixed-allotment variable rate” standard tender procedure, in which banks bid for a certain amount of money, to a “fixed-rate full allotment” procedure. This meant that any bank requirement for liquidity was met, and moreover, was met at very low interest rates set up by ECB. Moreover, the maturity of the refinancing operations was increased from one week up to six months. This measure provided addition funds

in a market that almost stopped allocating liquidity, while the demand for liquidity from troubled firms increased exponentially. As a result, ECB acted as a surrogate in the market for allocating liquidity and for setting the price for this liquidity.

The second non-standard measure was to increase the list of the assets that ECB accepted as collateral. Even before the crisis the ECB was accepting as collateral private assets, a regulation that was ultimately used by other Central Banks. But during the crisis that list expanded even greater, so government securities represented only 44% of the nominal value on the list, the rest being private securities. The total number of these securities is now over 45,000, while the total value exceeds 12 trillion euros. This represents approximately 86% of all debt securities issued in euro and to 130% of the GDP from the euro area. This extended list of collateral securities has greatly expanded the liquidity capacity of the banks and allowed them to extend credit lines or to roll over maturing loans.

If the first two measures intended to provide almost unlimited liquidity in the market at a very low interest rate, the last measure was aimed at increasing the tapping capacity of the credit institutions. While before the crisis the counterparties of the ECB numbered around 1700 institutions, following a change in the operational framework, that number increased to over 2200 entities that can refinance themselves with the ECB. The remaining 4300 credit institutions will not encounter great problems if they desire to become eligible too.

All these measures adopted by the ECB in order to combat the economic crisis and to provide the much-needed liquidity across the market have resulted, of course, in an expansion of the Eurosystem balance sheet. This reached 19% of the GDP at the height of the crisis, namely the beginning of 2009. Since then, the liquidity started flowing back to the money market, a sign of improving confidence and more favorable conditions.

4. Conclusion

European Central Bank uses complex mechanisms in order to safeguard its primary monetary policy objective, the price stability over the medium term. These mechanisms ensure that the liquidity level from the market is adequate, both over the short and the long term. Moreover, they are very important in fostering economic development. With the onset of the current crisis, these mechanisms have been put to great stress, as the financial turmoil has gripped the markets and drained them of liquidity.

Because of the flexibility that was inherently constructed into these mechanisms, the regulators were able to modify them so as to better suit the tormented climate. Consequently, the counterparties of the ECB had greater access to vital resources and were thus able to continue operating without great distress. As the liquidity scarcity was defeated, the next step – the most important step – is to restore confidence in the markets. Confidence is probably the most expensive resource right now, and without it, there can be no economic recovery, no matter how sound the financial indicators look.

ASPECTS ON THE IMPACT OF GERMAN FOREIGN CAPITAL INVESTMENT IN ROMANIA

The evolution of the foreign direct investments (FDI) in Romania and especially the German ones, which are presented in this paper, show an increase over the past years, but have a declining trend from 2009. Among the main arguments underlying the German FDI in Romania are included the well trained personnel and the low average salary of 200 €. Another strong issue is that Romania has a large domestic market, language diversity and tax benefits. Despite the financial crisis Germans are planning interesting investment opportunities in environmental technology in Romania for 2010 and are forecasting for this year a real investment growth of 1.1% compared to last year. The newly built highway and trunk road network, the modernization of industrial plants and adapting to environment challenges make Romania become even more attractive.

Keywords: Foreign Direct Investment, German, Romania

JEL: F21 - International Investment; Long-Term Capital Movements

1. Introduction

Romania is not only a versatile holiday destination, but also an important business location and has from the rim of the Carpathians to the Black Sea unimaginable beauty and untouched landscapes. Many villages and cities, which often have their history lasting for centuries, have such an original structure that one could not find anywhere else in Europe.

Hungary was the first country in Europe to break the borders and barriers of the Iron Curtain on May 2nd, 1989. The symbolic opening of a border gate between Austria and Hungary in the Pan-European Picnic in August 19th, 1989 was the first „official” opening of the Iron Curtain with the approval of both governments. The opening of the Berlin Wall on November 9th, 1989 marked the end of the Iron Curtain and with it the end of the Cold War. The Czechoslovaks broke their border fortifications in December the same year. In Romania the communist regime was abolished in December 1989, change that created space for the democratization

2. German direct investments in Romania

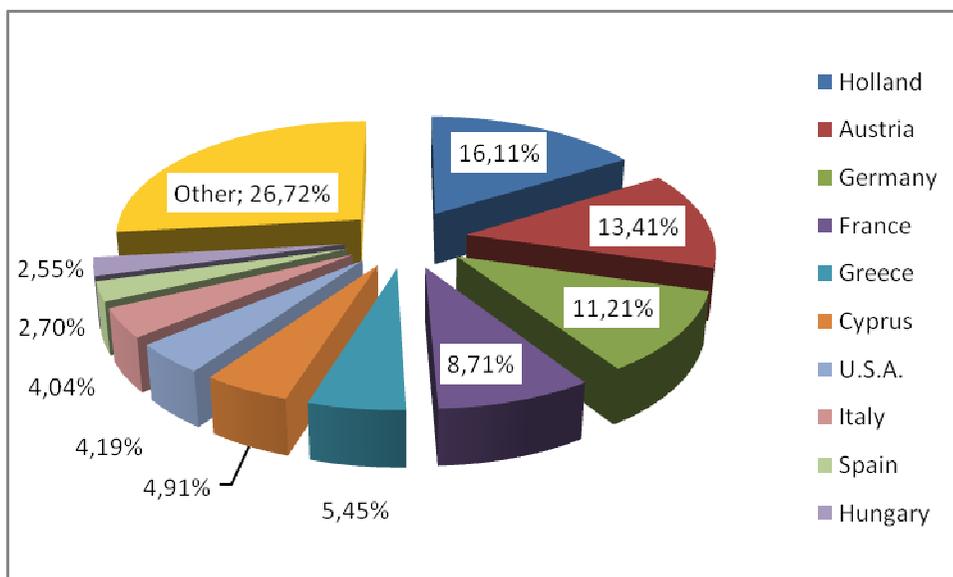

After the political turn in Romania several improvements took place, so that not only the German-Romanian relations improved, but also the foreign investors became aware of the opportunities this country offers. The foreign trade regulations have been gradually liberalized, trying now to follow the guidelines set by the European Union (EU). “Incredible as it may seem today, Romania was the second East European country to permit foreign investment”.⁶⁹

The political relationship between Germany and Romania is a stable one. They find their basis in the Treaty of Friendship signed by both parties in 1992, when Germany begun providing substantial support for Romanian’s accession in the EU.

⁶⁹Dobosiewicz, Z. (1992): *Foreign Investment in Eastern Europe*, Rutledge, London, pg. 48

The German direct investment amounted 2.83 billion Euros until December 30th, 2009⁷⁰, being a share of about 11.21% of the total foreign direct investment in subscribed capital. Regarding the investments in Romania, Germany is third⁷¹ behind the Netherlands (with 4.06 billion Euros – 16.11%) and Austria (with 3.38 billion Euros – 13.41%) and followed by France (8.71%) and Greece (5.45%) (see also Figure 1). However it is also notable, that a number of German companies, which invest in Romania through subsidiaries engaging in other states, are therefore outside the Romanian statistics reported as German investments. At the end of December 2009, the number of companies with German participation registered in Romania was of 17,110 enterprises (10.26%).⁷²

Figure 1 - Classification of companies by foreign direct investment by the investors' countries of origin (December 2009)

Own representation based on - Source: Central Trade Register Office - Statistical Synthesis No.140, online resource: http://www.onrc.ro/statistici/is_decembrie_2009.pdf, last accessed: 17.04.2010

The structure of German investment consists mainly of small business; about 90 percent are running at less than \$ 50,000.⁷³

If we are to consider the ranking by foreign participation in the total subscribed share capital of the top 50 countries during 1991-2008 (current balance on December 31st, 2008), it is easy to observe that Germany is again third (with 2.48 billion Euros – 11.40%), having in front the

⁷⁰All the following informations regarding the amount of foreign investment of companies with foreign participation in the capital were taken from the Central Trade Register Office – *Statistical Synthesis No. 140*. Online source: http://www.onrc.ro/statistici/is_decembrie_2009.pdf, last accessed: 17.04.2010

Information source: The Trade Registry computer system unit is designed by the National Trade Register in accordance with legal provisions in this field. The source of information is the Trade Registers computerized system, maintained by the Trade Register Offices attached to courts.

⁷¹Central Trade Register Office – *Statistical Synthesis No. 140*, pg. 8. Online source: http://www.onrc.ro/statistici/is_decembrie_2009.pdf, last accessed: 17.04.2010

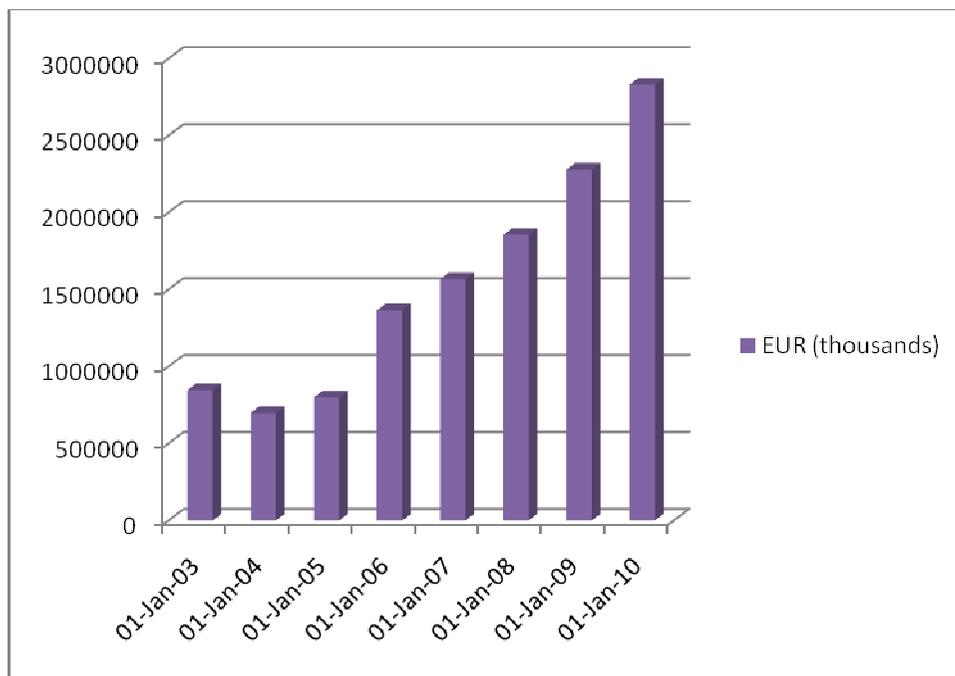

⁷²Central Trade Register Office – *Statistical Synthesis No. 140*, pg. 8. Online source: http://www.onrc.ro/statistici/is_decembrie_2009.pdf, last accessed: 17.04.2010

⁷³Auswärtiges Amt Germany, <http://www.auswaertiges-amt.de/diplo/de/Laenderinformationen/Rumaenien/Bilateral.html>, last accessed: 17.04.2010

Netherlands (with 3.85 billion Euros – 17.70%) and Austria (with 2.53 billion Euros – 11.65%).⁷⁴ But if we would consider the number of companies with German participation in the capital during 1991-2008, we may conclude that Germany is second (16,623 companies), Italy (26,934 companies) being first.⁷⁵

As Figure 2 shows, German investments in Romania during 1st of January 2003 to 1st of January 2010 show a significant increase. From December 31st 2005 to December 31st 2009 German investments doubled their amount.

Figure 2 – Germany as investor in companies with foreign capital participation

Own representation based on – Source: Central Trade Register Office – Statistical Synthesis No. 56, 68, 80, 92, 104, 116, 128, 140, online source: http://www.onrc.ro/romana/statistici.php#inv_2010_1, last accessed: 19.01.2010

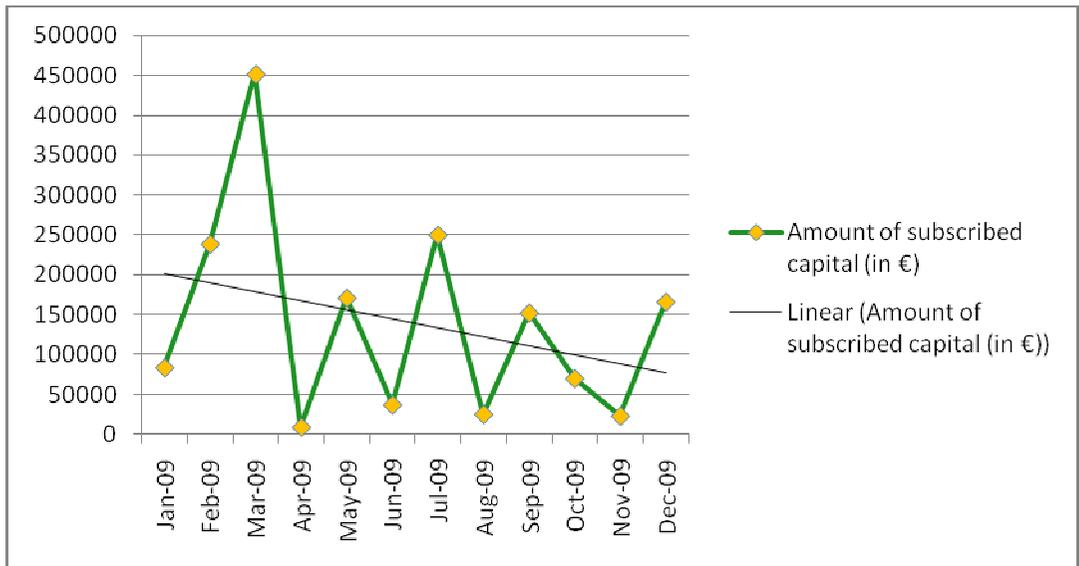

In the first three months of the past year foreign German investments in companies increased by approximately 540%, being followed by a decrease in March and April. If we would consider a linear trendline for the subscribed capital, as shown in Figure 3, we could easily observe that German direct investments in Romania tend to decrease, as this tendency has been influenced not only by the economic crisis, but also by the unstable political and economical environment⁷⁶ of the past year.

⁷⁴Central Trade Register Office – Statistical Synthesis No. 140, pg. 26. Online source: http://www.onrc.ro/statistici/is_decembrie_2009.pdf, last accessed: 17.04.2010

⁷⁵Central Trade Register Office – Statistical Synthesis No. 140, pg. 26. Online source: http://www.onrc.ro/statistici/is_decembrie_2009.pdf, last accessed: 17.04.2010

⁷⁶Most important events being Boc government fall of October 2009 and the presidential election, the depreciation of the national currency (RON), visible since the end of 2008, but stronger in 2009 and the need for external funding, agreements signed with the IMF – International Monetary Fund, have influenced foreign direct investments in Romania. Rising unemployment and economic contraction caused by the global crisis have fuelled the political and social instability in Eastern Europe.

Figure 3 – German investments in companies by foreign direct investment, incorporated during 2009

Own representation based on - Source: Central Trade Register Office - Statistical Synthesis No. 129-140, online source: http://www.onrc.ro/romana/statistici.php#inv_2010_1, last accessed: 19.04.2010

German companies have also been hit hard by the financial crisis, in particular, the export-oriented sectors have suffered from a sharp drop in demand.

3. Why investing in Romania?

„Corruption” was a keyword that was usually brought to attention when talking about Romania⁷⁷, but nowadays many things have changed in a positive way. The country has much to offer, think the German investors, who are certain to find here cheaper and creative workforce. Romania is a country with a huge backlog. 20 years after the political turn billion Euros still flow in the second largest country in Central and Southeastern Europe. Even if foreign investors sometimes wouldn't recognize that Romania's cheap labor market is the decisive investment factor, the proof lies in the average salary of 200 €⁷⁸, wages which are expected to increase in the future. Romania has also a large domestic market, language diversity and tax benefits (unique profit-tax of 16%).

But why do Germans invest in Romania? Is it only because of the cheap labor market? Has Romania to offer more, compared to its neighbor countries in the region? It is, first of all, because

⁷⁷According to the corruption perceptions index 2008 calculated by Transparency International– the global coalition against corruption Germany was ranked the 14th out of 180 countries while Romania the 70th). For more information see also the *Global Corruption Report 2009. Corruption and the Private Sector* by Transparency International, pg. 331-337, 362-367; online source http://www.transparency.org/publications/publications/global_corruption_report/gcr2009, last accessed: 20.04.2010 and *Annual Report Transparency International 2008* by Transparency International 2008; online source: http://www.transparency.org/publications/publications/annual_reports/ti_ar_2008, last accessed: 20.04.2010

⁷⁸Deutsche Welle – aus der Mitte Europas, *Fokus Osteuropa – Immer mehr deutsche Unternehmen investieren in Rumänien*, online source: <http://www.dw-world.de/dw/article/0,,1635805,00.html>, last accessed: 18.04.2010

Romania is since January 1st, 2007 a European Union member state. Second, there is huge untapped economic potential and third, because of the qualified human capital.⁷⁹

Despite Romanian potential of turning into a business location many investors are holding back.⁸⁰ They need confidence that the risk remains as low as possible. The Romanian General Consulate in Bonn has recognized the information gap and reacts. People need confidence to invest their own money, says the General Consul Florin Vodita. He therefore invites German companies that are successful in Romania, to share their experience with those who show interest towards this business location. Vodita says that the basis of such events is the confrontation between German investors operating in Romania and those who wish to operate. So, a seminar has resulted on the basis of personal relations between the General Consulate and the Romanian-German Business Club in Romania. This formula first emerged in 2004 and signals were very positive.⁸¹

Hanicke Thomas, managing director for IHK Duisburg, who attended the second seminar held by the General Consulate in 2004, expressed his opinion, that the feedback of very different entrepreneurs from different industries was positive. He has also realized that many companies are interested in Romania.⁸²

For 2010 the German companies see Romania as a potential investment market, with a constant evolution/chance for the direct investments in various sectors, most desirable being engineering, automotive, chemicals, and constructions, electrical/electronic, IT & telecommunications and medical technology. In addition, there are interesting investment opportunities for German companies with know-how in environmental technology. They also forecast for this year a real investment growth of 1.1% compared to last year.⁸³

The expansion of the highway and trunk road network, the modernization of industrial plants and the adaptation to the environmental challenges make Romania become even more attractive. An improvement is shown in the business climate because of the liberalization, the increased efficiency of the banking sector and because of the lower subsidies and fewer interventions in the economy.

4. Conclusions

Romania was and remains an interesting investment destination for the German capital. Romania may well stand up to international tax competition. The country promotes low costs in combination with sufficient qualified personnel. The hourly wages are much lower than in other Eastern European countries that already joined the EU. Wages are expected to increase in the near future, but an increase of the disposable income brings with it impulses for the domestic demand, which should in turn lead to increasing production and marketing opportunities for investors on the largest market in Southeast Europe.

THE GENERAL FRAMEWORK OF EUROPEAN CORPORATE SYSTEM

Frunză Ramona

*„Alexandru Ioan Cuza” University of Iași
Centre for European Studies*

In corporate governance, through its specific available mechanisms, some measures can be taken to strengthen institutional development (against corruption, administrative shortcomings, favouritism) and to promote market values. These values include accountability, transparency, primacy of law, equity, property and protection of minority shareholders. It should be considered in this context the fact that, as good would be the regulatory framework, if shareholders (owners) are not active and get involved, things can not move towards an optimal way.

Based on these aspects, we intend to emphasize in the present paper which is the effectiveness of the corporate system in Romania compared to other European countries.

Keywords: corporative governance, principles, efficiency

JEL Classification: G30, G34, M14

1. General aspects of corporate governance

Many specialists have tried to define the corporation and we mention the most edifying the one of O. Williamson, who argues: “modern corporation is a product of a series of organizational innovations that have had the purpose and effect the realization of savings in the transaction costs”⁸⁴. Experts speak of different models of corporate governance. For example, the German model investors are institutions (banks) which control the activity of company and its management. In other countries, is significant “the minority shareholder protection”. But, whatever the approach, the essence remains the same: the governance structure is determined by property rights. Thus, laws that imposed, lets say, diffuse ownership have created so-called “corporate Berle-Means”, in which the fragmented ownership change the power in the company in favour of managers⁸⁵. In modern terminology, the argument presented by A. Berle and G. Means is as follows: for shareholders the organizational, monitoring and control costs of management tend to be high compared to benefits, especially when ownership is dispersed and the cost of collective action is high. According to the Berle-Means thesis, corporate managers were considered masters of their own and not those who take materials advantage of their own actions, they would be prepared to allocate resources for uses that do not seek to maximize the capital value of firm. For this reason, the economic results of production in corporations may reflect excessive consumption for the held activity, limited incentives for introducing and adapting new technologies etc.

The central issue of corporate governance system of modern corporations has been made in the famous article of M. Jensen and W. Meckling, *Theory of the Firm: Managerial Behaviour, Agency Costs and Ownership Structure*⁸⁶, one of the most cited articles in economics literature on how to structure ownership in various organizational arrangements. The authors sought to demonstrate that an owner-manager, who shares ownership of a company with shareholders that are not managers, not lead company with the intention of maximizing profits. Moreover, they showed that this would happen in a hypothetical world where the costs of monitoring foreign owners regarding business management, are zero. But, hypothetical worlds are not relevant

⁸⁴ Williamson, O., *The modern Corporation as an Efficiency Instrument*, in S. Pejovich (ed.), *Governmental Controls and the Free Market*, Texas University Press, College Station, 1977, pp. 163-194.

⁸⁵ See Berle, A., Means, G., *The Modern Corporation and Private Property*, USA, 1932.

⁸⁶ Jensen, M., Meckling, W., *Theory of the Firm: Managerial Behaviour, Agency Costs and Ownership Structure*, *Journal of Financial Economics*, no. 3, 1979, pp. 305-360.

alternatives. Recognition of this fact contributes to increased interest in identifying those situations (institutional and organizational arrangements) that can mitigate the agency opportunism so that human behaviour in business management to become more predictable, especially at an entrepreneurship level. This approach represent the problem of the way of how entrepreneurs, business owners, shareholders are anticipating the behaviour of the decision-makers in the company, i.e. the problem of predictability of the managerial decisions, which nature should be in concordance with the requirements of owners.

2. Corporate system in Romania. Comparison with other European countries

The majority of the companies in Central and Eastern Europe are conducted by the owner but the management is realized only by professionals. In what is concerning the corporate governance, the main compromise is the one between the assuring of the incentives for the majority owners and the protection of small investors⁸⁷. First, measures to protect small businesses are extremely important in combating fraud and reducing financial costs and secondly, to protect small investors by maintaining in function or in taking the leadership of an organization could discourage strategic investors and inhibit restructuring where appropriate. As majority owner distances himself from day to day management ceasing the responsibility to professional managers, corporate governance is changing the nature of the problem. Managers need to be monitored and only the majority owners have enough incentives to carry out this task. Therefore, in the implementation of existing laws in EU countries, efforts are made to preserve incentives for active shareholders. Few states provide a better legal system for minority shareholders. They face substantial problems and the actions they take can easily be blocked by majority shareholders.

Because in Romania, as in other countries, the interests of shareholders and managers can often divergent, corporate governance may become a factor that brings interests through active intervention, according to a detailed code of doing business, of the boards, which provide the interests of shareholders, regardless of the percentage share they hold, exercise permanent control over the executive leadership of the company and are responsible for the transparency of the transactions concluded, to the General Assembly of Shareholders (GAS)⁸⁸.

In Romania, there are many companies that have minority shareholders. To highlight their activities are used a series of indicators:

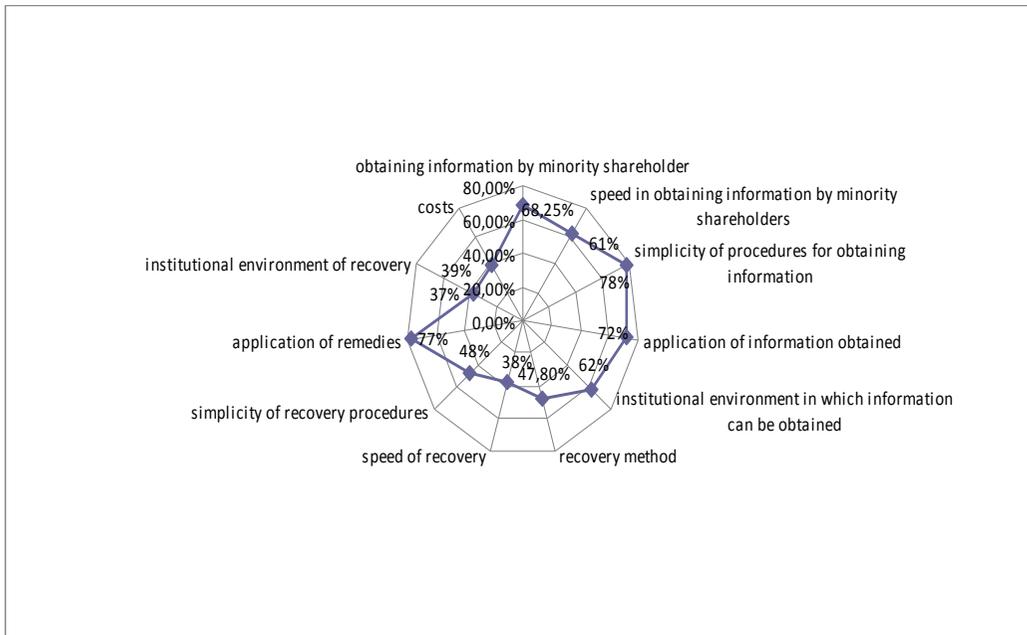

- *ability to obtain information about their company* (speed in obtaining information, simple procedures for obtaining information, applying information obtained, the institutional environment in which information can be obtain - refers to a country's legal framework to implement and enforce corporate governance legislation);
- *recovery method* - refers to the remedies which are available to a minority shareholder whose rights have been broken (speed of recovery, simplicity of recovery procedures, application of remedies, institutional environment of recovery);
- *costs* - estimated costs to be paid by a minority shareholder to have legal action.

In our country, these indicators record the following values:

⁸⁷ Berglöf, E., Pajuste, A., *Emerging Owners, Eclipsing Markets? Corporate Governance in Central and Eastern Europe*, in P.K. Cornelius, B. Kogut (ed.), *Corporate Governance and Capital Flows in a Global Economy*, Oxford University Press, 2003, pp.1-40.

⁸⁸Property rights theory starts from the assumption that corporate efficiency depends fundamentally on the quality management but also exercising a rigorous control by shareholders on managers.

Efficiency of minority shareholders in Romania

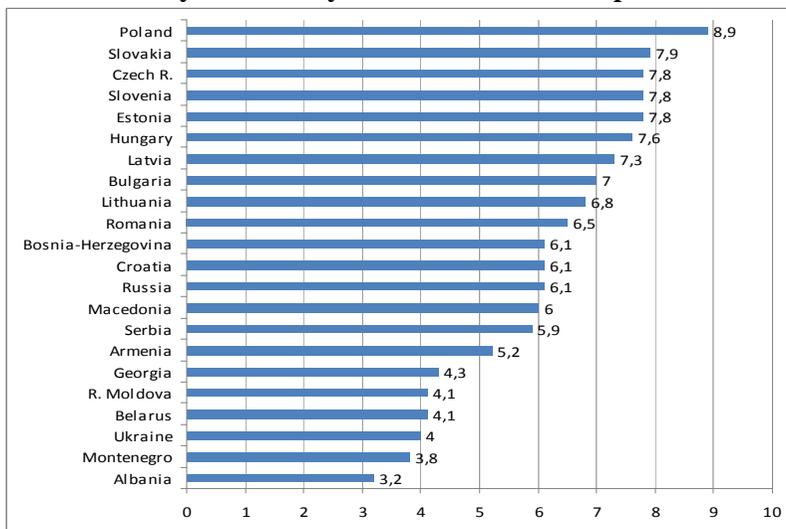

Source: after EBRD, Legal Indicator Survey, 2008

Making the average of the 11 indicators is obtained an average efficiency of the activity of minority shareholders of 57%.

Concerning the efficiency of minority shareholders to obtain information about their company (first indicator), in the year 2008, the situation is represented below:

Efficiency of minority shareholders at European level

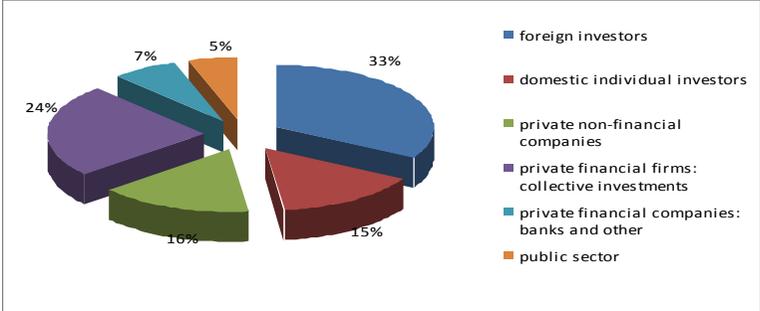

Source: EBRD, Legal Indicator Survey, 2008

Note: The score for each country is calculated on a scale of 1-10, where 10 represents maximum effectiveness.

Leaders in this chapter are Poland, Slovakia, Czech Republic, Slovenia, Estonia. Romania received 6.5 points (having thus an average efficiency) and Albania, Montenegro and Ukraine occupies the bottom of the ranking. But who are the shareholders in the European corporations? The answer to this question is found by analyzing the graph joined:

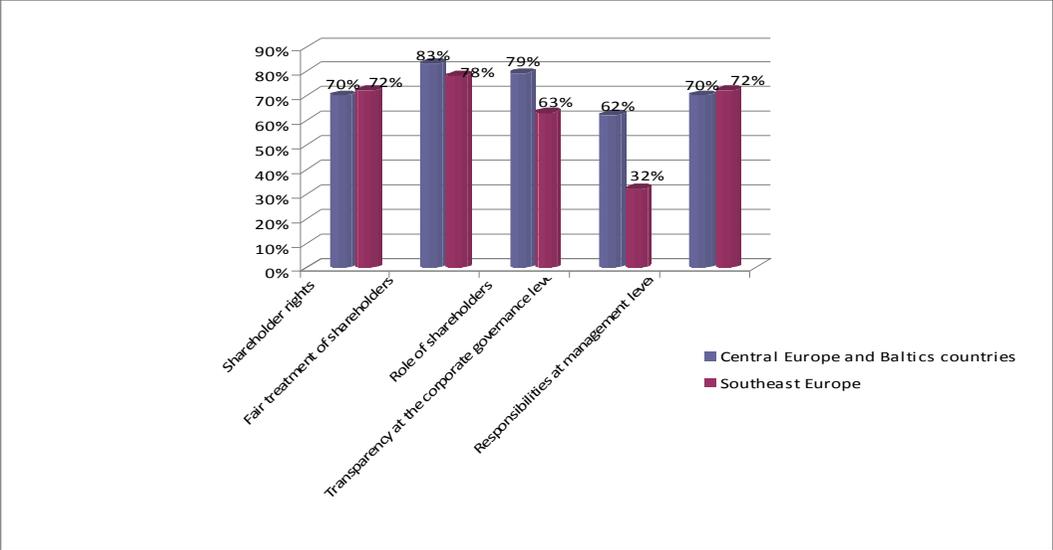

Shareholders in European corporations

Source: FESE, Nestor Advisors, 2007

The foreign investors are major shareholders of the corporations (33%), followed by private financial firms (24%), private non-financial companies (16%), domestic individual investors (15%), etc. Referring to the level of compliance with OECD principles of corporate governance, the situation is as follows:

Compliance with the OECD principles on corporate governance

Source: after <http://www.waset.org/ijhss/v1/v1-1-2.pdf>

We conclude that the principle which was adopted the most, according to OECD criteria, is the one concerning the fair treatment of shareholders. In Central Europe and Baltic countries it is found in a proportion of 83% and in South-Eastern Europe of 78%. The principle which is mainly respected refers to the transparency of corporate governance. Here is the big problem, especially in Southeast European states. Therefore, appropriate measures should be taken on the line.

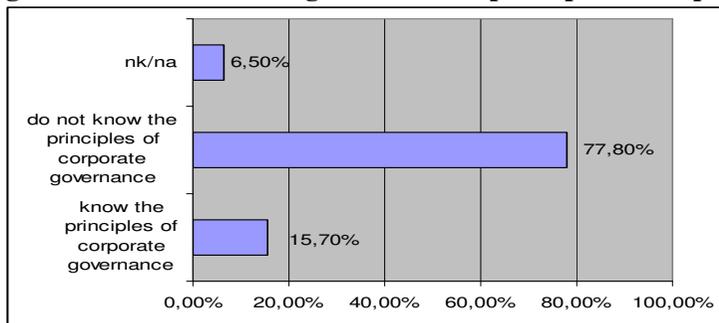

We point, in the following table, the legal basis of the corporate governance in some countries in Southeast Europe:

Countries	Sets of rules that serve as national code for corporate governance
Albania	Company Law (1992)
Bosnia-Herzegovina	Laws on banks and Laws on business companies
Bulgaria	Law for the emission of bonds
Croatia	Company Law
Macedonia	Code of company and the rules of trading company shares
Serbia & Montenegro	Law on enterprises and Law on security and other financial instruments of the market
Romania	There is no specific national code of corporate governance. It is regulated by Company Law, Security Law

Source: after <http://www.waset.org/ijhss/v1/v1-1-2.pdf>

Concerning our country, the Group of Applied Economics conducted in June 2007, a survey on the principles of corporate governance at the level of 153 manufacturing firms. In their choice have been taken into account the turnover, number of employees and regional distribution. Thus, it was found that:

Information degree of Romanian managers about the principles of corporate governance

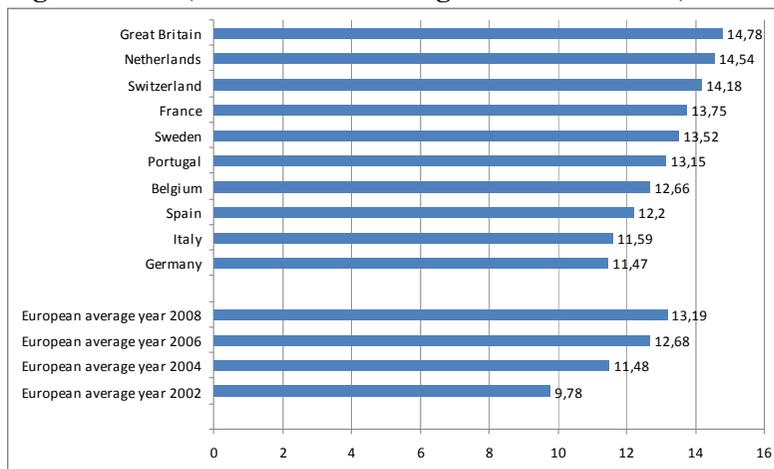

Source: after <http://www.euractiv.ro>

We observe that from the firms surveyed, 77.8% do not know the principles of corporate governance, 15.7% know these principles and 6.5% do not know / do not answer. In addition, it was found that 79.7% do not apply these principles. However, it is possible that more firms to apply these principles without know them. Also, the survey reveals that 34.7% of companies do not have a written code of conduct setting, which to establish formally rights and responsibilities of the GAS members and of the management, the way of communication and reporting between managers and shareholders. In the case of 31.3% of the companies, shareholders do not receive in advance the documents to be discussed at General Assembly of Shareholders and for 26.2% of the company, minority shareholders have no access to accounting records.

To see which the implementation level of corporate governance is, Heidrick & Struggles International has conducted a comprehensive analysis on the 294 large companies in 10 European countries: Belgium (19), Switzerland (20), France (40), Germany (30), Italy (40), United Kingdom (50), Netherlands (23), Portugal (10), Spain (35) and Sweden (27). Were selected only top companies, according to market capitalization, based on national indexes (eg the Financial Times Stock Exchange 100 Index (FTSE 100), 40 Cotation Assistée en Continue (CAC 40), Iberia Index 35 (IBEX 35), Deutscher 30 Aktien Index (DAX 30). The test results highlighted:

Corporate governance (in accordance with governance criteria) – country scores

Source: after Corporate Governance Report, Heidrick&Struggles International, 2009

Note: Each company was evaluated individually (on a scale of up to 16 points) and finally a score for each country was calculated on which it was generated an European average.

We see that there is a relatively small disparity between the countries in which is prevailing the corporate activity: the difference between best and lowest score, achieved in 2008, is 3.3 points versus 9.5 points in 2002. Improvements were made in each country, indicating the fact that a general and continuous process is manifesting in increasing corporate governance standards. It appears that above the European average for 2008 are situated Great Britain, Holland, Switzerland, France and Sweden. We state that Portugal has made most progress in this field in recent years: from 4.9 points in 2002 rose to 13.2 points in 2008.

Conclusions

Corporate governance is useful as a concept that can be the basis for restructuring the Romanian economy, but it will have a real impact only in the condition in which the private companies will decide to become open entities, to address capital market to procure the necessary funds for development. Until then these companies will be leaded only by the decision-making of business owner; state-owned companies with lack of working capital, will be able to apply only in a small measure and more declarative the principles of corporate governance, different interests as their market position being determined in a larger measure by extra-economic decisions. State-owned companies may have poorer conditions of action because of lack of development funds which can not be obtained without the main shareholder support which is the state.

On those presented, it results that is necessary that the public and private sector to cooperate to develop a set of rules, obligatory for all. Business associations, chambers of commerce and industry should try to encourage their members to develop governing norms for the protection of shareholders and of social responsibility for all the parts involved.

This article is aimed at describing the influence that foreign direct investments have on a recipient economy, as this study focuses on the changes that foreign direct investments imposed on Romanian economy. In principle, foreign direct investment should enhance one economy's results as they pump capital, the vital fluid of any successful enterprise, completing or replacing own capital, as the economy becomes interesting because of its raw material resources, financial facilities or human resource. Anyway, there are some instances that need turning own capital to profit, as, this would benefit more than permission for foreign capital to be turned into advantage. The actual study looks on investments that are to be conducted by Gabriel Resources in Roșia Montană area and tries to evaluate if the business site acts on long term in favor of our national economy.

Jel: F21 - International Investment; Long-Term Capital Movements

Keywords: long term investments, Roșia Montană, risk or opportunity

It is obvious that the times we face will change the way people think and act, changes are needed, as economies are not responding fast enough to outside stimuli and other control mechanisms are to be designed and brought into function if we want to avoid future economic and social struggles.

Most economic theories conclude that foreign direct investments act in favor of a recipient economy, as they influence all those elements that make an economy increase the pace it develops, and create, or become a part in creating a healthy environment governed by objective laws, having participants that accept a normal profit level, and avoid searching for those escape routes that guarantee an above the average level of earnings. The main problem of the contemporary way in which business is being done is that rationality has left a place for greed and abnormality. If all of us would understand that living this age of liberalism does not mean using all tools for self accomplishment, but being aware of the fact that turning global means that paths and channels are created and they become permanent bonds between economies, links that permit fast spreading of financial crisis and other negative influences on national or regional economies, and that some of our actions influence the way in which people live across oceans, then it is for us to be most careful when deciding to move one "brick" of the wall we could call "economy".

For being successful, foreign direct investments depend on a number of issues such as: the marginal cost of accessing a foreign market being smaller than the marginal income obtained in that field of interest, the existence of those elements that make operations abroad being less expensive than the export of the same product and a proven fact that, production abroad is far more efficient than the export or license selling.

As all developing countries Romania cries for foreign direct investments because they become important ways of sustaining the economy, as own capital is scarce and if it exists it is probably being directed to safe keeping, because of the unstable environment it has been created in, and if capital is not being engaged in an economic cycle, the results are not the best hoped for at the end of the mentioned cycle. Then, lacking basic production technology, knowledge and innovative

products, a developing economy is likely to import more than it exports, so, it should have an unbalanced balance of payments that can only be brought to a neutral level by absorbing and attracting all available capital. There would be more issues in favor of foreign investments, and it is hard to cast a shadow of doubt on any of them, but still, there are some intriguing questions that need to be answered, some things concerning the elements that make a country attractive for those who want to make good use of their capital and others concerning facts about national strategies and involvement of national authorities in choosing the best options on long term for its citizens.

As an European Union member, Romania has developed a legal framework on foreign direct investments that is based on transparency and non-discrimination. Romania's investment policies encourage capital transfer and the entry of well trained personnel in support for the foreign direct investments. Romania has a wide network of treaties that concern investments with neighbour countries and OECD countries. Romania is the single economy of the South Eastern Europe which is a member of OECD's Declaration on International Investment. Regarding investment promotion, Romania is reviewing all operations of the national investment promotion agency (ARIS). Romania could try improving the facilitation services at the pre-and post-entry phase of an investment, as it should consider implementing a strategy to facilitate greater commercial linkages between foreign investors and local firms. ARIS could also consider improving the quality of aftercare services it offers to foreign investors, such as obtaining business registration, licenses and work permits⁸⁹.

When deciding to invest, there are some facts that have to be taken into consideration: first, brings to front the fact that a decision to invest in a foreign country is influenced by those background facts that would either verify or not this simple mathematical equation (expected profits / risks investing in foreign country) > normal profit that can be obtained in own economy. If we would consider all economic risks that can emerge in home economy being equal to 1, normal profits being equal to 3, for instance, and if we conclude that emerging markets have an increased level of risks that concern capital investment in comparison with developed economies, then, it is certain that the only real attraction would be those profits that can be obtained. So, the equation into question would have to be $7/2 > 3/1$, and it is obvious that if business risks double, profits have to be more than double to make that emerging economy interesting for those who want to invest. Then, investments can be done in the single interest of imposing monopoly on some resources so, on a certain time extent, as resources become scarce and their price explodes, having a high demand and few that are capable of filling the demand means that profits will not take long to emerge. Of course there are other needs that could lead to foreign direct investment as the need to launch operations on certain markets, to obtain the desired market share, to relocate harmful and old industries, and so on⁹⁰.

All these instances show the same pattern, those who possess capital gain profits and strategic positions, are privileged, but what about those who seek for investors?

Romania tends to enter the same vicious circle, as foreign direct investments, as good as they seem to be have a real disadvantage: they deprive home economies of the chance to gain more by exploiting themselves those resources in some next economic cycles, engaging as much labor force as they desire, well, as much as they can sustain, and to redirect profits obtained in that field to those areas that need financial sustainment, so, by depriving economies of this opportunity, foreign investors push future generations further away from the chance to escape the same poor economic status, as home economy gave away or sold all those elements that provided strategic or competitive advantages.

⁸⁹ OECD, *Investment Reform Index 2010 Monitoring Policies and Institutions for direct investment in South - East Europe*, pag. 308

⁹⁰ Postelnicu Cătălin, *Economie Internațională*, Universitatea "Babeș-Bolyai" Cluj-Napoca, Editura Presa Universitară Clujeană, 1999, pag. 107-108

If on short term direct investments provide the economic boom needed to climb higher on the scale that measures living standards or income levels, on long term, it is obvious that they give up strategic economic investment gaps that can no longer be filled in by residents or home companies, that by now, have the capital needed to invest in that field.

It is not a question of being in favor of investments or of being a patriot even if it is not suitable, but a question of judging thoroughly and implementing a strategy that would only allow investments in those interest areas that are not strategic and that do not deprive national economy of gains and welfare that can be obtained and achieved later, when it has developed good managing capacities and has reached the needed amount of capital as to be able to start exploiting the advantages it has. It has been proven that the best way to act when dealing with this kind of problem is to think on long term, as on short term things tend to be unstable and reviving an economy takes more than few months or years. Then again, when foreign investors are resource seekers, and the investment they look for consists in precious metals things are even more complicated. The desired action would be investing own capital and if this does not exist, these type of resources have a rather stable evolution on international markets so, they can be thought of on long term.

A long disputed investment, one that shows all positive and negative sides of an investment is that desired by Gabriel Resources Ltd. Canada in the area of Roșia Montană, a renowned mining camp since ancient times. In this respect a new company emerged, Roșia Montană Gold Corporation, having as major stock holder Gabriel Resources Canada (80 %), Minvest S.A. Deva (19,3 %), this being the company that ran operations here until the possibility of an investment became a real fact, and 0,7 % other minor stock holders⁹¹. This new enterprise (RMGC) obtained an agreement to exploit an area of 4282 hectares, the intended goal being to build and operate the largest gold digging site in Europe for extracting a quantity of about 300 metric tones of gold and 1600 metric tones of silver, using the method of surface excavations in four opened quarries estimated being the equivalent of 100 hectares each, excavations that would result in over 220 million metric tones of displaced ore⁹².

The business plan extends for 17 to 20 years, and over, because the site will enter after the mining field will not be viable anymore in a preservation stage, one that is going to last for many years. Romanian economy would benefit, as stated by officials of RMGC, of a total sum of about 4 billion dollars (3 billion euro) as follows: 1.8 billion dollars as dividends, for being a stockholder with a share of 19,3 %, tax and royalties paid towards local, regional and national budgets, and the rest of 2.4 billion dollars⁹³, investments in human resource, infrastructure, spare parts, maintenance, etc. Other benefits consist in translation of service and operations to Romanian entrepreneurs and enterprises that would enhance local and regional economy.

For opening and operating the site the estimated investment would be about 1.7 billion dollars and until now there have been over 400 million invested in expropriating while other objectives as buildings and production facilities would cost about 900 million dollars, and the rest (over 500 million) being intended to cover operation and conservation schedule.

Sometimes, when trying to convince people that the importance of the investment is crucial it is decisive how the project is being brought to public attention, the way in which it is perceived by common people. The mentioned project was aimed at describing the poor and harsh environment in the area and showing all positive aspects about the investment plan. One of the many claims that made people become anxious to see the start of this project was that of those about 500 (some say not more than 300) jobs that are planned for the people in the area, a region living on the brink of poverty, where net gains were estimated for 2006 being around 653 euro/year/capita,

⁹³ <http://www.rmgc.ro/proiectul-rosia-montana/economie/planul-de-afaceri>, last accessed: 21.04.2010

where 1 % of the inhabitants live on less than a dollar a day, and 7 % on less than 2 dollars a day⁹⁴, and where young persons would not have any opportunity but to become miners as their forefathers. Little did people know that creating this project meant that there could no longer be a second company to exploit the gold ore here, so, the not very efficient Minvest Deva facility, having around 775 employees did close up its gates, for the people living here a true tragedy.

The technology used to extract gold is based on treating the grinded ore with a solution of sodium cyanide, a method that can seriously damage the environment and the experience of the ecological disaster that happened in a similar facility near Baia-Mare is at least relevant if not scary. Similar accidents, more than 30, just after 1990 have happened in other countries that host this kind of business, major ones in the USA (1993 and 1998), The French Guyana, Australia and The Philippines, but fortunately in less inhabited areas, so with less harmful effects. Most of them because of dam failure but some because broken pipes and other transport accidents. No one can guarantee that similar ones will not happen in the future, and finding those guilty for the unwanted event and punishing them does not serve for anything, as a lot of harm has been done. In this instance, it is not very hard to imagine what would happen if about 250 million tonnes⁹⁵ of contaminated water, sterile and waste would end up in one of the major Romanian rivers and finally in the Danube or The Danube Delta. Still, there are other chemical compounds used for neutralising cyanide, their effects are not very well known so it would be sensible if the matter would be treated very serious.

Another interesting aspect about the project is that, it is intended to operate in an area full of archeological remains, some dating back to the Roman age, a true problem, another issue that prolonged an already frustrating debate, because Gabriel Resources Ltd. engaged in preserving those historical sites, but it lacked and still lacks some essential documents that should state that indeed, the company has preserved and assured all historical remains as it should have done. Anyway, a lot of fuss for a thing that becomes interesting only in documents, as no historical site in the area has ever raised true interest in dedicated circles before this investment opportunity emerged, and more, there are a lot of better preserved sites that could bring much more benefit than the ones in Roşia Montană and its surroundings (which are not very attainable), but suffered a similar treatment, one that shows critical lack of both funding and interest for our national heritage.

Indeed, something that indisputably could raise the region's potential would be creating a network of infrastructure, both social and economic that would boost interest for the area. Then again, even if a suitable infrastructure would exist, the constant danger of harmful chemicals used to extract gold such as cyanide would drive people away from the area, so, in the end, nobody, or some few citizens would benefit of the new, modern social and economic infrastructure. The process of extracting gold would irreversibly scar the landscape making it unattractive to other economic activities and minimizing its potential to attract tourists. In the end, this investment could result in actual net losses and not net gains, as, on long term, a lot of other investments would be needed as to reverse the situation to its original coordinates. Therefore it is decisive for this business opportunity to be turned upside down and again, because a study on the impact of this investment on future generations has not been conducted yet, and maybe it can not be done because of the multiple changes that influence world trade on a daily basis. Maybe, gold price on international markets will climb to ever higher rates, so, Romania will only benefit in a fraction

⁹⁴ Giovanetti Frederic, Guelph Stantec, *Managementul impactului social, Planul de acțiune pentru strămutare și relocare* (Social impact management - The action plan for moving and relocating), Volumul 1: Raportul principal, Elaborat pentru: S.C. ⁹⁵ Estimated content of the used water storage dam.

of about 1/5⁹⁶, the most part of the benefits being directed to Gabriel Resources Canada. No one, or some few have thought about analyzing and predicting how the international gold market would fluctuate, and if now, when the index is at a certain level of 1113.34 dollars/ounce⁹⁷ operations potentially run by the state owned company are not viable, maybe at a future level of 1650 dollars/ounce⁹⁸, and having the same amount of inputs means that extraction could prove being of great benefit for the national economy, that could use profits as investments in other sectors, so that the need for foreign capital and international loans would not be that great. The mirage of foreign investors is so great that a lot of people do not realize, forget or consciously admit that when giving up an activity in favor of somebody else, you are no longer able to exploit some of the actual prosperous opportunities on the international economic scene. The business plan proposal for the RMGC operations emerged on a basis of an average gold price of 900 dollars/ounce and an average price of 12,5 dollars/ounce for silver, these figures lead to an estimated net profit of RMGC around 1,9 billion dollars, the Canadian enterprise Gabriel Resources, as a major share holder will cash in dividends of about 1,3 billion dollars, which divided for an estimated operating time of 15 years result in an average of 87 million dollars/year net profits for the Canadian counterpart.⁹⁹

Investments help an economy by translating risks from that economy to those who invest. If investments go to non volatile sectors like precious metals, then, the investment is almost sure to pay dividends, so, it should be interesting for both private investors and for governments.

In this respect, there are a series of strange facts about this investment project, the main one being that instead of encouraging an enterprise based on foreign direct investment, the long desired investment plan is being directed to a waiting list for few minor issues that can be solved at an administrative level without debating so much on the reasons, and because this is not being done, makes some wonder if foreign direct investments is what Romania really wants.

It is also peculiar how a Canadian company saw potential in an enterprise that the Romanian government declared not worthy of any interest, and how, after luring investors with a lot of advantages, investors that bought a lot of the properties that make the interesting area for exploiting the gold ore, now, suddenly things got a lot more complicated and it is not sure yet that the project will finally start as planned or if Gabriel Resources bought a lot of unusable land.

Nevertheless, a strong debate emerged on whether operations should or should not begin, this debate concentrating inside and outside forces, so, an international strife emerged, one that eventually will drag away potential investors, as no one would risk their own capital in a place where things seem to move like a boat in the wind, never knowing where the next day will find you.

It is for all those deciding on this issue to analyze better, deeper and faster and never agree on long term foreign investments in strategic branches of the economy if a thorough study does not show an impossibility for Romanian capital to multiply in that branch. If state owned enterprises had better management, then, using the same strategy as foreign investors do, the trade deficit can be covered not by attracting capital in the shape of foreign direct investment, this being comparable to an outside action but by producing own one, and using it to stimulate other sectors from the inside, sectors that are going to produce competitive goods and services that are going to become desirable on international markets, in terms of efficiency a far better choice. In the

⁹⁶ The actual rate of benefits for Romania, as it is a share holder for 19,3 % of the total shares through Minvest Deva, a state owned company.

⁹⁷ Average gold price of April 2010 (<http://goldinfo.net/londongold.html>, last accessed: 22.04.2010); 1 ounce equals 28.3495 grams

⁹⁸ Estimated price for beginning of 2011 – *Jim Sinclair Bets a Million Dollars Gold Price Will Hit \$1650 before the 2nd Week in January 2011*, an article of Wednesday 2nd of April 2009, on www.goldprice.org, last accessed: 21.04.2010

⁹⁹ But, as mentioned above, the average gold price rose by more than 200 \$/ounce over the initial estimates, meaning that profits would be greater than estimated.

contemporary economy not assuming risks means not taking actions, but when having such an opportunity in a truly low risk segment, it is imperative to act before others do.

THE EU TAXES AND THE ROMANIAN APPROACH

Păun Ciprian

Mihnea Iuoras

Babes-Bolyai University

Faculty of Economics and Business Administration

Abstract: The accession of Romania to the European Union took place on 1 January 2007, at a very delicate moment for the Member States. Fifty years have passed since the signature of the Treaty of Rome, on 25 March 1957, and the EU has not managed to achieve the political union that the founding fathers had anticipated. On the other hand, the recent Berlin Declaration, signed on 25 March 2007, mentions the new aims of a “United Europe”, insisting on the creation of an area of freedom, democracy and rule of law. The economic dimension of the Union has become secondary and contains a reaffirmation of the European model¹⁰⁰

Keywords EU law, taxation, Romanian Legal Environment

Jel classification K00, K21, K23.

I. Introduction

On 14 July 2004, the European Commission made public the document “Financing the European Union” COM 2004, 505. The report¹⁰¹ argues for the drawing of direct tax resources in order to cover the EU financial needs by proposing: Excise duties on motor fuel used for road transport, Revamped value added tax, Corporate profit taxes.

We consider that the three types of taxes proposed by the European Commission in the Report are in fact specific to different institutional and political structures or to different stages in institutional evolution.

The first tax proposed - the “energy tax” - has as a starting point the political realities of today’s European Union. It corresponds to the institutional model defined by the Founding Treaties.

The proposal for such a resource is rooted in the recent Directive 2003/9/EC that “restructures the Community framework for the taxation of energy products and electricity”, and which, from 2004, subjects most energy products to minimum rates of taxation. The new fiscal resource would only be levied on motor fuel used for road transport; this includes leaded and unleaded petrol, diesel and, to a much lesser extent, LPG and natural gas. The estimates by the Commission show that EU rates below half of the minimum rates in the Energy Taxation Directive would match the intended target, namely to finance half of the EU budget. Moreover, the proceeds from such a tax, for the European Union, and for the Member States (for the most part) would not be sensitive to the often wild fluctuations of the energy prices in the international markets, since the levy is based on quantities sold and not *ad valorem* and demand for such energy products is relatively price-inelastic¹⁰². Still, imposing such a tax would not be a success in the extremely sensitive period for the energy field, before the Commission and the Member States establish concrete

¹⁰⁰ „This European model combines economic success and social responsibility. The common market and the Euro make us strong. We can thus shape the increasing interdependence of the global economy and ever-growing competition on international markets according to our values. Europe's wealth lies in the knowledge and ability of its people; that is the key to growth, employment and social cohesion.” Available at http://www.bundesregierung.de/Content/EN/Pressemitteilungen/BPA/2007/03/2007-03-25-berliner-erklarung-deutsch_en.html.

¹⁰¹ The name “the Report”, to refer to the above document, is used throughout this entire contribution.

¹⁰² See Sylvain Plasschaert, Toward an Own Tax Resource for the European Union? Why? How? And When?, *European Taxation* 2004, p. 473.

measures to assure energy independence, or better to diminish the dependence on external energy resources.

We must also add that according to the Accession Treaty of Romania to the European Union by way of derogation from Art. 7 of Directive 2003/96 /EC, Romania may apply the following transitional periods:

- Until 1 January 2011: to adjust the national level of taxation on unleaded petrol used as propellant to the minimum level of EUR 359 per 1 000 l. The effective tax rate applied to unleaded petrol used as propellant may not be less than EUR 323 per 1 000 l as from 1 January 2008.

- Until 1 January 2013: to adjust the national level of taxation on gas oil used as propellant to the minimum level of EUR 330 per 1 000 l. The effective tax rate applied to gas oil used as propellant may not be less than EUR 274 per 1 000 l as from 1 January 2008 and EUR 302 per 1 000 l as from 1 January 2011. By way of derogation from Art. 9 of Directive 2003/96/EC, Romania may apply the following transitional periods. Until 1 January 2010: to adjust the national level of taxation on natural gas used for non-business heating purposes to the minimum level of taxation laid down in the Treaty¹⁰³.

Applying such a tax before Romania ends its transition periods can be advantageous for the state, but unfair for Communitarian solidarity.

The other proposal – the national VAT-based tax takes another institutional step which transforms the Member States from contributor (in the actual system) to collector (collecting 1% from the national taxes).

Member States today contribute to the EU budget out of their national VAT receipts, but this contribution is levied on a notional harmonized VAT base, which deviates from the actual VAT bases in the Member States. In essence, the notional VAT base is arrived at by dividing, for each Member State, its total VAT receipts by the weighted average rate of VAT that is derived from the national accounts. The incomplete harmonization achieved so far in the VAT area, especially on account of the rather wide dispersion of zero-rated transactions amongst Member States, prompts such adjustments. The Report proposes to substitute the present complex system of contributions to the EU budget, based on a statistically reformulated VAT base, by an EU rate that would be incorporated in the national VAT rate and applied on the same taxable base in each Member State. Cutting a rate of 1% out of the existing national VAT bases of all Member States would allow the financing of about half of the EU budget. The VAT burden in each Member State would not be increased, as the national rate would be lowered *pari passu* by the 1% EU levy.

The advantage of using this type of tax comes from the fact that the Member States can maintain their own policies regarding VAT, and in Romania's case, the impact would be minimal. The basic VAT rate in Romania is 19%. A lower rate of 9% applies to admission to castles, museums, memorial houses, historical monuments, architectural and archaeological monuments, zoos, botanical gardens, fairs, exhibitions, supply of books, newspapers and magazines, school manuals, with the exception of those intended exclusively for publicity; supply of prostheses of any type and accessories to them, with the exception of dental prostheses, supply of orthopaedic products, medicines for human use and veterinarian use, accommodation provided in hotels and similar establishments, including the rental of land prepared for camping.¹⁰⁴

This type of tax, proposed in the Report, could be integrated very easily in the fiscal policy of the current government because of the emphasis on consumption taxes and on increasing buying power by decreasing direct taxes. At the same time, the 1% directed to the EU budget on receipts,

¹⁰³ See the full text of the treaty in English in <http://www.mie.ro/index.php?p=117&lang=en>.

¹⁰⁴ For all the exemptions see *Romanian Tax Code*, Art. 141-142; see also, Bălan, *Drept Financiar*, C.H.Beck, București, 2007, Dan Drosu Saguna, *Drept fiscal*, Ed. C.H. Beck, București, 2006, Minea, Costas, *Dreptul finantelor publice. Drept fiscal vol II*, Ed. Sfera Juridică, Cluj-Napoca, 2006.

tickets, invoices would create a stronger link between citizens and the EU bodies. The positive effect would be represented by the fact that the prices of products would not increase after application of this tax. From the point of view of the legislator, this kind of tax would not be accepted. The Romanian Finance Minister has required since 2005 an increase to 21% of the VAT. He argued that the use of the unique quota for the taxation of salaries inaugurated a new strategy of increasing the collection of VAT funds, stimulating consumption and increasing buying power.

The third tax proposed by the European Commission – the corporate income tax, common to all Member States - represents the third institutional and political level of development, also related to the federal conception on the EU.

The Commission's present thinking and cogitations on this matter can be inferred from the Report and from two associated, brief "non-papers", i.e. without official status, which are devoted to two of the "comprehensive solutions", which were considered by the Commission, "A Common consolidated EU Corporate Tax Base" and a possible Home State Taxation pilot project for small and medium-sized enterprises¹⁰⁵. These texts contain some ambiguous and even contradictory statements; they are not clear-cut on several essential contours of such a tax, and even on its ability to function as an appropriate instrument for EU revenue generation.¹⁰⁶ At Scheveningen, the Commission obtained a mandate from a majority of Member States to undertake preliminary work towards a common definition of the taxable base; this shows that the debate about the future shape of corporate taxation is nowadays more open-ended than a few years ago. But the perspective is likely to shift more to the efficiency-enhancing virtues of an EU-wide approach than to its revenue-raising potential. The most important supporters of this tax are the multinational companies, operating on the EU level. Still, many of them have already found extremely attractive remedies, using the national systems of taxation and the double taxation treaties. The opposition of the "Fiscal Sovereignty" supporters represents one of the most important problems of using the tax. Due to a lack of general Community rules on direct taxation, the power to determine the criteria for the levying of taxes in order to define tax jurisdiction and for avoiding double taxation lies within the Member States. The ECJ must respect the tax sovereignty of the Member States¹⁰⁷. Introducing this type of tax presupposes a change in the institutional structure and should start with the adoption of the proposals the Commission formulated in the context of institutional reform.¹⁰⁸

In conclusion, we consider that introducing an EU tax is a very complicated process due to the consensus that must be obtained in the EU Council. On the other hand, the philosophy of each of the taxes proposed by the Commission is directly linked to an EU institutional vision. We appreciate the effort of the European Commission in identifying new resources to finance EU budget, especially considering that Romania is going to be one of the major contributors to the 2007-2013 budgetary funds. In fact, EU citizens are the real contributors to the budgetary funds, and the way of collecting and using the Communitarian resources should be communicated in a transparent manner to the citizens. By maintaining the present system, the European Union will continue to be dependent on the Member States and will not be able to develop an institutional edifice in conformity with the citizens' aspirations. If we take the ECJ as example, one notes that in addition to Community rules, ECJ case law has been the best guardian of EU fundamental rights.¹⁰⁹

¹⁰⁵ In the Home State Taxation (HST) scheme, the taxable bases of the affiliates in participating Member States would be defined as that of the parent company of the enterprise group.

II. The concept of tax in EU law and its compatibility with Romanian tax law

The accession of Romania to the EU took place at a moment in which the concepts referring to taxes are clearly marked by the Founding Treaties and by ECJ jurisprudence. Romanian tax law has suffered successive modifications in the past 18 years. The modifications have been inspired by Romania's accession negotiations to EU, and also by the economic changes during the period. Because of the European Commission's technical support, Romania has started to define concepts like "tax", "duties", "taxes" or "taxation" using the Communitarian meaning in the Founding Treaties and ECJ jurisprudence.¹¹⁰

1. Interpreting Art. 269 EC Treaty

Art. 269 of the EC Treaty comprises an extremely generous provisions in the first paragraph and extremely exigent conditions in the second one. We will look at two different articles of the Treaty: Art. 37(2) and Art. 269(2). In Art. 37 EC Treaty, the law-making process is formulated in the following manner: "The Council shall, on a proposal from the Commission and after consulting the European Parliament, acting by a qualified majority, make regulations, issue directives, or take decisions, without prejudice to any recommendations it may also make." Art. 269(2) provides that: "The Council, acting unanimously on a proposal from the Commission and after consulting the European Parliament, shall lay down provisions relating to the system of own resources of the Community, which it shall recommend to the Member States for adoption in accordance with their respective constitutional requirements."

In our opinion, Art. 269 EC Treaty does not give the possibility to adopt a regulation because of the formulation of the second paragraph. Unlike the second paragraph of Art. 37 which uses the verb, "make", Art. 269 uses "recommend". At the same time, from the point of view of fiscal strategy, tax can be included in a special protocol annexed to the treaties, signed by the presidents or prime-ministers or in a Council Resolution.

Romania is a national state, from a constitutional point of view, and it does not have the judicial-institutional culture of federalism. That is why legal scholars have interpreted in a restrictive way the provisions of the Founding Treaties in line with French judicial doctrine. According to the Romanian Constitution, Art. 148(2): "As a result of the accession, the provisions of the constituent treaties of the European Union, as well as the other mandatory community regulations shall take precedence over the opposite provisions of the national laws, in compliance with the provisions of the accession act". Art. 139 of the Romanian Constitution provides in paragraph 1 that "Taxes, duties and any other revenue of the State budget and State social security budget shall be established only by law." This text is applicable only to national budget but, according to Art. 56 (1) "Citizens are under the obligation to contribute to public expenditure, by taxes and duties."¹¹¹

From the above texts, it appears that the adoption of an additional special protocol to the EC Treaty or a Council resolution concerning the collection of an EU tax would not contravene the Romanian Constitution. At the same time, this kind of provision would constitute a legal base for the collection of all three types of taxes mentioned in the Commission Report. A resolution of the Council, followed by a constitutional ratification, would not give more legitimacy to the citizen-Community relation. In Romania ratification is a technical-judicial proceeding, which can pass unnoticed by the simple citizen.

To include a provision dedicated to European taxes in Romania's Constitution will offer the chance of more involvement of the citizen.

¹¹⁰ See Cosmin Flavius Costas , *Jurisprudenta fiscala a Curtii de Justitie Europene*, in *Curierul Fiscal* nr. 1/2007; Angela Miff, Ciprian Păun, *Dreptul Afacerilor*, Ed. Imprimeria Ardealul, Cluj-Napoca, 2006, pp. 254-289.

¹¹¹ See also, Deleanu, *Instituții și proceduri constituționale în dreptul român și drept comparat*, Ed. C.H.Beck, București, 2006, pp. 86-165.

2. EU tax based on Art. 308 EC Treaty?

Art. 308 of the EC Treaty provides that “if action by the Community should prove necessary to attain, in the course of the operation of the common market, one of the objectives of the Community, and this Treaty has not provided the necessary powers, the Council shall, acting unanimously on a proposal from the Commission and after consulting the European Parliament, take the appropriate measures.” The problem is, as mentioned in the Romanian specialist literature, to grant more independence to the EU institutions in their relation with the Member States. At present, the Member States’ contributions and VAT levies fund the EU budget. The European Union is trying to find solutions to allow it to expand its competencies beyond the ones mentioned in the founding treaties. Art. 308 cannot be used as a legal base to institute EU taxes.¹¹²

3. Interpreting Art. 37(2) EC Treaty as a legal base for EU taxes

The Common Agricultural Policy has been a very important subject on the Member States’ agenda, as well as for the founding institutions since the beginning of the Communities. Art. 37(2) contains a proposal to streamline the activities in the agricultural domain. According to the ECJ, two conditions must be fulfilled in order to apply the provisions from the above article.

1. The provisions must have as a purpose the production and trading of agricultural products, as mentioned in the first Annex of the EC Treaty
2. The legal regulation must contribute to the accomplishment of CAP¹¹³.

At the same time, the majority required by the Art. 37(2) is a qualified majority, while Art. 94 of the EC Treaty requires unanimity for tax collection. Considering the arguments mentioned above, there is no way the second paragraph of Art. 37 can be used as a legal source for the EU tax.

4. “Provisions primarily of a fiscal nature” and the interpretation of Art. 175(2) EC Treaty

Art. 175(2) EC Treaty, introduced by the Treaty of Nice, refers to environmental policies. The first part of the article contains the following provision: “By way of derogation from the decision-making procedure provided for in paragraph 1 and without prejudice to Article 95...” If we check Art. 95 EC Treaty, we notice that it does not have as an aim the applying of fiscal provisions, as mentioned in paragraph 2. “The Council shall, acting in accordance with the procedure referred to in Article 251 and after consulting the Economic and Social Committee, adopt the measures for the approximation of the provisions laid down by law, regulation or administrative action in Member States which have as their object the establishment and functioning of the internal market. 2. Paragraph 1 shall not apply to fiscal provisions, to those relating to the free movement of persons nor to those relating to the rights and interests of employed persons.” Noting the logic of the Community texts, one can conclude that the provision in Art. 175(2) is a special provision dedicated to the environment, which also comprises a taxation provision. The expression “Provisions primarily of a fiscal nature” indicate that it may have a different content or may contain other measures, but must have the legal nature of a tax provision. Using an energy-based tax resource should be connected with an environmental protection purpose. In this case a tax on the energy consumption can be promoted due to Art. 175(2) EC Treaty.

5. “No taxation without representation!”

The point of view put forward earlier concerning the EU institutional levels of development remains valid. Through its institutional structure, the European Community is an interesting

¹¹² See also, Gyula , *Drept comunita*, pp. 151-155.

¹¹³ See EuGH Rs 68/86 VK/Rat Slg.1988, 855 Rn. 14, Rs. 131/87, Kommision/Rat Slg. 1989, 3743, Rn.10, Rs. C-180/96 VK/Kommision, Slg.1998, I-2265 Rn.133.

compromise between the Member States' interests and the interests of European citizens. A new political and institutional system, proposed by the European Constitution, has been rejected by the direct vote of the European citizens of France and the Netherlands. In this connection, it must be mentioned that the EU democratic deficit is a problem of communication and transparency. If the simple European citizen had more awareness of how he personally has profited from the creation of the EU, he would have a more open position toward the Communitarian project. Not having an access to the academic media, magazines, books, conferences, the EU citizen selects from the mass media the information that intrigues him. Most of the time, the media presents the negative part of things, fulfilling the role of critic that it plays in society. We will not read in the papers how impressed were the Romanian students that have visited Brussels because this is not news that sells!

The members of the European parliament expressed their opinions about EU's own resources in the latest Report of the Committee of the Budget, concerning the future of such resources, published on 11.01.2007¹¹⁴.

The report starts from the current legal basis: „the current Own Resources Decision of 29 September 2000 that entered into force on 1 March 2002, has as its main features: an own resources ceiling of 1.24% of the Union's GNI, an allowance for the Member States for their collection cost of traditional own resources of 25%, a maximum call-in rate of VAT of 0.50%, a value added tax base of the Member States restricted to 50% of their GNP (capping of the VAT base) and a rebate in favour of one Member State with exceptions for some other Member States concerning the financing of this rebate”. The proposal “calls therefore for a two-stage approach aiming, in its first phase, at an improvement of the current system of national contributions, for which the following political principles should be applied: Equality between Member States, Simplicity of presentation for elected representatives and citizens alike, Solidarity and equal dignity amongst Member States, Establishment of a political link between a reform of revenue and a review of expenditure as it is already correctly included in the Interinstitutional Agreement. Provisional and transitional character of the system, (...) and in the second one, it proposes principles “which have emerged in all contacts with national parliaments, as cornerstones for any future own resources system: Full respect for the fiscal sovereignty of the Member States., Fiscal neutrality, No changes to the order of magnitude of the EU budget, Progressive phasing-in of the new system, Establishment of a clear political link between a reform of revenue and a reform of expenditure”.

The conclusion is extremely clear: “the project reiterates that, in all contacts with the national parliaments of the Member States, a general consensus has emerged that the time for a genuine new European tax has not yet come; has chosen to respect this wish of an overwhelming majority of the Member States' parliaments and not to pursue this option for the time being. Stresses, however, the interest in examining the creation of a new system of own resources based on a share of a tax already existing in the Member States, the idea being that a certain percentage of an existing tax would be fed directly into the EU budget as a genuine own resource, thus establishing a direct link between the Union and the European taxpayers; underlines that this kind of solution would only mark a return to the principle laid down by the Treaty of Rome, whereby European expenditure has to be financed by European resources. In the same time it recalls that the candidate taxes most commonly mentioned for this purpose during the exchanges with the national parliaments are the following: VAT, excise duties on motor fuel for road transport; excise duties on tobacco and alcohol; taxes on corporate profits.

In conclusion, the idea of an authentic European tax has more supporters in the “non-democratic” structures like the Commission than in the original European democratic forum - the European Parliament.

The article analyses the possibilities for virtual enterprises development and facilitation on the European Single Market, with a special emphasis on the case of Romania, as new Member State of the European Union, which can use this possibility to quicker and easier involve in the Single Market. Virtual enterprises are organizational structures of the knowledge economy, with great potential for development in the near future. Their characteristics, as well as advantages and limitations are considered, in order to identify the issues and the appropriate measures related to their development and facilitation in the context of the European Single Market and Romania.

Keywords: Virtual enterprises, Virtual enterprises policies, European Single Market, Internationalization.

JEL Classification: F23, L22, O33.

1. Introduction

The virtual enterprise - or virtual organization - is a concept launched in the early '90s of the last century, in order to describe the effects of the electronic business development (e-business), based on new information and communication technologies, which resulted in radical structural changes in the economy, both inside organizations and in the relations between them. A virtual enterprise is a new form of the relations between organizations in light of these developments.

A virtual enterprise can be described as a group of enterprises which come together in an integrated network to share skills, competences and resources in order to better attend market opportunities, with the support of the information and communication technologies. It envisages the creation of an organizational forms which allows for a synergetic combination of the partners' core competences to achieve maximum consumer satisfaction.

2. Virtual enterprises – organizational structures of the knowledge economy

The central element that characterizes the "virtuality" of such organizational forms is the ability of the enterprises to offer a complete product to consumers for which it does not have all the necessary competences, the others being achieved through cooperation. In this way, each enterprise can bring a contribution inside the partnership in order to produce more complex but also more customised goods and services¹¹⁵.

Virtual enterprises can be best described by their main *characteristics* and in this respect may be referred: the focus on core competences, a single point of contact with customers, the

¹¹⁵ Jürgen Noll (2008) *Virtual Enterprise Networks in Europe: Economic Opportunities and Legal Challenges*, GRIN Verlag, Norderstedt, Germany, p. 6.

international dimension, independency, low formalization, the systems provided by information and communication technologies, temporariness¹¹⁶.

Each of the partners in a virtual organization focuses on their *core competences*, their complementarity allowing for the achievement of synergy. Virtual enterprises' competitiveness is therefore primarily due to an advantage of differentiation - because the current market requirements call for a diversified portfolio of high skills, but also for cost reduction for different processes – based on distinct competences, technology, and a rational division of labour between the partners. The focus on core competences enables the cooperation with other enterprises for the non-core competencies. Virtual enterprises are therefore a dynamic combination of core competences, thereby meeting market requirements in terms of efficiency and effectiveness, rapid response and flexibility.

Virtual enterprises' support systems are based on *information and communication technologies*, which allow for overcoming the problems of geographical distance between components and facilitate coordination at low communication costs. Advances in information and communication technologies can also be considered as the main element that enables the creation and development of virtual enterprises. Such support systems allow for the development of intensive communication processes between the enterprises, at a maximum speed.

The products or services created within a virtual enterprise are provided by a *single point of contact with customers*, which can be a trademark or an enterprise focused on sales which acts on behalf of the entire organization. From the customer's point of view, a supplier that provides the whole offer is more attractive than several small businesses which must coordinate, and the customer doesn't need to know its suppliers or partners.

Virtual enterprises do not have a common area where the employees are located, and so the network can expand with no geographical restrictions, in several different countries, the *international dimension* being actually considered implicit for the virtual enterprises. This is a significant advantage in a globalized business environment where the international presence of a business is becoming increasingly important. At the same time, geographical distance still holds an important place, even if it has become insignificant for transmitting information, it remains an important factor for the timely supply of resources and the production of goods and services.

Although they have joint activities, the partners within a virtual enterprise remain legally and economically *independent*. A virtual enterprise aims to combine resources and expertise in order to better exploit business opportunities, with no merger of their internal structures. This creates a fluid organizational system that allows for flexible recombining of resources. However, we can still argue the co-dependency that comes from the cooperation of the enterprises, in the sense that each of them depends on the performance of the others.

In order to achieve flexibility and response speed, the enterprises do not adopt a hierarchical, formal organizational system, and the relations between them are characterized by *low formalization*, oriented towards value creation. Virtual enterprises are characterized by rather informal relations based on mutual trust.

Virtual enterprises are regarded as *temporary networks*, quickly set up in order to exploit a specific market opportunity, which can disperse afterwards, reconfiguring into other forms, according to the new emerging opportunities. Such flexibility enables enterprises to form systems that can respond quickly to the current market requirements and to dissolve after the requirements have been met.

Actually, all the organizations are dependent on time and market requirements - some virtual enterprises exist only for certain projects, while others last throughout years and decades, constantly adapting to market changes. The flexibility of a virtual enterprise is given by its

¹¹⁶ Marita Haas (2007) *The Formation Process of SME-networks. A comparative case Analysis of Social processes in Austria, Belgium and Turkey*, DUV, Wiesbaden, Germany, p. 16.

capacity of rapid transformation in relation to the market conditions, and, under stable conditions, the virtual enterprise can keep same partners for a considerable period of time by maintaining a very close collaboration, while under unstable conditions, the virtual enterprise can constantly change its components.

These characteristics of virtual enterprises have undergone changes over time, both in terms of economic reality and conceptual approach, although they are relatively new organizational forms of the contemporary economic environment. Thus, the focus on core competences remain an essential coordinate of the virtual enterprises, but *there is a tendency towards long term cooperation, with higher levels of formalization, and the international dimension is not necessarily essential*. Also, *information and communication technologies and a single point of contact with customers are more and more applied on a medium level*. The emphasis is on *creating and maintaining stable networks, on the basis of specific policies*¹¹⁷.

3. Virtual enterprises development and facilitation

There are many *advantages* of developing such organizational forms, that derive from the characteristics of the virtual enterprises. The focus on core competences enables competitiveness and costs reduction. Being built upon systems based on information and communication technologies which facilitate fast data transfers and coordination within the company at low costs, with no geographical and temporal boundaries, virtual enterprises enable efficiency gains for all activities. The possibilities of rapid and competitive reconfiguration of resources in order to respond quickly to market opportunities provides flexibility and speed of response to market requirements.

At the same time, virtual enterprises have some *limitations*, among which should be mentioned especially the current, still insufficient level of technological capacity and affordability, which hinders a full integration of the virtual enterprises, that are wholly dependent on the quality and transparency of electronic information exchanged between the partners. This has implications on the distribution of profits, costs reduction, strategies and policies, information privacy and intellectual property protection. Although virtual enterprises do not imply hierarchical relations, the dominance of the enterprises from its core may appear. Another problem is related to regulations, including those regarding electronic contracts, taxation, monopolies. Virtual businesses do not fall under the classifications provided by law, and production can be placed anywhere the law is more favorable.

Facilitating the creation and development of virtual enterprises must consider each stage of their *life cycle*, which can be defined in the following steps:

- *Creation* - the initiation and constitution of a virtual enterprise, by an enterprise or a group of enterprises, which have seized a market opportunity and carry out a strategic plan for the operation of a virtual enterprise in order to exploit it;
- *Operation* - Execution of operations within the defined scope of the strategic plan;
- *Evolution* - The context of virtual organizations is rapidly changing which lead to a continuous evolution of the virtual enterprise, within the current strategic plan;
- *Metamorphosis or dissolution* - based on the experience gained during the functioning as a virtual enterprise, its components may choose either a metamorphosis into a new virtual organization by changing its form, with the establishment of new goals, or for its dissolution¹¹⁸.

Corresponding to these steps, the creation or participation in virtual enterprises, from the point of view of their management, as distributed economic processes, requires, specifically:

- *Creation of a virtual enterprise*:

¹¹⁷ Idem, p. 28.

¹¹⁸ Luis M. Camarinha-Matos, Hamideh Afsarmanesh (2007) *A Comprehensive Modeling Framework for Collaborative Networked Organizations*, in *Journal of Intelligent Manufacturing*, vol. 18, nr. 5, p. 529-542.

- *Forming a virtual enterprise*: development and announcement of the distributed economic processes, search for potential partners, receipt of proposals and selection of partners from the negotiation phase to the legal agreement;
- *Modelling the virtual enterprise*: coordination of the distributed economic processes;
- *Operation and evolution of a virtual enterprise*:
 - *Management of the distributed economic processes*: evaluation, measurement, simulation and monitoring of the distributed economic processes, from technical, human and socio-legal point of view;
 - *Supervision*: reconfiguring a virtual enterprise by inclusion or exclusion of members, changes to the contract regarding the distributed economic processes like rescheduling or cancellation;
 - *Dispute settlement*¹¹⁹.

At each of these stages a number of specific issues arise that may prove problematic for creating or participating in virtual enterprises - from the firms' perspective, or for their facilitation - from a regulatory and institutional perspective.

4. Issues in virtual enterprises development and facilitation on the European Single Market and Romania

Virtual enterprises require a *specific environment for development*, beyond the general trends of globalization and dynamism of the business environment. The U.S. is the reference model in this respect, as environment for the emergence and proliferation of such organizational forms, as far back as in the late '90s of last century being reported over 250,000 virtual enterprises¹²⁰. This can be explained by the fact that the U.S. is already constituted as an integrated market with a fluid social structure, individualism and autonomy in operation. We may argue that the *European Single Market* does not fully meet the features of the U.S. market as an enabling environment for the creation and development of virtual enterprises, especially due to the lower integration and still higher administrative and regulatory uncertainties. However, the progresses towards a full integration, and, especially, the specific efforts to create a favourable environment for the virtual enterprises, enable their creation and functioning, an aspect of great importance especially for the new Member States like Romania, which can use this possibility to quicker and easier involve in the Single Market. The worldwide efforts to boost virtual enterprises are most visible in the European Union, and among the programs with specific measures in this regard can be mentioned: the European Strategic Program on Research in Information Technology - ESPRIT (1983 - 1998), Information Society Technologies - IST (1999 - 2006), Information and Communication Technologies - ICT (2007 - 2013), International Scientific Cooperation - INCO (2002 - 2006 and 2007 - 2013). One of the European Union projects, the European Collaborative Networked Organizations Leadership Initiative - ECOLEAD, conducted between 2004 and 2008, put as a vision that "in ten years, in response to fast changing market conditions, most enterprises and specially the SMEs will be part of some sustainable collaborative networks that will act as breeding environments for the formation of dynamic virtual organizations"¹²¹.

In the case of *Romania* is primarily proving problematic what is in fact a prerequisite for the existence of the virtual enterprises, namely, the *availability of information and communication technologies*. The issue of its implementation in Romania is hindered by both objective and subjective factors, including the lack of the specific information and communication technologies

¹¹⁹ Emil Scarlat (2006) *Proiectarea unei arhitecturi de întreprindere virtuală utilizând sistemele multiagent*, in Emil Scarlat, *Agenți și modelarea bazată pe agenți în economie*, Editura ASE, București, p. 34.

¹²⁰ Jürgen Noll (2008), *op. cit.*, p. 2.

¹²¹ Luis M. Camarinha-Matos, Hamideh Afsarmanesh, Martin Ollus (2008) *Ecolead And CNO Base Concepts*, in Luis M. Camarinha-Matos, Hamideh Afsarmanesh, Martin Ollus (ed.) *Methods and Tools for Collaborative Networked Organizations*, Springer, New York, p. 3-32.

infrastructure at national level, underdeveloped communication networks, still high costs for communications services, weak informatization among the economic organizations, lack of the specific culture in informatics among the employees, resistance to change¹²². We may assert that in Romania the introduction and use of information and communication technologies is still incipient, which does not repeal, however, the possibilities for the Romanian enterprises to adopt organizational structures such as virtual enterprises, provided the appropriation of the necessary infrastructure. Issues fall to a more general level, respectively, achieving the Romanian knowledge society, which, providing the adoption of a correct management, and especially, consistent efforts of the decision makers, can become reality.

In the creation of a virtual enterprise, a key issue is *identifying the appropriate partners and establishing relationships with them*, both for the initiating enterprise and for those wishing to join a virtual enterprise. Conclusion of contracts can be a complex, long lasting process, from the first contact phase to the negotiation phase and the reach of an agreement. This is a problematic issue, and one of the solutions proposed is the use of electronic institutions have all the information needed to identify potential partners, act as a broker, facilitating negotiation, contract validation, monitoring and enforcement, building members' reputation¹²³. Building such institutions is still a desideratum, as there are many problems to be addressed in this regard, like for example, related to the development of an open and flexible support infrastructure, allowing for use on a wide variety of platforms, the ensuring of data safety, confidentiality and veracity, or the establishment of a uniform regulatory framework, based on certain standards of conduct which need to be set out.

The possibilities for virtual enterprises development on the European Single Market remain primarily related to the *firms' networks*, of either high or low formalization. The projects at the European Union level trying to facilitate such networks can also be an opportunity in this respect. The existing relationships between companies, especially long term ones, can offset these difficulties, actually incorporating a degree of flexibility. In this case, contracts are not necessarily required, and business opportunities can be exploited as soon as they appear.

Mutual trust is fundamental for the existence of virtual enterprises, as it acts as a substitute for two critical factors, which are often missing in a virtual enterprise, namely, the hierarchical control associated with traditional organizations, which rarely can be found in a network of independent firms, and the legal framework to regulate the formation, operation and dissolution of the organization, much less developed in the case of virtual enterprises, since long contract negotiations could reduce or even cancel out the positive effects of a fast-reacting virtual enterprise¹²⁴. Mutual trust results from an expectation of fair behavior and a level of understanding of shared business practices, which is facilitated by closer interactions than those usually found in a virtual enterprise, as well as a common history, which also is not a feature of a virtual enterprise. Thus, mutual trust is a factor influencing the trend of formation of stable, long term virtual enterprises. In any case, mutual trust plays an important role for the electronic business in general, which, despite the issues of trust that they may involve, have seen a spectacular development.

Related to the issue of mutual trust it has to be mentioned the possibility of an *opportunistic behavior* in a virtual enterprise, since each member pursues its own interests - maximizing profit - without taking into account the interests of its partners. Given that there is no leader to carry out strict a monitoring and there is no way to certify the validity of determining the price structure,

¹²² Bogdan Ghilic-Micu, Marian Stoica (2006) *Economia digitală și societatea bazată pe cunoaștere*, in Ion Gh. Roșca (ed.) *Societatea cunoașterii*, Editura Economică, București, p. 131.

¹²³ Henrique Lopes Cardoso and Eugénio Oliveira (2005) *Virtual Enterprise Normative Framework Within Electronic Institutions*, in Marie-Pierre Gleizes, Andrea Omicini, Franco Zambonelli (Eds.) *Engineering societies in the agents world V: 5th international workshop*, ESAW 2004, Toulouse, France, Oct. 20-22, Springer-Verlag, Heidelberg, p. 18.

¹²⁴ Jürgen Noll (2008), *op. cit.*, p. 8-9.

there is a risk of exploitation which can occur within a virtual enterprise. This again suggests the idea of establishing stable virtual enterprises.

The regulatory framework for virtual enterprises in the European Union is that regarding the information and communication technology services, including the protection of intellectual property - such as protection of computer programs or databases - distance selling, electronic commerce, electronic money, electronic signature. Of special interest for virtual enterprises is the *Directive on Electronic Commerce* - whose main provisions are transposed into Romanian law by *Law no. 365 of 7 June 2002 on Electronic Commerce*¹²⁵ - which sets out the main rules of conduct for virtual business, like the requirement of transparency concerning information about the organization for the customers. The *Directive on Distance Selling* - which has as Romanian counterpart the *Ordinance no. 130/2000 on the Legal Regime of Distance Contracts*¹²⁶ - influences the activities of virtual enterprises as it introduces a number of regulations, particularly regarding Business-to-Consumer type sales. The *Directive on Electronic Signatures* - with its corresponding *Law no. 455 of 18 July 2001 on Electronic Signature*¹²⁷ - is of particular importance for the virtual enterprises, confirming the validity of distance contracts between the participating firms.

We cannot assert, however, that there is an integrated regulatory framework for virtual enterprises on the European Single Market, as there still are a number of legal concerns regarding, for example, legal representation - in the sense that within a virtual enterprise, its components remain independent as a legal entities, which raises the question on how a virtual enterprise could and should be constructed legally. In practice, the members can found an association for each project, or establish a leading firm acting as a legal entity, and the other participating firms receive the status of sub-contractors.

5. Conclusions

Virtual enterprises are organizational structures of the knowledge economy having as main characteristics the focus on core competences, a single point of contact with customers, the international dimension, independency, low formalization, the systems provided by information and communication technologies, temporariness. There are many advantages that derive from such characteristics, among which flexibility and response speed, which motivate the efforts for facilitating their creation and development.

In the context of the European Single Market, the integration of markets, and, especially, the specific efforts to create a favourable environment for the virtual enterprises, enable their development and facilitation in all the Member States, which can use this possibility to quicker and easier involve in the Single Market. Issues related to virtual enterprises development and facilitation include: availability of information and communication technologies, identifying the appropriate partners and establishing relationships with them, building networks, achieving mutual trust, developing an integrated regulatory framework.

We may argue, in any case, that virtual enterprises are still a nascent form, but with substantial development potential in the near future on the European Single Market, along with the progresses towards integration as well as regulation and institutionalization. They can also be an effective possibility for Romanian enterprises to gain access on the Single Market, on the condition that the related difficulties can be successfully overcome, as a specificity being mentioned that they would rely mainly on such informal relationships developed by firms.

Ministry of Administration and Interior

The article analyses the possibilities for facilitating Romanian firms' access to the European Single Market through clusters development and internationalization. Having considered the clusters' role and characteristics, in order to determine their potential for growth and internationalization and the implications at a national, regional and firm level, this potential is analyzed in the context of the European Single Market. The cluster approach in the Romanian context, as status-quo and possibilities for development, is analyzed considering the specific policy, institutional and economic framework, providing recommendations for appropriate measures in order to greater benefit from the clusters' potential and the opportunities provided by Romania's integration in the European Single Market structures.

Keywords: Clusters, Cluster policies, European Single Market, Internationalization.

JEL Classification: F23, L22, O33.

1. Introduction

Cluster-type agglomerations have been a socio-economic reality even before the Industrial Revolution, drawing the attention of well-known researchers like Marshall, who noted the tendency for specialised firms to be concentrated in "industrial districts", or Schumpeter, who noted the innovative potential of cluster-type phenomena in his now highly influential exposition on the role of entrepreneurs and the "creative destruction". The fundamental changes in the economy, leading towards a knowledge-based economy and society, have determined the proliferation of clusters – considered as organizational forms specific to the knowledge economy, with enriched potential, functionalities and characteristics.

Clusters and cluster policies have began to arise special interest in the last decade of the 20th century, which has grown substantially in the last years, in order to accomplish the competitiveness demands at a national, regional and firm level in the emerging knowledge economy. Clusters intercorelate the constitutive firms in an integrated system which provides higher possibilities concerning the access to knowledge and information, costs reduction and innovation, thus contributing to the economic development of the region where they are located.

2. Clusters' role and characteristics

The cluster concept has been introduced to the attention of both analysts and policy-makers by Michael Porter¹²⁸ in his highly influential analysis of the competitive advantage of nations, which is presented as resulting from the interactions of four forces which compound the competitiveness "diamond" – factor conditions, demand conditions, firm strategy, structure and rivalry, and related and supporting industries. The last of these points toward the importance of location and

¹²⁸ Michael E. Porter (1990) *The Competitive Advantage of Nations*, Macmillan, London.

offers an explanation for the well-known success of Silicon Valley in electronics, or Hollywood in the film industry.

Porter also developed a widely-used definition: “Clusters are geographic concentrations of interconnected companies, specialised suppliers and service providers, firms in related industries, and associated institutions (for example universities, standards agencies, and trade associations) in particular fields that compete but also co-operate”¹²⁹.

Approaches to cluster vary, focusing especially on elements like *location*, *industry* or *innovation*; a common element is the inter-firms and other organisations linkages, which provide economic value to clusters. There is a shift of focus from a firm-level to an inter-firms approach. In the context of the knowledge economy, it is well recognised that industry specific knowledge is becoming cumulative and embedded in a particular region or area rather than in a specific firm¹³⁰. Clusters largely resulted from the opportunities for economic transactions between firms, explained by Porter in terms of “*economies of agglomeration*”¹³¹; however, concerning the latest generations of clusters, the emphasis has shifted to *learning and knowledge access*.

Location, or geographical proximity, has been greatly emphasized, however, it is not sufficient for a cluster development, as geographical proximity facilitates but does not guarantee effective inter-firms interactions. Actually, progress in information and communication technology has allowed for the creation of *virtual clusters*, at an international level and based on emergent technologies, which create and share information and knowledge across great distances. Clusters may also be viewed as networks of firms with complex interactions, but they differ from networks in that they integrate firms linked in a value chain, as an alternative way of organising the value chain¹³².

Clusters can be very different in terms of density, social cohesion, level of activity, vitality, industry concentration, geographical area and stages of development. It is worth mentioning a general classification which allows for an analysis of a cluster’s *development stage and possibilities*, thus distinguishing between: *potential clusters* – that present good opportunities for development and where some key elements of an effective cluster are already in place, *latent clusters* – with an high number of firms but where the level of interaction among them is still low due to lack of trust, low cooperation and high transaction costs; *working clusters* - well developed industrial districts¹³³.

Clusters’ role as competitiveness and innovation promoting mechanisms is largely recognised. Among the many clusters specific *competitiveness-generating advantages* that mark their proliferation tendency can be counted: inter-firm cooperation at lower costs, higher innovation possibilities for persons or organisations, dissemination and lower costs and risks for research and development activities, higher technical, economical and organisational flexibility, shorter periods of time for manufacturing, lower unit costs due to scale economies at the cluster level, etc¹³⁴.

Clusters’ *innovative potential* is mostly due to access to knowledge and information, new technologies, business concepts, etc, and to flexible organising, as an essential characteristic of

clusters¹³⁵, which allows for a quick efficient reconfiguration of its activities. OECD specialists have actually suggested a cluster approach as a “reduced national innovation system”, as clusters incorporate the main requirements for promoting innovation¹³⁶.

3. Clusters development and internationalization on the European Single Market

Clusters can facilitate the *internationalization* of firms on the one hand, through the benefits offered to members, and, on the other, through initiatives at a cluster level. Specific barriers to internationalization, regarding managerial, financial, informational and competition-related issues faced by firms can be substantially reduced by a *cluster membership*¹³⁷. Firms’ competitiveness is enhanced through the external characteristics of the cluster, such as cost advantages due to proximity, joint marketing, reduced costs of access to competent personnel and information, etc. Positive externalities of the clusters thus determine the members’ growth and competitiveness, and participation to a cluster will have a positive impact on their internationalization. Clusters may thus become a platform to boost self internationalization of firms.

Cluster based initiatives for internationalization have become more numerous and wider in recent years, although traditionally, the focus was on the internal activities related to improving the business environment at a cluster level, strengthening the links between participants, and modernizing the members’ strategies and transactions. International cooperation between clusters and between clusters and other actors is a strong impetus towards internationalization for the firms within the cluster. Also, we can say that it is a way to prevent one of the main cluster limits - and networks in general - namely, *the lock-in effect*¹³⁸, which occurs when a firm is over-embedded with existing cluster partners and fails to broaden its network horizons with other prospective partners and to identify potential business opportunities beyond the cluster boundary. Smaller firms are more likely to be locked in and subject to inertia in clusters due to their liabilities, whereas firms that are larger and better positioned within the cluster may often exercise stronger power upon smaller firms.

Cluster based internationalization may take different *forms*, among which the most common approach is *establishing contacts* with other networks and clusters. This may include facilitating knowledge and experience exchange, for example by mutual providing of information and mutual exchanges of staff. More advanced forms of international cooperation are *partnerships*, by sharing support services and access to facilities like research and development centers.

The growing importance of establishing international relations between clusters is due to the changes in the global economic environment in which clusters operate. Reducing barriers to trade and investment, and technological changes have determined decreasing transport and communication costs, and thus have created opportunities to *break the supply chain at a geographical level*. The efforts for fostering internationalization have been mainly directed to increasing income from exports, but the focus is currently shifting to creating and sustaining competitive advantages through international cooperation. As a result, clusters tend to specialize on their core competences, which further leads towards a growing integration of clusters into global supply chains.

We may argue that the *European Single Market* actually creates additional pressures for the development of the relations between clusters. National borders continue to distinguish between the European markets and the competitive environments, by political, administrative, legal,

¹³⁷ David McHardy Reid, Richard DeMartino, Stelios C. Zyglidopoulos (2005) *The Internationalization Journey of a High-Tech Cluster*, în *Thunderbird International Business Review*, vol. 47, no. 5, p. 529-554.

¹³⁸ Marian V. Jones, Pavlos Dimitratos, Margaret Fletcher, Stephen Young (2009) *Internationalization, entrepreneurship and the smaller firm: evidence from around the world*, Edward Elgar Publishing, Cheltenham, UK, p. 109.

cultural barriers. However, the efforts to consolidate the Single Market and, particularly, to eliminate the obstacles to the free movement of goods, services, capital and people, act as strong incentives for international cooperation between clusters. European clusters can not rely solely on the natural forces which determine the agglomeration of firms, attraction of capabilities and assets, as do, for example, the clusters on the U.S. market, with a higher level of integration, but this may be offset to some extent by promoting and strengthening international cooperation¹³⁹.

Fostering clusters development and internationalization is an important axis of the Community Programs, particularly circumscribed to the territorial cooperation objective of the Cohesion Policy, but also as a way of promoting innovation in the Lisbon Strategy. Key measures for cooperation between European clusters in specific areas of coverage include: the *European Cluster Policy Group* - cluster policies, the *European Cluster Alliance*, under PRO INNO Europe - cooperation at the political level, the *European Cluster Observatory*, under Europe INNOVA - European clusters analysis, *European Innovation Platform for Clusters*, under Europe INNOVA - fostering innovation, the *European Excellence Cluster Initiative* under PRO INNO Europe - quality of clusters management¹⁴⁰. Europe INNOVA is a European initiative which aspires to become the laboratory for the development, testing and promotion of new tools and instruments to support innovation, with a view to helping innovative firms to innovate faster and better. PRO INNO Europe is an initiative of Directorate General Enterprise and Industry which aims to become the focal point for innovation policy analysis and policy cooperation in Europe, with a view to learn from the best and contribute to the development of new and better innovation policies in Europe.

4. The cluster approach in the Romanian context

In Romania, the general approach to clusters can be described in the way that the national level has been "too high", whereas the local level has been "too low"¹⁴¹. The institutional framework for regional economic development includes the Regional Development Agencies, created in the late '90s of the last century¹⁴². Clusters began to be mentioned in the national strategic documents in the context of Romania's integration in the European Union, as a priority related to the economic development and integration into the Single Market structures. However, no national cluster specific institutions or policies have emerged so far.

Considering the proportionality between the quantity and quality of knowledge circulating and spilling over between the firms within a cluster and the cluster's size, level of specialization and the extent to which the locality or the region is geared towards and focused upon the industries comprising the cluster - which also appears in the literature as the cluster dominance¹⁴³ - the European Cluster Observatory proposes an indicator that measures the specialised critical mass' to develop positive spill-overs and linkages for each cluster by assigning each cluster a number of stars for each of the three criteria. Thus, *size* is measured by the number of employees, *specialization* - compares the proportion of employment in a cluster category in a region over the

total employment in the same region, to the proportion of total European employment in that cluster category over total European employment, and *focus* - relates employment in the cluster to total employment in the region.

In the case of Romania, according to this methodology, the identified clusters appear as shown in Table 1. and Table 2:

Table 1. The main clusters in Romania by stars, employment and specialisation

Cluster	Region	Employees	Specialization	Stars
Apparel	Nord-Est	53 835	6.64	« « «

It can be argued that in Romania, the existing clusters have a relatively low level of specialization, but have a significant number of employees at a regional level. Among the main clusters in Romania, and also, among the oldest ones, can be mentioned especially those of the North-West and West regions, which have been created mostly due to foreign investments from Italian clusters beginning in the early 90's of the last century. The main industries of Romanian clusters are: apparel, textiles, building fixtures, communications, oil and gas, metal, automotive and footwear.

Table 2. The main regions in Romania by total number of stars and share of employment in clusters with stars

Region	Total number of stars	Share of employment in clusters with stars
Centru	27	71.25%
Sud-Muntenia	26	71.43%
Vest	22	62.53%
Nord-Vest	19	63.06%
Sud-Est	17	77.59%
Nord-Est	17	60.47%
Sud-Vest Oltenia	15	50.75%
Bucuresti-Ilfov	15	54.92%

Source: European Cluster Observatory, ISC/CSC cluster codes 1.0, Dataset 2007/06/06.

In what concerns the regions comprising the highest number of stars, according to the European Cluster Observatory, Centre and South-Muntenia regions are primarily noted.

We may argue that clusters are a relatively recent phenomenon in Romania - which emerged in the early 90's of the last century, in the context of the transition to a market economy - clusters are few in number and unevenly distributed across Romania. Thus, their capacity for association, cooperation and coordination at national and international level - which should be inherent to their development, as it can be argued, for example, for Italian clusters - is reduced. Moreover, because the phenomenon is relatively recent, cluster specific policies and institutions at national, regional and local level have not yet sufficiently emerged. Hence *the need to adopt specific measures and instruments for the development and internationalization of Romanian clusters*.

The potential of clusters as engines for the economic development at regional and national level is widely recognized. Clusters are also effective ways to conduct efficient policies, as firm-level interventions are too costly and tend to distort competition, while policies directed at broad industries will tend to have little effect and may miss the critical levers. Clusters can help to identify opportunities and threats in the business environment affecting the whole economy, and they can be the testing "laboratories" for adequate solutions addressing them. Clusters can also help the private and the public sector policy making by facilitating collaboration and joint action along a wide set of players¹⁴⁴.

The need for intervention by policy measures for clusters promotion in order to prevent some negative effects of the market mechanisms meets several arguments, including the non-appropriability of positive externalities, lack of location information, lack of coordination of members, restrictions on firms' mobility, negative externalities¹⁴⁵.

The development and internationalization of clusters requires *coordination at national and regional level*. Clusters literature particularly points to the importance of national policies, but in order to obtain superior knowledge and greater adaptability to the conditions of the region, it is essential that these efforts be coordinated at a regional level, and this is especially important in a country with a relatively weak state such as Romania¹⁴⁶. The cluster approach has yet to be mandated at the level of central government, and the measures should further be adapted and varied according to the characteristics of clusters.

5. Conclusions

Clusters are acknowledged instruments for providing competitiveness, access to learning and knowledge, innovation and growth at a national, regional and firm level. Clusters can facilitate the internationalization of firms on the one hand, through the benefits offered to their members, and, on the other, through initiatives at a cluster level. Clusters development and internationalization is an important axis of the Community Programs, while the characteristics of the European Single Market provide strong incentives for international cooperation between clusters.

Romania's integration in the structures of the European Single Market provides specific opportunities for Romanian clusters development and internationalization. Clusters are a relatively recent phenomenon in Romania, with a reduced capacity for association, cooperation and coordination at national and international level, but there is potential for a cluster approach which can be used for facilitating Romanian firms' access to the European Single Market. Applying the cluster approach in Romania requires the adoption of specific measures and instruments for the development and internationalization of Romanian clusters and coordination at national and regional level.

EUROPEAN MIGRATION POLICY AND FUTURE CHALLENGES

Stanciu Simona

University of Oradea, Faculty of Social Humanistic Science

Șodinca Gheorghe Gigel Angel

Inspectoratul de Poliție Bihor

One of the core areas of the European integration project is the cooperation in matters of “common immigration policy”. Cooperation between EU member states in matters of migration policy has its origin in the realisation of freedom of movement, particularly the Schengen Agreement, also developed in the Maastricht Treaty of 1992, in the Amsterdam Treaty of 1997, and in the Treaty of Lisbon of 2007. The thematic agenda of cooperation has been extended significantly in recent years, and continue to promote integration towards a common European migration policy.

Keywords: migration policy, EU, challenges

JEL code: J68 - Public Policy

Within a population of more than 500 millions of persons¹⁴⁷ and 23 official languages¹⁴⁸, the aging European Union is becoming a “melting pot” of people of different ethnic, linguistic and cultural-social origin.

An emerging question is: Where should be the boundaries between the EU common immigration policy and the national sovereignty and national identity? Common policies are yet isolated, and these matters are generally handled between two governments on areas in which the member states are pursuing common interests. Common interests concern improved state control over migration, cooperation between border police and strengthened the fight against irregular immigration and asylum abuse¹⁴⁹ (Lavenex, 2009). Some of the integration policies aim at maintaining cultural diversity.

Considered initially as an economic theme, the migration’s multiple social aspects are now widely recognized. Labour market issues represent the core aspect of the immigration. A great number of labour market data refer to the labour market situation, but the central concern to individuals and society are the statistics directly relevant to citizens like employment and unemployment. Data show the Employment Rate¹⁵⁰: 65.9 % (2008) (Eurostat - EU 27), the Foreign population (2007): 28,861,974 (5.8%) (Eurostat - EU 25), the Percentage of foreign employees amongst gainfully employed (2007): 6.7%, the Unemployment Rate¹⁵¹: 7.0% (2008) (Eurostat - EU 27). The European labour markets are deeply hit by crisis, but more resilient than expected¹⁵² (*Employment Analysis of the European Commission*, 2010). Recent employment measures undertaken by Member States to combat the employment effects of the crisis: *maintaining employment, creating jobs and promoting mobility; upgrading skills and matching labour market needs; increasing access to employment*¹⁵³ (*Employment in Europe 2009*).

¹⁴⁷ 501.259.840 in 1st January 2010 in Europe (Eurostat - EU 27).

¹⁴⁸ Official languages: French and English (main working languages) plus 21 other official languages.

In the discourse over the profile of migration in the EU, Sandra Lavenex¹⁵⁴ points, in *Focus Migration*¹⁵⁵, to important aspects in the European policy in matters of migration: cooperation in matters of immigration and asylum, the institutional basis of *European Migration Policy*, freedom of movement and the *Schengen Agreement*, the *treaties of Maastricht, of Amsterdam, and of Lisbon*.

1. Cooperation in matters of immigration and asylum

The collaboration in matters of immigration and asylum is a relatively new aspect - first introduced at the end of the 1980s -, and becomes today one of the core areas of the European integration project. European cooperation on matters migration policy has been communitised step-by-step. Few common policies were noticeable and concern areas of bilateral interest harmonized by governmental measures. Less progress has been made in the area of labour migration cooperation, in relation to the rights of legally settled foreigners in the EU, and concerning foreign integration.

Considering the legal categories, the labour migration dominates in countries with less regulated labour markets (UK, Ireland, the Czech Republic, Denmark), in most other states family reunification represents the strongest immigration category (France, Sweden), while a middle position (similar percentages in labour migration and family reunification) have Italy and Germany.

The institutional basis of European Migration Policy. Until the end of the 1990s, intergovernmental decision-making procedures predominated. Nowadays, the decision rules are communitised, member states share central powers and responsibilities with the supranational institutions of the EU. The most important EU instruments on asylum and migration policy, however, were adopted under the earlier intergovernmental procedures.

The concentrated influence over common policies is in the hands of representatives of the member states in the *Council of the European Union* (also called the *Council of Ministers*), in this case the *Ministers of Justice and Home Affairs*. The Council of Ministers adopts resolutions based on a qualified majority, which means that individual states cannot exercise a veto and a minority can be overruled.

The *European Commission* now has the exclusive right to adopt legislative initiatives. Under the “co-decision procedure”, the *European Parliament* has the right to participate in decision making, which means that its agreement is necessary in the legislation process.

Freedom of movement. Cooperation between EU member states in matters of immigration policy has its origin in the realization of freedom of movement, particularly the *first Schengen Agreement* in 1985 (France, Germany and the Benelux). The European Commission simultaneously formulated the *first guidelines for a Community policy on migration*.

The *Schengen Agreement* specified to abolish all checks on persons at their internal borders. The states would determine measures to safeguard inner security after the abolition of border checks - concluded with the 1990 *Convention implementing the Schengen Agreement*. Alongside cooperation on the part of the police and judiciary in criminal matters, this included the standardisation of regulations for foreigners entering and remaining for short stays within the “*Schengen area*” (a single *Schengen visa*), border police cooperation, and in asylum matters, the determination of the member states responsible for an asylum application.

The provisions relating to asylum policy were adopted in 1990 in the *Dublin Asylum Convention*, which was ratified by all EU member states and, after difficult internal policy ratification processes, came into force in 1997. Similarly, the *Convention implementing the Schengen Agreement* was subjected to considerable delay and did not come into force until 1995. The

¹⁵⁵ Focus Migration is an information service that offers up-to-date figures, data and analysis on immigration, migration, asylum and integration issues. The service consists of three core products: country profiles, policy briefs and the “Migration und Bevölkerung” newsletter (in German only), <http://www.focus-migration.de/index.php?id=4&L=1>.

“*Schengen acquis*” of 1997 was transferred into European law with the *Treaty of Amsterdam*, the “*Schengen area*” was expanded step by step beyond the original five member states.

Today the *Schengen* regulations apply in all EU member states with the exception of Ireland and the UK, Bulgaria, Romania and Cyprus. Iceland, Norway and Switzerland are associated with the Agreement as non-EU member states. Intergovernmental cooperation within the Schengen framework can be regarded as the driving force and laboratory for EU-wide cooperation in matters of migration policy and, in criminal and police issues. The coupling of cooperation on migration policy with questions of internal security has also given rise to a focus on control aspects of immigration policy.

The second phase of cooperation on migration policy is the *Maastricht Treaty* of 1992. Influenced by the fall of the “Iron Curtain” and strongly growing numbers of asylum-seekers, the 1990s were markedly characterised by member states’ domestic priorities. In the absence of strong European powers and responsibilities, changing EU presidencies were, to a large extent, able to shape the agenda, which resulted in a lack of coherence in, and commitment to, the integration process. The Treaty formalised the previously purely intergovernmental cooperation and set it on a new basis in the so-called “third pillar” of the EU.

The Amsterdam Treaty of 1997 reflects the central priority that asylum and immigration policies now enjoy in the EU. The Treaty transferred these policy areas to the supranational first, or Community, “pillar”. Integrated the *Schengen acquis* into the treaties, and determined – after a transition period of five years (de facto six) and with slight restrictions –supranational decision-making rules were introduced. The accession of eight new member states on 1 April 2004 pointed to the urgent need to come to an agreement on central matters before the admission of so many new members.

The Treaty of Lisbon negotiated in 2007. The 2001 *Treaty of Nice* made no appreciable changes to this basis of power, the Treaty of Lisbon negotiated in 2007 extends decision-making rules based on qualified majority voting and increased the involvement of Parliament by extending its co-decision powers to the one field that had hitherto been excluded: labour migration. Due to Ireland’s failure to ratify it, however, the Treaty of Lisbon cannot currently come into force.

The role of the European Council:

- *The 1999 Tampere European Council* underlined the humanitarian basis of European asylum policy and the binding force of the 1951 *Geneva Refugee Convention*. A programme of action was agreed for 5 years to accompany the implementation of the Amsterdam treaty.
- *In 2004 in Den Haag*, the European Council extended this action plan for the following 5 years to include new focal points, in particular the external dimension of EU asylum and immigration policy (a stronger involvement of transit states and countries of origin outside the EU in the control of migration flows).

Immigration Policy. The *Treaty of Lisbon* contains the aim of a “common immigration policy” (Article 17), to date the EU has no comprehensive common regulations regarding the admission of third-country nationals or labour migration, with the exception of the right to family unification and two regulations concerning the admission of students and researchers cooperation has concentrated on formulating common regulations for crossing the external border, including a common visa policy.

The *common visa policy* is supported by an electronic visa information system (VIS) in which data for all visa applications in the EU are stored, including the applicants’ fingerprints and biometric data.

The “*Blue Card*” initiative proposed by the European Commission for highly skilled persons from third countries provides for simplified, fast-track admission procedures and preferential rights of residence for such third-country nationals. Blue Card holders would immediately receive the right to family reunification as well as the right, after two years’ legal residence in a member country, to look for work in other EU countries without having to return to their home

country. At the same time, the member states would retain the right to make the issuing of a Blue Card dependent upon the labour market situation within their country as well as to apply national law to the filling of available posts. Following European Parliament approval in November 2008, it is expected that the Council of Ministers formally pass a corresponding directive in early 2009.

Free movement of workers. The free movement of workers is regulated in [Article 39 of the EC Treaty](#); [Regulation 1612/68](#) of 15.10.1968 on freedom of movement for workers within the Community (OJ No L 257, 19.10.1968) ; [Directive 2004/38/EC](#) of 29.04.2004 on the right of citizens of the Union and their family members to move and reside freely within the territory of the Member States (OJ No L 158, 30.04.2004) ; [Directive 98/49/EC](#) of 29 June 1998 on safeguarding the supplementary pension rights of employed and self-employed persons moving within the Community (OJ No L 209, 25.07.1998); [OJ L 236 of 23.09.2003](#) Enlargement 2004: Accession Treaty; [Czech Republic \(Annex V\)](#); [Estonia \(Annex VI\)](#); [Latvia \(Annex VIII\)](#); [Lithuania \(Annex IX\)](#); [Hungary \(Annex X\)](#); [Poland \(Annex XII\)](#); [Slovenia \(Annex XIII\)](#); [Slovakia \(Annex XIV\)](#); [OJ L 157 of 25.4.2005](#) Enlargement 2007: Accession Treaty; [Bulgaria \(Annex VI\)](#); [Romania \(Annex VII\)](#)¹⁵⁶. In 2008, the Commission presented a Communication on *A common immigration policy for Europe: principles, actions and tools* (European Commission, 2008a)¹⁵⁷.

Integration Policy. In 2004, the *Council of Ministers* adopted a series of *Common Basic Principles on Integration (CBPs)*:

- the integration is a two-way process between the immigrants and the receiving society;
- immigrants must have respect for the basic principles of the EU as well as basic knowledge of the guest country's language, history and institutions;
- occupation and training are central to integration;
- immigrants should be involved as far as possible in the development of integration policies;
- to incorporate the integration of migrants in all public policies as a general principle and to introduce clear goals, indicators and evaluation mechanisms in order to facilitate the measuring of progress. These general principles have not been further specified in a legal sense, and no accompanying measures have been adopted for their implementation.

In a 2005 communication the Commission also put forward non-binding proposals on integration policy under the title “A common agenda for integration – framework for the integration of third-country nationals in the European Union”.

Some of these proposals were adopted by the Council of Ministers in its likewise non-legally binding 2007 conclusions on the strengthening of integration policies in the European Union by promoting unity in diversity.

Although the effect of such an approach is limited, reduced as it is to an exchange of information and being entirely on a voluntary basis, the member states also omitted in the Lisbon Reform Treaty giving EU bodies and institutions new powers to act within the field of integration. Instead, Article 79(4) of the Treaty of Lisbon states that the envisaged so-called “common immigration policy” should be developed “excluding any harmonisation” in the field of integration

EU citizenship. The EU citizenship is introduced by the Maastricht Treaty and refers to the rights and obligations of citizens of member states that result from their right to free movement within EU territory. Every person holding the nationality of a member state is automatically also an EU citizen; EU citizenship complements, but does not replace, national citizenship. The EU citizenship do not affects the heterogeneous nature of citizenship regulations within the

¹⁵⁶ European Commission–Employment, Social Affairs and Equal Opportunities, *Legislation. Free movement of workers*, <http://ec.europa.eu/social/main.jsp?catId=474&langId=en>.

¹⁵⁷ European Commission (2008a), Communication from the Commission to the Council, the European Parliament, the European Economic and Social Committee and the Committee of the Regions, *A common immigration policy for Europe: principles, actions and tools*, Luxembourg, COM (2008) 359 final.

individual states. Nearly all member states acknowledge the right to citizenship based on parentage (*jus sanguinis*) as well as the principle of awarding citizenship to persons born within their territories (*jus soli*).

2. Future Challenges

The thematic agenda of cooperation has been extended significantly in recent years, with the strengthening of supranational actors, the Commission, the Parliament, and also the European Court of Justice. First steps are taken today towards a common admission policy for labour migrants, greater standardisation of asylum systems, the creation of instruments for member states to share the burdens of migration policy in a spirit of solidarity, plus a comprehensive foreign policy agenda linking migration policy goals with development policy priorities.

Along the already widely discussions on migration, as the need of aging Europe for labour force, migration inside Europe and the EU labour migration since enlargement, immigration from the third countries, social cultural integration of migrants and the influence of cultural diversity on labour market entry of migrants, national and communitised level in Integration Policy, migrants' experiences with Public Employment Support Services, there are a series of new perspectives debated in the scientific literature. Some of the actual themes with a special role in social discourse have caught the imagination of academics, the media and international and national policy makers across the globe, for example:

- possible effects of climate change on global migration processes;
- the permissibility of dual citizenship;
- increase in female labour migration;
- migration and health. "Migration makes you sick - migration improves your health prospects?";
- Integration Policy at a Regional Level;
- effectiveness of Control Strategies on irregular migration in Europe;
- Civic Integration Courses for immigrants;
- migration and recruitment of professionals, in particular healthcare workers: causes, consequences and policy responses;
- new outflows of high-skilled personnel from Europe to countries which were not a destination before;
- good practice for the integration of immigrants.

The continuing external migration pressure as well as the demographic development within the EU will, continue to promote integration towards a common European asylum and immigration policy. The heterogeneity that has evolved within the EU and the continuing emotional debate on migration on the domestic front, a preference can be seen for less prescriptive, predominantly operative coordination, coinciding with cautious and somewhat reluctant harmonisation.

MOBILITY OF WORKERS IN THE EUROPEAN UNION

Stanciu Simona

University of Oradea, Faculty of Social Humanistic Science

Șodinca Gheorghe Gigel Angel

Inspectoratul de Poliție Bihor

The paper aims to describe briefly some of the main elements of the migration phenomenon in EU: push/pull factors of the mobility and costs/benefits of migration; free movement of workers in the European Community, with Specific Provisions in the Accession Treaty and the current [Job Mobility Action Plan \(2007-2010\)](#); Europeans work abroad and “Third-country” nationals.

Keywords: mobility, labour force, EU

JEL code: J61 - Geographic Labor Mobility; Immigrant Workers

1. Introduction

There is no official definition of migration in the European Union. The term describes the process of persons moving across borders to live and work and generally implies non-EU citizens moving into or within the EU¹⁵⁸. Other sources describe migration as the movement of a population from a region to another region with the purpose of remaining temporary or definitively in the new geographic zone. The labour force migration is the process of labour force moving from a country to another.

From the perspective of the social mobility analyzed in the international context, the labour force migration – when takes place in an organized and controlled way – is a positive phenomenon which is the answer to the needs of all social actors involved in this complicated equation: countries of origin, destination countries and the immigrants themselves. Migration could be the ideal framework for the individual achievement. „The international community should create a world in which no human being is obliged to migrate. Migration should be a process entirely on a voluntary basis and planned on legal basis, in order to enhance individual capacities and for fulfill personal aspirations.” (James N. Purcell, General Director of the International Organization for Migration, 2007)¹⁵⁹. By contrast, the illegal immigration represents a source of dangers for the national security of each state, causing disturbing effects on demographics, labour market, through straightening the black market and proliferation of criminality.

On a global level, 3,3% of the population is migrant. The number of migrants in the highest in Europe (56 millions), then in Asia (50 millions), North America (41 millions). More then 20% of the labour force of Romania works abroad. The foreign population presence in the EU is growing: in 2003 EU-15 were 17.12 million (3.76%) and in 2007 EU- 25: 28,861,974 (5.8%) (Eurostat)¹⁶⁰.

2. Causes and effects of migration

The migrants are persons having the goal of a work engagement abroad, of family reunification, person willing to study abroad, independent migrants etc. Migration for the purpose of family reunification has a privileged status in the majority of Western legislations. In some countries is even the only form of legal immigration, but same time, just the presence of a family member does not mean automatically the admission in the receiving state. Certain conditions have to be fulfilled by the family member in order to immigrate: the biological or legal relation with the

¹⁵⁸ European Commission, <http://www.eurofound.europa.eu/areas/industrialrelations/dictionary/definitions>.

¹⁵⁹ cf. Șodinca G. A., *Impactul social al migrației ilegale. Masuri de combatere a migrației ilegale la nivel European*, paper presented at the Conference „Educație și schimbare socială”, organized by the Faculty de Social Humanistic Science, University of Oradea, 20-21 February 2009.

¹⁶⁰ European Commission, Eurostat, Europa server: <http://europa.eu>.

already immigrated persons, the status of the family members abroad, financial and housing aspects.

Aging labour force

The aging population, due to the increase in life expectancy and low fertility, determine the need for the labour force in developed countries.

Demographic data demonstrate the lack of generations in replacing the old generations. The most affected region is Europe: the percent of 20% senior citizens in the general population in 1998 will grow to 35% old persons in 2050. It is estimated that until 2050 the country with the highest number senior citizens will be Spain, followed by Italy. This process will determine huge deficits between the need and offer of labour force. The aging labour force also limits the economic growth.

Growth in the EU up to 2025 will be mainly dependent on migration. Without positive net migration, the population would already have declined in some EU States, with the working age population predicted to decline by some 20 million between 2010-2030 (Eurostat projections)¹⁶¹. Economic and political forecasts predict that immigration will continue to grow in the future. Since 1999, more effective EU strategy was introduced towards a common migration policy to promote the economic, social, cultural, and political integration of migrants.

Push&pull factors

At the base of all migrations are causes concerning two types of factors:

- *push factors*: poverty, war, persecution, hunger, lack in freedom etc.
- *pull factors*: peace, health, higher income etc.

These factors can explain that immigrants accept lower-skilled jobs, and lower incomes. The *economic sectors* where migrant workers are concentrated in the lower-skilled jobs within those sectors, even though on average they have a higher skills level are:

- education;
- care and health;
- hotels and catering;
- agriculture;
- construction.

Categories of migration

The main types of migration are:

- migration for development;
- escape migration;
- migration of the elites (*brain-drain*).

The brain-drain phenomenon involves the leaving of specialists, of highly-specialised persons, towards developed countries. The emerging regions for intellectuals are: Africa, China, South-East Asia, India. Countries such as Canada, SUA or Australia make all possible efforts in order to attract highly-specialised persons. The migration of specialists include forms as brain overflow, brain export, brain exchange, brain-drain.

The circular migration involves the persons immigrated for a period of time and who return to the natal country. By encouraging this type of flows, the long illegal stay of immigrants in a country is prevented. The reticular migration represents the migratory moves done as a response to a sudden decision, by taking in account the advantages, risks and the economic, politic and social context. In the literature, a great number of other migration classifications are described, such as: of entrepreneurs, of students, oscillations, of the “stars”, migration of competencies etc.

Effects of migration

The migration phenomenon affects all three actors involved: emerging country/destination country and the immigrant himself.

¹⁶¹ European Commission, Eurostat, Europa server: <http://europa.eu>.

Table 1. *Negative / positive effects for the emerging country / destination country*

<i>For the emerging country</i>		<i>For the destination country</i>	
<i>Disadvantages</i>	<i>Advantages</i>	<i>Disadvantages</i>	<i>Advantages</i>
- loose in human capital - loose in qualified persons - increase in unemployment - distance from the family, family dissolutions etc.	- remittances - incomes that, in the form of either funds or goods, flows back into the country of origin; investments of the persons who return - increase in life conditions for families back home.	- many times, the immigrants don't return to the country of origin - negative perception about immigrants - cheap labour force: foreign workers accept lower incomes	- immigrants occupies the jobs refused by the locals - contribution to state budget by the payment of taxes - many workers are professionals - redress of the lack in work force in many economic domains
<i>For the immigrant himself</i>			
<i>Costs / benefits</i> - financial and psychological costs - higher incomes - better living standards - social and cultural adaptation etc.			

Also, we have to take in account the impact of globalization on labour market, which determine:

- elimination of national borders;
- emerging transnational communities;
- multinational companies move to places where cheap labour force is provided;
- labour force moves freely;
- globalization in technologies, in communications, in transport influence the labour force migration.

Table 2. Positive and negative effects of the globalization phenomenon

<i>Positive effects of globalization</i>	<i>Negative effects of globalization</i>
<i>Economic and social progress</i>	Threats on national sovereignty
<i>Innovation in technologies</i>	Continuous subordination of poor nations and regions by the rich ones
<i>Diversification in offer of goods and services</i>	Accentuation of discrepancies between the rich and poor
<i>Higher life standards</i>	Blending of cultures
<i>Abundance in information</i>	Destruction of local traditions
<i>Increase of cultural freedom</i>	Destruction of the environment

3. Free movement of workers in the European Union

The free movement of persons is one of the fundamental freedoms guaranteed by Community law: it is perhaps the most important right under Community law for individuals, and an essential element of European citizenship.

For workers, this freedom has existed since the foundation of the European Community in 1957. It is laid down in *Article 39* of the *EC Treaty* and it entails:

- the right to look for a job in another Member State;
- the right to work in another Member State;
- the right to reside there for that purpose;
- the right to remain there;

- the right to equal treatment in respect of access to employment, working conditions and all other advantages which could help to facilitate the worker's integration in the host Member State. Regulation governing the free movement of employees also applies to Iceland, Liechtenstein and Norway, members of the European Economic Area.

Tensions between the economic and the social perceptions of free movement of workers

Although free movement is an economic, not a social concept, it creates many problems of a social nature:

- transfer of pensions and social benefits;
- entitlements of migrant workers to unemployment;
- social security and other benefits;
- family issues of education;
- housing etc.

Policy initiatives, legislative provisions and court decisions were concerned with economic and not social consequences – that is, with possible restraints on free movement and not with the social implications of free movement of workers.

Job mobility is affected by the rules governing supplementary pension schemes, which continue to pose obstacles to mobility for workers across Europe, according to two independent studies, presented by the European Commission in January 2008. The studies support the case for a Europe-wide initiative to improve people's access to supplementary pension rights when changing jobs or working in another EU country and form the background to the Commission's proposal for a directive on pension portability.

Social policy in the EU was closely connected with the mobility of labour within the common market (1957 [Treaty of Rome](#), entitled *The European Social Fund*, had as its main function “to improve employment opportunities for workers in the common market”, *Article 123, now Article 146 EC*).

Overall, the principle of free movement of workers as a founding principle of the common market had an initially dominant influence on the perception of the nature of labour regulation in the EU. In contrast, there is the much later; and potentially critical, emergence of a right to free movement of persons, as citizens of the EU (Article 18 EC). Eliminating the need for an economic justification for the right to free movement based on work, this shift to free movement of citizens has wider consequences for the initiatives and actions of EU institutions active in the field of free movement. Promoting mobility is one of the three key priorities in employment defined by the European Council (the three key priorities in employment are: maintaining employment, creating jobs and promoting mobility; upgrading skills and matching labour market needs; increasing access to employment)¹⁶².

Specific provisions in the Accession Treaty: Transitional periods

Following EU enlargement in 2004, some EU15 Member States introduced what has become known as the 2+3+2 regulation. This is essentially a transition formula which allows Member States to impose restrictions on the free movement of labour (except Malta and Cyprus). It requires Member States to indicate their intentions regarding labour mobility in 2006 and 2009 and then by 2011 to lift all restrictions.

With the accession of Bulgaria and Romania in 2007, two countries also covered by the 2+3+2 rule, access to employment can theoretically be blocked until 2014.

[Job Mobility Action Plan \(2007-2010\)](#)

[The European Job Mobility Action Plan \(2007-2010\)](#)¹⁶³ has the following aims:

¹⁶² Commission of the European Communities, Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of Regions, *A Shared Commitment For Employment*, Brussels, 3.6.2009, COM(2009) 257 final.

¹⁶³ European Commission, *Communication on Mobility. an instrument for more and better jobs: the European Job Mobility Action Plan (2007-2010)*, (COM (2007) 773 Final).

- to improve existing legislation and administrative practices regarding worker mobility;
- to ensure policy support for mobility from authorities at all levels;
- to reinforce EURES¹⁶⁴ as the one-stop instrument to facilitate mobility of workers and their families, and
- to foster awareness of the possibilities and advantages of mobility among the wider public.

The mobility of workers in Europe thus remains an important resource both in terms of employment and European competitiveness and is a central concern for Member States today. It is also central to the priorities of the 2007-2010 [Action Plan](#) and the [new phase of the Lisbon Strategy](#) (2008-2010), which aims to make the European Union the most competitive economy in the world and achieve full employment by 2010. These include numerous provisions aimed at facilitating and structuring worker mobility by providing more guarantees for both employers and employees.

The working conditions - principles in the EU are:

- non-discrimination at work on the basis of nationality;
- equivalent working conditions;
- equal treatment between persons irrespective of racial or ethnic origin ;
- equal treatment in employment and occupation (protect all Union citizens and third-country nationals and both cover ‘employment and working conditions, including dismissals and pay).

Social security provisions grant rights as similar as possible to those enjoyed by Union citizens to third-country nationals legally resident in the Community.

Europeans work abroad

Very few Europeans work abroad, EU effective mobility rate is about half that of the US. The 2007 “Mobility in Europe” study (Eurofound) concludes that:

- long distance mobility is not common:
 - only 18% of Europeans have moved outside their region;
 - only 4% have ever moved to another Member State;
 - only 3% outside the EU;
 - different Member States have different mobility intentions;
- young and educated workers are the most likely to move;
- mobility goes hand in hand with economic success.

The 2008 “Geographic mobility in the European Union: optimising its social and economic benefits” study (European Commission) confirms these data and pushes the percent of workers from the Member States of the EU who live in a different Member State from their country of origin to 1.5%.

Third-country nationals

Used in the Treaties, the term “third country“ means a country that is not a member of the EU (not party to an agreement between two other countries). This term create ambiguity also incorrectly interpreted to mean “third-world country“.

Third-country nationals tend to be disadvantaged in terms of employment, having a labour market participation rate and an employment rate lower than the figures for EU nationals (European Commission, *Employment in Europe*, 2002). Member States vary considerably in the way they conceive the integration of third-country nationals and in the extent to which they have developed and implemented integration policies.

On the one hand, the Community provides some protection to third-country nationals (for ex., entitles long-term residents to a residence permit of at least 10 years or an unlimited residence permit); on the other hand, on combating the illegal employment of third-country nationals

¹⁶⁴ EURES (European Employment Services): the European Job Mobility Portal is a network between the European Commission and the Public Employment Services of the EEA Member States.

provides for reinforcing cooperation between Member States with regard to immigration policy in respect of third countries.

CONSIDERATIONS CONCERNANT L'ASSURANCE DE LA REPRESENTATIVITE DU CITOYEN EUROPEEN DANS LA SITUATION ECONOMIQUE ACTUELLE

Timofte Claudia Simona
Université d'Oradea
Faculté de Sciences Juridiques

Ligia Valentina Mirișan
Université d'Oradea
Faculté de Sciences Juridiques

The participation of the social partners to the European governance, lately possessing a great „potential” in democratic terms, should stimulate definitively. The current experience demonstrates that the possibility to point out the benefits, but also the limits of such implication. Nevertheless it's true; the rules for such potential it should express (especially in the legislative procedure) must be consistent with the base principles of the democracy and the legitimacy for achieving the goal to represent a lot of voices.

Keywords: representativity, European citizen, social partners, sectorial associations of the commercial union.

1. Remarques introductives

La législation européenne débuta par être un ordre légal autonome par une série de traités internationales où le rôle de la Cour Européenne de Justice fut crucial pour défendre et enrichir le contexte de la société européenne. Apprécier la citoyenneté européenne dépend de considérer certains facteurs qui se trouvent dans la vie sociale qui créent l'identité européenne, de même qu'elle peut être structurée par la mettre en relation avec à la loi d'une part, et la mettre en relation avec les réalités en évolution pour devenir une citoyenneté européenne active, qui connaîtra un développement permanent, influencée par un accroissement graduel dans le statut légal.

La construction européenne connut un rythme accéléré de changement pendant les derniers vingt ans, fait qui engendra la succession de traités qui survinrent à des périodes de 5 ans: l'Acte unique européen, le Traité de Maastricht, le Traité d'Amsterdam, le Traité de Nice, le projet de traité constituant une Constitution pour l'Europe et, à présent, le Traité de Lisbonne, entré en vigueur dès le 1^{er} décembre 2009.

Regardant les objectifs du Traité de Lisbonne¹⁶⁵, il est intéressant la superposition des certains aspects de la citoyenneté qui interagissent avec la loi positive et la théorie politique pour deux motifs. Un des motifs serait sa nature, parce que les deux perspectives impliqueraient deux discours distincts qui devraient se mêler. Le traité de Lisbonne, concernant la participation directe des citoyens européens, apporte comme nouveauté leur droit à l'initiative législative. Ainsi, un million de citoyens provenant de plusieurs pays membres pourront demander à la Commission de présenter une proposition législative dans des domaines qui tiennent de la compétence de l'Union. Pour implémenter cette initiative, on a besoin d'adopter un acte législatif européen qui détaille la méthodologie d'appliquer des prévisions. Si on fait une analyse, on constate le fait que les deux visions partagent l'idée de créer la citoyenneté par intégrer et identifier le soutien légal.

¹⁶⁵ http://europa.eu/lisbon_treaty/glance/index_ro.htm.

2. Problématiques au niveau théorique et débats au niveau pratique

Les débats ininterrompus en relation avec la manque de la légitimité, la responsabilité et la transparence démocratique au niveau de l'Union Européenne, l'intensification d'un meilleur gouvernement par accroître le niveau de participation de la société civile pour son amélioration, ont été fortement soutenus parmi les citoyens, mais aussi entre les institutions de l'Union Européenne.

Le concept de «participation» se trouve au fondement de la Charte Blanche du Gouvernement¹⁶⁶, mais la Commission identifia «la transparence, la participation, la responsabilité, l'efficacité, la cohérence» comme des principes fondamentales d'un bon gouvernement. La participation de la société civile au développement du gouvernement transnational par l'intermède des organisations représentatives des intérêts sur-nationaux, fut qualifiée par la littérature de spécialité comme la solution appropriée «de connecter la société à des structures de gouvernement».¹⁶⁷ C. Sabel – M. Dorf opine que conformément au modèle proposé par la Commission Européenne—qui semble être assez pertinent de la perspective de la démocratie expérimentale¹⁶⁸—la participation à la démocratie est conçue comme le plus approprié chemin de suivre pour que la société civile arrive à influencer le gouvernement de la communauté publique.¹⁶⁹

Une fois le Traité de Lisbonne entré en vigueur, le Parlement Européen, choisi par le vote direct, aura un plus de pouvoir, donc, un plus de responsabilité, comme il jouira de nouveaux instruments pour protéger les droits et les libertés des citoyens, leur permettant de prendre part au procès politique communautaire, mais il assurera la protection des droits des parlements nationales d'élever des objections aux propositions législatives communautaires, s'ils considèrent que le principe de la subsidiarité fut enfreint.

Les groupes d'intérêt ont été en permanence présents au niveau européen en soutenant le procès d'implémentation des politiques européennes,¹⁷⁰ mais comme la Charte Blanche fait mention aussi, la recherche dans le but de trouver des «règles de participation» de la société civile au gouvernement européen se trouve encore au début.¹⁷¹

Comme exception des règles informelles mentionnées, le gouvernement européenne est présenté dans le domaine des politiques sociales de l'UE, où la participation des groupes d'intérêts comme partenaires sociales¹⁷² à la procédure d'adoption des lois fut garantie sur le plan constitutionnel (art. 138 et 139 du TCE). Comme résultat, le spectre des politiques sociales peut représenter maintenant un domaine important pour l'expérience dans l'importante recherche des nouveaux modèles de participation.

La literatura de specialité entreprend une analyse nuancée, analyse à laquelle on fait référence désormais, du mode dans lequel la problématique de la représentation des partenaires sociales au niveau de l'Union est comprise, dans le cadre plus large de l'approfondissement de son caractère démocratique. Cette analyse nous montre que, le but d'atteindre un gouvernement démocratique par l'intermède des modèles de participation peut être mis en danger si, au fondement, la

¹⁷¹ L'activité d'autres groupes d'intérêts est en effet, même plus loin conformément aux procédures informelles ou institutionnalisées au moins" (comme est le cas de la „comitologie”).

¹⁷² Cette expression fait référence, dans le jargon de la loi communautaire, aux principes organisations des unions de commerce ou des associés d'employés qui opèrent au niveau européen.

représentation des intérêts n'est pas garantie. Lorsqu'il s'agit de connecter la législation, l'encouragement du procès d'auto ajustement par les organisations privées doit être mise en relation avec le besoin fondamental de représentation des intérêts de ceux qui ne sont pas représentés par les organisations impliquées dans la procédure, et qui seront affectés par le résultat du procès législatif.

D'une perspective historique, les unions de commerce et les associations de business—aujourd'hui, explicitement prévues dans la Charte Blanche, comme des organisations qui appartiennent aux groupes d'intérêts de la société civile— ont été organisées au niveau de l'Union Européenne dès le début de la construction communautaire. Et pourtant, si au début celles-ci n'ont été impliquées qu'au niveau du lobbying, leur participation évolua peu à peu, et à présent, elles sont mentionnées au niveau des schémas institutionnels.¹⁷³

Il y eut des voix au cours du temps qui ont accusé l'Union qu'elle souffrait d'un *déficit démocratique*, manifeste par l'inapplication totale au niveau du fonctionnement de l'Union des procès spécifiques d'une démocratie. Ce déficit démocratique, on suppose, se réduit à la suite de l'entrée en vigueur du Traité de Lisbonne, qui accrût le rôle du Parlement Européen, de même que l'introduction du droit d'initiative législative des ressortissants des pays membres.

Le procès mentionné dans lequel les partenaires sociales du procès de consolidation des politiques sociales au niveau de l'UE connut une première étape au moment de l'apparition de l'Acte Unique Européen en 1986, lorsque la relevance «du dialogue social» entre les partenaires fut reconnue dans l'article 18b. Puis, en 1992, la Convention concernant les Politiques Sociales, annexée au Traité de Maastricht inventa le système de consultation et participation des partenaires sociales au procès législatif. Dernièrement, par incorporer le dessus Convention du TCE par le Traité d' Amsterdam en 1997, le procès législatif assure l'implication des partenaires sociales dans le cadre de la législation communautaire.

Le nouvel article 152 du Traité de Lisbonne mentionne que «l'Union reconnaît et promeut le rôle des partenaires sociales à son niveau, en tenant compte de la diversité des systèmes nationales. Cela facilite le dialogue, en leur respectant l'autonomie. La réunion sociale tripartite au plus haut niveau pour un croisement économique et emploi contribuent au dialogue social».

En jetant un coup d'œil plus attentif sur les règles du domaine de la représentation des intérêts, elles soulèvent des doutes sur la participation implémentée conforme à la pratique actuelle, peut accomplir l'objectif de la croissance de la légitimité démocratique dans le procès législatif.

Dans la même littérature de spécialité se montre que, les derniers amendements des Traités et l'évolution des stratégies politiques au niveau européen ont couronné le rôle majeur des partenaires sociales dans la formation des politiques sociales de l'Union Européenne.¹⁷⁴ Pourtant, l'autonomisation des acteurs sociaux du droit d'ébaucher la législation—une des fonctions principales du système politique—constitue la plus importante reconnaissance de la relevance attribuée aux acteurs de la collectivité.¹⁷⁵

Les principales caractéristiques de la procédure législative dans laquelle les partenaires sociaux sont impliqués (procédure que l'on peut définir comme un «dialogue sociale») peuvent être synthétisées: les partenaires sociaux peuvent participer au procès législatif conformément à l'article 138, par. 2 du TCE, la Commission, avant de soumettre une proposition dans le domaine des politiques sociales, doit consulter les partenaires sociaux, qui, à leur tour, peuvent émettre une opinion ou une recommandation. Après une deuxième consultation, la proposition législative suit la procédure prévue dans l'article 251, qui implique le Parlement Européen et qui va être adoptée par le Conseil, soit avec une majorité qualifiée, soit en unanimité (art. 137).

¹⁷³ M. Weiss, *The Future Role of The European Union in Social Policy* in C. Engels/M. Weiss (eds), *Labour Law and Industrial Relations at the Turn of the Century*, Den Haag 1998, S. 489.

¹⁷⁴ C. Barnard, *The Social Partners and the Governance Agenda*, *European Law Journal* 8 (1), 80-101.

¹⁷⁵ B. Bercusson, *European Labour Law*, London, Butterworths, 1996, 538-552.

La procédure législative peut avoir une deuxième alternative (art. 138 par. 4), où les partenaires sociaux deviennent des joueurs importants: à la première consultation, les partenaires sociaux peuvent informer la Commission en relation avec leur désir de faire un accord dans le but d'adopter une proposition législative. Ainsi, les partenaires sociaux rédigent une proposition législative dans 9 mois (terme qui peut être prolongé par la Commission). Si les partenaires sociaux finissent par s'entendre, (art. 139 par. 2), elle peut être implémentée soit par une décision du Conseil, soit au niveau national (conformément aux procédures des partenaires sociaux et pays membres).¹⁷⁶ Mais si, les partenaires sociaux n'arrivent pas à s'entendre en relation avec une proposition législative, on appliquera la procédure « standard », prévue dans l'art. 137. (La Commission proposera la procédure prévue dans l'art. 251). A présent, le Traité de Lisbonne entré en vigueur, on observe quand même, une amélioration au niveau du dialogue entre les partenaires sociaux, comme il résulte de l'actuel article 155 (ex. art. 139 TCE), dans le sens où les Accords signés au niveau de l'Union sont mis en application en conformité avec les procédures et les pratiques propres aux partenaires sociaux et au pays membres ou, dans les domaines subissant les prévisions de l'art. 153 (notre remarque—c'est-à-dire les domaines dans lesquels l'Union soutient et complète l'action des pays membres), sur la demande commune des parties signataires, par une décision du Conseil, à la proposition de la Commission, le Parlement Européen est informé. Le Conseil décide en unanimité dans le cas où l'accord en cause contient une ou plusieurs dispositions se référant à l'un des domaines pour lesquels il est nécessaire l'unanimité en conformité avec l'art. 153 alinéa 2.

Jusqu'à présent, le Conseil implémenta toujours les accords des partenaires sociaux par l'instrument légal de la Directive, suivant la technique des « annexes ». A cause d'une pareille procédure, l'accord—annexée à la Directive dans le texte original ébauché par les parties, produit des effets *erga omnes*, comme effet de la législation communautaire.¹⁷⁷

On reconnaît aux partenaires sociaux l'option dès que la Commission les informe sur l'intention d'agir dans le sens d'accepter la proposition de la Commission. Dans ce cas, les institutions communautaires, c'est-à-dire, le Parlement et la Commission sont exclus d'intervenir dans le procès législatif ou d'élaborer parallèlement des propositions.

A la suite de ce que l'on a présenté, on peut souligner certains aspects critiques :

- En ce qui concerne les sujets de la procédure, l'article 138 ne prévoit aucune définition des « partenaires sociaux » et aucun critère d'accès à la procédure. En ce cas, qui sont les personnes qui font les règles?
- En ce qui concerne l'exclusion du Parlement Européen, conformément à l'article 138 et 139 du TCE, en case d'intervention des partenaires sociaux, le Parlement Européen ne joue aucun rôle, n'a aucun droit, pas même celui de consultation ou d'information. Y a-t-il une conséquence de cette procédure au niveau de la légitimité démocratique?
- En ce qui concerne le contrôle institutionnel, le traité ne contient pas de clauses spéciales relativement à une éventuelle pouvoir de modifier la Commission ou le Conseil en respectant la proposition des partenaires sociaux. Dans cette situation, en quelle mesure, les institutions évoquées gardent ses pouvoirs de contrôle sur la législation proposée? Quelles sont les limites des actions des partenaires sociaux?

Parce qu'il n'y a pas une définition des « partenaires sociaux » dans les sources juridiques de l'UE, en réalité, il y a une pratique établie qui fait référence aux associations « sectorielles » des unions commerciales et organisations d'entreprise (dans le secteur du commerce industriel, etc.) et à d'autres trois organisations « intersectorielles ou trans-sectorielles » (ETUC-European Trade

¹⁷⁶ L'implémentation de l'accord par des procédures des partenaires sociaux au niveau national ne fut jamais mise en pratique, comme il n'y a pas le même système de relations industrielles dans l'Europe en mesure d'assurer une application uniforme dans tous les pays membres de l'accord adopté au niveau européen. S. Sciarra, *Collective Agreements in the Hierarchy of the European Sources*, au-dessus 11.

¹⁷⁷ Directive du Conseil 97/81/CE concernant l'accord de l'UNICE, CEEP et ETUC.

Unions Confederation, UNICE-Union of Industrial and Employers' Confederations of Europe and CEEP, European Center of Enterprises with Public Participation). Ces organisations sont présentes– du point de vue «historique»– dans le cadre de la Communauté Européenne. Toutefois, à partir du phénomène de reconnaissance du «dialogue social» à travers l'Acte Unique Européen (1986), ETUC, UNICE și CEEP sont devenues les principaux interlocuteurs des institutions européennes. ETUC, UNICE et CEEP réalisent la liaison avec d'autres agents collectifs– des représentants des travailleurs et du management au niveau national¹⁷⁸.

Quant à ce sujet, on doit préciser les suivantes choses :

- il y a encore des problèmes de coordination importants et de représentation entre le niveau national des associations et le niveau européen des organisations. Les actants du niveau européen sont impliqués dans l'élaboration de leurs règles internes, en leur manquant tout mandat d'agir comme des opérateurs de transaction à l'appui des associations nationales qu'ils représentent;

- il y a un lien relativement faible entre le niveau européen des organisations et leur action, à savoir les employés pris individuellement. Les associations du niveau européen constituent le point de lien entre les confédérations comprenant d'habitude des fédérations. Finalement, on peut observer que le bénéficiaire de l'accord ou de la mesure législative (l'employé) n'a aucun mandat pour pouvoir négocier avec les organisations européennes. Pour cette raison, la conclusion– que ETUC, UNICE, CEEP peuvent au moins être des organisations représentatives, mais pas pour la majorité des employés au niveau européen– est bien justifiée;

- le déficit de représentativité du travail et des associations d'entreprise au niveau national, à cause des quelques membres des deux parties. Il est évident que quels que soient les accords signés par des partenaires sociaux européens, ceux-ci sont valables seulement pour une partie des employés, à savoir ceux qui sont impliqués dans ce procès.

Concernant ces observations, la littérature de spécialité met en discussion le problème de la *représentativité des partenaires sociaux: la perspective de la Commission Européenne et du Tribunal de Première Instance* ont exprimé des certaines réticences vis-à-vis de la procédure législative en question.

Si l'on poursuit l'Accord sur les Politiques Sociales du 1992 et on se rapporte au droit de consultation pour les partenaires sociaux, on va constater qu'en décembre 1993, la Commission a établi trois critères de sélection pour pouvoir faire partie de la catégorie des «partenaires sociaux»¹⁷⁹. En plus, la Commission a souligné le fait que les critères de sélection sont applicables seulement dans le cas des consultations des partenaires sociaux, car on leur applique le principe de la reconnaissance s'ils se décident d'entamer des négociations en vue de conclure un accord. Ensuite, la Commission a rédigé une liste avec les organisations, attachée à la même communication, liste qui est réactualisée presque chaque année.¹⁸⁰

Cette formulation a conduit à des critiques considérables à cause des critères de sélection, des critères qui n'avaient rien à voir avec une «réelle» représentativité. Comme résultat, le Parlement Européen a conseillé de faire réviser les critères de représentation, en suggérant que les organisations devraient recevoir un mandat réel de la part des membres, afin de pouvoir agir comme des actants représentatifs dans la procédure du dialogue social¹⁸¹. Même jusqu'à présent de telles modifications n'ont pas été entreprises.

¹⁷⁸ Sujet prévu dans l'article 5 de la Convention ILO n° 87, du 9 juillet 1948, où l'on précise que « les organisations de travailleurs et management ont le droit d'établir et devenir membres des fédérations et confédérations; toute organisation, fédération ou confédération a le droit de devenir membre d'une organisation internationale d'employés ou employeurs ».

¹⁷⁹ Communication de la part de la Commission en ce qui concerne la Mise en pratique de l'Accord sur les Politiques Sociales [COM (93)600 final].

¹⁸⁰ Report on the representativeness of European social partner organizations, European Commission, Brussels, September, 1999.

¹⁸¹ La Proposition du Parlement Européen a été signalée dans la Communication de la Commission Européenne, The Future of Social Dialogue at European level [COM (93)448 final].

Les partenaires sociaux participant aux négociations des accords qui ont mené à l'implémentation des Directives du Conseil ont été ETUC, UNICE et CEEP, pendant que d'autres organisations n'ont pas été admises dans la liste de la Commission pour des négociations. À cause de cela, l'entier système a été saisi au Tribunal de la Première Instance.

Le Tribunal a affirmé qu'une organisation privée ne peut invoquer devant les institutions communautaires aucun droit de participation aux négociations pour arriver à un accord, parce que cela est une «affaire exclusive» réservée aux partenaires sociaux. Quand même, le droit de recours devant l'Instance, pour raison d'exclusion, est admissible seulement si l'on démontre qu'il y a une «représentation insuffisante» des partenaires sociaux. Le concept de «représentativité cumulative suffisante» est présenté par le Tribunal, en faisant référence à la représentativité des toutes les parties signataires, prises ensemble, en respectant le contenu de l'accord¹⁸².

3. Conclusions

Le moment où les partenaires sociaux demandent l'implémentation législative d'un accord, la Commission «après avoir résumé le contrôle de la procédure» a le devoir «d'examiner la représentativité des signataires de l'accord en question».

Malgré cela, la résolution du Tribunal de Première Instance n'a pas clarifié les incertitudes pertinentes concernant encore le «dogme» de la représentativité.

Le paradigme d'accepter le fonctionnement de la représentation des intérêts dans les politiques débattues constitue la principale caractéristique du système corporatiste. Tandis que le lobby est perçu comme un mécanisme des articulations d'intérêts dans un système basé sur une compétition ouverte, du point de vue corporatiste, l'insertion de la participation à la décision publique en étant réalisée à travers un petit nombre d'intérêts des associations.

On considère avec justesse que, jusqu'à une certaine extension, l'incorporation des intérêts, représentés par les organisations de travail, sont familières aux traditions des certains Etats membres où les modèles corporatistes ont été pleinement implémentés dans les années 1970. Quand même, la redécouverte—au niveau macro ou triparti—de la concentration au niveau national des dernières années, a déterminé le relancement des théories corporatistes et l'apparition aussi d'une littérature concernant ce phénomène.

Pour le futur de l'Union Européenne, la réalité de l'existence de 27 Etats membres a exigé une solution pour la réforme de l'Union, et le Traité de Lisbonne pourrait être le médicament pour une Union qui tend à s'étouffer à cause de son propre succès, mais, pour l'instant, il est trop vite d'attribuer au nouveau traité des mérites qui pourront être observés au long du temps.

THE WESTERN BALKANS - THE WAY TOWARDS THE ADHERENCE TO THE EUROPEAN UNION

Tiri Edvana

West University of Timișoara

Pipa Donila

West University of Timișoara

Fejzulla Erion

European Assistance Mission to the Albanian Justice System (EURALIUS II)

Through this essay we will try to analyze the situation of Western Balkan, comparative aspects of macroeconomic indicator and the possibility for the adherence to the European Union.

Keywords: Western Balkans, candidate states, potential candidates, adherence, crisis

Introduction

The Western Balkans have in their geographical structure seven states: Albania, Croatia, Serbia, Montenegro, Bosnia-Herzegovina and Kosovo - the youngest state of the world at this moment. The Western Balkans' History is sprinkled with repressions and massacres on behalf of different empires: there was also a civil war that affected this geographical region. As a result, the Balkan States can hardly live in peace and harmony, so a quick integration of them into N.A.T.O. and E.U. would change the Balkan States' mentalities in order to transform them into members with complete rights of those two associations. We will present the two sides of the situation: on one hand, we have the countries in the East and Central Europe, which accomplished in 2004 the conditions to adhere to the European Union - we have to specify here Romania and Bulgaria, which became members of the E.U. on January the 1st 2007; on the other hand, we have Croatia and Serbia, which had a higher level of livelihood than the other countries in the structure of the Western Balkans - these states ought to have become members of the E.U. in the same time as the other two states mentioned above, but Croatia and Serbia continued to fight one against the other, fact that also decreased their economy. These two last states have hardly become members of N.A.T.O. on April the 4th 2009, but they continue their attempts and reforms in order to become members of the European Union.

1.Candidate states

The candidate states for the European Union are: Croatia, Turkey and the Ex-Yugoslav Republic of Macedonia.

The opinions of the E.U. countries are divided concerning a new extension of E.U. for instance, Markel Angela, the German chancellor, proposes during the Meeting of the Ministries of Foreign Affairs at Prague (the headquarters of the Presidency of European Union in the year 2009) that EU should *press the stand-by button* referring to the extension of its limits. The source cited is an article published on September the 30th 2009, article in which the German chancellor also mentions that she believes only in the integration of Croatia in the near future and in the stoppage of the extension process. She also affirms that the Treaty at Lisbon should be ratified before E.U. being able to extend more its limits.

Contrary, the Swedish Ministry of Foreign Affairs (Sweden is the country which will assume the E.U. presidency on June 2009), Carl Bildt, warned that *the crush of the Balkan countries' aspirations to the adherence to E.U. will have devastating consequences* because the Balkans are contained in Europe, so this part of Europe should be also contained in E.U.

Croatia

In comparison with the situation of Turkey, Croatia is more favoured to become a member of E.U. because it is sustained by more states members of E.U. Croatia is also thought the only state which can adhere to E.U. in the year 2011. The last opponent to the adherence to E.U. of this country is Slovenia, state that continues a territorial dispute for many years with Croatia. As a result, N.A.T.O. and E.U. decided that both countries should adopt a *constructive* approach in order to solve this problem at least after the integration of Croatia into N.A.T.O. (April the 4th 2009).

The Ex- Yugoslav Republic of Macedonia (FYROM)

Macedonia has made progress lately regarding the reforms in the judicial system, has accomplished its obligations foreseen in A.S.A. and has progressed in its fight against corruption, in improving the reform of the public administration, in stimulating people to occupy a job and to distribute efficiently the manpower. This state continues to strengthen the multiethnic democracy by applying the rules taken to the Agreement at Ohrid, in 2001, when it was accepted the usage of Albanian language in those cities and countries in which the Albanian population predominates. As a consequence, in few Macedonian cities have been opened schools and universities having Albanian as official language and two Albanian parties are in coalition with the Macedonian Party that governs.

2. Potential candidates for the EU:

Albania

The European Commission President, Romano Prodi, declared at Tirana, that the negotiations for the accession of [Albania](#) to the [European Union](#) could begin in March 2002, but due to the political instability of the country the negotiations have been postponed. The internal crisis of the government Socialist Party had negative consequences on the discussions for the [Stabilization and Association Agreement](#). However, the Council has accepted the necessary directives to start the SAA negotiations in the Luxembourg Meeting in October 2002 and negotiations were officially opened in on January 31, 2003.

On April 1st, 2009 the 27 EU Member States have ratified the Stabilization and Association Agreement for Albania, a huge step for the country in her mission for reform and accession to EU, but the official application submitted on 28 April 2009 in Hague was considered to be anticipated.

What were the reasons to consider Albania's application anticipated?

- First of all, Europe was facing the parliamentary elections.
- The global economical crisis was a recent challenge in every country

After Romania and Bulgaria had adhered in 2007 without fulfilling all the conditions needed, the European Union was not ready for another EU enlargement. The Lisbon Agreement was in session representing another reason for the postponement.

In a November report the Commission concluded that Albania needs to make progress in terms of state administration and courts, but also as in terms of organized crime and corruption.

In conclusion, the elections are expected to bring changes in politicians' mentality, in order to turn Albania into a powerful democracy and to enhance the chances to become a member of the EU.

Montenegro

In 2006, through a national referendum, Montenegro proclaimed its independence towards Serbia. In order to be seen as a serious candidate for accession the country must continue to

reform its judiciary sector, the weaknesses in this field representing a strong reason for Germany to come out against its application.

It is noticeable the weariness of the European Parliament members regarding a new wave of enlargement so these Western Balkans states have to work hard in the direction of their acceptance in the EU, their future depending on their return to Europe.

Bosnia-Herzegovina

Bosnia-Herzegovina must reach a necessary political consensus and to continue its reforms, while Kosovo, the newest state in the Western Balkans, which finds itself in the main stages of integration in the EU, has been accepted as a FMN Member State in April 2009, and after 2 months as a member of the World Bank. Kosovo cannot be accepted as a member of the European Bank because its independence is not yet recognized by 4 EU Member States, as Serbia's acceptance is blocked by the Netherlands and who must cooperate with the International Criminal Court for the handing over of the war criminal Ratko Mladić and at the same time must recognize the independence of Kosovo.

3.Comparative aspects of GDP and GDP per capita for the Western Balkans countries.

States		1999	2003	2006	2008	2009
Albania	GDP in US\$	2199 (95)	3146 (99)	7145 (04)	8532 (05)	9273 (06)
	GDP/capita in US\$	670 (95)	930 (99)	1918 (04)	2899 (06)	3354 (07)
Croatia	GDP in US\$	15508 (95)	20222 (99)	31343 (04)	36230 (05)	41542 (06)
	GDP/capita in US\$	3250 (95)	4530 (99)	5440 (04)	9558 (06)	11576 (07)
Macedonia	GDP in US\$	1813 (95)	3348 (99)	4672 (03)	5711 (05)	6214 (06)
	GDP/capita in US\$	860 (95)	1660 (99)	2248 (04)	3059 (06)	3659 (07)
Serbia	GDP in US\$	15910 (95)	13742 (98)	20492 (03)	25747 (05)	31594 (06)
	GDP/capita in US\$	1510 (95)	1289 (98)	2626 (04)	4220 (06)	5596 (07)
B&H	GDP in US\$	5900 (92)	4706 (99)	8446 (04)	9568 (05)	12815 (06)
	GDP/capita in US\$	1500 (92)	1210 (99)	1883 (04)	2533 (06)	3712 (07)
Montenegro	GDP in US\$	–	–	–	2042 (05)	2462 (06)
	GDP/capita in US\$	–	–	–	3310 (05)	3745 (06)
Kosovo	GDP in US\$	–	–	–	–	–
	GDP/capita in US\$	–	–	–	–	–
Slovenia	GDP in US\$	16328 (95)	19862 (99)	27671 (03)	34146 (05)	36715 (06)

	GDP/capita in US\$	8200 (05)	10000 (99)	15214 (03)	18610 (06)	22933 (07)
Romania	GDP in US\$	33488 (95)	33034 (99)	59694 (03)	97660 (05)	118370 (06)
	GDP/capita in US\$	1480 (95)	1470 (99)	2535 (04)	5633 (06)	7697 (07)
Bulgaria	GDP in US\$	11225 (95)	11572 (99)	23142 (04)	26960 (05)	31469 (06)
	GDP/capita in US\$	1330 (95)	1410 (99)	2347 (04)	3995 (06)	5186 (07)

Source: Istituto Geografico De Agostini Novara, *CALENDARIO ATLANTE DE AGOSTINI*, 1999, 2003, 2006, 2008, 2009

Taking into account the macroeconomic indicators, the GDP and the GDP per capita in the table No 1 we see an economic backwardness of the Western Balkans countries due to the wars and conflicts between them compared with 2 states of Eastern and Central Europe. An example could be Slovenia a country with a homogeneous population of 1.9 million inhabitants situated in Central Europe between the Alps of Austria and Italy. The wars held in 1991 against Bosnia Herzegovina brought her and its neighbours besides bombs and death, economic destruction. Due to the war, the GDP was lower compared to the one of Romania, but the GDP per capita was higher and the incomes were bigger compared with Romania and Bulgaria.

Analyzing the period 1999-2006 an increase of both macroeconomic indicators can be noticed. That's one of the main reasons why Slovenia and 9 other countries in the Eastern and Central Europe applied to join the EU.

On January 1st, 2007 both Romania and Bulgaria became Members of the European Union. Romania compared to Bulgaria is better situated economically speaking with a higher GDP indicator, but the difference in the case of the GDP per capita is remarkably smaller. The situation is highly different for Croatia, who, after the amnesty between Croatia and Bosnia and Herzegovina settled in 1995 at the Conference in Dejton, registers an important increase of the GDP per capita indicator compared to Romania. This represented a certain proof that, after the death of President Tudjman, Croatia began to meet the necessary conditions to join the EU, conditions that brought her the accession to NATO on April 4, 2009.

Romania in comparison with Serbia is better situated for both indicators: GDP and GDP per capita. The situation can be explained by the fact that after the war between Croatia and Bosnia Herzegovina, Serbia continued a policy based on violence and pressure against the Albanian population in Kosovo. That was also the reason why Serbia was not accepted in NATO and did not sign an MSA. In addition Serbia is not ready yet to satisfy one of the main conditions: to recognize Kosovo's independence.

Comparing 3 more regressed economically speaking states from the Western Balkans Albania, Macedonia and Bosnia Herzegovina, it can be noticed that regarding their GDP's Albania is superior to Macedonia and inferior to Bosnia Herzegovina and in the case of its GDP per capita Albania is inferior to both countries above mentioned. Macedonia's GDP is higher than the one of Bosnia Herzegovina their GDP's per capita being approximately at the same level.

Albania after the political disaster of 1997 registered small successes in its way to become a European Union member: its economic indicators have increased after 2005, the country became politically stable, reforms have been undertaken since 2006, the elections were free and their result was accepted by the EU, the SAA was signed and ratified on the 1st of April 2009 by the 27 EU Member States and on April 4 the country joined NATO along with Croatia. These successes were regarded as challenges but also as opportunities to accede to EU and determined the country to continue to fulfill the Copenhagen criteria, as its only chance to join the European family. The

“Adriatic 3” Charter (between Albania, Croatia and Macedonia) settled the candidature of these 3 countries for NATO, but Greece with its veto-right solicited that the name of the Macedonia Republic be changed. Nikola Gruevski, prime-minister of Macedonia turned down the request without reaching to a consensus with Greece, resulting to the rejection of Macedonia’s application to join NATO and the country’s inability to participate to the “Bucharest Summit” in 2008. But “NATO’s doors remain open for Macedonia” as stated by George Bush, Former-President of USA.

4. Do you think that Albania is crossing a crisis period?

Do you think that Albania is crossing a crisis period?

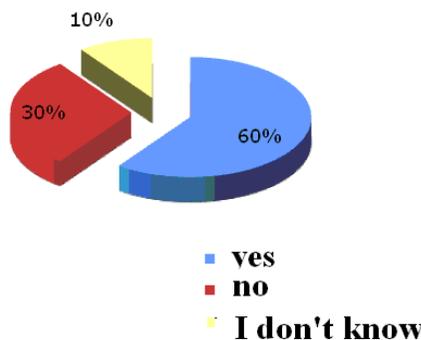

Chart no.1. Do you think that Albania is crossing a crisis period?

As we see from *Chart no.1*. 60% of those questioned believe that Albania is crossing a crisis period; some claimed that it’s been in a crisis for over 10 years, others for over 19 years, some said that the crisis is felt in every sector of life, others stated that the country is in a crisis because the crisis is a global phenomenon now, even in EU, a crisis characterised by the prices increase without increasing the wages, low purchasing and low national currency power. They expressed the hope that a good politic of government and the reforms are the solutions to surpass the crisis period.

30% of respondents said that Albania is not crossing a crisis period because it registers the highest economic growth in the region, and as Albania is mostly agrarian it is not affected by the global crisis.

Only 10% believe that Albania is partly confronting a crisis because it is a country without scholarship and it doesn’t register a great economic development, that the crisis is not felt as much as it is felt in other countries. Other persons claimed that Albania is crossing a crisis period but is fighting against it and that overcrossing the crisis or not depends in Albania on the moment and on the July free elections.

Conclusions

In conclusion, as stated by the Former-President of the European Commission, Jaques Delors “EU Members need time, family spirit, mutual understanding of the others’ traditions and psychology, in order to consolidate the Union”.

The extension towards the Western Balkans countries serves the interest of the EU, otherwise not being possible to maintain the peace, the stability and the security and to prevent the conflicts in the area. The non-acceptance of these countries in the EU would have global consequences, because if one's looking back in history can notice that the Balkans conflicts and wars brought economic crisis, loss of human lifes, damage and higher costs to rebuild those countries.

**SUB-SECTION: EU SUSTAINABLE ECONOMIC DEVELOPMENT AND
COMPETITIVENESS**

INNOVATION – THE CORNERSTONE OF ECONOMIC SUCCESS AT EUROPEAN LEVEL

Hristea Anca Maria

Academy of Economic Studies Bucharest

Faculty of Accounting and Management Information Systems

In a world that is in a permanent change, in which the interdependencies between the states are more and more obvious and the rivalry and the inequalities between the nations deepen, one of the main objectives of the actual era wishes to be the growth of the competitiveness and innovation degree at a microeconomic level and at a regional and international level. The innovation process means the conversion of new knowledge into economic and social benefits, as a result of some complex interactions between numerous actors in a system that is formed of an environment (local, regional and national) that has productive firms, research institutes, and networks through which all these come into contact.

Keywords: region, innovation, rivalry, methodology, diagnosis, evaluation.

JEL classification: A,F,G, H,R

1. Globalisation – a game with a positive sum?

The globalisation of the economies accentuated the rivalry between territories, states and regions. The geo-economical shiftings recorded in the last years, the delocalisation and relocalisation of the activities can be found in a redistribution of the economic actors on the rivalry scene and even more, in a deepening of the differences between the rich and the poor states. The world leaders as the USA and Japan have to face a strong rivalry in the innovation field from states that a few decades ago were used as cheap work force. The technology transfer from the rich countries to such countries represented eventually the launching stone to the new world that seem to appear. If in 1990 the production of high technology of China was less than 10% of the production of the USA, in 2000 it comes to about half it.

Some authors believe that the great world platforms of innovation must adapt really quickly and they must discover new breaches in order to fight the new big demographic powers – China, India or Brazil – that have the potential to develop in all the fields. The particular character of the economical growth without precedent of some countries as China or India make that on the medium term to see changes in the international environment and the developed countries as the USA and numerous European countries to be threatened by the Asian tigers. The importance of the “reserve troops” that is the human resource, respectively the hundreds of millions of Chinese and Indians that are capable to adapt to change and to reach a high degree of education is obvious. The rise of the efficacy in the two states and the orientation towards technological innovation generates advantages that can be compared and emphasized by the Ricardian theory in the fight of the entities for supremacy.

Starting from this reasons the European states consider it to be crucial the problem that refers to the definition and the putting into practice of a effective collective strategies, that limits these shiftings and that will support Europe in improving its position on the world market in this field. Economic rivalry represents today the base of a “permanent war of the shiftings” and no leader position can be considered sure and durable. Today’s winners can become tomorrow’s losers. Innovation is considered to be the key to prosperity for the enterprises and the geographical territories.

2. Stimulating creativity and innovation at European level

The new tendencies at world level aim at the involvement in a big measure of the scientific potential in all the productive fields. In this context the Operational Programms 2007-2013 regarding the Structural European Funds have as a priority the innovation's development according to the Lisbon Strategy. These represent a special opportunity that aims to stimulate technological and non-technological innovation in enterprises and the territorial diagnosis analysis have the role to determine the regional potential of innovation, the way and the importance of the public financing, national and communitary, that one has as his disposal. In one of her speeches Danuta Hubner, the European Commissary for the Problems of Regional Policy, said that regional strategies must favour the investements in the field of the research and techonological development, of innovation, of the human capital and of the entrepreneurial spirit and to analyse the extent to which these investments answer to the specific needs of economical development of each region.

The communitary strategic orientations that the European Council adopted in October 2006 regarding the innovation and the research offers to the cohesion policy a double role: on the one hand it has to support the regions in the putting into practice of the action plans and of the regional innovation strategies that aim at the growth of the rivalry of the invoolved entities and of the European Union, as a whole. On the other hand it has to contribute at the growth of the capacity of scientific research and innovation in the region up to a level that will allow the participation to the transnational projects of research.

The international studies have shown that the density and the vitality of the local networks of knowledge contribute in a significant manner to the dynamism and the competitiveness of the enterprises and that they give an essential role to the local policies and especially to the regional ones of economical development. From the research made the author of the present paper noticed that the regional authorities, especially the ones from Romania, need a very sophisticated and permanent diagnosis of the mechanisms that set into motion the "regional innovation machine" with the purpose to focus the efforts on the incontestable priorities that create richness. The durable development through innovation is based on the intensification of the regional activity for the business environement, through the attraction of talents and the development of the access to knowledge and opportunities. More attention should be given to the regional keeping and improving the human capital, to promoting the cooperation between companies, to the facilitation of the harmonization of knowledge with the international market and to supporting the obtaining of the intellectual property rights. For the stimulation of the rivalry of the economical regional system one will have in mind the diminishing of the significant technological difference by facilitating the acquisition of equipment, technology and services. Regarding the educational system we have in mind the development of doctorate and post-doctorate programms made in association with the business environement.

The regions are often the managers of some global subventions made in the regional rivalry and the occupation of the work force programms. In this context, the European Comission emphasises the fact that during the 2007-2013 programms the made diagnosis should focus on the strong and weak points of the teritories from the point of view of innovation so that the consolidation of an effective innovation strategy is reached, a strategy that is pertinent in connection to the European stakes.

The scientific approach that is intended towards the making of an informatic model of evaluating the innovation degree at a regional level wants to give for the regional managers and to the research and education specialists a robust methodology of teritorial diagnosis and of innovative management.

A recent study made at European level show that Europe started to catch up with difference that separates it from its main rivals, USA and Japan, at performance level into the innovation field. The first place goes to Switzerland, followed by Sweden, Finland, Germany, Denmark and The

United Kingdom. All these six countries are situated better than other European states and than the UE, as a whole. We must notice that the new states that became members recorded the biggest success, especially Cyprus, Romania and Bulgaria, although their performances are below the European average. The tendencies are emphasised by the dashboard of European innovation for 2008. In the 8th edition of the report published by the European Innovation Scoreboard, that appeared in January 2009, made by Maastricht Economic and Social Research and Training Centre on Innovation and Technology, was measured the performance of the states that are members of the European Union under the innovation aspect. According to this publication, the differences of performance in innovation divide the UE countries into 4 groups:

- *Group 1.* Switzerland, Sweden, Finland, Germany, Denmark and The United Kingdom – the leaders when it comes to innovation, with performances that are high above the UE average;
- *Group 2.* Austria, Ireland, Luxembourg, Belgium, France that are on the second place, with performances that are above the average of the UE;
- *Group 3.* Cyprus, Iceland, Estonia, Slovenia, Czech Republic, Norway, Spain, Portugal, Greece, Italy, that are considered to be moderate innovators, with performances regarding the innovation under the UE average;
- *Group 4.* Malta, Hungary, Slovakia, Poland, Lithuania, Croatia, Romania, Latvia, Bulgaria, Turkey are the countries that are about to make up the differences, with performances regarding the innovation that are very low in connection to the UE average. Bulgaria and Romania are the countries that have the fastest rhythm of improving their performances.

Created on the data that existed before the start of the economic crisis the study uses 29 indicators for evaluating the level of innovation of a country. Innovation is considered to be the main factor for the stimulation of the the economical growth and the main way in which we can prevent some risks – for example the changes of the climate. Among the indicators we can find the popularity of the scientific and technical studies made by the universities, the number of patents, the rising of the funds given to the research, the availability of the risk capital for the new companies and the share that the exports of high technology have. The situation from the UE has evolved a lot in the past 5 years. Although it is still behind the USA and Japan, the differences tend to diminish from year to year. It is also situated pretty well compared to the emergent economies as China, India and Brazil. Yes it also has weak points. UE is behind the USA especially in the field of investments, and it is behind Japan regarding innovation in research-development and the information technology. In the same measure the companies from the UE spend less on non-technological innovations, as professional training, design and marketing, although they are essential elements for maintaining the competitiveness. The study was published in the same time with a report regarding the UE's performances in research-development and of the efforts to create an European research space. It indicates the fact that the number of the researchers from Europe is increasing and that the UE becomes more and more attractive for foreign researchers and for private American investments in this field. The study also shows that the funds given to the research-development stayed at 1,84% of the PIB, less than the objective of 3% that was established in the UE. The objective of 2009 is to promote creativity and innovation capacity. This aspect is in accordance with the Communication of the Commission "A comprehensive strategy regarding the innovation in the UE" that says that "without education as a central policy, innovation will stand alone. It has to promote talent and creativity from the beginning." The European Year of Creativity and Innovation has as its main target the awareness of the importance of creativity and innovation for the personal, social and economical development; the spreading of the best practices to stimulate education and research. Creativity and innovation contribute to the economical prosperity and to the individual and social welfare.

3. The contribution of the Economic-financial Analysis to the making of models of determination of the innovation degree

Promoting the stipulations of the Lisbon Strategy, Romanian education, as we know it today, is going through a stage of transformation, that is oriented towards the society that is based on knowledge and innovation. 2007 represented the beginning of the efforts of orientating the national policy towards the development of knowledge on durable criteria, in close connection with the European objectives for this matter. The triade education – research – business environment has become the corollary of the professional formation of the European citizen. In this context the Romanian institutions – public, private or business environments – build their development strategies on the performance and competitiveness criteria. More than before innovation is the supreme condition in establishing the comparative advantage on a global level. One can notice that Romania started this approach from an underprivileged position. Although the efforts are obvious, under an institutional aspect and under financial aspect as well, as the last statistic data show, from the point of view of innovation Romania is situated (European Innovation Scoreboard) among the last three states members of the UE. Compared to the developed countries, Romanian economic agents are still putting the research-innovation chapter on the last place when it comes to giving money. If in the developed countries the noncorporate credits have important values in the total of the given resources, in Romania the focus is placed on the productive-material aspect. Because the evaluation of the innovation degree at the economical agents level was not a real issue up to now, being a new field, in the last three years efforts have been made to identify and select the measurement indicators. At a regional and national level the demand is higher, because the diagnosis of the innovation degree is made through the centralization of the data from the territories.

Integrative part in this determination process, on scientific criteria of the contribution brought to the Romanian people at the development of the society based on knowledge, is the scientific activity of the Economico-financial Analysis Department. In the last years, the majority of the department's members are included into the National Plan for Research, Development and Innovation – PN II through two projects, from Programme 4 – Partnerships in priority filed:

- INNOINDEX – informatic model and programme to determine the innovation degree of the IMM – term 2007-2010;
- INNOREG – Informatic programme and model to determine the innovation degree at the development regions – term 2008-2011

The author of the present paper is ASE principal in the second partnership project “Informatic model and programme to determine the innovation degree at the level of the development regions” (The Academy of Economical Studies is one of the eight partners), the coordinator being IRECSO. The role of the Economico-financial Analysis in the evaluation of the innovation degree is decisive because:

- any indicator of measuring the innovation must be interpreted and understood under the aspect of content;
- the evaluation of the results at IMM level or region is made by interpretations on the comparisons in time or space.

In the diagnosis analysis of the innovation degree are identified through a multitude of methods that can be applied, but selection imposes scientific argumentation; in the determination of a refined model of evaluation of the innovation degree, the role of the analyst is as important as the role of the statistician, because, in theory, the model will be established on the base of identification of a score function; it results that from the total of the researched indicators only a small number will be taken into account, according to relevance. The final interpretation of the results of the research will be made with the help of the financial analyst.

The regional, national and international diagnosis analysis means the identification of the strong and weak points of the innovation process, it has to be methodical and to exceed the mere enumeration of the general statistical elements (staff, added value, investments, research expenses,

number of patents) or of the list of universities, research centres, incubators, without being accompanied by commentaries that are argued or scientifically based.

The conclusions that were drawn after the analysis of an area must be completed by the diagnosis of the global stakes that are characteristic of the region, through an examination of the microeconomic dynamism of the innovation systems actors, by the appreciation of their capacity to generate knowledge and to transform them into new products or services, or in “business models” (innovative), by evaluating the access to capital.

The representatives of the scientific world believe that in the modern economy the traditional advantages represented by the natural resources or by the geographical position are not the only solution for diminishing costs. The key factors of prosperity can also be the access to knowledge, talent and creativity. Innovation is a multiform process with multiple causes, as J. Schumpeter described it in his studies regarding the approach of the new combinations of production factors and their role in the economical evolution.

Innovation means, in the opinion of OCDE, the introduction on the market of a new product (thing or service) or that is changed under the aspect of its fundamental characteristics, of technical, logistic, material or immaterial nature, that can respond to the destination it was made for. Starting from this concept one can say that innovation is not a simple and obvious process and that it means the conjoined efforts of some persons, teams, institutions, that often are not in the same location. Innovation is first of all a business of the entrepreneurs, but the big organisations, the regional environment that stimulates creativity, research and innovation has a central part in creating wealth for the a nation. The regions and the vitality of the ecosystems play a determinant role in creating new value. The possibility to come into direct, informal and repeated contact with an important number of “producers of knowledge”, researchers, university professors, financial agencies allow each firm to benefit from a positive “externality”.

The most used referene today is that of the **regional innovation systems**, that are in the opinion of the specialists, a method to describe an ensemble of actors and institutions for which mutual relationships are decisive for the good functioning of the ensemble. Such a system allows the optimization of the transfers of competences and the collaboration among different actors of regional development.

The diagnosis analysis in the field of innovation at a regional level has to have three main components:

- the analysis of the global components based on the indicators of economic activity and of the innovation potential;
- the analysis of the actors and of the networks of the regional system of innovation;
- the description of the functioning of the government process of innovation and of determining the strategic priorities.
- From the studied bibliography, we can draw some conclusions regarding the position of the innovation in a strategic plan:
 - Innovation is a challenge and a reality of the contemporary world.
 - Most of the developed countries invest in innovation in the last years under all its forms.
 - There is not a unique methodology of diagnosis analysis at regional level.
 - The indicators of the evaluation of the degree of innovation are numerous and they are approached slightly different from one country to another.
 - The innovation degree is more important at the level of the activity clusters.
 - The role of the regional and research institutions is significant in developing innovation.
 - The analysis of the innovation degree is insignificant if we do not compare it with other regions.
 - The degree of innovation means an indistructable relationship between state-industry – science.
 - The qualitative analysis has an essential role in researching the studied phenomenon.

- The migration of the Romanian workforce towards Occident affects on medium and long term the performances of the country.
- Innovation determines the rise of the work productivity and the emergence of new professions, but it can diminish the degree of occupation in the fields with the highest degree of innovation.
- A negative natural output affect a people's creativity.
- The constant training and formation of the employees can be found in the rise of the innovation degree.

THE DIAGNOSIS ANALYSIS OF REGIONAL INNOVATION - APPROACHES AND OPINION

Hristea Anca Maria

Academy of Economic Studies Bucharest

Faculty of Accounting and Management Information Systems

The communitary strategic orientations that the European institutions promoted since October 2006 have at their base the fact that research and innovation have a direct contribution at the prosperity and the welfare of the individual and of the community. The main objective of the research and technological development policy promoted by the European Union is that in the following years this regional group to become the most competitive economy based on knowledge in the world. The studies have shown that the density of the local networks of knowledge and their degree of involvement in the making of a plus of wealth in the region could have a decisive contribution at the dynamism and the competitiveness of the enterprises, of the business environment, in general.

Keywords: region, innovation, strategy, methodology, diagnosis, analysis.

JEL classification: A, F,G, H, R

The promotion of the innovation policy at a regional level imposes a permanent diagnosis of the mechanisms of carrying out the system of regional innovation in such a manner that the efforts are focused on the incontestable priorities, that are the makers of added value and that we should give up the effort to decypher the meaningless details that lead to no future effects.

In the European programmes of rising the competitiveness at a regional level and of occupying the work force the regions are often the managers of a global subvention for whose use the European Commission recommends the making of diagnoses that emphasises the strong and the weak points of the territories through the perspective of the innovation so that the consolidation of some effective innovative strategies is reached in connection to the European stakes.

Romanian projects regarding the regional innovation through the scientific approach that they have in mind try to give the local managers and to the specialists from research, education, a robust methodology of territorial diagnosis and the instruments necessary for steering and innovative management.

1. The systemic approach, creative concept of innovation

In literature it is shown that *knowledge networks* represent a collective factor of economic performance and one of the most important axes of the modern politics of innovation. The notion of “society based on knowledge” has become in the last years a concept that is common to all the states that are members of the European Union. Each economic agent, manager, researcher or employee comes into contact with numerous entities in the sphere of his own unit or in other units that are situated in the same geographical area or in other regions/ countries. From the experience of the developed countries it was noticed that the efficacy and the productivity of each economic agent depends largely on the number and intensity of these connections that become more efficient when the geographical proximity is higher; because of this one of the main objectives of the European communitary politics is the development of innovation at a regional level. Frequently, the utility and the clarity of the scientific information is lost when their transmission is not made directly, through dialog, but by using informatic techniques of communication, because either the message or its content is altered. For this reason, in the making and following the putting into practice of some innovative projects the meetings “face to

face” are preferred. Innovation is an interactive process. For this purpose, the production of knowledge is necessary, but not sufficient for innovation, it creates potential that has meaning only if it exists as final demand. The production of knowledge must be capitalized through the constant interaction between producers, entrepreneurs, users or intermediaries of knowledge and the public institutions.

The fundamental role of knowledge when we talk about societies, institutions of higher education and research can be described through the image of “triple helix” (science – industry, industry – state, state – science) that is perceived as being the DNA of the economic tissue and of innovation. According to the circumstances, the universities, the industries and the public organisms can play different roles in the innovation process, around the three great actors, science – state – industry, gravitates a large variety of institutional networks. The collective decisions are the result of the complex institutional arrangements between local and national partners, in which the public collectivities play a dominant influence.

A frequent phenomenon that we can find in the modern democracies is the plurality of actors in making the politics of regional innovation. Many times they are situated on rival positions. This is why a correct institutional government of the innovation process means the creation of an equilibrium between the autonomy, cooperation and rivalry of the actors involved. In order to assure the development on the long run of the economical regions, the institutional government has to set the “rules of the game” in the so-called institutional “coopetition” (cooperation-competition); one must make the difference between the subjects that are the object of codecisions and that mean the coordination in activity, and the ones that assure the territorial dynamic through a form of rival politics. The rules of the game indicate the directions on which one can act as to obtain the maximum of effect. French literature and the literature of other European states recommends a demarcation of the action fields of the regional actors as it follows:

- Common fields: diagnosis, vision, the big axis of politics, the management of difficult priorities;
- Coordinated fields: financial and fiscal aid, incubators, the public scientific parks, the transfer organisms of technology that is financed by public fundings;
- Rival fields: the duties of the factories, the counseling in innovation and technique, the financing of the factories, the private incubators, and other actions that have effects through private efforts.

The defining of the regional policies of innovation means the deep knowing of how the regional economy works and the economical evaluation of the existing public strategies.

2. Regional systems of innovation, strategic diagnostic field

The role of the diagnostic analysis at a regional level is to identify the strong and weak points that are specific to the innovation process; it has to be methodical and to go beyond the mere enumeration of the statistical general elements (research staff, added value, investments, research expenses, number of patents) or of the list of universities, research centres, incubators, without being accompanied by argumented and scientific based commentaries.

The conclusions drawn from the analysis of a region must be completed by the diagnosis of the global stakes that are specific to the region, through the examination of the microeconomic dynamism of the actors of the innovation systems, by the appreciation of their capacity to generate knowledge and to turn it into new products and services or in “business models” (innovative) through the evaluation of the acces to capital.

The diagnosis analysis in the field of innovation at regional level is a must and it has to have three main dimensions:

- The analysis of the global components based on the indicators of economic activity and of the innovation potential;

- The analysis of the actors and of the networks of the regional system of innovation;
- The description of the functioning of the innovation government process and of the establishing the strategic priorities.

The deep description of the importance and of the dynamics of the main groups of activities allows the positioning of the specialization of the region as a strong or weak point and the making of the strategic activity clusters on which studies will be made afterwards and action programs will be implemented. The diagnosis analysis will aim at the “macroeconomic” elements of the regional system of innovation, that will be classified in the following categories: general indicators of the economic activity, human resources, financial resources, data about the innovation environment, “innovation” outputs, the dynamics of innovation.

The diagnosis is the systematic analysis of the regional activity, under different aspects, through the identification of the main indicators that can offer information about the degree of innovation of the region and by the making of comparisons between regions or the European environments, of other countries etc. The diagnosis analysis imposes the putting into practice of an ensemble of quantitative and qualitative methods among which a high degree of use will have:

- Statistical methods: indices, concentration coefficient Gini, growth rates, specific weight, medium rhythms etc;
- The score functions;-
- The evaluation ratings;
- Profiles technique;
- Decomposing, grouping and comparing;
- Swot analysis;
- Pareto method;
- Questionaries and surveys.

As general lines the diagnosis means the going through the following stages:

- the identification of the purpose of the innovation analysis at a regional level;
- the determination of the influence factors, of the chance relations between these and of the methods – quantitative and qualitative – that can be applied;
- the analysis of the results and their interpretation according to region;
- proposing an action plan at a regional level;
- establishing the regional innovation strategy.
- presenting an informatic model about the evaluation of the innovation degree at a regional level.

The diagnosis will end by emphasising the strong and weak points in a synthesis and the conclusions will lead to the making of innovation strategies of the region.

Comparison, as a qualitative method of diagnosis analysis, is best to be made by connecting the results of the region with the data of other regions and European countries. No indicator has scientific value if it is not compared in time and/or in space.

The regions used as a comparison base in interpreting can be Romanian (them among themselves) because the purpose of this comparison is not to classify the regions, as European Innovation Scoreboard does, not to suggest to the region managers the reproduction of a model that is considered to be the best, but it only invites to reflection starting from the data presented. The major difficulty in analysing the innovation process on a national and regional level comes mainly from the limits of the statistic apparatus and from the fact that weft of the innovation is not really well localized and thus we do not have enough data for innovation.

European Innovation Scoreboard limited the analysis to a set of 7 indicators that describe the main characteristics of innovation in the European regions: the number of the staff hired in science and technology, the degree of participation to the continuous formation of the persons with ages between 25 and 64 years old, the share of the Research-Public Development (C-D) in the region PIB, the share of Research-Private Development in the region’s PIB, the existing jobs in the

manufacturing fields of low, medium and high technology (% of the total occupation), the existing jobs in the fields of high technology of services (% of the total occupation) and the number of patents at the million of inhabitants.

The present scientific paper wants to be a synthesis of the research made by the author with the occasion of the first stage of the project INNOREG – MODEL AND INFORMATIC PROGRAMME FOR THE DETERMINATION OF THE INNOVATION DEGREE AT THE LEVEL OF DEVELOPMENT REGIONS (INNOREG) – 2008-2011 (see explanations in the paper “Innovation – the cornerstone of the economic succes at an international and regional level”), in which the ASE partner had as a responsibility the study of the diagnostic analysis in the field of innovation at a regional level.

3. The selection of the indicators used in the diagnosis of the region

Although the attention of the authors in the project INNOREG is to identify an important number of indicators that can provide useful information regarding the degree of innovation in Romania – at a regional level – the experience of the European states that have tried the same procedure have shown that the analysis will limit itself only to a part of them, for reasons that have to do with the finality of the diagnosis, that has as a purpose the offering of a framework, common and simple, in an operational purpose, in the terms of public policies. The proposed elements that are a part of the diagnosis are available in general in the main informational sources (Eurostat, general indicators that are identified in every region).

The obtaining of information, that allows the making of the innovation indicators, faces an obstacle: the uncertain character of the innovation process. Tradition privileges the patents (in connection to their number and their quoting) on the one hand and the input of the research on the other hand (expenses for Research-Development, number of researchers, research staff) as being relevant landmarks in the evaluation of the innovation process. In the last years progress was recorded regarding the way of reviewing the inventions that are effectively marketed but their importance is still limited because the obtaining of information is very slow.

The problem that appears is that of determining the measure in which these differnt indicators are combined, can be substituted or are complementary. Many of the indicators that are specific to the innovation process are re-divided often in the fields of “high tech” manufacturing in the sense that each can be used as a “latent variable of the innovative performance”. The situation is in requital, much more complicated in other fields (“low tech” and services).

A study made by Autant-Bernard and N. Massard insists on 5 indicators of output that they apply on the departamental data in the case of France. The main information of output of the innovation are in their opinion: the total number of patents that have a projection in the department, the number of projections belonging to a factory that introduced innovation as a method etc.

The diagnosis of each region imposes the complementary analysis according to necessities, the research project that has to be elaborated only offers a common minimum frame of analysis and presentation, that is called to evolve in the same time with the amelioration of the statistical aparatus.

Innovation is a multiform phenomenon that can be analysed as a transformation process of the resources and that is in the same time the manifestation and the result of a certain dynamics. The French literature regarding this subject describes the different dimensions of innovation through an ensamble of components that can be analysed, each, through a set of indicators, that we enumerated above:

- General indicators of the economic activity performance: refers to the description, with the help of this subensamble of indicators of the demographic and economic global data of the region that appear more as a data base and as results of the innovation process.
- The structure of the economic activity: the structures of the activity are an “entrance” and a result; a strong orientation of the region towards “high tech” emphasises a positive

performance of innovation and in the same time a favourable factor of development of new productive capacities.

- Human resources of innovation: in all the studies on innovation and territories, the degree of preparation of the human resources is one of the most direct elements in the making of the innovation process.
- Financial resources of innovation is also an important factor in all its forms.
- Data regarding the environment – the innovation environment: cultural and technical capacity of dispersing the innovations into the economy is an essential dimension that can be appreciated today through the perspective of some partial and often fragile elements.
- “Output innovation”: the dynamic of the exits appears as a particular component of the regional system of innovation because the evolution of the ensemble can manifest itself under very different forms.

These subensembles create among them a system which means that each represents on the one hand the causality elements for other subensembles and on the other hand they are the results of other components. This synergy is known and from the diagnosis analysis made at a factory level where the same indicator can represent the cause and the effect of other economic phenomena. Mutual interactions are created that generate a favorable dynamics or on the contrary there is the risk that they lose the collective competitiveness. For example, the “innovation” performance and dynamic of the region depends equally on the human and financial resources; but at the level of international rivalry regarding the human talents/aptitudes and the financing, the growth of the resources is connected to the attractiveness of the region, thus to its performances. It is only one of the examples that shows that the economical structures are connected on the long term with other dimensions of the innovation system.

Each dimension is involved in diagnosis through an ensemble of statistics available: *diagnosis is strictly conditioned by the possibilities of the statistical apparatus*. In the majority of cases the relevancy of each of the indicators that reflect the component that we are talking about, respectively innovation, would become a debate topic vast and sterile; one must make a selection and a determination of the measure in which they are combined and they have a common result; the main goal is to apply the innovation’s components in an unitary manner for the region’s ensemble.

In certain situations we will mention statistics that will be available in a near future or that are in the making right now. For example, we are talking about the limited present possibilities of exploiting at a regional level the CIS inquests. The analysis made by this organism allow us to have precise information regarding the importance and the relevance of the innovation policy in factories. Up to now this inquest was not made through a perspective of making its results regional.

For each indicator it would be useful to make simultaneously of a:

- time analysis (for a longer period, taking into account the structural nature of the given phenomena) with the positioning of the region in connection to the medium tendency of the reference regions;
- space analysis, comparisons with similar national regions or to the European regions of reference; if it is possible the comparison will be made with at least one American state and a Canadian region. For Europe a list of regions is proposed; it refers to the regions Flandra, Basque Country, High Austria, Piemont and Midland Region from the United Kingdom.
- positionings of the researched ensemble in connection to the European regions.

The different categories of indicators proposed by the authors have as a main goal the facilitation of analysis through the framing of the results, as strong/ weak points of the region according to a very strict description (swot analysis). For each subensemble a type of synthesis will be made under the form of an appreciation of the potential of the region, that is rated on a quantitative scale,

from 1 to 5, mainly through comparisons with reference European regions; the interpretations will allow the emphasis of the possible and priority actions in connection to the findings made.

4. The analysis of the strategic priorities at the regional level

The methods used for the analysis of the strategic public options are very different. The strategic and budgetary decisions in general are the result of experience and inspiration of the specialist teams involved. A big importance in the making of the regional innovation strategy it has the demonstration of the share that the reasoning manner have regarding the quantitative methods. The speciality literature recommends to the public managers the specification of the personal criteria of selection and starting from this the manner in which they can build the “basic strategy”. After the processing of the information it is suggested to reflect upon the way of governing and of steering of the putting into practice of the innovation strategy in order to find viable amelioration ways. The notion of strategy, well-known in the military field, was taken and even imposed to the factories starting with the ‘70s in order to mark better the action way in an environment with rapid shiftings and that is dominated by uncertainties on all plans. The strategic approach meant the determination of the activities that “were considered to be the most interesting ones” for the enterprises.

The strategic vision imposes itself nowadays even in the public collectivities, states or regions that should identify the major stakes of the entity, the action course, the priority fields or the way in which public resources should be focused and how to identify the directions towards which it is necessary to accomplish the convergence of the local actors’ visions.

The central objective of the regional strategy is the economic development on the long term. Competitivity and the economic growth often appear as secondary compared to the objectives that are considered to be major for the region: the growth of the degree of occupation of the work force and the assurance of the social fairness. Innovation is perceived sometimes as being involved in the deepening of the social inequalities and as favouring a limited number of entrepreneurs and employees. International studies show the fact that at an international level there is a certain hesitation among the population regarding the growth of the economy as an effect of the innovation. Some authors think that innovation determines the growth of the technicalness degree and that it diminishes the role of the human work. A simple example shows that in the last decade only by the informatization of the German bank system the number of employees was reduced by 70%. In a similar manner other fields gave up their work force in favor of technology in order to cut down expenses. Other authors consider that innovation on the one hand diminishes the work demand in certain areas but it is also an important generator of new professions and jobs through the creation of new activity fields. The truth will be learned in time; at a global level poverty is still a devastating scourge.

5. The instruments of the regional politics of innovation and their efficacy

The innovation politics has as its disposal many instruments some of which we enumerate here:

- *Actions at the physical resources level:*
- Stimulating savings and investments as well as the actions that will determine the region’s attractivity for “external” investments.
- Attracting investements in education and research for:
 - infrastructure;
 - endowing the universities and the research organisms;
 - challenges for improving the quality of the research and of the university production.
- *Actions to develop the entrepreneurial dynamism:*
- Actions that tend to facilitate the innovative entrepreneurs and their judicial and fiscal environment that depends mainly on the state;
- Direct and indirect financial support.
- Supporting the creation and the growth of the innovative enterprises, owing to the infrastructure, as scientific parks, incubators or technopoles.
- *Actions regarding the interactions of knowledge between the economic actors:*

- Cells that will support the sign-off in the private universities or research center, to support the seed capital (amorçage) or of the risk capital.
- Supporting the dynamics of the innovation phenomena at the level of the economic “tissue”, especially through actions of counselling regarding the profit of the IMM, actions to stimulate the demand for knowledge, actions of transfer of knowledge after the institutionalization of the higher education.
- Supporting/ developing an ensemble of private intermediaries.
- Supporting the innovation poles policies (or of competitiveness) and of the “clusters”.
- *Actions of “policy intelligence”* what is the equivalent of actions conduct type for the improvement of the efficacy of the ways of putting into practice, at the level of defining the policies and at the level of their following.

There is a real debate regarding the economic efficacy of many of these instruments; the dominant conclusions are that public institutions that have the right to make a decision must ask themselves “what efficacy I expect from the instruments used?”, because it depends on the microeconomic circumstances and data: the selectivity and the identification process of the enterprises that support innovation, managing the competence and the efficient functioning of the knowledge infrastructures, and even the simple material realisation of the equipment in cause.

REGIONAL ECONOMIC GROWTH THROUGH TOURISM. THE CASE OF REGION WEST

Boldea Monica

FEAA, Universitatea de Vest, Timisoara

Lavritys Patrick

FEAA, Universitatea de Vest, Timisoara

Dragoi Ionut

FEAA, Universitatea de Vest, Timisoara

The regional development should aim to correlate and integrate tourism among the other integrative parts of the regional and local development, taking into account the fact that a region's prosperity as effect of tourism development may be shown clearly in several stages: on the spot (as a result of direct consumption of the tourist product), on short term (through continuous absorption of the work-force and encouraging the welcoming commerce) and in the long run (concentrating capital for investment in the general infrastructure and the one of tourism, in structures of reception for tourism and in the development of urban services). The analysis of intra-regional disparities as part of the economic growth at the level of Region West starts off with the idea that each component county has a different landscape, which favored or inhibited their economic growth; in the same time, each component county has its own specific, which can be promoted through tourism, inducing in time a regional income, and respectively, a socio-economic and cultural growth of less developed areas.

Keywords: tourism, regional development, intra-regional disparities, economic growth

JEL code: R11

1. Tourism – fosterage instrument of regional development

The National Strategy for Regional Development, drawn up based on the Plan for Regional Development and the National Strategic Frame of Reference 2007 – 2013, has identified the development of tourism as a priority for development, given the existing potential for tourism in every one of the eight regions for development in Romania. This potential proves the financial backing offered to rehabilitate the infrastructure of areas aimed for tourism and to turn into account the natural, historic, and cultural patrimony, to include them in tours of tourism and promote them with the purpose of attracting tourists.

The development of tourism is in complete harmony with the Communitarian Strategic Orientation 2007-2013, as the putting into practice of this axis of priority shall contribute to the improvement in the regions' degree of attractiveness and to the creation of new workplaces. The investment in tourism and culture will allow the developing regions to make use of the advantages offered by their potential for tourism and their cultural patrimony and to identify and strengthen their own identity, in order to improve their competitive advantages in sectors with high added value and high cognitive and qualitative content, on both traditional and emerging markets.

As an integrative part of the national economy tourism excels its economic role directly, first through the contribution it has to create regional and national income and the acquiring of foreign currency, then through the positive effect it has upon the social-economic and cultural growth of certain areas in the country and upon the internal monetary flow, and indirectly by the influence it exerts upon other branches of the national economy. Considered an economic activity, tourism includes a various range of services, such as: informative services, the sale of travel, transport,

accommodation, treatment in spas, activities of entertainment and pleasure. Consequently, at the level imposed by its role and functions, tourism appears as a result of the concerted and combined effect of multiple branches. Some of these, for example construction, the industry of electric and thermal energy, engineering, the textile industry, agriculture, the food industry – are considered as supplying branches, and what they supply is involved either in the material base of tourism, or in the production offered by public food supply. Other branches, like transport, goods' circulation, communications, and culture compete independently in order to meet the needs of tourists. The large number of branches which are involved in catering tourism shows that the “product” of tourism can be of high quality only if all the elements involved in its creation, or are an integrative part of its structure, are as well of high quality.

2. The potential for tourism and possibilities of regional development of tourism in the Region West.

The Region West – one of the eight regions of development in Romania – has a remarkable potential for tourism given its extremely rich and various landscape (in the region there can be found every form of relief, from plains to mountains), the climate with oceanic or sub-meridional influences, a hydrographical network of great representation, a various background of forests and hunting, all of these making up very attractive destinations for tourism. The region also hosts especially attractive mountain sceneries, karst relief in the mountains, karst and glacial lakes, natural lakes of everglade, mineral and thermal springs, leaf-bearing forests and coniferous forests, a hunting background with various species, national parks and natural reservations, dendrological parks and many areas for skiing. The region disposes of archeological vestiges, of historical and art monuments, architectural ensembles, plastic art and memorial monuments, displayed on a vast area in both urban and rural living spaces. To these one should also add museums, the art collections and galleries, the popular architecture, the folk costumes and pottery, ethnographical museums, traditional folk events, festivals and artistic events; there should also be mentioned the technical industrial patrimony, including dams, lakes of accumulation, hydro-power stations, the museums of steam locomotives, furnaces of the Middle Age, various plants and industrial centers. The distribution concerning every constituent county would look as follows:

The county of Arad has an increased potential of developing, in the long run, the tourism for business and transit, due to its geographic location and also due to the numerous foreign investors present in the county. Then, a large number of natural, cultural, historic and ethnographic sightseeing spots offer the possibility of practicing other forms of tourism as well, for example – the ecological tourism or the tourism for pleasure, the tourism for culture and history, and the tourism for treatment and spas. Among the sightseeing spots we can mention the Hodos-Bodrog Monastery, the „Adormirea Maicii Domnului” Monastery in Bezdin, the „Sfanta Fecioara Maria” Monastery in Radna, the Fortress of Aradului, the Fortress of Ineu, the Castle in Savarsin, the Soimos Fortress, the Bohus Castle in Siria, the Historic Centre of Arad, the Natural Park Natural Lunca Muresului, the Macea Botanical Garden, the Baile Lipova Health Resort, and the Moneasa Health Resort.

The county of Caras-Severin has an obvious potential for tourism, due to the diversity of its landscape, the great number of lakes of accumulation, the emphasis being on the Baile Herculane Health Resort and Spa or the Danube Strait. There can also be distinguished five areas for tourism – the Semenice area, the Cerna Valley area, the Anina Mountains area, the embankment of Nera-Beusnita and the Iron Gates. Among the sightseeing spots we can mention the Semenice Resort, the Muntele Mic area for tourism, the Domogled National Park – Cerna Valley, Baile Herculane, the embankment of Nera-Beusnita National Park, the Museum of steam locomotives in Resita (a collection of 16 locomotives, including the first locomotive manufactured in 1872), the Pietra Scrisa hermitage, the Rudaria Water-mill Park, the railways Oravita – Iam and Oravita

- Anina (the first railway range in the country, opened in 1854), the carcass of the Roman settlement Tibiscum (106 AD.), the Moldova Noua sightseeing spot.

The county of Hunedoara disposes of both the variety of the landscape and the wealth brought by the elements of cultural character; the county preserves over 400 sightseeing spots – historical and art monuments, and monuments of natural history – starting with the prehistoric era and continuing through the dacic, roman, feudal and modern times. Among the sightseeing spots we can mention first the two capitals of Dacia and the Roman Dacia - Sarmizegetusa Regia and Ulpia Traiana Sarmizegetusa, and then there are the Fortress of Deva and the Fortress' Hill, the Corvinesti Castle in Hunedoara, the Geoagiu Bai Resort, the Dendrological Park Simeria, the Museum of Gold in Brad, the Retezat National Park, the Mountain Resort in Straja, the Complex of monuments in Tebea, and the Dacic Fortresses in the mountains of Orastie.

The county of Timis disposes of a diverse natural potential, springs of mineral and thermal waters which enjoy recognition for their sanatory qualities, the hunting and piscicultural background, as well as the variety of the elements of architecture, folk art and folklore, all of them ensuring a diversified offer for tourism. Timisoara, the county's city of residence, comes fourth place on a national level according to size, and has been recognized since the 18th century as „Little Vienna”, being an important historic, economic, financial, cultural and scientific centre. Among the main sightseeing spots there are the Buzias Health Resort and Spa, Baile Calacea Health Resort, the Swamps in Satchinez, the Dendrological Park Bazos, the Museum of Banat in Timisoara, the „Traian Vuia” Memorial House, the Orthodox Cathedral in Timisoara, the Cave in Romanesti, the Village Museum of Banat, the Roman-Catholic Dome in Timisoara.

This various range of resources for tourism may generate and sustain a variety of tourism practices, among which: the widely used tourism (for circulation), the tourism for health and spa, the tourism for rest and relaxation, the tourism for business, the tourism for mountain-hiking, the tourism for sporting hunting and fishing, the cultural-historic tourism, the tourism for speology, the sporting tourism, the tourism for cruising, the religious tourism, the urban and rural tourism, the intercultural tourism, the gastronomical tourism with local specific. Regarding tourism, new products and new forms of recess tourism can be developed, like rural tourism and the tourism for adventure. There can also be developed the tourism for business, generated by conferences, symposia and exhibitions, diplomatic events, cultural and scientific events, the multinational companies' business expansion in the region.

Even without a detailed exposure one can easily notice the vast existing potential of the Region West, which, unfortunately, is not put in good use concerning the sustainable and ecologic development of the region. Regarding the capacity for accommodation in the year 2006, Region West ensured only 7,46 % of the entire capacity for accommodation in the country. On a regional scale, Region West was placed last but one regarding the number of tourists arrived in the region (9,87 % of the tourists visiting Romania in 2006), the 4th place regarding the number of staying overnight (2.006,2 thousand), and, respectively, the 4th place regarding the index of net usage of the capacity in function (36,3%, despite the strategic geographical location of at least two counties – Timis and Arad – and, as well, despite the external economic exchange which has been traditional for centuries. The potential for tourism in the rural area should also be taken into account, given certain characteristics of Region West, like its diverse landscape, the architectural tradition in the rural area, historical and archeological vestiges, mineral and thermal water resources; for the time being, the social transparency is very low, 9 % of the villages in the Region West having a high and very high potential for tourism. These are distributed in the counties of Hunedoara and Caras-Severin, in harmony with the protected areas and natural monuments in the region. It is especially this area that – fated right from the start to host mono-industrial activities and becoming, in time, vital industrial centers due to the intensive exploitation of raw materials – suffers from an acute economic and social crisis because of the

collapse of the planned economy's system and the economic transition of Romania towards the market economy. For this reason the presence of foreign investors is also very scarce, they showing preference more towards the counties of Timis and Arad, so that, in order to economically revitalize the two less developed counties in the region, it is necessary to win the interest of the foreign investors over, and this would require to begin with the development of the infrastructure for access and utilities, necessary for both the proper unfolding of the economic activities, and for ensuring a comfortable living for the population in these areas.

3. The infrastructure for access

In what concerns the infrastructure for access, a series of shortcomings excel, which diminish the possibility of a vast economic development, respectively to sustain a flow of tourists adequate to the region's potential for tourism; these are mainly high-lightened by the lack of motor highways (the immediate effect being the unjustified intensification of traffic on roads which are not proper for inter-regional and international transport), the lack of ring-roads in the case of most cities and towns in the region (which makes the inside traffic to be very difficult and also increases the duration of travel), the low carrying capacity of existing roads showing effects of accelerated degradation, and the high percentage of out-dated district roads, which leads to a decrease in possibilities and of the traffic capacity, respectively to a lack of access possibility regarding sightseeing spots in the territory.

Having a strategic geographic location at the crossroads of commercial paths which connect Central Europe to the Mediterranean South, Region West represents a bordering region, a "frontier" region, which disposes of four crossing points of the frontier with Hungary – Nadlac, Turnu and Varsand (in the county of Arad), and Cenad – Kiszombor (in the county of Timis) and four crossing points of the frontier with the Republic of Serbia – Jimbolia and Moravita (in the county of Timis) and Naidas and Moldova Noua (in the county of Caras-Severin). Five European roads cross Region West directed North-South and West-East, three of which are considered main European roads (E68, E70, E79), and respectively two secondary European roads (E 671, E 673). Of the ten Pan-European corridors (which have been given recognition as main thoroughfares of transport in Eastern Europe, aimed to connect Western and Eastern Europe, as well as the states of Eastern Europe), three of them cross the Romanian territory, two of which cross Region West: the Corridor IV (Berlin – Nurnberg – Praga – Budapesta – Constanta – Salonic – Istanbul – having two integrative parts, road and railway) and Corridor VII (the Danube, crossing Region West between Bazias and Cozla).

The motor highway designed for the future, in order to connect Budapest to the Black Sea, has been foreseen to cross Region West from West to East; this highway is forecasted to ensure a fast connection between the centers Timisoara – Arad – Deva, having as well a significant contribution to the traffic release on the other roads in the region.

Regarding air passages, The Region West disposes of airports in each integrative county, in the cities of Timisoara, Arad, Caransebes and Deva (there should also be mentioned that in Romania, based on the European Treaty, eleven airports are located on the TEN-T network, two of which being located in Region West). It is also worth mentioning that the Traian Vuia Airport in Timisoara is the second airport in Romania regarding its importance, catering an immediate area of 2,1 million inhabitants (both Region West and the Hungarian and Serbian Banat area). Its technical endowment allows access for some of the biggest airplanes, a quality that grants a significant potential to the airport, as air gateway of the region, in the use of tourism and fast access to economic circuits, including overseas markets. Its location, the rise in foreign capital and a fast growing number of investors in the Region West, as well as the fact that the airport enjoys competitive endowments of aeronautic type has led to a rise in passenger and commodity trafficking, so that the present issues the airport's administration is concerned with, involve the lack of space on the platforms, in air-stations, respectively in the parking lot. The county of Arad

disposes as well of an international airport, also having a strategic location. It allows easy access to economic agents from nearby areas (especially the counties of Arad, Hunedoara, Bihor and Alba, respectively Bekes and Csongrad in Hungary, regarding the transport of commodities). The contribution of air transportation to the economic life of the region could be improved through investment in airport services, in specific endowment regarding landing in difficult conditions, in ensuring the connection by air transportation between district centers, respectively in the potential for development of the two airports which are not sufficiently used – Deva and Caransebes. The airport in Caransebes, in the county of Caras-Severin, initially designed for internal flights, is at present in private property, maintaining however its potential of being used for external passenger trafficking, especially regarding tourism. In what concerns the airport in Deva, in the county of Hunedoara, this one is at present used only for activities like sports aviation.

4. Challenges and opportunities

The frail development of tourism in the Region West is also due to uncompetitive products of tourism and the unskilled personnel in the field; moreover, in 2006, the Region West disposed of only 10,55% of the total number of the personnel hired in the structures of reception and accommodation in the country, most of them working in the Timis county. The tourism in spas would also have a high potential of development in the region, the region hosting 13,3 % of the total number of health resorts and spas in the country, most of which are to be found in the county of Caras-Severin. Turning account of the attraction for tourism can contribute to the economic growth of the urban centers, which are currently in decline, or of the peripheral rural areas, mainly by favoring the setting up and development of local enterprises, thus transforming the areas with low economic competitive character into areas attractive towards investors. The activity of tourism creates demand for a large range of goods and services, acquired later on by tourists and companies of tourism, including goods and services created by other economic sectors (commerce, constructions, transport, the food industry, confections and footwear, the small industry and handicraft). Last but not least, tourism creates opportunities for regional and local economic growth and has a lasting contribution to creating new employment forms by turning into account the cultural and natural patrimony; in addition, a significant part of the newly created jobs involves a regional opportunity to absorb the female work-force.

The Region West enjoys a very diverse potential for tourism to be promoted, a potential which offers the possibility of practicing an entire range of forms of tourism all year long; even so, the tourism in the region is a lot less developed compared to other areas in the country (mentioning factors like a relatively reduced denseness of the population in the region, an insufficiently developed infrastructure for access to sightseeing spots and diverse locations, respectively the massive emigration of the population traditionally fond of tourism). The putting into operation of the 5th axis of priority of the Regional Operational Program (POR) – by improving the infrastructures of the areas aimed for tourism and the ones of the accommodation services – is expected to determine a qualitative growth, towards European standards, of the entire range of conditions for practicing tourism, with a direct influence upon the increase in demand for tourism for Region West, and implicitly for Romania, as a European destination.

5. Conclusions

The reasons which negatively influence tourism at the regional level are first the lack of a consistent strategy at the central level, given the conditions in which the development and promotion of tourism are not part of the local administrations' priorities, or maybe only to an insignificant extent, then the lack of transport infrastructure (roads, railways, adequate and modern waterways and air passages; even the road network is not properly maintained, isolating or making the sightseeing spots very difficult to reach). On the other hand, the lack of quality

service regarding accommodation, of a competitive management, of complementary services for tourism, of some documentation and guides and even the lack of an aggressive challenge on hand various forms of advertising, makes many sightseeing spots and various areas for tourism to remain unknown to the wide public, either home or overseas, with every negative consequences emerging from here.

The role of tourism in the regional economy, and implicitly in the national economy, refers mainly to a superior capitalization of available resources, which involve the economic and cultural rise of certain inhabited areas, the development in a territorial structure, the setting up of fields of activity which might absorb part of the workforce, it may also be an activating element of the global economic system, respectively a means of diversifying economic structures, parameters of education and training, has a calling for ecology, it imposes measures to protect the environment and the basic values of the human life (water, air, flora, fauna) and it also represents a lever to diminish the inter- and intra-regional disparities.

THE IMPACT OF THE CAP-AND-TRADE SYSTEM ON SUSTAINABLE DEVELOPMENT IN ROMANIA

Bologa Gabriela

Agora University College of Law and Economics Science

Balint (Platon) Judit

University of Oradea College of Economics Science

The issue of pollution is an important contemporary issue. Within the last 20 years, there have been global studies on how to stop global warming. The European Union is the world leader in concrete measures undertaken in this respect. The introduction of the cap-and-trade system, begun in 2005 with the carbon emission certificate trade mechanism is considered a modest success that needs perfecting. The new EU directives of 2009, that come into effect in 2013, test member countries in the area of conventional and renewable energy strategies which have to be adapted to the national environmental protection strategies.

Keywords: market failure, cap-and-trade, emission certificates, carbon market

JEL: Q54

Introduction

The impact of climate change on a global scale is more and more evident. The European Union, in the first decade of the 21st century, implemented a measures to reduce greenhouse gas emissions through the cap-and-trade method, using financial means, such as „carbon certificates”, creating a functional „carbon market”. These measures were in line with the Kyoto protocol, which sets objectives until the year 2012. In the year 2009 the ambitious legislative package for the 2013-2020 period came into effect. The EU wishes to reduce greenhouse gas emissions by at least 20% as compared to the year 1990, as well as to increase the percentage of green energy usage from 9 to 20% and to decrease primary energy consumption by 20%. The impact of implementing the energy/climate change package on the Romanian economy would affect the energy sector, the legislative process, profession reconversion, scientific and technological research, as well as the policy of attracting foreign investments and european funding.

Conceptual frame

People engage in market exchanges when they anticipate that through these operations their overall wealth increases. When, through these operations, the optimum results aren't reached, the neoliberal theory calls this *market failure*¹⁸³. One of these market failures are externalities.

Externalities are costs or benefits for a certain party which does not take part in the transaction. The classical case of negative externalities is pollution. For resources to be optimally used, the price paid for using them has to cover the *opportunity cost*. Nobel Laureate James M. Buchanan demonstrates the necessity of interpreting cost as *natural derivation from the act of choice*. If a company can use a factor de productie without paying for it, the resulting offer curve does not represent the whole marginal production cost.

$$\text{Social cost} = \text{private cost} + \text{externalities}$$

When the produced quantity is too great compared to the whole cost, then the social cost represented by the externality must be *internalised*. According to the methodology, as seen by the neoclastic theory, the government, which presumably always acts in the best interest of the public,

¹⁸³ Revista Economie Teoretică și Aplicată nr. 7/2006 Radu Șimandan, *Polurea și proprietate: Cât mai rezistă teoria eșecurilor pieței?*, <http://www.ectap.ro/articole/128.pdf>.

must intervene and correct the flaws of the market. The government, in order to fulfill its regulatory task, may use two methods: to impose centralised taxes, according to economist A.C. Pigou, or decentralised and tradeable (pollution) permits.

If property rights over some resources, used as production factors, are in the clear, the owners would be encouraged to enter into negotiations with the one that does the pollution. If there is the possibility of these negotiations, but these do not lead to optimum results, they are considered market failures. Elements of the negotiations, such as: informing, negotiating, stating, monitoring and applying the terms of the contract are activities that include costs, designated as **transaction costs**, highlighted by Nobel laureate economist Ronald Coase¹⁸⁴. An analysis based on transaction costs defines externalities as follows: *the net value of externalities constitute the minimum threshold for associated transaction.*

According to Coase's theorem: in an exchange where external costs are present, the agents will negotiate until the point in which the resulting production is at an optimum amount, if three conditions are respected¹⁸⁵. These conditions, in the case of pollution, are as follows:

- it is clearly defined when something can pollute, and in what amount.
- those who pollute have to pay to do it or they can be paid, by the owner of the affected resource, to abandon the practice of polluting.
- informing, negotiating, stating, monitoring and applying the terms of the contract should be at a low cost.

The problem of climate change is the consequence of **market failures**: those who produce damages to others by greenhouse gas (GHG) emissions do not usually pay anything.¹⁸⁶

Taking action against climate change can be achieved in three ways:

1. By states taking individual or collective action to reduce or limit the greenhouse gas emissions through imposed standards and regulations. This is called „**command and control**”

2. Carbon/energy tax

3. Imposing a limit on emissions while simultaneously trading in emission certificates. This is called „**cap and trade**”

If the first mechanism is of a public nature, the other two work through market means. State control is strong in the first case, medium in the second, and weak in the third.

Legal frame

In June 1992, the **United Nations Conference on Environment and Development** took place in Rio de Janeiro, where the need to integrate economic development and environmental protection into the sustainable development objectives was recognised, as well as the problem of an international environmental law, as a way of promoting sustainability, was raised. During this conference, the following documents were adopted:

- the Rio Declaration
- Agenda 21
- Convention on Biological Diversity
- Framework Convention on Climate Change

Romania ratified this document as Law nr. 24 of May 6, 1994

The Kyoto Protocol, of December 1997, is an international agreement regarding the environment, the agreement was put in action in October 2004 by the ratification of the Russian

¹⁸⁴ Ronald H. Coase, *The problem of Social Cost*, Journal of law and Economics 10/1960.

¹⁸⁵ Revista Economie Teoretică și Aplicată nr. 7/2006 Radu Șimandan „Polurea și proprietate: Cât mai rezistă teoria eșecurilor pieței? „, <http://www.ectap.ro/articole/128.pdf>.

¹⁸⁶ Andrei Mocearov, “Fișă de analiză 1. Economia sistemelor de comercializare ale cotelor de emisie de CO2.” http://m.cdep.ro/afaceri_europene/afeur/2009/az_378.pdf.

Federation. Until 19.01.2009¹⁸⁷ the protocol was ratified by 84 countries that are responsible for 63,7% of the total greenhouse gas (GHG) emissions in the world. Romania ratifies the Kyoto protocol through Law number 3 of February 2nd, 2001 and therefore assumed the reduction of greenhouse gases by 8% compared with 1990.

The agreement stipulates for the 37 industrialized countries found in appendix 1 of the UNFCCC (*United Nations Framework Convention on Climate Change*), a reduction of the polluting emissions by 5,2% in the period 2008-2012, as compared with the emissions of 1990. Romania is part of the “transition economy” countries in appendix 1 of the UNFCCC. Flexibilization mechanisms for reaching the reduction targets assumed by the states mentioned in appendix B are:

AAU (Assigned Amount Unit) – the international commercialization of *emission certificates* - countries that are in appendix 1 of UNFCCC.

CDM (Clean Development Mechanism) - implementing projects in developing countries (that are not in Appendix 1) for generating CER (Certified Emission Reduction) credits. The projects are initiated by the industrialized countries from appendix 1 of UNFCCC.

JII (Joint Implementation) - between the states from appendix 1 of the UNFCCC (developed countries, developing countries). Romania is the beneficiary of the projects through the JI mechanism, implemented by the industrialized countries. For every saved tone of CO₂eq¹⁸⁸ the investor obtains an ERU (Emission Reduction Unit).

The European Union, to coincide with the Kyoto protocol parameters, launched the European Union Emission Trading Scheme for all the 25 member states, on January 1st 2005 following the principle of cap-and-trade, “limitation- transaction”. The allocation of the emission process has become an important stake, in the conditions that these permits can be freely traded on the carbon market. The Commission, through Directive 2003/87/CE has foreseen for the 2005-2008 period that member states are the ones that assess the amount of permits through the allocation with a free title and in a direct way. The scheme takes place on a three implementation periods: the first between 2005-2007, the second between 2008-2010 with a reduction by 8% of GHGs as compare to the 1990 levels, and the third period between 2013-2020. Financial instruments included in this scheme:

EUA – European Union Allowance – a tradeable unit (valued on the stock market) of the Transaction Scheme. 1 EUA represents the right to emit one tone of carbon

CER – Certified Emission Reduction – a unit equal to one tone of carbon dioxide. CERs are issued for the reduction of emissions from C.D.M. – Clean Development Mechanism (green energy) activities.

ERU – Emission Reduction Unit – obtained through a J.I. (Joint Implementation) project. One unit equals one tone of carbon dioxide.

VER – Verified Emission Reduction – are carbon credits which may be used to compensate carbon emissions. 1(one) VER corresponds to one tone of carbon dioxide.

The most important international financial markets on which these certificates are traded are Bluenext, European Climat Exchange, Intercontinental Exchange. Carbon dioxide emission certificates are traded on the Sibiu Exchange, as underlying asset, starting December 2009.

Member states have set, in the case of industrial output, a global limit on greenhouse gas emissions for which certificates (rights to emit one tone of CO₂eq per year) have been issued, equal in number to said limit. This system controls greenhouse gas emissions for approximately 15.000 companies, oil, gas and energy installations, celulos, paper, cement, glass and steel factories within the EU. Companies that emit more than their given quota will have to pay fines:

¹⁸⁷ United Nations Framework Convention on Climate Change - UNFCCC. http://unfccc.int/files/kyoto_protocol/status_of_ratification/application/pdf/kp_ratification.pdf.

¹⁸⁸ Equivalent carbon dioxide (CO₂eq) is the universally used unit of measure to indicate the global warming potential of the six types of greenhouse gases (GHG).

100 euros for every tone over the limit, during the 2008-2012 period, and, as an added measure, they will be forced to continue to submit the missing certificates the next year. Companies buy and sell certificates depending on how they fulfill their pollution goals.

Through the AAU mechanism, for the 2008-2010 period, the European Union has a set maximum yearly value of 2.08 billion tones of CO₂, and Romania of 75.9 million tons. Out of a total of 379.7 million certificates given to Romania for said 5 years, 351.1 million are split between 8 economic sectors, as set out in the HG 60/16.01.2008.

Sector	Certificates for 2008-2012
Energy	208,674,068
Oil refineries	28,818,122
Ferrous metal production and processing	61,654,319
Lime	4,908,313
Cement	41,251,885
Glass	1,618,308
Ceramics	1,753,842
Paper and cellulose	2,449,411

According to the *Fourth Global Evaluation Report of the Intergovernmental Panel for Climate Change*¹⁸⁹, written in 2007, human activities contribute substantially to the growth of greenhouse gas concentrations in the atmosphere, determining the change of its composition and subsequent global warming.

To combat climate change, the European Parliament – in December 2008 – and the Council of the EU – in April 2009 – adopted the „Energy – Climate Change” Package, also called the 20/20/20 Laws.

The objectives set out by the European Union with regards to this law are:

- The reduction of greenhouse gases by 20% until the year 2020, compared to 1990.
- A 20% share for renewable energy in EU final consumption, as well as a 10% target for biofuel in transportation.
- A 20% reduction in energy consumption as estimated for 2020, through increased energy efficiency.

The directives that make up the package are:¹⁹⁰

- Directive 2009/29/CE modifying Directive 2003/87/CE and improving and extending the commercial scope of greenhouse gas emission certificates.
- Directive 2009/28/CE regarding the promotion of the use of renewable energy sources.
- Directive 2009/31/CE regarding the geological capture and storage of carbon dioxide.
- Decision 406/2009/CE regarding member states’ efforts to reduce GHG .
- Directive 2009/30/CE, which forces fuel suppliers to cut greenhouse gas emissions generated in the fuel production chain.
- Directive 2009/33/CE, which concerns the promoting of green and energy efficient road transport vehicles.

Directive 2009/29/CE stipulates:

- The extension of the affected sectors, by including new ones, as well as new greenhouse gases that originate in various industrial processes.
- Geological capture, transport and storage of all greenhouse gas emissions.

¹⁸⁹ <http://www.ipcc.ch/>.

¹⁹⁰ General report on the activity of the European Union 2009 <http://europa.eu/generalreport/>

- The assignment of greenhouse gas emission certificates shall be “100% free” for energy-intensive sectors that face the risk of relocation¹⁹¹ as well as for the energy producing installation that work in a cogeneration system, with the purpose of serving centralised heating systems.
- The assignment by “auction” for the energy sector, as well as for electrical production, shall be a minimum of 30% for 2013 and shall be gradually extended to 100% by no later than 2020. These auctions shall be open, transparent and the operator shall have the possibility of buying certificates from any Member State.
- The assignment by “auction” for installation from other, non-energy, sectors shall gradually rise from 20% in 2010 to 100% in 2020 on the basis of the principals of reference values of the most efficient technology.
- The Reserve of New Installations (RNI) shall be managed on the European level, the assignment shall be with a free title, based on the reference value of the most efficient technology.

In Romania, considering the strict terms for the implementation of the legislative package, the “Action plan for the preparation of Romania for the enabling of the Energy – Climate Change legislative package” was approved, and thus the institutions, their responsibilities and their action plan for the next period were set out. The National Agency for Environmental Protection, through the Climate Change Service, created the “Guide for applying the 2009/29/CE Directive”¹⁹².

The impact of the “Energy – Climate Change” Package on the Romanian economy

In Romania’s particular case, the situation of the primary energy sources is worrisome, especially in the context of analysing the energy security. The European Institute of Romania, in its “Perspectives on Romania’s energy security” study, concludes that the real situation regarding energy security is as follows:

- Dependence on importing energy resources, diversification of supply sources.
- Decisions regarding the national energy sector have an inertia of 4-20 years.
- The need to improve the efficiency of and modernise the energy sector by stimulating investments, as to reduce national losses in the consumption sector that are currently at 30-35%..
- The need to create an institutional frame for the energy sector.
- The structure of the energy balance: few resources, but expensive and diversified.
- Holds the largest share of renewable energy in the primary energy consumption in Central and Eastern Europe.
- Holds a great economical and technical potential in the renewable energy sector, unfortunately it’s untapped.

The known oil reserves will be used up in less than 20 years, natural gas reserves in about 15 years, coal reserves in 40-50 years and uranium reserves can ensure the functionality of two groups at the Cernavodă nuclear power plant until 2017.

A study¹⁹³ made by the European Institute of Romania in December 2009 analyzes the impact of the *Energy – Climate Change* Package on the Romanian economy and society. The conclusions and proposals have the purpose of facilitating the implementation of the package, but also of reducing its negative effects. Some of the most important measures proposed by the said study:

- The establishment of an institutional framework that incorporates a national planning institute, an energy and resources minister, a neutral body to supervise the energy market, a national body

¹⁹¹ carbon leakage –the move towards other markets that have less strict rules than those set out by the EU

¹⁹²The Regional Agency for Environmental Protection Cluj Napoca
<http://www.arpmnv6.ro/Ghiduri%20eco/Ghid%20incadrare%20instalatii%20EU%20ETS%20post%202012%20revizuit%2022.12.2009.pdf>

¹⁹³ European Institute of Romania, București, Impactul implementării pachetului energie-schimbări climatice asupra economiei românești, Proiect SPOS 2009 Studii de strategii și politici, www.ire.ro.

for the management of the *Energy – Climate Change* Package through information centralisation and a regulation agency for the monitoring of intermediate and final targets.

- The development of a common document that incorporates the strategies in both the energy sector and the environment.
- Investments that strengthen transport networks and energy distribution.
- Growth of energy efficiency and the reduction of final energy consumption.
- The establishment of a fiscal regime for emission certificates and their transaction, the determining of the accountant rules of expenses of the scheme's implementation for the producers of heating and electricity by cogeneration.
- The creation of a legal framework necessary for ensuring the investment of funds acquired by the selling of CO2 certificates.
- The implementation of workforce qualification programmes for designing, building and operating the new green technologies.
- The need for a rehabilitation programme of certain thermo-electric powerplants that use indigenous coal, correlated with the desulphuration programme.
- The drafting of an evaluation study of our country's potential in the geological capture and storage of carbon dioxide.
- A programme for the thermal rehabilitation of buildings.
- The drafting of a study concerning the state of centralised heating systems and of a national strategy in the area of home heating.
- The development of the nuclear program, as an alternative to the country's dependence on natural gas imports and the replacement of old energy capacities with fossil fuels.
- A regulation of the introduction of the tariff binomial for heat and natural gas.
- Ensuring that energy prices have a high degree of tolerance by the consumers, through a system of energy assistance, wholly oriented towards all low-income families by eliminating subsidies and seasonal help.
- The continuation of energy sector privatisation together with public-private partnerships.
- The growth of the level of structural fund absorption, funds meant for improving environmental factors

ECONOMIC IMPACT OF GLOBALIZATION ON THE ENVIRONMENTAL POLICY OF THE EUROPEAN UNION

Călborean Raluca

Babeş-Bolyai University

Faculty of Economics and Business Administration

Environmental policy has become an object for description and analysis. A global environmental mechanism intends to promote collective action at the international scale and to build an integrated environmental policymaking and management framework concerning the tasks of a shared global ecosystem. Governments use a number of different types of environmental policy instruments to implement their environmental policies: legislative, technical and economic-financial instruments. The encounter is to combine the environmental protection with continuing economic growth in an over the long term sustainable way. This paper tries to underline that there is an under appreciation of the adaptability of social structures even within economics of environmental policy, to the extent that it is necessary to fully acknowledge and highlight the inborn trade-off between economy and environment.

Keywords: environmental policy, sustainable development, globalization, acquis communautaire, economics

JEL codes: Q01, Q50

1. Introduction

Global environmental policymaking in the last decade has focused more on principles and declarations than on mechanisms for modifying environmental driving sources. The principal focus has been on drafting treaties. Gaps in issue coverage and, sometimes, even contradictions among treaties and organizations with environmental responsibilities have undermine result-orientated actions.

Environmental policymaking combines the identification of a goal with some means to achieve that goal. In practice, these two components are often linked within the political process.

The complex structure of the European Union (EU) generates uncertainties: EU tends to be rather a political concept, while Communities reserve their juridical personality.

Environmental protection is a priority objective of the European Union. This paper analysis incentives and contradictions of action programs and instruments formulated for implementing ecological policy.

2. Environmental Globalization

Globalization requires thoughtful and modern ways. A global environmental mechanism intends to promote collective action at the international scale and to build an integrated environmental policymaking and management framework concerning the tasks of a shared global ecosystem.

There is an under appreciation of the adaptability of social structures even within economics of environmental policy, to the extent that it is necessary to fully acknowledge and highlight the inborn trade-off between economy and environment.

The environment enters in the competences shared between Community and Member States (MS). The Community competence harmonizes with the different national policies.

Nowadays, environmental policy has become an object for description and analysis. The rate of change, both in circumstances as into the beliefs and attitudes of people respecting their environment in every aspect of modern society, during the last century upon government is

reflected in public policies and that related to the human environment and the biosphere has been numerous and rapid since the 1972 United Nations Conference in Stockholm.

The legal base of the European Union's environmental policy¹⁹⁴ is set out in the Treaty on European Union (EU) and is based on Article 174 of the Treaty establishing the European Community. It aims to ensure the sustainable development of the European model of society. Policy concepts such as preventive measures, precautionary principle, the "polluter pays" principle and combating environmental pollution at source have precious importance and are of maximum applicability.

The main objectives laid down in Article 174 are:

- preserving, protecting and improving the environment quality;
- protection of human health;
- prudent and rational utilization of natural resources;
- promoting measures at international level for handling of regional environmental issues.

The European Union is one of the initiators of the United Nations Environment Program (UNEP) creating a strategic approach to the international management of chemicals, takes part to a number of international agreements and partnerships and is a signatory and active participant in the Kyoto Protocol on Climate Change, which entered into force in February 2005.

Its objectives regarding the environment are: control of activities with an adverse environmental impact, protection of air and water quality, waste management, conservation of resources and protection of biodiversity. However, environmental problems were increasing and reaching global-scale proportions through environmental consequences. They have brought an accumulation of natural wealth, but also an exceed of the capacity of natural systems to process and neutralize the residual products of modern civilization: contamination of air, water and soil, decrease of the restorative capabilities of over-stressed species and ecosystems often to the point of extinction.

Starting in the 1980s, governments saw the emergence of an international environmental agenda over the next two decades as the first attempt at global environmental governance¹⁹⁵. Some of the most important accomplishments in the area of global environmental governance are:

- an agenda of the most important environmental concerns has been defined;
- action plans, treaties and international conferences have been developed;
- relevant scientific research has been made;
- campaigns concerning environmental problems supported by national governments, nongovernmental organizations (NGOs), multinational corporations have been launched;
- international environmental affairs has become a major subject of teaching.

Hama Arba Diallo, executive secretary of the United Nations Convention to Combat Desertification (UNCCD) said: "Perhaps the only concept as heavy laden with multiple agendas as globalization is 'sustainable development'".

The European Association Agreement stipulates that Member States development policies must be guided by the principle of **sustainable development**¹⁹⁶ in order to achieve a form of

¹⁹⁴ "Policy" is hardly a precise term, but it is used here as defined by the **Oxford Reference Dictionary** (1986) as "a course of action adopted by a government or party or person".

¹⁹⁵ The definition of the term "governance" has varied according to the scope of decision-making power. There has been a move to a definition under which "governance, at whatever level of social organization it may take place, refers to conducting the public's business – to the constellation of authoritative rules, institutions, and practices by means of which any collectivity manages its affairs" (John G. Ruggie, *Reconstituting the Global Public Domain: Issues, Actors and Practices*, published in *European Journal of International Relations*, Vol. 10, Issue 4, 2004).

¹⁹⁶ The word "sustainability" is derived from the Latin *sustinere* (*tenere*, to hold; *sus*, up). The main meanings provided by dictionaries for *sustain* are to "maintain", "support" or "endure". However, since the 1980s **sustainability** has been used more in the sense of human sustainability on planet Earth and this has resulted in the most widely quoted definition of sustainability and sustainable development, that of the Brundtland Commission of the United Nations on

“development that meets the needs of the present without compromising the ability of future generations to meet their own needs” by integrating environmental requirements into the definition and implementation of other EU policies and activities.

The director of the Third World Network, Martin Khor, is a critic of the current globalization process. He supports the idea that the reason for the marginalization of the sustainable development paradigm and of the market paradigm has been “the strong support and aggressive advocacy of the powerful countries” for *both* results.

The needs of all countries, an assurance from the strong to help the weak, the worry about the proper development of the environment and an understanding that the state and the international community must intervene on behalf of the public interest to attain greater social equity and bring about more sustainable patterns of production and consumption, characterizes the sustainable development paradigm on Khor’s behalf.

3. Eco-Economy

As it seems, the expression of **eco-economy** belongs to the American scientist Lester R. Brown. He entitled one of his famous works “Eco-Economy: Building an Economy for the Earth” (2001). From the etymologic point of view, the origins of the term eco-economy come from the Greek *oikos*, which means house, household, habitat, citadel.

Eco-economy is synonym with ecological-economy and it incorporates the recognition of a subsystem resulted from the multiple, objective interaction of two realities: the economic reality and the ecologic reality. The origin of both terms comes from Greek: *nomos*, meaning law and *logos*, meaning science, discourse, order.

The critics of economic globalization see in the process of globalization an exacerbating of environmental problems. Economic globalization leads there for to:

- a decrease in the ability of national governments to cope with environmental management problems;
- an increase in corporate power and reach;
- an enlargement of environmentally destructive growth;
- the stimulation of particular sectors that have negative side effects;
- the commodification of resources such as water.

On the other hand, within globalization, environmental quality can be achieved through the strengthening of environmental management by improving capacities in government to manage economic affairs. It can lead to increased incomes, which in turn can lead to governmental revenues for social and environmental programs, and to an increasing international trade in resources. The Nobel economist Joseph Stiglitz has noted the result to be that “globalization today... is not working for much of the environment.” Nor, in his view, is it “working for many of the world’s poor” or “for the stability of the global economy.”

4. Environmental Policy Instruments

Governments use a number of different types of environmental policy instruments to implement their environmental policies: legislative, technical and economic-financial instruments.

The **legislative instruments** create the legal framework of the Community policy for the environmental protection. They consist of over 300 normative acts (directives, regulations and decisions), that have been adopted beginning with the 1970s; the so called *acquis communautaire*.

The term *acquis communautaire* of environment represent both the entire legislation as the whole of the policies and institutions created to certify the continuous application and development of

March 20, 1987: “sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs” (<http://en.wikipedia.org/wiki/Sustainability>).

this legislation. Regulations with an horizontal character that facilitate the process of making a resolution, developing and involvement of the civil society in the protection of the environment, and the regional legislation that refers to all the regions that make the object of environmental policies, are the categories of regulations included into the *acquis*.

According to the EU legislation, the *acquis* comprises “legal instruments covering a wide range of fields, including water and air pollution, the management of waste and chemicals, biotechnology, radiation protection and nature conservation”. Environmental impact assessment has to be carried out by the MS before certain public and private-sector development projects are approved.

The **technical instruments** ensure the proper keeping of the quality standards concerning the environment and the use of the best reachable technologies. This category consists of the following instruments:

- standards and emission limits;
- the Best Available Technologies (BAT);
- the *eco* denomination (eco-labeling);
- criteria for environment inspection in the MS.

The **economic-financial instruments** are represented by different programs, such as:

- **LIFE+** program: technological projects with environmental benefits, projects contributing to the implementation of the EU's Birds and Habitats Directive and to the EU's goal of halting the loss of biodiversity and projects that spread information about environmental issues, such as climate change and conservation.

- **Structural Funds** (European Regional Development Fund (ERDF) and European Social Fund (ESF)) and **Cohesion Fund**: financial instruments of EU's regional policy which aim to restrict the development disparities among regions and MS. The Funds participate in pursuing the goal of economic, social and territorial cohesion. For the period 2007-2013, the budget allocated represents 35% of the Community budget and is the second largest budget entry.

Economic driving forces and **market-based instruments** (MBI) are very effective to inspire accordance with the environmental policy. They are often defined, such as in the *Oxford Reference Dictionary*, as “instruments or regulations that encourage behavior through market signals rather than through explicit directives”.

These policy instruments, MBIs, such as environmental taxes, tradable permit systems or targeted subsidies, are a cost-effective way to protect and improve the environment and are often described as “harnessing market forces” because they encourage firms (and/or individuals) to undertake control efforts that are gaining acceptance as important policy mechanisms for achieving environmental protection goals.

5. Conclusions

A global environmental mechanism intends to promote collective action at the international scale and to build an integrated environmental policymaking and management framework concerning the tasks of a shared global ecosystem.

Gaps in issue coverage and, sometimes, even contradictions among treaties and organizations with environmental responsibilities have undermine result-orientated actions.

The eco-economy incorporates the recognition of a subsystem resulted from the multiple, objective interaction of two realities: the economic reality and the ecologic reality. Within globalization, environmental quality can be achieved through the strengthening of environmental management by improving capacities in government to manage economic affairs.

The strategies of governments improve the quality of the environment and they support the Member States and regional and local authorities in implementing policies and environmental legislation. Legislative, technical and economic-financial instruments represent different types of environmental policy instruments to implement governments' environmental policies.

On the other hand, the critics of economic globalization see in the process of globalization an exacerbating of environmental problems. The goal that wants to be achieved in liberalized trade and investment flows should be complemented by efforts in the environmental and social areas. The encounter is to combine the environmental protection with continuing economic growth in an over the long term sustainable way.

In a globalised economy transport is one of the most important factors linking the national economies and maritime transport is the main way to deliver goods in international trade. For any international company, choosing the appropriate transportation as part of the logistic solution is vital for its competitiveness. In the context of the economic crisis, CEE strategic location factors play an important role for regional companies which adapt and change their logistic services by developing new scenarios for the shipping industry in order to obtain a better position on the global market. In addition to a favourable geographical location CEE has several other important arguments, like sufficient harbours for developing container terminals to launch extensive container transport transit. The most important recent trends in logistics are shown, as well as the framework of the EU maritime transport.

Key words: maritime transport, EU transport strategy, supply chain strategy

Cod JEL: L91, L98, L52.

1. Introduction

In Europe there are over 1200 commercial harbours spread over 100 000 km of coast, many of them benefiting from the European funds. Improving the competitiveness of the maritime transport can bring important benefits to the whole economy. Approximately 40% of internal commerce goods and almost all goods destined for the international commerce are transported by sea. This sector represents an important source for jobs and income in Europe. Every year, over 400 million passengers and over 3.5 billion tones of goods pass through the European ports. Using the rapid growth of international commerce in the last decade, the maritime goods transportation sector in Europe has also developed considerably, companies investing important amounts of money in fleet renewing and extension. These companies face a fierce competition due to the firms that apply inferior safety measures. The instability of energy markets and piracy also stop the development of maritime transportation.

The purpose of this study is to increase understanding of the opportunities for improving freight logistics and transport in Europe, identify obstacles to change and recommend measures that would enhance the competitiveness of European industry and services. The article focuses on some key topics: the main driving forces behind changes in the location of economic activities in Europe, how are these decisions influenced by supply chain management considerations and what initiatives would improve the efficiency of European freight logistics and transport. The most important recent trends in logistics are towards: shorter order cycles, more frequent, more reliable deliveries, closer relationships with only few of the suppliers, greater use of IT systems

and outsourcing logistics; the future of E-commerce, and the impact which this will have on logistics is still to be determined¹⁹⁷.

2. Literature review

The paper is presenting a synthesis of the recent research works in transport and supply chain management. The *supply chain management* is considered by **Hung et al (2004)** to be used in the literature with different meanings, such as: purchasing and supply; transportation and logistics; marketing; and level of coordination. According to **Mak and Ramaprasad (2003)** *supply chain management* is “a set of approaches utilized to efficiently integrate suppliers, manufacturers, warehouses, and stores, so that merchandise is produced and distributed at the right quantities, to the right locations, and at the right time, in order to minimize system-wide costs while satisfying service level requirements”. A lot of research has been made regarding supply chain management, but according to **Sanchez-Rodrigues, Potter and Naim (2010)** “little research has been undertaken including transport operations as a strategic member of the supply chain, with hardly any work on the impact of uncertainty on transport operations within supply chains”. In the maritime transport sector, the effort to obtain economies of scale and a certain level of control over the logistic function are influenced by services globalization, the development of the container system transportation, the transport alliances and transport concentration in a small number of ports (the so called hub ports). The role of ports has changed now, transforming them into freight distribution hubs¹⁹⁸.

Sanchez-Rodrigues et al. (2007) cited by **Sanchez-Rodrigues et al (2010)** develop a logistics-focused uncertainty model. The Logistics Uncertainty Pyramid Model includes the following uncertainty sources that can affect transport operations: shipper, customer, carrier, control and external uncertainty. The research conducted by **Sanchez-Rodrigues et al (2010)** suggests the following causes of transport uncertainty: delays, demand and information issues, delivery constraints and lack of coordination. *Delays* appear to be very important for shippers, customers and providers, hence affecting all logistic chain members. *Demand and information issues* were considered the second most important barrier to achieving a high level of logistics performance; *delivery constraints* are considered to be another important barrier in transport operations, as they can cause potentially delays. Finally, *lack of coordination* within the logistics chain and at the company level can cause disruptions in the delivery process.

Few companies are self-sufficient, therefore the dependence on other firms. When their resources and competencies are not sufficient, firms are likely to establish connections with other organizations on the market that are able to offer the needed services. According to **Fugate et al. (2009)** “in a supply chain environment, buyer-seller arrangements involve other entities as well, such as third-party organizations (e.g. transportation providers)”. Mentzer et al. (2001), cited by **Grawe (2009)** considers that “an effective logistics operation can provide a competitive advantage for a firm and increase a firm’s market share”. Logistics can also enhance customer value and logistics managers consider that it adds value to the company.

Monczka et al. (2005) cited by **Meixell and Norbis (2008)** thinks that “mode choice and carrier selection are part of the decision-making process in transportation that includes identifying relevant transportation performance variables, selecting mode of transport and carrier, negotiating rates and service levels, and evaluating carrier performance”. Choosing the appropriate transport solution is very important, as it represents an average of 20% of total production costs.

¹⁹⁷ Freight Logistics and Transport Systems in Europe. Trends in the location of European industry and its interaction with logistics and transport, European Council of Applied Sciences and Engineering Euro-CASE, 2000

¹⁹⁸ Short sea shipping in Europe, Volume 772, De European Conference of Ministers of Transport. Combined Transport Group

Meixell and Norbis (2008) reports that transport industry challenges are nowadays transportation capacity shortage, international growth of economic activities, economies of scale and scope, security concerns and environmental and energy concerns.

Transportation capacity shortage has surfaced in logistics management. Capacity limitations have an impact on all carriers; therefore their capacity to overcome these limitations will help to differentiate from current competition.

Global transportation involves higher cost and longer transit times, making *international growth* an important challenge in supply chain management.

Economies of scope are “readily apparent relative to the use of transportation equipment after it is emptied, while *economies of scale* are a concern relative to shipment size. There is a strong incentive to ship in full truckloads to minimize the cost associated with the considerable capital expenditure for equipment. Economies of scale are also affected by the handling of inventory” considers **Meixell and Norbis (2008)**.

Security in the supply chain is also very important thinks Russell and Saldanha (2003) cited by **Meixell and Norbis (2008)**, the consequences being “an additional \$151 billion annual cost, \$65 billion of which is in logistical changes to supply chains. How can this problem be solved? “By selecting security-conscious carriers, shipping via secure ports, meeting packaging security requirements, and providing background information on key personnel” considers Rinehart et al. (2004) cited by **Meixell and Norbis (2008)**.

Environmental and energy concerns presents a challenge to logistics managers, as environmental impact is increasingly important to consumers, being known that transportation sector is a major contributor to air pollution, acid rain, maritime water quality problems.

3. EU legal framework for the maritime transport

Transport is an essential component of the European economy. The transport industry at large accounts for about 7 % of GDP and for over 5 % of total employment in the EU. The present situation of the supply chain system in CEE area has been from manufacturer-led to retailer-led supply chains (from “push” to “pull” supply chain economics). Transport and logistics have relatively little effect on the global location of primary activities – the manufacture and sale of final products. This is determined by markets, labor conditions, financial incentives, and the social or cultural preferences of senior management. However they influence regional and local location decisions where site accessibility is a significant factor¹⁹⁹.

In the maritime sector, marine pollution and maritime accidents were considerably reduced and the EU has established one of the most advanced regulatory frameworks for safety and for pollution prevention. Safety agencies have been set up also for aviation (EASA), maritime affairs (EMSA) and rail transport (ERA)²⁰⁰.

In 2009, the third maritime safety package has been adopted by the European Parliament. With the adoption of the first two legislative packages on maritime safety (the so-called ERIKA I and II packages), the message delivered by the EU being that substandard shipping would no longer be admitted.²⁰¹ The EU has proposed guidelines for the development of an integrated maritime policy, which constituted one of the Commission’s strategic objectives for the period 2005-2009²⁰².

These guidelines form a central part of the Communication on an Integrated Maritime Policy for the EU (Blue Paper) adopted by the Commission and approved by the European Council in 2007

¹⁹⁹ Freight Logistics and Transport Systems in Europe. Trends in the location of European industry and its interaction with logistics and transport, European Council of Applied Sciences and Engineering Euro-CASE, 2000, p. 8-9

²⁰⁰ A sustainable future for transport. Towards An Integrated, Technology-Led And User-Friendly System, Directorate General for Energy and Transport, European Commission, 2009

²⁰¹ http://ec.europa.eu/transport/maritime/safety/third_maritime_safety_package_en.htm.

²⁰² http://europa.eu/legislation_summaries/maritime_affairs_and_fisheries/maritime_affairs/pe0003_en.htm.

and are part of the United Nations' 1982 Convention on the Law of the Sea and the World Summit on Sustainable Development in Johannesburg in 2002. Member States are encouraged to *establish their own integrated maritime policies* in close collaboration with their national and regional maritime stakeholders, should consider *creating internal coordinating structures* within their government frameworks and all *maritime stakeholders should participate in integrated maritime policy-making*.

“Maximising sustainable use of the oceans and seas while enabling growth of the maritime economy and coastal regions is the prime objective of an integrated maritime policy for the EU” according to the European Commission; therefore the following measures will be taken:

- create a strategy to alleviate the consequences of climate change;
- enhance professional qualifications and studies in the maritime field;
- create a European maritime space without administrative or customs barriers as well as a comprehensive maritime transport strategy for 2008-2018;
- issue guidelines on the application of environmental legislation relevant to ports;
- promote technological innovation in the shipbuilding and energy sector;
- support international efforts to reduce pollution of the atmosphere and greenhouse gas emissions attributed to ships;
- build a knowledge and innovation base for the maritime policy.

The Commission Green Paper: Towards a future Maritime Policy for the Union: a European vision for the oceans and seas is in line with the Lisbon Strategy and aims to obtain sustainable development by reconciling the economic, social and environmental dimensions of the exploitation of the seas and oceans. The EU is the biggest maritime power in terms of maritime transport, coastal tourism, offshore energy production, shipbuilding technologies and related services.

The EU is also the leader in building of cruise ships, renewable energy and ports. The Green Paper examines the factors influencing competitiveness: the state of the marine environment, scientific knowledge in all areas relating to the oceans, innovation and the expertise of the workforce. Maritime policy “forms part of the Lisbon Strategy by proposing to exploit synergies between regional policy and policies on fisheries, research and innovation, businesses, maritime transport, the environment and energy in order to promote sustainable development”²⁰³.

4. CEE's arguments in logistics

In the context of the economic crisis, CEE strategic location factors play an important role for regional companies which adapt and change their logistic services by developing new scenarios for the shipping industry in order to obtain a better position on the global market. Together with further deepening of the single market, integration of the EU with neighbor regions will continue. Globalization, enabled by the liberalization of trade and by developments in transport (such as reefer containers) led to enhancement of the world economy. Transport outside Europe will increase much more than inside Europe and EU external trade and transport are likely to keep growing rapidly in the coming years.

SWOT Analysis

Strengths

- Low labor costs, compared to the ones in Western Europe; the problem is now if this opportunity will remain with the EU accession of CEE countries.
- Workforce is literate and speaks foreign languages.
- Lower operating costs are provided by the difference in labor rates, generating net savings.
- Delocalization of R&D centers in CEE means that companies can develop products adapted to

²⁰³ http://europa.eu/legislation_summaries/maritime_affairs_and_fisheries/maritime_affairs/166029_en.htm.

the targeted markets.

- The Black Sea represents a main maritime transport way in Europe, and Romania has access to it; it also has access to the Danube, a very important important way of, which has a total 2411 km navigable, 78 ports and 1100 ships registered in 30 states.

Weaknesses

- The EU is on its way to create a level playing field in the increasingly integrated transport market, but issues such as differences in taxation and subsidies still need to be addressed.

- The environment remains the main policy area where further improvements are necessary. In the EU, compared with 1990 levels the transport was the sector with the biggest growth rate of greenhouse gas emissions.

- Lack of enough intermodal nodal points.

- Not enough developed port infrastructure.

- The logistic market started to have a negative rate last year, as the quantity of logistic spaces delivered has decreased from 250.000 in 2008 to only 50.000 in 2009 in Romania, for example.

The rate of usage of logistic spaces also decreased from 96% in 2008 to 88% in 2009.

Opportunities

- The demand for freight transport in the EU grew on average by 2.7 % per year. The growth of freight transport is also linked to economic practices (concentration of production in fewer sites, to economies of scale, delocalization, JIT deliveries) that allowed reduction of costs.

Threats

- Environmental challenges

- Transport will suffer from the effects of climate change and will necessitate adaptation measures. Global warming resulting in a rising sea level will amplify the vulnerability of coastal infrastructures, including ports.

- Increasing scarcity of fossil fuels.

- The economic crisis that affects this sector of activity also.

5. Conclusions and future research

The purpose of this study was to show the role of transport policy in Europe, as transportation represents more than only a problem of cost, distribution playing an important role in obtaining a competitive advantage. "The performance of the transport carrier may influence the effectiveness of the entire logistics function of a company", as it is considered by **Meixwell and Norbis (2008)**. The results of this study also reveal the presence of a regulatory framework of the maritime transport in the EU and also show, through a SWOT analysis the main arguments that CEE region has regarding the logistic system.

HARMONIZATION OF THE APPROACH AND PRACTICES RELATED TO THE STATE AID IN THE INTENTION OF STATES TO INTEGRATE IN THE EUROPEAN UNION

Chiriac Mirela

University “Lucian Blaga” of Sibiu, Faculty of Economic Sciences

Caraganciu Anatolie

University “Lucian Blaga” of Sibiu, Faculty of Economic Sciences

State aid is seen as a threat to the competition environment. It is justified only when it is granted for covering the deficiencies appeared on the market, or it is used as an instrument for structural changes promotion. Thus, the goal of policy in the state aid field is, on the one hand, to realize equilibrium between the necessity and admissibility of state interventions on the market and, on the other hand, to protect loyal competition. The extension of the European Union in the Central and East-European zone involved a careful attention on the harmonization of state aid policy of the candidates. In order to prevent the “import” in the European Union of the incompatible state aids at the date of adhesion, a complex mechanism for the candidate countries was established. An interesting example which is analyzed in the framework of the topic is the case of the Republic of Moldova, where the state aid exists, but until now there is no legal framework in the field.

Keywords: state aid, competition, integration, harmonization.

JEL: F02, F55, K00, K42, N44, P21, P27

State aid has its origins at the beginning of the European Community. Provisions prohibiting state aid were already included in the Treaty of Coal and Steel Community. Anyway, the Treaty of Rome from 1957 introduced a series of exceptions from the general principle of interdiction and offered to the European Commission the exclusive right to authorize state aids that obey to some rules. After more than 50 years the provisions on state aid remain the same, even if the modernization process hallmarked the competition and state aid fields.

Art. 87 of the Treaty of the European Union prohibits the granting by Member States of financial aids to the economic agents, no matter their form, but also lists a series of circumstances in which such measures of financial aid can be, exceptionally, approved by the European Commission.

The granting of aids can be completely justified when these are granted in the goal of covering the deficiencies appeared on the market, or when these are used as an instrument for structural changes promotion; in this framework, state aids serve a common interest, because they contribute to the development of a competitive industrial structure, having, in consequence a decisive role in the creation of labor places. The intervention of state can take place along with different policies promoted by the state, as regional, research and industrial policies, etc. But these interventions should not harm competition.²⁰⁴

A support measure adopted by the state will be qualified as state aid according to the art. 87 of the Treaty of the European Community and is usually prohibited if it cumulates the following four conditions:

- Implies the use (direct or indirect) of the financial public resources;
- Confers an advantage to the beneficiary/beneficiaries;
- Is selective;
- Distorts competition, with negative effects on the trade among Member States.

It has to be mentioned that only if all those four conditions are fulfilled, then we can speak about state aid in the sense of art. 87 (1) of the European Union Treaty. This means that if all four conditions are not fulfilled, then the rules on state aid do not apply.

²⁰⁴ Falon Marc., Droit matériel général de l’Union Européenne, Edition Academia-Bruylant, 2002 p.353

Following the above-mentioned, the goal of policy in the state aid field is, on the one hand, to realize equilibrium between the necessity and admissibility of state interventions on the market and, on the other hand, to protect loyal competition. That is why a significant part of the European competition legislation is dedicated to the regulations on state aid.

State aid plays a significant role in the development of a viable and functional market economy. That is why, the efficient application and implementation of a policy in the field of state aid represents a very important component of the enlargement process of European Union.

Thus, the extension of the European Union in the Central and East-European zone involved a careful attention on the harmonization of state aid policy of the candidate countries. This has been determined by the fact that before the adhesion the governments of the given states, being in transition process, had a bigger freedom in granting state aids, because there were no principles or strict rules related to the protection of competition environment from distortions that may have been caused by the state aids. Before the transition period, in the Central and East European countries subsidies were largely used. The real production costs were not reflected in the price, which lead to losses or extreme profits registered by some enterprises, “failures” that were immediately covered by budgetary subsidies or taxes. As the cost production was different from an enterprise to another, the same was the level of subsidies, each of them reflecting specific features of enterprises.

In the period of transition to the market economy, Central and East European countries have tried to reduce budgetary subsidies and to pass gradually to the liberalization of prices. Thus, the majority of budgetary subsidies granted to the enterprises have been eliminated from those sectors in which the liberalization of prices began. More by token, the revenue tax has been equilibrated, the taxes on turnover have been rationalized, and the ad-hoc exemptions were abolished.

Initially, those transformations caused a momentary disequilibrium in the economy. State enterprises began to have serious difficulties, manifested by the decrease of internal demand because of import liberalization, the decrease of exports provoked by the collapse of the Council of Mutual Economic Aid, etc. The above-mentioned problems had a chain effect that have led to the inter-enterprises’ debt increase. Moreover, the unemployment rate increased. In this situation, the government of countries undertook some actions so that enterprises survive, granting aids to state companies, an aid which, in many cases only delayed the bankruptcy because it was not oriented to the necessary restructuring of those enterprises. It has to be mentioned that in the planned economy many enterprises had a monopolistic or oligopoly position, and their bankruptcy could provoke the chain collapse of the furnishers who were dependent on those companies.

In most of the cases governments granted support to enterprises only until the privatization started. The given process in these countries knew a series of combined methods: tenders. Public bids, selling the social parts to the employees and managers, etc. The biggest problem resided in the fact that the reserve of private savings was too reduced for the procurement of industrial goods at very low prices.

The above-related facts lead to the conclusion that state aids had a more controversial history in the Central and East European countries. Thus, the principles of the policy in state aid field benefited of a greatest attention in the process of European Union enlargement in the Central and East European zone.

At the beginning of the 1990, the European agreements began to be implemented, fact which gave a new approach to the trade between the European Union and Central and East European countries. According to these Agreements, the countries obliged themselves to harmonize their legislation with the one of the European Union, including rules concerning the competition in sectors that were affecting the trade among the two parties.

A little bit later, in 1993 European Council of Copenhagen defined criteria that had to be fulfilled by the candidate countries to the European Union. Among the requirements there was also the existence of functional market economies, which would have the possibility to face the pressure of competition and market forces of the European Union. Adhesion negotiations that began in 1998 determined the conditions to be fulfilled by every country candidate to the European Union, basing on the principle of adoption, implementation and application of the Communitarian Acquis by the candidate countries, i.e. laws and detailed rules adopted on the basis of European Community Treaty.

In practice, every new candidate must establish a monitoring authority of state aid, which would analyze the allocation of state resources, for establishing whether these are or are not state aid under the article 87 of the Treaty, as well as if those have been or have not been compatible with the common market. Where it is identified that state actions are incompatible with the Communitarian Acquis, the states are obliged either to adapt them to the Community requirements and rules, either to gradually eliminate them.

The progress in the state aid field has been much slower than that in the antitrust policies domain; this has been the situation until 2001 when more coherent regulations on state aid have been adopted. Enterprises, including public ones, had to accustom to function without any financial support from the state, and the public organizations involved in the guaranteeing of aid – with ex ante notification procedures.

In the result of efforts for adopting the adequate legislation and for nominating the authorities to implement it, the negotiations were concluded. The given negotiations, referring to all the countries and less to Bulgaria and Romania, ended at the European Council of Copenhagen in December 2002 and the Adhesion Treaty was signed in Athens in April 2003. From the autumn of 2002, the Scheme of Supervising State Aid offers a more clear vision on the process of enlargement and on the negotiations.

In order to prevent the “import” in the European Union of the incompatible state aids at the date of adhesion, a new mechanism for the candidate countries was established, a mechanism designated to examine the measures of state aid granted before 1 May 2004 and which is still applied after that date. This is well known as “the mechanism of existent aid”. The goal of this mechanism is to offer a guarantee concerning the measures of aid from the state, applicable after the adhesion date also. The mechanism applies for the state aid in all the sectors, less for agriculture and transportation, for which there are some specific provisions.

In the Adhesion Treaty it is stated that the programs of aid and the individual aid that have been adopted in a new member state before the adhesion and are applicable after the adhesion should be considered as existent aid according to the Article 88(1) of the European Community Treaty if one of the following conditions is fulfilled:

-measures of aid that entered in force after 10 December 1994 have been automatically considered existent aids starting with the date of adhesion;

-measures proposed by the candidate states in 2002 have been examined by the Commission under the provisions of the Acquis on state aid; measures considered to be in conformity with the rules on state aid and have been qualified as existent aid and included in the list attached to the Adhesion Treaty. This list has been finalized in November 2002;

-for the non-accepted measures in the list attached to the Treaty and for those enlisted after its finalization and until 30 April 2004, there has been introduced the so-called “interim procedure” for the existent aid, according to which, the candidate states proposed to the Commission a series of measures for analysis. The Commission approved all the measures that were compatible with the laws on state aid. When the Commission doubted about the compatibility, it was initiating an investigation procedure to be enforced on the adhesion date. The notion “applicable after adhesion” represented a crucial factor in making the decision of assessing a certain measure by

the Commission, because that one could not reject measures that were not “applicable after the adhesion”.

The given notion was referring the following types of aid: schemes of aid, considered to be “applicable after the adhesion” if, from the date of adhesion the granting aid could still be made on the basis of those schemes without any additional measures’ implementation; the aid that was not connected to certain projects and which has been granted before the adhesion of one or more enterprises for an undetermined period of time or for an non-precise sum; measures concerning individual aid for which the level of aid originated from the state were not known at the moment of granting the aid.

All the measures applicable after the adhesion, which were considered state aid but which were not fulfilling the above mentioned conditions of existent aid, have been considered as new aid granted after the adhesion. The classification of a measure as existent aid, in opposition to the new aid has a very important consequence: the Commission can immediately initiate the formal investigation procedure regarding the new aid that does not correspond to the interim procedure. If it is proven that the given aid is incompatible with the Treaty provisions, the Commission will decide to retrieve it from the beneficiaries. In contrary to the new aid, an existent measure of aid is “protected” from the actions of the Commission since it is the subject of a cooperation procedure between the Commission and the Member States.

The beginning of transition period was more difficult for the economies of former communist countries, some of them being characterized by the existence of important industrial sectors which were functioning on the basis of huge volumes of subsidies from the government. Among those countries 8 were candidate to the adhesion. The European Union started the negotiations with candidate countries from the principle of equal chances among local private firms, potential foreign investors for those economies and big companies and, as a consequence, tried to eliminate any state intervention in this domain. All the agreements signed before the adhesion provided complete alignment of these new member states to the norms and legislation of the European Union in the sphere of state aid.²⁰⁵

European Commission proposed, during the pre-adhesion negotiations that every state establishes a national authority for the supervision of state aids. The measure has been implemented with quiet great difficulties by the given states. Negotiations in the field of competition policy have been finalized without demands of exception or delay with 4 of 10 candidate countries (Baltic States and Slovenia) in 2001, while in the case of the other 6 countries some open questions remained and some transitional arrangements have been accepted, most of them related to the fiscal crediting schemes, designed to attract foreign investors and to restructure steel industry.

In the last year, European Commission (DG Competition) launched a special program of consultations designed to define a special Plan of actions and a set of clear regulations, oriented to the increase of competitiveness in the field of state aids.²⁰⁶ The document has been finalized before 2007 and has been transformed in legislative set, clearly defined, applicable in all the EU Member States, which provides some ex-ante rules for the state aid:

- state aid can be authorized by the European Commission to be granted at the notification of the given member states, following certain guiding lines and in certain special domains of an interest to the European Union in general;
- regional development for covering the disparities created in a discriminatory way; research-development-innovation; environment protection; restructure or saving some firms in difficulties; capital of risk - are the above-mentioned domains;

²⁰⁵ Ciupagea C., Atanasiu I., Câmpeanu V., //Analiza și evaluarea evoluțiilor în plan economic, social, legislativ și instituțional în cazul noilor state membre ale Uniunii Europene. Studii de Impact. Studiul 9// Institutul European din România - p.83

²⁰⁶ “State Aid Action Plan. Less and better targeted state aid: a roadmap for state aid reform 2005-2009”, Consultation Document, DG Competition, EC, Brussels, 2005

-state aids will be more easily accepted if they will envisage the increase of innovative capacity and the development of small and medium size enterprises or if they will be designed to develop the human capital (training, jobs creation, etc).

In the framework of the subject concerning the harmonization of policy in the state aid field by the states that intend to integrate in the European Union, an interesting case is that of the Republic of Moldova. If the European Union has a performing normative framework in the field of state aids, the Republic of Moldova did not even define legally the state aids and has no mechanism of evidence of the latest until now.

But, the Republic of Moldova undertook international obligations to abstain from the granting of state aid that distorts or risks to distort competition, as well as to create a national mechanism for centralizing the information concerning the state aid.

Partnership and Cooperation Agreement between the European Union and Moldova²⁰⁷ (hereinafter referred to as the Agreement), as well as the Action Plan European Union - Republic of Moldova, establish that Moldova should undertake the Community Acquis in the field of state aid.

Art. 48 of the Agreement establish the obligation of the parties of the Agreement to action as to remedy or eliminate, through the application of its laws referring to competition or through any other methods, the restrictions related to the competition of enterprises or those resulting from the intervention of the state, to the extent to which those can affect the trade between the Community and the Republic of Moldova.

In the frame of the obligations established by the Action Plan European Union - Republic of Moldova, the National Agency for the Protection of Competition drafted the Law on state aid. Currently the unique legal tool in the field of state aid in Moldova is the Law Nr. 1103-XIV from 30.06.2000 regarding the protection of competition and, until de adoption of the Law on state aid, the competition authority of Moldova follows to take as legal basis the above mentioned law, especially art. 9, which prohibits the unjustified granting of fiscal or any other type of facilities to the economic agents so as to create them a privileged situation against other economic agents on the same market of goods.

Nowadays, in conditions of a lack of normative framework of state aids, it is impossible to monitor the state aids granted in the Republic of Moldova. Thus, all the state aids in Moldova can be divided in two categories:

-state aids granted on the basis of a normative act (laws and government decisions);

-state aids granted on the basis of an administrative act.

If the normative and legal acts are public, being published in the Official Monitor, then the administrative acts adopted by local public authorities and other institutions that manage public resources very often are not public and can only be discovered after a control over the management of public financial resources. Often the state aids granted on the basis of administrative acts are considered to be illegal and this is confirmed by the Reports of the Court of Accounts of the Republic of Moldova.

Analyzing the state aids granted in Moldova we see that there is a lack of unique support program for the autochthon enterprises. In many cases state aids are granted with a lack of transparency and with infringements to the law. The lack of normative framework in the field of state aid allows the majority of state interventions in the economy through financial support offered to enterprises to be qualified as infringements to the law. It is also obvious that in conditions when the legal framework of state aid lacks, many of the beneficiaries of state aid have been selected without an economic justification, in function of circumstances.

²⁰⁷ Partnership and cooperation agreement between the European Community and its member states, on one side, and the Republic of Moldova on the other, adopted on 28.11.1994 in Bruxelles, ratified through the Parliament Decision nr. 627-XIII from 03.11.1995

Still the state aids in Moldova exist and this fact cannot be ignored, but the current system of granting them is characterized by inefficiency, non-transparency and bureaucracy. Thus, there is an urgent need for the elaboration of normative framework of state aids in Moldova and for the establishment of a mechanism for centralizing and monitoring the information on the granted aids.

The well known fight for staying in the hegemonic race of US-EU-Japan axis was perhaps too brutally interrupted by a seemingly simple economic and financial crisis that occurred in 2009 on the EFS world stage. Only that, from then and until now a seemingly endless series of debates and analysis to restore the steps of the community on the world scene like a magnet attracted the attention of the media and not least the politicians. Could it be an unanimous conclusion? Well, it seems that the problem of the intelligent reconstruction seems to cause many raids such as financial and economic espionage, which complains about the lack of sustainable ethical conduct generally valid. Of course that will be required in this particular neo-landscape specific to the 3rd millennium an intelligent neo-mix anchored to public and private forces, in order to reach the capacity to influence the power required by the trend of the XXI century.

Key-words: globalization, reconstruction, sustainability

JEL Classification: M – Business Administration and Business Economics; Marketing; Accounting

M1- Business Administration, M19 - Other

Starting from the premise that, in principle, an economic and financial crisis can be perceived by a corollary of faces, tools and actions and considering the neo-script EFS (economic-financial-social) present, we are able to appreciate that any country, region or area belonging to the spectrum M3 (micro-macro-mondo economic) present has to discern mechanisms able to bring a range of financial and economic growth and pass the unwanted episode from 2009. The past must load with effective strategies and tactics found in this XXI century, which must cope with reduced state budget, in the conditions of more and more unintelligent micro-macro economics allocations.

Such steps should be eliminated in perspective and aligned with actions able to match the landscape found in the EU area, in order to obtain a specific action model, capable of incorporating sustainable development compatible with current EFS environment. However, the proposals in June 2001 that defined sustainable development as a mechanism for meeting the needs of present generations without compromising those of future remained only a goal. Yet, such interesting approaches remain noted in several agendas of the European Commission meetings.

It would be beneficial to understand that such approaches do not allow a future extension without horizon, remains suspended pending as long as global crisis' waves (Martin, H.P., Schumann, H., 1999) flood the world from end to end, visible narrowing the states' action instruments seen individually. And although the term "sustainable development" dates back more than 30 years, one applicable generally valid mechanism was not even drafted and implemented.

In this context, a community state neo-vision and not only should comply proactively to be able to outline such a policy mechanism. It can also bring into question a true Community therapy able to answer a corollary of the essential issues of which the most stringent considering:

- identify risks that haunt EFS systems at M3, so it can be constituted on time effective blocking barrier, resulting in these efforts costs and minimal resources;
- possible development of a realistic benchmarking, able to provide understanding and arguments which regulates generic markets, upstream and downstream on value creation chain;
- adapting to the sinuous pressures brought by risks that are not carefully analyzed what claims community audits, able to ensure a balanced financial maintenance from the perspective of well known cost-benefit equation;
- understanding the Community growth strategies with a correct decision-making approach able to be permanently activated to Community feedback, which will ensure a proportionate approach to available resources to be involved in the strategies followed.

If we assimilate in a proactive way all these elements operational-conceptual then we can merge into a systemic mix that could be represented as:

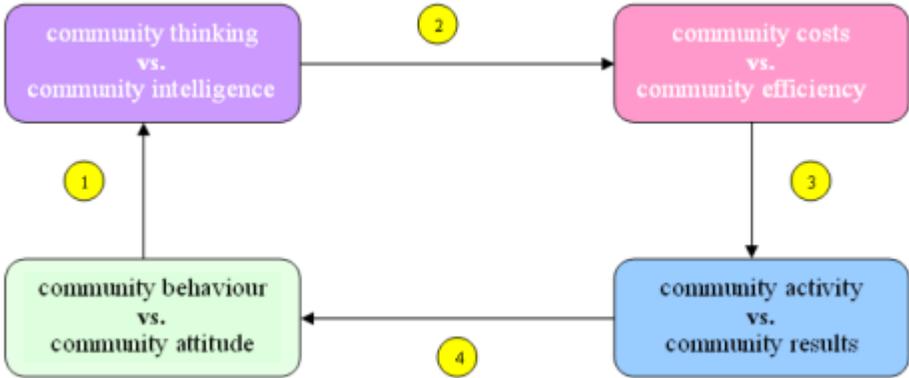

Fig.1. Reconfiguring the euro area mentality in a pragmatically neo-direction
 Source: made by authors

Starting from the 1-4 system, the involved changes consistently and logically requires evaluation of their effects in terms of a set of neo-retrieve factors at C3 (quantity, quality, competitive) so as to be able to bring a balanced assimilation, sustainable on micro-macro economic level. If this mechanism will in fact be implemented at Community level, we consider that the results currently posed ESI (economic sentiment indicator) may remain anchored to continue growing.

Fig. 2. ESI (Economic Sentiment Indicator)
Source: Business and Consumer Surveys, March 2010

If in March 2010 ESI has enjoyed a positive impetus to reach the level of 99.6 (+ 2.0 points) in the EU and the 97.7 (+ 1.8 points) in the euro area, the negative breaks from 2009 should represent a strong enough signal on economic activity under pulse rate crisis (Dufour, J.L., 2002) of XXI century. 2009 was also the only one responsible for changing the apparent sustainable upward trend (taking into account the period 1991-2009) specific to the euro area, by reference only to two relevant indicators: BCI (Business Climate Indicator) and industrial production, look rendered graphics in Fig. 3.

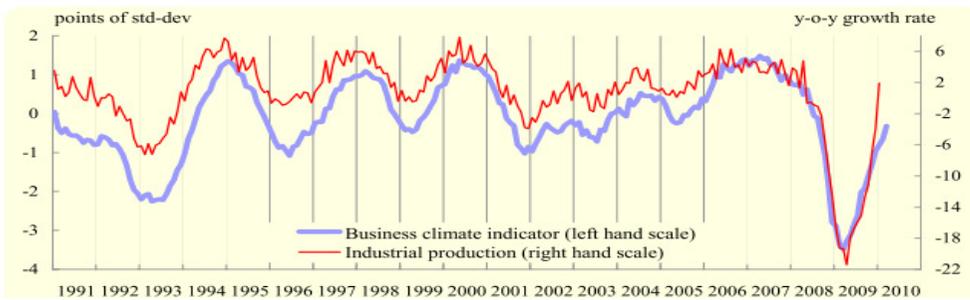

Fig.3. Business climate indicator and industrial production for the euro area
Source: European Commission services, March 2010

This can be better explained by optimistic projections of 2010, which are also strengthened by the observation of confidence indicator in industry, with complex analysis strictly on euro area, according to Fig. 4.

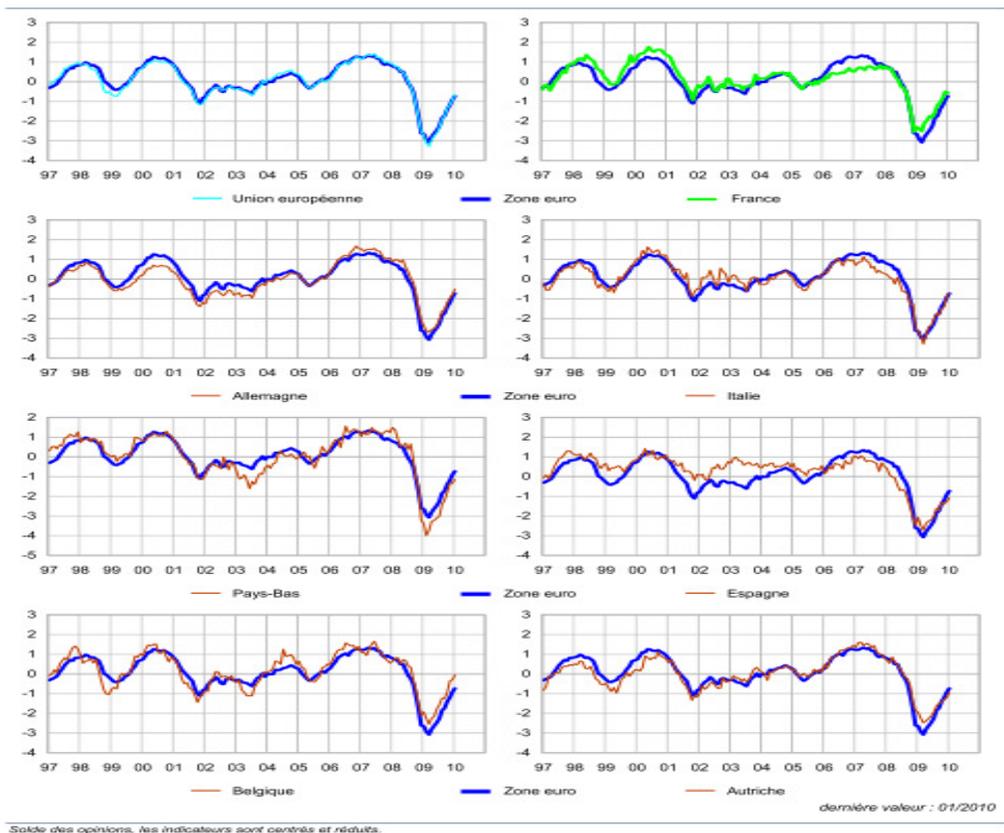

Fig. 4. Evolution of confidence indicator in industry - specific to euro area
 Source: European Commission, February 2010

And for this report extracted from the euro area covered by our present work, to be as comprehensive, relevant and transparent as possible, we consider that it must not be created niches at Community level capable of undermining the Treaty of Lisbon in 2007, which is able to guarantee various opportunities for development (Berowicz, L., 2001) of Community external relations, security, within a legal framework, and in full accordance with the rights of de facto powers of the EU.

Also a sensitive issue from the perspective of EU smart steps was found in military, the relations that line up on a M3 stage. It is therefore particularly important to reach a common ground and in long-term maintenance of European security by finding sustainable levers capable not to harm the EFS rights and interests at European level but also international. Even if the establishment of such a climate is a point of action continues in the Community, it must grasp a number of other disturbing factors which are involved in this context, able to converge dynamic to heaviness political forces EU relations' as a result of the unprecedented intensification of non-military neo-dimensions to the security community states (illegal immigration, electronic sabotage, organized crime, arms trafficking and/or drugs, etc.).

A generic superposition of such neo-patterns can reach the idea of EU decision-making mechanisms reconfiguration need in order to derive competitive actions-package, involved synergistically in the changes context undergo of the 3rd millennium EFS play. Și totuși, apreciem că situația devine cu atât mai interesantă cu cât jocul Rusiei pe scena mondială devine tot mai imprevizibil în raporturile sale cu zona comunitară care pare să rămână sub incidența unui raport de influență imaterial dar suficient de pragmatic. And yet, consider that the situation is

even more interesting with Russia's game on the world stage becomes more unpredictable in its relations with the Community area which seems to remain under the influence of an intangible report but pragmatic enough. O problemă conexă este datorată și raporturilor Rusiei cu lumea islamică, ceea ce aduce noi fricțiuni prin demersurile întreprinse de NATO (1), care rămân perpetuu în poziție de alertă. A related issue is due to Russia's relations with the Islamic world, which brings new frictions with the steps taken by NATO (Archick, K., Gallis, P., 2005), which remain perpetually in alert position.

Moreover, the context in which Russia does not seem to give up power pole inserted at the regional level, EU intelligent approach would be limited to prevailing concerns over leaving on strengthen own institutional reforms and / or grinding construction euro area, but the launch of projects able to lead Member States in a race of extra-EU cooperation likely to lead to a visible intensification of international trade so as to actively contribute to the fight for redrawing the zones of influence of geopolitical (Hlihor, Ct., 2001) and geostrategic.

It is understood that currently there is not drawn a transparent map that contains EU desirable limits and actually didn't notice until now the existence of any document to restrict de facto this right. De fapt, extinderea comunitară aflată sub incidența unui dezderat optimist nu se va intersecta cu bariere reale de opoziție statală decât în contextul în care membri ideja existenți vor solicita în mod expres stoparea acestui fenomen. In fact, EU enlargement covered by an optimistic goal will not intersect with the real barriers of state objection only in the context in which members will ask specifically to stop this phenomenon. This clearly claims taken account of common community ideals and values, as long as they are concerned, according to the laws, rights and shared responsibilities. EU forces relations in the horizon of 2015 are, clearly, under cyclical effects of benchmarking trio's USA-EU-Japan, not forgetting any moves made by China and Russia. In this case, we find it appropriate to present in Fig. 56 și situația schimburilor proprii axei input-output precum și pe cea a soldului tranzacțiilor curente în perioada 2003-2009 the situation of input-output axis trade and also the current transactions balance during 2003-2009.

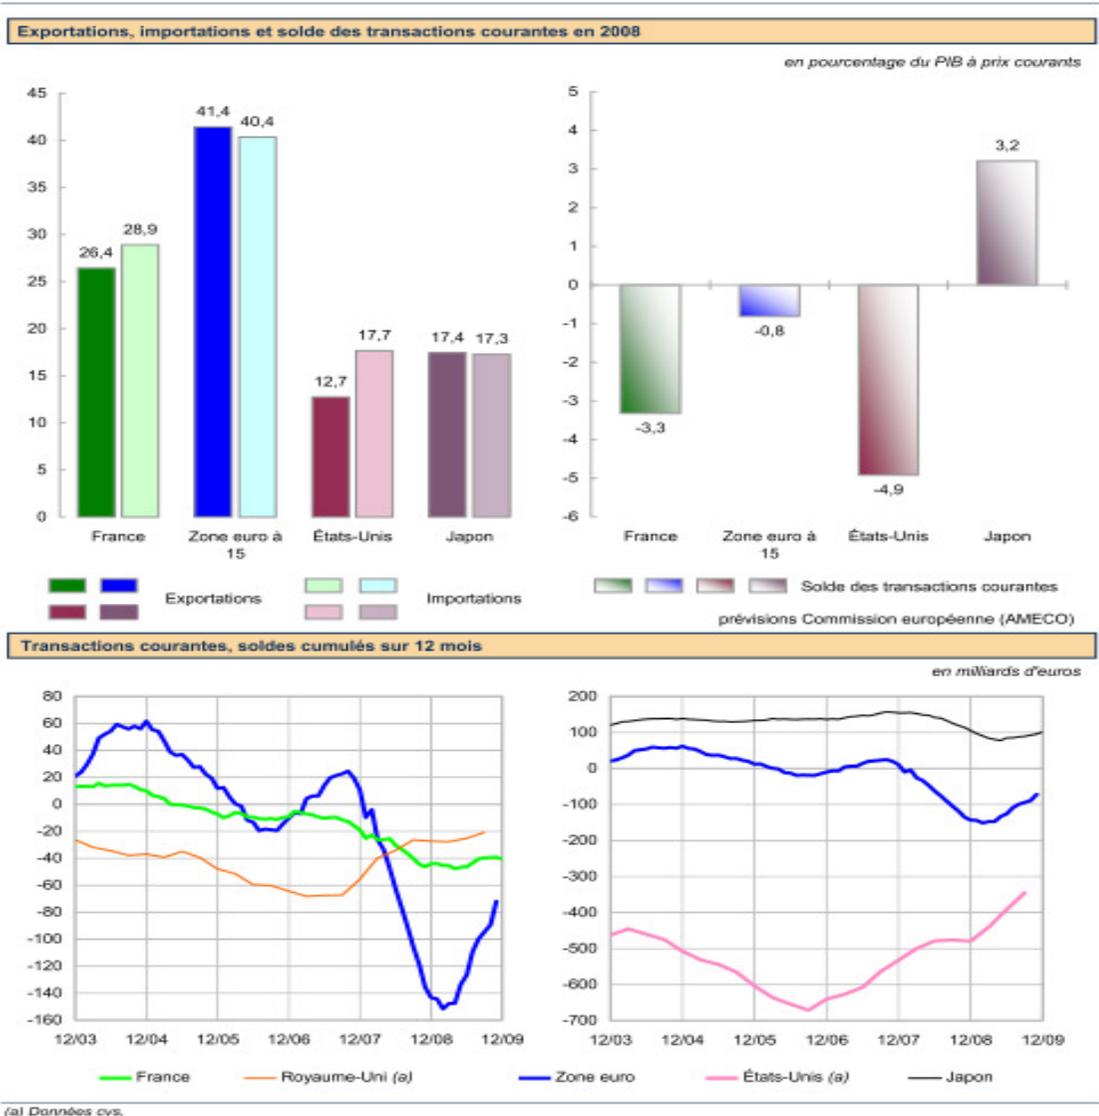

Fig. 5. Foreign trade and balance of current transactions

Source: national reports, European Commission, EUROSTAT and the ECB, February 2010

2009 economic and financial effects that translate globally, according to the principle of domino, will also remain in 2010 another coagulant factor of pressures that lurk Community stability. In this landscape the EU power can not be maintained or increased only in the context of a neo-touch intelligent assimilation, which to render neo-assets on the record of a stable democratic consistency.

This will talk more and more about the duo NATO-EU (NATO, 2001) to be maintained in the perspective of bet that the euro area can not afford to lose in the context in which he brings more than a guarantee of a strategic approach, actually representing a pact with long-term future.

Conclusions

Dynamics of an EFS uncertain horizon, which occurs after the post-2009 curtain was raised, does not provide more sustainable prospects than we expected. It is assumed that the future brings even some of past and/or present solutions, but not in such volcanic and tumultuous environment as the one specific to XXI century.

Practically, nothing could be maintained, preserved and reproduced in the current EFS neo-environment, everything was doomed bottlenecks systemic-rational (Stiglitz J. E., 2005) that practically paralyzed preparation and years of training of most active Member in the M3 stage. Therefore, awareness of new paradigms and limits of contemporary shows that the mainspring of the neo-perspectives should not be stopped but forced to pump again mobilizing energies of creative know-how at LRI level careless of power of influence which they proper said discharge (Dumitraș, C., Roșu A., 2010).

In other words, valences of the EU smart steps to maintain supremacy in the race world, must be harmonized directly in a useful, feasible and rational way, with the approaches to operational-systemic planning, directly aligned with emerging sustainable tactics. However, a comprehensive Community vision can not be extracted from a context of globalization that includes a Summum of feature and positive-negative factors, an environmental mortar mix specific to effervescent EFS precedent free and EFS and military wars (Arădăvoaicei Gh., Stancu V., 1999), which become increasingly intangible, more versatile and more inhuman. And in such circumstances a community specific area rattrapage can no longer be anchored by a forecast into the future, much less as the mechanisms of globalization in mobile contemporary born new crisis germs that "takes the form of institutional perplexity, supplementing the one of elites' power (Bădescu, I, 2009).

COMPETITIVENESS AND INNOVATION OF THE ROMANIAN COMPANIES

Nagy Csaba

Mihai Eminescu University of Timisoara, Faculty of Touristic, Hotel and Commercial Management

In front of the Romanian economy which has been integrated only for a few years, lies the challenge of competitiveness which in many cases is associated with innovation. To turn from a close center oriented economy to market economy required an enormous effort from the population and from the companies as well, but the real challenge is still to come. The requirements of competitiveness and innovation of the United European Market are compulsory, from the point of view of the Romanian entrepreneurs is vital for their survival and development. The studies made so far are not very promising. There are many things to be done, many problems are still not solved in the European Union. The European Union is behind its traditional competitors USA and Japan. This is why one of the major concerns of the EU is competitiveness and innovation.

Key words: competitiveness, innovation, development, factors.

JEL classification: O11, P25, F15, O31

The appearance of the Common European market and the economic situation of the USA and Japan required from the EU the reconciliation and putting forward of the strategies for growth and development before their national economic politics. Two documents are representative from this point of view The Agreement for Stability and Growth and The Lisbon Plan. The initial plan which wanted to turn the EU into a model of achieved competitiveness proved to be exaggerated and at the 2005 European Council held in Brussels called the results „mixed” and the unofficial results are even more drastic, the Lisbon Strategy is characterized by „*the lack of development*” (Hodson, 2005), „*failure*” (Pisani-Ferry and Sapir, 2006; Wanlin,2006), „*disappointing result*” (Kok, 2004) and even more „*a ridiculously ambitious main target*” (Wanlin (2006).

According to the data of Wanlin (2006) in 2005 the average GDP of the EU of the 15 was smaller with 27% of the GDP of the US, though in comparison with 2000 till when the productivity of the EU grew with 1.4% yearly between 1995 and 2005, then the growth in the US was 2.4% yearly. The study prepared by Bannerman (2002) showed that in the period 1990-2000 the EU reached a 3% growth only in one year in contrast the growth fell under 3% in the US only in one year. The level of the achievements of the main competitors mainly that of Japan’s and US’s secure a perfect basis for comparison regarding the level of competitiveness that must be achieved by the EU. The main objective of the Lisbon Plan says that “*an economy based on knowledge, that would be the most competitive and dynamic in the world, that is able to develop continuously, with more workplaces and bigger social cohesion*” has to be achieved till 2010. This is characterized by four things: “*growth*”, “*innovation*”, “*employment*” and “*cohesion*” plus we have to add the fifth one which was decided at the 2001 meeting of the European Council held in Goteborg taken from the idea of “*sustainable development*” regarding “*environmental protection*”.

By the middle of 2005 the accent fell on a precise target whose main objectives were directed to “*growth*” and “*employment*” but the targets multiplied on the level of communities and nationalities.

The Lisbon Strategy despite its goodwill and disputable applications appears as a reaction, a behavior which is needed because of the growing economic battles. The Lisbon Strategy does not offer a recipe for the achievement of higher competitiveness for all industries. Till now the competitiveness of the national economies was analyzed either in big lines – where more national economies were discussed World Economic Forum – Yearly Competitiveness Reports; IMD

World Competitiveness Yearbook), or in the analysis of the EU's economies, including the new member countries and the nominated countries economies (EU Commission, EU Sectorial Competitiveness Indicators, Lisbon Review, CER, The Lisbon Scorecard I,...,VI), or in the national analysis regarding the achieved Lisbon objectives mostly in the case of the national programs (in the case of Romania the GEA – *The Reports of the Group of Applied Economics and the Lisbon Strategy 2006 – National Reference Program*). The different studies cannot be compared in all respects because in most of the cases the data under discussion differ. The results of the broad reports are in favor of “*global*” indicators, while the so called “Scorecard” reports use “*structural*” indicators which use values taken from the economy and social medium, that can be aligned into a specific category from E to A where E is the least powerful value and A is the most powerful one.

The reports took into account the factors of competitiveness also but from different perspectives – the WEF is not a “*benchmark*” but it measures the respective factors with a specific method and ranks the countries according to it, while the reports based on the Lisbon Plan compare the facts to a previously planned objective. We have to mention that the objectives are determined based on the situation of the member countries which differ a lot from the situation of the new ones which sometimes make the comparison difficult or even impossible.

From the above mentioned we can conclude that beside of the fact that they used the same objectives the approaches differ, the indicators of the competitiveness are different and in such cases the different reports rank differently the same country.

Till 2005 the WEF used two indicators to determine the competitiveness of the different countries – GCI (*Growth Competitiveness Index*) and M/BCI (*Micro/Business Competitiveness Index*). Besides these the WEF in its 2006/2007 report developed a new method for determining competitiveness, which includes all the indicators of competitiveness taking into account the facts of the present and productivity in which they are used. It includes the effectiveness of the work and the flexibility of the workforce market. The factors of competitiveness can be divided into 9 groups: 1. Institutions; 2. Infrastructure; 3. Macro-economics; 4. Health and education; 5. Higher education and trainings; 6. The effectiveness of the market; 7. The level of technology; 8. The level and complexity of companies; 9. Innovation. Though these factors are common their importance varies from country to country and from periods to periods.

The WEF Report based on the phases of the factors of competitiveness speaks about ***three phases in which a country can be:***

- I. *Phase* – The competitiveness is *factor driven*. It is characterized by: the low level of education of the workforce, the existence of natural resources – which are at the basis of small prices, but the products are simple. At the same time supposes the existence of some basic requirements: institutions, infrastructure etc.
- II. *Phase* – The competitiveness is *efficiency driven*. This period is characterized by high efficiency and the good quality of the products. The competitiveness is the result of the high level of education of the workforce using the existent technologies.
- III. *Phase* – The competitiveness is *innovation driven*. This phase is based on the products which are the result of innovation and on the complex production processes.

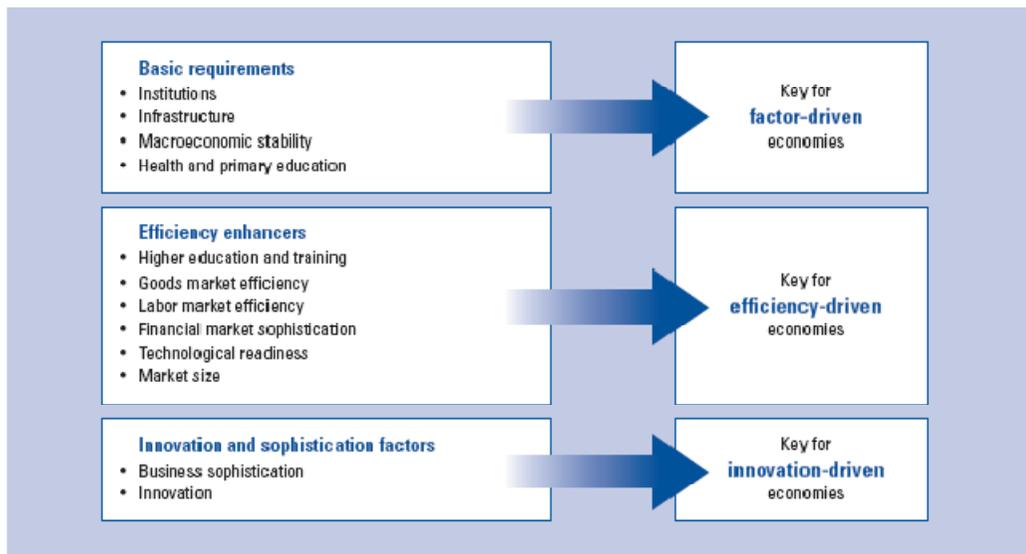

The GCI captures this open-endedness by providing a weighted average of many different components, each of which reflects one aspect of the complex reality that we call competitiveness. We group all these components in 12 different pillars that we call the *12 pillars of competitiveness*²⁰⁸. These pillars are:

²⁰⁸ It is notable that the 12-pillar index recalls the origins of the World Economic Forum's work on competitiveness, taking into account the complexity of competitiveness and the large number of factors driving productivity. Klaus Schwab's pioneering competitiveness index from the Report on the Competitiveness of European Industry (Schwab 1979), and annual competitiveness reports released over the many years that followed, was a weighted average of 10 factors that can be summarized as follows: (1) dynamism of the economy, (2) industrial efficiency and cost of

- First pillar: *Institutions*
- Second pillar: *Infrastructure*
- Third pillar: *Macroeconomy*
- Fourth pillar: *Health and primary education*
- Fifth pillar: *Higher education and training*
- Sixth pillar: *Goods market efficiency*
- Seventh pillar: *Labor market efficiency*
- Eighth pillar: *Financial market sophistication*
- Ninth pillar: *Technological readiness*
- Tenth pillar: *Market size*
- Eleventh pillar: *Business sophistication*
- Twelfth pillar: *Innovation*

The concept of stages of development into the Index are integrated by attributing higher relative weights to those pillars that are relatively more important for a country given its particular stage of development. That is, although all 12 pillars matter to a certain extent for all countries, the importance of each one depends on a country's stage of development. To take this into account, the pillars are organized into three subindexes, each critical to a particular stage of development. The *basic requirements subindex* groups those pillars most critical for countries in the factor-driven stage. The *efficiency enhancers subindex* includes those pillars critical for countries in the efficiency-driven stage. And the *innovation and sophistication factors subindex* includes all pillars critical to countries in the innovation-driven stage. The three subindexes are shown in Figure 1.

Figure 1: The 12 pillars of competitiveness

Reference: World Economic Forum, "The Global Competitiveness Index: Measuring the Productive Potential of Nations" XAVIER SALA-I-MARTIN, JENNIFER BLANKE, MARGARETA DRZENIEK HANOUIZ, THIERRY GEIGER, IRENE MIA, FIONA PAUA, weforum.org/pdf/.../Reports/gcr_2007/chapter1.pdf

production, (3) the dynamics of the market, (4) financial dynamism, (5) human resources, (6) the role of the state, (7) infrastructural dimension, (8) outward orientation, (9) future orientation, and (10) sociopolitical consensus and stability.

The interrelation of the 12 pillars are: Innovation (12th pillar) is not possible in a world without institutions (1st pillar) that guarantee intellectual property rights, cannot be performed in countries with a poorly educated and poorly trained labor force (5th pillar), and will never take place in economies with inefficient markets (6th, 7th, and 8th pillars) or without extensive and efficient infrastructure (2nd pillar).

The different member countries of the EU take into account the above mentioned ones in the development of their own strategy. The 2005/2006 WEF report puts Romania on the 68th place among the 125 countries which was a place lower from the earlier year's rank though the level of the indicator grew to 4.02 from 3.67. This means that the situation worsened on a relative level (compared to other states). The Report said that for the first time Romania leaves the I phase (cheap workforce, natural resources) and because certain basic requirements have been fulfilled (institutions, macro-economic stability, infrastructure, the basic level of education and health system) it gets into the II phase which is efficiency driven.

Tabel 1: Global Competitiveness Index 2007-2008 (position)

Rank (Out of 131 countries/economies)	
Global Competitiveness Index 2007-2008	74
<i>Subindex A: Basic requirements</i>	88
1st pillar: Institutions	94
2nd pillar: Infrastructure	100
3rd pillar: Macroeconomic stability	84
4th pillar: Health and primary education	52
<i>Subindex B: Efficiency enhancers</i>	62
5th pillar: Higher education and training	54
6th pillar: Goods market efficiency	74
7th pillar: Labor market efficiency	85
8th pillar: Financial market sophistication	78
9th pillar: Technological readiness	59
10th pillar: Market size	43
<i>Subindex C: Innovation and sophistication factors</i>	73
11th pillar: Business sophistication	73
12th pillar: Innovation	76

3.2. Innovations	3,14	68	5,90	Japan

Reference: *The Romanian European Institute, 1st study, 2006*

We can see from the table that Romania's weak points are linked to the factors defining competitiveness but the growth of it depends on the investment decisions of the companies which are influenced by the business environment.

In the study of the WB published in 2006 which dealt with the business environment using ten indicators put Romania on the 46th place, in comparison with the 72nd place of the earlier year out of 170 countries.

Competitiveness can be defined in several ways, but the most accepted one defines it as the ability to sell a product. In practice it is characteristic from the point of view of companies, industries or on a macro-economic level. When we speak about the competitiveness of companies of industries then in most of the cases we analyze the supply and in this case it appears in the form of price or quality. The price based competitiveness which is the result of the difference between the efficiency of the production factors and the price of it that in most of the cases is the result of economies of scale. The quality based competitiveness can be the result of the market markup the products in question differ profoundly from other products. The reports on the industries use the quantitative factors (price, the size of exports, productivity, investments) and qualitative ones (management, brand, innovation).

The GEA spoke about the followings in its report on Romanian competitiveness:

1. *Workforce* – with the following sub-indicators:
 - unit labor cost – ULC;
 - the percentage of educational costs in the GDP;
 - the percentage of graduates in sciences and technology;
 - long life learning – LLL.
2. *Market* – sub-indicators: the level of investment per capita
3. *Research – Development – Innovation* indicators:
 - the level of cost for RDI in GDP;
 - the rate of innovation.
4. *Business environment* – with the following sub-indicators
 - state aids;
 - risk capital;
 - business survival.
5. *Infrastructure* – with two structural rates:
 - the level of logistics in GDP (growth indicator);
 - IT costs.

The work method implies four stages:

- 1.The appearance of composite indicators which compares the Romanian competitiveness to the EU's average;
- 2.The analysis of the influential factors compared to the EU;
- 3.The analysis of the relative position of the Romanian competitiveness (compared to the 15 EU countries and to the 25);
- 4.The analysis of the relative position from the point of view of the influential factors.

We have to mention the following results:

Table 3: The nominal value of the indicators of competitiveness

	Romania	EU 15	EU 25
Competitiveness	0,0017	0,042	0,038
Work efficiency	0,006	0,047	0,042
Employment rate	0,029	0,037	0,035

Conclusions

As a conclusion we have to mention that Romania in its fight with the economic and social problems did not promote the objectives set by the Lisbon Strategy. In the EU the main objective is to develop competitiveness with steps increasing innovation – they create new workplaces and stress those economic activities that protect environment – while in Romania the main stress was on the restructuring of the economic structure and to improve the entrepreneurial environment. The politics of the future will stress the development of the infrastructure – as the main factor of economic growth – to improve the partnership between the public and private to improve RDI, to improve the ability to develop the structural basis, to improve education and trainings and to facilitate financial reductions for RDI.

In the present there are more documents on the tasks which are varied. We can speak about the National Development Plan, The National Strategy Framework, Industrial Political Strategies, The National Export Strategy, The National Strategy of RDI 2007-2013.

ROMANIA'S ABSORPTION POTENTIAL OF E.U. FUNDS FOR RURAL DEVELOPMENT – A REGIONAL ANALYSIS

Dachin Anca

Academy of Economic Studies in Bucharest, Faculty of Economics

Ailenei Dorel

Academy of Economic Studies in Bucharest, Faculty of Economics

The post-accession programs supported mainly by the European Union create a better chance for the modernization of the agricultural sector and the rural area in Romania. However the funding process depends highly on the absorption capacity of the potential beneficiaries. The paper focuses on the regional distribution of financial allocations for rural development, especially for agricultural holdings, by correlating them to the determinant factors of the absorption capacity. The distribution of selected applications at regional NUTS3 level reveals that poorer regions with high employment in agriculture have no advantage in the access to development funds.

Keywords: rural development, regional development, financial support, absorption capacity of the agricultural sector

JEL classification: O13, R12, R38

1. Introduction

The process of Romania's integration to the European Union determined major changes in the economy and society (Zahiu, 2006). The pre-accession programs (SAPARD) and later the post-accession programs based on non-refundable European support and funds from national public sources in agriculture and rural areas contributed to these changes (Toma, 2008). The development of rural areas is the main objective of the National Rural Development Programme of Romania 2007-2013 (NRDP, 2009), but this is also aimed by market policy measures in agriculture and other measures provided by post-accession operational programmes for development (Toma, 2009).

In 2010, after three years since the accession to EU, the programmes supported by European funds have made progress in institutional building, selection of applications for the funds and the payments process. The preparation period for some of the NRDP measures was extended because of institutional disfunctionalities and some of them will be implemented starting with 2010. The absorption of funds provided for investment in agriculture is still lagging behind, even if the process was accelerated in 2009. The rural area is changing not only as a result of post-accession programmes, but also of changes in the population behaviour in the new context.

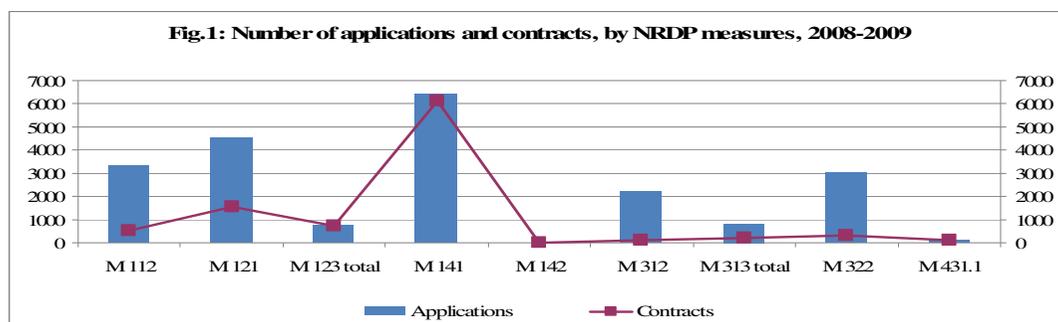

2. Comparative analysis of projects' funding for rural development in the period 2007-2009

The only measure started for implementation in 2007 was *211 Support for mountain areas*, while the next measures started in March 2008 (NRDP Progress Report, 2009). At the beginning of 2010 most of the projects are in the stage of the funding process, so it is too early for evaluations of their impact. However the behaviour of potential beneficiaries of funds is reflected by the distribution of applications by measures and by the share of eligible projects in total applications. A high number of beneficiaries involves a larger part of rural population connected to the development process.

The following analysis takes into consideration the measures financed from NRDP, except the direct payments per hectare (measures 211, 212 and 214) and the direct complementary payment (measure 611). Regarding the total number of applications until 09.04.2010 (fig.1), in a good

position are the measures *121 Modernization of agricultural holdings* and *141 Supporting semi-subsistence agricultural holdings*. The measure 121 was attractive, since the 4529 applications in 2008-2009 sessions asked for a public support that is 1.4 times higher than the funds allocated by NRPD for the whole period 2007-2013. However only 34% of the applications were selected for funding, representing 53% of the total public allocation. The number of applications for the measure 141 is much higher, but the 6148 applications selected and contracted cover only 9.7% of the public allocation for 2007-2013. These projects have a lower average value and also lower potential for modernization of agriculture.

One of the most attractive NDRP measure was *322 Village renewal and development*, but the overwhelming number of applications was only partly selected, by reaching at present only about 52% of the total public financial allocation for 2007-2013.

112 – Setting up of young farmers; 121 - Modernization of agricultural holdings; 123 – Adding value to agricultural and forestry products; 141 - Supporting semi-subsistence agricultural holdings; 142 – Setting up of producer groups; 312 – Support for micro-enterprises creation and development; 313 – Encouragement of tourism activities; 322 – Village renewal and development, improving basic services for the rural economy and population and upgrading of rural heritage.

Source: Romanian Ministry for Agriculture and Rural Development, DG for Rural Development

The economic crisis had strong negative effects in Romania in 2009 and 2010 and is a factor that reduces the capacity of co-financing European programmes from national public and private sources, in accordance with the decreasing income of the state budget and of the potential beneficiary economic agents. Also there is reduction of the economic agents' absorption capacity of the financial allocation for market oriented activities, because of the decrease of the internal and external demand for goods. The crisis induces distortions to the absorption capacity and also to expected results of financial support due to its deep impact and high uncertainty about the recovery process.

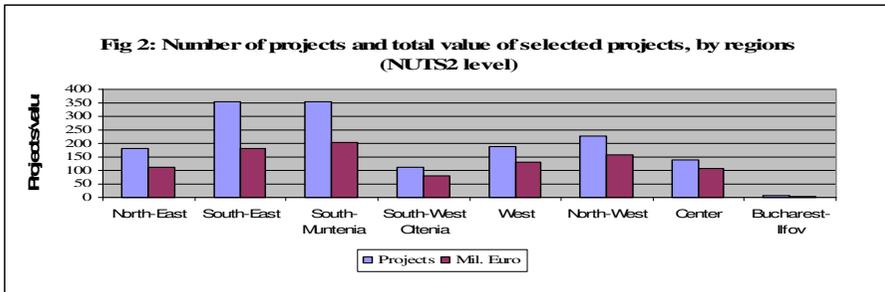

The measures for the improvement of competitiveness in agricultural holdings and semi-subsistence farms should contribute to the sustainable development of the Romanian agriculture. But the results of these measures will be seen only in medium and long term. The expected effects on agricultural producers are the increase of investments for modernization and transformation of holdings in entirely market oriented production units. The number of holdings able to comply with the quality standards for agricultural products should increase, as well as the number of units able to export agricultural products. The increase of investment leads to higher productivity and agricultural income, by having positive effects on the rural development.

3. Financial support for the modernization of agricultural holdings

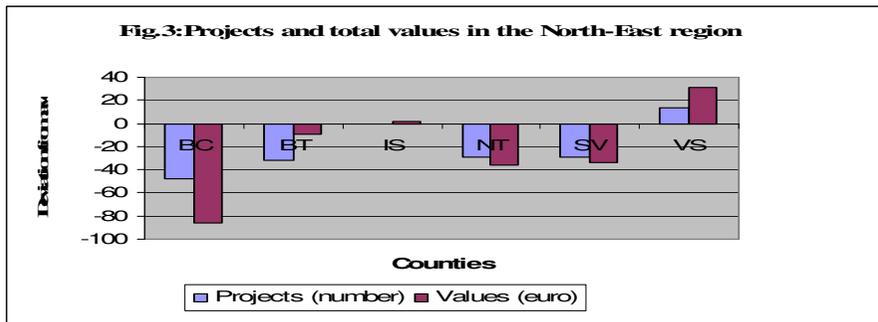

The agricultural resources and the absorption capacity of the financial support for agriculture are unequally distributed in the territory (Alexandri, 2008). For the moment the best picture for this capacity is given by the regional distribution of the selected applications. Actually investment in agriculture is the key of rural development, since agriculture is still the main activity in rural areas. Potential beneficiaries that understand the advantages and the mechanism of the public

support in a limited post-accession period and have the ability to apply successfully for funds represent the main source for future rural development. The crisis may delay the process, but there is still time until the end of the programming period.

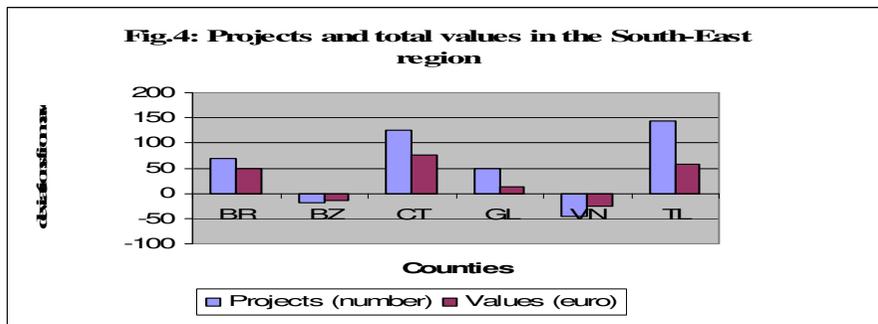

The following analysis is based on own calculations by using data from the Selection Reports of the Ministry of Agriculture regarding applications for the NRDP measures. The highest number of selected applications are in the regions South-East and South-Muntenia (fig.2), but their average total eligible value per project is lower than in other regions.

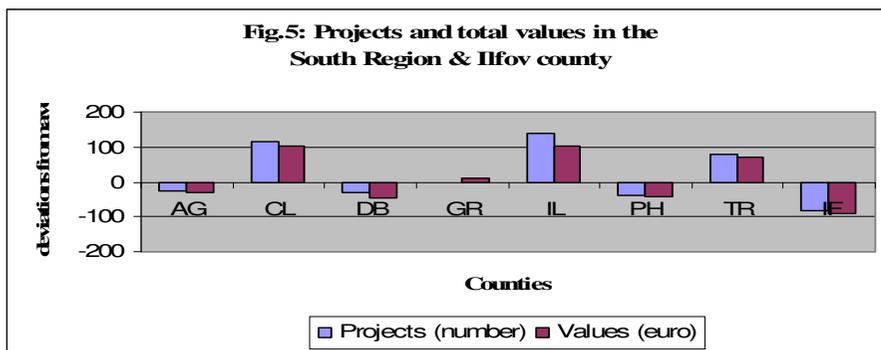

The deviation from the national average (in%) of the number of selected projects and their total eligible value by counties (fig.3-9) show the important local differences in improving the activity in agriculture.

4. Determinants of the absorption capacity

The lack of homogeneity within the development regions in connection with the implementation of the 121 measure is due to the differential in endowment with natural agricultural resources, but also to other economic and social factors. The authors consider that the most important factors that determine the absorption capacity of the financial support at county level (NUTS3) are: gross value added (GDP), agricultural production, agricultural area, employment in agriculture, gross enrolment rate and share of rural population. While calculating the correlations, the factor “share of rural population” was eliminated from the calculations because of possible autocorrelations of error effects with employed population in agriculture.

The procedure used was the comparison of the number of projects and total eligible values of the projects with the absorption capacity given by the determinant factors in each county of every region.

Finally we tested the correlations between allocated funds and specified indicators. For that we calculated the deviations from the average level of each indicator for every county:

$$Dif(x_i) = \frac{x_i - \bar{x}}{\bar{x}} \cdot 100$$

Where:

Dif(x_i) – deviation from average level of x

x_i – value of x variable for each NUTS 3 level

\bar{x} - average level of x

By testing separately each indicator’s influence over deviation of distributed funds (F_i) and the selected projects (P) we found that only the agricultural area (S_AGR_i) is significantly correlated from the econometric point of view with both variables. The influence of the other indicators is not significant in the econometric correlation, but the gross enrolment rate has a special position.

However, in the combination of influence factors the best results of the econometric tests obtained are in the case of the econometric equations that use the independent variables agricultural area (S_AGR_i) and employment in agriculture (Poc_AGR_i). The regression equations which add other factors besides the previously mentioned factors are not significant from the econometrical point of view. According to these conditions, we used the following equations of regression:

$$DF_i = a \cdot DS_AGR_i + b \cdot DPoc_AGR_i + \varepsilon_i$$

$$DP = c \cdot DS_AGR_i + d \cdot DPoc_AGR_i + \varepsilon_i$$

$i = 1, 2, \dots, 42$ NUTS 3

where:

DF_i - deviation from average of Funds

DP - deviation from average of Project number

DS_AGR_i - deviation from average of Agricultural Area

$DPoc_AGR_i$ - deviation from average of Employment in Agriculture

ε_i - estimation error

The comparative results for the two variables are in table 1.

The agricultural area has the highest influence on the number of selected projects, as well as on the value of the projects (with a slight difference in favour of project numbers – the coefficient of correlation 1.72 compared to 1.668 for project value).

Table 1: Coefficients of correlation

Variable	Funds	Number of projects
DS_AGR_i	1.668837	1.720024
[t-stat]	6.263487	5.871887
$DPoc_AGR_i$	-0.445832	-0.522539
[t-stat]	-1.894956	-2.020167
C	4.37E-15	7.20E-15
[t-stat]	6.06E-16	9.08E-16
R squared	0.518237	0.481821

The authors consider that the correlation with the average size of the agricultural holding from each county would bring better results of the econometric tests, but there is a lack of necessary data for the moment. The findings of the procedure are normal because the efficient agricultural holdings need larger agricultural area. It is interesting that the employment in agriculture has a negative influence on the correlation to the allocated funds and the selected project number. Even if the value of the coefficients of correlation is low and at the limit of econometric significance, the results are normal if we consider the surplus of employment in agriculture.

5. Conclusions

The most successful measures for rural development in terms of application selection and their funding in the period 2008-2009 were those regarding the modernization of agriculture and the village renewal and development. The selected projects for investment in agricultural holdings (measure 121) are unequally distributed at regional level. The less developed regions North-East and South-West have also less accessed the development funds. According to the econometric analysis, the most important determinant of the absorption capacity at regional (NUTS3) level is the agricultural area, while the employment in agriculture has rather a negative influence.

THE IMPACT OF STRUCTURAL FUNDS IMPLEMENTATION IN BIHOR COUNTY. CASE STUDY ON THE REGIONAL OPERATIONAL PROGRAMME 2007-2013

Chirilă Lavinia Florentina
Faculty of Economics
University of Oradea

As The County's Development Plan 2007-2013 shows, Bihor county, which through its geographic position and existing local resources, plays a strategic role, of the West gate of Romania, distinguishes through a low unemployment rate, of 2,7% in 2007, on the third place in Romania after Bucharest and Timiș county and on the first place in the North-West region that he is part of, through a high living standard, with a GDP of 55% of the European average, ranks among the most developed counties in Romania (range 8 in the country according to the GDP value per capita, range 2, after Cluj county in the North-West region).The present paper analyses the absorbtion rate of structural funds allocated through the Regional Operational Programme of Bihor county and sets itself to formulate some conclusions regarding the way in which Bihor county has valued until present the development opportunities offered by the Regional Operational Programme, respective regarding future action directions, established by the Bihor County Development Plan, 2007-2013.

Key words: regional development, regional politicly of EU, structural funds, absorbtion rate of structural funds, Regional Operational Programme, Bihor County Development Plan.

JEL Classification: O22, R10, R11, O10

Introduction

Bihor County, through its geographic position and its local existing resources, fulfils a strategic role, of Western gate of Romania. The county distinguishes through a *low unemployment rate*, of 2,7% in year 2007, on the third place in Romania after Bucharest municipality and Timiș county and on the first place in the North – West Region that it is part of. Through a *high living standard*, with a GDP of 55% of the European average, value registered in the year 2006, Bihor county is part of the most developed counties in Romania, being situated on 8 place on country according to the GDP value per capita, and in the North – West region, Cluj county is the only one that goes beyond Bihor, both through the development of the economy and through its relative proportion. Having a high attractive level, for investors and tourists, Bihor county disposes of a growing entrepreneurial capacity and a developing human capital, process sustained by a young and extremely dynamic academic system (Development Plan of Bihor County 2007-2013, 2007). The message of regional or cohesion politicly of the European Union for the period 2007 - 2013 is “a bigger economic growth and more workplaces for all the regions and towns from the European Union”. In order to fulfill this, EU has allocated for the cohesion policy the total amount of 347.4 billion Euros for 2007 - 2013, that means that over one third of the European Union's budget is allocated to the financial instruments of the cohesion policy of the European Union: European regional development fund, Cohesion fund and Social European fund. 82 % of the total amount of the funds will be directed to the convergence regions – which shelters 35 % of the European Union's population. In the other regions, approximately 55 billion Euros are allocated for the objective „Regional competitiveness and the work force employment”. Other 8.7 billion are available for cross-border, transnational and interregional cooperation, in the frame of the objective „European territorial cooperation” (European Commission, 2010). The present paper proposes to analyze the *impact of using structural funds*

on Bihor county, answering questions such as „Where are we situated in present compared to the vision for Bihor county proposed through the Development Plan of Bihor County 2007-2013?“, „Are we heading in the right direction?“. There are also sighted aspects as the identification of the priority axis with the highest absorption rate. The identification of obstacles that blocks funds absorption in adverse fields as well as formulating solutions for the stimulation of structural funds absorption is another objective of the paper.

Literature review

The absorption rate is defined as the ability of a country or organization to use efficiently financial assistance received. In the case of the Regional Operational Programme, the absorption rate is given by the capacity of eligible organizations to elaborate and implement viable projects. In other words, even though the needs of a country or organization are big, their ability of using efficiently the financial assistance can be reduced from various reasons (for example the lack of skilled labor forces, the lack of planning, the lack of co-financing, etc.). An inappropriate use of structural funds will lead to a very small absorption rate (Regional Operational Programme, 2010). According to the European Commission Report from May 2007, regarding the cohesion policy, the premises of success in implementing European funds depend in big measure of the solid institutional capacity of public administration from member states. There are two directions of the European funds drain. On one side, the contribution of the fund suppliers (the supply side) at successful funds administration is determined by the quality of public administration, and on the other side, regarding the demand side, public benefits depend of the way of funds implementing. The role of the public administration is therefore a bivalent one, having the quality of contributing both from the position of coordinator of European funds administration, as well of the beneficiary, administrative capacity being filled by the ability of administration according to the legal discretion that regulate the funds that they will dispose of in project implementation. Consequently, consolidating the administrative ability of structural funds absorption as well as preparing fund's portfolio, viable public investment projects are extremely important to guarantee the success of implementation.

Empirics

For the present paper we analyzed the priority axis that met the highest call for financing, using The stage Report of communication of implementation of the North – West Regional Development Agency, as well as the Information regarding the stage of projects presented for financing through the *Regional Operational Programme 2007-2013* in North – West region at 14.12.2009, containing detailed information about Bihor county. We realized a comparison between Bihor county and the entire North-West region, and we extracted conclusion on the base of the results that we obtained.

According to “The information regarding the stage of the projects applied for financing through the *Regional Operational Programme 2007-2013* in North – West region at 14.12.2009”, in Bihor county, the situation of the projects that applied for financing is the following:

Table 1

Priority axis	Field of action	Total number of projects applied – out of which: contracted – rejected -ended	Total value of projects (million euro)	Irredeemable financing asked (million euro)
1 – Supporting	1.1 – “Integrated plans of urban development” –	Integrated plans of urban development	15.43	10.53

Source: North-West Regional Development Agency data, 2010.

Analyzing Table 1, we notice that the absorption of structural funds differs from a priority axis to another and from an intervention area to another. According to the report studied, in Bihor County, the biggest number of projects submitted has been registered on Priority axis 4, called “The support of the development of local and regional business environment”, intervention area 4.3 “The support of microenterprises development”, with a total number of 15 submitted and contracted projects, being in the implementation stage. Even though the value of these projects is small, in average approximately 200.000 €, we notice that the private business environment is receptive and interested in structural funds absorption. On the other hand, the most problematic regarding the total number of projects submitted are the intervention fields 4.2 “Rehabilitation of industrial sites, polluted and unused and preparing them for new activities” and 5.3 “The growth of touristic potential”, where up to the moment of the report no contract had been submitted, so the absorption rate is 0. Another phenomenon observed is the fact that almost all priority axis, respective intervention fields, have a high percentage of projects rejected as it follows: Priority axis 2 “Development of regional and local transport infrastructure” - 40% projects rejected; Priority axis 3 “The improvement of social infrastructures” registers an average of 26% rejected projects on the 3 intervention fields reported; Priority axis 4 “Support of local and regional business environment development” - 30% projects rejected on the 3 intervention areas; Priority axis 5 “Durable development and tourism promotion” – an average of 45% projects rejected. This phenomenon is attributed by the present governance to the lack of interest of the previous governance, and the fact that there is not a unitary approach at the level of the Management Authorities and Intermediary Organisms. The main problem is bureaucracy; **it passes a long time between the moment when the applicant’s guide is published and effective contracting of the projects, this leading to the large number of projects rejected, etc.**

Considering the financial allocation on development regions for Romania, in the Regional Operational Programme 2007 – 2013, we observe that to the North-West region has been allocated 12.09% of the total value of funds allocated to Romania. So, in The Regional Operational Programme up to present, Bihor County has accessed 22.93% of the total value of funds allocated for period 2007-2013 to the North-West region, and respectively 2.77% of the total funds allocated for Romania in the period 2007-2013. It is a high percentage, but predictable, considering the fact that the county we are speaking about is the second one as dimension in the North-West region, after Cluj County, with a total numbered of 15 projects won only on the intervention field 4.3 “The support of microenterprises development”, according to Table 1. As it can be noticed in Table 2, a high value of won projects is registered by the investment in county roads, infrastructure, healthy services, projects that come from the public sector. But, even though the value of the projects is big, fact that contributes to a high absorption rate, the number of projects is reduced, the need of active implication of public sector in funds absorption being still felt in intervention fields such as 5.3 “The growth of touristic potential”, 4.2 “Rehabilitation of industrial sites, polluted and unused and preparing them for new activities”.

Table 2

Priority axis/Intervention field	NV (mil. €)	BH (mil. €)	% (BH/NV)

Source: North-West Regional Development Agency data, 2010;

In Table 2, it is realized a comparative analyses between the values of the structural funds allocated to the North-West region, through the Regional Operational Programme, and the total value of accessed funds up to the present moment in Bihor county, for every Priority axis and intervention field, by correlating data from the Report regarding the stage of projects submitted for financing through ROP 2007-2013 for Bihor county with the data regarding The financing allocation on development regions through ROP 2007-2013. As we have noticed earlier, the areas with the smallest level of absorption through ROP 2007-2013 are 5.3 “The growth of touristic potential”, 4.2 “Rehabilitation of industrial sits, polluted and unused and preparing them for new activities”. We already know the fact that main reason that determines this phenomenon is the lack of active and dynamic public implication of the public sector in absorption structural funds, in this field the state is the eligible beneficiary. Also, we notice the interest of the microenterprises and the availability of the private sector to access structural funds, even though the co-financing is a big impediment in funds absorption. The co-financing is the main reason for which many microenterprises give up projects that they have won. So, we come back to the public sector and government who must accelerate the process of adopting the law regarding the

public-private partnership in order to ease the access of private sector to investment in infrastructure.

Results

We consider that we are heading in the right direction, but not as fast as we should, so we must try harder. We have managed to access a high percentage of structural funds intended for Romania, North-West region, through investing in infrastructure, roads, sewerage systems, modernization and technologization of the microenterprises but, what is alarming is the fact that the needs are still very big and far from being satisfied. Even though the implication of county's local authorities in the structural funds absorption has risen lately, there are still fields where the absorption rate is zero. Surprisingly, Priority axis 5.3 "The growth of touristic potential", and Priority axis 4.2 "Rehabilitation of industrial sites, polluted and unused and preparing them for new activities", not so surprisingly, have the absorption rate 0. The second county as dimension in the North-West region, Bihor is situated on the second place regarding the structural funds absorption through the Regional Operational Programme 2007-2013, after Cluj County, which is according to general expectancies, but far from full valuing the county's potential, especially in the field of tourism, where we have an enormous potential revealed by the resorts of national interest (such as Băile Felix, Băile 1 Mai, Băile Tinca popular for the balneary tourism; mountain resort Stana de Vale; etc.), the existence of the treed carst and of a high number of caves of national and international value. We consider that the local authorities should show a bigger opening towards funds accession, by creating partnerships with universities in order to skill public employees in funds accession and implementation. Far from formulating exhaustive conclusions, we express our hope that, Bihor county will manage to determine and to be aware of the fact that it should grow the grade of public responsibility towards the exploitation of all development opportunities so that, according to the vision proposed through The development plan of Bihor county for 2007-2013, up to the year 2027, to offer to its citizens a unpolluted environment, a high living standard and a competitive, dynamic and an economy integrated in the European single market.

“ATTRACTIVENESS” VERSUS “CONSTRAINT” IN SELF-EMPLOYMENT OPTION IN A CERTAIN FIELD FOR MANAGER WOMEN OF THEIR OWN BUSINESS IN THE WEST OF ROMANIA

Dodescu Anca

University of Oradea, Faculty of Economics

Abstract

Starting from the way in which women, generally speaking, understand entrepreneurship – as a choice or as a necessity, the present paper aims to discover in what percentage women in the West of Romania, have been influenced in the decision to become entrepreneurs or in self-employment option by the “attractiveness” or by “constraint” and, then, in what proportion, considering the general entrepreneurs inclination, to start business in the fields that they have worked before, validates in their case the hypotheses that women choose the sector in which they have knowledge and experience. The first part of the paper analyses the literature in the field emphasizing on the occupational situation and professional training as factors of the feminine entrepreneurship, respective activity fields preferred by women for self-employment. The second part of the paper presents the preliminary research results regarding the correlations between occupational status, professional studies and activity fields in the case of feminine entrepreneurship in the West of Romania, results of AntrES project. The paper analyses the answers given into the questionnaires applied and reapplied to one of the aim groups of the project – manager women – in the period 17-31 July 2009, respective 20-28 November 2009 – at the beginning and at the end of the Entrepreneurial school at the level of AntrES territorial centers (county residence towns: Arad, Baia Mare, Oradea, Reșița, Satu Mare, Timișoara).

Key words: Entrepreneurship, women entrepreneurship, self-employment, entrepreneurial mobile, occupational status, professional training

JEL Code: E24, R11, J24

Literature review

Even though still poor in relation to the significant growth of the women proportion and their contribution in entrepreneurs line and yet far from creating adequate theories, starting from the opening operated by the first notable article dedicated to the subject - „*Entrepreneurship – a new feminine border*” (1976), the literature consecrated to the feminine entrepreneurship hangs upon some conclusions: entrepreneurs women have similar motivations with those of entrepreneur men: the wish of accomplishment, work satisfaction and independence (Schwartz, 1976); women are less qualified, less capable, less trained in the field of business, have a smaller inclination to entrepreneurship and manage to settle a business in a slower rhythm than men (Hisrich și Brush, 1983, 1984, 1985, 1986, 1987; Brush et al., 2004; Casson, Yeung, Basu, Wadson, 2006); women meet opportunities and barriers different from those encountered by men in the field, fact that affects their participation and performance in the entrepreneurial field (Parker, 2009); entrepreneur women are represented in few sectors of the economy, there exist fields „dominated” by men, for example, the building sector, the activity sectors preferred usually by entrepreneur women are: services; tourism; commerce etc., the biggest concentration being in the industry of services, especially in the field of sales and “other services” – financial services, insurance and real estate, vocational services, business services (Bates, 1995), the explanation is connected, on one side, by the lack of knowledge and technical abilities, that discourage starting a business in production or high technology field; on the other side, there is a more difficult access to financial resources, that determine choosing that activities who engages a lower capital

level (Bruni, Gherardi, Poggio, 2008); considering the general tendency of entrepreneurs to start businesses in the fields where they have worked before, women choose the sector where they have the highest knowledge and experience (Parker, 2009). We notice therefore from the literature in the field the „stereotype of business woman” – built around „less” than men – less capable, less qualified, less trained, less brave, slower, less equipped with capital or less able to access capital etc. Besides stereotypes, infirmed or confirmed by the literature in the field, the most accepted premises at the moment is that „the gender gap in entrepreneurship” is relatively, generally speaking, depended by cultural factors and customs regarding female participation in economic activity (The Global Entrepreneurship Monitor – GEM, 2007, 2008, 2009), but certainly exist with respect to new venture creation and business ownership (Report on Women and Entrepreneurship – GEM, 2007; Parker, 2009). Starting from the way in which women, generally, perceive entrepreneurship – as choice (an opportunity for personal development, a way of filling family’s incomes, a wish to cover a social need, a solution to enter into an activity in which the selection criterions are less strict, a strategy to have a bigger freedom to administrate the activities of the business and of the family, etc.); or as a necessity (the unique way of growing family’s incomes, of gaining financial independence, of growing the socio-professional statute, of independence and autonomy in the work developed, of fulfillment and personal satisfaction, etc.) (Bruni, Gherardi, Poggio, 2005), we propose to investigate to what extend the manager women in the West of Romania, who form target groups of the AntrES project, have been influenced in their decision to become entrepreneurs by the “amenity” or by “constraint” and, more on, in what proportion, considering the general tendency of entrepreneurs to start-up a business in the fields that they have worked before, validates, in their case, the hypotheses that women choose the sector where they have most knowledge and experience.

Aspects regarding the research methodology

The project entitled: *Entrepreneurship and the Equality of Chances. An Inter-regional Model of Women School of Entrepreneurship*, financed by the European Social Fund with an amount of over 3.5 million Euros, is the first strategic project in the field of human resources development in Romania that promotes female entrepreneurship. The covering area of the project is the Western part of Romania, and includes Maramureş, Satu-Mare, Bihor, Arad, Timiş, Caraş Severin Counties, being implemented by partner universities from each of these counties. The general objective is to promote the equality of chances in the field of entrepreneurship, by stimulating the implication of women, especially those coming from rural areas, to initiate and develop their own business in the context of sustainable development of their communities. The project is addressed to a overall target group of 1800 women wishing to develop their own business (288 SME female managers from urban area)– target group I, or to set up their own business (1440 women from urban and rural area) – target group II, or to become trainers in the entrepreneurship field (72 women, students in Economics, which will be trained and who will benefit from job as trainers for rural area, in the project)- target group III. The duration of the project is of 2 years, starting in January 2009. As initial result of the project, a *Women School of Entrepreneurship*, consisting of 6 territorial, 24 local and 72 rural centers, along the Western part of Romania, was set up, and training process *The School of Entrepreneurship - Module I – Business start-up*, respectively, *Module II – Business development* was finished at the territorial level. Parallel with the training process in the territorial centers, the inter-regional team developed specific methods designed to monitor the project’s target groups, including a set of focused questionnaires in order to the development of a specific research activity, having female entrepreneurship in the Western part of Romania as main subject. So, in the period 07.17.2009-07.31.2009 (the beginning of the Entrepreneurial School at the level of Territorial Centers – at the first course) have been applied at the level of the territorial centers (the county residence towns: municipalities Arad, Baia Mare, Oradea, Reşiţa, Satu Mare, Timişoara) the research-

monitoring questionnaires aimed to the manager women (target group I): 153 questionnaires, distributed on territorial centers, as it follows: Arad – 27, Bihor – 30, Caraş-Severin – 24, Maramureş - 24, Satu Mare – 24, Timiş - 24. At the end of the Entrepreneurial school, level TC (at the last course, respective in the period 20-28 November 2009) it was reapplied the same questionnaire, more exactly a total number of 149 questionnaires, distributed on territorial centers as it follows: Arad – 24, Bihor – 28, Caraş-Severin – 24, Maramureş - 25, Satu Mare – 24, Timiş - 24. The questionnaires applied to the target group I – manager women – have been formed of a total number of 52 questions, grouped as it follows: 39 questions in section A – Questions about women entrepreneur/manager and their businesses; 13 questions in section B – Aspects regarding the psychological profile of the entrepreneur/manager women. The present paper proposes to analyse the answers for the following characteristics: the occupational situation at the moment of initiation or acquiring the business; the reasons which stood at the base of the wish and of the decision to initiate its own business; the reasons which determined the choice of the field of activity; the field in which they developed their studies – professional studies. Regarding the characteristics enumerated, there have been formulated a series of hypotheses who were tested, as it follows: 1. *The higher educational level is associated to a bigger business, older, viable, smaller obstacles perceived at the beginning of the business and now*; 2. *The field that they have studied in is correlated with the field of activity of the firm, with the viability of the business, the fields considered more appropriate for the feminine entrepreneurship*; 3. *Participating at courses/trainings is benefic – according to the field/title of the course, could be registered a more easy access to financing, a perception less acute of certain obstacles.*

Results

The majority of the respondents(66%) are aged between 30 and 49 years, the average age of the respondents is 37,6 years; most of the respondents are married (66%) and live in households with 2-4 members, having one or two children(51,6%). The average household income for last month of the manager women questioned is 5276 lei, while the personal average income of those is of 2449 lei. Regarding the current businesses of the respondents, over 88% have been initiated by them, alone or with other persons. Only 12% have acquired the business in other ways: legacy – 5.4%, joining an existing firm -4.1%, buying it – 1.4%, franchise – 0.7%. The majority of the manager women in our sample (over 80%) has university or post university studies. As general fields of study, slightly over half of the respondents have done studies in the economic area (field associated in great proportion to the entrepreneurship and the management of a business) - 51,70%, followed by the technique field - 17,01%, socio-human - 12,20%, juridical - 5,44%, medical - 3,40%, environment - 6,12%, exact sciences - 0,68%, economic engineering - 2,7% etc. Many of the manager women (40%) have followed specialization courses or specialization courses in different fields. Out of those, predominate those related to the management and business administration: project management, financing forms, accountancy, human resources, audit, communication, insurance, tourism, management, business development, sales, quality, taxation, real estate agent, real estate marketing, entrepreneurship etc. The most important motivations, as well as the context in which the respondents have decided to initiate a business are very eloquent: most of the entrepreneur women started their business alone, over one third of them either did not have a workplace or were going to lose it, or they were unhappy with their workplace they had regarding the wage aspect, work conditions, climate, etc. The analyze of the problems from the occupational situation from the moment of the business initiation enumerated by the respondents at the question – Which of the following situations illustrate better the occupational situation from the moment you decided to start your own business? – leads to the conclusion that the choice of the perspective of self-employment has been conditioned by constrain (total 70% - I had a workplace, but the salary was unsatisfying, takes the first place – 35.3%, followed by – I did not have a workplace – 16.7%, but there are also answers like: I had a

workplace, but I was going to lose it – 8.7%, I had a workplace, but the conditions were difficult – 5.3% , I had a workplace, but the relationships at the workplace were unsatisfying – 4%). There are answers that mirror the attractiveness in the perception of entrepreneurship (I was happy with my workplace -15.7%, the possibility of an additional earning – 0.8%, I was called in the administration board – 0.8%, I answered an offer – 0.8%), but attractiveness is situated here after constrain. In change, at the question – Which of the following situations illustrate better the moment in which you initiated your business? – surprisingly, on the first place it is situated the attractiveness – emphasized by answers as: I had a business special, favorable conjuncture – 29.45%, followed by – I had a special business opportunity – 28.77% (total 58,22%); and not the constrain – emphasized by answers as: it has changed the general economic context -17.81%, I needed money because the number of my family’s members has raised -7.53%, I needed money because I remained the financial support of the family -6.1%, qualification -0.8%, workplace conflicts -0.8% (total 33.04%). At the question which is the reason for what you are ready to initiate a business – the wish of self-fulfillment remains the main option of the manager women (re-testing situates it on the first place, with 48%), followed by the need to earn more -27%, the wish to have a higher social statute - 20% and the opportunities on the market -5%. In enumerating the problems from the occupational situation from the initiating moment, the problem of unsatisfying salary is predominant, followed by the lack of a workplace (more than 53% of the respondents declared that at the moment of business settlement they had a workplace, but they were not happy with their salary). It is to be remarked that the unhappiness towards the occupational status from the respective moment has conjugated with the apparition of an idea or with a favorable conjuncture. The two conditions – unhappiness towards the occupational statute, but the favorable moment for the expression of the business idea – describe the context in which the present entrepreneurs assumed the risks of a business start-up coming from the prevailing wish to prove themselves and those around them that they can succeed. The accent falls, in our opinion, for this target group – on opportunity/attractiveness prevailing towards need/constrain. Regarding the previous fields of activity of the of the questioned manager women - 78% of them had previous workplaces before the entrepreneur experience. In average, manager women who worked in other places than their own business, had two previous workplaces, the highest number of workplaces being 6; fields of activity preferred with prevalence by them – fields in which it can be initialized a success business are, according to first choice: on the first place – services, services in general, (43), according to the literature on this topic, on the second place – commerce (31), followed by tourism (28) (totally over 80%); significantly less first choices head towards consultancy – 7, production -6, alimentary sector - 5, agriculture – 3 , medical-healthy – 3, construction – 2, sales- 2, transport -2, real estate – 2 , etc. Retesting reflects the validation of the hypotheses that the preferred field by women is the services one – on the first place – doing services, services generally, with a significant growth of the interest for consultancy services (financial, managerial, economic), but on the second place it is situated the tourism, followed by commerce, slightly reorienting towards fields as consultancy, lawyer services, reflect a trend at the moment, but also the birth of some new fields – education, kindergartens, events organizing, patisserie, beauty salon, old people care etc. reflects the movement of the weight center of initiative towards fields that perform starting from specialized expertise (women specific?!) and not from capitals.

Conclusions

After the correlation analysis taken, the situation of the hypotheses tested, respective 1. *The higher educational level is associated to a bigger business, older, viable, smaller obstacles perceived at the beginning of the business and now;* 2. *The field that they have studied in is correlated with the field of activity of the firm, with the viability of the business, the fields considered more appropriate for the feminine entrepreneurship;* 3. *Participating at*

courses/trainings is benefic – according to the field/title of the course, could be registered a more easy access to financing, a perception less acute of certain obstacles, it stays like this:

1. *The higher educational level is associated to a bigger business, older, viable, smaller obstacles perceived at the beginning of the business and now – **does not validate**.* From a static point of view it is not proved the significant relation between the field of studying and the success of the present business, the size of the present business, future plans for developing the business, the way of perception of the obstacles and the perception of the adequate field for starting up business by women.
2. *The field that they have studied in is correlated with the field of activity of the firm, with the viability of the business, the fields considered more appropriate for the feminine entrepreneurship.* For example, women with economic studies should: prefer businesses in economic area, had several businesses in time and not been bankrupt, started their business rather alone, have a business plan at least started, perceive the economic constrains as being less acute etc. – **validates**. The analyses have revealed a significant relation between the field of studying of women and the field in which the business activity develops ($\chi^2=99.6$; $p<.001$). So, the persons with education in the economic area develop their activity in tourism and services (rez. aj. =2.3), those who studied in technical area have firms with activity in industry, constructions (rez. aj.=2.8) and commerce (rez. aj.=2.0), and those who were trained in the field of environment protection, develop their activity in agriculture (rez. aj.=3.9), but also in education and research (rez. aj.=3.2).
3. *Participating at courses/trainings is benefic – according to the field/title of the course, could be registered a more easy access to financing, a perception less acute of certain obstacles –**validates**.* Participating at specialization courses has a positive effect over the accession of repayable funds, credits. The analyses highlight a significant relationship so that women who have a further specialization through these courses have accessed in higher number repayable funds comparatively with those who do not have an additional education (rez.aj.=2.6). The relation is not significant in the case of accession irredeemable funds.

The manager women in West of Romania analyzed initiated their own business in proportion of over 88%. The option of abandoning a workplace, respective the perspective of self-employment has been conditioned by a constrain in proportion of over 70% (underpaid salary, not having a workplace, the possibility of losing the workplace, though work conditions or unsatisfying conditions at the workplace), but – surprisingly, in proportion of almost 60% - the way in which they describe the situation in the moment of the business start-up – lead to the idea that attractiveness of the applying a business idea perspective, in a favorable conjuncture, or after meeting a business opportunity and not the constrain (the general economic context, the need of financial resources, family constrains, workplace conflicts) have predominated the decision to become entrepreneurs and self-employ. The fields of activity preferred with predilection by manager women in the West of Romania (in proportion of over 80%) are services in general, with a significant growth of the interest for consultancy services (financial, managerial, economic) followed by commerce and tourism, respective tourism and commerce, exactly as the literature dedicated to the feminine entrepreneurship describes. The empirical data can lead to the conclusion that women in the western part of Romania prefer self-employment fields so-called “feminine”: education, kindergartens, event organizers, patisserie, beauty salon, inside lay out, old people care, etc., the weight center of business initiative is in that areas in which the professional studies, competence and expertise specialized and specific “feminine” are prevailing and not the knowledge and technical abilities determine a low level of capital, confirming again, the hypotheses of the specialization side. The hypotheses that women have the tendency to start-up business in the areas where they have worked before and that they choose the sector in which

they have most knowledge and experience validates as well, over 80% have graduated from university or have done a post-university degree, slightly over half have studies in the economic field, the analyses show that the persons with studies in the economic field develop their activity in tourism and services, those who studied technical have firms with activities in industry, constructions and commerce, and those who studied the environment protection develop their activity in agriculture sphere, but also education and research. A happy result, and, equally encouraging in our efforts is that women in the western part of Romania consider that participating at specialization courses has a positive effect over accessing repayable funds, credits, and over their business generally speaking. The conclusions formulated represent preliminary research result, the research being developed during the project AntrES which regards women who wish to initiate their own business and it follows to be continued at the level of the local centers, respective rural centers in the West of Romania.

IMPACT OF THE NATIONAL ECONOMIC FACTORS ON THE COMPETITIVENESS OF THE ROMANIAN INDUSTRIAL PRODUCTS

Dragomir Laurentiu Constantin

University of Craiova,

Faculty of Economics and Business Administration

Tanasie Anca

University of Craiova,

Faculty of Economics and Business Administration

In the current circumstances a clear objective of the economic policies all over the world is the improvement of the efficiency of production and trade and in consequence of the competitiveness of the products both internally and internationally. These aspects are essential in the case of Romania because they provide the efficient participation of our country in international commercial flows.

This study shows that the products and sectors of the Romanian industry were characterized, at least in the period of 1990, through a relatively low competitiveness, aspect which was pointed out by the evolution of the gross added value.

Keywords: competitiveness, national factors, industrial products

JEL Classification: F40, L60

The problem of international specialization represents a highly important problem, especially under the current circumstances of the world economy. This may lead to economic advantages materialized in the reduction of the disparities between the levels of development of different states, but, at the same time to the gradual accession to the productivity and prosperity standards specific for the industrial countries. The accomplishment of this objective involves a continuous, regulative feedback in the field of competitiveness, which should be maintained at a high level under the context of the different positive and negative influences of some national and international factors.

Going on the idea of the Porter model, there are four basic factors included in the category of the *national* economic factors:

a) *local resources*, where we have to take into account: ♦ human resources (quality, classification and staff costs and management, standard labour time and work ethics); physical resources (abundance, quality, accessibility and cost of land water, mineral reserves, forest reserves, fish reserves, climate conditions, geographical position, etc); ♦ scientific and technological resources; ♦ financial resources, in general; ♦ national infrastructure, the quality and the cost of using the infrastructure(transport, telecommunications, bank transfers, social assistance, etc.). The competitive advantage appears when the companies will be able to make a necessary combination of factors at a low cost or if the factors used have a higher qualitative level.

b) *dimension and structure of the internal demand*, this aspect is leading to important scale economies or to the stimulation of the learning curve, with major influences on the competitiveness internationally. In order for the companies to gain competitive advantage, the internal demand should create enough pressure to influence the accelerated innovation. The high exigency of the national customers may contribute to the increase of the competitive advantage, because it forces companies to use high standards in the field of quality, facilities, services, etc. A consequence of the dimension of the internal demand is that the small nations may be

competitive on segments which represent a high average on a local level, but a low average on a regional or global level.

c) *related industries and subassemblies*- are highly important in gaining the competitive advantage. The successful development of an industry of subassemblies and components involves the existence of some efficient sub-suppliers and related sub-branches which should stimulate other sectors of activity, creating therefore possibilities for other industries to increase their competitiveness.

d) *industrial structure and competition*, as a last element of the national economic factors refer to the competitive oligopolistic structure. These structures are extremely strong and stable in time, leading to a series of national rivalries from which the international successful companies usually gain. The oligopoly structures facilitate and conquer new markets because the national rivalries create pressure for innovation which increases the competitive advantage, leading to clear advantages through competitive prices, high quality, response speed, seriousness, long term relationships. In this context, we will obtain a competitive environment which is hard to re-create through the competition with the external rivals.

Along with these national economic factors, another factor with an influence which cannot be neglected is the *evolution of the phenomena and processes of the world economy*, which are hard to predict or even unpredictable, have a major impact on the evolution of the economic and industrial structures. Because, the long-lasting evolutions of the global market influence the specialization and integration options in the international labour division, the main tendency which should contribute to the orientation of the structures of industry, sub-branches, and groups of products from a national economy refers to the permanent growth of the quality and competitiveness of the products which are submitted to global exchanges. This fact is reflected in the efforts of the industrialized countries towards the improvement of the performances and competitiveness of their products in order to improve the exchange rate.

Starting from the main relevant aspects related to global practice and taking into account the dimension of the national economic environment and the development degree, the structure of the industry from Romania, in the current and next period could suffer a compression and crystallizing around some well defined points and identified according to the interdependencies and determinations among the sectors, branches and sub-branches of the Romanian economy. We anticipate the change of the weight centre of the structural modifications on the level of the branches, sub-branches, and range of products, products and even on some of their components, as an effect of specialization of the principle of complementary production.

Due to the changes in the economic structure both on a macroeconomic level and on a world-economic level from the last decades, the behaviour of the economic operators have taken new shapes. These structural changes which have essentially changes the world economic landscape relied on three main events:

- American deregulation, launched in the 80s which made all the etatist barriers falls;
- The downfall of the economic management communist systems;
- The burst of internet which has led to a revolution in telecommunications, with effects on the organised financial markets, modifying the behaviour of the banks and of all its users.

At the same time, the globalization of the markets has determined a globalization of marketing. Global marketing refers to the encouragement of the research initiatives of finding new markets segments or niche all over the world, the capitalization of the buying and selling opportunities of the products and services internationally. The market globalization has triggered a phenomenon of individualization of the consumer's needs. For example, in the context of the single internal European market the consumer is looking more and more for the "European" product, internationally and not nationally. Under the influence of the economic changes, the consumer which was used to the local products gradually becomes more open for foreign products. The producers, in their turn, are transformed in multinational companies.

In the context of these tendencies, a new type of European marketing is defined, the European countries adapting their production and trade strategies in order to take advantage of the new opportunities as much as possible. The strategy relies on the delimitation of the new markets, which are re-grouped on more countries or regions, especially those situated on the border with the former national markets. Gradually, the commercial policy of the enterprise will pass from the segmentation of the national markets to a transnational segmentation in order to reach consumers with identical behaviour in many countries. The pair product-market passes from the national dimension to the European and even international dimension. Will appear gradually, for some products, the transnational niche, i.e. segments where the consumer is the same for more countries.

At the same time, production will not be standardized any more, but flexible. The enterprise will no longer be considered isolated; it will have very flexible relations with the suppliers and the distributors. The computer-based design, the flexible workshops will allow producers to meet the changing needs of the customers. The introduction of the products on the market will not be reserved only for the specialized salesmen, but their responsibilities will be split among the other categories of staff of the enterprise which become in this way part-time marketers. The development of production will be made on regions of the world, and a series of standardized component will allow the production of an entire family of products.

We can argue that in this context, of the new type of marketing, the features of the competitiveness concept become more and more complex. An increasing attention is given to the phenomenon of external promotion of goods and services manufacture in a country, of implementing their own investments in foreign territories, in order to impose the national cultural values in the international arena, using a certain "aggression" on the world markets in the fight for winning the more consistent market segments. On the other hand, we can experience nowadays an openness of the markets towards the world competitiveness, through the liberalization of the interface systems between the national and the world economy, in the case of the financial-banking system, at the same time with the free movement of goods and services.

As a result of the world exchange and cooperation, and of the specialization in fields which have comparative advantages, the countries can accelerate the rhythm of growth and they can expand their range of products. They will be interested to increase their degree of competitiveness in those fields where they have comparative advantages. This thing can be accomplished only if those countries have globally restructured the internal socio-economic system in order to make it more competitive. Even if competitiveness is demonstrated and it is sustained on the world market, it is not real unless it has been obtained a certain economic and social efficiency on the internal market.

In order to identify the industrial sectors with development perspective and to create the sector strategies and the commercial policies which can create the circumstances for the efficient capitalization of those perspectives, we can use a series of indicators in order to assess the competitive advantages on the level of the industry, sectors and groups of products.

Such an indicator is *RCA* – *revealed comparative advantage*, which outlines the weight of a sector in the total export of goods and services, compared with its weight in the import of goods and services. This indicator is determined for each industrial sector according to the export of internal production and the import which compete the internal production and not with the import of intermediate goods for internal production. It can be calculated according to the following formula:

$$RCA_i = \ln[(E_i/I_i)/(E/I)]$$

where: RCA_i = revealed comparative advantage of sector i ;

E_i, I_i = export, respectively import of sector i ;

E, I = exports, respectively total of imports.

If the size of this indicator is positive, then we can talk of a comparative advantage for the sector *i*, and if it is negative then we have a negative comparative advantage. At the same time, the higher its value, the higher is the comparative advantage for the analysed sector.

In what competitiveness is concerned, the RCA indicator is more significant than the average of the export of the sector in the total production, because it reflects the intensity of the orientation of the sector both towards export and towards import.

The evolution of this indicator in the period 2006-2008 points out the fact that Romania has a relatively reduced degree of competitiveness of the industrial products, aspect, pointed out by the values registered by the revealed comparative advantage indicator.

Romanian foreign trade with industrial products and the indicators of the Revealed Comparative Advantage (RCA) according to the Classification of products by activity (CPA) in the period 2006-2008

Code CPA	Name of activity	Export FOB (euro million)			Import CIF (euro million)			RCA		
		2006	2007	2008	2006	2007	2008	2006	2007	2008

35	Other means of transport	984	1214	1451	383	516	538	1,40	1,41	1,52
36	Furniture; other manufactured goods n.e.c.	1160	1327	1324	709	921	1099	0,95	0,92	0,72
40	Electrical energy, gas, steam and hot water	169	144	275	36	64	45	2,00	1,36	2,34

Source: own calculation according to the Romanian Statistical Yearbook 2009, pp. 901-902

From the analysis of the Romanian foreign trade one can notice that in 2006 only 9 industries were registering positive values of the revealed comparative advantage indicator, pointing out a certain comparative advantage in those sectors, and in the years 2007 and 2008 their number

increased to 10, after including tobacco in this category. This growth is insignificant, taking into account the fact that most of the sectors of activity are characterized through negative values of this indicator so there is a lack of comparative advantage.

We can notice from the industries which have a positive revealed comparative advantage, in its descending order, that the same industries can be found in 2008 (with small differences in classification as opposed to the previous years); these industries are: electric and internal energy, gas and water; tobacco industry; textiles industry, transport industry; coke, refined petroleum products and nuclear fuel industry; wood and products of wood (except furniture), furniture industry; leather and leather products industry; electrical machinery and apparatus industry; metallurgy industry.

At the same time these 10 manufacturing industrial sectors have contributed and contribute with more than 50% to the export of our country (in 2006-62,32%, in 2007-58,49%, in 2008-54,25%). Although these weights are slightly reduced (which means a small growth of the weight for export for other industrial products), it is still situated relatively high values, which makes the specialization degree of the Romanian economy and its participation in international exchanges quite reduced. The export potential from the Romanian economy in the analysed period is concentrated along three fields: wood manufacturing (wood and products of wood, furniture), light industry (textiles and textile products, wearing apparel, leather and shoes) and metal manufacturing (metallurgy, metal constructions and metal products); generally branches consume a lot of resources and energy.

In consequence, in order to improve the competitiveness of the sectors of the Romanian industry we have to act towards increasing the compared advantages through the structural adjustment and foreign direct investments. In order to accomplish all these, a series of actions are necessary:

- investments in transport and commercial infrastructure;
- the improvement of the level of the service network to sustain export;
- free access to information and circulation of innovation;
- promoting an active marketing for the dynamic branches, creating some partnerships production-research-education;
- improving the identification methodologies of the opportunities, strengths, weaknesses in the internal and external trade, creating pilot research centres not only on an aggregate level but also on an industrial and product level.

In this context, our country has to focus strategically on competitive advantages, on the development of some capacities and competences for the export sectors, in order to create highly developed economic environment in the context of globalization and free trade.

This debate reveals that it is just as difficult to determine the borders of Europe as it is to establish the identity of its citizens on the basis of cultural criteria

Keywords: Integration, europe, social, cultural

Cod JEL: F10, F36

I. Introduction

What does this restructuring of political conflict mean for European integration and European identity? Three important implications come to the fore. First, in both logics of political conflict, Europe is perceived as being part of the problem and not part of the solution. Using the economic logic, “losers” of globalisation consider the EU not as a counter-weight to “neoliberal” globalisation, but as its intensification and acceleration. From their point of view, it is difficult, if not impossible, to distinguish between the benefits of an internal European market and the negative consequences of global economic integration. Meanwhile, using the cultural logic, the transfer of sovereignty to the EU is primarily perceived as an immediate threat to national identities, national institutions and national democratic practices – and an enlargement process without limits and clear ends is seen as a threat to the cultural homogeneity, particularly of “old” Europe.

At best, European integration seems to produce a delicate trade-off for its citizens: they have to accept a loss of sovereignty and national identity in exchange for new, and vaguely defined, economic and political powers.

Unsurprisingly, the EU has therefore become an easy target for all kinds of populist parties and movements. Second, the restructuring of political conflict has considerably politicised the process of European integration. Yet, the manifestations and consequences of this must frustrate those who debate the possibilities and opportunities of increased politicisation at EU level. Notwithstanding the remarkable successes of some anti-European parties at the last election to the European Parliament, we must acknowledge that the politicisation of Europe mostly takes place at the national level. Since the 1990s, Europe has become a salient and hotly contested issue in national election campaigns and, as a result, an issue of “mass politics” in most member states.²⁰⁹ Moreover, the politicisation of Europe did not take place along the traditional “left-right” axis; rather, it is the product of anti-European parties and political movements. Thus, ironically, the mobilisation of European citizens on European issues has been achieved most successfully by the critics of the EU and by the defenders of national identity and sovereignty.

The third implication – which comes as a direct consequence of the second – is that appealing to a culturally defined European identity would be like pouring oil on a fire. It has to be said that broader political campaigns and debates on identity, outside of academia, would largely benefit

²⁰⁹ Hooghe, L. and G. Marks (2009). *A Postfunctionalist Theory of European Integration: From Permissive Consensus to Constraining Dissensus*. In: *British Journal of Political Science* 39(1), 1-23.

the radical populist parties on the right and on the left, who have already successfully mobilised along the lines of identity, immigration and integration. It is true that the concept of “European identity” is in itself highly ambiguous, not least because most of its multiple varieties try to combine “unity” and “diversity” in some way²¹⁰. However, one commonality that runs through all of the definitions is that by emphasising a European “we”, the concept is based on constructions of some kind of “sameness”. If we cast our minds back to the Copenhagen Declaration in 1973, it can be observed that it was precisely this idea of “sameness” that was highlighted. The declaration acknowledges the “diversity of cultures” within Europe and the importance of common interests, but puts particular emphasis on “the framework of common European civilisation”, “the attachment to common values and principles” and “the increasing convergence of attitudes to life” which are supposed to give “the European identity its originality and its own dynamism”. While such an idea of European identity has become outdated in scientific discourses²¹¹, it still informs the majority of public debates, where the emphasis is on Europe as a distinctive cultural entity united by shared values, culture and identity²¹².

II. The dangers of European identity

Such an understanding of European identity will inevitably run into two difficulties. The first one is identifying the norms and values that constitute the common “cultural heritage” of Europe. Usually, “references are made to Europe’s heritage of classical Greco-Roman civilisation, christianity, and the ideas of enlightenment, science, reason, progress and democracy as the core elements of this proclaimed European legacy”²¹³. This approach is obviously “euro-centric” and completely neglects the importance of non-European cultures, global processes and dependencies for the emergence and transformation of “European” values. Therefore defining “sameness” without reference to “others” is not only incomplete but inadequate²¹⁴. Moreover, as controversy over the reference to the Christian tradition in the European Convention in 2003-4 revealed, there is no agreement on the relative importance of the various different components of a “European civilisation”. Consequently, any debate on “common values” will inevitably spark off conflicts within European societies and between member states.

There is then a second difficulty which is both highly significant politically and closely related to the current restructuring of political conflict in Europe. “The construction of a cultural boundary necessarily entails a process of inclusion and exclusion. It requires the designation of the differences between insiders and outsiders, members and nonmembers”²¹⁵.

Indeed, the concept of cultural identity formation and the cultural logic of political conflict have much in common. They both employ symbolically defined codes of exclusion, and, as debates on immigration and EU membership for Turkey have demonstrated in recent years, these codes have already been defined largely by the political right.

The intense debate on EU “boundaries”, provoked by the decision to start membership negotiations with Turkey, is certainly most instructive in this respect²¹⁶. Here, the question of

Turkey's EU membership was transformed into a question about the "cultural identity" of Europe. References to a "common geography", a "common history" and "common values" were made in order to permanently exclude Turkey from the EU. Turkey served as a symbolic code for the "Islamic east" which was sharply set apart from the "Christian west". This symbolic code was subsequently used to establish a distinct culturally defined boundary between Europe and non-Europe. An empirical analysis of this debate in west European countries reveals "that the frames used are not only defending national identity, but also a nascent European identity that is exclusive (against Turkey) and inclusive (within Europe) at the same time"²¹⁷. As alluded to above, it is the populist right who have successfully exploited this argument with the help of identity-based arguments emphasising the threat of mass immigration and islamisation. The political dangers here are signified; not least due to the fact that Christian-Democratic and conservative parties, despite their more general pro-European commitment (with the notable exception of the British Conservative Party), are in firm opposition to further EU enlargement, in particular the accession of Turkey.

This debate reveals that it is just as difficult to determine the borders of Europe as it is to establish the identity of its citizens on the basis of cultural criteria. Many territorial borders in Europe were drawn and altered in the past with outright arbitrariness – Poland's history demonstrates this exemplarily; not to mention the fact that the historic and cultural ties of European countries extended well beyond Europe due to their imperialist and colonial pasts²¹⁸. Moreover, we should not forget that in the age of globalisation borders have fundamentally changed in their significance and character. Borders, even territorial ones, are increasingly becoming unclear, permeable and in need of political definition and decision. That is not to say that Europe's borders cannot or should not be laid down, but that they cannot be found in a "common" history, culture or geography. Europe's borders must be defined politically. In other words, instead of cultural criteria, we need political criteria.

III. European integration as an open political project

Past debate and experience in Europe clearly show that it is conceptually inadequate and politically dangerous to construct a European identity on the basis of common cultural values. This does not do justice to the heterogeneity that the EU has already attained, nor to the internal pluralism of its societies. In particular the latter holds true in the case of the status of Islam within Europe. Moreover, the EU cannot be defined by a pre-established set of geographic borders. Any attempt to do so has faltered and will falter due to the dynamic character of the European integration process.

This does not mean that the EU can survive without its own identity and affective ties to its citizens, or that it is principally impossible to limit or finalise the European integration process. Rather that we should approach these questions in an entirely different manner. The present recipes to resolve the political crises of the European project are based on a serious misunderstanding. Essentially, concepts from the history of nationbuilding in Europe are being transferred to the EU without qualifications. Instead, the EU and the European integration process must be understood and promoted as an open political project²¹⁹. Doing so, primarily, means that European identity must be fixed to political criteria and not to historic or cultural attributes. Europe cannot be united in the long run by a cultural identity, no matter how it is defined. The European project must be accomplished through a common political identity. This political identity, in turn, cannot be imposed "top down" but needs to emerge from the European citizens' everyday experience with the norms, institutions, procedures and conflicts of the

European political process. Nor can it be based on abstract principles. The European Union must develop its identity through daily practice as a community of political actions and communications.

This is where one of the EU's major deficits becomes most evident: Brussels seems incapable of offering European citizens sufficient opportunity to participate in the political process, something which would reinforce identification with the European project. The EU has struggled to create a positive and convincing tie between its politics and the living conditions and life chances of its citizens – and due to this lack of political identity, compensation by cultural means is insufficient. The circle can only be squared by the by strengthening the political identity itself.

Therefore, it is essential that EU citizens are given greater opportunity to participate in European politics. Furthermore the EU needs to expand its competences in political areas where citizens expect a strong EU presence – most importantly in foreign and security policy.

IV. Conclusions

Defining the European identity politically and not culturally does not imply that Europe can succeed entirely without a common normative foundation. Even the European project needs a normative foundation and this foundation requires a historic dimension. However, neither the Christian culture nor the universal values of the Enlightenment can be used to form the normative basis of Europe's political identity. In reality it is the "dialectic of Enlightenment"²²⁰ – on the positive side, the commonly shared expectations of a social and political order based on reason and, on the negative side, the common experiences from the horrors of totalitarianism in the 20th century, the Holocaust, the Stalinist terror, the Armenian genocide in Turkey and the self-imposed dangers to humanity and civilisation posed by new technologies. Together – and only together – do these attributes constitute a common horizon of experiences along which the European project has been promulgated in the past and through which its political identity must also be established normatively in the future.

INFLATION AND COMPETITIVENESS - A VAR MODELLING APPROACH

Fratostiteanu Cosmin

University of Craiova

Faculty of Economics and Business Administration

Tanasie Anca

University of Craiova

Faculty of Economics and Business Administration

VAR modeling in inflation forecasting has been widely used, and rather successful, even if there have been several critiques of its exactness or accuracy. This paper is structured into two sections. The first one accomplishes a general presentation of VAR modeling in forecasting inflation, and the second is focused on the results of this econometric approach for inflation in Romania. Even if we considered methodologies containing inflation measured using CPI, CORE1 and CORE2, testing will only be performed for the CPI Inflation.

Keywords: inflation, VAR models, forecast

Forecasts of real macroeconomic statistics have been successfully produced by vector autoregressive (VAR) models. Even though, this type of models are still used by a large number of monetary institutions, including national banks in the process of forecasting short-term inflation and in isolating essential determinants for the inflationary process. Romania, and the Romanian National Bank represent examples in this respect. The NBR is interested in both forecasting and determination on monetary and non-monetary elements responsible for the inflation in Romania. This represents an important issue due to the fact that, in Romania, for instance inflation seems to have become a process with long duration and high significance in connection to the EMU accession process.

VAR modeling has its theoretical genesis in the time series analysis of Wold, Taio, Box and Jenkins. They basically modeled the moving average and autoregressive components of a time series, which can then be used to predict future movements in the variables. The most widely used model was the Box and Jenkins autoregressive integrated moving average (ARIMA) models. Much of the appeal of VAR stems from Sims (1980) critique of structural models. He basically questioned the theoretical validity of the restrictions imposed on the structural models of the time. Sims favored an theoretical approach to modeling based on vector autoregressions, in which the data generation process determines the model.

Given the objective of price stability, the ability to predict the process of price adjustments is essential. From a policy perspective, an understanding of the interactions and transmission process between the main macroeconomic variables and prices serves to guide the process of policy formulation and implementation. In understanding and predicting inflation it is necessary to understand the importance of shocks and the underlying process. Critical elements of these are the persistent components such as expectations, indexation and the structural factors such as the openness of the economy, as well as the production function. This paper explores these interrelations and attempts to provide an alternative means of forecasting inflation by employing a Vector Autoregressive (VAR) model. In so doing it attempts to elucidate some aspects of the transmission process. The initial relative success of this approach led to the development of large scale models, the most noted of which were the MIT, Penn State and the Federal Reserve models. During the late seventies, however, these models were criticized by Lucas as being highly inappropriate for policy analysis as they violated the 'policy invariance' property. More recently, Sims (1980) in a seminal critique argued that the restrictions applied to structural models in the estimation procedure were 'incredible' and could not be properly tested.

A VAR model uses historical data to predict future values. An unrestricted VAR (UVAR) model can be written

$$x = \mu + \beta(L)X + \varepsilon \quad (1)$$

where x is a $k \times 1$ vector of variables, μ is a $k \times 1$ vector of constant terms, $\beta(L)$ is a polynomial of degree m in the lag operator (L), and ε is a $k \times 1$ vector of error terms. In practice, a k -variable model is often simply k separate equations for which the coefficients can be estimated by ordinary least squares. The price equation in the VAR considered below is

$$p_t = \mu_p + \sum_{v=1}^k \sum_{j=1}^m \beta_{j,v} x_{v,t-j} + \varepsilon_t \quad (2)$$

where p is the inflation rate, t indexes time, v indexes the particular variable, j indexes the lag number, and μ_p and the $\beta_{j,v}$ are coefficients. Note that even for a relatively small VAR model such as the one used in this paper, with the number of variables $k=5$ and the lag length $m=6$, the price equation contains 31 coefficients to be estimated. It is often believed desirable to limit the number of estimated coefficients.

In order to limit the number of estimated parameters, this paper's strategy is to reduce many lag lengths in an adjusted VAP (AVAP) model. For each equation, set two lag lengths -- one for the dependent variable and another for all independent variables -- in order to optimize some statistical criterion. The particular criterion used in this paper is the Schwarz Criterion (SC), which typically gives a parsimonious specification.' It is defined as

$$SC = T \ln \delta^2 + N \ln T \quad (3)$$

where T is the number of observations, N is the number of estimated coefficients, and δ^2 is the estimated residual variance. By minimizing the Schwarz Criterion one is trading off the lower residual variance from adding an additional coefficient against a penalty term that rises with the number of estimated coefficients. The strategy for selecting lag lengths is to specify a maximum lag length, assume that all independent variables in each equation have the same lag length, and compute the Schwarz value for all possible lag length combinations. Of special interest is the price equation for the AVAP model, which is

$$p_t = \mu_p + \sum_{v=1}^k \sum_{j=1}^m \beta_{j,v} x_{v,t-j} + \varepsilon_t + \sum_{v=p}^m \sum_{j=1}^m \beta_{j,v} x_{v,t-j} \quad (5)$$

where the number of lags m , of the dependent variable is three and the number of lags q of each independent variable is one.

Because many variables do affect inflation, and are in turn affected by inflation, it is possible to identify a small selection of economic variables, movements in which appear to have been highly correlated with inflation in the past and as such may then be useful in forecasting future inflation. The VAR approach provides a convenient means of accomplishing this, as it relies on the causal and feedback relation amongst variables.

The two essential hypothesis of this research are: 1. inflation is a persistent phenomena in Romania, more than in every other CEEC candidate to the adoption of the Euro; 2. the accession to the Euro-Area has no opt-out clause for the most recent EU member states, and thus, neither for Romania. The two hypothesis are of crucial importance to both Romania and the Euro-Area

as a dynamic monetary entity – inflation can cause serious economic and monetary damages to all involved parties while the Euro adoption is a simple matter of time.

Thus, this study is of major interest to both the EU (and the Euro-Area) and the Romanian authorities. This could offer a better perspective concerning Romania’s real compliance to the real and nominal convergence criteria, and at the same time, it could offer viable and scientific solutions to Romanian authorities in their search of an optimal monetary policy set of actions when facing the entrance in the ERM III.

Inflation has become a serious and severe matter especially when considered in the context of the monetary integration process. CEEC’s performance during transition time, but also as functioning market economies, have been measured using inflation as central indicator. In most recent evolutions, Romania has proved to be unsuccessful in implementing a solid disinflation process (gradual disinflation - a targeted depreciation rate of the exchange rate as a nominal anchor). For 2008, the National Bank of Romania, has admitted, before the end of the year, that the inflation target has been missed reaching 6,57%.

Table no. 1: Inflationary variations in Romania

Annual variation (%)			dec. 07/ sep. 08(pp)
	sep. 08	dec. 08	
CPI	6,03	6,57	Æ 0,54
Volatile Prices	10,57	12,56	Æ 1,99
Administrated Prices	7,28	4,97	2,31
CORE2	4,60	5,83	Æ 1,23

(Source: National Bank of Romania)

Therefore, Romania is an interesting case for studying a more general question: Why do countries choose different targets for disinflation? Like most similar literature, previous studies on disinflation in Romania estimate a vector autoregressive model to illuminate the links among inflation and other macroeconomic variables.

From a methodological point of view, the measurement of inflation is difficult. The aim of this research project is to point-out the influence of some different elements from the classic ones. An upward bias in the consumer price index driven by four effects such as quality effect, substitution effect, new goods effect, outlet effect.

The quality effect stems from changes in the quality of a good that may lead to price increases that are misconceived as price inflation. The substitution effect relates to changes in consumption patterns: In response to relative price increases, consumers may switch to similar but cheaper products. The new consumption pattern is not always reflected in updated weights for the consumer price index.

The new goods effect arises when new goods are included in the CPI consumption basket only with a delay. Finally, the outlet effect stems from the difficulties faced by official price collectors in reflecting consumers’ moves towards shopping at cheap outlets such as hypermarkets.

The econometric analysis also wishes to study the possibility to predict inflation and its determinants. In this respect, a distribution of price modifications shall be accomplished on main groups of products and VAR bi-variant models shall be built in order to determine the economic variables determining inflation and finally being able to predict it. Most studies start from the assumption that price changes for the main components of the consumption basket are normally distributed. The asymmetry coefficient or the high variability of prices’ movement may lead to an inclination towards inflation due to the asimetric behavior towards prices’ change. Distribution is also significant in predicting inflation evolution. In order to determine prices’ distribution and inflation determinants in Romania, we shall use price sub-groups from the CPI for the last 5

years, adjusted and standardized. The Jarque-Bera test will help in establishing the existence of a normal distribution or not. In order to determine the inflation determinants, we shall test the Granger causality and we shall built bi-variant VAR models using inflation series (measured using the CPI, CORE1221, CORE2222 and CORE3223).

The analysis from the monetary point of view includes an evaluation of the Balassa Samuelson effect and of elements such as the exchange rate, the interest rate, the balance of payment etc. Research can be sustained in this area by contacts, information exchange and documentation within the National Bank of Romania who has already supported actions in this respect. I have been part of a research program and conference organized by the National Bank of Romania with the best 8 young economist investigating the issues around Romania's present and perspective convergence to the Euro-Area and the Euro adoption process.

The importance of asymmetrical shocks which could lead to an upward bias in inflation rates must not be neglected. Three types of possible shocks deserve particular consideration: terms of trade shocks, agricultural shocks, and adjustments of administered prices. They might prove to be responsible for part of the inflationary process, but at the same time, they might also carry on a chain of asymmetrical shocks further on to the Euro- Area once Romania becomes a member and the issues surrounding inflation have not yet been solved.

The present econometric analysis studies the possibility to predict inflation using VAR models. In this respect, we studied price modification on categories of goods and services and bivariate VAR models in order to identify the variables that determine inflation and based on which inflation can be forecast, according to procedures used by Christoffersen and Wescott (1999).

Most analyses referring to inflation leave from the hypothesis that the modification of the prices of the most important components of the consumer's basket are normally distributed.

This is important from at least two points of view. First, as Ball and Mankiw (1995) and Pujol and Griffiths (1996) argued, the asymmetry coefficient or the high variability of the prices' movement may lead to an inclination towards inflation due to unequal behavior towards price change. Second, it facilitates forecast. In order to compute the distribution in price changes from 55 month (June 2002 – December 2006) – 1925 observations. Each price change has been standardized by deducting the monthly average inflation for each month and dividing the difference with the corresponding standard deviation.

The Jaque-Bera test confirms (at 1% relevance level) the inexistence of a normal distribution. The obtained distributions have a positive asymmetry coefficient and a high curtosis excess.

In order to establish determinants of inflation, we tested for Granger causality and VAR models using the inflation series measured using the CPI, CORE1, CORE2, CORE3. Based on the results, VAR multivariate models were used in for CPI inflation measure.

The used series are: - price indices, administered prices' indices, indices of industrial production, the average gross wage, the average net wage (2004=100), the unemployment rate, the PPI, monetary aggregates M2, M1, the net internal actives of the banking system, the real interest rate, the real assets value, the nominal exchange rate (lei/EUR), the result of the public budget as percent of the budget income. All the series have been used in log (excepting interest rate the real assets' value, the exchange rate and the budget result). The causality bivariate Granger test results (probabilities associated to the F-static test) between the CPI measured inflation and the macroeconomic variables are presented in the table below.

²²¹ CORE1 = CPI – administered prices

²²² CORE2 = CORE1 – prices for season products

²²³ CORE3 = trimmed mean 23 percent

Table no. 2: Results of the Granger test

Lags	1	2	3	4	5	6	7	8
Indicators

Budget result	0.015	0.017	0.043	0.081	0.149	0.192	0.159	0.077

(Source: own calculations)

According to probabilities associated to a 5% relevance level, the evolutions of inflation is preceded by the evolution of : administrated prices, unemployment rate, industrial production price index, M1, M2, the exchange rate, and the budget result. In building the VAR models, in determining the lag, the probability resulted from the Granger test were taken into account.

According to the results obtained in the impulse-response functions, inflation is influenced by: the index of administrated prices, unemployment rate, M1, M2, internal net actives of the banking system, exchange rate.

In order to asses the inflation prognosis, we use a VAR multivariate model with 4 variable lags: inflation (CPI), M2, real interest rate, the exchange rate and the budget result.

According to the diagnosis through sum of errors and the sum of the square errors, the Jarque-Bera test rejects the hypothesis of a normal distribution. The dynamic relations between inflation and unemployment and administrated prices are correct – an increase in unemployment determines an increase in inflation, and an increase in administrated prices determines a decrease in inflation.

Also, due to the correlation between M1, M2 and the net internal actives of the banking system, the VAR model only retained the M2 variable.

VAR model appear in consequence as a solid instrument in modeling and forecasting inflation. The Romanian case is a special one in respect of this matter – the inflationary phenomenon – and has to be studied accordingly. The present analysis is only a small step indeterming inflation factors and fors-eeing their influence. Econometric results obtained in simulations on the designed models are significant and in strict accordance to the economic reality and theory. Actual development and inflation evolution stages in Romania require a deeper analysis of

monetary and non-monetary determinants of inflation and share they account for. In this respect, further research is to be continued. The initial hypothesis remains and even becomes a conclusion – inflation is and seems to remain (at least on a short run) a persistent phenomenon with causes that can be traced beyond the monetary instruments.

AN OVERVIEW OF THE GENERAL EVOLUTION OF THE ROMANIAN FOREIGN TRADE AFTER 1989, WHILE TRYING TO JOIN THE EU (I)

Giurgiu Adriana

University of Oradea

Faculty of Economic Sciences

Department of International Business

Research Centre for Competitiveness and Sustainable Development

Those 17 years (since 1990 until the accession date to the EU) of institutional and economic-social reforms which, with all the good and bad things, brought Romania to the European Union starting with 1 January 2007, and should make us now be able to emphasise a few elements connected to the Romanian foreign trade. Thus, we consider that the present paper is of a significant importance for the specialists in the foreign trade problems, as well as for the Romanian and all other EU economic operators because we will try to realise a “radiography” of all the general aspects and tendencies of the Romanian External Trade during the years 1990-2006, and their effects upon the Romania’s current and future membership to the European Union, as part of the Common Trade Policy, by presenting some relevant indicators, such as: the volume of foreign trade, volume of exports and imports, GDP growth etc.

Key words: Romanian foreign trade evolution, imports, exports, balance sheet, EU accession process, GDP growth

JEL codes: F14, F15.

We couldn’t start our analyze on the Romanian foreign trade during 1990-2006, without considering the context of the international trade in the same period, which has suffered dramatically changes in the last few years and it might continue changing, such as: the liberalization and globalization inducing a higher mobility and a rapid delocalization of the factors of production, a higher fragmentation and specialization of the activities on the value chains of products and services. The area of service trade has also been expanded. The value retain at the national level is becoming more and more difficult to achieve due to the proliferation of global value chains in the attempt to minimize the costs and maximize the profits. The international competitively is, therefore, more dynamic and the competitive advantages are more volatile and less sustainable, the only perennial advantages being the absolute ones, due to the natural resources (see, for example, the OPEC countries). Even though, competitiveness was and remains fundamental for the so much claimed sustainable economical development, being highly necessary an assembly approach, so much the more the successful economies continuously create and recreate competitive advantages. Moreover, the macro-, mezzo-, and microeconomic strategic reasons, just like the different public or private interested institutional entities cannot be separated one from another, which through their activity generate an impact on the foreign trade, thus a coherent and unitary approach regarding the development of the trade being absolutely necessary.

It is also important to understand the fact that the competitive advantages do not come from protectionism, quota or preferential access to the market. On the contrary, they lead to stagnation, low levels of entrepreneurial abilities and low motivations of the private sector towards efficiency, quality, innovation and product development.

In this international economic context, Romania of the 90’s, as an economy in transition, was clearly marked by the dramatic way in which the change of the role of the state in economy has been made favouring the increase of the role of the private sector. This change was though in

accordance with the market oriented approach of the WTO and European Community, realities marking the Romanian foreign trade after 1989. Therefore, once defined the direction of the Romanian economy, in the following years the state enterprises and its agencies, left as a result of the late privatization, had to – due to economic and legal reasons – adapt their way to develop business, including in what the goods and services purchase was concerned. But the evolution in this period of the Romanian foreign trade was influenced by the fact that there were numerous hesitations regarding the privatization of the state sector, as well as regarding foreign investments. Where the privatization of the state monopolies succeeded, though, the role of the state was simply transformed into a regulating one and as a result, positive evolutions have been registered. Regarding the private sector, the non-interventionist approach of the state towards the competition was justified by considerations regarding the market for a part of this sector, while on the other side, a pro-active policy would have been necessary to ensure the benefits of the economic liberalization.

As it concerns the methodological approach in this paper, for the analysis on the evolution of the Romanian external trade after 1989, we used a series of general statistic indicators, such as: *the volume of foreign trade, the volume of export, the volume of import (in prices CIF and FOB), balance of trade (exports FOB - imports CIF), balance of trade (exports FOB - imports FOB), and export per capita*. With these indicators' help, we can notice the evolution in time of the foreign trade in a particular country and they are very useful to make general comparisons with other countries. The terms of these comparisons could be easily considered superficial and irrelevant enough in the conditions of contemporary world economy complexity because the data presented by them are not sufficiently processed and, taken as such, can determine serious errors of economic interpretation (for example, comparison of the Romanian foreign trade's volume with that of the USA and the presentation of this comparison without interpretation and without taking into account the other factors specific to each country). In spite of all these, the analysis allows though the observation of an ascending or descending evolution in the case of exports or imports and can raise the interest for the identification of causes on which these phenomena are based. From this point of view, our analysis will be based on the unitary system of general indicators- *the volume of foreign trade, volume of export, export per capita* etc., as well as on a series of computed indicators (such as: *the degree of openness, the degree of concentration*), which we consider complex and eloquent enough in our attempt to determine and quantify the strong and weak points of the Romanian foreign trade in the context of European integration.

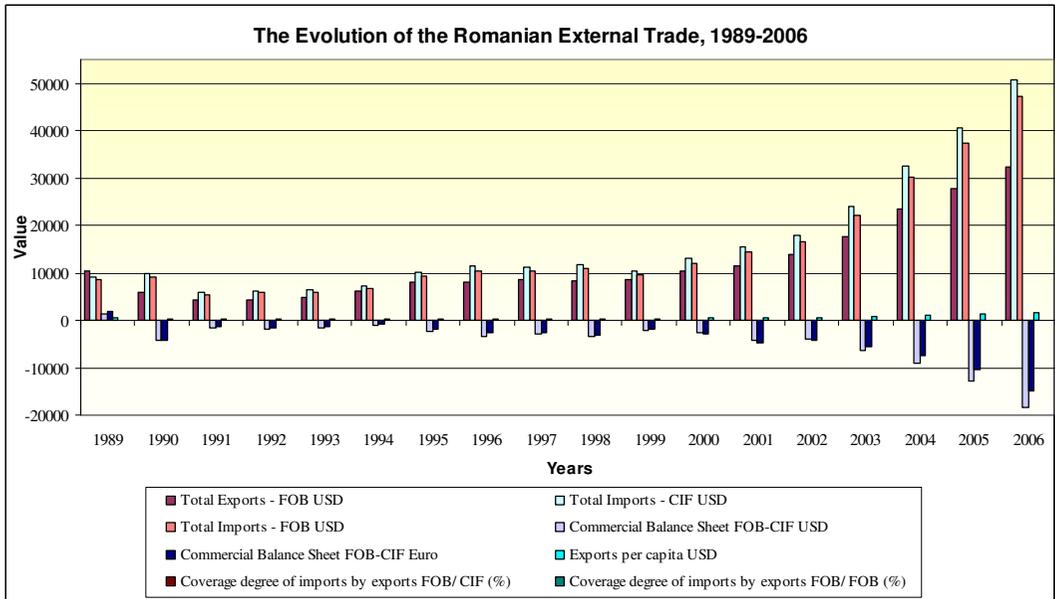

We would also like to state that, we started our analyze considering that, under normal circumstances, a deficit of the commercial balance does not necessarily involve a low level of efficiency in economy, because the way in which this deficit is financed matters, generally agreeing that there are countries which are net exporters and countries which are net importers, the difference being covered by foreign loans. As the foreign loans though did not have a correct destination and were not used efficiently, the pooling of direct foreign investments was affected, being important that at the government level to be correct investment policies so that they should cover both the initial loans as well as the commercial deficit. Form this point of view, Romania was permanently confronted with an insufficiency of financial resources coming from abroad²²⁴, while the national potential was also more below the productive investments' needs of the Romanian economy.

The computed statistic data clearly suggests that since 1990, Romania was a net importer, while Romania's exports were quite low at the beginning of the transition period, registering in 1990 only approximately 5727 millions of Euros. Analyzing these data, we notice that for a 7 year period we have witnessed a growth in the exports' value of almost 5.6 times and in that of

²²⁴ We mention that fact that the financing of the commercial deficit of the commercial balance is made by current private transfers, but this manner of financing is considered illusory, due to the fact that these transfers depend on exogenous factors and their use in the current consumerism can, actually lead to import stimulation.

imports of 5.09 times. The ascending trend is obvious; no matter it is the case of exports, imports or balance of trade, of its deficit respectively. We can notice also an ascending trend of the export per capita, due to actually the growth of the total exports during the entire analyzed period. *Graph 1* presents the evolution of exports and imports, of the balance of trade respectively, and it confirms the tendencies noticed based on the statistic figures, that are a deepening of the commercial deficit of Romania.

Graph 1

Source: Statistic data provided in the annexes of the book: Giurgiu, Adriana, *Comerțul intraeuropean. O nouă perspectivă asupra comerțului exterior al României (Intra-European Trade. A New Perspective onto the External Trade of Romania)*, Economica Publishing House, Bucharest, 2008.

Table 1 provides the indicators of evolutions which, through the way they are computed and interpreted, are suited best for the general analysis of the foreign trade activity and reflect the fact that Romania was among the countries in transition with an inferior evolution of exports compared to the evolution recorded by imports. The computation made based on the data in US dollars of the *Annex 1*, reflects a more accentuated evolution of exports than if we consider an increase of 17.19% compared to the previous year, but if we express the data in Euro, the increase is more modest, around 16,15% (a clearer exemplification comes from the comparison of data for 2004). Obviously, the explanation resides in the more rapid depreciation of the European currency compared to the US dollar as against the national currency, during the same year. The same situation happens in the case of imports, a reason for which our analysis, concentrated also on the values stated in USD (US dollars), is not affected from the point of view of comparisons between exports and imports.

From the analysis of the two entries, we can notice that there were periods when the evolution of exports surpasses the evolution of imports (1991, 1993, 1994, 1997, 1999, 2002), but in the majority of the cases the situation was reverse (in all the other years). The imports had a higher growth than the exports, and the fact that there was a higher starting basis explains actually the existence of the commercial deficit of the country and therefore, of an under-capacity to export of the Romanian economy compared to imports. The superiority of the growth rate of imports compared to the growth rate of exports demonstrates that the liberalization policies of foreign

trade have favoured the imports of merchandise and the quantity of goods exported remained reduced.

The evolution of the foreign trade activity in its whole is important because it actually presents both evolutions, of imports and of exports. We present this evolution, too in what follows (based on data in *Annex 1*) for clarification and on the trend of foreign trade in general, as a result of the two evolutions, of exports and of imports.

The trend emphasized in the following graph (*Graph 2*), for the sums stated in US dollars, a trend which does not appear anywhere on the graph for the values stated in Euro, shows us that there has been a relative stabilization of the volume of transactions for 1996-1997-1998, around the value of 20 billion US dollars. Practically, this stabilization results from the relatively constant level of imports and exports in this period and of the relatively low oscillations from one year to another.

Table 1. The Evolution of the Romania's exports and imports during 1990-2006

Year	Evolution of exports (US dollars) expressed in %	Evolution of imports (US dollars) expressed in %	Evolution of exports (Euro) expressed in %	Evolution of imports (Euro) expressed in %
1990	-44,931820	+9,046161	-59,589331	-19,969241
1991	-26,147186	-41,619019	-35,149293	-48,740771

Average	+9,060899412	+12,60414194	-9,735594384	+9,735594353

Source: Personal computations based on statistic data provided in the annexes of the book: Giurgiu, Adriana, *Comerțul intraeuropean. O nouă perspectivă asupra comerțului exterior al României (Intra-European Trade. A New Perspective onto the External Trade of Romania)*, Economica Publishing House, Bucharest, 2008

The subsequent growth trend is obvious, due to which we can state that Romania's involvement from the point of view of the total volume of foreign trade in the external economic exchanges is more and more intense. This, at a first sight, would seem an extremely favourable to Romania, in the conditions in which in the world, currently, it is promoted the idea of free trade and the advantages that it can bring. Actually, in the foreign trade's volume imports have a considerable weight which negatively affects the situation of the balance of trade and implicitly that of the current account deficit.

In order to identify the causes contributing to the global deficit of the balance of trade and to the increasing imports we have considered necessary to present data afferent to GDP, respectively

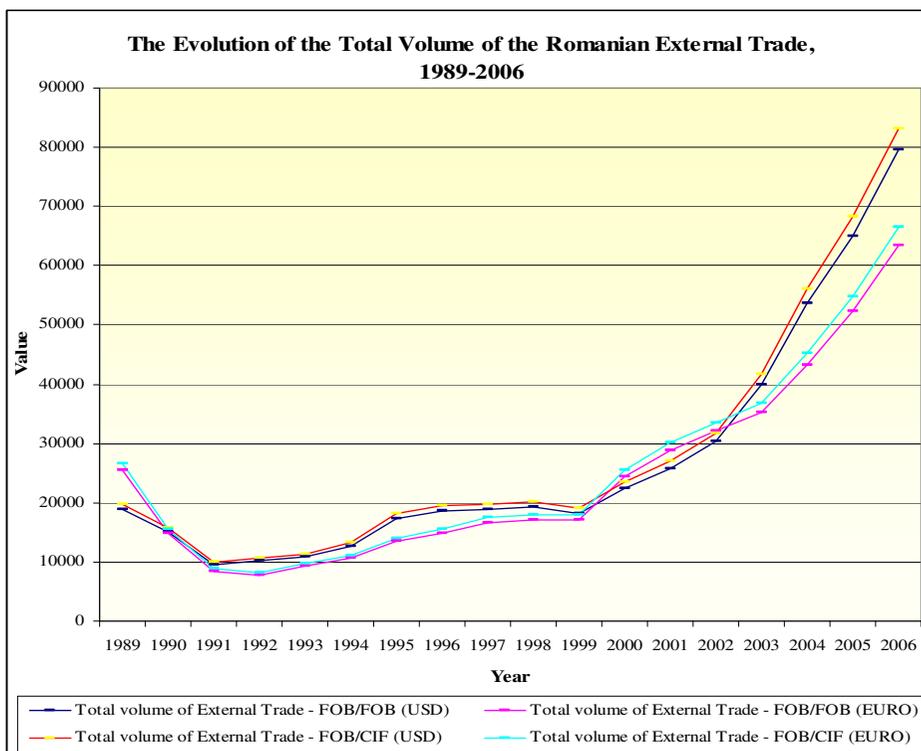

the growth (or GDP diminution) in the period analyzed, and therefore, we can notice that the GDP evolution is negative at the beginning of the period of transition, some economists naming this phenomenon as *negative economic growth*. Starting with 1993 though, the bringing to a normal state begins; therefore we have negative economic growth during 1997-1999, too. (See Table 2)

Table 2. The rate of GDP growth, 1989-2006, basis in chain

Year	Real evolution of GDP (%)	Year	Real evolution of GDP (%)
1989	-5,8	1998	-4.8
1990	-5,6	1999	-1.2
1991	-12.9	2000	2.1
1992	-8.8	2001	5.7
1993	1.5	2002	5.0
1994	3.9	2003	4.9
1995	7.1	2004	8.3
1996	3.9	2005	4,1
1997	-6.1	2006	7,0

In *Graph 2* we can notice that the highest rate of external trade volume growth was recorded in 2004, the analysts attributing this growth to the internal consumption, which is partially true as a result of the fact that our data relative to foreign trade reflected a high level of deficit in the balance of trade, meaning that, mainly, the consumption of import goods contributed to the country's economic growth. Let us remember that in that year the consumption credits were launched on the market for the population and thus it was recorded an explosion of import with electric appliances and electronics.

In **conclusion**, based on the above analyse and on the data regarding Romania's foreign trade, to be found in the specialty literature²²⁵ there have been identified three stages of the evolution and tendencies in the Romanian foreign trade, that is:

- 1990-1993 – the stage of the accentuated decline of the Romanian foreign trade due to the changes in the system in the conditions of some massive imbalances on the domestic markets, especially on the important exporters' markets; in this period there was a series of external restrictions derived from the localization of Romania in a geographical area unstable from the economic and political point of view;

- 1994-1998 – the stage of the economic macro-stabilization efforts, characterized by attempts to force the exports, in the context of Romania's integration in the WTO structures and of Romania's candidature to the EU, the Romanian currency depreciated compared to its purchasing power, our country's accession to the CEFTA free trade area;

- 1999-2006 – the stage of real privatizations in the industrial sector and of restructuring the inefficient sectors, of the efforts with a higher degree of simultaneity in creating a liberal economic environment and of real facilities given to foreign investors.

AN OVERVIEW OF THE GENERAL EVOLUTION OF THE ROMANIAN FOREIGN TRADE AFTER 1989, WHILE TRYING TO JOIN THE EU (II)

Giurgiu Adriana

University of Oradea

Department of International Business

Research Centre for Competitiveness and Sustainable Development

Considering the context of the international trade in the period 1989-2006, which has suffered dramatically changes, we have continued to analyse the realities marking the Romanian foreign trade after 1989. As a matter of fact, the EU as we have noticed in previous articles, started even in 1990 to have important weights in Romania's imports and exports, these weights surpassing 50% of the total of imports and exports starting with 1995, since when we can say that Romanian has been performing preponderantly economic exchanges with the European Union countries. Thus, in the present paper we continue our "radiography" concerning the general aspects and tendencies of the Romanian External Trade during the years 1990-2006, and their effects upon the Romania's membership to the European Union, by presenting some relevant indicators, such as: the geographical orientation and the Romania's exports and imports to/from EU etc.

Key words: Romanian foreign trade evolution, imports, exports, EU accession process, geographical orientation, weight of Romania's exports and imports to/from EU, in the total Romanian exports and imports

JEL codes: F14, F15.

Considering the context of the international trade in the period 1989-2006, which has suffered dramatically changes, we have continued to analyse the realities marking the Romanian foreign trade after 1989. Where the privatization of the state monopolies succeeded, though, the role of the state was simply transformed into a regulating one and as a result, positive evolutions have been registered. As it concerns the methodological approached in this paper, for the analysis on the evolution of the Romanian external trade after 1989, we used a series of general statistic indicators, which are very useful to make general comparisons with other countries.

With respect to the geographical orientation on partners, the statistical data analysed in this paper reflects a growth of the weight of European countries and especially of those in the EU, both at import as well as at export. For exemplification we present these weights only for the EU (see *Graph 1*), because only for this region the trend to grow is obvious. With the other areas, the growth is slow or there has not been recorded any growth, the weights being relatively low and insignificant.

Therefore, the trend to intensify the commercial exchanges with the European Union is clear. As a matter of fact, the EU as we have noticed previously, started even in 1990 to have important weights in Romania's imports and exports, these weights surpassing 50% of the total of imports and exports starting with 1995, since when we can say that Romanian has been performing preponderantly economic exchanges with the European Union countries. We must mention here that this year - 1995²²⁶ – represents actually the year when Romania officially applied for the accession to the European Union, which determined to a certain extent this important weight held by EU in our foreign trade, because of the fact that by achieving the consensus of the political

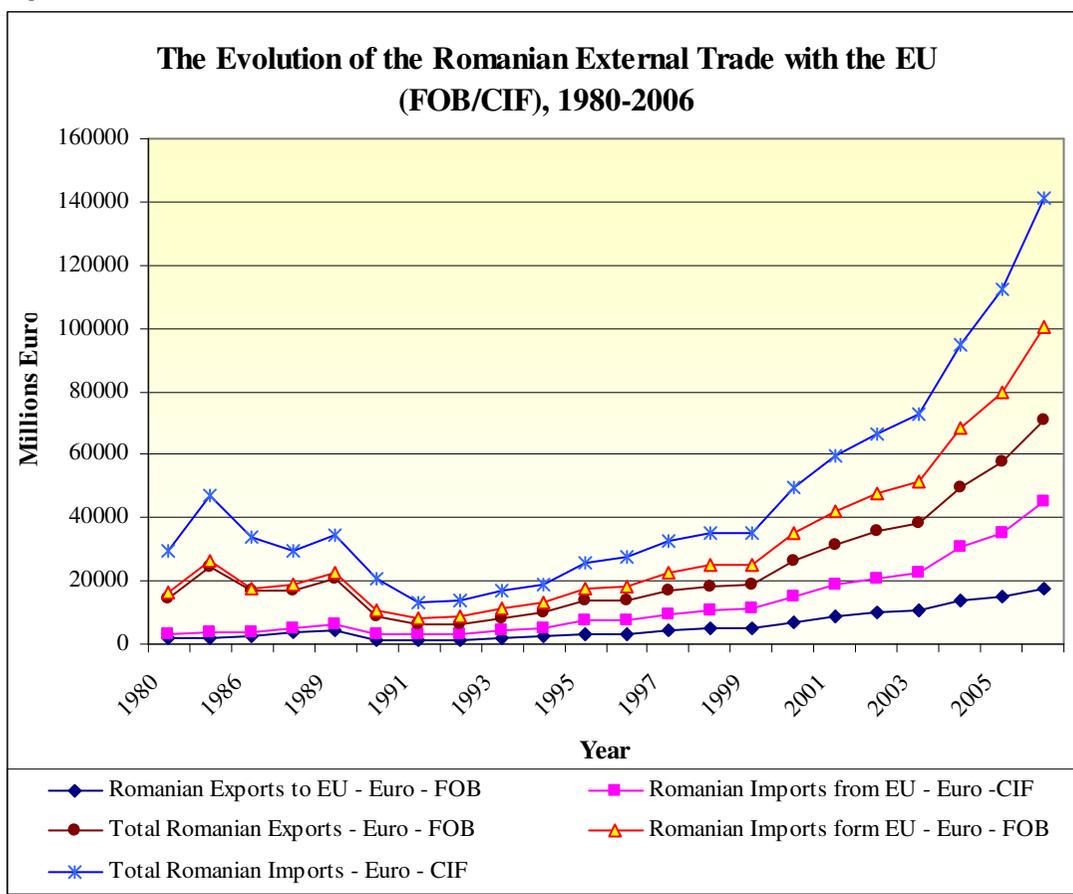

²²⁶ more exactly, on June 22, 1995.

class regarding our candidature to EU, this consensus was reverberated on the legislation, too and on the policy applied subsequently in the commercial filed.

According to the EU Association Agreement, Romania gradually and asymmetrically reduced the customs duties for the industrial products import from EU, completely cancelling them on 1 January 2002 (while EU eliminated these duties on 1 January 1997), as well as the quantitative restrictions for the trade with merchandise due to be processed (for example, *Lohn* for the export with textiles and clothes which led to the increase of that group's weight in the total exports of Romania towards EU, from 33.4% in 1994, to 36% in 1997), as it can be seen in *Table 1*.

Therefore, starting with 2002, a free trade area was constituted between EU and our country regarding the industrial products. The trade with agricultural products has been partially liberalised, due to this sector's sensibility in EU, by signing reciprocal conventions for a series of agricultural products: tax exemptions and reductions, tariff contingents and reciprocal elimination of the export subventions for some products, following that the complete liberalization should take place when Romania accedes to EU²²⁷.

Graph 3

²²⁷ As a matter of fact, Romania is considered as being a country with competitive advantages in trade with agricultural products, if eliminating the external distortions.

Table 1. The weight of Romania's exports and imports to/from EU, in the total Romanian exports and imports, 1989-2006

Year	Exports to EU – Weight % in total of exports	Imports from EU – Weight % in total of imports
1989	32,9	11,7
1990	33,9	8,3
1991	36,9	6,3
1992	35,2	13,8
1993	41,3	13,9
1994	48,2	21,8
1995	54,2	28,9
1997	56,5	41,3
1998	56,5	45,3
1999	64,5	48,2
2000	65,5	50,4
2001	63,8	52,3
2002	67,8	52,5
2003	67,2	57,7
2004	67,7	60,7
2005	72,9	56,5
2006	67,6	57,4

Source: Personal computations based on statistic data²²⁸

Regarding the other areas (see *Graphs 2 and 3*), the weights are considerably low. The reasons for this orientation of the foreign trade preponderantly towards the EU and significantly to a smaller extent towards the other areas are:

- for example, with Africa and Middle East, the weight became lower during 1999-2002 due to the tensions and long crises in the Middle East; moreover, the traditional relationships with this area did not manage to be maintained in the first years of transition, being reconsidered on other bases after 2002, when Romania became a USA partner in the military operations in the area, thus registering a considerable sudden change of the commercial exchanges with the countries in this region (for exemplification, the Romanian exports raised from 335 million Euro in 2001, to 1749 Euro in 2006; the CIF imports in the same years raised from 137 million Euro, to 750 million Euro) and an annual surplus of the balance of trade on this destination. Therefore, this market should still be considered by Romania because it seems that our products are in demand in the region, being competitive for the purchasing power of that particular population. Obviously, an analysis of the structure of our exchanges on this direction is necessary to be able to realise if the situation is conjectural or not;

- with the EFTA countries, the level of commercial exchanges, yet reduced as value, recorded also a negative balance of the Romanian balance of trade in the period we are analysing;

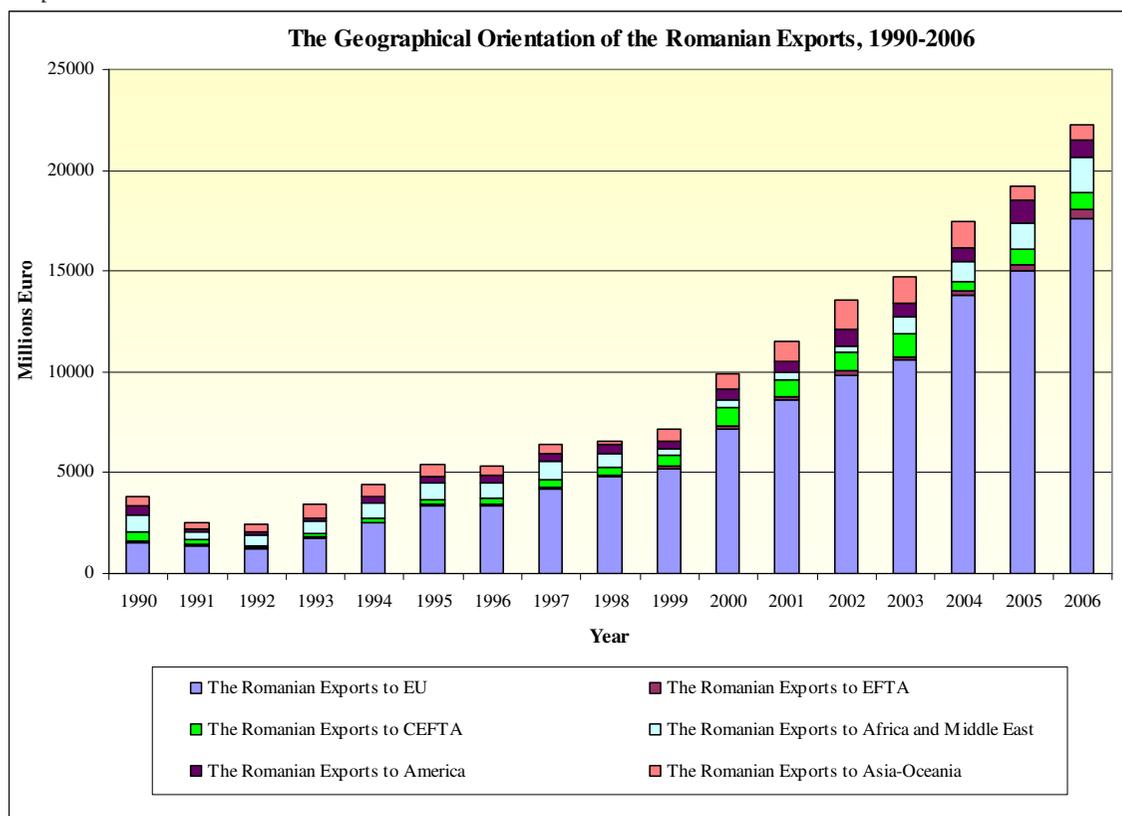

- with the Asia-Pacific region, even though the trade has recorded a preponderantly ascending trend since 1990 onwards, Romania's exports towards this region lowered due to some limitations of imports by this area; in spite of all these, we can notice an increase of the Romania's imports, starting with 2001, when China adhered to the WTO; from the point of view of the negative balance of our balance of trade – which, as a matter of fact, records the similar trend of the EU on this relation – we consider this region as not being beneficial for the

²²⁸ see Annex 2

Romanian products because it is the most competitive market for Romania – and not only – currently (for example, Romania’s exports became lower from 1447 million Euro in 2002, to 733 mill. Euro in 2006, while the CIF imports in the same years increased from 2009 million Euro to 3363 million Euro).

- with the region of America, even though the trade has recorded a preponderantly ascending trend since 1990 onwards, Romania’s exports towards this region recorded cyclical fluctuations starting with 2000; in spite of all these, we can notice an increase of the Romania’s imports, starting with 2000, year when Romania started its accession negotiations to the European Union; but from the point of view of the negative sold of the Romanian balance of trade – which is opposite compared to that of the EU on this relation – we consider North America – especially if we take into consideration the commercial exchanges with the USA – as not being beneficial for Romania’s exports. In exchange, South America can be considered as a market with an important potential for the Romanian products, especially in the present, as EU members and beneficiaries of the free trade agreements of this area with the Latin American countries. We cannot though but notice the fact that the positive trend of Romania’s commercial exchanges with the region of America started in 1993 – after a significant previous diminution – when the USA re-awarded Romania the most-favoured-nation-clause.

Graph 4

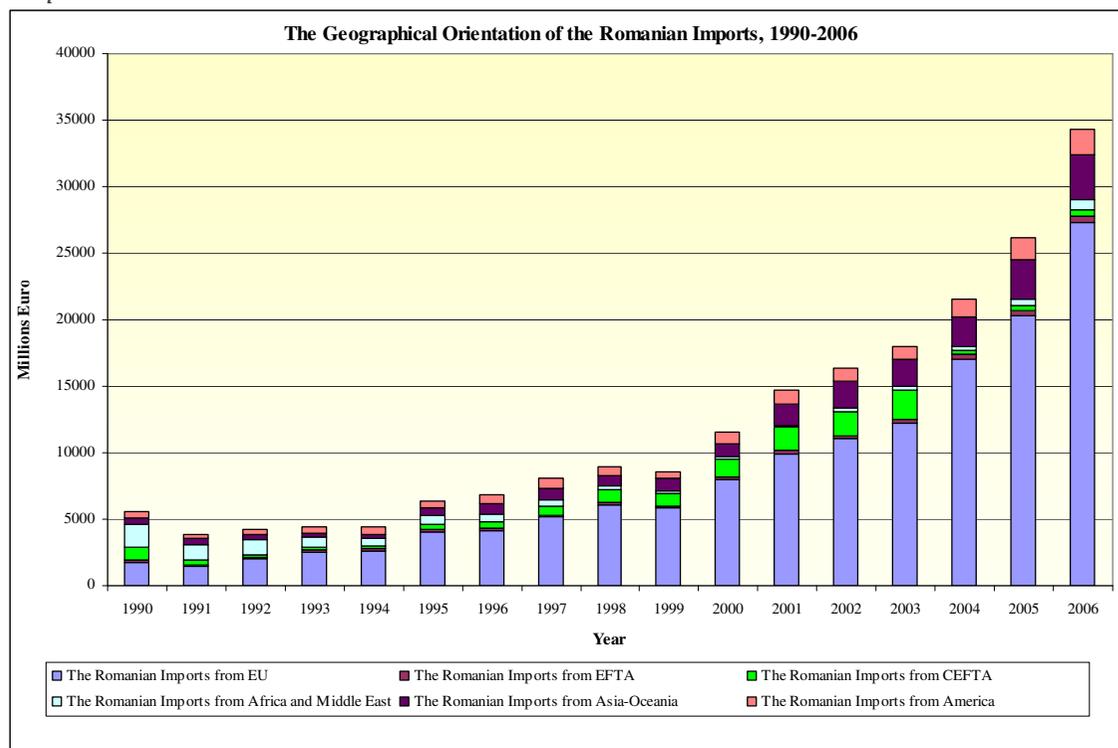

Source: Personal computations based on statistic data provided in the annexes of the book: Giurgiu, Adriana, *Comerțul intraeuropean. O nouă perspectivă asupra comerțului exterior al României (Intra-European Trade. A New Perspective onto the External Trade of Romania)*, Economica Publishing House, Bucharest, 2008.

Thus, as a **conclusion**, we appreciate that Romania has readapted its external commerce after the year 1989, according to the existing conjunction on the international markets, but, although it has

reoriented from the geographical point of view, actually, the external commercial changes of the country are far from registering the desired efficiency (if we refer only to the commercial balance account), the export levels are still situated almost in all the cases under those of the imports. This fact is, first of all, due to the fact that the geographical reorientation has not been accompanied by great changes in the structure of the exported goods and nor by an increase in their competitiveness. In addition, Romania has guided itself mostly on the markets with which it already had closed agreements of free trading, even if – as we have proved in the regions of Africa and Middle East – there was and still is a huge potential for our exports on other destinations, more efficient, at least on a short and medium term, until we manage to produce intensive technological products.

This geographical orientation of our external affairs – which actually had a meaningful contribution to the commercial deficit of our country – was mainly owed to the used promoting measures by the Romanian commercial politics in the analyzed period, that were mainly focused on the markets of EU states and those with which we had bilateral agreements starting from the year 1990, not having at all any foundation for the aim of efficiency of our external affairs. Even more, the country's commercial deficit has accentuated in the first months from joining the European Union, fact that clearly shows the necessity to reorient the Romanian exports towards markets with a higher potential.

Graph 5

O nouă perspectivă asupra comerțului exterior al României (Intra-European Trade. A New Perspective onto the External Trade of Romania)*, Economica Publishing House, Bucharest, 2008.

Thus, as a **conclusion**, we appreciate that Romania has readapted its external commerce after the year 1989, according to the existing conjunction on the international markets, but, although it has reoriented from the geographical point of view, actually, the external commercial changes of the

country are far from registering the desired efficiency (if we refer only to the commercial balance account), the export levels are still situated almost in all the cases under those of the imports. This fact is, first of all, due to the fact that the geographical reorientation has not been accompanied by great changes in the structure of the exported goods and nor by an increase in their competitiveness. In addition, Romania has guided itself mostly on the markets with which it already had closed agreements of free trading, even if – as we have proved in the regions of Africa and Middle East – there was and still is a huge potential for our exports on other destinations, more efficient, at least on a short and medium term, until we manage to produce intensive technological products.

This geographical orientation of our external affairs – which actually had a meaningful contribution to the commercial deficit of our country – was mainly owed to the used promoting measures by the Romanian commercial politics in the analyzed period, that were mainly focused on the markets of EU states and those with which we had bilateral agreements starting from the year 1990, not having at all any foundation for the aim of efficiency of our external affairs. Even more, the country's commercial deficit has accentuated in the first months from joining the European Union, fact that clearly shows the necessity to reorient the Romanian exports towards markets with a higher potential.

At the same time, one must also underline the important role played by the *Romanian commercial politics reform* in the whole process of the economical reform in our country, which can be explained through the fact that, on a short term, it has been a good substitute for other politics, because it stimulated the competition (reducing the dominant positions in economy and disciplining the application of subsidies), it has eliminated the distortions created by system of administrated prices and created pressures for the modernisation of the fiscal system.

INDIVIDUAL AND CONTEXTUAL DETERMINANTS OF ENTREPRENEURSHIP: AN INTERNATIONAL COMPARATIVE ANALYSIS

Hatos Roxana
University of Oradea

Hatos Adrian
University of Oradea

Abstract

Models of entrepreneurial behavior focus usually on individual level factors yet a great deal of beginning and running a business depends on the economic, social and institutional environment. Our analysis uses data from the 2008 European Social Survey to assess the weight of country-level characteristics in explaining individual entrepreneurship measured as self-employment of business ownership. The article starts with a literature review which puts the bases of our hypotheses. The results describe cross country comparisons of entrepreneurship rates, individual and country-level regressions of entrepreneurship. As expected, there are large differences between countries with respect to rates of entrepreneurship. A great part of this variance can be accounted for by the division between the former socialist countries and the rest and by levels of urbanization.

Keywords entrepreneurial behavior, contextual factors, comparative analysis

JEL: A14

Introduction

Models of entrepreneurial behavior focus usually on individual level factors yet a great deal of beginning and running a business depends on the economic, social and institutional environment. Unemployment basically acts as a push factor for self-employment (Audretsch & Thurik, 2006). Based on literature review we expect a positive influence of income differentials on the number of self-employed (Evans & Leighton, 1990). Most studies investigating the role of motivational determinants of the choice for self employment pertain to the *individual level*. Urban areas will give rise to economies of scale through which small-sized entrepreneurship in retailing comes under pressure (Noorderhaven, Thurik, Wennekers, & Van Stel, 2004; Wildeman et al., 1999). We expect life-dissatisfaction to be positively related with job-dissatisfaction and thus with self-employment. The role of post-materialism in explaining differences in self-employment between countries is dealt with in Uhlaner *et al.* (2002).

Data

We have used the data base of the 2008 European Social Survey which includes answers from 54988 subjects selected using a stratified probabilistic procedures from the adult populations of 28 countries. The data were weighted in order to adjust the data base to the size of each country's population. The weighted data base contains 58456 cases.

Variables

The dependent concept in the study is entrepreneurship. Entrepreneurship was defined as business ownership or self-employment. As such, we have defined as entrepreneurs those individuals who, in the European Social Survey indicated their occupational status as being self-employed or working in family business. According to this definition, 9,9% of the sample qualify as entrepreneurs.

Individual-level variables

Variable name	Description	Measurement	Univariate statistics
age	Age of respondent	Numeric	Avg=47,1 Stdev=18,6
edu_square	Squared of Years of full-time education completed	Numeric	Avg=158,3 Stdev=101,7
male	Gender	Dichotomy (1=male)	44,5%
rural	Residence	Dichotomy (1=rural)	31,6%
father_empl	Father self-employed at 14	Dichotomy (1=self employed when the subject was 14)	16,3%
mother_self	Mother self-employed at 14	Dichotomy (1=self employed when the subject was 14)	6,0%
father_sec_ed	1=father with secondary education	Dichotomy (1=father with secondary education)	41,9%
mother_sec_ed	1=mother with secondary education	Dichotomy (1=mother with secondary education)	43,4%

Contextual variables

Inspired by the literature we have modeled individual entrepreneurship using several features of the countries in the data base:

Variable name	Description and source	Measurement	Univariate statistics
Frmcommunist	Country former communist or not	Dichotomy (1=former communist)	12 (42%)

THE BALANCE OF PAYMENTS' SUSTAINABILITY AND THE EUROZONE ACCESSION CONVERGENCE CRITERIA

Hățegan D.B. Anca

Faculty of Economic Sciences

The main purpose of the balance of payments (BoP) is identified as representing the long term need of equilibrium and stability of the international payments and revenues. The purpose of this paper is to determine the factors that influence the balance of payments of a certain country, by using a rigorous classification that reveals the complexity of these factors. Our conclusions are very relevant, especially for countries like Romania, because, in order to achieve the external equilibrium, it seems that every county must adopt a mix of internal economic policies, and although theoretically this can be realised, sometimes in practice it can prove to be impossible on account of inability or refusing to combine the appropriate economic policies.

The balance of payments purpose, functions and sustainability

The main purpose of the balance of payments is identified as being the long term need of equilibrium and stability of the international payments and revenues. This objective is determined by certain costs of certain imbalances between payments and revenues. The nature of the costs depends on the exchange rate type of regime.

As in accountancy the balance of payments is always balanced, the imbalances registred refer to the main accounts' balance, the current account and the financial and capital account, except the National Bank reserves.

*In other words, **the balance of payments general imbalance** represents the sum of all comprising accounts' imbalances, according to its architecture. Thus, the goods and services balance result, the income balance result and the current transfer result form the current accounts' imbalance. And the capital and financial account imbalance is given by the results of the financial account and capital account. So, every account's balance is obtained by adding all its comprising subaccounts' balances, and every subaccounts' balance is obtained by adding all its comprising items.*

The external imbalance nominal value is given by balance of payments surplus or deficit and is reflected in the financial flows volume and sign. Thus, the balance of payments deficit represents the continuous negative and high value balance of all reserve assets.

According to the theory, the external imbalance appears only if the exchange rate is administered in a certain degree, because when the exchange rate is floating, every imbalance trend should be counteracted by a spontaneous shift of the exchange rate towards the equilibrium.

*Therefore, the external balance represents the situation when the sum of the current account and the financial and capital account balance is zero. When this theoretical concept is transformed into an efficient policy, we can find many inconveniences, specially regarding the *period* considered when the balance of payments is analysed, *the period* when the balance of payments*

equilibrium forecasts to be obtained, *the balance of payments structure* and the *relation* between the internal and external balance.

The current accounts' balance is one of the most important and most controversial ways of measuring the macroeconomic performances in a transition economy, and reflects the connection between the national economy and the rest of the world.

Regarded from a macroeconomic perspective, the current account balance reflects the impact of foreign resources inflow on the economic development and also draws the attention on a dangerous and unsustainable imbalance, determined by the cumulation of external debt as a result of the disparities between the available income and the economy's absorption capacity, and the difference between the national savings and gross investments²²⁹ (key factors of economic growth), that transforms the saving - investment balance into the measuring instrument of the resource necessity generated by the economic evolution in a certain period of time.

A deficit resulted from the high level of investments can be sustainable only if the investments are directly related to capital formation and economic growth. *A deficit resulted from a low level of national savings* is more doubtful.

We consider that the current accounts' deficit sustainability is a complex concept that depends on several factors, like: the goods and services exports' growth rate compared with the one of the imports, the structure of exports, imports, government expenditure and national credits, and also the improving prospects of collecting budget revenues. And the governmental deficits sustainability has important consequences on the economy's external deficit sustainability. In transition countries the large governmental deficits are not covered by private savings, this situation being reflected in large current account deficits. Thus, budgetary deficits are largely covered by external loans, that can become a burden for the economy, if they are not used for financing fruitful investments. .

The foreign direct investments inflows perspectives influence the external deficit sustainability (a large percentage of FDI inflows could be helpful for covering the current accounts' deficit, but it must be considered that in the transition economies that have already finalised the privatization process, a drop of FDI inflows will probably be registered, FDI ensuring only the short term current account deficit sustainability) and also their economic destination. There are several long term FDI inflows perspectives, with positive effects on our country's competitiveness and supply expansion, including an export oriented production, on the account of Romania's production potential. Another important aspect refers to the phase of FDI: growth stage or the repatriation of profits stage. The historical experience shows that overall, FDI help the balance of payments, only in the first stage. In the second stage, their impact on the balance of payments becomes negative.

The current accounts' deficit also depends on the level, destination and structure of the external debt and on maintaining the possibility of covering the current accounts' deficit through external financing, ie the existence of a positive differential of the real interest rate and an external creditworthiness, and also of the international reserves evolution and balance, and of the tradable goods sector's developing degree.

The economy's capacity of sustaining the current accounts' deficits also depends on the financial system development level, first of all because an undeveloped banking system discourages the national savings. Secondly, an undeveloped financial system could not efficiently assign capital inflows and savings towards investments. The third reason refers to a banking system crisis that would support an exchange rate crisis.

The real exchange rate and the exports and imports elasticity influence the exported and imported volume of goods, and therefore the external deficit's sustainability. The national currency

²²⁹ That splits the private and public sector gap.

devaluation represents a major risk for the current accounts' sustainability, because it makes the external financing more expensive.

Other determinants also have impact on the current accounts' sustainability level are the economy's degree of openness, the structural reforms and the level of labour productivity..

An extremely important aspect that must be considered when studying the current accounts' deficit sustainability refers to determining an „anchor”, like some comparing criteria. This kind of anchor for establishing the current accounts' sustainability could be avoiding insolvency of a certain country, this representing one of the economic policy strategic goals.

The convergence criterias and the balance of payments

The euro area balance of payments represents a statistical overview of the economic operations between the resident and non-resident countries of the euro area, registered in a certain period of time, usually one year

The European Commission Treaty establishes that joining the third stage of EMU depends on meeting the real and nominal convergence criterias and could be realised at the moment chosen by each country. Also the Treaty sets the *exclusion clause*, according to which Great Britain and Denmark can remain outside the EMU if they decide so, despite meeting the convergence criterias.

The convergence criterias (Maastricht criterias)²³⁰ are variables that express the homogeneity degree between the economies regarding the main features. Between the EU member states must exist a certain degree of homogeneity so that the economic growth in the EMU could be sustainable, and so that the possible common shocks shouldn't determine asymmetric effects between the member states.

The nominal convergence represents the medium term progress to reaching Maastricht's nominal convergence. The sustainability of meeting the nominal convergence criterias represents a sine qua non condition for joining the euro area

The nominal convergence criteria can be classified into *monetary criterias* (the first three) and *fiscal criterias* (the next two) and they are:

- **price stability**: the average inflation rate of the countries wishing to adopt the euro must not overcome by more than 1.5% the average inflation rate of the first three most performant economies regarding the price stability;

- **interest rate**. The countries wishing to join the euro area must have a long term nominal interest rate that should not overcome by more than 2% the long term average interest rate of the first three member states with the lowest inflation. \

- at least two years before joining the euro area, the candidate countries must join the ERM II, proving their **national currency stability** through maintaining it between + / - 15% compared to a central parity established compared to the euro²³¹.

ERM II represents a sort of training room, that allows the transition period needed for adopting the euro. Joining the ERM II is optional regarding the period of time chosen, but is mandatory for adopting the euro. MRS II represents a mechanism through which the EU assures that the member states are heading towards stability, from an economic point of view.

- **The budgetary deficit** must represent not more than 3% of real GDP;

²³⁰ The Maastricht criterias are included in the 121 Article of the Treaty and in the 21 Protocol attached to the Treaty.

²³¹ When establishing the central parity there must be considered the balance exchange rate and the exchange rate's evolution in the period before determining the central parity, for being credible and for diminishing the risks. The central parity must reflect the economic reality.

- **The external debt** can not overcome more than 60% of GDP. There are some exceptions to this conditions, for countries with a decreasing external debt, that insures a close percentage to the established value.

Meeting all the criterias with the appropriate values does not involve the real convergence.

All the candidate states must also meet the **legal convergence** criterias. This means adjusting the national legislation and the regulations issued by the member states' Central Banks to be fully compatible to the ESCB Statute, in order to planning and implementing the European monetary policy. Largely, this convergence referes to problems regarding the national Central Banks independence and their integration in the ESCB.

In addition to the nominal convergence criterias, when assessing if a member state is ready or not to adopt the euro, the European Commission and the European Central Bank also consider the market integration, the balance of payments' situation, labour costs and other price indicators (real convergence).

The real convergence implies the economic development that insures reaching the EU's and euro area's real income level, the gradual proximity, as coherent and as faster as posible, regarding the income per capita and the price level, of those closest regarded from the economical development point of view. In other words, the real convergence involves equalizing the living standards, what the EU calls „economic and social cohesion”. The variables that express the real convergence are: the unemployment rate, the structure of the balance of payments²³², national income per capita and public expenditure. For obtaining this it takes more time than for meeting the nominal convergence criterias, as their accomplishment affects positively the real variables.

After the research conducted for realizing this paper and in order to argument the theory, in the following part, we will try to analyse the main convergence indicators and also to draw up the most appropriate conclusions regarding our countries situation. .

As regarding our country's recent **price stability**, the inflation rate was above the reference value. In March 2010, the reference value was 1.0%²³³. În Romania, the inflation rate registered was 5.0%, 4.0% above the reference value.

After a period of deflation, HICP was below 4% in the second part of 2007 and 2008, on the account of raising food and fuel prices. In July 2008, the annual inflation rate reached the high value of 9.1% and remained that way despite the strong economic downturn, registering 5% in the second half of 2009. The gap between the euro area inflation rate reflects a rise in the price of tabaco, fuel and the persistent inflation in services sector. In the firs quarter of 2010, the annual inflation rate still remained high, registering 4.6%.

The Romanian economy was strongly affected by the global economic downturn, as our country's economic growth decreased from 7% in 2006-2008 to -7.1% in 2009, on the account of the decrease of the local demand, and on the back of approved credits and investment inflows. The available information and indicators for the first semester of 2010 sugest a superficial recovery of the Romanian economy. The forecasted GDP growth is 0.8% for the year 2010 and 3.5% for 2011, reflecting so an increase of the local demand components, except the public expenditure.

The labour market reacted late at the difficulties of the economic situation. The unemployment rate increased to 6.8% in 2009, from 5.8% in 2008. In 2009 the labour productivity decreased to registering negative values, on the back of lower results.

²³² Article 121 from the EU Treaty (1992) affirms that besides the qualitativ criterias, „the state and evolution of current account balance” of all the candidate countries must be examined before they join the euro area\

²³³ Calculated as the average of Portugal, Belgium and Estonia's last months' average inflation rate, plus 1.5%

Since 2005 Romania operates in an inflation targeting framework, combined with a floating exchange rate regime. BNR highlighted the fact that all exchange rate and monetary operation instruments will remain available, including the interventions for stabilizing the national currency.

The leu's exchange rate floated a lot in the 2000's. Between 2004 and 2007 the leu appreciated, on the account of capital inflows, attracted by the slight economic recovery and the EU accession perspectives. After a five years appreciation, in the second half of 2007, the national currency suddenly depreciated, as a consequence of the first signs of global financial markets downturn. The leu's depreciation trend in 2007, was only interrupted in the second part of 2008.

Another important moment of the leu's depreciation was in 2008, on the account of worsening of the global financial markets situation and the rising fears of foreign investors towards the macroeconomic imbalances. After Romania asked for international financial assistance, the financial market pressures lowered and the national currency stabilized for a while during 2009. Financial market pressures reappeared at the end of 2009, on the back of the local policy uncertainties. At the beginning of 2010, the financial markets conditions improved and the leu's exchange rate registred a slight improvement.

In Romania, the long term interest rate was all the time above the reference value, since January 2007, when our country joined the EU. In March 2010, the reference value, as calculated by the average long term interest rate of Portugal and Belgium, plus 2%, was around 6%, and Romania's long term interest rate was 9.4%, 3.4% higher.

As regarding the external deficit, the Council adopted a decision, saying that Romania registred an **excessive deficit**, based on the previous year's deficit of 4% of GDP. In the same time, the Council recommended our country to correct the excessive deficit until 2011. In February 2009, the Council suggested new recommendations, that should be met until 2012. An increase on financial efforts was recommended and also strengthening the fiscal policy and adopting and implementing pesions reform.

The governmental deficit rose in the period 2005-2009, reaching 8.3% of GDP in the last year. The worsening of our country's deficit between 2005 – 2008, when the real GDP growth registred 6.4%, was on the back of the expanding fiscal policy orientation, reflected by the structural deficit deterioration, that reached 7.7% of GDP, in 2008. The fiscal deficit deterioration is a sign of the economic downturn's effects on governmental financing

The approved budget for 2010, adopted in January 2010 expresses a 6.3% of GDP deficit. According to the political conditions reflected by the programme for supporting the balance of payments, tha planned adjustments are tied to expenses: the measures imply a 2.2% of GDP reduction, but also an increase in incomes of 0.5% of GDP. Anyway, the 2010 Commissions spring forecasts show a deficit of 8% of GDP.

Romania's external deficit reached 12.8% of GDP in 2007, followed by a slight reduction in 2008 to 11.1%. The strong increase of the external deficit between 2005 and 2007 reflected a deterioration of the trade balance, because the imports were encouraged by a strong internal demand. In 2008, Romania's external deficit started to adjust, as a result of the internal demand decrease and the consumers' preference for local products and also continued in 2009. As to regarding the services, the trading balance was neutral in the last period. The negative income balance decreased, on the back of decreasing the investment profit repatriation by foreign companies in 2007. In change, the repatriated income by the Romanian workers that work abroad represented a supporting factor of the external deficit, even though their contribution decreased in 2009, on the account of the global financial crisis.

As regarding the saving – investment balance, the rise of the external deficit between 2005 – 2007, was largely due to accelerating the local investment activities, while the savings rate followed a slight increase. The difference between savings and investments strongly decreased on

the account of the economic downturn and the balance of payments adjustment in the financial and non-financial sectors.

In the last years, Romania's deficit was largely covered by FDI net inflows (on the back of the privatization process). In 2007, the FDI percentage in financing the external deficit decreased to 45

The financial accounts surplus decreased to 5.3% of GDP in 2009, from 12.6% in 2008. The decrease can be explained by the decrease registered by other investments as well, although the international financial assistance acted like an offset. The FDI net inflows decreased considerably under 4% of GDP in 2009, reflecting the reinvested profits.

The international reserves rose by 1% of GDP in 2009, partially due to the IMF loan.

Romania's **external debt** rose rapidly in the last years, reaching 68% of GDP in 2009. Before the economic crisis, the balance of payments positions' worsening was largely due to the loans from the banking sector. In 2010, the strong need for credit will probably contribute to our country's external deficit.

Conclusions

The main conclusion that can be drawn after this research is that the balance of payments represents an unreplaceable instrument to describe a country in its relations with the international environment, for assessing the strengths and weaknesses in its international relations. Also, the balance of payments explains a lot of things about every country's economic structure, about its past and future.

As regarding Romania, the European Commission considers that our country does not meet any of the euro area accession criteria, like the price stability, the governments budgetary position, the exchange rate stability and the long term interest rate convergence, but it also faces law-making obstacles.

As regarding the convergence criteria, our country's annual inflation rate is above the reference value since we joined the EU..

Romania does not meet the budgetary position criteria, being submitted to an excessive deficit procedure and having to reduce the negative balance of public expenses to under 3% of GDP until 2012.

For joining the euro area, a country's national currency must be included in ERM II. The leu's exchange rate is still free, and the downturns on the global financial markets, starting with the the second half of 2007 determined an appreciation, also supported by our country's macroeconomic imbalances.

Long term interest rates were still very high in 2009, on the account of the market volatility, before decreasing at the beginning of 2010, as a result of the internal market indicators improvement.

The external deficit reached 12% of GDP between 2007 and 2008, on the back of the accelerated growth of internal demand, and after it decreased, being supported by the trade deficit reduction..

As a result of the legal compatibility and meeting the convergence criteria, the European Commission considers that Romania does not require the conditions for adopting the European currency.

STATE AID AND PARTICIPATION TO INTERNATIONAL TRADE FLOWS. ROMANIA'S CASE

Nitulescu Ioana

Academy of Economic Studies Bucharest

Ichim Nela Ramona

Romanian American University Bucharest

Pavel Elena Mihaela

Romanian American University Bucharest

This article focuses on the Romanian state aid and participation to the international trade flows. The purpose of this research was to determine whether the state aid offered takes into account the evolution and the requirements of the new market conditions generated by the economic and financial crisis. Our main conclusion was that regarding Romania's participation to the international trade flows, as the state aid measures focused mainly on sectors with high social impact, trade came second on the government's concern.

Key words: state aid, trade flows, subsidies

JEL classification: F14, F43

Introduction²³⁵

Before analyzing the connection between state aid and trade flows we will first mention some articles which previously tackled this topic.

First of all, Garcia and Neven (2005) analyzed how state aid affects and distorts competition and trade within and across jurisdictions. They conclude that the magnitude of the distortion depends on the type of state intervention and that the impact of selective state aid on market prices and competitors depends mostly on the particular characteristics of the market. We therefore chose for this research a 3 year timeline (between 2007 and 2010) when the effects of the world economic and financial crisis were felt by all member states. We therefore considered a market environment with extreme conditions when state aid is required in order to keep up with the external competition.

Regarding the European Union (EU), Bruce Lyons (2009) suggested that the most familiar problem to the European debates on state aid is that subsidies create international distortion to competition. His explanation was that inefficient firms receive subsidies and then take market share from more efficient foreign suppliers. In this case not only competition is affected, but also the trade between the member states, and this fact we intend to focus on in this article.

However, Philip Lowe, the former Director General DG Competition (2009), pointed out that for the European Union, relaxing or suspending the state aid rules for the duration of the financial and economic crisis should never be an option. The effect would be that some companies which enjoyed state subsidies would also get a competitive advantage over their competitors. The most important thing is to acknowledge that public intervention has to be decided at national level, however, at the same time, it needs to be implemented within a coordinated framework and on the basis of common principles to the whole EU.

When starting to analyze state aid expenditure during the financial and economic crisis, a higher

²³⁵ This article is a result of the project POSDRU/6/1.5/S/11 „Doctoral Program and PhD Students in the education research and innovation triangle”. This project is co funded by European Social Fund through The Sectorial Operational Programme for Human Resources Development 2007-2013, coordinated by The Bucharest Academy of Economic Studies

aid volume was expected but we should also take into consideration the EU political mandate for “less and better targeted state aid” especially for this period when there is a need for a more effects-based approach. In this context we can use the general balancing test developed by Friederiszick, Röller and Verouden (2006). In essence, this test asks whether (i) the state aid addresses a market failure or other objective of common interest; (ii) the state aid is well targeted and whether (iii) the distortions of competition are sufficiently limited so that the overall balance is positive.

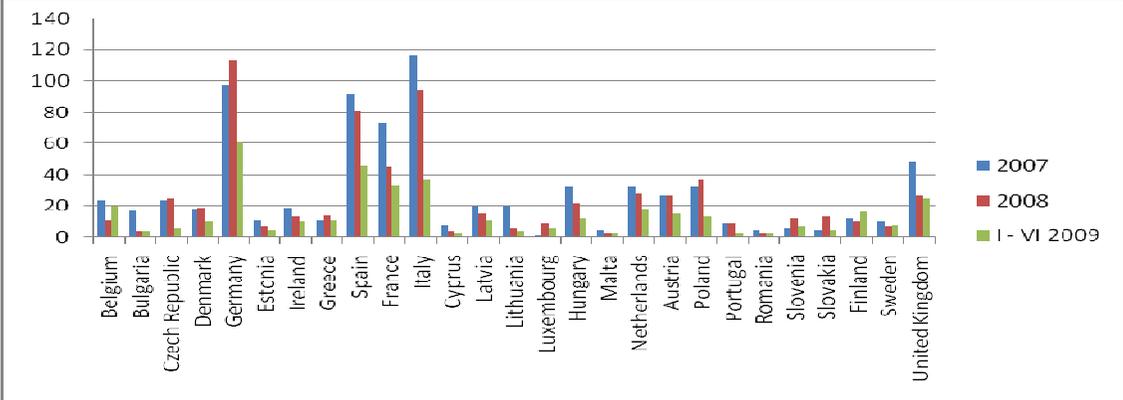

Based on our previous research, our article will focus on the connection between state aid offered by the government and Romania’s participation to the international trade flows. Ichim, Pavel and Nitulescu (2010) found that the higher the trade dynamics, the more intervention is required. Free trade is not entirely the solution for the countries when they deal with extreme conditions such as financial and economic crisis or high competitive environment.

State aid measures in Romania in the context of economic and financial crisis

As the European Commission reported, crisis measure implemented and reported by member states in 2008 amounted approximately to 212.2 billion EUR, which means around 1.7% of EU 27 GDP. The big increase of State aid to industry and services at EU27 level can be attributed to the thirteen member states which granted aid to financial institution in response to the crisis. Many of the EU 12 countries did not support their banking sector and their aids levels remained unaffected by crisis measures.

Looking at figure 1, we can see also that there are significant disparities between countries regarding the number of State aid measures notified during the analyzed period (2007- first semester of 2009). On the first place is Germany with 114 State aid measures during 2008, followed by Italy (95), Spain (81), France (45), Poland (37), Netherlands (28) and the UK (27). Compared to 2007, in 2008, the number of State aid measures decreased with some exception in case of Germany, Greece, Poland, Slovenia and Slovakia. For the latter countries a wider range of measures were needed to stabilize the economic environment. In 2008, the number of State aid measures was significantly lower in Luxembourg (9), Cyprus (4), Romania (3) and Malta (3). Compared to 2007, in 2008, the number decreased, with one exception, Luxembourg, which registered just one case in 2007. By the end of the first semester of 2009, the situation remained almost unchanged for Romania and Malta, both with 3 new notified measures.

Figure 1: Number of State aid measures by country notified by year - covering all economic sectors

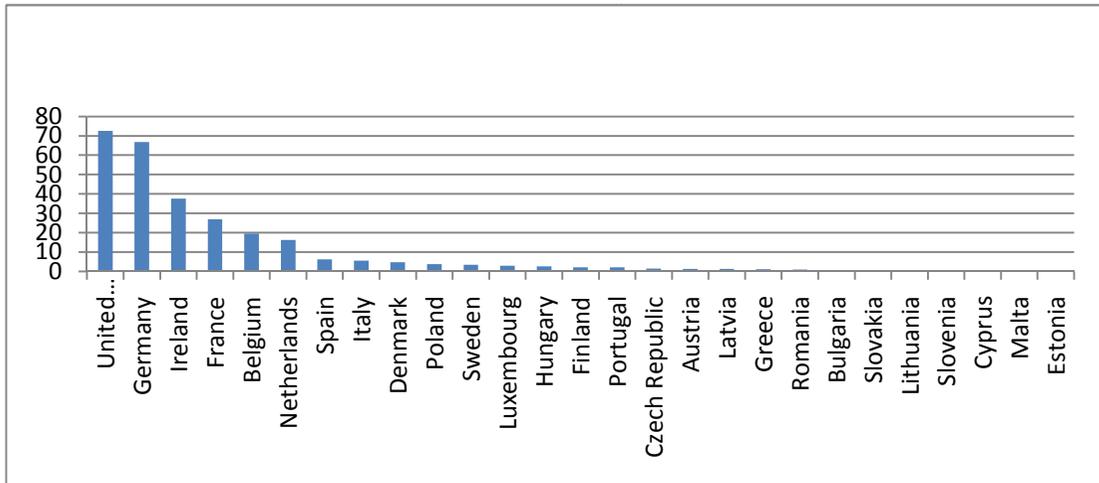

Source: Eurostat data processed by the authors

In 2008, total State aid granted by Member States was approximately 279.6 billion EUR. In absolute terms, United Kingdom showed the highest aid level (72.5 billion EUR) followed by Germany (66.8 billion EUR), Ireland (37.5 billion EUR), France (26.8 billion EUR) and Belgium

(19.4 billion EUR). As the figure 2 shows, Romania was on the twentieth place with a total state aid of 0.9 billion EUR.

In relative terms, State aid amounted to 2.2% of EU27 GDP in 2008. This average masks significant disparities between Member States: the share of total aid to GDP amounts to less than 1% (of GDP) in ten countries and exceeds the average in eight countries. In the latter group, the sharp increase on State aid was due to the crisis measures. For Romania, the level was 0.64% of EU27 GDP.

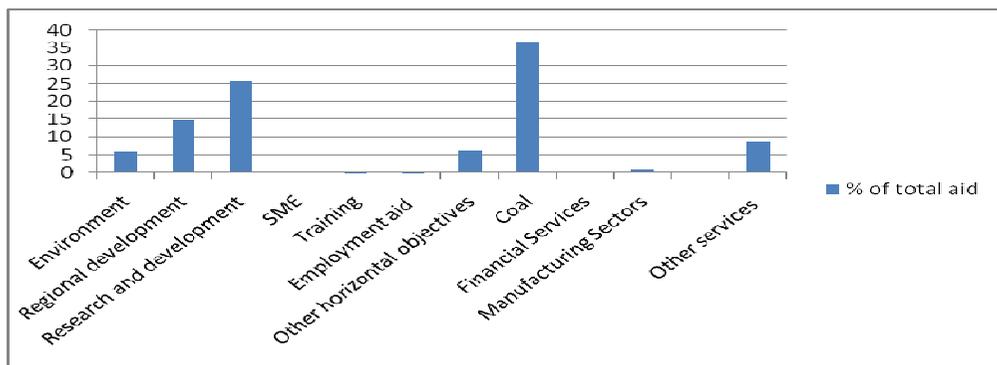

Figure 2: Total State Aid less railways, 2008 – billion EUR

Source: Eurostat data processed by the authors

Significant differences were found between member states regarding the sectors towards which aid was directed. In Romania, most of the State aid measures (53%) were concentrated for the horizontal objectives of common interest. In this category aids considered as being better suited to address market failures and thus less distortive than sector and ad hoc aid can be included. Research and Development and Innovation, safeguarding the environment, support to SMEs, employment creation, the promotion of training and aid for regional economic development are the most prominent horizontal objectives pursued with state aid. From the horizontal objectives, while the highest support was for research and development (27.7 %) followed by regional development (14.7%), small and medium enterprises received no support. Low levels of support received also the employment and training fields (both of them 0.1%)

Figure 3: State aid for primary objectives and sector aid as % of total aid (crisis measures excluded); 2008

Comparing to other member states, the share was significantly lower in Romania, in seventeen member states, 90% or more of all the aid awarded in 2008 was earmarked for horizontal objectives. In Ireland, Hungary, Slovakia and Spain, the share of horizontal aid was between 70% and 85%. As we can notice in figure 3, for Romania, a significant proportion of aid continues to be awarded to the manufacturing sector as well as to the mining industry (36.5%).

As regarding the crisis measures, while most of the EU countries chose different types of interventions (guarantee schemes, recapitalization schemes, and schemes combining several measures or ad hoc interventions) in support of financial institution, in Romania there was no support for this kind of institution by the middle of 2009.

Romania's participation to trade flows 2007-2010

Figure 1 and 2 in the appendix are relevant in order to establish Romania's rank concerning its participation to international trade flows among member states. Both figures show the evolution of intra and extra EU total product imports and exports of member states. As it can easily be noticed, most members maintain their rank among the 27 EU countries. Romania does not make any exception. Based on our calculation, Romania is the 18th among the EU members during all three years, 2006-2008. As mentioned above, in 2008, Romania was ranked twentieth with a total state aid offered in amount of 0.9 billion EUR and the 18th EU trader.

In January 2007 compared to January 2006 the exports reached a 2.9% growth while the imports rose by 16.7% (all calculated by reference to RON amounts). Due to Romania's new status as member of the EU, both the exports and the imports reached higher growth rates. In January 2008, compared to January 2007, the exports grew by 25.8% while the imports by 19.7%. January 2008 was the second month when the dynamics of the exports exceeded the one of the imports. 33% of the exports and 37.7% of the imports were auto vehicles and transport equipment while manufactured goods represented 42.1% of the exports and 29.9% of the imports. The global economic and financial crisis has also had an impact over the Romanian economy and therefore, in January 2009 compared to January 2008, the exports dropped by 12.9% and the imports by 28.2%. Once again auto vehicles and transport equipment along with some manufactured goods are the main products to be exported and imported (auto vehicles and transport represented 38% of the exports and 33.3% of the imports while other manufactured goods accounted for 41.7% of the exports and 32.9% of the imports).

In January 2010, however, though the crisis is far from being over, both the exports and the imports show a different trend. Compared to January 2009, the exports grew by 18.4% and the imports only by 3.5%. However, compared to December 2009, both the exports and the imports decreased (by 3.5% for the exports and by 17.1% for the imports).

From this presentation one aspect is worth noticing. Both the manufacturing sector and the car industry are the main generators of imports and exports. At the same time these sectors are also state aid beneficiaries. For instance, in December 2008, the Romanian car industry took a severe hit and therefore the government decided to grant state aids to Renault Dacia (€ 15.4 million) and auto parts suppliers: Delphi Diesel Systems Romania (€ 24.7 million), KS Atag Romania (€ 27.9 million), Calsonic Kansei Romania (€ 17.9 million) and Honsel (€ 37.4 million).

However, state aid was seldom focused on trade during this period. As the crisis was felt deeper and deeper the attention was drawn from trade to other sectors and this affects Romania's participation to the international trade flows.

Conclusions

The economic and financial crisis raised new challenges for EU regarding especially State aid control. This is the case for most of EU countries. The big increase of State aid especially to

industry and services at EU27 level can be attributed to the thirteen member states which granted aid to financial institution in response to the crisis.

Many of the EU 12 countries did not support their banking sector and therefore their aid levels remained unaffected by crisis measures. In Romania this is not the case as no financial institution was offered support by the end of 2009. However, a significant proportion of aid continued to be awarded to the manufacturing sector as well as to the mining industry without any relation to the external competitiveness of those sectors.

Regarding Romania's participation to international trade flows, as the state aid measures focused mainly on sectors with high social impact, trade came second on the government concern. If our previous research showed that the bigger the participation to trade flows the larger the support, Romania is an exception during the period taken into consideration. Regarding the "less but better targeted" state aid, it seems that Romania only managed to accomplish the first part of the rule.

EUROPEAN SOCIAL MODEL.COMPETITIVE ADVANTAGE OR ECONOMIC HANDICAP.

Iovițu Mariana

*Economy and Economic Policies Department,
Faculty of Economy,
Bucharest, Academy of Economic Studies*

“Corporate social responsibility” (CSR) represents equally a very actual debate, but also an appraisal criteria of the dynamic of eco-social integration quality process at European level. Especially that the protection need is demanded by the current economic crisis.

This concept is meant to combine the position, attitude and behaviour of the trade-unions with the interests of employer’s organisations in search of possible influential mechanisms of the competitive advantage at European level. Due to the current economic crisis, the implications on the labour force market are causing an explainable anxiety.

The attention of the decision takers is oriented towards joining the objectives “social well being with economic well being” in view of an expected economic come back. This approach proves a significant change at the level of economic and social policies within the European Union.

Key concepts:

- *European social model*
- *Social responsibility*
- *Socially responsible enterprise (responsible entrepreneurship)*
- *Triple profitability line*
- *Workforce flexicurity*

The implementing measures of the Lisbon Strategy have pointed out the huge efforts of the European and newly joined countries, materialized in achievements but also in failures and arrears in what is concerning the proposed objectives. On top of these, the effects of the eco-social crisis have added major implications on the employment level at the European market of labour force.

The idea of equal opportunities for all citizens of Europe, without discrimination, represents a principle and it is a well-known European value. Equal opportunities for all represents a desire and one of the substance components of everywhere democracy, next to liberty and respect of the fundamental human rights.

The aim of the present work is to prove that, in the current crisis context, there is essential for Europe’s future to correlate the economic adjustment efforts with new coordinates of European social models.

In this regard, we will draft some dimensions of the eco-social approach of the effects and implications of the crisis at European level, comparing several models of economic²³⁶ and European social models²³⁷.

1.- „Social Europe” in time of crisis

With no exaggeration, it can be stated that we are now living a temporary crisis of the European labour force market. Indeed, more and more insistently it is spoken of the „European overponderability” in what is concerning the enlargement wave. In this direction, the

²³⁶ William J. Baumol, Robert E. Litan, Carl J. Schramm - *Capitalismul bun, capitalismul rău și economia dezvoltării și a prosperității*, Ed. Polirom 2009

²³⁷ Anthony Giddens - *Europa în epoca globală*, Ed. Ziuva 2007

Euroscepticals are formulating their opinion on the basis of the negative effects and lack of efficiency of enlargement on EU space on work conditions and life of the rest of the population. The problem of the labour market it is not summing up just to quantitatively analyse the demand and the offer of workforce.

The approach of the qualitative size of the labour market requires an interpretative analysis of the qualification level, of the creative potential and other skills that has to possess the worker. The confrontation of workers differently trained in East and West emphasis opposite, if not contradictories qualities and lacks, mentalities and behavioural attitudes.

The social aspect has been ignored for a long period of time, the European market focusing almost entirely on the economic issue to obtain a competitive place in the world. The inclusion now of the social issue on the EU concerns due to an enlargement towards states from Eastern Europe that primed the socio-economic conflict, has determined a reorientation of the logics behind economic – social connection.

Now days, it is stated unreservedly that the binomial becomes social – economic. The performances and economic competitiveness can be achieved only through the social responsibility (SR) of the employer. *The ethical investments* are in this case, the motivation of the companies to realise and obtain the “*triple profitability line*”, which express the join of the obtaining criteria of economic rentability with social and environmental ones²³⁸.

The concept of “*European social model*” pleads for an in-depth investigation of the opportunities provided by the new good-practice of a global Europe. Confronted with the domino effects of the economic crisis, the EU citizens are asking themselves pressing questions regarding the economic – social future of the Europe that is suffering nowadays on the conflicts of community versus national interests. An anxiety attitude it can be noticed in what is concerning “*the future of the European identity*”.

The scenario of a “*social model*” is in the same time, questionable and disputable.

The European social model (ESM) is, in Giddens opinion, a disputed notion, since there are views according to which, the model is neither social (entirely), nor European (by tradition), nor... properly a model !

In order to sustain the relevance of the eco-social report, ESM is absolutely dependent on *two essential economic factors: economic prosperity and redistribution schemes*.

In spite of these, ESM is suffering due to the lack of economic support, both factors being put under impossibility sign, since of the actual crisis.

The golden era of the “*welfare state*” has passed since unemployment, inflation, globalisation, lack of social protection measures have gathered and questioning ESM, even determining its collapse. If it is respected the connection ESM – economic prosperity, then the indicator GDP/inhabitant is eloquent to prove that the economic performances are supporting the high level of social performances and standard of living.

The different types of social models: northern (providence state), conservative or corporate (Germany, France, Italy), liberal or Anglo-Saxon (Great Britain, Ireland), Mediterranean (Spain, Portugal, Greece)²³⁹ are a starting point in the analysis of the most suitable development forms of the social space with mutual implications on the economic performances.

In support of the veracity of these correlations, it has been added three criteria that form “*the trilema of economy working*” (according to Esping-Andersen). These are:

1. a balanced budget,

²³⁸ The information documents concerning the ethical investments (RSI) are low as number, which indicates a lack of concern for this category of investment. They are reaching a level of 5% only in Great Britain. Nowadays, the attitude has significantly changed also at EU level, by reaching a greater level of interest for the RSI products. Thus, 30% of the managers consider RSI of important success on short term and 86% appreciates its profitability on long term.

²³⁹ The classification of welfare state from Europe has been realised for the beginning by Gøsta Esping-Anderson, and reviewed then by other dedicated authors.

2. reduced economic inequalities, and
3. a high level of employment.

We need to mention that these criteria are to be found in Lisbon Treaty.

Of course, the capacity of governments to promote satisfactory policies for all three lines of action is limited. This is why the social models are distinguished through the different combinations of those three criteria; clearly, though never it will be possible to simultaneously achieve all three objectives.

And then, how should we obtain economic growth and social justice in the same time?

An economically disputable idea is that of the correlation of a high level of employment (70% in accordance with Lisbon regulations) with a minimum decent wage. In our opinion, the present European context is marked by the struggle of trade-unions for a level of *European income*, which makes questionable the above-mentioned correlation. The flexibility of the labour market is another dimension that, in theory sounds well.

In reality, the pronounced practice of protectionism by EU leading countries is an opposite reaction to the right of free movement of the workforce.

2.-Competitive advantages of economic development models.

The classification of economies in four categories: state managed capitalism, oligarchic capitalism, big companies capitalism and entrepreneurial capitalism²⁴⁰ leads to the idea that in the companies behaviour it is compulsory to be introduces the concept of “*corporate social responsibility*” (CSR) in order to define an European system suitable to the human being and not only to the business world. *The responsibility and social cohesion are integral parts of the competitiveness.*

This term has acquired new connotations since, with great insistence, *social affairs, workforce and equal opportunities* have represented at European level the three forces that have expressed the concern and interest for the fundamental objective: creation of new jobs in view of modernizing economies.

The motivation of introducing CSR in the behaviour of companies, it can be found actually in their attitude towards the issue of the hired worker. It is well-known the fact that businesses that disregard or neglect the man and its social problems, especially the position of workers employed, do not meet the ethical criteria. The existence of the market and the analysis of its eco-social dimensions highlight the inequity and the need of social justice caused by the competitive mechanism. Moreover, a behaviour that proves neglect of accountability and social responsibility of the employer towards the employees leads to conflict, unfavourable tensions for work climate and finally to a decrease of the profit.

The second reason for taking into the account the CSR by the companies is the desire to be successful in business, to display a reference example in business world on how to approach the employer to employee, always ready to respond to the issues related to the place and work conditions, the level of income claims, social insurances, etc.

Since the competitiveness is a qualitative feature, it arises that CSR is expressing a trait and a quality of management style and activity organisation that contributes, through its positive effects, to the development of the individual and society progress, diminishing in the same time, the environment impact. *In this case, the social responsibility it can be considered as added value for the company and society.*

²⁴⁰ The classification belongs to Baumol-Litan-Schramm authors and it is welcomed to explain the advantages/disadvantages of guiding the development efforts of its suitable markets.

3.- The responsible entrepreneurship and "triple profitability line"

The assessment of the company responsibility level is performed through the awareness of the positive effects of SR on businesses. The transfer of know how among good practices of the companies contributes to the improvement of the application framework of the social responsibility.

The inclusion of SR in the European policies significantly contributes to the European strategy for economic growth and job creation.

In the partially confuse application and assessment circumstances of SR at European level, there are several approaches that try to prove nevertheless the existence of interest and concerns related to the concept implementation in business behaviour.

Involvement of social actors in policy formulation and search of SR implementation related solution is a task and an objective of U.E social-economic policy.

„The culture” of a company is fundamented on compulsory and voluntary basis to adopt economic and social responsibilities. The firms have a economic accountability towards the shareholders and a ethical and social responsibility towards employees.

The adversity and opposition of the enterprises comes even from the incumbency feature of the constraint and the need to assume the SR measures.

Major issues facing the EU today are:

- ***The social-responsible approach*** to the problems at European level which can lead to successful economic recovery;
- Application and generalization of a ***European "social model"*** confirms that ***economic competition can be reconciled with social and environmental responsibility***, which means that economic profit can be assimilated with the social-human one;
- Determination of leaders to build a better and stronger Europe, ***for the benefit of citizens***.

If the European Commission does not support more vigorously the implementation of CSR principles, it is possible that the UN initiative "Global Compact Network" and the "Global Reporting Initiative" to take the bar in the procedures for implementing CSR.

In the current context of qualitative development of European space, CSR must prove its viability and to manifest as fundamental element of the European social model. The practices related to the social responsibility are a contribution to the sustainable development and providing equal opportunities to all members of the society becomes a long term strategy of the sustainable development.

In a society fully marked by risk and uncertainty of today and tomorrow, the restoration policies do not provide job security or continuity of employment. ***The restoration interventionism*** as positive approach of social protection comes to ensure further coverage of the risks.

Diversity and welfare, immigration and citizenship, lifestyle changes, environmental issues, climate change associated with energy shock are all the issues of the current period, which we are living in.

Europe's right to a second chance has become an obsession. The idea is fair and retains its identity in the throughout the conceptions marked by a unite Europe's ideology. Here it is a reflection subject for us all.

A POSSIBLE FRAMEWORK TO ASSESS THE GROWTH EFFECTS OF FDI ON THE HOST ECONOMY

Magai Ágnes

University of Debrecen, Faculty of Economics and Business Studies/ and Hungarian Ministry of Finance

It is generally assumed that foreign direct investment (FDI) inflow has positive impact on economic growth. However, empirical evidence doesn't always support this assumption. The inflow of FDI - particularly in the case of developing and emerging countries - can be an important vehicle for transfer of technology and knowledge, which according to leading growth theories are the main contributors to economic growth. We indicate some links between FDI and the most accepted economic growth theories. We argue that positive effects of FDI depend on a range of factors: type and form of FDI on the one hand, and host economy characteristics (absorptive capability, institutional environment, initial income level of the country etc.) on the other. The present paper tries to determine a possible framework for this assumption.

Key words: foreign direct investment, economic growth, host economy characteristics, type and form of FDI

JEL classification code: F43, F21

Introduction

It seems logical to argue that FDI contributes to higher economic growth in host economies. Inflow of physical capital contributes to higher gross fixed capital formation (GFCF) that may cause some positive effects on GDP growth already on the short term, depending of course on the amount of the foreign capital. More FDI in relative terms²⁴¹ believed to have stronger impacts on the host economy, however, as we are going to explain in the present paper quality of FDI is more important than that of quantity.

The aim of this paper is to explain briefly the role of FDI by the mean of main growth theories and illustrate that different types of FDI have different growth effects on host economies. However, the paper doesn't take into consideration the detailed growth effects of foreign direct investments. We argue furthermore, that local factors of the host economies should be considered as important factors if evaluating FDI growth promoting effects.

FDI and growth theories

Inflow of FDI is preferred generally because of its long term effects: employment effects, as well as technology and knowledge spillovers. Due to transfer of higher level technology and more advanced knowledge to the host country the productivity is expected to improve. As a result of this FDI can promote economic development. Modernization theory follows this assumption.

On the other hand dependency theory emphasizes the negative effects of foreign direct investments. Especially in case of developing and emerging countries it is a relevant question whether FDI can contribute to economic development through some channels or FDI rather crowds out domestic enterprises and doesn't lead to improvement.

If we would like to measure the effects of FDI on economic growth it is useful to determine what kind of factors are likely to lead to economic growth at all. For this purpose it is worth to have a look at the main growth theories.

²⁴¹ FDI per capita, FDI per total GFCF, FDI per domestic GFCF, FDI per GDP are the most often used indicators to compare relative levels of FDI among economies.

Capital accumulation is considered as one of the most important factors of economic growth. According to the neoclassical growth theories the less advanced is an economy, that is the smaller is the capital stock, the higher is the rate of return to capital. Due to increase in capital stock per capita returns to capital will decrease. Thus one can expect positive effects of FDI considering physical capital only on short term (*Herzer et al., 2007*). Additionally, according to other assumptions of the neoclassical models (constant scale efficiency, positive elasticity of substitution, perfect competition) FDI as pure physical capital cannot contribute to long term economic growth (*Sass, 2003*). Moreover, neoclassical growth theories treat FDI identical to domestic investment.

In spite of that the indirect role of FDI already appears in neoclassical growth theories. More capital due to more intensive FDI inflow may contribute to employment growth and technology and knowledge development, thus generating total factor productivity growth. However, neoclassical growth theories consider technology only as an exogen factor.

In endogen growth models FDI is assumed to be more productive than domestic investment, because FDI promotes the incorporation of new technologies in the production function of the host economy (*Borensztein et al., 1998*). Technology is considered as an endogenized factor and diminishing returns to capital can be offset by spillover effects stimulating long-term economic growth. According to *Yao and Wei (2007)* domestic capital is essential for faster economic growth, but it doesn't provide possibility to take over more advanced technologies. In contrast to this capital stemming from abroad may accelerate the takeover of generalized purpose of technologies and knowledge²⁴² and the dissemination of special technologies and knowledge. Moreover, in this view FDI has positive impact on the quality of labour. More advanced management practices may also contribute to higher productivity.

Consequently, deriving from a brief description of growth theories regarding the role of FDI one can argue that FDI may promote economic growth via several channels.

Categorization of FDI in the light of its growth effects

Taking into account different categorizations of foreign direct investments some important conclusions can be drawn. Direct investments coming from abroad have advantages or disadvantages depending on the investors' motivations. Resource-seeking, efficiency-seeking, market-seeking or strategic FDI is assumed to have different impacts on long term economic growth. The literature suggests that resource-seeking FDI doesn't generate positive spillovers. *Adams (2009)* points out that in some developing countries rich in natural resources²⁴³ significant part of FDI goes to the primary sector. Investments in the primary sector don't have linkages with other branches; furthermore technology and knowledge spillovers are likely to be insignificant. For example in Nigeria, where mining and oil-industry is the main target of foreign investors, technology transfer is not really typical (*Akinlo, 2004*). One may argue that resource-seeking FDI doesn't affect host country's productivity positively.

Efficiency-seeking FDI seems to be more useful regarding its growth effects. This type of FDI is often realized in manufacturing that operate with knowledge and technology compatible with the host countries development level (*Nunnenkamp-Spatz, 2004:58*). Despite the logical assumption it is worth to take into consideration that low level manufacturing may preserve economic structures on a longer term. Based on this it is also worth to take into consideration that one should distinguish between different manufacturing investments if examining FDI growth effects. Market-seeking FDI is likely to be beneficial for host countries' consumers by introducing new products and services. More intensive competition may force domestic companies to produce more productively, but crowding out effects can be unfavourable. Additionally, *Nunnenkamp and*

²⁴² e.g. computer

²⁴³ for example Sub-Saharan Africa studied by Adams (2009)

Spatz (2004) raise the attention that profit repatriation is a typical negative effect of new market seekers FDI.

Alfaro (2003) has come to the conclusions that FDI has ambiguous impacts on growth depending on sectors. According to her empirical cross-country analysis²⁴⁴ FDI in the primary sector exerts negative effect on economic growth, while investments in manufacturing tend to have a positive one. Growth impacts of FDI in the service sector proved to be ambiguous.

Beugelsdijk (2007) analyses FDI growth effects depending on whether they are vertical or horizontal ones. Vertical FDI is mainly present in low-skill-level industries and tries to make use of cheap labour-force. Horizontal FDI is considered as substitution for export-activity. Since both types of FDI have different motivations growth-effects should be also different. Horizontal FDI can be more beneficial for the host economy because spillover-effects are relative strong, while vertical FDI has favourable impacts on the labour market. According to *Beugelsdijk (2007)* these two effects together determine the role of FDI in economic development.

Agosin and Mayer (2000) emphasize that investments in form of merger and acquisitions (M&A) do not necessarily lead to additional capital accumulation in the host country. Basically, already existing assets are taken over by foreign investors. M&A could be noteworthy in the statistics, but it is unlikely to bring significant amount of technology and knowledge. They argue furthermore, that crowding out effects can be typical in the case of this kind of FDI. In light of the above it should be an important step to distinguish between greenfield investments and cross-border M&A if studying FDI growth effects.

Some examples above already show that traditional examination of FDI growth effects, namely using aggregate statistical data, may lead to mixed and unbiased results. Findings of cross-country studies, panel estimations, time series analysis are often viewed by scepticism. *Lipsey (2006)* points out the problem of aggregate FDI statistics as follows: significant amount of FDI goes to Luxemburg, but it is almost unlikely that foreign capital has led to productivity and GDP growth in the country.

The question of the localization advantages of the host economy

FDI is welcomed and encouraged in almost all countries in the world. One of the reasons for this is some successful stories, for example South-Korea. But impacts of FDI cannot be equal in all countries. Localization advantages of economies, even in certain country-groups too, are very diverse, therefore effects of FDI are very various on different host economies. One may also argue that countries in different stages of development benefit differently from FDI. Host economies' localization advantages are changing over time providing changing environment for foreign investors. The Investment Development Path²⁴⁵ (IDP) model suggests that less advanced economies host rather resource-seeking and labour intensive FDI (*Dunning – Narula, 1996*). In this early stage of development localization advantages of the country are still not able to attract FDI with high technology level. The economy due to low absorptive capability, namely quality of human capital and ownership advantages of local enterprises, wouldn't be able to benefit from foreign investments. Higher income-level countries are ready to compete more successfully with foreign companies and to take over and integrate technology and knowledge from them. Combination of localization advantages and ownership specific advantages therefore tend to play an important role in realization of FDI growth effects.

Blomström et al. (1994) found that low-income developing countries don't benefit substantially from FDI, while high-income developing countries do. This can be explained by the fact that less advanced economies can be characterised by lower level human capital and absorptive capacity.

²⁴⁴ Based on a sample with 47 developing, emerging and developed countries between 1981-1999

²⁴⁵ Investment Development Model²⁴⁵ suggests a systematic relationship between the level of development and net investment position. The model indicates five stages of development.

A certain threshold level of development is crucial to be able to absorb new technologies and knowledge from FDI. Conclusions of *Borensztein et al. (1998)* are similar to this: FDI can exert positive growth effects only if the level of education is above a given threshold; only countries with sufficient absorptive capability are able to utilise spillover effects from FDI.

Alfaro et al. (2004) and *Alfaro et al. (2009)* indicate the role of financial institutions. The authors argue that FDI plays an important role in economic acceleration in the investigated developed and developing economies, but the quality of the local financial markets is crucial for positive impacts to be realised. Importance of institutions is emphasized by *Bengoa and Sanchez-Robles, (2005)*. The role of economic policy proved to be a key factor regarding growth effects of FDI on Latin-American countries (*Bengoa – Sanchez-Robles, 2005*).

In contrast to the above *Carkovic and Levin (2005)* argue that country specific factors, such as income level, quality of human capital, openness of the economy etc. don't play significant role regarding FDI growth promoting effects.

Results of numerous empirical investigations depend on the econometric methods used, the group of countries, the number of years, the influencing factors selected etc. In our opinion both type of FDI and development level of the investigated country, that is localization advantages, are important to take into consideration if analysing FDI benefits.

Conclusions

Many papers so far have investigated economic effects of FDI on host economies. In light of the above one can argue that investigation of FDI growth enhancing effects should be based on differentiated approaches. Econometric modelling with aggregate FDI data may lead to biased and ambiguous results; therefore it seems to be logical that differentiation of FDI data should be the first step when evaluating FDI growth impacts. In addition, several studies argue that it is important to identify the main characteristics of the host economy if comparing large number of countries. Absorptive capability, institutions, the structure of the economy etc. determine whether economies are able to benefit from FDI or not.

In new EU member states FDI inflow has accelerated after accession; governments have encouraged foreign investors to set up affiliates in their countries. In some aspects it has led to a regional competition for more capital in order to be able to provide more workplaces already on the short run. Sometimes, however, long term impacts of growing number of foreign companies haven't been really taken into consideration. In some of the new member states dominance of FDI has already led to economic and social problems, especially when economic policy for domestic-owned enterprises hasn't been tailored to the new conditions. The recent economic crisis also raised attention to the dependency problem of small economies. Study of the possible effects of FDI using a similar framework described in the paper would lead to a better understanding of FDI impacts on Eastern European host economies as well.

BIODIVERSITY'S CONSERVATION AND ITS IMPORTANCE - NEW CHALLENGES FOR ROMANIA IN THE CONTEXT OF EUROPEAN INTEGRATION

Mardiros Daniela

University "Alexandru Ioan Cuza" of Iași

Faculty of Economics and Business Administration

Borza Mioara

University "Alexandru Ioan Cuza" of Iași

Faculty of Economics and Business Administration

The concept of biodiversity or biological diversity has been defined for the first time in the context of a new international instrument for the environment, the UNCED Earth Summit in Rio de Janeiro 1992. The biodiversity ensure the life support system and the development of socio-economic, reason for that it is essential for the ensurance of the survival of all forms of life. That is, from an ethical standpoint, each biodiversity component has an invaluable intrinsic value and the human society has the obligation to ensure its conservation and sustainable use. The costs of biodiversity loss or damage are very difficult to determine, but studies realized so far at the world level shows that there are substantial and in growing. For Romania, the biodiversity conservation, have, as goals, the following one: conservation of biological diversity; sustainable use of components of biological diversity; fair and equitable sharing of benefits arising from utilization of genetic resources.

Keywords: biodiversity, conservation, goals, European integration, sustainable development.

JEL Classification: Q - Agricultural and Natural Resource Economics; Environmental and Ecological Economics; Q5 - Environmental Economics; Q57 - Ecological Economics: Ecosystem Services; Biodiversity Conservation; Bioeconomics; Industrial Ecology

1. Introduction

Biodiversity means the diversity of life on earth and involves four levels of approach: level of ecosystems, species, genetic and ethno-cultural. The economic value of biodiversity is reflected by capturing its components, such as: non-renewable natural resources; renewable natural resources; the services provided by ecological systems. The aesthetic value of biodiversity is a fundamental human need, the natural and cultural landscapes being the basis of the touristic and recreational development sector.

Biodiversity conservation, ratified by Romania by Law no. 58/1994 has, as goals, the following one: conservation of biological diversity; sustainable use of components of biological diversity; fair and equitable sharing of benefits arising from utilization of genetic resources.

2. Some specific aspects regarding the role of biodiversity principles for development

At EU level, the Strategic Plan for biodiversity conservation plans to reduce the current rate of biodiversity loss at global, regional and national level, as a contribution to poverty alleviation and for the benefit of all life forms on earth, by creating an European ecological network (Nature 2000 - covers 17% of the EU territory, being the most extensive network of protected areas in the world) which includes a representative sample from all species and natural habitats of Community interest, for the adequate protection of them and ensuring their long-term viability, through the objected manifested against the current trend of fragmentation of natural habitats. That opposition is based on the fact that the development of the socio-economic systems can only be based on natural and semi-natural ecological systems. Regarding the principles underlying at

the basis of the biodiversity conservation and sustainable development of socio-economic system, there are presented in Table no. 1.

Table 1 Principles of biodiversity

No.	Principle	Provisions
1.	preventing	Biodiversity conservation is carried out effectively if they are eliminated or mitigated the effects of possible threats
2.	precaution	Lack of full scientific studies can not be regarded as motive for acceptance of activities that may have significant negative impacts over the biodiversity
3.	polluter pays	The one who is causing the destruction of biodiversity has to pay the costs of prevention, reduction impact or environmental reconstruction
4.	public participation in decision making and the access to information and environment justice	The public should have access to environmental information and the right to participate inside the process of making environmental decisions
5.	good governance	The government must fulfils eight major characteristics - to be participatory, measurable, transparent, accountable, effective and efficient, equitable and consistent with the legal norms
6.	sectoral integration	The biodiversity conservation and sustainable use of its components must be taken into account in making decisions and establishing of sectoral policies process
7.	ecosystem approach	Is an integrated management strategy, adaptive, based on the application of appropriate scientific methodologies which takes into account the ecosystems structure and functions and their support ability
8.	ecological networks	To ensure the connectivity between the components of biodiversity with the one of the landscape and social structures, having as central components the protected natural areas are established green color links
9.	subsidiarity	Regulates the exercise of power; decisions should be made to the lowest level (local, regional, national)
10.	compensation	In case that exist a negative impact and in the absence of alternatives solutions, for major public interest objectives are established countervailable measures

Source: Ministry of Environment and Forests – *National Strategy for Biodiversity Conservation*

At the meeting on the environment in March 2009, the Council called the elaboration, at the EU level, of a new perspective and a new target in mater of biodiversity, based on and contributing to the international discussions refers to an biodiversity global perspective by 2010, as part of an updated strategy which will be adopted by the end of 2010 for the CBD implementation.

To implement the EU strategy looking the biodiversity conservation has been established an Action Plan with the following priority objectives: maintaining the diversity of ecosystems and habitats inside the protected areas; maintaining the specific diversity through: restore, maintain or reduction the decline of the populations belonging to the protected species and the improvement of the status of the endangered species; maintaining genetic diversity through: preserving the genetic diversity of crop plants, domestic animals, of the species of economic importance and also, the maintenance of local communities traditions for their use; the reduction of the pressures looking the habitat loss, through the land use change; the limitation of the invasive species

impact; the stopping of the unsustainable exploitation through: the use of products derived from biodiversity components that are exploited sustainably; the production areas managed in accordance with the requirements for biodiversity conservation; no endangered species of fauna or flora must not be the subject for international trade, etc.

3. The evolution of biodiversity conservation policies in Romania

Regarding Romania's policy looking the biodiversity conservation, its temporal evolution shows from Table no. 2.

Table 2 The evolution of the policy looking the biodiversity conservation in Romania

No.	Period	Events
1.	XV – XIX century	Appears the first rules aimed the safeguarding which are traceable to ancient Romanian law; that provide a better conservation of natural resources, being a law which impose a strict set of rules and measures;
2.	1922 - 1928	Is a period with busy activity for nature protection, backed by brand names in the world of biology, geology, geography and forestry
3.	1930	Is adopted the first law to protect the nature monuments, which marked a new phase of nature protection in Romania. Based on this piece of legislation, was established the first Commission to safeguard the nature monuments.
4.	1935	Establishment of National Park Retezat
5.	After 1990	Is repeated and strengthen biodiversity conservation activities by developing of new laws and creating appropriate institutional structures
6.	2005	Accession Treaty of Romania to the EU and the Protocols includes Romania's transposition concrete commitments, implementation and control of the entire <i>acquis communautaire</i> and provide some transitional period of implementation of certain environmental obligations;
7.	2007-2013	National Development Plan (NDP); orient and stimulate economic and social development of the country in line with the EU Cohesion Policy setting as global goal, as quickly as possible, the reduction of the socio-economic differences between Romania and other countries of EU and detailing the specific objectives of the process on the following priority areas: the increasing of the economy competitiveness and developing based on knowledge; bringing to the European standards of the basic infrastructure; the protection and the improvement of the environmental quality; improving the sectorial and regional systems of the environmental management; the biodiversity conservation and the ecological reconstruction; risk prevention and intervention in cases of natural disasters; the development of rural economy and the increasing of the productivity in agriculture, forestry and fisheries sector; the reducing of the development disparities between regions and inside them.
8.	2007-2013	National Strategic Reference Framework (NSRF); sets priorities for intervention of the EU financial instruments (European Regional Development Fund - ERDF, European Social Fund - ESF and Cohesion Fund - FC) inside the policy of economic and social cohesion and linking the priorities of the 2007-2013 National Development Plan with the one of EU established by the Community

No.	Period	Events
		Strategic Guidelines looking the Cohesion 2007-2013 and the renewed Lisbon strategy;
9.	2010-2030	National Sustainable Development Strategy; main lines of action: rational linking of the development goals, including the investment programs, with the potential and capacity to support biodiversity; the accelerated modernization of the education, training and public health systems, taking account of adverse demographic trends and their impact on the labor market; the use of the best available economically and ecologically technologies for the investment decisions of public funds and the stimulation of such decisions from the private sector; the firm introduction of criteria of eco -efficiency in all production activities and services; the anticipation of the climate changes effects and the develop of solutions for both long-term adaptation and action plans; ensuring food security and safety by building Romania's comparative advantages looking the development of agricultural production, including organic products; providing food for humans and animals, without compromising the requirements for maintaining and enhancing soil fertility, biodiversity and environmental protection; the need to seek additional sources of funding, in terms of sustainability, for projects and programs that impacted particularly in infrastructure, energy, environmental protection, food security, education, health and social services; protection and enhancement of cultural and natural national heritage

During the prolonged process of transition to the democratic governance and to a functioning market economy coexisted management policy objectives and administration forms belonging also to the old and new cycle of development: private and state ownership, centralized and decentralized administration, systems of intensive farming and subsistence. So, currently, dominates a series of threats for the biodiversity in Romania, such as: land conversion, infrastructure development, expansion and development of the human settlements, hydraulic works, overexploitation of the natural resources, inappropriate exploitation of the non-renewable resources, nvasive species, climate changes, pollution.

4. The accordance of national strategy for development with European strategies

Research, education, business and civil society engage with authorities and local communities to promote conservation and sustainable use of the biological diversity. The national strategy to conserve the biological diversity is not a simple action but focuses, on a harmonized manner, the general objectives of conservation and sustainable use of the biological diversity, ensuring, at the same time, the integration of national policies at regional and global level.

The new financial mechanisms whose purpose is to protect and produce economic benefits for present and future generations, are developed in line with the new type of innovative solutions whose effect is manifested, on the one hand, towards the conservation of the biological diversity and sustainable use, and secondly, to maintain and improve the socio-economic stability. According to the internationally agreed policies, the biodiversity conservation can not be done in an abstract context because it is closely linked to the processes of human socioeconomic systems of development.

In that direction and given the time in 2010-2020, Romania will need to successfully tackle a series of challenges posed by systematic strategic objectives in Table 3.

Table 3 Romania challenges regarding biodiversity conservation as part of European strategy

No.	Challenge (strategic objective)	Operational objectives and action plans
1.	The development of the general institutional and legal framework	SNPACB's adoption by a legislative act, which assure the legal power and the strengthen of the existing legislative framework; setting clear of the mandates of the institutional structures, to avoid conflicts of interests and responsibilities; the ensurance of the necessary staff and the increasement of its training; the staff stimulation to ensure business continuity in the environmental structures; the establishing of a separate budget lines for the biodiversity conservation at the level of the central public authority for environmental protection;
2.	Ensure consistency and efficient management of the national network of protected areas	The development and the implementation of the methodologies and technical rules for the administration financing assurance of the protected natural areas; the development and the implementation of appropriate methodologies and rules for the allocation of the compensatory pays; the creation of an additional financial system to supplement the budget of protected natural areas (taxes, tariffs, rules which allow that the incomes produced by the protected natural areas to be used for the management measures and not to be transferred to the state budget, etc.); the improvement of the financing mechanisms for the biodiversity conservation; the creation and the development of appropriate institutional structures to coordinate the management of the entire network of protected areas; the improvement of the legal and regulatory framework necessary to ensure the conservation of the biodiversity in protected natural areas; the ensurance of the appropriate management structures for all the natural protected areas; the establishment and the adoption of models for the content of the Magement Plans for all categories of protected areas; the developing and the approving of the management plans for protected natural areas; the developing of the guidelines for management of Natura 2000 sites;
3.	Providing a favorable conservation status for the protected species	The developing, the update and the adoption of the National Red Book Lists of flora and fauna; the adoption of specific regulations and of the appropriate institutional framework to ensure a favorable conservation status of strictly protected species of Community and national interest positioned outside of the natural protected areas; the improvement of the institutional and administrative framework to control the work of harvesting/capture, purchase and sale of protected species;
4.	Sustainable use of components of biological diversity	Proper impact assessment of the strategies, policies, plans and programs over the biodiversity; the increasing participation of the interested factors in the proper impact assessment procedures; the internalization of the biodiversity value of the cost/benefit analysis; the establishment of the eco-labeling schemes based on life cycle analysis of the products for which the production, distribution, use or depositing may affect the biodiversity; the integration of the biodiversity concept in the evaluation mechanisms;

No.	Challenge (strategic objective)	Operational objectives and action plans
5.	The control of the invasive species	The preventing of the intentional and unintentional introduction of allochthonous species; the rapid detection and identification of new potential invaders before entering to the national territory; the rapid answer to the penetration of the allochthonous invasive species;
6.	The access to genetic resources and equitable sharing of benefits arising from their use	The development of an appropriate legal and institutional framework which corresponds to the consistent implementation of the international regime of access to the genetic resources and to the equitable sharing of benefits arising from their use.
7.	Support and promote knowledge, traditional practices and innovations	The development of a consistent national policy looking the protection of the knowledge, traditional practices and innovative methods in connection with the access and utilization of the genetic resources; the development of legal framework looking the intellectual property rights necessary for the promotion of the knowledge, traditional practices and innovative methods.
8.	Promotion of research and technology transfer	The development of the National Program for taxonomy; taking into account the priorities of the biodiversity conservation, the development and the technology transfer in the National Strategy for Research, Development and Innovation;
9.	Communication, education and public awareness (CEPA)	The CEPA strategy development; the development of the institutional capacity in the communication area; the alignment to the ideas of the Convention looking the biodiversity conservation in the communication, education and awareness;

5. Conclusions

We can not conclude without mentioning that after the EU accession, large companies and corporations in Romania have become more attentive to the environmental issues (the biodiversity conservation), developing and financing corporate social responsibility projects whose annual value is the order of several million euros. As financing sources for the biodiversity conservation are and will remain the LIFE + Programme, the European Funds and the Environment Fund. Absorption capacity of these funds must be improved by the reviewing of the access criteria that have proven ineffective so far. Romania must also strengthen the financing capacity of existing financial instruments (The Environment Fund) and to continue to focus on the developing of new financial and economic instruments to achieve the objectives of the convention looking the biodiversity.

ACHIEVING SUSTAINABLE SECURITY – VULNERABLE PUBLIC GOOD IN THE CONTEXT OF A NONPOLAR SECURITY ENVIRONMENT. SHIFTS IN THE CONCEPT OF SECURITY

It is important to start our assumptions from the fact that, from some economists' point of view, most of the cases which were considered examples of actual public goods were found to be wrong. So, what we want to find out is whether, considering the fact that security must not be provided only through private means, we can still talk about an equal distribution of it, or it has shifted to a selective distribution of security. In order to answer the question whether security can still be provided by the state in an equal distributional system, we will use it as a premise and try to prove it. Beginning with the theoretical characteristics of a public good and with the definitions of the present concept of security we will try to find out if one can still speak of security as a public good, and moreover, as a global public good.

Key words: public goods, global public good, security

JEL Code: L88, L86, L70

1.Current security environment characteristics - the globalization of insecurity

Sustainable development of a state is meant to combine economic growth with preservation of the natural human health as a prerequisite for ensuring the equilibrium of systems that brings about the existence/operation itself of society and the maintenance of a stable security environment. Therefore, any modification to any of these components leads to changes and alterations of the whole process of sustainable development. Events occurring worldwide aimed at national and international safety and security have determined a new approach to national security, demonstrating how vulnerable are certain areas or sectors that provide essential services to all areas of social life.

By analyzing the international security environment, it is noted that many concepts have changed, many developments have been altered after all terrorist attacks of this decade. This raises a crucial question: 'Which are the characteristics of the world today?' Nowadays, the international environment is characterized by the extension of the influence of globalization in increasingly more activity areas, and this implies, as I said above, a redefinition of all concepts that until now seemed well founded.

In this respect, debating security, Timofte (2005) showed that 'extremely fast current changes require responses adapted to the multidimensional reality of security, removal of barriers between different measures of the intelligence services, in order to allow cross action, integrating all its dimensions (diplomatic, military, economic, socio-cultural, humanitarian, environmental and other), as well as the progressive adjustment of all types of societies'.

Also, in a paper on security standards, Muresan and George (2005) state that "events such as March 11th, 2004 (terrorist attacks in Madrid), August 14th, 2003 (USA left in the dark because of

a power failure) and September 11th, 2001 (terrorist attacks on the WTC) have become benchmarks in the process of assessment and identification of new requirements relating to the priority of reforming the whole concept of security and its management at the individual to international level .(...) An initial issue dealt with only by the military sector, security tends to be a common good, being characterized by the phenomena affecting existing goods in a market.”

In this context it should be given greater attention to these areas of interest which directly concerns civil society, but also national security, given the extent and negative consequences that may result from disruption of the functioning of these industries or sectors. “The world will not be the same” was one of the most frequently used phrases after the tragic events of September 2001 in the USA. And indeed, now, after almost 9 years, we can say with certainty that the world has changed. First of all the principles that the whole world was based on have changed, principles that in the last decade of the XXth century – that began with the fall of the Berlin Wall and the disappearance of the Soviet Union – have seen an expansion of democratic regimes in the world, the flourishing of globalization, legitimization of the rule of law and human rights. Also, the individuals’ perception on the state's capacity to protect them has changed, they acknowledging the increased vulnerability of the citizen, of the state and of the security systems in general.

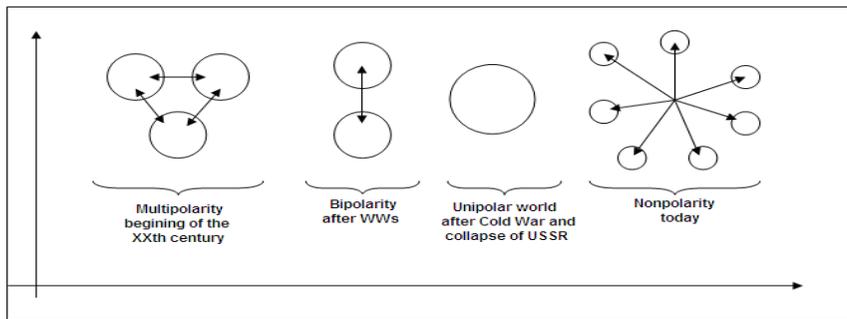

Therefore, it was clearly stated that the lack of control over the complex process of globalization has profoundly negative effects on ‘this interconnected world (Sarcinschi, 2006), globalization being seen as an amplification factor of insecurity. Also, because these systemic changes, ‘the classical array of security proposed by the Watson Institute for International Studies specialists²⁴⁶, is rather an array of globalization, insecurity, whereas illustrates how the risks, dangers and threats spread from the individual to global level and vice versa’ (Sarcinschi, 2006).

1.1.Nonpolarity – characteristic of the current security environment

Haass (2008), in Foreign Affairs, said that the main feature of international relations in this century is nonpolarity: a world dominated not by one, two or more states, but by the dozens of actors with different power. This trend is in itself a profound break from previous eras. In the first part of the XXth century we have a multipolar distribution of power, followed by the rise of a system of international relations dominated by two superpowers (the bipolar era). The Cold War and the collapse of the Soviet Union announced the beginning of unipolarity, an international system dominated by a superpower – the United States.

At first glance, today's world seems to be multipolar. The major powers (China, EU, India, Japan, Russia and USA), combined, comprise about half of world population, 75% of global GDP and 80% of the defense expenditures. However, appearances are deceptive. The world today differs substantially from what we call a classic multipolar system, because we see an unprecedented dispersal of power to various power centers, of which only a minority are states. Indeed, an emblem of the new world is that nation-states lost their monopoly on power and ability to influence global dynamics alone. The authority and power of the states is now shared with the main actors of globalization: global and regional organizations, NGOs, international corporations, media, paramilitary organizations, cities (New York, Shanghai), political parties, organized crime cartels, NGOs. In the era of nonpolarity, power and influence are becoming less interacted.

²⁴⁶ Watson Institute for International Studies, <http://www.watsoninstitute.org>.

The nonpolar world is a consequence of globalization. Globalization reinforces nonpolarity in two ways: a large part of cross-border flows take place outside the control of sovereign governments, and often without their knowledge. In this respect, globalizations dilute the influence of major powers. Likewise, globalization increases the power of non-state actors: energy exporters, terrorist organizations, multinational companies. It is increasingly clear that to be today's most powerful state does not mean to hold a virtual monopoly on power. It is very easy for individuals and private groups to acquire and to exercise substantial power.

The international security environment is marked by developments and major changes taking place globally, being characterized by a relatively high degree of instability, unpredictability, as well as by the expression of risks and new, asymmetric threats, thus emphasizing the need to redefine the whole concept of security and proper management of potential threats, both internationally and at the individual level. Thus, the focus moves on human security²⁴⁷, with an agreement regarding that security should be considered from a broad perspective, taking into account factors other than the military. But this expansion entails risks, namely that the security sector can become too powerful if it is active in the society's demilitarized areas, or may not have expertise to address these challenges. (EURISC Foundation 2004) And in these circumstances, can we speak of security as a public good?

2. Public goods and global public goods – definitions and characteristics

In the classical theoretic school, public goods are characterized as being non-exclusionary and non-rival, and can be also externalized. Perhaps, as Kaul (2000) stated, the easiest way to define a public good is to examine it in opposition with a private one. Private goods are typically traded in markets. Buyers and sellers meet through the price mechanism. If they agree on a price, the ownership of the good can be transferred. Thus private goods tend to be exclusionary, as they have clearly identified owners, and also tend to be rival, as, usually, only one individual has property rights over them at one time.

However, not all the goods are consumed similarly. The question that rises is: could there be exclusion without rivalry for some goods? And the answer is a positive one, although it is quite difficult to provide perfect examples of such goods. So, public goods have just the opposite qualities to those of the other goods. They are non-exclusionary and non-rival in consumption. In other words, the concept of public good refers to the fact that these goods belong to everybody in common, so that the consumption of a good by one individual does not affect the consumption of the same good by another individual - Samuelson (1954).

The classical example is that of a light house that is meant to guide the ships' crew to sail safely to the land. So, any ship that is near the light house and can see its light can use it, without paying anything and without excluding anyone else from using it. Still, some economists reject the idea

²⁴⁷ UNDP introduces for the first time in a report of 1994 the concept of 'human security', that was developed subsequently. It is suggested to change the concept of security in 2 ways: from an increased approach on territorial security to highlighting individuals' security, and from a security based on weapons to a security based on sustainable human development (<http://www.undp.org/hdro/hdrs/1994/english/94overview.pdf>)

of public goods. For example, Fudulu (2003), speaking of this classical example, argues that if two or more fishermen are approaching the same lighthouse, they are using in fact different goods, because ‘there is at least one aspect of consumption which is different. They might be using the same building and other technical facilities, the same power, the same personnel, but they cannot use the same location to watch the lighthouse. Fisherman A’s location cannot be employed by fisherman B. The area from which the consumption of the good can be performed (which is a fundamental aspect in this peculiar case) has shrunk and it will shrink as the number of fishermen increases; the lighthouse is less and less “good”. In fact, we can say that we are dealing with different goods.’

In spite of these theories, whether there are public goods or whether individuals are left only with “the choice of a distributional system, that is, equal distribution (for what economists call public goods) or selective distribution (for what economists call private goods)”, as considers Fudulu (2003), economically speaking, public goods have the following characteristics: *non-rivalry*, that is a public good is non-rival in consumption because the margin cost associated with this good by another person is zero and the variable costs remain constant no matter the number of individuals using it and *non-exclusiveness*, that signifies that technically it is impossible to exclude a person from benefiting from a public good through a divisibility mechanism, *i.e.* the price.

Based on these characteristics, one can ask where public goods come from, that is who provides them, because, once they exist, they are there for all to enjoy. Economists such as Fudulu (2003) say that it is because of these special features of the public goods that markets cannot produce them, or at least not in sufficient quantity, hence compensatory state actions are required. So, as there are situations when market failure phenomenon appears (noticed through the existence of externalities), the state intervenes in order to correct this situation through the provision of public goods that can satisfy the demand, facilitate the development and promote social cohesion. As we have said previously, this phenomenon appears when the market itself can not allocate the resources efficiently.

We must add that economists define *externalities* as instances where an individual or company’s actions have economic consequences for others for which there is no compensation. One important distinction is between positive and negative externalities. Instances of the latter are most commonly discussed, such as the environmental pollution caused by a plant, which may have impacts on the value of neighboring homes. The basic conclusion is that, in the absence of government intervention or other solutions to internalize the externalities, negative externalities are over-provided and positive externalities are under-provided.

As any kind of good, public goods are produced and require resources. So it is often the most rational strategy for private actors to let others produce them and seek to enjoy these goods without contributing to their production. This is perhaps the greatest dilemma that public goods face. Without some sort of collective action mechanism, they risk being under-provided. Conversely, without collective action, public goods would be over-provided – and Kaul (2000) mentions here “public bads”, such as pollution, noise, street crime and so on.

For a long time, during discussions on public goods, there was the assumption that they have exclusively a national nature. But in the present reality, the new challenges that our world faces, and we mean here the systemic changes generated by the irreversible globalization process, have imposed a reshaping of the concept of public goods. Globalization is associated with increased cross-border flows that include goods, services, labor and financial capital. We can no longer speak only of public goods at a national level, as globalization has affected this concept, too, and led to the emergence of *global public goods*.

Based on the same theoretical aspects presented above, we can characterize global public goods as goods whose benefits reach across borders, generations and population groups. So global public goods provide non-rival and non-exclusionary benefits to people living in different countries. The only difference from the national public goods is that, if at the national level states

often step in to facilitate the collective action needed to avoid over-production or under-provision of public goods, at the international level there is no such institution. Yet, as history has shown, if global public goods do correspond to national needs and interests, states manage to reach agreement on coordinated action.

3. Security as a global public good

International developments thus led to a reassessment of the concept of "security" and to the need to redefine it.. The Challenges induced by globalization, its overlapping with the trends towards regionalization and fragmentation, generate new tensions and new risk factors. Great disparities in the economic development, which increasingly emphasizes within conditions of unprecedented technological progress, discriminatory access to education and health, vital life resources, information and knowledge cause serious social crisis, generate frustration and raise discontent. With economic globalization, social crises are accompanied, not once, by identity crises, generating unexpected violence.

International relations explain, traditionally, the concept of security through the concepts of power (supported by the disciples of the Realist School) and peace (associated to the disciples of the Idealist School). These concepts have governed all the aspects of national security until the 80's. Speaking of the security concept, Buzan (1991) pointed out that "this is a more fickle, sharp and useful approach to the international relations studies than power or peace". The current international situation advocates the revival of some geopolitical theories which consider globalization as a central component of national strategic power. Most citizens tend to define the risks to their security predominantly in domestic terms – from drug and people trafficking to terrorism, organized crime and state corruption. In the past, national security was considered "the nation's capacity to follow its national interests" (Hartland-Thunberg, 1982) or "the nation's capacity to hold out against foreign aggressions" (Giacomo, 1989). In others' point of view, national security was "that part of the governmental policy that has as objective the creation of national and international conditions favorable for the protection and extension of national values against real or potential enemies". (Trager and Simonie, 1973)

Nowadays, the concept of *security* has acquired different dimensions within the context of globalization, such as economical, political, ecological and military dimensions. Conventional military power has lost its role as an indicator of one state's power and as an institution able to dishearten a wide range of possible threats. According to Krell (cited in Ionescu, 1993), "military security no longer means ensuring territorial inviolability, but protecting the individuals and their daily life against military violence". Thus, national security became human security, focusing on the individual and the community.

Based on the theories of public goods, and on the definitions of security experts consider that *national security* is a *public good*, the citizen being the beneficiary of the state's efforts. The international organizations consider the concepts of security and also peace as being public goods. Moreover, with the outgoing process of development and globalization, both the United Nations Program for Development and the World Bank have also included these concepts as being global public goods. Why?, one can ask. Because, besides creating and preserving the equilibrium of the social and economic systems, another role of the state is that of protecting the interests of its citizens. For such purpose the national interests are defined as the totality of the common factors in the diversity of the particular purposes of the people, which refers to the present and future protection of the citizens, at the same time with the rational, efficient and sustainable use of the resources.

Buzan (1991) states that, in the context of the actual international system, security represents the ability of the state and society to defend the autonomy of its integrity and identity. Thus, based on the above, and even on Samuelson (1954), one can notice that the state's intervention in

regulating the economic order and ensuring the equilibrium of national systems in order to create and maintain a safe and stable security environment is perfectly justifiable.

Conclusion

Non-rivalry and non-exclusiveness define public goods. However, because of the recent transformations and shifts in the international relations and in national policies, the concept of security tends not to be considered anymore as a public good, as it comprises the characteristics of rivalry and exclusiveness, if only we consider the problems the minorities encountered in the US after September 2001. To amend this, as security must be a state produced and provided good, the government should shift the focus from national defense to human security and must interact with the civilians in order to realize a compromise between ensuring national security and preserving human rights and liberties.

Although in the current international context, the contradiction between freedom and security has become undisputed at the practical level, we cannot say yet that this antithesis has a degree of artificiality in the sense that 'we cannot talk about the existence of a total security status, as meeting the objective and subjective conditions referring life and living conditions vary from one individual to another, from an international player to another' (Sarcinschi 2006). In this context, what is possible for someone, for someone may be objectionable, and hence the problems that occurred. In fact, the main question is 'how much people are willing to give of their rights and freedoms for an added security?'

POLICY CHALLENGES AND PROBLEMS FOR EUROPEAN COUNTRIES AFTER THE CRISIS

Moise Mihaela

*Academy of Economic Studies from Bucharest
Faculty of Commerce*

Nae Tatiana-Roxana

*Academy of Economic Studies from Bucharest
Faculty of Commerce*

Most countries in Central, East and Southeast Europe have emerged from the trough of the crisis already at the end of 2009. Several leading indicators point to a modest upswing. All countries in the region will grow again only by 2011. Growth may accelerate slightly in 2012, but will in general be slower than in the pre-crisis period. Given the weak rebound of economic activities, unemployment will continue to rise. Economic policies should focus on countercyclical measures, correcting real exchange rate misalignments, as well as changing the regulatory framework and a range of supply-side policies. This article argues that three specific policy issues need to be addressed urgently in Central, Eastern and Southeastern Europe in order to avoid a new sustained period of recession or depression: orderly exchange rate adjustment, fiscal stress and, financial sector vulnerability.

Key words: crisis, New Member States, economic growth, financial stabilization

JEL Classification: O10, R58

Recession deeper than expected

After a long period of convergence, Central, East and Southeast Europe experienced a deep recession in 2009. The relatively moderate GDP decline (-3.6%) on average for the new EU member states (NMS) reflects Poland's weight in the group, the only EU country to have recorded positive GDP growth last year (Albania, Kazakhstan and China registered positive growth rates as well – see Table 1).

In most other countries the catching-up process was interrupted, in particular the Baltic States were thrown several years back – more than Russia and Ukraine. The most conspicuous response to the crisis was a radical depletion of inventories and, closely related to this, a dramatic improvement in net exports since the contraction of imports was much larger than that of exports. This, together with less profit realized by foreign companies operating in the region, resulted in a sizeable reduction of current account deficits.

Modest upswing in the making

Most countries in the region have emerged from the trough of the crisis already at the end of 2009. Several leading indicators point to a modest upswing. Poland's growth will once again boost the NMS average in 2010, while the rate of expansion in the Czech Republic, Slovakia and Slovenia will be meagre. Hungary, Romania and Bulgaria are still expected to stagnate in 2010, the Baltic States will record further negative growth rates – just as Croatia, Bosnia and Herzegovina and Montenegro.

It is expected that all countries in the region to be growing again only by 2011. That growth may accelerate slightly in 2012, but will in general be slower than in the pre-crisis period. The main prerequisite of an upturn is a marked recovery in global trade, including a rise in demand for imports from the region. Increases in private consumption are not likely to be very pronounced as long as employment fails to grow. Investment will not act as a strong engine of growth either.

Given the generally weak rebound of economic activities, unemployment will continue to rise, probably peaking in 2010, before falling slowly to pre-crisis levels. The most vulnerable group of workers affected by the crisis are again those with low skills.

Downward risks of forecast

There are several downward risks to our forecast. The revival of financial intermediation may turn out to be sluggish. With the upturn of economic activities more firms may find it difficult to secure funding. Withdrawal of demand-supporting schemes and the need to consolidate fiscal balances may delay or weaken recovery in the EU and put a brake on export-driven growth of the region. A possible revival of cross-border capital flows would again exert strong pressure on exchange rate appreciation – with all the familiar negative effects. The main risk associated with the current problems in Greece is that the extension of the euro area may be delayed. That may well cross the plans of those NMS that have based their medium-term economic strategy on the earliest possible adoption of the euro.

Redirecting the growth model?

Until the recent economic crisis the countries of Central, East and Southeast Europe benefited for a long period from a process of ‘catching-up’ based on two pillars: (i) a high degree of liberalization of trade, capital movements and financial market integration, and (ii) membership in the EU or the prospects of either accession or a strong association with the EU. Both these two

sets of factors will still be in operation also after the crisis, but there will be some significant changes in the way the 'integration growth model' will function. A combination of both changed external conditions (for example slow growth in main export markets, higher risk assessment of the region) as well as internal behavioral responses to the crisis (for example more difficult financing conditions, increasing savings rates of the household sector, constraints on fiscal spending) will shape the growth paths of the region.

Emerging Europe, the EU and the IMF

The conclusions of the G20 Summit do not address directly the problems that countries in Central, Eastern and Southeastern Europe (CESE) face. These countries can be differentiated by three criteria:

- by the distance to the EU and the euro (New Member States, NMS; Future Member States, FMS; Neighborhood States, NS);²⁴⁸
- by their exchange rate regimes (fixed or floating);
- by the state of their external balances (deficit or surplus, the latter mainly oil exporting countries).

When it comes to the NMS, those are mostly countries with current account deficits, but they differ with respect to exchange rate regimes. Slovenia and Slovakia are in the euro zone, the Baltic countries and Bulgaria are on fixed exchange rates (indeed, they mostly rely on currency boards), while the rest float their exchange rates. To all of them, the G20 conclusions offer the opportunity to approach the IMF and make use of its reformed and increased lending capabilities. There is nothing else that would be specific to these countries.

The FMS are in a different position due to the fact that they are financially and in terms of trade integrated with the EU, but cannot hope to be supported by the ECB or by the EU budget to the same extent as the NMS. Therefore, they have to rely more heavily on the IMF. Indeed, most of these countries are contemplating a program with the IMF. Serbia already has a standby agreement, Bosnia and Herzegovina is preparing to work on one, and Turkey is probably going to ask for a new program, while the others are more reluctant to go down that road, though that may prove necessary. In these group of countries, there are those who use euro (Montenegro and Kosovo; unilaterally, not as members of the EMU), and those who rely, *de facto* or *de jure*, on fixed exchange rates (Albania, Bosnia and Herzegovina, Croatia and Macedonia), while a minority, Turkey and Serbia, rely on floats or rather managed floats (though Serbia in essence alternates between fixed and floating exchange rate policies). All of these countries report trade and current account deficits, some very large ones.

The NS are an even more differentiated group. Those that have experienced dramatic changes in their external positions, in trade and in exchange rates, have already approached the IMF: Ukraine, Belarus, Armenia, and Georgia. Its increased budget and reformed model of lending may prompt renegotiations of the already existing programs and may also induce other countries to approach the IMF in order to anchor their macroeconomic stability. The exceptions are oil exporting countries that have accumulated large reserves and may not feel the need to seek further financial support (e.g. Russia and Azerbaijan).

Three problems that need addressing

²⁴⁸ NMS: former socialist countries that joined the EU in 2004 and 2007: 5 Central European countries (the Czech Republic, Hungary, Poland, Slovakia, and Slovenia); 3 Baltic countries (Estonia, Latvia and Lithuania); 2 Balkan countries (Bulgaria and Romania). FMS: candidate countries (Croatia, Macedonia and Turkey) and potential candidate countries (Albania, Bosnia and Herzegovina, Montenegro and Serbia). NS: Eastern European countries covered by EU Neighborhood policy (essentially former Soviet Union member states or members of the Commonwealth of Independent States now).

Apart from the strengthened mandate that the IMF has received by the G20 Summit and apart from the effort that this institution has made to reform its procedures and conditions for lending in order to make it easier for countries to approach it, the Summit has not really addressed the main problems that these groups of countries face. These are essentially the following three:

- exchange rate adjustment,
- fiscal stress,
- financial vulnerabilities.

Given that most of these countries run high trade or current account deficits or both, exchange rate adjustments seem mandated. In the case of countries with flexible exchange rates that is being done via nominal depreciation. This, however, threatens the sustainability of their balance sheets – fiscal, financial, corporate and those of the households. Large initial devaluations in some of these countries (e.g. in central Europe) prompted the fear that their banks may run into troubles that may put much of the EU banking sector at risk.

The action of the IMF, the ECB, the European Commission and individual European countries with large financial exposure to these financial markets have managed to stabilize the vulnerable exchange rates, but their sustainability will depend on the depth and the duration of the recession in the EU and in these countries. The persistent weakness of the Hungarian economy, for instance, suggests that the existing challenges have not been addressed adequately. Indeed, Romania has recently joined Hungary as an EU member state with rather shaky macroeconomic stability and in need of a similar support package.

Countries with fixed exchange rates are trying to adjust their real exchange rates by wage and expenditure cuts and are facing deep recessions. The Baltic economies are currently shrinking at a rate of about 10% and Bulgaria seems to be entering a rather deep recession too. Things may change if external demand improves dramatically in the next few quarters, otherwise the prospect of a depression may prove unavoidable and their currency arrangements may collapse leading to a disorderly adjustment. The additional problem that countries that are trying to adjust through deflation face is that not very much can be done to help them if they do not want to deviate from that path of adjustment, at least not through the instruments enumerated in the G20 Communiqué. Clearly, fiscal stimulus is not supportive of deflation and the same goes for increased financial support.

The IMF programs, where they exist or may be contemplated, could only bring additional support to the exchange rate, but they cannot make this process easier. The alternative, of course, is orderly nominal exchange rate depreciation.

The FMS are, for the most part, in a similar situation as the NMS with fixed exchange rates. The difference is that they have less of an incentive to contemplate a change in their exchange rate regimes, if they happen to rely on fixed exchange rates. This is because they have fewer sources of support for an expansionary fiscal and monetary policy either from the IFIs or from the EU. The new IMF approach to lending could support a nominal exchange rate adjustment, as in the case of the classical Bretton Woods system, but whether that can come together with more expansionary fiscal and monetary policies is an open question. Certainly, the answer will be easier to come with if there were an additional financial support that would target the fiscal and the financial balances. Similar problems are faced by FMS with floating exchange rates and by most NS. Even in the cases where expansionary policies would be advisable, it is not clear how those were going to be financed. These problems have not been addressed by the G20 Summit in their policy conclusions.

Thus, if real exchange rates are to be adjusted and deep recessions and even depressions, with their uncertain political and social outcomes, are to be avoided, sources to support fiscal and financial balances will have to be found. For most countries considered here, EU should be ready to provide that support or at least advocate that it should be provided. This is for the reason that these are either member states or future member states or are economies that are increasingly

integrated with the EU single market. So, their macroeconomic stability and growth are important for the EU itself.

Exchange rate adjustment

In addition to the increased and reformed role of the IMF, three policies could be developed by the EU in order to support the stability and growth in CESE. One is orderly adjustment of the exchange rates of countries with unsustainable external balances. The experience so far seems to indicate that countries with flexible exchange rates have managed to adjust their real exchange rates through nominal depreciation, while countries with fixed exchange rates have yet to manage to do that. Therefore, the latter should be supported in that process. That would mean nominal adjustment similar to that which took place in central European countries with floating exchange rates, e.g. about 20 to 30%.

This adjustment may be resisted because of the widespread euroization in these countries. In order to overcome this resistance, various schemes of compensation of various sectors could be used through a combination of tax reliefs or with appropriate transfers.

Fiscal stimulus

In addition and in conjunction with that, there is a need to support these countries in their ability to have a countercyclical fiscal policy. Currently, in the majority of these countries, fiscal deficits are increasing even though public expenditures are declining. This is because of negative growth. Thus, fiscal policy is both pro-cyclical and unsustainable; the latter because it is difficult to finance these higher fiscal deficits. In the case of NMS, some support for fiscal stabilization if not expansion is available, though some countries still have difficulties placing their government bonds (e.g. Hungary). However, most other countries, with the exception of Turkey, can hardly find sources to finance increased public spending.

Those sources cannot be found in the IMF loans, so additional sources of sovereign lending should be created. At the moment, the EU has set up a stabilization fund that could perhaps mobilize 600 to 700 million euro for FMS, but that is far too little for what needs to be done to support stability and growth in these countries. A Fund with three to four times that money may prove to be helpful and should not be a huge burden on the EU member states.

Financial stabilization

Finally, more will have to be done to support financial stability of these countries. In a number of cases, e.g. Romania and Serbia, IMF programs have come with the commitment on the part of the EU banks to refinance the corporate sectors in these countries. It is not all that clear what that means in practice as credit and other financial flows to many of these countries are declining rather dramatically. There is a danger that the process of deleveraging of the banks will be accompanied with large number of bankruptcies and rising unemployment in these countries. In addition, that development will leave these countries with higher credit risks that will stifle their growth prospects in the medium run. These problems, arguably the key to stability of the whole region, have yet to be addressed.

Conclusions

In order to make it possible that CESE countries weather the current crisis and go through the process of adjustment that will make it possible to them to return to the path of convergence growth, the increased role of the IMF should be supplemented with:

- Orderly adjustment of real exchange rates in countries with unsustainable current account deficits,
- A support for countercyclical fiscal policy, and

- Support for the continuous credit activity of EU banks in order to avoid the process of deleveraging that leaves mass bankruptcies behind.

For all these, huge amounts of money are not necessary, political will and coordination is.

REGIONAL GOVERNMENTAL BOTTOM-UP DECISION MAKING PROCESS USING ONLINE CHANNELS

Mureșan Mihaela

*“Dimitrie Cantemir” Christian University, Bucharest
Faculty of Banks, Finance and Accounting*

The paper introduces an innovative approach related to the citizen-oriented governance paradigm implemented through a regional virtual platform. The solutions proposed rely on the potential of the information and communication technologies (ICT) for inclusion, democracy and development, and represent the results of a Romanian research project: “Knowledge management architecture in environmental, social and economic areas, designed to support the sustainable regional development strategy”, financed under the national research budget. This work was supported by CNCSIS –UEFISCSU, project number 896 PNII – IDEAS contract 383/2007. The e-Participation process focused on the sustainable regional strategy design stands for an efficient solution to increase the public engagement of the citizens around the issues that affect their lives.

Key words: e-Participation, e-Voting, regional development strategy, bottom-up decision making process

JEL Classification: H11, H79

1. Regional development strategy as a knowledge based process

The research contextualizes Romania’s challenges, taking into consideration the specific situation of the transition from a centralized to a decentralized governmental system. In addition, another major challenge for the reform of the public administration is making governmental decision making process more efficient, as well as accelerating the transition of the public administration to the knowledge society, consisting in the use of advanced e-Governance paradigm, not only for reducing the bureaucracy, but also for increasing the transparency and the democratic engagement. The actual Romanian legislation creates the frame for the design of the regional development strategy, taking into consideration the European Cohesion Policy, the main challenges of the knowledge society, the decentralization priorities and the new created Romanian territorial structures (the eight development regions). The institutional infrastructure for the new territorial structures is represented by the eight regional development agencies, non-governmental entities providing public services and cooperating with the public local and central administration. In addition, the challenges of becoming a member of the European Union lead to a wide re-engineering process for the local and central governance, due to the increased need of connectivity and efficiency. The regional development stands for the main driver for increasing the competitiveness and attending the goals of the Lisbon Strategy. Simultaneously, due to the increased complexity of the actual development and the various challenges of the global knowledge society, the local governance has to double the efforts for finding the best ways to integrate the regional knowledge and expertise resources and to create a holistic approach related to the regional strategy design. The public administration is involved in and has the responsibility for the design of the regional strategy, as a participative and iterative process.

The coordination of the regional strategy design represents the responsibility of the Council for the Regional Development (CRD), the main decisional actor at the regional level, integrating representatives of various public administration entities. The Council also coordinates the activity of the regional development agencies (RDA) and validates the final version of the strategy. The development of the regional partnership represents the responsibility of the regional development

agencies, which are also in charge with the design of the regional development strategy, coordinating the activity of the Committee for the Design of the Regional Strategy (CDRS). The CDRS is responsible with the consultation process, creating the opportunities for the wide regional debate among the main regional stakeholders: representatives from the central and public administration, socio-economic entities, high education institutions, research centers etc. A key role plays the National Institute for Statistics (NIS), providing the main information for a quantitative analysis. The regional strategy represents the basis for the elaboration of the Regional Development Plan (RDP), including concrete measures for the implementation of the strategy and the adequate financial plan. The Ministry for the Regional Development and Tourism (MRDT) has the responsibility for the design of the RDP, integrating the regional strategic frames.

The transition to the knowledge society involves a deep innovative process, mainly based on ICT, applied to all the entities representing public administration, business, education, social, and cultural areas, including the communication between the regional stakeholders and the governmental entities. The reform of the regional governance represents one of the major priorities in the knowledge society, due to its strong interaction with the citizens or juridical entities, increasing the efficiency of the public administration and the regional competitiveness (priority of the information society i2010 initiative, main component of the Lisbon strategy [6]). Consequently, the design of the regional strategy, due to its complexity and wide integration of various knowledge and perspectives, becomes a knowledge based process. Despite the legislative framework, ensuring the premises of a participative process for the design of the regional strategy, in fact, the direct observations and the surveys carried out revealed a lack of citizens' involvement and a very poor regional entities' involvement in the consultative and decisional processes. The analysis of the consultative processes carried out in Romania during the regional strategy design period (2005-2007) indicates a gap between rhetoric and reality, such as the lack of a consistent dialogue between the local governance and the regional actors, including the inhabitants of the region. Moreover, the analysis highlights also the reduced use of the digital tools, including data bases, analysis instruments and a specific interface for providing public information related to the regional strategy design, a consistent SWOT analysis, benchmarking results for a deep understanding of the positioning of the region compared to other similar regions, aiming at creating a realistic view of the strong and weak points, as well of the regional trends. Simultaneously, the previous strategy design process has integrated especially quantitative approaches related to the sustainable regional development, calculating various indicators and comparing the results to the other similar European regions. The previous process of designing the regional strategy was based on a set of global statistical indicators which could not reveal all the important real life aspects for a realistic socio-economic analysis linked with environmental issues. Consequently, the debates in the work groups have not been always conducted taking into consideration a realistic and scientific base and thus the results have not the expected relevance.

The consultative process was limited at the organization of some workshops with the representatives from various regional entities, but their number and consistent contribution were quite reduced. The conclusion of the desk research consists in the identification of a limited stakeholders' participation in this process, without creating a real wide regional partnership. Moreover, the citizens do not represent a target group for the consultation and deliberation activities of the regional strategy design. Beyond the need of stimulating the public engagement in the process, it is also necessary to improve the set of indicators and to provide advanced sustainable development models, in order to present various simulations for the possible regional development, taking into account the environment, the social, economic and personal development.

2. The transition to the e-Governance

The regional development, as main pillar of the European cohesion policy, represents a very important pole of creativity and innovation, contributing to the increase of the competitiveness, goal of the Lisbon strategy. The actual approach focuses on a global perspective in order to improve the local action (“think global – act local”). The sustainable regional development is articulated in the actual global frame, taking into account the international agreements, the European sustainable development policies and the national sustainable strategies. The actual European strategic frame integrates various policies which have the same goal: to create a space with better conditions for all the European citizens in a sustainable way. The renewed Lisbon strategy aims at integrating also the environmental perspective, as Göteborg strategy stipulated: “the urgent need to secure a better quality of life for present and future generations”. This requires sustained economic growth which supports social progress and respects the environment, a social policy which underpin economic performance and a cost-effective environmental policy [14]. In order to cope with the actual challenges and the increased complexity, the public administration has to improve its activity by using the potential of the information and communication technologies on one side, and improving the public services and democratic processes and strengthen support to public policies, on the other side. “The use of information technology to support government operations, engage citizens, and provide government services” [3] represents one main issue for the transition to the e-Governance. In addition, this transition process involves also major structural changes for the public administration and the governance of the society [8] on one side, and crucial citizens’ mentality changes on the other side, developing the regional stakeholders’ pro-active behavior in the framework of the policies design, approval and implementation. In this perspective, the e-Participation concept has strong links with the e-Democracy, which refers to “the possibility to develop the influence and participation of the public in the political sphere” [11], using advanced and efficient online interaction channels. As the European Commission outlines, “the pressure on public administration is so great, that improving existing routines with the help of ICT alone is not enough; progress also requires more innovative approaches” [7]. E-Participation relies on consultative processes based on two ways online communication channels, helping the citizens to experience results they can see and touch. “By investing in transferable local models and tools, more people will use the Internet as a tool to strength their communities, protect and enrich their families and neighborhoods, and be heard in a meaningful way” [2]. The e-Participation tools as “web based systems for supporting the decision-making at governmental levels” [12] increase the interactivity between the governmental entities and the public, which creates advantages from both parts: administration and citizens. The regional governance has to cope with major challenges induced by the increased global competition, the democratic deficit, the ageing population, and the actual financial crisis. Due to the actual complexity of the global environment the regional governance has difficulties in developing appropriate policies and in finding the best solutions for their implementation. Meanwhile, the citizens and the regional entities have the opportunity to contribute with their opinions and views to the regional strategic issues, influencing the regional policies. The direct consequence is the openness of the public administration [10] and the extended use of the ICT tools, namely the Internet for providing efficient communication (e-Consultation and even e-Voting tools) between public and policy makers. Despite the democratic deficit, the observers of the European e-Consultation processes noticed that the citizens’ initiatives “have been poorly and arbitrarily integrated in the respective policies they intend to inform” [13]. Thus the governmental systems, the decisional processes and especially the mentality of the politicians need major changes for integrating bottom-up decision procedures supported by the online channels.

3. e-Region platform for the sustainable development

In accordance with the European framework, the Romanian procedure for the strategy design includes the participation of various actors in a formal or informal way in order to support decision-making process for public policy purposes at any stage of the policy lifecycle [12]. The lack of citizens' participation to the public policy definition represents a weak point of the previous procedure related to the regional strategy design, therefore the involvement of the citizens is a major concern of the Romanian local government. According to the desk research, surveys and direct observations, the research team identified the use of a virtual regional platform (e-Region), as an efficient solution to fit the actual requirements of the e-Governance and to bridge the gap between citizens and regional public entities. This approach is in line with the decentralization process in the public administration and also with the need of changing the system-oriented strategy design process to an actor-driven one, in a democratic-centric view. In this perspective, the main goal of the e-Region platform is to contribute to the regional development and to increase the regional competitiveness.

Analyzing the state of the art in the realm of the regional virtual platforms, we identified various initiatives of using the ICT tools at the public administration level, such as the "e-democracy.org, a citizen project promoting democracy in public life", illustrating "how e-tools can be used not only to give people a voice, but also to really solve problems in communities and to make democracies vastly more engaging. Ultimately, it is a negative approach to politics if citizens remain limited to the use of electronic tools to politically arm themselves and to fight for influence and power, or if they simply remain hidden behind a disempowering anonymous cloak with online news and blog comments" [2]. An European approach is the British forum (<http://www.e-democracy.org/uk/>) which provides a virtual space for sharing best practices, knowledge and for finding solutions for specific issues. Another regional internet portals [9] are more business oriented, such as the digital business ecosystems platform [1], and not a bridge between public administration and the regional actors.

The online Romanian regional platform focuses on main regional workflows which could facilitate administrative and operational processes supporting citizens, research, academic and business entities in their interaction with the regional/local administration, aiming at contributing to the regional strategy design and implementation. The structure of the online e-regional virtual platform is built taking into consideration the regional organizational infrastructure and the relationship between the local and central public authorities and implements SOA concepts. In this view, the Regional development agency could be the integrator of the information workflows, ensuring interfaces with citizens, business, academic and research entities (end users), as well as with other regional entities and public authorities, at local level (Regional Development Council, Town Halls etc) or at central level (Ministry of the Regional Development and Tourism, Ministry of the Environment and other sectors ministries). The regional platform, proposed by the research team, offers the infrastructure and the specific tools for the e-Knowledge, e-Consultation and e-Voting tools. The paper emphasizes the idea that the e-region platform could be the main knowledge integrator and generator at the regional level for the accuracy of the process of the sustainable regional strategy development and implementation. The regional virtual portal provides simultaneously a quantitative approach represented by the information concerning the regional opportunities and possible evolution trends, based on advanced modeling tools and indicators, and, complementary, a qualitative approach using various tools for the direct expression of the specific actors' opinions. The set of integrated indicators and models for the sustainable regional development stands for the regional knowledge base, which is permanently enriched with the regional actors' contribution (especially by the integration of experts' knowledge). The e-Region platform provides advanced tools for the presentation of the data and simulations, according to the various sustainable development models, aiming at informing the regional actors concerning the evolution of the region and the future trends. The two ways online communication channels ensure also the integration of the

experts' knowledge in the existing regional knowledge base, creating the premises for a better valorization of the regional intellectual capital. The regional experts' contribution for the refinement of the sustainable regional development models represents a major benefit for the public administration in its efforts to cope with the actual challenges induced by the globalization process and the actual complexity of the sustainable development in the knowledge society. The e-Knowledge processes strengthen the connectivity of the regional governance with the regional academic and research community, creating efficient links in the interest of the local development. Beside the advantage of a permanent improvement of the regional knowledge related to the design and implementation of the sustainable strategy, the e-Region platform provides open accessibility to the regional information and knowledge, increasing the capacity of the regional stakeholders to be involved as contributors to the strategy design. For this purpose, the regional knowledge base provides valuable knowledge and information related to the regional development trends, models and scenarios. The accessibility to this information, the simulations, the benchmarking and the various scenarios provided offer a scientific frame for a better understanding of the possible evolution of the region and a holistic and accurate approach related to the sustainable regional development. The platform, through its specific e-knowledge tools, supports the quantitative approach and provides valuable information for the regional actors, including the citizens. The quantitative analysis involves advanced sustainable indicators and models, for the appropriate evaluation of the region compared with other similar European regions and with other Romanian regions. The sustainable models and complex indexes integrate four axes: human development, environment protection, economic and social development. The information provided illustrates the positioning of the region in the European and national space and the future trends in the regional sustainable development. The open access to the information concerning the regional data, and the various analysis and interpretations provided, support the need of the regional actors, including the citizens, to be informed and to formulate their opinion by analyzing the information and taking into consideration the real opportunities, according to the existent resources and development trends. The e-Knowledge provides also two ways communication tools for updating the database and the knowledgebase. Thus the regional actors are simultaneously beneficiaries and contributors to the regional knowledge base. Apart from the e-Knowledge tools, the e-Consultation tools implemented through the e-Region platform provide specific structured and unstructured questionnaires for gathering the regional actors' opinions. These primary data, representing the regional actors' views on the regional priorities for the sustainable development, will be integrated with the secondary statistical data. The holistic perspective created through the integration of the regional actors' views with the experts' and public administration's views represents a better basis for the design of the regional sustainable strategy. This new approach introduces a qualitative and sustainable dimension by creating new infrastructures as the regional online platform for empowering the regional actors and their interaction with the public administration structures. The e-Governance approach articulates technologies and knowledge with democratic centric tools, aiming at strengthening the regional partnership and creating a scientific base for the open decisional processes. In this perspective, the decisional process integrates bottom-up views having a more realistic dimension and facilitating the consensus building regarding the strategy design. Consequently, the major idea promoted by the project stands for creating the infrastructure related to the regional e-Governance, aiming at facilitating the design of a regional knowledge base focused on the sustainable development issues and also regional actors' active involvement in the regional policy design through the online channels. The fulfillment of these ambitious goals involves a complex process for translating the research results into practical applications, which enables transformational changes based on technology, as mentioned at the Ministerial Conference in Lisbon, 2007 [5]. The e-Governance involves advanced and efficient interaction tools such as: e-Knowledge and e-Democracy (including e-Participation and e-Voting services), enabling the

regional actors' pro-active and participative behavior in relation with the local government and in the framework of the local policies design, approval and implementation.

3. Conclusions

The main findings introduced by the research project are represented by the improvement of the scientific base of the regional strategy design and by the efficient interaction of the regional/local public entities with the stakeholders. This innovative approach represents a qualitative change at the regional/local administration level, involving major process re-engineering decisions. The decisions makers, represented by the various local/regional or central entities will have at their disposal accurate information, including the feedback obtained from the regional actors, in order to improve the process of the design of the sustainable regional strategy. The information could be used as well during the strategy implementation for the ongoing assessment of the regional projects, aiming at meeting the strategic goals. The platform articulates functions and components such as the regional knowledge repository and generator, the e-Participation and e-Voting tools, creating the premises for bridging the gap between local governance, main stakeholders and citizens. The platform offers also a solution for the decentralization process, which represents a real challenge for the Romanian local administration. This stands for an efficient way to involve citizens and organizations in the regional development, as a knowledge based process. The design and the implementation of the regional/local strategy becomes an efficient and more realistic bottom-up process, integrating the best experiences and practices and better responding to the local needs.

Sarpe Daniela

“Dunărea de Jos” University of Galați, Romania, Faculty of Economic Studies

Mazilescu Vasile

“Dunărea de Jos” University of Galați, Romania, Faculty of Economic Studies

The purpose of this paper is to present the current situation of Romanian tourism and its prospects in the context of international competition in tourism.

Romania's exceptional tourism potential is characterized by two essential components: natural component, represented by spectacular scenery, diverse relief combinations, favorable climatic conditions, therapeutic value and abundance of natural treatment factors and anthropic component, represented by the remains of civilizations that have succeeded on Romanian territory since time immemorial, monuments and religious artifacts or secular, elements of ethnography and folklore of great beauty and originality.

Keywords: tourism, tourism potential, tourism structures, competitiveness

JEL classification: F15, L83, J63, O18

1. Introduction

Before 1990 Romania was an important tourist destination for the Eastern European market, mainly promoting the seaside tourism products, balneoclimaterical resorts, cultural programmes and the famous monasteries located in the Northern Moldavia and Bukovina. The Romanian tourist offer has not changed significantly over time. However it became uncompetitive in relation with the requirements of tourism demand and with similar tourism products available on international markets. This is why, even though all the eight Regions of the country, especially those lagging behind in development, have a significant potential for tourism development, currently the tourism contribution to the growth of the national economy is still low.

The Romanian tourist industry “engines” are actually some segments which are well functioning: agro tourism, mountain and spa tourism, events and tours tourism. More than one third of all European mineral water can be found in Romania. Thus, due to the Herculane Spa, attested since the 2nd century A.D., Romania may be considered one of the founder countries of spa tourism.

The accommodation capacity (number of places) by Regions indicates important differences. The South-East Region has the largest accommodation capacity (47%), being hardly followed by Centre Region (12.5%) and North-West Region (9.2%). It can be estimated that in the next period, the distribution of accommodation capacity on regions of development will be balanced, due to the interest displayed by the entities involved in tourism, but also by the support provided by the local authorities. However, the coastal tourism of Black Sea and Danube Delta and Carpathians and Carpathian areas are expected to continue to develop in the next period of time.

In Romania, the accommodation capacity is significant (280,000 beds²⁴⁹), compared with other countries that recorded outstanding achievements in tourism such as Czech Republic, Croatia, Poland, Hungary etc.). However, because of the mass tourism, a lower category of

²⁴⁹ <http://www.eu-turistul.ro/analiza-pietei-turistice-romanesti/2-capacitatea-de-cazare-turistica.html>.

accommodation establishments (the weight of 1-2 star hotels on the Romanian coast exceeds 80%) has been predominant.

The number of housing units has increased over the past decade by about 25%, especially due to the emergence of new forms of accommodation (rural, urban and agro hotels, youth hostels). However, places of accommodation on all types of units and categories has decreased by almost 7% in the last decade, due to the restitution of nationalized properties (including tourism villas) and a change of destination structures.

Tourist reception structures and particularly the recreational offer are outdated, uncompetitive, the tourism services and tourism programs being accomplished stereotypically and are characterized by a modest quality and the quality-price ratio is inconclusive. Therefore, a steady decline of foreign tourism demand for Romania has been recorded in the last 20 years.

Thus the upgrading, re-launching and development of Romanian tourism and the creation of new modern and competitive tourism products are necessary on the tourist market. Therefore the main purpose is to develop the recreational and animation offer which displays in general high attractiveness, by creating entertainment and theme parks, water parks, offers that are present in the world countries having tourist tradition. The main key tourism indicators reflect discrepancies on the regional level, both in terms of number of tourists as well as the capacity of employing facilities.

2. Competitiveness of Romanian tourism

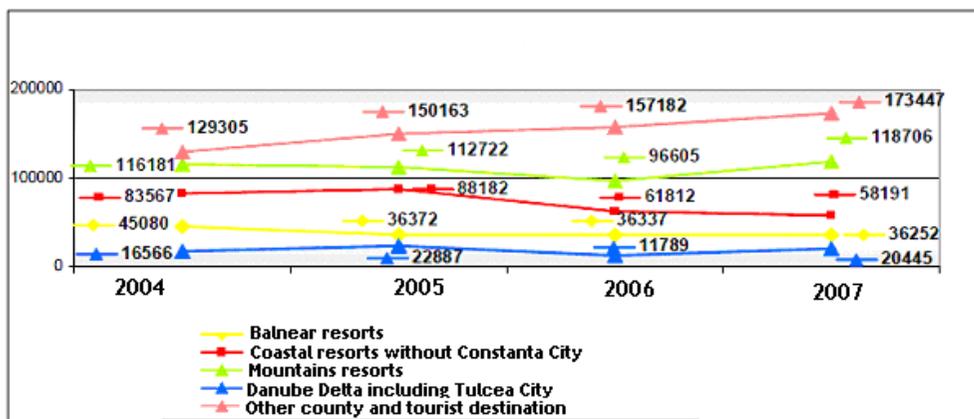

Regarding the total number of tourists that have been accommodated in the registered accommodation structures, a positive development can be noticed thus improving the tourism sector's contribution to gross domestic product (GDP).

Regarding the total number of tourist on development areas, the most important increase has been recorded in the Bucharest area, displaying an increase of 76.54%. The other examined areas, such as the coastal resorts or the ones from the mountain area or the balnear resorts have recorded modest increases or even they have entered the regression, an instance in point being the Danube Delta area.

The number of foreign tourists fluctuations acted in the same way as the total number of tourists described above. Thus, the most significant increase has been recorded in the county seat and in Bucharest, whereas the Danube Delta or the coastal resorts, excluding Constanta, have recorded negative trends.

The extremely low percentage of tourists who chose the Danube Delta can be noticed, approximately 1% of total domestic tourists, representing a paradoxical situation in terms of tourist potential of the area, a potential that unfortunately cannot be taken advantage of due to the lack of proper facilities and poor condition of infrastructure.

According to the analysis of tourism competitiveness, based on the development indicators 8 countries were considered as competing countries in tourism against Romania: Bulgaria, Croatia, Serbia and Montenegro, Hungary, Czech Republic, Slovakia, Poland and Ukraine.

The project strategy for the period 2007-2013 of the National Tourism Authority (NTA) Romania is overtaken by Hungary, Czech Republic, Bulgaria, Croatia, Poland and Slovakia in the tourism industry's competitiveness index.

Compared with these countries, Romania has an average tourism competitiveness index of 58.91, which is lower than the values recorded in Hungary (78.44), Czech Republic (74.47), Bulgaria (68.57%), Croatia (68, 04), Poland (66.03) and Slovakia (62.84). however this index is superior to the one recorded in Ukraine and Serbia - Montenegro. Romania is more competitive in prices, environment, openness to international trade and tourism and in social services.

Nevertheless, our country retains an advantage over Ukraine and Serbia - Montenegro. Romania is more competitive compared with some of its competitors in price, environment, openness to trade and tourism and social and less in technology, human resources and infrastructure.

Compared with Bulgaria, Romania is more competitive in pricing (concerning the hotel room tariffs; PPP index, level of taxation in tourism), infrastructure (only concerning the roads and the railway – displaying indices that are superior to Bulgaria), environment (carbon dioxide emissions are less than those in Bulgaria but having a higher population density), technology (only concerning the high-tech exports), social (regarding the index of newspapers and television).

Compared with Croatia, Romania is more competitive in pricing (only regarding the tourism tax), environment (carbon dioxide emissions being less than in Croatia but a higher population density), international openness (concerning the level of taxation in international trade) and social (the index of newspapers and television).

As far as Hungary is concerned, Romania is more competitive only in pricing (regarding the tariffs charged on hotels room and the level of tourism tax) and social (only the TV index), according to the data provided in the document.

Romania is also more competitive but only in pricing compared with Slovakia (regarding the tariffs charged on hotels room), human tourism (only concerning the number of people involved in tourism), environment, technology (only in high-tech exports), international openness (regarding the visas) and social (the index of newspapers and television).

Compared with the Czech Republic, Romania is more competitive only in pricing (regarding the tariffs charged on hotels room and the tourism tax) and social (regarding the index of newspapers and television).

To Poland, Romania is only competitive in pricing (regarding the tariffs charged on hotels room and tourism tax), human tourism (concerning only the economic impact of tourism), technology (only in high-tech exports), international openness (the tourism openness index and trade openness index) and social (only the index of newspapers and television).

Compared with Ukraine, Romania is more competitive in pricing (regarding the tariffs charged on hotels room, purchasing power parity and level of taxation in tourism), human tourism (only concerning the population involvement in tourism), environment (carbon dioxide emissions being less than those in Ukraine, a higher population density), technology (concerning the number of Internet users, mobile high-tech exports), international openness (regarding the visa section and the tax on international trade) and social (concerning the human development index, newspapers index, computer index and television index).

Compared with the existing potential in our country and compared with other Central and Eastern European countries, Romania is presented in terms of modest economic performance displayed by the tourism industry.

3. Tourism trends in Romania

A 3.6% increase of tourist structure capacity of accommodation (from 283,701 places to 295,898 places) was recorded in 2009, the largest increase of 4215 places being recorded in urban and rural hostels.

This phenomenon can be explained due to the lower volume of financial effort required by the investments in boarding houses and also to the increase of interest in this form of tourism. However it is noteworthy the investment effort shown in the developing and modernizing the upper class tourist structures, the increase pace of these categories capacity being of 17.8% for 5 stars, 38% for 4 stars and 3.5% for 3 stars.

The year 2009 displayed a tendency of reducing the average length of stay in hotel structures, brought about by the increased tourist traffic in weekends and also by the fractionation trend of holidays, a phenomenon which has become more obvious in our country. Therefore the figures provided by the travel agencies are below those recorded in 2008 concerning the national tourism actions. A decrease can also be noticed regarding the number of days spent by tourists in such accommodation structures, this decrease being of 8.7 % compared with the data recorded in the previous year.

Table 2 Arrivals of foreign tourists in Romania from European Union by country of origin

BULGARIA	818009	1035913

Source: EUROSTAT

Regarding the foreign travel statistics shoe an unexpected development, which is mainly due to the reduction of their costs that was generated by the global economic crisis. The explanation of foreign travel increasing is the strengthening of the middle class and their wish to travel abroad and to make contact with other cultures and civilizations, high quality tourism services as well as freedom to travel in Europe.

4. Conclusions

In 2009, the profit made from the international tourism earnings was of EUR 4.5 billion, while the GDP tourism contribution is still low (only 3.5% of GDP contribution from tourism activities for 2008²⁵⁰); the number of tourism work places is quite significant - 105 thousand jobs (1.2% of total employment).

Concerning the tourism sector support, by investments in tourist attractions, accommodation and infrastructure services, it is expected that these positive trends characterizing this particular field to continue in the next period of time as well. This optimistic forecast is also based on the analysis of the development of the tourism sector on the world level.

Among the most significant issues the following ones may be mentioned : increased number of tourists, increased number of people interested in ethnic tourism (visits to native places),

²⁵⁰ <http://www.ziare.com/business/economie/02-19-2009>.

increasing demand for new destinations, increased attendance at health resorts and spas (due to increasing concern for body maintenance, beauty, gymnastics, fitness, etc.), increasing number of older people who are more active and willing to travel, tourists become more experienced, they expect quality attractions, facilities and services ensured by the tariffs/prices which are adequate to the quality of their traveling facilities; business environment development or for congresses, conferences, meetings, etc., increased number of tourists concerned with preserving and protecting the natural environment, tourism uses to an increasing extent the modern technology in fields like online booking services and marketing; in recent years, the Internet has become an increasingly important means of information and marketing.

These expectations may indicate a growing demand for tourism in Romania, especially as the accommodation facilities and tourist attractions will adapt to the market requirements, achieving a quality and a capacity which are significantly higher to the current ones. The National Association of Travel Agencies from Romania hopes that in 2010 the Romanian tourism will recover from 2009 and record a slight increase of at least 5%.

THE CURRENT ACCOUNT DEFICIT AND THE FIXED EXCHANGE RATE. ADJUSTING MECHANISMS AND MODELS.

Negrea Adrian
University of Oradea
Faculty of Economic Sciences

Hațegan D.B. Anca
University of Oradea
Faculty of Economic Sciences

The main purpose of the paper is to explain what measures can be taken in order to fix the trade deficit, and the pressure that is upon a country by imposing such measures. The international and the national supply and demand conditions change rapidly, and if a country doesn't succeed in keeping a tight control over its deficit, a lot of factors will affect its wellbeing. In order to reduce the external trade deficit, the government needs to resort to several techniques. The desired result is to have a balanced current account, and therefore, the government is free to use measures such as fixing its exchange rate, reducing government spending etc. We have shown that all these measures will have a certain impact upon an economy, by allowing its exports to thrive and eliminate the danger from excessive imports, or vice-versa. The main conclusion of our paper is that government intervention is allowed in order to maintain the balance of the current account.

Keywords: current account, trade deficit, trade surplus, absorption, elasticity, the Keynesian multiplier model of national income, fixed and floating exchange rate.

JEL codes: F32, F31, O11, O24, P1.

1. Adjusting mechanisms of the current account deficit, if the exchange rate is fixed.

Both in practice and theory, the accent is set on the deficit of the external trade balance (and not on its surplus), because the adjusting process determines the reduction of the international reserves, and forces the country to impose corrective measures.

If the exchange rate is fixed, the corrective process involves the transfer of national resources abroad. These transfers can be measured by the following methods, which limit at studying the behavior of the current account and the adjusting process of its deficit: elasticity approach; income approach; absorption approach.

1.1. Elasticity approach

The elasticity approach is based on the variations of the nominal exchange rate (devaluation, appreciation) for the necessary adjustments in reestablishing the external balance. By devaluation or appreciation of the currency, there will be an inflationary or deflationary regime that counts for the growth or decrease of the internal prices.

In the case of a regime of fixed exchange rates, currency appreciation or devaluation are used to optimize the external trade balance. This affirmation is based on some key premises that some economists consider that are arguable in some poor developed countries. These premises refer to the extent that the change in import prices affects the quantity asked by imports and exports, measured by the elasticity of demand by price.

In the case of devaluating the national currency, the relative prices of imports and exports suffer changes. So, the export prices in foreign currency decrease compare with other countries prices, and the internal import prices rise compared with the national products that substitute imports, provoking the decrease of the imports volume, and the growth of the export volume of goods,

thus improving the situation of the current account. So, the devaluation concentrates on the reduction of excess spending on imports, and the appreciation process focuses on the reduction of excess revenues from exports.

The elasticity of imports (exports) by price, is an instrument which shows the measure that physical volume of imports (exports) suffers modifications, when the price fluctuates. This is reported like this: $E_{M(X)} = \text{percentage modification of imports (exports) quantities} / \text{percentage modification of imports (exports) prices}$.

If the price modification reflects in the modification of imports, than the demand is elastic to the price. If the demanded quantity suffers less modifications, than the demand is inelastic to the price.

If the elasticity of demand for imports based on prices is nil, than the demand for imports is perfectly inelastic, and the same amount of goods will be imported no matter what the price is in the national currency.

1.2. The absorption approach

The absorption approach is the name of a set of ideas about the external trade balance, associated with the work of Meade, Alexander and Mundell, expressed in a paper by Johnson (1958).

In a closed economy, the national income can be separated into sectors where the production is being sold: consumption, investments, public spending; and also in those sectors where it is won: consumption, saving and taxes: $C+S+T = Y = C+I+G$, (1) were: Y is the national income, C is the consumption, S is the national private savings, T is the taxes, I is the national investments, and G are the governmental spending.

Because $C + I + G = A$, were A is the internal absorption, it results that $Y=A$ (2).

From equation (2) we conclude that in a closed economy, the national spending has to be equal to the national income. And, if we assume that there is a budget equilibrium ($G=T$), it results that the national investments has to be equal to the national private savings ($S = I$).

When we pass to an open economy, we add the income earned through exports (X) minus the national spending on imports (M). The equation becomes (1) $C+ S+T = Y= C+I+G +X-M$ (3)

By reorganizing the equation number (3), we obtain: $X-M = (C+ S+T) - (C+I+G) = Y-(4)$

The national income can be larger or smaller than the internal absorption, meaning that the current account output can be a deficit or a surplus.

Starting from equation number (3) and by rearranging the terms we have: $S +(T-G) -I = (S-I) +(T-G) = X-M$ (5). The equation number (5) signifies that the net financing capacity of an economy = net financing capacity of the private sector from which we lower the need of financing of the public sector = the account of the current operations.

If we consider the budget surplus (T-G) as governmental savings, or the budget deficit as spending, we can define the national savings as $EN = S+(T-G)$. Than the equation can be written $EN - I = BC$ (6). This equation has the following meanings: the total national savings out pass investments with a sum equal to the external trade balance account.

1.3. The income approach (the Keynesian model of the national income)

1.3.1. The Keynesian model of a small country

The income approach refers to the effects of the national income modifications over the adjusting process of the current account. The modifications of the national income can contribute positive or negative to the correction of the external imbalance, but in both cases, the effects can be incomplete, having to be accompanied by alternative correction measures, like the change of the nominal exchange rate. *This analysis derives from the model of the Keynesian simple multiplier, in the case of a small but open economy.*

The national income in an open economy is determined by the sum of consumption, investments, governmental spending and the net external spending on goods and services. So, by resuming the equation number (3): $Y = C + I + G + (X - M)$ (3)

$$C = C^* + cY \quad (7)$$

In the simple Keynesian model, both governmental investments and spending are considerate exogenous (fact showed by the asterisk in the right of the letter) $I = I^*$ și $G = G^*$

The demand for exports (imports for foreigners) is a function of relative prices and national income from abroad (Y^*): $X = X_d(E, Y^*)$

So the simplified formula for the demand of exports, regarding the fact that the exchange rate is fixed, and the foreign income is exogenous, we have: $X = X^*$ (8)

The demand for imports depends on the relative prices and the national income: $M = M_d(E, Y) = M^* + mY$, (9) were: Y is the national income; C is the aggregated consumption; C^* is the autonomous consumption; c the marginal inclination to consumption; I^* are the autonomous investments; G^* is the governmental autonomous spending; X is the exports determined by external factors (like the external income); M is the aggregated imports; M^* is the autonomous imports; „ m ” is the marginal inclination to imports affected by the national income, and assures the connection between the national income and those of the imports. We consider „ m ” as positive and subunit, following the fact that imports are an increasing function of national income. So the imports go the same way with the national income, but in a smaller proportion.

Replacing the equations (7), (8) and (9) in the equation number (3), we obtain: $Y = C^* + cY + I^* + G^* + X^* - (M^* + mY)$

$$\Delta Y = \frac{\Delta C^* + \Delta I^* + \Delta G^* + \Delta X^* - \Delta M^*}{1 - c + m} \quad (10)$$

The multiplier of an open economy, like in the equation number (10) is $\frac{1}{1 - c + m}$. This is

smaller than in a closed economy, ($\frac{1}{1 - c}$) because of adding the marginal inclination to imports

(m), which represents a leakage of incomes abroad care.

$$\frac{1}{1 - c + m} < \frac{1}{1 - c}$$

$1 - c = s$, were „ s ” is the marginal inclination to savings.

The equation number (10) can be expressed:

$$\Delta Y = \frac{\Delta C^* + \Delta I^* + \Delta G^* + \Delta X^* - \Delta M^*}{s + m} \quad (11) \text{ or } \Delta Y = \frac{\Delta A^* + \Delta X^* - \Delta M^*}{s + m} \quad (12) \text{ were}$$

$A^* = C^* + I^* + G^*$ represents the exogenous component of the aggregated demand.

The multiplier for any autonomous component of the spending is: $\frac{\Delta Y}{\Delta A} = \frac{1}{s + m}$ (13)

In practice, the sum between „ s ” and „ m ” is less than 1, and by this ht multiplier is supraunit. That means that an autonomous increase of spending can provoke the increase of the national income in a greater measure.

The equation number (11) can be used for determining the impact of the modification of the components of the national income over the external equilibrium. The current account can be expressed like this (if we consider that as majority the commercial flows, and the other components – the income and transfers – unimportant): $CC = X - M$ resulting $\Delta CC = \Delta X - \Delta M$ (14)

By replacing the equation number (9) in the equation number (14) we obtain $\Delta CC = \Delta X^* - \Delta M^* - m\Delta Y$ (15)

With the help of the equation number (15) we can determine the direct impact of the modification of autonomous imports and exports, and the indirect impact of the modification of any component of the national income, over the external equilibrium. So, the changes of the national income (in any direction) will affect the external equilibrium.

By introducing in the equation number (15) the ΔY from the equation number (11), and by rearranging the terms, we obtain:

$$\Delta CC = \frac{s}{s+m} (\Delta X^* - \Delta M^*) - \frac{m}{s+m} (\Delta C^* + \Delta I^* + \Delta G^*) \quad (16)$$

If we suppose that ΔM^* is very small, almost equal to zero, then: $\Delta CC = \Delta X^* - m\Delta Y = \Delta X^* -$

$$m \frac{1}{s+m} \Delta X^* = \frac{s}{s+m} \Delta X^* \quad (17)$$

The expression $\frac{s}{s+m}$ is smaller than 1, which means that external trade balance is improving

less than the exogenous growth of exports, because of the increase of imports based on the increase of the national income. Per total the effect is positive, because imports don't increase as much as exports.

1.3.2. The Keynesian model with two big countries

In this model we consider two countries large enough to affect each other's national income, because the development of the rest of the world depends on the evolution that country, and the exports evolution of the host country depends on the abroad evolution. By this, the rest of the world (in order to ease the analysis we consider the rest of the world as one country) and the host country are interdependent.

Because the abroad national income is endogenous, the foreign country shapes itself analog to the host country, admitting that its exports are the imports of the host country. This depends on the national income of the host country: $M = M^* + mY$ (18)

The imports of the foreign country are the exports of the host country. These depend on the national income of the foreign country: $X = X^* + m_s Y_s$ (19) where m_s is the marginal inclination to imports of the foreign country, s_s is the marginal inclination to savings of the foreign country, and Y_s is the national income of the foreign country.

So, from the equation number (19) results that when the national income increases abroad, the foreigners import more from the analyzed country.

In the equation number (12) X^* is replaced by the new expression of exports, resulting a new

$$\text{formula of the equilibrium national income: } Y = \frac{A^* + X^* - M^* + m_s Y_s}{s+m} \quad (20)$$

From the above equation we assume that the internal national income depends positively from the foreign national income. When a big country registers an expansion, it imports more from its trading partners.

In these conditions, the solution for the foreign equilibrium income is: $Y_s =$

$$\frac{A_s^* + M^* + mY - X^*}{s_s + m_s} \quad (21), \text{ where } A_s^* \text{ represents the autonomous component of foreign}$$

spending.

The equation number (21) is the version for the foreign country of the equation number (20). The equilibrium national income for any of the two countries is obtained by resolving simultaneous of the two equations. The multiplier of an expansion of the host economy is:

$$\frac{\Delta Y}{\Delta A} = \frac{1}{s + m - \frac{m_s m}{s_s + m_s}} < \frac{1}{s} \quad (22)$$

This is larger than the multiplier of a small country $1/(s + m)$, because a part of the spending that gets out of the country as imports they come back as exports. Also, the multiplier from the equation number (22) is smaller than that of a closed economy ($1/s$), as long as "m" and "s" are higher than zero.

In the case of the model with two countries: $\Delta BC = m_s \Delta Y_s - m \Delta Y$ (23). From the equation number (23) we find that if the host country registers an expansion larger than the foreign country, than the host country will suffers a deterioration of the external trade balance, assuming that two countries have the same marginal inclination to imports.

1.3.3. Transmitting the economic shocks in the Keynesian model

Next, we will analyze the way of transmitting, over the borders of one country, the economic shocks, in the conditions of a fixed exchange rate in comparison the floating one, starting from the Keynesian model. This comparison is one of the criteria that a country uses in order to chose its exchange rate.

1.3.3.1. Transmitting the economic shocks in the case of a fixed exchange rate

For simplicity we start from the premise of a small country. Another premise is to ignore the repercussion effects due to the modifications of the foreign national income.

According to the equation number (13), an internal imbalance, like a reduction of the demand of investments, can provoke the decrease of the internal national income with $\frac{\Delta Y}{\Delta I^*} = \frac{1}{s + m}$ in the

mode with a small country. An external imbalance, like the reduction of the export demand, can provoke the modification of the national income wit the same amount: $\frac{\Delta Y}{\Delta X^*} = \frac{1}{s + m}$. In this

case, a part of the foreign modification is transmitted, through the external trade balance, in the host country.

In the model with two big countries, the export multiplier is higher (as we can observe from the equation number (22)), because a part of the national income leakages return as imports, return back as exports

1.3.3.2. Transmitting the economic shocks in the case of a floating exchange rate

In the case of the floating exchange rate, the Central Bank doesn't intervene. We assume that there are no capital, financial or transfer flows, so the external trade balance is nil. In the condition of a floating exchange rate, you cannot realize a surplus of the external trade balance, because the excess of the foreign currency, obtained by reducing imports, provokes the appreciation of the national currency, which in return supports imports and discourages exports.

The zero sum of the external trade balance means $\Delta BC = \Delta X^* - m \Delta Y = 0$, from which results $\Delta X^* = m \Delta Y$.

The reduction of net exports determinate by the appreciation of the national currency has to be suffice to counteract the downfall of imports provoked by the diminish of the national income. To calculate the variation of the national income we start with the equation number (11): $\Delta Y =$

$$\frac{\Delta I^* + \Delta X^*}{s + m} = \frac{\Delta I^* + m \Delta Y}{s + m}$$

$$\Delta Y = \frac{\Delta I^*}{s} \quad (24)$$

1.4. Conclusions of the mechanisms that adjusts the current account when the exchange rate is fixed.

The adjusting problems do not appear in the case of floating exchange rates, because in this regime the adjustment is automatic and its determined by the market conditions. The nominal exchange rate reacts in the changes of the supply and demand of imports and exports, and thus, the adjustment of the external balance is done automatically.

The analysis stated above has only one major flood, and that is the minimization of the external balance to a null entry in the current account (the difference between imported and exported goods and service registered in the current account), the capital and financial accounts not being analyzed This characteristic imposes serious limits regarding the conclusion of this paper.

In practice, the external balance is equal to the zero sum of the aggregate current account and the capital and financial accounts. By introducing the capital and financial accounts, changes the shape of the analysis in a radical way.

Although the model of the national income multiplier is restrictive, with its help some interesting information can be obtained.

The most important conclusions are evident in the simpler form of the Keynesian model, when the foreign national income is considered constant. This premise is realistic if we assume that the host country is too small to influence the foreign national income. The first conclusion refers to the variation of government spending. Such changes have a multiplying effect upon the national income, because at every round of spending, a part of the obtained income is transforming in more spending, but the effect upon the national income is lower than in a closed economy, because a part of the income is spent outside the country for new imports, which can increase the deficit of the trade balance. Feedback effects through the foreign national income can be obtained only in the case of big countries, and amplifies the effects upon the internal national income.

The next conclusion refers to devaluation. If the Marshall-Lerner condition is obtained, the devaluation of the national currency will determine the improvement of the trade balance, and of the national income, because of the multiplier, but because the growth of the national income amplifies imports, the improvement of the trade balance will be smaller than in the case of omitting the effects of the income.

ROMANIAN WORKFORCE FACING EUROPEAN UNION'S NEW CHALLENGES-THE UPSURGE OF ACADEMIC SPIN-OFFS

Nica Elvira

*The Economic Studies Academy, Bucharest
Management Faculty*

Popescu Gheorghe

*Dimitrie Cantemir University, Bucharest
Finances, Banks and Accounting Faculty*

*In facing new European Union challenges in terms of **higher transfer of knowledge** some Romanian organizations founded as efficient creating a new linkage between the theory and practice in terms of using the newest information cited in the specialty literature within the **reengineering of the managerial processes** in order to adapt to the actual financial and economic conditions. Thus according special attention **to the empowerment of the academic spin-offs** the organization also empower the essential knowledge and know-how transfer from the field of universities and research institutes into the economic field.*

*Therefore we found, as a sine qua non condition of facing the European Union challenges, the need of **promoting a new, improved linkage between the educational environment an the entrepreneurial environment.***

Keywords: intellectual capital, academic spin-offs, know-how transfer, education inclusion, work-integrated learning.

JEL Codes: I21, J54, O31.

1. Introduction

European challenges brought us in front of new managerial paradigms, aimed at **forming a culture of performance in both public and private sector**. In this regard, efficiency, effectiveness and high quality of services offered by an organization, the replacement of hierarchical organizational structures, highly centralized to decentralized structures, where decisions on resource allocation and service delivery are taken closer to the place of delivery, flexibility to explore alternatives for direct public provision and regulation are constantly setting up the guidelines for underlining the sine qua non condition of cost efficiency optimizing.

Moreover, **the tendency to exploit the capacity for holistic knowledge**: reason, sense, and will, of the human brain, **joins a progressive upward trend by acquiring new productive forces** in order to provide a rational way of life in the idea of finding and implementation of new types of education that effectively manage and ensure the organization-education synergy development.

The actual occurrence of financial and economic crises and of major disorders in economic activities generated within the labor market a major unemployment rate sizing, effect which required finding new solutions in order to restore the economic equilibrium.

Therefore the European strategies to develop a knowledge-based economy promoted the work-integrated learning policy that acts in synergy with the financial-economic cohesion policy and with the information society development initiative in order to highly capitalize new informational technologies, action that can create the socio-economic progress preconditions²⁵¹.

In the current situation, **work-integrated learning is viewed as a solution of facing the European Union new integration challenges** that lie within the approaches, methods,

²⁵¹ Nica E., Popescu Gh., Work-integrated learning an anticrisis policy to empower economic growth, Bulletin of the Transilvania University of Braşov, 2010.

techniques of companies generated by focusing on production and use of knowledge, which provides a superior way of development, in regard of multiple facets of knowledge. The need of adjusting Romanian economic principles to the new European guidelines is founded on the pillar of accessing new world wide opportunities.

Therefore, work-integrated learning occurs in all areas relating to the new organization, and highlighted the practice before the theory. Moreover, in developed countries in particular, there are operating thousands of **firms that have developed practices focusing on knowledge management in their various forms, in order to access a substantial addition of functionality.**

2. Academic spin-offs projecting premises

The first Romanian economic issue that stands before know-how transfer is the education one. The access to pre-primary education has started to have an more important role in employment participation, particularly for those facing other barriers such as single parenting or higher education conditions in order to access a future employment.

The statistics published by the competent authorities regarding the European Union status showed that in 2007, almost half (46 %) of all children aged between zero and two in the EU-25 were cared for solely by their parents²⁵². For children in childcare for 30 or more hours per week a small majority were in formal care arrangements, while for shorter periods other care arrangements were more common. The statistics show that parenting covers a very significant percentage of a person's time. Thus the time spent for continuous educations is found to be, as time goes by, often reduced. Therefore the medium of human factors accessing higher education, statistically speaking, joins an decreasing trend.

These being taken into consideration is vital to be mentioned that low levels of educational attainment and illiteracy are often barriers to employment and further training, this becoming an rigorous condition found within all European Union countries, not only al Romanian level.

The same statistics cited above, underlines the fact that participation in education (among 15 to 24 year olds) averaged just less than 60 % in the EU27 in 2007. Moreover the cut-off age of 24 years allows a comparison between young and adult populations, although the resulting rates are influenced by choice or students having to repeat school years and reflect national service commitments. A high proportion of students may also have already completed tertiary education before the age of 24 in a number of Member States. The majority of education funding in the Member States comes from public rather than private funds; this government spending accounts for approximately 5 % of GDP. Financial aid may take the form of scholarships, grants, and child allowances, reimbursement of expenditure, or loans as the most recent statistic calculations are underlining.

The European Union has foreseen this to be happening an thus the new project of Europe 2020 aims at social inclusion that 75% of the population aged 20-64 years must have a job. And in order to be doing that the human factor has to be educated.

From this point of view the European Commission²⁵³ apart from setting up the objective of sending 3% of the EU's GDP to be invested in Research &Development, sets up a new target: The share of early school leavers should be under 10% and at least 40% of the younger generation should have a degree or diploma. Which is going to be **a great European challenge for Romania**, as the thoroughly analysis of dropout rate in higher education is being constantly increasing. As we can observe from the below the histogram of dropout rate in higher education Romania has almost doubled this education indicator:

²⁵² Eurostat Statistical Books, Combating poverty and social exclusion, A statistical portrait of the European Union 2010, Belgium 2010.

²⁵³ Europe 2020: Commission proposes new economic strategy in Europe, Brussels, 3rd March 2010.

Table 1. Dropout rate in higher education²⁵⁴

	-Percentage-							
	2000	2001	2002	2003	2004	2005	2006	2007
Primary education in which:								
Primary	0,9	0,6	1,2	1,2	1,5	1,7	1,8	2,0
Secondary education	0,8	0,6	1,0	0,9	1,2	1,3	1,5	1,7
Highschool education	0,9	0,6	1,4	1,5	1,7	2,0	2,1	2,3
Vocational education and apprenticeship	3,8	3,5	3,3	2,7	2,4	2,3	2,7	3,3
Secondary education and apprenticeship	6,1	6,6	6,8	7,9	5,9	5,5	7,4	8,2
Secondary education and apprenticeship	8,5	7,6	9,5	8,1	7,7	9,2	8,6	7,5

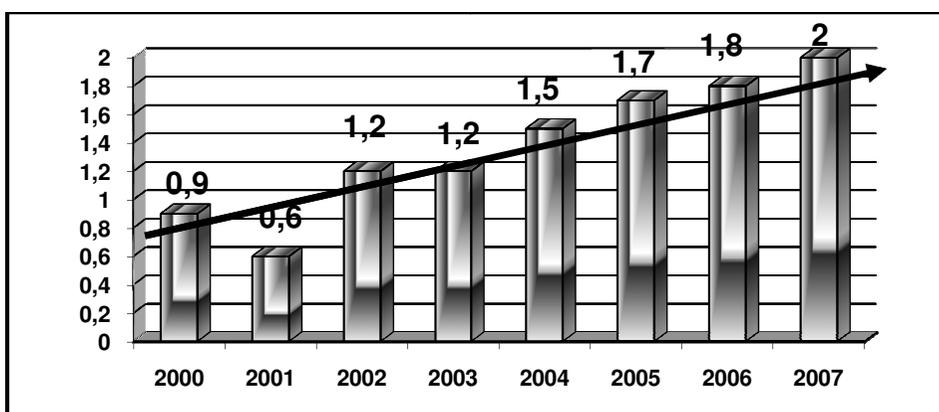

Figure 1. Dropout evolution

As the European Union statistics capture more than a third of the EU population between 25-64 years participate in formal or non-formal education and training²⁵⁵. There are significant country differences in participation rates according to results from the first Adult Education survey. But the particularity is that among those participating, **a large majority participate in non-formal education and training and over 80% of the non-formal activities are job-related**, that means that the human factor is not involving itself in lifelong education, unless it is a part of the job description, fact that is worrying.

Another specific characterization is that about 6% participate in formal education and training. Formal education and training has a large share of total instruction hours. The reason is also the lack of time, thus being known that the non-formal education and training involves spending a shorter period of study.

What is remarkable is the issue consisting in intellectual capital motivation for accessing the lifelong learning programs and that is to do a better job and **improve career prospects**, which is in economical speaking **raising the competitive advantage**. Taking into consideration that most non-formal education and training activities are job-related, underlines an innovative aspect: the involvement of an increased number of companies are preoccupied by human factor optimization

²⁵⁴ Anuar statistic 2008, <http://www.inse.ro/cms/rw/pages/anuarstatistic2008.ro.do>.

²⁵⁵ Boateng S. K., Population and social conditions, Statistics in focus, 44/2009.

by education. Employers and non-formal educational institutions are the most significant providers of non-formal education and training and thus the **employed human capital rises up its efficiency also throughout programs based on work integrated learning**. And the common evolving practice around all the European Union countries is that about 60% of employed participants are sponsored fully or partly by the employers, aspect that shows once again that most of the productive companies are being aware of the need of know-how transfer from the education institutions to the employed human capital.

Thus lifelong learning is occupying its vital role in designing a most competitive and dynamic knowledge-based economy in the world, and a cohesive and inclusive society aiming at world wide know-how transfer between organizations and not the least between countries.

Aiming at **acquiring continuously updating and improving the skills and competencies** of the employed human capital **is considered a prerequisite for organization's development and participation of all employees within all aspects of managerial processes reengineering**.

But these objectives cannot be acquired unless the organization do not allow the upsurge of²⁵⁶:

-**developing higher education employability** by finding the most effective ways to take advantage of synergies with industry;

-**identifying best practices and experiences and enterprise integration**, exacerbating their sustainability in a system-level point of view;

-**defining guidelines for an integrated program linking universities and enterprises**, the guidelines must being tested and reviewed with a wide range of stakeholders and policy makers, and also put into context in relation to current initiatives education and new national and European programs.

Continuing on this line it is foreseen the need of a **higher collaboration between the academic institutions and the public and private organizations in order to empower the know-how transfer**.

3. The upsurge of academic-spin-offs

Promoting the concept of the increased need of informational transfer from the academic sector towards the public and private sector we encounter a major aspect increasingly present on the point that companies should consider certain factors relating to sources of scientific opportunities as a present conditions for becoming increasingly competitive. According **special attention to the empowerment of the academic spin-offs** the organization also empower the essential knowledge and know-how transfer from the field of universities and research institutes into the economic activity through the direct involvement of their employees who participate in entrepreneurial activities.

So these academics, researchers and students sustain a direct involvement in the recovery of economic opportunities associated with such scientific knowledge which they possess. Their work is both in the initiation of entrepreneurial action and in granting DC consulting, training, technical assistance in order to maximize the economic opportunities identified by the organizations.

Taking into consideration that **spin-off stands for the new business initiatives creation within an existing company or organization**, started by an employee or a relatively small group, the organization may declare that spin-off become so independent, that with their feasibility in terms of legal structure, technical and business, are creating a new company. But when we found it implemented with the help of academic researchers, organizations are referring to this as **creating an academic spin-offs**.

So in facing new European Union challenges in terms of higher transfer of knowledge some Romanian organizations founded as **efficient creating a new linkage between the theory and**

²⁵⁶ Cooperation between higher education institutions and enterprises, Lifelong Learning Programme, Compendium 2008.

practice in terms of using the newest information cited in the specialty literature within the reengineering of the managerial processes in order to adapt to the actual financial and economic conditions.

In facing these new challenges most of the organizations learned from experience that not only the material, informational and financial resources need to be optimized but also the human resources must be continuously improved. And the best way of making human capital provide gainful results was found to be throughout educating it. So the basis of developing academic spin-offs are found once again in the need of putting valuable information in well cognitive developed person's hands. Therefore distributing the most precious know-how must cover the specialized labor force

From this point of view new business development, particularly in the context of high-tech or knowledge-intensive, is found by the organizations being a complex process in which many agents, organizations and other stakeholders are involved. Thus universities are expected to support further development of markets for innovation dissemination, and evaluation of their transfer to industry.

So, the processes to commercially exploit research results vary widely upon organization. This may involve licensing, creating partnerships and joint ventures to share both the risks and rewards eventually creating spin-off companies. As shown below:

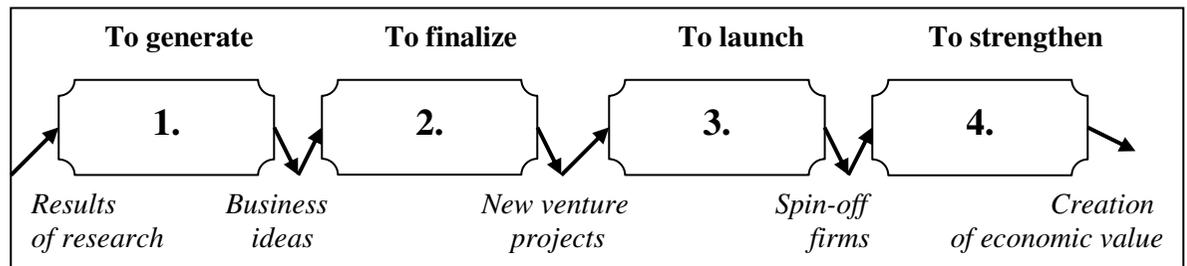

Fig.1. The global process of valorization by spin-offs²⁵⁷

A spin-off company emerging from the University enhances the interaction and contact between the latter and the market, and it also helps **transform the academic culture in an entrepreneurial environment focused on market and society.**

The experience showed that there are **three main types of academic spin-offs**²⁵⁸:

- established teaching and research staff of universities and autonomous research institutions;
- DC students or graduates established firms to commercially exploit research results in which they were involved throughout the study;
- companies set up to commercially exploit research results completed within the university.

Most experts consider that, in fact, only the first two categories of firms represent the authentic academic spin-offs. In order to maximize economic and scientific opportunities offered by the university there have even developed models based on competence and competition in recent years, policies and programs for special actions. **These practices empower increasingly the awareness of the valuable benefits generated by developing academic spin-offs.**

Presenting the academic spin-offs has several advantages as rapid discovery of economic opportunities offered by scientific knowledge nouns, operative recovery, through entrepreneurial, pragmatic values of associated scientific and scholarly knowledge and know-how transfer, the acceleration of company's establishment and development in tech, essential to economic progress

²⁵⁷ Ndonzuau F. N., Pirnay F., Surlemont B., A stage model of academic spin-off creation, Technovation 22/2002.

²⁵⁸ Nicolescu O., Nicolescu C., Intreprenoriatul si managementul intreprinderilor mici si mijlocii, Concepte, abordari studii de caz, Editura Economica, Bucuresti 2008.

of each country, recovery and talent development among teachers, researchers and students, **achieving synergy effects of scientific and entrepreneurial environments as a result of combining scientific activities, teaching, consulting and entrepreneurship.**

Therefore we may find that often spin-offs are developing in the incubators and technology centers, which are generating increasingly important economic opportunities in the fields of science and cutting-edge information technology, biotechnology, electronics and many other domains.

In order to **promote the benefits of academic spin-offs** many companies, universities and governmental organizations now have an "Office of Technology Transfer" (also known as "Tech Transfer" or "TechXfer") dedicated to **identifying research which has potential commercial interest and strategies for how to exploit it**²⁵⁹. In economic terms the importance of education in acquiring skills that can be used in the labor market is underlined by the substantial differences in unemployment rates depending on the level of education attained by members of the workforce. Generally, higher levels of educational achievement reduce the likelihood of unemployment²⁶⁰.

Hence **the academic spin-offs upsurge can be used as an innovative solution for the Romanian entrepreneurial domain in facing the new European Union challenges.**

THE LISBON TREATY- LINK BETWEEN PARTICIPATIVE DEMOCRACY AND ADMINISTRATIVE MODERNIZATION

Onofrei Mihaela

University “Alexandru Ioan Cuza” of Iași

Faculty of Economics and Business Administration

Bosie Irina

University “Alexandru Ioan Cuza” of Iași

Faculty of Economics and Business Administration

This paperwork examines briefly, the implications it carries on the Lisbon Treaty, the organizational, institutional and decision-making level in the current context of the European Union, included in the reform process. It is important to mention that the European Union's desire is to assign a new role, upwards of national parliaments it is materialized with the new regulation of the Lisbon Treaty. This creates premises to develop a common foreign policy, providing Member States and Community institutions the chance to creatively use new opportunities. The Treaty encourages participative democracy and citizen participation with implications in decision-making efficiency gains.

Keywords: subsidiarity, the Lisbon Treaty, national parliaments, reform

Jel Code: N14, G18

1. Review of the Lisbon Treaty: coercive measures or participation for the European Union citizens

The Lisbon Treaty entered into force in 2009, it didn't radically change the institutional structure of the European Union, but the expansion and the need for legislative adjustments was necessary for the community. Initially the legal rules were designed for a smaller Union, with a capacity of less predictability, regardless of an economic recession, financial climate change, sustainable development issues, high crossborder crime environment and corruption. These adverse events have expanded from year to year, and the need for change and legislative update for the European Union was inherent. Countries that signed the Treaty, sustained that this change is necessary to adequately solve the new issues that appeared.

The Treaty outlined new tasks for European Parliament, Council and Commission, which have a decisive role in the European Union. All started from premises that the members welfare is very important for the Union as it was intended to approach their institutional environment. Union Citizens, represented by the parliaments of their Member States exercise their rights by contributing to the expansion process of European Union. The Parliaments of each Member State receive the permission in order to express opinions regarding legislation, how it is applicable differentially for each state, as required.

European Union must aim the welting life of their citizens and members within the context of the general good and cannot exist without the Member States, being established in order to help them. If we accept the idea of administrative communication, formal communication directions respects the relations in the institution, communication is taking place generally in three directions: top-down, bottom up, horizontal. We can consider that the intervention of the citizens within the expressing of the opinions regarding the European Union is an application of the administrative communication, this time it's about European institutions communication.

2. The changing process and its implications on the increasing the decisional power of the Community institutions

Although other EU treaties, including the Amsterdam Treaty, didn't achieved high expectations of Member States, the treaties, however amplified the EU decision-making power. One of the important changes brought about by the Lisbon Treaty, is the right of Governments, the European Parliament or the Commission, Council of Europe to submit proposals for revising the treaties. These proposals shall be submitted to notify the European Council and national parliaments, with the purpose to increase or reduce the competences awarded the European Union treaties.

Institutional power, by strengthening the role of Parliament, is a key point, thereby, grant new powers to national parliaments, and thereby increase the force decisions of Member States, streamlining decision-making at European level. The role of the increased parliaments of the Member States power aim to protect the rights of each Member State on issues of taxation and defense.

The legislation elaborated by the Union is forwarded to national parliaments. By the early warning system, parliaments shall have eight weeks to support their view to EU legislative proposals. If the proposals do not meet the social, economic, political realities and there are disagreements with provisions in relation to the real situation, the national parliaments can make additions or changes on behalf of these proposals.

From the perspective of Member States involvement in decision making, the problems outlined by the states must be supported by the other Member States. Some areas require unanimous approval as tax issues and defense issues, and other decisions must be taken by qualified majority vote, the double majority.

The Lisbon Treaty is aimed to ensure the EU citizens' freedom, justice and security, disclaiming the internal barriers.

Sustainable development is a goal achieved by the Treaty being possible to have balanced growth, economic competitiveness, employment, and maintain stable exchange rate of euro, finally resulting uniformity in economic welfare, while maintaining traditional values of each Member State. Member States established force, is determined by investing the national parliaments with new powers. National parliaments will have a direct input into European decision making.

The system introduced by the Lisbon Treaty gives Member States the role of national parliaments to observe and control the European Union in not exceeding its powers, because there are certain problems that can be handled at the country level, regional or local level.

The democratic nature of the European Union is greatly improved by increasing the power of Parliament, and the competence of the Union it's defined by the European Union Member States. The powers are outlined by the principles of subsidiarity and proportionality.

Within the Lisbon Treaty are recognized the regional and local dimensions of subsidiarity and a great importance have the introduction of a flexibility clause where European Union get the goals they are not expressly covered by treaties.

Lisbon Treaty gives the right of Member States to withdraw from the European Union. Withdrawal is realized through one agreement between the applicant Member State and European Union, formally from the negotiations. Decision is taken by the Council in order to obtain qualified majority voting. This is possible after Parliament approval, so the procedure has a long journey after careful and complex analysis.

The European Union operates with the principle of representative democracy, citizens are directly represented at the Union Parliament. Member States are represented in the European Council by the heads of states and/or Government and by the Council of each individual state government that are accountable to parliaments and citizens of the Member States.

Lisbon Treaty governs the right of every citizen to participate in the democratic life of the Union, and through political parties at European level, citizens are given community decisions.

3. Content and implications of new regulations of the Lisbon Treaty

Lisbon Treaty has reinforced the power of Member States by granting power to involve in decision-making, but strengthened the attribution of European institutions. Regarding the European Parliament, as the representing citizens of Member States, following the Lisbon Treaty, has increased its powers at the legislative level, the budget and approval of international agreements. Changes have occurred in its structure too, the number of European deputies has exceeded up to 751. Allocation of seats per Member State will be under the principle of degressive proportionality, deputies in countries with a huge population will represent a higher number of citizens than the deputies that represent countries with a lower population. The modification brought with the Lisbon Treaty involves the European Council and refers to the decision process. Council will decide by qualified majority. There are exceptions in cases where treaties provide another procedure, as unanimous vote. These changes will strengthen the transparency and efficiency. The Council represents the member governments and this respects its role that remain unchanged, also maintaining its role in foreign policy, security policy and coordination of economic policies.

European Commission's role is to promote the general European interest and the Lisbon Treaty without changes in its structure. According to the principle of equal rotation between Member States, since 2014, the college will be composed of an equal number of commissioners with two thirds of Member States, 18 in case of European Union has 27 member countries.

European Council, institution of the European Union, will not have another attributions added. As a novelty, however, the Treaty creates a new post, the President of the European Council. It is elected for a term of two and a half years and provides training and continuing work.

Provisions in the European Union Court of Justice has changed, the Lisbon Treaty extends the scope of its intervention, in terms of criminal cooperation measures such as introducing some procedural changes.

The role of the European Central Bank and the Court of Auditors has not changed following the adoption of the Treaty.

Court of Justice becomes the European Union Court of Justice, Court of First Instance Court is changing its name, judicial chambers are specialized courts also remain Public Function Tribunal.

4. The role of national parliaments in the context of the subsidiarity principle

The Lisbon Treaty, through the Protocol regarding the role of national parliaments in the European Union and the Protocol regarding the principles of subsidiarity and proportionality, gives new competences and strengthens the role of national parliaments in the European Union.

Council of Europe is an organization of parliamentary cooperation between national parliaments and recovery tasks in compliance with human rights.

Subsidiarity principle it is seen in terms of political concept which aims regulator powers of European member states. It is a principle of legitimation of powers that implies three rules: efficacy, tolerance and respect, competence of individuals and groups. [Bîrzea, 2001]. The Treaty brought an extremely important regulator of novelty, stating that national parliaments are directly involved in monitoring EU activities in the correct application of the subsidiarity principle.

Through the subsidiarity, the European Union institutions restricting their area, assuming only the action that can't be achieved at the Member States level. Investments with decisional power are made at the citizen level, the citizens have the right to express their views to EU decisions, this fact highlights that the EU gives rights to citizens of Member States in terms of decision making.

Inside the Treaty are reminded issues such as how national parliaments exercise control over their governments regarding the activities of the European Union. This aspect is governed by constitutional organization and practice of each Member State. Through the Treaty is encouraged participation of national parliaments in EU actions to strengthen and to express views on draft EU legislation and on other matters which may be of particular interest to them. [Lisbon Treaty, 2009]

Through the Treaty are determined the forms of transmission of legislation, for example if the draft legislative acts issued by the Commission, shall be forwarded to national Parliaments at the same time as to the European Parliament and Council. Draft project of legislative acts are sent by the European Parliament to national parliaments.

Interparliamentary measures and cooperation are indrawn, the European Parliament and national parliaments set together and start organizing cooperation within the Union.

The protocol on the principles of subsidiarity and proportionality wanted decisions to be taken at a level as close to citizens. [Lisbon Treaty, 2009].

Desire Treaty on subsidiarity and proportionality establish a system for monitoring the application of these principles.

Legislative acts elaborated by the Commission are consulted with regard to regional and local dimension of expected action.

The treaty required the organization of conferences designed to promote information exchange experiences between national parliaments on specific issues, foreign policy and security issues.

Draft legislative acts shall be justified in relation to the principles of subsidiarity and proportionality. Any legislative draft should contain a detailed statement to assess compliance with the principles of subsidiarity and proportionality. This statement should include elements to assess the financial impact of the project concerned. [Lisbon Treaty, 2009]

Annually, the Commission must show a report to the European Council, European Parliament, Council and national parliaments on the application compliance with the Protocol on the role of national parliaments in the European Union, and the Protocol on the principles of subsidiarity and proportionality.

Therefore subsidiarity is essential for the proper design of the Political Union and the legitimacy of skills and activities. In this sense, subsidiarity has always been accepted, although the Maastricht Treaty left much to be desire in the implementation. Given that subsidiarity is to ensure effective decisions, moving the center of gravity closer to the citizen, in practice often found the existence of centralized accents, as opposed to the original wishes.

Lisbon Treaty is involved in regulation of the subsidiarity principle, offering to other treaties of the EU reform a treaty with a mission to change the rules for EU states, is closely related to the principles of proportionality and necessity.

Conclusions

Lisbon Treaty provisions have emphasized the primary role of the principles of participatory democracy, this concept is getting new values in the territorial space of the Member States. The Treaty creates favorable conditions for expansion of participatory democracy within the European Union. The Lisbon Treaty provisions facilitate communication between community members and decision-making capacity increases relative to the rationality and efficiency of decision making.

News to the Lisbon treaty meant to improve standards of ongoing European process, under the banner of "Unity in diversity". EU Reform Treaty gives further advisory role, coordination and support of Member States, defense, monetary and economic issue, taxes, drawing the coordinates followed to ensure optimal balance of the Union. Trends harmonization of Member States does not diminish the sovereignty of nation-states, does not affect the cultural traditions and customs, on the contrary, it aims to improve relations between Member States, ensuring rising living standards in a different EU, but several guards measures of identity.

"The word power" of the European Union member states, enhanced by the Lisbon Treaty, invests the European Union with an unitary force coordination, bringing their own development strategies to ensure convergence.

EUROPEAN POLICIES FOR THE STIMULATION OF THE DEVELOPMENT OF SMALL AND MIDDLE SIZE ENTREPRISES

Pop (Bandi) Ramona

Universitatea Transilvania din Braşov

Facultatea de Stiinţe Economice

Europe's small and medium-sized enterprises are the engine of the European economy and the main drivers for achieving sustainable growth and more and better jobs. At EU level, the European Commission has developed a comprehensive SME policy, which aims to ensure that Community policies and actions are small-business friendly and contribute to making Europe a more attractive place for setting up a company and doing business.

Keywords : SME's, European Commission, financing opportunities, private and governmental policies.

Cod JEL lucrare: M31

Introduction

The Small and Middle Size Enterprises represent the engine of European economy and are also the most important driver of new jobs and economic growth. The European Commission through its actions, sets the needs of the small enterprises in the center of its policies. The European Commission develops and applies a variety of political measures especially conceived to support the SMEs in Europe. These policies have in view to create those conditions on which the SMEs can be created and be prosperous. But the SMEs will have the main role, if the EU follows its objectives of acceleration of the economic growth and creation of more and better jobs.

The new strategy of the Commission in the field of the SMEs aims to apply the principle „think small first” that allows the improvement of the business environment for the SMEs, the reduction of administrative costs, the simplifying and accelerating of the compulsory procedures, the improvement of the access of the SMEs to the markets and the growth of their competitiveness. The member states have taken responsibility, through the European Charter for the Small Enterprises, to develop a favourable business environment for the SMEs. One of the main objectives of the Community action is to allow its member states to benefit of the experience of their homologation and make use of its policies. This way everyone may become aware of the good practices and can apply them in his case.

The Commission has initiated a process of reduction of the bureaucracy the firms are confronted with and revises the existing community legislation, aiming to eliminate the unuseful administrative requirements. Also the member states are asked to follow the example of the Commission. According to the estimates; this exercise may reduce the administrative costs by 25%, costs that are presently paid by the SMEs.

The new Community policy on small and medium-sized enterprises (SMEs) creates a more coherent, pragmatic and horizontal framework for these enterprises.

It aims to unlock the vast untapped potential of SMEs to create growth and employment within the European Union. SMEs will become more competitive, due to the promotion of entrepreneurship, improved access to internal and external markets, simplified Community legislation, improvement of their growth potential and an effective partnership with SME stakeholders²⁶¹.

²⁶¹ European Parliament Resolution on a strategy for the simplification of the regulatory environment (Rapporteur: MEP Giuseppe Gargani ref. A6-0080/2006 – PA_TA-PROV (2005/2006))

Small and medium-sized enterprises (SMEs) make a major contribution to growth and job creation in the European Union (EU). This is why the new policy on small and medium-sized enterprises (SMEs) creates a more coherent, pragmatic and horizontal framework for these enterprises.

Promoting entrepreneurship and developing an environment favorable to SMEs will allow them to become more competitive. SMEs are very diverse, and consequently have different needs to become more competitive. Some are active in vast markets, others in local or regional markets. If by definition all SMEs have fewer than 250 employees, some are micro-enterprises, others are family SMEs. In order to unlock the growth potential of SMEs as a whole, policies and action to support them need to reflect this diversity.

The success of this new policy will depend on the effective involvement of all SME stakeholders, national, regional and European, public and private.

1.Policies in the field of the SMEs - Contents

The SMEs are responsible for a great proportion the economic and vocational activity in Europe. This governmental policies must be adopted that should contribute to the stimulation of the development of the SMEs.

1.1 Presentation of the main financing opportunities granted to the SMEs

The Capital is essential for the start of development of a company, but to find out the most adequate financing form is very often a major obstacle for the small and middle size enterprises. The investors and the banks often avoid paying the initial costs of foundation of the SMEs due to the implied risks. Sometimes the entrepreneurs do not entirely understand the concerns of the investors or the banks, fact that makes it difficult to find the necessary financial support. Presently, the European Commission is implementing a number of programs especially granted tot the environment of financial improvement of the SMEs in Europe.

The European Union offers support to the small and middle size enterprises in Europe.

This may be found under different forms, like subventions, loans and in some cases –guarantees. The support may be offered directly, in the forms of the programs managed under national or regional level - as the Structural Funds of the European Union. Also, the SMEs may benefit of a variety of non-financial consultancy measures offered as programs and services of support for enterprises.

This tool aims to present the main community programs existing for the SMEs and contains a short description as well as the main sites of each program.

The European Commission collaborates with national authorities at the improvement of the financial environment for SMEs. Through the organization of experience interchanges and good practices between the national governments, the Commission has allowed many member states to bring concrete improvements to the financial environment for the SMEs. Also the Commission has taken floor in the dialogue between bankers and SMEs in order to identify and reduce the main obstacles that the small enterprises may come across when looking for a financing form.

1.2 An adequate legal framework for the stimulation of the development of the SMEs.

Presently the European Union undertakes huge efforts to reduce bureaucracy inside the existing legislation as well as in the legislative propositions. For the beginning, the Commission has rejected 68 projects of laws in 2006 and other ten projects in 2007. For the beginning the Commission works at the diminishing of the number of laws that has in view the simplifying of the SMEs' activities. These include the reduction of the reporting imposed by the accounting regulations, the reduction of costs for the trans-border taxes and the simplification of the customs

procedures. We have to assure the fact that the new laws do not make the activity of the SMEs more difficult but have in view their needs²⁶².

This is a part of the principle “think small first”, introduced by the Commission in 2005, once with the presentation of the new policy regarding the SME’s. All the legislative propositions have as object of a thorough verification regarding their potential impact on the SMEs.

1.3 Guarantee of the loyal competitiveness

A unique competitive and open market is the best guarantee offered to the SMEs, that follow to increase the effectiveness and their innovation potential. Thus the EU has introduced a powerful policy in the field of competitiveness which should protect the SMEs against the non-loyal competitions of other economic agents. Without neglecting its engagement for a free competitiveness in Europe, the Commission updates its regulations in order to encourage the national and regional authorities to further redirect the public subventions. The Commission will continue to reduce the controversial actions and those which modify competitiveness in favor of the national champions and in change to sustain those measures that contribute evidently to the intensification of growth and job creation.

Because the European SME’s have the biggest growth potential and of new job creation, the small firms will be the first ones to benefit of these measures.

A particular field the Commission is concentrated upon is the prevention of abuse of dominant position. The large firms that exploit its power of market in order to eliminate the smaller competitors are implicated in anticompetitive practices that are forbidden by the Community legislation. The Commission grants a special attention to the complaints made by the small enterprises that reflect such situations.

Also, such fusions are forbidden that create or consolidate a dominant position, impeding such potential abuses that may come afterwards. Generally the mergers which imply SMEs are not object of a Community control, because these cases do not have a European dimension. However, some arrangements between the large companies can damage the competitors, against the smaller enterprises. The most familiar examples are the arrangements regarding the prices or the cartel in which the companies establish as commonly agreed the level of prices, thus the clients cannot benefit of the competition between the suppliers in order to obtain lower prices.

On the other hand the arrangements between the SME’s are to a high extent exempted from the interdictions stipulated in the Community treaties.

These should be able to protect from the competitors from abroad who do not observe the rules. The objective of the European commercial protections tools TDI is to protect the European companies from the commercial un-loyal practices from the third countries, as well as against the dumping or subventions that negatively transform the market. Also, these instruments protect the European producers in case of some strong and instant waves, of unforeseen import. The antidumping anti-subvention measures aim to reestablish of an efficient and loyal competitiveness on the inner market. These instruments have an important role for the SMEs. The Commission has initiated communication and counseling actions especially by the Euro-Info Centers wanting to assist the SMEs in their work with these instruments²⁶³.

Also an assistance office was launched for the SMEs. At the same time the Commission views upon the third countries in order to verify whether these use the commercial protection instruments legally and correctly, directed against the EU. In case needed the Commission intervenes to guarantee the access of the European companies on the third country markets many representing a problem to the SMEs.

²⁶² European Council (15 and 16 December 2005): Conclusions of the Presidency
<http://ec.europa.eu/enterprise/policies/sme>

²⁶³ http://ec.europa.eu/enterprise/entrepreneurship/docs/financing/sp_2008_ro.pdf

Conclusions

The development policies of European level aim to improve the existing situations, to eliminate the existing disfunctions, the balancing of the future development and consolidate the developing directions.

According to the specific situation on local level the, development policies may be separated as:

- Policies based on opportunities that allow the contraction of weaknesses - combinations that support strategies directed towards change.
- Policies based on opportunities sustaining strengths – combinations that sustain offensive strategies.
- Policies based on weaknesses and threats – combinations that support defensive strategies
- Policies based on strengths and threats – combinations that sustain diversified strategies

For each one of the given policies development programs are proposed, as general formulas, which at the stage of the action plan will turn into groups of projects, whose accomplishment will lead to the implementation of development policies.

The success in solving the problems of economic development of the SMEs and of implementing the adopted policies can be attained only through collective efforts of the governmental, private and non-governmental sectors.

SIBIU EUROPEAN CULTURAL CAPITAL PROGRAM: MEASURING THE IMPACT ON THE ACCOMMODATION SYSTEM

Richards Greg
Tilburg University
Faculty of Social and Behavioural Sciences

Rotariu Ilie
University Lucian Blaga Sibiu
Faculty of Economic Studies

The Sibiu 2007 European Cultural Capital (ECOC) was monitored in order to highlight the long-term impacts of the event. Preliminary findings on the tourism impacts are presented based on field research among visitors and statistics and field inventory. The most visible as well as the most significant impact on the city is the growth of accommodation supply. Not only did the number of licensed units and room grow substantially, but there was also considerable growth in the informal accommodation sector. Not only the city of Sibiu, but also the surrounding region benefited from the ECOC opportunity. The research shows that although the informal sector was able to respond fastest to the growth in accommodation demand, the greatest economic impact came from the development of large commercial hotels in the city itself.

Keywords: European Capital of Culture, tourist accommodation, economic impact
JEL: O22

The European Capital of Culture staged in Sibiu during 2007 was a unique event. It was the first European Capital of Culture (ECOC) to be staged in one of the post-2004 EU accession countries, and it represented a major challenge in being staged just as Romania was joining the EU. A framework for monitoring the impacts of the 2007 ECOC in Sibiu was established in January 2007, as part of the ATLAS Winter University, which formed part of the ECOC programme. Pilot surveys were carried out with residents and visitors in order to design the final research instrument. This was largely based on questionnaires already utilized for other ECOCs, including Rotterdam (2001), Salamanca (2002) and Luxemburg (2007).

The surveys were also designed to provide comparisons with earlier surveys conducted in Sibiu by the “Lucian Blaga” University in the framework of the ATLAS Cultural Tourism Research Project. These surveys provide a useful benchmark for the period before the ECOC, with data collection having started in 2001. This research, which is still in progress, has revealed some particular methodological problems that arose in comparing field research with official or officious statistical data. Most of these issues are related to accommodation data.

In attempting to measure the tourism impact we have found that it is difficult to separate the impacts of the ECOC itself from the general growth in tourism supply in Sibiu, which would probably have shown some growth without the ECOC. However, looking at the pace of growth, it is clear that the period after 2007 has seen a substantial increase in the supply of hotels and other accommodation facilities. In particular there was a sharp increase in the number of hotels and hotel beds in the city of Sibiu itself.

Capacity in Sibiu county hotels, 2006-2009 according to official statistics

	2006	2007	2009
units	22	27	43
rooms	1072	1227	1988

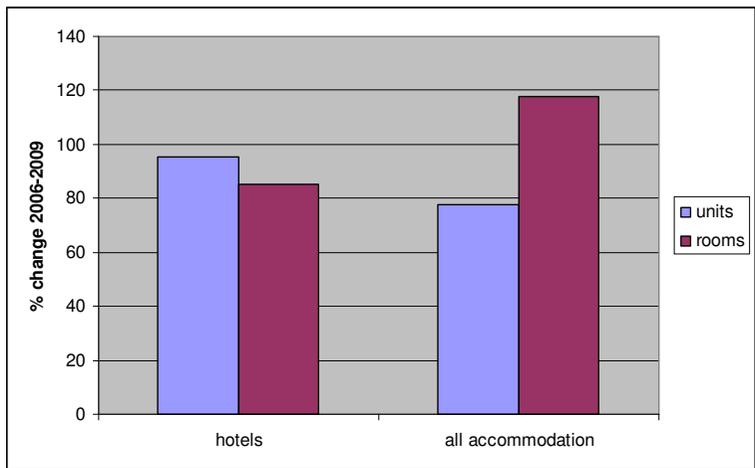

This growth has been reflected to a greater or lesser extent across the county of Sibiu and in other categories of accommodation as well.

Capacity in Sibiu county all accommodation, 2006-2009 according to official statistics

	2006	2007	2009
units	271	359	481
rooms	2316	3057	5039

The overall result has been a doubling of total accommodation supply since 2006.

% growth in accommodation supply 2006-2009

Trends in the economic impact of tourism are also evident from the data on tourism tax revenues. These show clearly that 2007 marked a giant leap forward in terms of the development of the tourism economy of the city and the contribution of tourism to civic finances. Tourism tax revenues grew by over 70% between 2006 and 2007, and have remained at these high levels in 2008 and 2009. In spite of the general downturn in tourism in Romania, tax revenues were still 70% higher in the first half of 2009 than they were in 2006. This shows that the ECOC was successful in stimulating a qualitative change in the development of the tourism industry in the city.

Although the overall pattern of growth in accommodation supply is clear, detailed analysis of the accommodation data reveals major challenges in trying to reconcile different sources of information. Hotel statistics present considerable problems of analysis, because of different categorizations and a lack of coverage of certain types of accommodation. The Master Plan for tourism in Sibiu County presented in November 2009 by Marketscope shows that Sibiu County has a total of 518 accommodation units, of which most are rural tourist pensions (159), followed by general category of pensions (124) and urban tourist pensions (66).

Sibiu County: synthesis parameters of accommodation capacity								
BY TYPE OF UNIT, CLASSIFICATION OR AS ASSUMED BY THE UNITS								
Types units	Classified				Inventory (total tourist)			
	Number of units	% Of total units	Capacity (capacity)	% Of total capacity	Number of units	% Of total units	Capacity (capacity)	% Of total capacity
Apartments for rent	1	0.3%	2	0.02%	18	3.5%	117	0.9%
	11	3.3%	464	5.2%	36	7.0%	1,173	9.1%
Rooms for rent	14	4.2%	152	1.7%	17	3.3%	176	1.4%
Camping	2	0.6%	120	1.3%	2	0.4%	120	0.9%
Hostel	8	2.4%	389	4.3%	18	3.5%	984	7.6%
Hotel	32	9.5%	3,107	34.6%	39	7.5%	3,584	27.8%
Motel	7	2.1%	257	2.9%	8	1.5%	281	2.2%
Pensions	69	20.6%	1,218	13.6%	124	23.9%	2,144	16.6%
Rural Tourist Pension	125	37.3%	1,865	20.8%	159	30.7%	2,332	18.1%
tourist town Pensions	61	18.2%	1,173	13.0%	66	12.7%	1,278	9.9%
Villas	5	1.5%	236	2.6%	31	6.0%	704	5.5%
TOTAL	335	100%	8,983	100%	518	100%	12,893	100%

Source: Marketscope (2009)

In respect of accommodation available, rural tourist pensions account for less than one fifth of the total (18%) and hotels account for approximately 28%. But pensions have almost half the total volume of accommodation available in the county (44.6%).

Accommodation supply in Sibiu County, 2009 (official statistics)

Types units	Sibiu County	
	Number of units	Capacity (places)
Hotels	28	2473
Hostels	3	147
Motels	7	197
Touristic Villas	6	263
Touristic Chalets	11	396
Touristic boarding houses (pensions)	32	580
Agro-tourist boarding houses (pension)	74	1135
Camping	1	120
School and pre-school camps	7	590
Touristic house let-type units (<i>casute</i>)	3	112
Total	172	6013

Hostels and camp sites are not counted either by the Sibiu County Statistics Direction's monthly report or the National Institute for Statistics. The data as presented in Annex 2 of the Master Plan also show that some of the listed units are excluded from the statistics, as accommodation units of less than 5 bed spaces were not taken into account by official statistics and from January 2009 all units with less than 10 places were excluded.

Comparing the data from various sources underlines the problems in monitoring the accommodation impacts of the ECOC.

In general, the data show that the surrounding regions of Sibiu (villages and towns with in 30 km of the city) reacted sooner than city to the opportunities presented by the ECOC. The main growth in the Sibiu region took place in 2007, but the main expansion in the city itself didn't come until 2008, largely as a result of the delayed opening of major hotel projects there.

It is clear that the Sibiu region has a large number of small capacity units (most of them pensions), which practically double the accommodation capacity of the city. Field research has shown that the prices in this area are much lower than in Sibiu itself, and clients choose them not only on the basis of lower prices but also as a distinct offer, with a rural lifestyle contrasted to the urban experience offered by the city.

According to the Tourism Ministry data Sibiu county had 2315 rooms with 7399 places (3,2 places / unit) in 2006 compared with 4354 units with 11882 places (2,96 places / unit) in 2009. The number of units also grew significantly in the city, from 1029 units with 3756 places (3,65 places / unit) in 2006, to 2062 units with 6106 places (2,96 places / unit) in 2009. In spite of the opening of large chain hotels in Sibiu the smaller accommodation units grew faster. In the period before the ECOC in 2002 – 2005 this led to a shift away from tourists staying with friends and relatives towards staying in the newly-opened small accommodation units.

Although the informal sector was able to respond more rapidly to growing accommodation demand prior to the ECOC, our field research shows that few small owners had any specific business strategy or marketing plan. Some owners took advantage of growth in demand by opening their own website, often linked to the homepage of the Municipality. Many simply relied on month to month promotion. There is a general lack of professionalism among smaller accommodation operations and there is a need for special training.

The most surprising findings relate to the influence that the city has in the surrounding areas. These areas saw a growth in accommodation units of 116% between 2006 and 2009, and a 98,4% growth in the number of beds over the same period. Together, the city and the surrounding areas now have 3904 units with 19469 bedspaces, or almost 90% of the capacity of the county as a whole. The city of Sibiu itself only accounts for 53,3% of overnights in the county, which indicates that the city has generated tourist flows in the surrounding region more than in the city itself. Building the tourist offer for Sibiu must take into account the surrounding regions both in terms of additional supply and as a complementary tourism product.

However, effective planning for tourism development must also be based on accurate information about the supply of accommodation. These official figures from the Sibiu Department of Statistics are calculated using a sample of the licensed tourist accommodation units. In using these statistics the composition of this sample must be taken into consideration. Because of the ECOC the sample for Sibiu is larger than those for other counties as stated by officials from Sibiu Department of Statistics. It is very difficult to use detailed data from this source as the databases are custom-made and have to be analysed by the Department itself. These databases also contain no qualitative information on issues such as: tourist motivation, sources of information, tourist expenditure, etc. To gather these data field research is required.

The importance of collecting more detailed statistics is indicated by long term trends in tourism demand. An important change in the tourist season has occurred since 1990: a change in seasonality for high category hotels. Until 1990 all hotels were full from April until October because of mass tourism and coach groups. During the low season from November to March the only foreigners were Soviet groups on their way to visit relatives on Hungary, Czechoslovakia or the GDR. Now the major chain hotels have their low season in summer and their high season in spring and autumn because of events organized in Sibiu mainly by Romanian companies or global companies located in Romania. Further investigation is required to analyze this trend.

There are also no available data on the turnover of tourism industry in the city. Direct observation has shown that the restaurants are well developed in the city and in the neighborhoods. They are not only serving local people but also contribute to the animation of the areas in which they are located. During January 2007 the students of the ATLAS Winter University found that 84% of people visiting the main square regarded the general atmosphere of the city as the most important factor in their visit.

Some of the increase in hotel revenues is due to tourism growth, but there is also an important effect from the upgrading in the hotel stock. By 2009 Sibiu had an additional 6 four or five star hotels compared with 2006.

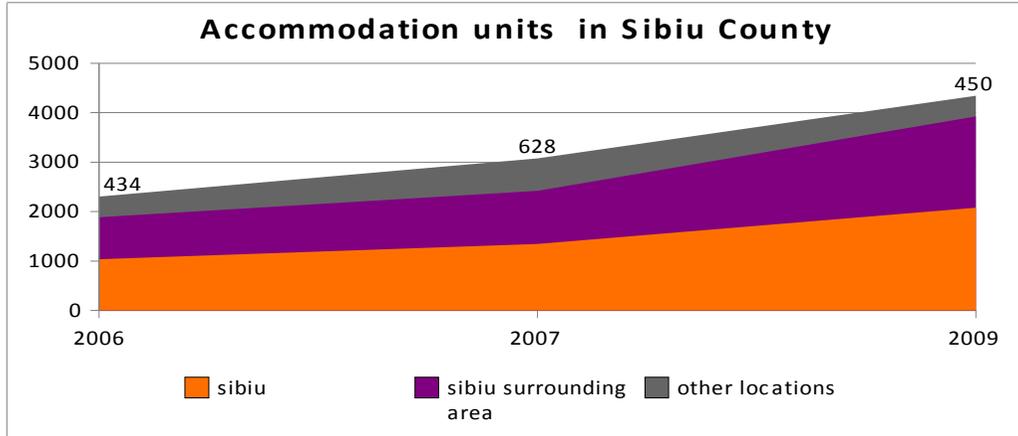

Number of hotels by category in Sibiu

	unclassified	1*	2*	3*	4*	5*	total
2006			6	6	1		13
2008			5	9	1		15
2009	3	1	7	12	6	1	30

Because many of the hotel projects related to the ECOC were not actually operational until 2007 or even in 2008, the biggest effects of hotel development were actually felt the year after the ECOC.

Not only did tourism increase, but visitors also stayed in higher grade accommodation and therefore paid higher average room rates. This picture only began to reverse in 2009 with the effects of the crisis, but this decline is also in line with national trends.

The growth of hotel accommodation in Sibiu itself also had a strong impact on the surrounding region. Growth in the regions close to Sibiu was just as strong as in the city itself.

In conclusion, our preliminary findings show that Sibiu ECOC has had a strong impact on accommodation development both in terms of quantity and quality, not only in the city itself but also in the surrounding region. Although the informal accommodation sector responded fastest to the opportunities offered by increased demand stimulated by the ECOC, the greatest economic impacts were derived from the opening of high-quality chain hotels in the city centre.

Faculty of International Business and Economics

In the context of the financial crisis the imbalances in the euro area have been underlined. The issue had been previously debated during the years preceding the financial crisis, but the strong global economic expansion and the ongoing economic integration within the euro area partly masked the problems arising from these differential developments. This paper analyses the advantages and disadvantages of the monetary union before and during the financial crisis and focuses on identifying solutions to correct the structural problems that are at the root of the economic divergencies within the euro area. Another issue that we discuss is how did price competitiveness diverged from one euro-area member state to another since the introduction of the euro, causing gains in price competitiveness for a small group of countries and significant losses for a larger group. The issue of competitiveness is essential for Romania as we are heading towards joining the euro zone.

Key words: EMU, competitiveness, structural problems

JEL classification: H7, O2, O4

1. Introduction

It is clearly that since it was created ten years ago, the economic monetary union contributed to a favourable climate for economic growth within the euro area. Throughout the financial crisis, however, the euro proved to be far more than a growth factor for the euro area. In several respects it has stabilised the member economies (the absence of exchange-rate risk within the euro area has represented an additional benefit during the crisis avoiding problems like appreciating currencies and inflationary pressure). Practically, it has significantly diminished money market tensions and therefore served as a buffer against global financial market shocks.²⁶⁴

At the start of the global recession, the Euro appeared to be faring relatively well. Germany and France were two of the first major OECD economies to emerge from recession. The collapse of Iceland had many people suggesting the Euro as the solution to global instability. However, in the past few months, the growing problems of Greece and other peripheral Eurozone countries have highlighted some of the problems with the bold Single Currency experiment.

The first problem facing the Eurozone is the prospect of a deep and persistent recession in the southern Eurozone economies. Greece, Spain and Italy already have falling GDP, but, current economic policies make it hard to see how they will recover.

²⁶⁴ Weber, A., Challenges and opportunities for the competitiveness of EMU member states. The euro in the financial crisis, Presentation at the Copenhagen Business School, Copenhagen, 22 March 2010

Taking the specific adjustment processes in a monetary union into account, we have to think about the conditions for sustainable growth in all euro-area economies and about how they can be achieved.

2. Literature review

There are several papers on the subject of the European Monetary Union. We will provide only a short description and analyse of the way the idea was created, developed and implemented.

After 1993, when economic growth was strong, both in Europe and The United States, the enthusiasm grew among European policy makers for completing the transition to the monetary union. Still, there were two countries that dropped out of the process: the United Kingdom and Denmark. Targets for inflation, interest rates, exchange rate stability, and fiscal stability were set as criterion for participation in the monetary union (the most important: a budget deficit of not more than 3 % and a public debt of not more than 60% of GDP).²⁶⁵

In order to preserve the fiscal discipline, a Stability Pact was agreed in June 1997, and for stabilizing exchange rates between the euro and the currencies of the EU members that hadn't entered the monetary union, an ERM II was established. As for the ones that were to enter the euro area, they agreed to lock their exchange rates from the mid-1998 for January 1999.

In 1998, The Economic Council decided for a large monetary union (including: France, Germany, Austria, Belgium, Luxembourg, Netherlands, Ireland, Italy, Spain, Portugal and Finland). The European Monetary Institute was created to prepare the common monetary policy.²⁶⁶

The European Central Bank developed the common monetary policy, focused on establishing anti-inflationary credentials. Critics argued that it was excessively rigid in what unemployment was concerned, but it allowed inflation to repeatedly stray above its target of 2%. The introduction of the euro began in 1999 and was completed at the beginning of 2002 (including Greece).

In 2002 and 2003, Portugal and then France and Germany violated the rule concerning the maximum percent of budget deficit in GDP. The Stability Pact was repeatedly bent and broken, under the umbrella of reformation in order to permit greater budgetary flexibility.²⁶⁷

The ECB considered price stability as an important objective, so in the context of a common monetary policy, the only tool that remained for dealing with each country's difficulties was national fiscal policy. The effective use of this instrument requires a budget close to balance in good times, so that a larger deficit would not damage confidence.

3. Implementation of the ECB Common Monetary Policy

3.1 Joining the euro area: advantages and disadvantages for national economies

Obviously, a single monetary policy was difficult to satisfy the needs of several national economies. For example, Italy, which competed with China in the production of specialty consumer goods, would have preferred a weaker euro exchange rate and a looser ECB policy, in contrast with Ireland, whose fast growing economy led to rapid increases in property prices, so a tighter ECB policy would have been preferred.

For the relatively poor countries, like Portugal, joining the euro area meant decreasing the interest rates, which led to growth of house-hold consumption and investments of firms. Increased demand resulted in increased wages, lagging competitiveness, and rising unemployment. The only solution was deflation and fiscal restraint, which were rising political issues at the national level.

²⁶⁵ Miron, D., Folcut, O., *Economia Integrării Europene*, Editura Universitară, București, 2008

²⁶⁶ Ghica, L.A. et al, *Enciclopedia Uniunii Europene*, Editura Meronia, București, 2005

²⁶⁷ Eichengreen, B., *Globalizing capital – A History of the international monetary system*, Princeton University Press, 2008

The main advantage of the single currency is that it eliminates most of the financial risks, as the intra-European exchange rates fluctuations could no longer be a source of such risks, or of amplifying them. Another positive result of the euro was stimulating the growth of European securities markets, by the effect of scale economies on bond markets, greater liquidity and lower transactions costs. It became easier for companies to issue bonds, which meant they benefited from a lower cost of capital, that results in an increased competitiveness.

An important beneficiary of the euro is the European consumer, as he can easily compare prices from different countries, which puts more pressure on the retailers and wholesalers. Studies by the OECD suggested that product market competition is critically important for stimulating productivity growth.

3.2 International currency competition

The short-term impact of the euro introduction was to reinforce the dollar’s preeminence, as the foreign-currency reserves of two important European economies were transformed into dollars. France needed to exchange it’s reserve of deutsche marks into dollars and Germany did the same with it’s reserve of francs.

After that, the euro began to gain strength, as the financial markets in euro area became more liquid than before, when there were many different national currencies.

Five years after the single currency creation, international debt securities issued in euros actually exceeded those issued in dollars (2004). The United States remains the world’s largest financial market, but the evolution of exports shows clearly that the EU is the international major exporter.

Table 1: Exports in goods (value), in billions of US dollars, monthly average

	2008	2009	2010 Jan
European Union	489,15	379,44	404,02
United States	107,29	88,07	98,40
China	119,16	100,13	123,70
Japan	65,31	48,25	63,68

Source: Monthly Statistics of International Statistics, OECD, 2010

The adoption of the euro by Slovenia (2007) and Malta (2008), extended the euro area, plus the prospect of new members from Central and Eastern Europe gives hope for the single European currency to gain more ground.

Of course, the evolution of the currency is directly related to labour productivity.

Figure 1: Labour productivity annual growth rate

3.3 Effects of the crisis on the euro-zone. The issue of price competitiveness

The financial crisis has led to a renewed debate about perceived imbalances in the euro area, which revealed the structural nature of the disparities. The issue had been previously debated during the years preceding the financial crisis, but the strong global economic expansion and the ongoing economic integration within the euro area partly masked the problems arising from these differential developments.

One of the practical problems that EMU member states have to face is that of differences in price competitiveness between them. Losses in competitiveness that some countries have experienced are not the root of the problem but rather a symptom of underlying unsustainable structural developments in some member states. Accordingly, the marked gains in price competitiveness the German economy has experienced have been a result of necessary structural reforms that were finally addressed in 2003 when domestic problems such as high structural unemployment, rising social security contributions and repeated excessive public deficits became more and more pressing. Analysing the German experience can help draw some conclusions for those countries that have lost competitiveness since the launch of the euro.

One important reason for growing heterogeneity within the euro area is that the benefits of monetary union, in particular lower interest rates and the elimination of exchange rate risk, have not always been used wisely and have tempted some countries to live beyond their means: Too often inflowing capital did not reach the most productive sectors, and in some cases cheaper and easier access to funding led to excessive credit dynamics facilitating a rise in household and corporate debt and ultimately causing the real estate markets to overheat. In addition, fiscal policy often failed to use higher growth and lower interest rates to reduce deficits sufficiently. In economies with rigid or only partly flexible labour markets all these large expansionary stimuli resulted in accelerated wage increases that were well in excess of productivity growth, reducing price competitiveness and exports of domestic firms.²⁶⁸

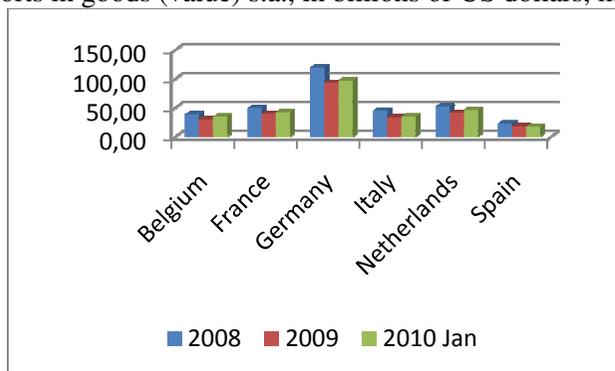

Consequently, price competitiveness has diverged significantly from one euro-area member state to another since the introduction of the euro. Whereas a small group of countries, led by Germany, has achieved gains in price competitiveness, a larger group suffered significant losses, amongst others Greece, Italy, Spain and Portugal. These underlying economic divergencies

²⁶⁸ Weber, A., Challenges and opportunities for the competitiveness of EMU member states. The euro in the financial crisis, Presentation at the Copenhagen Business School, Copenhagen, 22 March 2010

within the euro area are also reflected in persistent discrepancies in the current account positions of EMU member states.

The evolution of exports in the OECD countries can be observed in Figure 2, the main trend is descending between 2008 and 2010.

Figure 2: Exports in goods (value) s.a., in billions of US dollars, monthly average

Source: Monthly Statistics of International Statistics, OECD, 2010

As long as a flourishing world economy and the growth dynamics within the euro area masked the associated problems, those developments were neglected. However, the financial crisis has revealed the unsustainability of this state and therefore increased awareness of the risks it involves. These risks imply depressed future growth prospects, disturbances in capital flows if markets doubt the sustainability of large external borrowing requirements as well as difficulties for monetary policy as a result of the growing heterogeneity of euro-area member states. Hence, correcting the structural problems that are at the root of the economic divergencies is one of the major challenges for the future: For example, domestic firms have to become more competitive by increasing productivity and keeping costs in check, labour market flexibility has to be increased in order to mobilise a larger share of the working age population and to facilitate reallocation of workers to more profitable sectors (BIS Review 34/2010).

And structural deficits have to be brought down to sustainable levels by broadening the tax base or, preferably, cutting expenditure on government consumption and certain transfers.

Taking the current account as one indicator of the extent of these divergencies, one could get the impression that the financial crisis has halted the trend of growing heterogeneity within the monetary union, since current account positions have narrowed significantly in the years 2008 and 2009 (except for Italy and France). However, a closer look at the developments that underlie the changes in current account deficits shows that the reductions are still largely cyclical as they have been driven mainly by sharply falling imports rather than increasing export market shares. Hence, more profound and far-reaching changes have to be undertaken in countries that have lived beyond their means and thereby driven the divergencies within the euro area.

3.4 The competitiveness of Romania

The problem of competitiveness is becoming a vital issue for the future of every country and it is especially important for Romania as it is heading towards joining the euro zone.

A correspondent level of competitiveness needs to be mirrored first in the central parity which paves the way for ERM2 and, later, in the conversion rate agreed with the European Central Bank, the European Commission and the other member states. Blockages caused by the drop in

prices and salaries would burden and would make it more costly for the adjustment of a over-evaluated parity under the relation between employment and economic growth.²⁶⁹

In some economies, the authorities want depreciation due to the favourable effects on external competitiveness, but the negative impact may overcome the positive one. At least that is the opinion of specialists at The National Bank of Romania, so our currency is not overdepreciated.

4. Conclusions

Growth in the last quarter of 2009 has been revised downwards to 0.0%. Markets show no sign of letting up on the Greek Bond Market. The impact of this bad news has been to depreciate the Euro. The question is what will be the impact of a weaker Euro on the EU economy.

A weaker Euro would make Eurozone exports more competitive and increase the cost of importing goods into the Eurozone. A weaker Euro would make exports cheaper and could provide a boost to EU growth and employment. This is particularly important for Eurozone countries who rely on export led growth such as Germany.

However, the impact of a weaker Euro may be limited. Evidence suggests that demand for exports is often inelastic, a weaker currency is no guarantee of strong growth. The impact of a weaker Euro will have a different impact within the Eurozone. However, a weaker Euro will do nothing to redress the imbalance within the Eurozone area. Much more is needed than a depreciation in the Euro, as the majority of trade in the Euro is within the Eurozone. For example, a depreciation in the Euro would not restore the competitiveness of Spain's exports with regard to EU partners such as France and Germany. Other solutions must be found to solve the pressing problems in many Eurozone economies.

Structural reforms should be initiated for achieving the necessary adjustments to the market and bring back heterogeneity within the euro area to a natural and sustainable level. In addition, the effort and inconvenience associated with those adjustments will pay off as they lead to strengthened economic conditions in the individual economies and the euro area as a whole. The EMU urgently needs such market-based adjustments as they are a prerequisite for economic divergencies to come to a halt, for sustainable economic growth within the euro area and thereby for the continuing success of the euro.

FINANCING THE PROGRAMS OF LOCAL DEVELOPMENT IN TOURISM

Slusariuc Gabriela Corina
University of Petrosani
Faculty of Sciences

To remove the economical and social disparities between the regions, with the purpose of achieving the economical and social cohesion, in Jiu Valley microregion, due to the critical issues facing communities in this area a strategy has emerged for sustainable development for the period 2007-2013. Vulcan City, like other towns in the area, is a monoindustrial city focused on extracting coal. Thus, in the opinion of most political, decision-makers accountable, and the population, promoting tourism is the only option for recovery of the area. Therefore, Vulcan municipality developed a strategy that will have regard to the implementation of several projects with european funding aimed at boosting economic zone, increasing living standards, reducing unemployment and attracting investors.

Keywords: structural funds, tourism, strategy, financing, local development

The European Union works under the Structural Funds, the Cohesion Fund and other financial instruments to support the fulfillment of the general objectives (convergence , regional competitiveness and employment , European territorial cooperation), to remove the economical and social disparities between the regions, with the purpose of achieving the economical and social cohesion.

During 2007 - 2013 there are three financial instruments known as Structural Funds, namely:

- The European Regional Development Fund (ERDF)
- The European Social Fund (ESF)
- The Cohesion Fund (CF) and two complementary actions, namely: - The European Agriculture and Rural Development Fund (EAFRD); - The European Fisheries Fund (EFF).

Unlike the Structural Funds, The Cohesion Fund co-finances not programs, but provides direct funding for individual projects, which are clearly identified from the beginning.

The decision to finance a project is taken by the European Commission, in agreement with the beneficiary Member State, while the projects are managed by national authorities and are supervised by a Monitoring Committee. The Cohesion Fund is the financial instrument to support investment in transport infrastructure, energy and environment. The maximum rate of financing by the Cohesion Fund is 85% of public expenditure on the project.

The European Regional Development Fund finances activities in 14 main areas:

-Research and Technological Development-Informatisation Society - Transport - Energy - Environment - Tourism - Culture - Urban and Rural Regeneration - support for companies and entrepreneurs -- Investment in social infrastructure, including health and education. The Cohesion Fund finances major projects in transport (including transport projects aiming railways, multi-modal transport and maritime transport).

The European Social Fund finances projects from four main areas:

- Increase the adaptability of labor and business
- Improving access to the labor market
- Strengthening social inclusion (combating discrimination and facilitating access to the labor market integration of disadvantaged groups)
- Promoting partnership for reform in the areas of employment and social inclusion.

For a project to receive funding from the Structural Funds it should be in accordance with the requirements specified in the regulations of the European structural funds and the requirements of the operational program which was launched by the application proposals. Essential criteria,

conditions and documents required for access to funding will be detailed in each call for projects and related documents, including guide applicants. All documents related to a call for applications for projects will be available on the websites of the Management Authorities charge for managing the Structural Funds and on sites of intermediate bodies designated by the Management to meet the various activities. The development of a community, whatever it may be conceived in the absence of vision on the directions to which this community wants and can proceed.

Starting from the awareness of the current situation and through analysis of strengths, weaknesses, opportunities and risks, you built a real development strategy to base the future how a community that uses its existing resources and those that will be generated.

During the preparation of a strategic plan must take account of local needs and strategies of development that the county owned. In this context, the local community identifies ways of integrating the strategic plans for the development of community development strategies in the county.

The strategic plan of socio-economic development of the municipality Vulcan was developed in participatory by involving representatives of all social demographic groups in the community. Participation in developing the strategic plan of socio-economic development will help increase the spirit of initiative of people from the community, beds vulnerable to involvement in decision making and empowerment for decisions taken and the whole development process. However, the involvement of all stakeholders in the community will enhance the development of partnership between local government, community organizations and private businesses to solve community problems.

The facilitation of the participatory development of strategic plan for socio-economic development of the municipality Vulcan included the following steps:

- Step by Step preplanning

- developing strategic plan for socio-economic development of the municipality Vulcan

- supportive communities in the process of implementing a strategic plan for socio-economic development of the municipality prepared Vulcan.

Development and modernization of their communities in development and modernization is a priority of the microregion.

In the town of Vulcan was developed and approved the first strategic plan for social - economical development in the Jiu Valley being a pilot project of the National Agency for the Development of Mining Areas. This project was conducted in 2005, then in 2007 the strategic plan was updated until 2009, following this year that take place in participatory meetings with community members to refresh this until 2013. The need of the reactualization strategy is based on the fact that locally it has been successfully implemented a large part of the investment proposed to achieve during 2005-2009.

With the integration of Romania into the European Union to obtain funding for the projects aimed at socio-economic development, local communities must justify the need for projects that they find in a well-founded strategic plan and approved by the entire community.

It is very important that the skills and competence to be strengthened at the local level, which will allow communities to identify development projects adapted to their needs and requirements of the new legislative and institutional framework of Romania, the EU adapted. Each local community receiving assistance from the Regional Development Agency and the Center for Rural Development, the project "Strategies for local and global opportunities for a future European local communities in western Romania" for capacity building to develop strategies for development. By disseminating information, local communities will have - through a virtual platform StrategVest Project - local development strategies developed, the methodology and information on funding opportunities from the Structural Funds.

Besides this project, Regional Development Agency and will support all the local communities with information materials, documents the area needs and opportunities and sustain commitment to all projects that want to be “launched” by the agency.

From 1 January 2007 when Romania is a member with full rights of the European Union, all programs include the Government adopted as a priority, local development and modernization of local communities, but this upgrade is not feasible than from the inside, each administrative-territorial unit having to set strategic priorities and will identify sources of financing local development projects.

Given the nature of the critical issues facing communities in the 6 Jiu Valley towns: Petrosani, Petrila, Aninoasa, Vulcan, Lupeni. Uricani and need to concentrate efforts to develop socio-economic importance has emerged a strategy for sustainable development of the microregion for the period 2007-2013.

Achieving strategy for the Jiu Valley microregion was necessary for several reasons, significant being:

- the mobilization of the resources to cope with the problems faced
- the alignment of resources in relation to the mission and vision of local authorities
- achieving a perspective, a bridge between policy and action.

Within each community, there is a prior experience in developing / implementing local strategy, the implementation of local development measures with / without financing projects, and willingness to work to support the drafting and implementation of a development strategy socio-economic development of the Jiu Valley microregion of competitive projects.

To implement this strategy and to be able to obtain the funds needed to eliminate the disparities between communities, was considered and implemented, the association consists of the 6 locations of the Jiu Valley. This “Association for Sustainable Development of the Jiu Valley”, will be submitted for funding projects, encompassing all communities at these integrated projects which will aim at restoring the infrastructure at all levels. Structural and cohesion funds of the European Union are managed by the European Commission and intended to help finance structural measures at Community level and to promote the regions with delays in development, conversion of areas affected by industrial decline, unemployment combating long insertion training of young people or promote rural development.

On the other hand, each local authority, the partnership or the individual must ask the management, through application for funding, the amounts necessary to achieve objectives through the development strategy of the city, according to eligibility criteria, the available financial resources and the list of investments subject to approval from the local councils.

Based on the Operational Programs Regional priority axes and related guidelines for seeking funding, it is expected that each community in Romania to access the funds made available by the European Community, to align our standards of EU member countries.

The main objectives of the restoration is in infrastructure, whether it’s road infrastructure, social, environmental or any other kind of infrastructure. Efforts that each community must provide are long, expensive but they give satisfaction to the end of project implementation.

Projects, and the default management caused by the implementation of these projects involve performing interrelated activities, which can be shaped through networks. Since projects of this kind takes weeks, months or even years in their pursuit of changes that may impact on cost, technology or project resources.

Analyzing these factors allow local systems to plan, control and reorganize resources so that objectives to achieve the optimal and timely. The project is designed in the techniques of network planning as a collection of work, so default and events conducted within a certain period of time to meet a specific set of goals.

A project can be designed on different levels, encompassing problems of different sizes. Despite the extremely large variety of programs and projects are, however, some characteristics that we

find, regardless of size or geographical and temporal dimensions without budgets or teams to have any significant

The project represents a sum of activities leading to a common purpose and requires a significant consumption of resources (human, material, financial, equipment, information and documentation time). Implementation of a project involves an initial time and final time of the project, so lasting achievement. Initial time is considered in which the decision to move to design a project and the final one in which closed last activity provided by the project.

Project management, without which access to structural funds is virtually impossible, is a relatively recently emerged, and its importance has seen major growth because, at European and international level, more actions happen in some projects. Resources used by these projects, especially financial ones, play an increasingly large (such as the amounts carried by the PHARE and SAPARD) in economic development and their application is growing. Project Management consists of planning, organizing and managing the tasks and resources which aims to achieve a particular objective, the existence of constraints on time, resources and costs.

Vulcan to the municipality by development strategy shall have regard to the implementation of several projects aimed at boosting economic zone, increasing living standards, reducing unemployment and attracting investors to contribute to the elimination of all socio-economic disruption arising Jiu Valley began with the release of 1997. Vulcan City, like other towns in the area, is a city monoindustrial focused on extracting coal industry. Thus, in the opinion of most political, decision-makers accountable, and the population, promoting tourism is the only option for recovery of the area.

Such a study was conducted by prefeasibility, a feasibility study and developed the technical project for a large project, a project which is aimed at removing the Vulcan city of anonymity. Area proposed for this complex investment is Step Vulcan. But, aware that such a project "level" may not have positive results forecasted without collateral other projects at the municipality have undertaken the necessary to finance other projects, all of the structural funds. One of these projects was submitted to the Regional Development Agency West for evaluation, it will produce more desirable economic impact. It is the project "Modernization of the central road of the city Vulcan" which wants the modernization of the city's central boulevard, the road that connects directly with the road DJ 666, Step by Vulcan. This project has a value of 8,000,000 euros, with funding from the local budget by 2%. Another project, which was signed the grant aims at modernization of roads and alleys of the city of Vulcan, a \$ 750,000 project funded by the World Bank. Interesting is the fact that this community brings its contribution by 2% in value and the local authority co-finance with 8%. Also, Hunedoara County Council, will make funding a project which envisages the pitch of the road which connects the city and area tourist Vulcan Step Vâlcan respectively Vulcan 666 DJ - Step Vâlcan project worth approximately 3.5 million .

The microregion Jiu Valley has a rich fund travel far not enough exploited. Encouraged the Transylvanian Carpathians relief, the Jiu Valley offers a unique natural environment.

Although traditionally this region is not considered a tourist destination, there are at least three arguments which claim otherwise:

- Jiu Valley is the main gate of entry into the national park and access Retezat Muntii Parang, Retezat and Vâlcan - Jiu Valley is a region accessible tourism for all "pockets", □ tourist area Jiu Valley is a relatively undiscovered region. Due to geographical location and socio-economic context, the mountain forest and have not undergone the transformation lead to the same extent as most European tourist resort.

- is a complex investment objective, because the area Vulcan step will be divided into several sub-area, each bearing the imprint of an event in history, a personality that has passed through the area, etc..

From international experience it is found that, at present, resort tourism competitiveness can be maintained only through the creation of appropriate material bases. Attractiveness and success of

a resort is due to increasingly more entertainment and new things to be done. As a result, diversity and originality offer recreational items can be decisive in attracting tourist flows and a basis for assessing the competitiveness of tourism in the country, worldwide. The concept of leisure is a set of individual activities which are dedicated to free, to relax, to entertain, to meet aesthetic needs and to enrich their knowledge.

Step in the Vulcan are 49 private cottages and Cabana Step Vulcan with 80 places. To increase the capacity of accommodation in the area, owners can receive credits chalets advantageous for expanding and modernizing the chalets. In the area there is electricity, water and sanitation sector and soon will be installed the methane gas as pipeline gas main between Transylvania and Oltenia passing through the neighborhood, are already made the necessary steps to obtain the rate of gas required to feed the entire area. Also moves to buy a section of the line of the existing 110 kw, of which to make the supply of voltage of the entire area, and expansion of all areas for skiing until April.

To achieve the objective of the proposed investment in the municipality namely Vulcan "Development Step Vulcan tourist area " is intended a structural funding in the Regional Operational Program, Priority axis 5, and promoting sustainable development of tourism, the area of intervention 5.2"Establishment infrastructure development and tourism for recovery of natural resources and higher quality tourism services". If the funding can not be supported entirely from Western Region budget for this area of intervention - given the high value of the project - it is the difference budgetary request from ministries and the Ministry of Finance and Ministry of Tourism. The objectives of the proposed investment to be made by the project objectives are relevant objectives that will bring profit and only the local authority, which aims to be willing to "height" of European standards and which will certainly draw in the City of Jiu many Visitors lovers of winter sports and more. This will build 2 telegondolas that will "move" between the rates 770 - 1310m (3078m) and shares 1310 - 1620m (2995.18 m), which will have a capacity of 1800 persons / hour. Because European norms and to be felt in Pasul Vâlcan will be arranged and equipped ski runs of 3. Lengths that we will have these parts are modern 3768m, 738m and 642 m. Also, for tourists to enjoy the ski practice at night, all three parts will be fitted with facilities for night. All objects listed so far can not be put into practice if not improve the supply of electricity, which is why this investment was caught in the program. Establish water supply to normal parameters, it is an imperative because the ski will be equipped with facilities for producing artificial snow. To achieve the conditions of this plan, it is necessary to build two tanks 2x500mc. Through the project are provided to make construction and equipping of a health point of first aid, construction and equipping of a mountain of gendarmes, the construction and equipping of a mountain rescue and arranging two mountain rescue shelters. Therefore provided a signal and arrange accordingly, two mountain routes which will link between Vulcan and the Step Straja, and Step Schela Vulcan town and county of Gorj. The intention of a tourist information point, a goal that will end most specifically, to promote the resort Step Vâlcan and not only, both nationally and worldwide. Total cost of this project amounts to the sum of 31,000,000 euros.

All these efforts of the community and local government will work together with the signing of financing agreements, which will draw European funds, funds that will show that the Jiu Valley are both potential human and material.

FOREIGN DIRECT INVESTMENT-FACTOR OF INNOVATION AND ECONOMIC GROWTH IN TRANSITION ECONOMIES

Foreign Direct Investment (FDI) is an international venture in which an investor residing in the home economy acquires a long-term “influence” in the management of an affiliate firm in the host economy. Multinational firms own and transfer technology—which may not be available in the host country—that allows them to be more productive and profitable than firms that are not multinational in nature. Because such a transfer is assumed to contribute to the technical progress of the host economies, it is also assumed to contribute ultimately to their growth. The recent experience of Central and East European (CEE) transition countries testifies of FDI being the main vector of innovation diffusion in these economies. The present paper analyzes the contribution of FDI to the growth of CEE transition economies, with special reference to Romania.

Keywords: foreign direct investment, economic growth, transition countries

JEL Classification: E 01

1. Foreign Direct Investment in Central and Eastern Europe

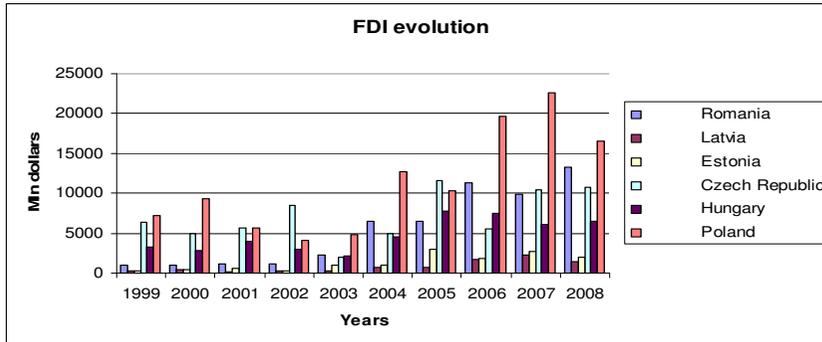

In a global economy, economic growth and human development are in direct relationship with international competitiveness. Capital flows, trade and financial markets' development, lower costs of transport, communications and information technology development all imply the development of global economic integration. Multinational companies combine advanced technologies, foreign capital and qualified workforce, creating development opportunities on an unprecedented scale.

Over the last decade, Foreign Direct Investment (FDI) became one of the main engines for integration into the world economy and contributed to the economic recovery and competitiveness increase of Central and Eastern European countries. After 1990, when the construction of a free market economy and its orientation to the world economy began, the economies of Central and Eastern European countries became an area of interest for FDI, particularly in developed countries. Western European countries of the European Union (Austria, Britain, Germany, The Netherlands, France, Italy, etc.), the United States of America and, to a less extent, Japan, represented the investment sources for the group of Central and Eastern European countries. EU Member States participated in foreign capital flows (1996) to Poland, Slovakia, Slovenia and Lithuania (60-80%), Bulgaria and Hungary (72-74%), Romania (50-54%). The countries that progressed most in reforming towards a free market economy were the main recipients of FDI (which was of considerable support in this complex and difficult process). In 1998, Poland, Czech Republic and Hungary held 64.1% of investments stock spreads across all countries in the region. As a proportion of GDP, few economies in the world had a similar level of FDI inflows as the Central and Eastern Europe leaders: Hungary, Czech Republic, Estonia and Latvia. In these four countries, investments were on average 4.5% of GDP during

1994 – 1999. FDI inflows during 1990-2000 were about \$ 142 billion. The largest amount was \$27.200 billion in 2001, which represented 3.7% of total world investment.

In the medium run, investment flows continued to grow rapidly in this area, due to the significant improvement of the business environment.

Table 1. FDI evolution during 1999 – 2008

Source: stats.unctad.org/FDI/TableViewer

Analyzing the chart above, we can see an increase in FDI since 2004, recording high jumps in Poland, Czech Republic and Romania. FDI flows in the Czech Republic, Poland and Romania represent 36-38% of the total FDI of the European Union.

National investment policies of Central and Eastern European countries share many common features, but there are also differences regarding facilities granted to foreign investors: at first, investments were made in areas considered strategic in terms of investors and national economies. Eventually, the investment policies in some countries became more permissive. To attract foreign investors, some countries in the region created a friendly environment and reduced bureaucracy, changed national legislation for investors, the country and its population.

Foreign investments are a main source of economic growth, their contribution resulting in:

- a) Capital growth
- b) Increased productivity and income
- c) Increased labour force both within their base and adjacent activities
- d) Higher production levels, due to the technological component of FDI
- e) Financing of the deficit of current account

Here are some factors that influence the size of FDI flows to a country:

- 1) The market size of both the investment exporting country and the investment importing country
- 2) The costs of production, the unit cost of labor, the fiscal level
- 3) Characteristics of the transition process, inflation, changes in currency, political risk, the privatization process.

These factors affect the decision of foreign firms' localization. Income tax reduction was a way to attract higher flows of FDI for Central and Eastern European countries that had similar level in terms of quality business and labour costs. The performance indicator of a country as concerns attracting investment (IPI) is calculated as the ratio of their share in global flows and their share in the World GDP; a value larger than 1 corresponds to a high flow of FDI relative to economy size. This index captures the influence of other factors besides the size of markets, namely business environment, the presence of natural resources, infrastructure and technology.

$$IPI = \frac{FDI/FDI_{world}}{GDP/GDP_{world}}$$

where IPI is Performance Index in Investment attraction, FDI_{world} is global flow, and GDP_{world} is global Gross Domestic Product

According to the World Investment Report 2007, published by UNCTAD, Romania ranked 21 among 141 analyzed economies, scoring 3791 points. This reflects a high capacity to absorb foreign investments, which will be exploited in the next period and can provide major benefits.

In 2009, Lithuania recorded a severe decrease in FDI flows, of 71%, with the most affected sector being real-estate. The only Central European country where real-estate flourished was Slovakia, where the TriGranit real-estate company had turnovers of \$2.3 billion. In Poland, the decrease of FDI flow was of 58% and affected key-sectors such as oil, natural gases and coal industries, as well as real-estate and finance. Although Poland succeeded in avoiding recession, FDI flows shrank: in finance by 86%, in the mining industry by 74% and in real-estate by 67%. A much smaller diminishment in FDI flows in real-estate (19%) was recorded in the Czech Republic. In 2008, the Czech Republic saw investments from car manufacturers Daimler, Volkswagen and Peugeot – Citroen. In Latvia and Slovenia, the diminishment of FDI flows was of 70%-71%. The cause for such a sharp decrease is the fact that, before the crisis, FDI in the two countries was rather limited and mostly focused on real-estate.

In order to forecast the recovery of FDI flows, PwC economists checked FDI dependency on various economic factors in several countries of the region. Overall, in the period 1997 – 2008, FDI in the region represented 4% of GDP. FDI was key to economic growth in Bulgaria, Estonia and Serbia and less important in Slovenia and Russia.

FDI flows are directly related to GDP/capita and inversely related to wages in the industrial sector and to credit risk premiums. By identifying key factors that influence the growth of investments, the experts worked out certain of scenarios for the period 2010 – 2014. The first and most likely is that risks will fall gradually and nominal wages will rise, along with GDP. By 2014, risks would reduce to their pre-crisis levels and FDI flows would be about \$172 billion. In the second scenario, wages would increase, as in the first scenario, but credit risks would also increase at first, compared to 2009, and then start decreasing. Under these circumstances, FDI would increase to \$147 billion in 2014. The assumptions of the last scenario are that risks will decrease, as in the first scenario, but wages would stagnate. This is the only case that would allow the investment boom seen in the period 2003 – 2007. This would imply that FDI would reach the levels of 2008 in 2012 and would increase to about \$234 billion in 2014.

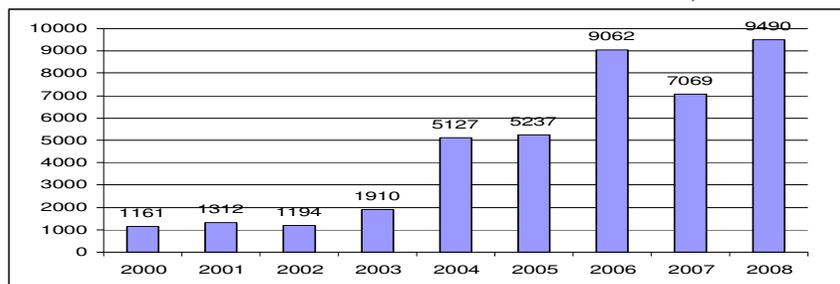

2. Foreign Direct Investment in Romania

After a timorous start in the first years of transition, FDI stocks increased significantly in 1997, being three times higher than in 1996, while in the following year, 1998, reached the highest value of FDI recorded in the '90's. The period between 1999 and 2002 was characterized by an FDI stock diminishment to about half of the value of 1998. In 2003, the investment value increased to a little over the value of 1998.

Starting with 2004, Romania has become one of the most important beneficiaries of FDI. If in 2000 it attracted 5% of total FDI in Central and Eastern European (CEE) countries, between 2003 and 2005 it attracted 15% of the total FDI in the region. Of course, these are very important years because of the great privatizations: Romtelecom (1998, 675 million €), SNP Petrom (2004, 1529 million €), BCR (2005, 3750 million €).

In the last few years, Romania benefited of high flows of FDI. Although FDI/capita is relatively low, reaching 35% of the average level of the neighbors from CEE, it has increased six times since 1999; in 2006, Romania ranked third among the New Member States (NMS), after Hungary and Poland, as this was a year in which many sectors continued the privatization, and the sectors already privatized continued to increase their capital, attracting new foreign and local investments, with effects on the structure of the economy.

Table 2. Evolution of FDI flows in Romania, 2000-2008 (mill. Euro)

Source: www.bnr.ro

In 2006, according to data from the National Bank of Romania, the total value of FDI stock reached 30.9 billion €. This represents an increase of over 9 billion €, in comparison with the previous year. In 2007, FDI flows decreased, as a consequence of the finalization of the privatization process. Greenfield investments had a significant increase after 2000. In 2005, there was an increase of 37% in Greenfield investments (235 projects of this type were recorded) in comparison with 2004. [World Investment Report 2006, UNCTAD, UN, New York and Geneva, pp. 263-265]

The main countries having FDI in Romania between 1991 and 2005 are: The Netherlands (15.75%), Germany (9.05%) and Italy (5.51%); over 80% of FDI is coming from EU.

The countries ranking 1 through 5 according to their contribution to total FDI in Romania, at the end of 2008, were Austria (18.8% of total FDI, decreasing from 21.4% at the end of 2007), The Netherlands (17.2% of total FDI, increasing from 16.3% at the end of 2007), Germany (15.4% of total FDI, increasing from 11.7% at the end of 2007), France (8.8%, same as in 2007) and Italy (7.3% of total FDI, increasing from 6.1% at the end of 2007, replacing Greece in the top 5 countries of origin of FDI in Romania).

The main sectors foreign investors were interested in are: production, trade, banking and telecommunications. Lately, important changes have taken place in the sectoral composition: investors' interests switched from low cost sectors to sectors with higher added value. This is reflected in the increase of the services quota.

The services sector attracted significant FDI flows in financial activities and insurance; in this sector, FDI stock as percent of GDP increased four times between 2003 and 2006.

Still, the most important beneficiary of FDI stocks remains the manufacturing sector, which represented more than one third of the total FDI in 2006.

Foreign investors are attracted by the cheap labor force, by proximity to the Euro zone, by the growth potential of the internal market. However, the boom of FDI determined by privatization is over. The advantage of the low cost of labor is slowly disappearing, as wages are growing significantly. The business environment and infrastructure become more important and, also, the availability of highly qualified labor force becomes an essential condition for investors. Accession to EU has contributed significantly to raising Romania's attractiveness for foreign investments. Through the adoption of *acquis*, it has conformed to European regulations, recorded economic growth and obtained a market economy status. The transition towards ERM II has created institutional instruments for a controlled inflation and competition pressures have strengthened monetary discipline. The geographical position, central in European space assures another advantage compared to rival emergent markets and offers advantages for investors in industries sensitive to distances, those supposing a fast reaction to changes in consumer markets, those using heavy, large or fragile products.

According to a study released by The World Bank [World Bank, Doing Business 2008, www.worldbank.org], in 2007 Romania ranked 48th out of 178 countries analyzed, concerning attractiveness to foreign investors, better than in the previous year (55th in 2006).

According to estimations made by the United Nations [United Nations, Prospects for Foreign Direct Investment and the strategies of transnational Corporations, 2005-2008, New York and Geneva, 2005, p.47], 22% of FDI experts and 27% of the questioned Multinationals appreciated Romania as being the most attractive investing destination in South-Eastern Europe, creating strong expectations for a positive evolution of investment flows.

According to CFI (Council of Foreign Investors), in 2009, FDI in Romania totalled €4 billion, half of the value recorded in 2008. The key factor for this decrease was the economic crisis, but political instability and the increase of the country risk also contributed to a lower appetite for investments.

To conclude, we could say that Romania has enough strength to be an interesting destination for investors, but the EU member state status is not a guarantee for attracting more FDI, without continuous efforts for further reforms and the business environment improvement.

3. The relationship between foreign direct investment and economic growth

As concerns the wide literature regarding FDI, most of the studies represent econometric analyses trying to establish, based on panel data, the relation between FDI and economic growth. We mention in this sense Li and Liu (2004), Durlauf and Quah (1999), Barrel and Pain (1997), Neuhaus (2006), Lensink and Morrissey (2001). Sova & al. (2009) has econometrically analyzed FDI for Romania.

From these studies, FDI seems to stimulate economic growth only for economies having proper “initial conditions”: highly qualified human capital (labour force with a high education level), a well developed financial sector and policies which stimulate free trade. Romania, like any other transition country from Central and Eastern Europe, satisfies these conditions.

In this sense, we mention the studies of Barro (1991) and Levine and Renelt (1992). The real gross domestic product regression is represented, in both models, by a four variable function.

In the case of Barro’s model, these are GDP per capita in the base year, primary school enrollment, secondary school enrollment and gross investments as a percentage of GDP. In order to estimate the regression equation in the case of Levine-Renelt model, the following four variables were taken into account: GDP per capita in the base year, the rate of increase in population, the gross rate of population in secondary school and the weight of investment spending in GDP. More recently, using extended data series until the mid-90’s, Fischer, Sahay and Vegh (1998) have applied these two models on the ten countries that were candidates to access EU. The aim of the study was to forecast these countries’ economies’ long-term development. The tested regression equations for CCE transition countries were the following: Barro’s growth equation is :

$$\text{GDP Growth /capita} = 0,0302 - 0,075 \text{ Y1960} + 0,025 \text{ PRIM} + 0,0305 \text{ SEC} - 0,119 \text{ GOV}$$

and the Levine and Renelt growth equation is :
$$\text{GDP Growth /capita} = -0,83 - 0,35 \text{ Y1960} - 0,38 \text{ POP} + 3,17 \text{ SEC} + 17,5 \text{ INV}$$
, where Y1960 is income per capita in 1960 expressed at purchasing power parity, POP – growth rate of the population, PRIM – primary school enrollment, SEC – secondary school enrollment, GOV –governmental expenditures as a percentage of GDP, INV – the weight of investment in GDP. All coefficients have a 5% level of significance, except the Y1960 coefficient from the Barro equation and the first term and the POP coefficient from the Levine and Renelt equation. The positive influence of FDI depends on its composition and also on its interaction with local investment. FDI flows in the primary sector can have limited benefits in GDP increase, since this often implies mega-projects, where, in general, no intermediary products created by local industries are used. On the other hand, FDI from the manufacturing

sector tends to have a significant effect on GDP growth, because of stronger connections between this sector and the rest of the economy.

In Solomon et al (2010), we performed an econometric analysis of the evolutions of FDI and GDP in Romania, based on a Markov switching model. From a regression analysis, based on quarterly data for the period 1998-2008, we concluded that there exists a strong correlation between FDI and GDP (the correlation coefficient being 0.976).

Another class of models (e.g. Keller (1996), Baldwin and Forslid (2000)) analyse FDI influence on growth in the context of endogenous economic growth models. Many studies (e.g. Borensztein, DeGregorio and Lee (1998), Bashir (1999), Contessi and Weinberger (2009), McGratten (2009), Chanda et al. (2007)) combine modeling with econometric techniques.

As concerns the existence of a causal relationship between FDI and growth, the results of econometric studies are contradictory.

Using GMM estimators and a panel data set covering the period 1960-1997, Carkovic and Levine (2005) conclude that FDI has no robust causal effect on economic growth. Gao (2005) studies FDI and economic growth in an endogenous economic growth model concerning two countries. Starting from a steady state between the center and the periphery, the model shows that economic integration generates FDI, leads to the expansion of R&D (Research and Development) in the industrial “center” and to the increase of the growth rate. In this process, the “periphery” enjoys an increase in living standards. As follows from this study, no causal relation is implied by the positive correlation between FDI and economic growth; both variables respond positively to economic integration.

On the other hand, Zhang (1999) finds, for China, bilateral causality between FDI and growth.

In Solomon et al (2010), we also studied the possible causality between the two variables, for Romania’s case, but we obtained negative results for the Granger causality test.

FDI can generate productivity through various channels, as imitation (adopting new production methods), acquisition of new skills (education/training of the labour force), competition (efficient use of existing resources by local firms) and exports (increase of local firms’ export potential).

An interesting study on FDI is the paper by Criscuolo (2005 b), which quantifies the contribution of foreign affiliates to productivity growth in OECD countries, using a growth accounting approach. The analysis confirms that foreign affiliates can make an important contribution to productivity growth. The contribution is larger in the manufacturing sector. In the services sector and in low-tech manufacturing sectors, the largest component of the contribution of foreign affiliates is due to the increased employment share of foreign affiliates. In medium-and high-tech sectors, the contribution is mainly driven by stronger productivity growth of existing foreign affiliates.

Conclusions

Foreign direct investment (FDI) has played and still plays an important role in the convergence process in Central and Eastern Europe, particularly in Romania, towards the development level and the welfare of the developed countries of the European Union. FDI can generate productivity spillovers through several channels, including imitation (adoption of new production methods), skill acquisition (education/training of workers), competition (efficient use of existing resources by domestic firms), and exports (expansion of export potential of domestic firms).

After a slow start in the first years of transition, FDI in Romania has significantly increased in 1997. Since 2004, Romania has become one of the most important beneficiaries of foreign direct investment in Central and Eastern Europe.

The main finding of the wide literature concerning the relationship between FDI and economic growth is that, in order that FDI had a positive impact on growth, the labour force of a given country must be relatively well trained. Romania, as well as the other East and Central European transition countries satisfies this condition.

Faculty of Marketing and International Business

Abstract: This millennium, confronted with a globalization of means leading as fast as possible at certain pursued aims, highlights the importance of competitiveness from the perspective of the continuous fight against limitation of resources. In this context, "the machine of life evolution and economy" has got an engine named competitiveness. "The rules of circulation" should focus on all livings to whom, from the perspective of survival and natural, human and social life accomplishment, the well-known concept of health may be attached. At the same time, competitiveness through environment health should try to reach the convergent performances which means that any form of superior knowledge and experience should always take into consideration environment health.

Keywords: competitiveness, environmental health, living entity

JEL: O13, I10, Q5

1. Remember

This millennium, confronted with a globalization of means leading as fast as possible at certain pursued aims, highlights the importance of competitiveness from the perspective of the continuous fight against limitation of resources. In this context, "the machine of life evolution and economy" has got an engine named competitiveness. "The rules of circulation" should focus on all livings.

"All livings" known on the Earth consist of a diversity of life forms, with human and nonhuman features²⁷⁰. People, families, environment, communities, organizations and institutions are common components of all livings. They are interrelated in an organic functionality, our existence depending on their normal development and purpose (desired) future. We raise the issue of analyzing all livings through the development of natural, human and social life. From the perspective of survival and fulfillment of human, natural and social life, the six components of "all livings" can be attached as a common denominator to the concept of "health."

"Extending the vision of human health on other components that define non-human life is meant to give a defining meaning to functionality without considering forms which manifest in terms of its purpose. This means, in our opinion, that as we talk about human health as a state of normality and harmony of life functions, we can also talk about family health, health organization, health communities, health institutions etc., as fully functional life status in these ways, in terms of their purpose as organic parts of all livings. While the concept of human's health is accepted as wellness excluding diseases, the other concepts, such as family health, organization health, environment health and so on, do not reflect the values that they define, the criteria that differentiate them and the indicators that quantify their evolution.

The model (see fig. no.1) denoting the health of "all livings" and its components is a nonlinear and dynamic that has to permanently adjust itself to new requirements and imperatives that exist or may appear.

²⁷⁰ Popescu, Constantin, *Raționalitate și speranță. Paradigma întregului viu*, Ed. Renaissance, București, 2006, p.34.

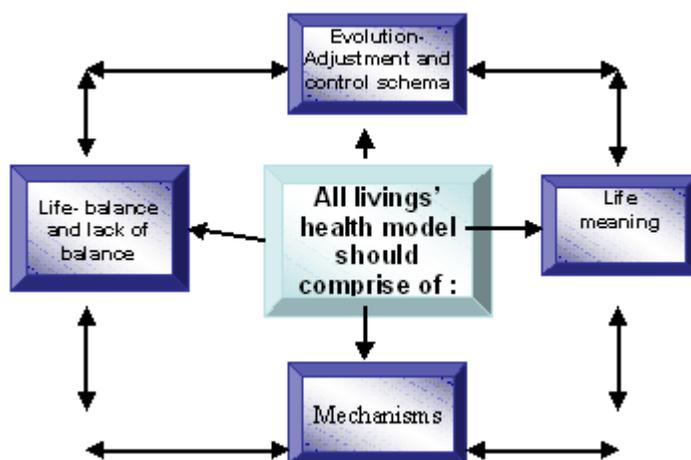

Fig. no. 1 Model of all livings' health

2. Competitiveness through environment health

The health of „all livings” is defined as an assembly of natural- social parameters of which constants give shape to the convergent evolutions in the time and the space of our common microcosm, for the phenomena and the processes generating life from the perspective of the paradigm presented above

For example, Hubert Reeves- physician and laureate of Albert Einstein prize wrote in 2005²⁷¹ that our Earth is sick. The planet is getting warmer and warmer, natural resources are getting fewer and fewer, soil and water are polluted and many species of plants and animals are either extinct or in prone of extinction. There are just negative effects of the damage that our civilization brought about in its race for development ignoring exactly the fundamental conditions of its own existence.

In other words, one of the components of the all living system- environment, is heavily affected by the action of other component- HUMAN. The consequence is the extinction of both components due to their interdependent relation. But, actually, what is environment or ecosystem made up?

The ecosystem is made up of communities of livings (biogenesis) occupying a space or a geophysical niche (biotope)²⁷². The interactions that take place within the system design and redesign a balance between the following moments entrance, birth, abandon and death.. The conflicts, adaptability, hierarchic organization are just several of the ecosystem principles and are similar to those of human society. The ecosystem relation is integrative between two open systems, which, actually, are part of the other one, but each of them stands for a whole system. At the same time, there is a direct relation between the autonomy of a living system and ecosystem: the bigger the degree of autonomy is, the more dependent on the ecosystem it is. At the same time, the greater the ecosystem complexity is, the more able it is to provide goods and products for society, implicitly to human

The relation man-society functions according to the principle autonomy through dependence, development and autonomy maintenance, being linked to educational dependences²⁷³ (schooling and long socialization) cultural and technical. In other words, the degree of humans' ecologic

²⁷¹ Reeves, Hubert, *Pământul e bolnav, ce șanse avem să supraviețuim*, Ed.Humanitas, București, 2005, p.26.

²⁷² Morin, Edgar, *Paradigma pierdută: natura umană*, Ed. Universității Alexandru Ioan Cuza, Iași, 1999, p. 22.

²⁷³ *Ibid.*, p.24.

independence and dependence is manifested at the level of social and natural, practically, at two heteronomous levels in a permanent interdependence.

In accordance with the whole living's vision paradigm, the parties can not be separated from the whole. Therefore, the whole concept of health gives the composing part alive, which we have named the same value as the whole environment. Therefore, the health of economy can not be separated from its natural support systems, namely the environment from where people get more of our resources.

More than half of the world's people depend directly on agricultural land, grassland and forests and natural sources of fish. And, there are more addicted to industries that are based on wood products, leather products, cotton textiles and food industry in terms of their jobs.²⁷⁴

When defining competitiveness through environmental health, it is important to track the performance of meaning. Through performances of meaning we understand to use the conquests of knowledge and life experiences in order to improve environmental health service. For example, the strategy of development and of elimination of health may be a sense that environmental systems that support economy do not get worsen.

But ... unfortunately, farmland surfaces get even shorter with direct effect on agricultural crops, grasslands turn into desert areas which influences the food of animals or increases temperature. Lester Brown says that if the degradation of Earth still keeps on growing, then recovery will mean a huge international effort- even larger and more demanding than the Marshall Plan²⁷⁵.

The divergent performances mean to use knowledge and understanding of life experience to destroy all forms of environmental biodiversity under all its expressions of identity. Unfortunately, these performances are now scattered across the Earth. For example, the manufacture and detonation of the atomic bomb is a divergent performance due to its damaging effects it can have on environment! The environmental effects revealed by the images captured after running experiments with nuclear bombs stand for such evidence.

Pharmaceutical and petrochemical industries have expanded so successfully the control on their consumers' products because they share the same mechanistic world views and the associated value system, which corresponds to their technologies and represents the basis of their economic and political motivation. And although their methods are generally against ecological principles being unhealthy, they are strongly supported by scientific authority, which subscribes to the same improper vision of the world. Changing this situation is now absolutely vital for our survival and welfare which will be possible only if people could get a new vision, a holistic and ecological one.²⁷⁶

Pope John Paul II, referring to the environment problems, stated in his encyclical letter *Centesimus annus*, that humans, seized with their desires of possessing and using after their own pleasures, more than necessary, consume excessively and disorderly the resources of the planet and its own life. It is the anthropological error that destroys the natural environment which, unfortunately, is overspread significantly in our times. Discovering their capacity of transforming and creating life, humans seem to forget that it is done with full sacrifice. They think the planet can always be used for their benefits as if it had not got any shape or destination that they can neither develop, nor ignore as well.... Thus, unfortunately people generate the revolt of nature that they hardly master in their intention of controlling everything. Under such circumstances, it

is easily to remark human's poorness and meanness revealing the desire of mastering for own interest and benefits²⁷⁷.

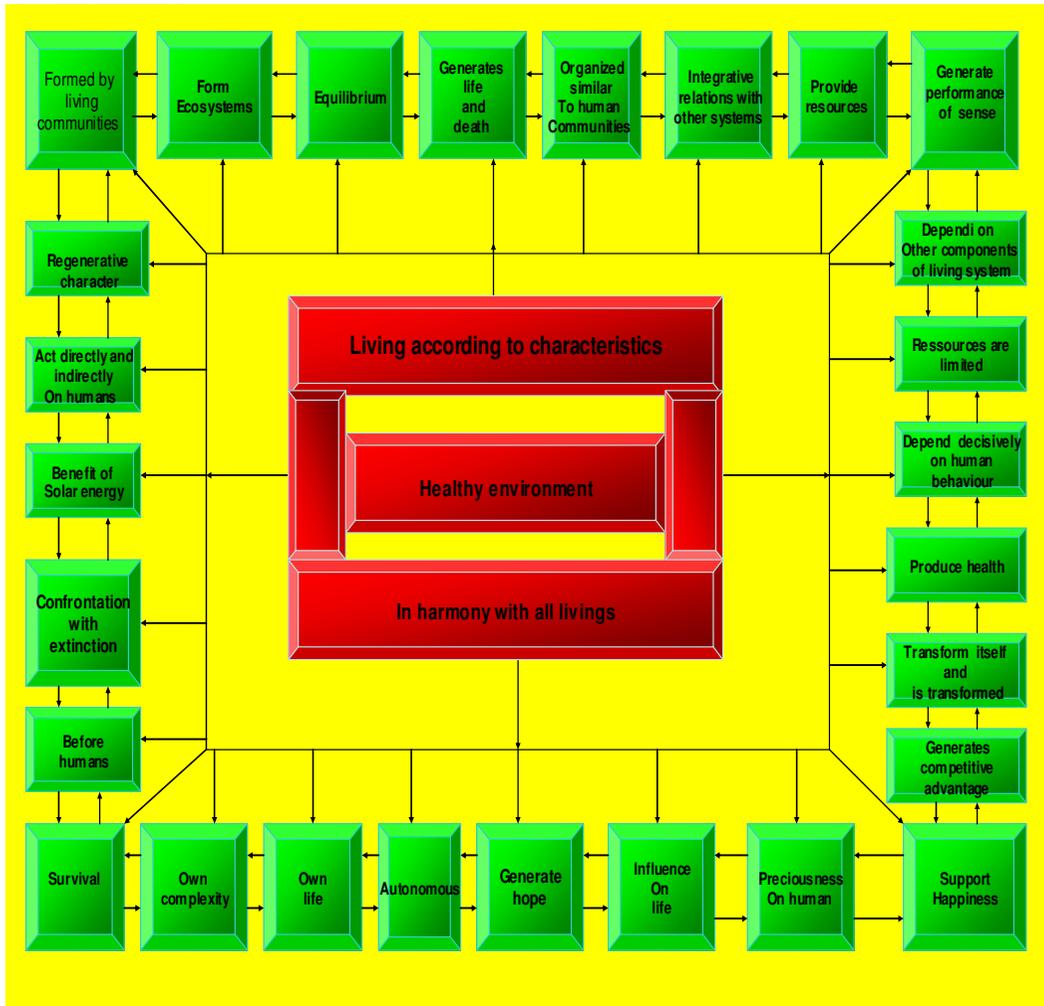

Fig no.2 Conditions for a healthy environment

3. Building a future together

We believe that it is time to reflect better of the consequences resulting from a rush at all costs after strict financial result competitiveness, whereas that environmental damage can quickly lead to economic decline, as it was the case with ancient civilizations that have shifted nature and have disregarded terms.

The solutions for the conflict between competitiveness and environment protection mentioned by several business people are generated, as Michael Porter asserted, by a narrow perspective on prosperity sources and static vision of competition. The strict regulations on environment do not end up the competitive advantage in front of rivals and certainly, it is often intensified. The properly established standards of results will encourage companies to redesign technology. In

²⁷⁷ Papa Ioan Paul al II-lea, Scrisoarea enciclică *Centesimus annus*, 1991, p.473-474 în *Enciclice*, Ed. ARCB, București, 2008.

many cases, it will lead to a process that does not pollute, but decrease costs and improve quality²⁷⁸.

It only depends on us the way in which we use democracy and power in order to understand amiably each other when approaching our future, world policies and customs to our children's benefits and the whole humanity. It is our duty to turn the 21st century in a flourishing epoch. Considering the context of this world economic crisis, we should free our imagination, invention capacity and spirituality with which we were also endowed. It is our responsibility. The future is ours²⁷⁹, the ex-president of the USA Al Gore asserts.

We can conclude that when fighting to get more resources definitely decreasing in number, to be competitive is quite real, but to be competitive and healthy is more important for our future as living forms of Earth, than for the interest of certain organizations or institutions. As responsible citizens of human society, it is high time to think of our future.

This paper aims to briefly present the effects of the financial and economic crisis in Romania in respect of the monetary developments and their impact on competitiveness, on firms involved in foreign trade on international market. All the analysis is undertaken in the general framework of the monetary integration process envisaging the Euro adoption, and in the context of actions of the Romanian National Bank as part of the foreign exchange and monetary policy strategy. Due to constant preoccupation from the most important monetary institution, the Romanian Leu has performed rather well compared to rest of the macroeconomic picture and seems to drag forward the whole set of other indicators, including economic aspects such as competitiveness. The connection between the foreign exchange rate and competitiveness can be best depicted in the effects on exporting firms.

Key words: exchange rate, competitiveness, monetary integration

JEL: F36, E42

Introduction

Everybody agrees on the fact that high liquidity has been an important issue in triggering the actual financial crisis. Many people have missjudged the phenomena as being a fundamental defect of capitalism. That is not true. The very inner nature of the economic cycle consists of ups and downs of recession and boom, with more or less acute picks. Realistically speaking, the crisis has been generated one one hand by cyclicity and on the other hand by missjudgement in the institutional level, in the system administration and capitalism itself is not to blame for the crisis. The economic overheat can most of the times generate such a recession if not well handled by responsible authorities well aware of the fact that individual consumers and firms must still be correctly directed, even in capitalism.

Crises and institutions can be connected to people. Administrators believed that the rules of functional economies could have been broken without any consequences. What will the lesson of this crisis be? Bad management can lead to such unfortunate financial events and not free markets.

Romania – Crisis and Competitiveness. A Monetary Approach

The starting hypothesis of the Romanian National Bank is that a more rapid increase in wages than in productivity would not lead to higher welfare, but rather to a lower one due to the gap between the two fundamental indicators and to the fact that the immediate consequences are a rapid price increase and the foreign exchange rate depreciation. All these have a negative impact on investments, on competitiveness and delay instead of

²⁸⁰ Article financed by UEFISCSU through the program IDEI, Contract CNCIS no. 826/19.01.2009

hurring the real economic convergence. This – real convergence - is the key linking element between competitiveness and the „big picture” of monetary integration for the Romanian Leu.

During the ten years previous to the financial crises, the yearly productivity gain has exceeded 10%. This has been determined by several factors: low starting point, significant decrease of population occupied in agriculture, and very important – an increase in investments and competitiveness. Even though, this increase has been surpassed by the one in wages and it accounts for the dramatic raise of the external deficit and also the inflationary pressure. In time, once the financial and economic crisis installed, the situation changed dramatically. Productivity decreased, bankruptcy spread and this in connection to economic rigidities, the infrastructure issues and the ever slowing economic restructuring process.

Considering all that, the National Bank has and will always been, for the sake of the Romanian economy, a promoter of a healthy and durable growth maintaining a real feature. Even beyond that, the market, and especially the traditional and well rained external market where our exporters evolve, will always depict growth based on a competitiveness surplus. Everything else will transform into inflation and into the depreciation of the national currency, bringing down the wages level to where it can be covered in productivity.

Many analysts believe that monetary policy in Romania still owes in regard of the recession control. The production gap of over 7%, seems to bring substance to that idea, but not for long. Even more, in its definition not influenced by offer factors, inflation has dropped from 6,3% in December 2008 to 2,8% in December 2009. This decrease is due both to recession and to the prudence of the Romanian National Bank in reducing the effective interest rate. Thus, we might believe that inflation is no more a real problem and this year, the RNB should lower the interest rate abruptly in order to stimulate economic growth and an increase in competitiveness. That is what firms and households expect. Even though, new economic evolution might emerge and the monetary strategy might have further constraints. Economic growth and competitiveness increase would restart under the influence of a remake in trust and external economic growth. That is why the National Bank supported exporters in the 2 month struggle with the foreign exchange rate appreciation as Romania experienced massive foreign capital inflows. This would reduce the disinflationary gap and thus it will contribute to the inflation and interest decrease less and less. Still it is rather probable that new factors emerge and support interest rates reduction, while others could act oppositely. Contradicting influences will bring further constraints to the monetary strategy.

Under these circumstances, achieving the inflation targets - 3,5% for 2010 and 3% for 2011 remains difficult. Once the global trust has been rebuilt, the chances for capital inflows to ingeminate increase. Globally, the financial crisis has brutally corrected lacks in balance. The still remains uncertain whether correction of the countries' current accounts – Romania's as well – are complete in connection to the long term trends, but it is certain that these corrections have only been the result of cyclical factors – as previously mentioned. Reforms meant to prevent remaking of un-sustainable unbalances associated to abundance in capital inflows did not take place, and that might strongly affect future competitiveness especially on foreign markets. The structural factors of imbalances have remained.

Though, even in countries with current accounts deficits, the crisis has brought an increase in savings. This process may be reversed once future positive prospects come up. In the Euro-Area – our permanent convergence aim - structural rigidities prevent a relatively high competitiveness and finally economic growth. This combination in structural factors

has existed previous to the crisis and lead to massive capital inflows, including in Romania. The new determining factor that could cause and inverse phenomena – meaning an outflow in the Romanian case is the financial crisis in Greece. This may occur as a consequence of the contagion effect. Only coherent policies can prevent that, for both the Euro-Area and the EU as a whole. As a consequence of recent actions of financial institutions from an international spectrum, that contagion probability remains rather low. The perspective of large capital inflows from 2010 is more probable. Recent foreign investments and net foreign transfers have restarted their increase. Recent estimates (*The Economist*) appreciate a total volume of investments close to 8 bln. Euros for this year and it may even exceed this figure. Even more, the interest rate differential stimulates the carry-trade operations. For the time being, the aggregate effect of these movements of capital on the current account deficit is not clear, but deterioration would not worry if reflective of the economic recovery.

For 2010, the capital inflows would probably have, from a theoretical point of view at least three effects: - inflation decrease; - stimulation of debts in foreign assets – a possible threat for the first one; - decrease of domestic competitiveness on international markets that would slow down exports. Mainly, a decrease in the interest rate does not stimulate the first effect, but contributes to the attenuation of the other two.

Thus, only through means of exchange rate, a change in the interest rate could have conflicting effects in achieving monetary aims.

Even though, for the Romanian case, this is not completely true. Influences on the RON appreciation on inflation heavily depends on the price setting mechanism. Data show that there are nominal rigidities in Romania, preventing a strict reflection of foreign exchange appreciation into significant decrease in inflation. Thus, disinflationary potential of the RON's appreciation remains rather low. Meaning, if we exclusively consider the exchange rate channel, a decrease of the interest rate does not cause significant damage in terms of inflation.

The need of interest rate reduction comes up from the perspective of the other theoretic effect of the foreign exchange rate appreciation – an increase in the foreign private debt. For 2009, the inflation decrease and the RON depreciation made that the gap between the costs of loans in domestic currency and in foreign currency to stretch. This year, an appreciation in the RON's foreign exchange rate could remake the gap. This would severely affect the imbalance in foreign currencies between assets (mostly in RON) and passives (mostly in foreign currency) as part of the real sector, making it vulnerable to eventual foreign exchange rate depreciation. Obviously, from this very perspective, the National Bank, responsible for the financial stability, is interested in reducing the interest rate.

Pressure for reducing the interest rate could also be generated by reasons of economic competitiveness. The National Bank has never shown lack of reaction to the domestic currency foreign exchange variations, always pointing out the managed float feature of the foreign exchange rate regime. This has also at times such as recently protected exporters.

A decrease in the unit labor costs, even more evident since mid-2009, has created the desired conditions for a reasonable appreciation that we have recently witnessed, an appreciation that has not affected firms' competitiveness and that has been buffered by the RNB. This gap has been recently consumed by the RON appreciation, being accompanied only by reactions from the same monetary institutions and not by significant lowering in labor costs. Concluding, it is rather probable that the remaining gap for foreign exchange rate appreciation, if there is any, determining disinflation could have significantly diminished. The tighter the gap is, the higher pressure for reducing interest rates aiming to temper capital inflows.

Conclusions

The relatively low impact of the financial crisis from a monetary point of view is due to the Romanian National Bank, to the features of the financial environment in Romania, and also to the prudential measures in monetary policy and in strengthening the financial stability. They could be resumed as following: - credit institutions in Romania do not have exposures on financial products that represented the origins of such turbulences (the „subprime” instruments); - most banks in Romania, even foreign ones are subject to prudential control from the RNB; - some of the National Bank’s measures have been more restrictive than Basel II; - the level of reserves stays high.

Even though, there have been several negative monetary aspects with further economic impact: high volatility of the foreign exchange rate, an increase in the external financing costs and a decrease in volume, a moderation in capital inflows and eventual repatriations, a possible deceleration of demand for Romanian exports as a consequence of competitiveness erosion and a decline in economic growth perspectives.

THE COMPETITIVE ADVANTAGE OF ROMANIA IN THE CONTEXT OF ECONOMIC RECOVERY

The economic crisis has given the opportunity for the world to reconsider the use of resources, so the subject of competitive advantage has become actual. There are several relevant papers on national competitiveness, but we consider that there are still important issues to discuss in order to identify the economic sectors in Romania that have the potential to create successful products for the global market. The paper applies modern competitiveness models on the features of our country, and concludes about the best use of our resources, in terms of increased productivity and optimal results. The goal is to encourage exporters to extend on several international markets and multinational companies to invest in developing new businesses in Romania.

Keywords: competitive advantage, resources, economic recovery

JEL classification: F16, F 59, O47

1. Introduction

The competitive advantage of a country refers to its ability to offer products or services on the global market, at the best price/quality ratio on a certain moment in time, and the national strategy for development should indicate the directions for assuring the sustainability of present competitive advantages and identifying new ones as the demand and offer on the global market changes. Obviously, the global financial and economic crisis, which started in 2007, had a strong impact on the global prices and sales on international markets. For example, the oil demand has decreased in 2009, and the price has fallen almost a 100\$ a barrel from a record high of 147,27 \$ a barrel. The consumption of oil worldwide can show a good perspective on the slowdown of the global economy.

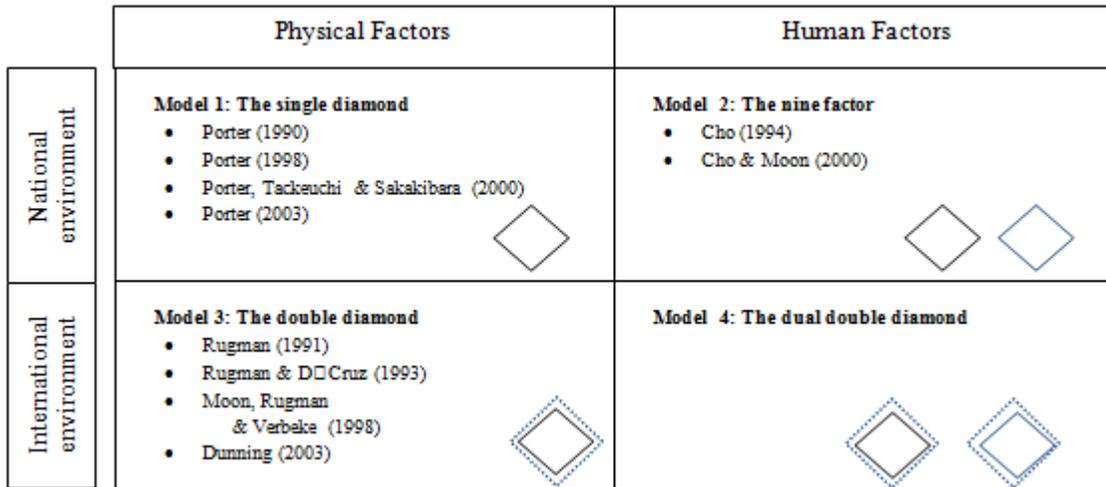

In this context, it is vital to reconsider our position on the international market, as a recovery after an economic crisis is always a time for earning new advantages or losing former ones. It is up to the country's leaders to formulate a winning strategy at this critical moment, and the economists must do their best to offer the theoretical basis for it.

2. Literature review

The main reference paper on the subject of national competitiveness is Competitive Advantage of Nations (Porter, 1990), where the author develops the diamond model, proposing five factors that influence a country's competitiveness on the global market. In his book, Porter argues that national prosperity is not inherited, but created under the influence of indigenous and exogenous variables. The indigenous variables are Factor Conditions, Firm Structure, Strategy and Rivalry, Related and Supporting Industries, and Demand Conditions. The exogenous variables are Government and Chances.

There were several developments of Porter's model, which are briefly presented in Figure 1 .

Figure 1: Extensions to the Diamond Model

Source: Moon, Hwy-Chang, 2006, *Competition and Cooperation between Korea and Japan: A Business Perspective*, 21COE, University of Tokyo MMRC Discussion Paper No.65

The horizontal axis shows the extension to the diamond model in terms of the sources of national competitiveness. The vertical axis, on the other hand, demonstrates the extension with regard to the scopes of national competitiveness.

The two extensions double the original single diamond in two distinct ways. Model 2 in Figure 1 introduces a new diamond of human factors as an extension to sources of national competitiveness.

On the other hand, Model 3 doubles its original diamond as an extension to scopes of national competitiveness, from a domestic context to an international context. Thus, the integration of these two extensions into a single framework results in a dual double diamond. At the lower right hand corner of Figure 1 is the DDD model, encompassing the previous extensions. The DDD model considers both physical and human factors in both domestic and international contexts.²⁸¹ There are two international institutions that publish national competitiveness reports: the International Institute for Management Development (IMD) and the World Economic Forum (WEF). The first report was published in 1989, when the two institutions were not divided, and they started to develop separate reports since 1996.

Table 1: Original models of the two reports (1996-2000)

IMD Report (1989 – 2000)	WEF Report (1996 – 1999)
Domestic Economy	Civil Institutions
Internationalization	Openness
Government	Government
Management	Management

²⁸¹ Moon, Hwy-Chang, *Competition and Cooperation between Korea and Japan: A Business Perspective*, 2006.

We can see the similarity of factors which are taken into consideration by the two reports, still they have different views on the definition of competitiveness and their models have been evolving over years, as it can be seen in Table 2.

Table 2: Revised Models of the Two Reports

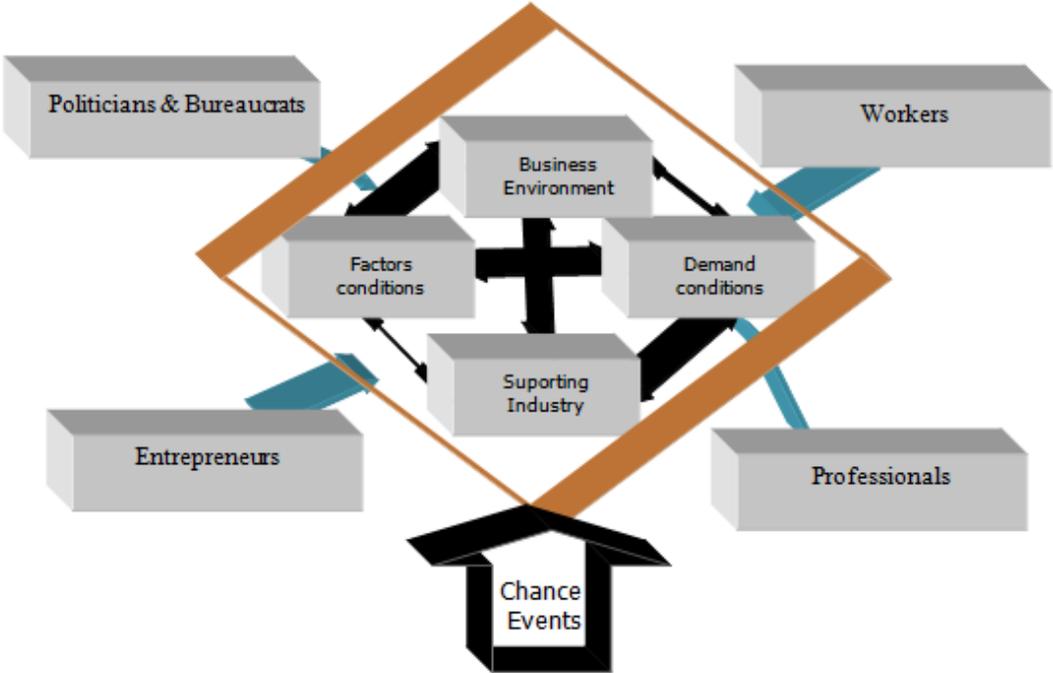

IMD Report (2001 – 2009)	WEF Report (2001 – 2009)	
Economic Performance	Aggregate Country Performance Indicators	Macroeconomic Environment
Government Efficiency	Public Institutions, Law	Public Institutions, Corruption
Business Efficiency	Company Operation & Strategy	Domestic Competition

3. Research methodology

After comparing the models found in the relevant literature on the competitive advantage theme, we chose an extension of Porter’s diamond model, the nine-factor model proposed by Cho, 1994; a comprehensive scheme is presented in Figure 2.

Figure 2: The nine-factor model

Source: Cho, D.S. and Moon, H.C., *National Competitiveness: Implications for Different Groups and Strategies*, International Journal of Global Business and Competitiveness 2005, Vol. 1, No. 1, pp 1-11.

The study we conducted applies this model on Romania, identifying the main features of each factor mentioned in the figure above. The informations were collected from official websites, reports and surveys among key-decision makers in the central administration.

4. Investors view on the competitive advantage of Romania

Sustaining the exporting activity is a rather difficult task for the government, as the economic situation doesn't seem to improve rapidly and the budgetary expenditures must be reduced.

So we can identify two main directions that should be included in the strategy for sustaining the romanian exports: the first one is offering tax reduction for the sectors which are identified as main export industries and te second one is to attract foreign investors for these.

Long-term investors seek attractively priced companies with prospects for sustainable value creation. Value creation means a company generates returns in excess of the cost of capital on its investments.²⁸²

Companies with global activity seek optimal supplying for material and components and choose locations for production in countries where they can get the highest scale economies.

Other resources that should be taken into consideration are the natural resources, like surface and underground waters, fertile agricultural land, oil and gas.

The table below shows the major macroeconomic development of Romania during 2005-2009.

	UM	2005	2006	2007	2008	2009
GROWTH AND ASSOCIATED FACTORS						
GDP growth	%	4.2	7.9	6.2	7.1	-7.2

Source of data: INS, BNR, Eurostat

As political advantages we can name the EU and NATO membership and as geographical location, Romania is situated at the turning point between EU, the Balkans and CIS countries,

²⁸² Mauboussin, Michael J., *The Ecosystem Edge*, Legg Mason Capital Management, 2005.

Romania is crossed by three important pan-European transportation corridors: corridor no. IV linking Western and Eastern Europe, corridor no. IX connecting Northern and Southern Europe and no. VII – Danube River, facilitating inland water transportation, at the same time connecting the Romanian Port of Constanta (the biggest Port to the Black Sea) to Northern Europe, through the Rhine.²⁸³

An increased interest of Foreign Investors has been noticed, Romania was found as leader destination for FDI in the region in a survey by Ernst&Young, April 2008.²⁸⁴

Still, the effects of the financial crisis can be observed at the level of Foreign Direct Investments in Romania, which has decreased in 2009, by almost 50% compared to the previous year.

An important resource advantage which our country can offer is a highly skilled labour force at competitive prices. The main sectors identified by the Romanian Agency for Foreign Investment are IT, engineering, and foreign languages use.

The premises for the development of the IT sector are insured if we take into consideration the numbers revealed by recent studies. There are over 13.000 IT companies in Romania (9.000 of which are exporters) and €400 million in software and IT services revenue each year.

As for the specialists in the IT sector, our country is the European leader and 6th in the world, in the number of certified IT specialists it produces: 230 IT specialists per million people graduate every year, one of the highest rates in the world and greater than that of the US and Russia.²⁸⁵

The Romanian market is, following Poland's, the second largest market in Central and Eastern Europe, with the fastest growing and the fourth IT market in Europe. Romanian companies serve the world's most demanding offshore customers in IT outsourcing, business process outsourcing, call center support, and product development.

4. Conclusions

In terms of implementing business projects, Romania offers an incredible potential for obtaining high profit margins. Whether they are situated in the western part of the country where business has grown bringing high rates of FDI, or the North Eastern area where lower FDI but high availability in terms of labor pool and land, locations for implementing business projects are spread all over the country.²⁸⁶ Investors can choose between greenfield or greyfield investments, as locations for buying or renting are available at lower prices than in developed countries in the EU, and there are several existing plants, which can be bought at acceptable prices, and can be modernised at affordable costs.

As for the main sector that has the greater potential for exports, is the IT sector we recommend that investments should be encouraged by taxes reduction and special condition in credit offers.

The industry has two main segments: IT services and hardware production. Both segments will be driven by some large projects for the upgrade and extension of IT systems in large Romanian companies, in banking, telecom, utilities or manufacturing, areas where the privatization process or fierce competition play key roles in IT adoption.

As for the exports of the Romanian IT sector, there are already foreign companies that are using services for software testing or creation and others that have delocalized their call centers for customers support. National policies should encourage investors to choose Romania for establishing their offshore businesses.

The paper presents an objective evaluation of the present state of the involvement of local public administration authorities in the development of rural communities, and it presents the necessary measures to improve life quality. Reaching such a goal will show why European Community and Governmental funds are so slowly obtained at the level of local public administration authorities and will allow the establishment of the ways to increase attractiveness for and interest in from the factors involved in promoting rural communities' development.

Keywords: local communities, autonomy, local public administration, development

JEL Classification Code: K 00, R 11, R 53.

The changes occurred in Romania in the aftermath of the so-called Revolution of 1989 on both political and economic levels, and particular on social level, have marked the entire Romanian society.

They have promoted, ever since the beginning of the '90s, studies concerning the market economy compared to centralised economic systems (which had proved inefficient). At the same time, they have removed both the State's intervention in economy and the so-called public control.

On the same occasion, they have defined new responsibilities at different levels. A new way of governing and a new legislative frame (adopted after existing models) have appeared.

To note that the option concerning the relationship between citizens and authorities (in the sense of their participation in social life) soon appeared and, in short time, it yielded good results.

At local level, decision-making is done with actual support from local authorities as a result of wide consultations.

At national level, the population is invited to express, through voting, its opinions and even sanction when it is the case.

Both local public administration and central public administration operate according to a well-known system, decentralisation.

This is how a series of responsibilities are transferred to the level of local communities and supported by the inhabitants of communes, towns, or municipia.

For a better distribution of the tasks, and also for an efficient knowledge, in accordance with a European model, Romania has an organic law regulating the activity of public employees as well as of the central and local administrative apparatus – the “**statute of public employees**”.

Local authorities are, in fact, representatives of the community. The issues of the communities are diverse and they need different specialists who, in close correlation, work to solve them.

The community is represented, locally, by authorities elected through universal, equal, direct, secret and freely expressed vote, under the conditions established by the law for the election of local public authorities.

The interests of the local community are different, and in close interdependence with its own potential of development.

The principle on which is based the functioning of central and local authorities is the principle of subsidiarity, defined both **horizontally** – market – family – community – State – and **vertically** – national level – regional level – local level – community level.

Any type of activity is based on a study or a project, and on an acknowledgement following public consultation. Carrying out these projects is possible due to the sums collected for the local budget and distributed in accordance with the needs of the community.

Building up local budgets is done in accordance with the principle of local autonomy by local councils, being made up of the totality of financial resources of the administrative-territorial unit.

Approaching this issue is a necessity asked by the need to find out sources for the progress of the Romanian village.

Sustainable rural development is a major objective of the national policy as part of the European Union strategy concerning the development of agriculture in accordance with the Common Agricultural Policy.

The notion of European administrative area

The notion of European administrative area was developed after the model of European economic and social areas.

A common administrative area is possible when a set of legal principles, rules and regulations is equally observed over a territory covered by a national Constitution.

The main texts making up the European Union (the Treaty of Rome – 1957 and the Treaty of Maastricht – 1992) do not suggest a common model of administration for its member states. Once the democratic nature of the political regime is established, the aspects related to Government and administration are subjected to the member states fully autonomous administratively.

Some of the aspects covered by the legislative activity of the European institution are:

- the intermediary role of the public administration which ensures free competition between the firms within the European Union stimulated so as to reach member-states specific standards;

- the support of the State for the enterprises, a support authorised and monitored by the European Union.

On the other hand, there is a rich legislative heritage concerning the autonomy, the legal aspects of some administrative sectors, which constitutes the so-called *acquis communautaire* (representing the entire set of common rights and obligations linking all the member-states within the European Union).

The structure of territorial public administration depends on the general option between centralising principles and decentralising principles. The necessity of local structures is determined by the fact that central public administration organisms cannot ensure the achievement of administrative tasks all over the territory and for which they need a local network.

Within the European Union, there are also both unitary administrative systems (France, Italy) and federal administrative systems (Germany, Belgium). These two forms of organisation mark the way local public administration is structured. Thus, a territorial community belonging to a unitary state is distinct from another one, which is a member of a federal state; the former will have only administrative competences and will not impact the state's unitary structure.

Integrated into a unitary administrative system or not, local communities benefit from the state's financial support – (federal) central administrations – but they are also tax-payers and produce a smaller income compared to the national average.

The institutional frame for the development of the rural communities in Romania

The administrative doctrine of the last years is based on three main principles when it concerns the way territorial administration is organised:

- the **principle of centralisation**, as a basic principle of organising local administration, supposes exclusively the dependence of local organs of the central administration, since they are, from a legal point of view, the only ones that adopt decisions applicable in the field, and territory authorities (we speak here only of state authorities) have only the competence of applying decisions of central authorities;

- the **principle of deconcentration** is, in reality, a form of centralisation of decision-making, and it consists in the acknowledgement of the state's agents distributed all over the country;

- the **principles of decentralisation** supposes the existence of some local public people designated by the community of the territory to have their own competences, and intervening directly in the management and administration of the community's "businesses": this notion also involves the idea of **local autonomy**.

The two notions are often used together, as stipulated by the art. 119 of the Constitution (1991): "*Public administration in administrative-territorial units is based on the principle of local autonomy and on the principle of decentralisation of public services.*"

As legal reality, local autonomy has varied depending on several factors such as:

- historical tradition;
- geographical environment;
- economic resources;
- degree of civic or political education;
- the state of national and international regulations.

Local autonomy in the communes and towns is exercised by two authorities: **local councils** and the **mayor**, elected under legal conditions. In this way, the legislator reflects the double nature of the commune, town or municipium, i.e. *community* and *administrative-territorial unit* (authorities elected through voting by a local community).

Through the prism of local autonomy, local public authorities are not subordinated to county or central authorities. But, on the ground of constitutional stipulations, **county councils**, the prefect or the Government may exert their prerogatives of *coordinating authority*, his/her prerogatives of controlling legality and its general public administration coordination, respectively.

Besides local public administration authorities, the institutional frame of the economic dimension of the management of regional and local development in Romania is ensured, mainly, by the following ministries:

- the Ministry of Economics and Finances;
- the Ministry for SMEs, Trade, Tourism, and Liberal Professions;
- the Ministry of Transport;
- the Ministry of Development, Public Works and Dwellings.

Conclusions

On the ground of our analyses whose results are presented above, we can say that Romanian administration is confronted with certain major problems needing solutions; it is obvious that the process of decentralisation of administration is stagnant since it lacks main elements such as basic rules, principles of functioning of the entire process, institutional structure that governs the process, the legal frame that allows the achievement of this process.

Local autonomy should function on the ground of some principles as subsidiarity – which supports wider competence delegation to local authorities in accordance with the European Chart of Local Autonomy – and solidarity – which aims at ensuring for all local communities the possibility of developing as harmoniously as possible in the spirit of national unity and of the observance of European standards.

Specificity of activities in the rural area does not contribute to the economic development of the villages.

It is imperiously necessary to attract investments for industrial activities or for the constructions which proved to be some of the basic branches of the national economy with important contribution to local development.

For these areas to become attractive from the point of view of investments we need to adopt and implement projects particularly in the field of transport infrastructure which should be contained in territorial management plans and, if the case, complementary to regional projects.

The lack of (little) funds at the disposal of local communities that allow the initiation and completion of feasibility studies in order to access European projects determines the lack of such projects thus depriving the community of its chances.

Thus, we need to find emergency solutions to meet the more serious issues accumulated in time, during the transition to market economy in Romania, as well as the changing of the concepts of social inclusion and development.

It is necessary to approach anti-poverty measures and to supply an action frame for their implementation, to permanently monitor the dynamics of poverty and of social exclusion, to develop reports concerning their specific aspects and to establish partnerships and cooperation relationship between the different institutions interested.

It is necessary to intensify actions in the field of social dialogue and child protection, to increase responsibility in supporting the families in need in order to prevent abandon and to protect the children in risk situations.

To sum up, the main factors leading to a flaw functioning of the local public administration are:

- dysfunctionalities in the relationships with the state decentralised institutions;
- insufficient financial resources at the level of local budgets;
- lack of funds for a good organisation of the different services;
- lack of space for the personnel and lack of technical equipment compared to the existing issues;
- flaws of the legislative system;
- lack of motivation of the personnel because of the low wages compared to the work and responsibility of the job;
- fear of unemployment.

In agreement with the present legislation (Law nr. 215/2001 concerning local public administration and Law nr. 315/2004 concerning regional development), local authorities should be involved in the development of programmes and in their implementation, no matter the financing form.

Thus, local public administration authorities become the main actors of local development.

**SUB-SECTION: THE IMPACT OF FOREIGN LANGUAGES ON THE
BUSINESS ENVIRONMENT**

VOCABULARY AND LANGUAGE TEACHING

Abrudan Cristina

Universitatea din Oradea Facultatea de Stiinte Economice

In this paper we have looked at the difference between teaching language structure and teaching vocabulary. We have discussed how counts of frequency alone are not enough to determine what words should be taught. We have seen that knowing a word means more than just knowing its meaning. Even that is problematical since meaning includes sense relations and context, for example. To know a word we also need to know about its use, how it is formed and what grammatical behavior it provokes. Above all, in this paper, we have approached the idea of how vocabulary teaching and learning need to be emphasized in order for students to be competent language users.

Keywords: vocabulary, teaching vocabulary, learning vocabulary, word selection.

Jel Code: Y8

To the non-language specialist, the common sense view of how languages are learned is that you substitute the words in your first language for the corresponding words in the second language. Words represent the building block upon which knowledge of the second language can be built. Armed with this common sense but naïve view, non-specialists would therefore be surprised if they were to survey the history of language teaching. Far from being regarded of pivotal importance in language learning, the status of vocabulary in the last 50 years has, on the whole, been relatively low. For many years, vocabulary was seen as incidental to the main purpose of language teaching – more exactly the acquisition of grammatical knowledge about the language. Vocabulary was absolutely necessary to give students something to hang on when learning structures, but was frequently not a main focus for learning itself. Recently, however, linguists have increasingly been turning their attention to vocabulary, stressing its importance in language teaching and reassessing some of the ways in which it is taught and learnt.

Nowadays, people are more and more aware of the fact that the acquisition of vocabulary is just as important as the acquisition of grammar, although the two are obviously interdependent. If language structures make up the skeleton of a language, the vocabulary provides the flesh and the vital organs. Vocabulary is the knowledge of words and word meanings. As Steven Stahl (2005) puts it, "Vocabulary knowledge is knowledge; the knowledge of a word not only implies a definition, but also implies how that word fits into the world." Vocabulary knowledge is not something that can ever be fully mastered; it is something that expands and deepens over the course of a lifetime. Instruction in vocabulary involves far more than looking up words in a dictionary and using the words in a sentence. Vocabulary is acquired incidentally through indirect exposure to words and intentionally through explicit instruction in specific words and word-learning strategies.

Unless words are used, an ability to manipulate language structures does not have any potential for expressing meaning. Here we talk about the importance of choosing one's words carefully. In the real life it is possible that where vocabulary is used correctly, it can cancel out grammatical inaccuracy. The need to study language structures is obvious, as grammatical knowledge allows us to generate correct sentences. However, at the same time, we must have meanings that we wish to express, and we need to have a store of words that we can select from when we wish to express these meanings.

A common problem in teaching vocabulary lies in the fact that whilst there is a consensus about at what levels grammatical structures should be taught, we can hardly say about teaching vocabulary. Of course, there are syllabuses that include word lists, but there is no guarantee that

the list for a set of students is the same with the list for another set of students at the same level. But, in the same time we can say students have to learn the use of the verb 'to be' before they learn its use as an auxiliary in the Present Continuous Tense.

One of the problems of vocabulary teaching is how to select what words to teach. Dictionaries for upper intermediate students frequently contain up to 55,000 words or even more, and a word may have many meanings. They represent just a small fraction of all the possible words in a language. For a second-language speaker to get to native-speaker level takes many years of hard work. One would have to double the size of the active vocabulary at least. Some linguists estimate that educated native speakers could have an active vocabulary of between 8,000 and 10,000 words. Good second-language speakers might have an active vocabulary of 3,500 words. That is quite a difference.

Frequency has been a general principle of vocabulary selection. The criteria of how frequently some certain words are used can help us decide which words we should teach. The words which are most commonly used are the ones we should teach first. Another principle that has been used in selecting the vocabulary is that of coverage. A word is more used if it covers more things than if it only has a specific meaning. In order to know which words are the most frequently used, we can read lists containing the most often used words in a certain language. This was done by Michael West who scanned newspapers and books in order to list his frequency tables.

Perhaps the greatest revolution in vocabulary investigation and design, however, has been the harnessing of the computer to the task of finding out which words are used and how they are used. The massive Cobuild computer-based corpus at Birmingham University has been used not only for the design of a learner's dictionary but also as a resource for a vocabulary driven course book. That is the usefulness of the computer, of course: you can key in a word and it will immediately give you examples showing you the sentences and phrases the word occurs in and how often it is used. The Internet itself is an almost perfect learning space. It should be possible, then, to design vocabulary syllabuses on the basis of computerized information. If we feed in enough text, from newspapers, magazines, books, letters, conversations, and so on, we will be able to make accurate statements about what words to teach. There is no doubt at all that the use of the computers has gained enormously from the information they have been able to access. But even with such scientific power at our fingertips, the problem of selection has not been completely solved.

The first thing to realize about vocabulary items is that they frequently have more than one meaning. The word "book" for example, obviously refers to something you use to read from, "a set of printed papers fastened together inside a cover, as a thing to be read." according to the Concise Oxford Dictionary. But the same dictionary continues in giving eight more meanings of the word as a noun, two more meanings of "book" as a verb and three meanings where "book" + preposition makes phrasal verbs. So, we will have to say that the word "book" means the kind of thing you read from but it can also mean a number of other things, too. What a word means can be changed, stretched or limited by how it is used and this is something students need to know about. Word meaning is frequently stretched through the use of *metaphor* and *idiom*. Word meaning is also governed by *collocation* – that is which words go with each other. But words can change their shape and their grammatical value, too. Students need to know facts about word formation and how to twist words to fit different grammatical contexts. And they also need to know how suffixes and prefixes work. How can we make the words potent and expensive opposite in meaning? Why do we preface one with *-im* and the other with *-in*? Students need to know also how words are spelt and how they sound. Indeed the way words are stressed – and the way that stress can change when their grammatical function is different – as with nouns and verbs, for example, is vital if students are able to understand words and use words in speech. Part of learning a word is learning its written and spoken form.

Thus, we come to the conclusion that teaching vocabulary is obviously more than just presenting new words. This may, of course, have its place, but there are some other things to be discussed, too. For example, students see a lot of words during one week, some of them are used straight away, others are not. The question is the following: Should we teach some words which we need for structure practice, for example, and not teach others which occur incidentally in reading texts, for example? Is there any way in which we can encourage students to really learn a word?

Experiments on vocabulary seem to suggest that students remember best when they have actually done something with the words they are learning. There is a definite advantage in getting students to do more than just repeat them. Tasks such as changing them to mean their opposites, making a noun an adjective, putting words together, etc. help to fix the words in the learners' minds. One way or another, we have to get students interact with words. We should get them to “adopt” words they like and that they want to use. We should get them to do things with words so that they become properly acquainted with them. Especially at intermediate levels and above, discovery techniques – where students have to work out rules and meanings for themselves, rather than being given everything by the teacher, represent an appropriate alternative to standard presentation techniques. This is certainly true of vocabulary learning where students will often be asked to discover for themselves what a word means and why and how it is being used.

At intermediate levels we can assume the students already have a considerable store of vocabulary. Rather than teach them new words we can show them examples of words in texts and ask them to use their previous knowledge to work out what words can go with others, when they should be used and what connotations they have. Discovery techniques used with vocabulary materials allow students to activate their previous knowledge and to share what they know (if they are working with others). The conclusion we can draw from this discussion about active and passive vocabulary and about interacting are best summed up by a quote from Adrian Underhill: “...engaging the learner... is essential to any activity that is to have a high learning yield.” (Underhill 1985:107)

We have already said that selecting words for teaching purposes is a very difficult task to do. We based this on the enormous number of words that any language contains. For the same certainly students will want to enlarge their vocabulary with many more words than we, their teachers, can teach them. Where can they get this information? Certainly dictionaries provide one of the best resources for students who wish to increase the number of words they understand, or at least for students who wish to understand what a word means when they come across it in a text or a conversation. Most students will consult a bilingual dictionary to find the equivalent in their language. There is nothing wrong with such dictionaries except for the fact that they do not usually provide sufficient information for the students to be able to use. Perhaps the greatest resource we can give our students is a good monolingual dictionary. They provide information about pronunciation, spelling, word formation, metaphorical and idiomatic use – the entire profile of a particular word. The fact that students do not use monolingual dictionaries very much is not just because of language difficulty, however. Dictionaries are very daunting precisely because they contain so much technical information. Unless we train students in how to understand the information and use the dictionaries, the money they spend in buying them will be largely wasted since they never open them.

The scientific research on vocabulary instruction reveals that most vocabulary is acquired incidentally through indirect exposure to words. Students can acquire vocabulary incidentally by engaging in rich oral-language experiences at home and at school, listening to books read aloud to them, and reading widely on their own. Reading volume is very important in terms of long-term vocabulary development. Extensive reading gives students repeated or multiple exposures to words and is also one of the means by which students see vocabulary in rich contexts. Cunningham (2005) recommends providing structured read-aloud and discussion sessions and

extending independent reading experiences outside school hours to encourage vocabulary growth in students.

It seems almost impossible to overstate the power of words; they literally have changed and will continue to change the course of world history. Perhaps the greatest tools we can give students for succeeding, not only in their education but more generally in life, is a large, rich vocabulary and the skills for using those words. Our ability to function in today's complex social and economic world is affected by our language skills and word knowledge. In addition to the vital importance of vocabulary for success in life, a large vocabulary is more specifically predictive and reflective of high levels of reading achievement.

L'EMPREINTE CULTURELLE ET SA DYNAMIQUE DANS LE MILIEU PROFESSIONNEL. COMMUNICATION ET ADAPTATION INTERCULTURELLES DANS LES ENTREPRISES ITALO-ROUMAINES

Catarig Andra-Teodora
Universitatea din Oradea
Facultatea de Științe Economice

The present paper presents a few aspects reflecting the difficulties that Italian businessmen face when adapting to the Romanian social and cultural environment or when leading Romanian working groups and their reaction towards working with Italian managers. The differences of mentality and both sides adaptation difficulties were detected starting from two questionnaires applied in mixed enterprises in county Bihor. The study underlines that the Romanians and Italians have two different ways of working, as a result of historical, economical, social and cultural differences.

Keywords: intercultural management, business culture, cultural dimension, cultural space

Cod JEL lucrare: F23, Y8, Z1

1. Introduction

Ces vingt dernières années, la réalité économique roumaine a connu une série de changements. L'un des plus importants concerne les investissements étrangers. Outre les incontestables bénéfices apportés par les investissements allemands, français, italiens ou américains, ceux-ci ont fait surgir des difficultés d'ordre juridique, économique, mais aussi culturel et ont déterminé des modifications significatives dans le milieu d'affaires et dans le micromilieu de l'entreprise.

Dans son ouvrage de 1996, Gh. Gh. Ionescu résumait les différences entre les organisations internes et les organisations mondiales à l'aide de deux notions: la *dispersion géographique*, relative à la question si les entreprises produisent ou exportent seulement dans des pays étrangers, et le *multiculturalisme*, à savoir les circonstances où plusieurs cultures interagissent dans les affaires.

La présente communication se propose d'analyser quelques aspects interculturels qui dérivent de l'implantation – dans la province de Bihor – d'entreprises dirigées par des investisseurs italiens. L'on retrouve ici les deux caractéristiques énoncées par le professeur Gh. Gh. Ionescu: les entrepreneurs italiens réalisent la production à l'extérieur de leur territoire national, en utilisant du personnel provenant de deux espaces culturels différents : l'espace italien et l'espace roumain. Nous définissons *l'espace culturel* comme l'ensemble des conditions matérielles et spirituelles dans lesquelles vit une communauté linguistique. C'est une réalité placée sous le signe de la tradition culturelle. Celle-ci peut influencer la manière dont les membres de la communauté perçoivent ou filtrent les informations, comprennent le monde, construisent leur discours et exercent leur activité (Catarig 2009).

En investissant en Roumanie, les hommes d'affaires italiens se sont retrouvés d'une part dans la situation d'entamer des relations d'affaires et de collaborer avec des entrepreneurs roumains, d'autre part dans celle d'embaucher, de diriger et de motiver le personnel appartenant à une culture différente. À leur tour, les hommes d'affaires et les employés roumains ont dû s'adapter aux exigences d'entrepreneurs étrangers.

Certes, entre les deux peuples il y a de multiples affinités, qui peuvent être expliquées par l'origine latine des Italiens et des Roumains. Néanmoins, le fait que chaque peuple a une histoire, des valeurs et des symboles qui lui sont propres crée un nombre considérable de différences

culturelles, que l'on ne doit pas négliger, car elles peuvent donner naissance à des malentendus, et parfois même à des conflits dans les relations de travail.

2. Méthode de recherche

Les chercheurs dans le domaine des études culturelles et dans celui du management ont démontré que les valeurs, les attitudes et le comportement des gens ont des racines profondes dans l'histoire et dans la culture d'un peuple. Ces aspects influencent non seulement la vie quotidienne, mais aussi la manière dont les gens travaillent. La plupart des études se réfèrent toutefois aux différences culturelles observées dans les milieux d'affaires américain, japonais, chinois, français ou allemand. Il y a très peu de recherches concernant la culture d'affaires en Italie ou en Roumanie.

Pour identifier et estimer les différences culturelles qui se manifestent dans le cadre des organisations dont les membres proviennent des espaces culturels italien et roumain, nous avons appliqué deux questionnaires dans dix entreprises fondées par les entrepreneurs italiens dans le département de Bihor. Pour que les résultats obtenus soient pertinents, nous avons sélectionné les entreprises qui opèrent depuis au moins dix ans sur le territoire de la Roumanie.

Le premier questionnaire, rédigé en italien, s'est adressé aux investisseurs, techniciens et ouvriers italiens et a été complété par douze personnes travaillant dans les domaines de l'industrie et des services. Au second questionnaire, adressé aux employés et collaborateurs roumains, ont répondu soixante personnes, dont 45% économistes.

L'analyse des réponses nous a aidé à établir en quoi consiste l'*empreinte culturelle* (ou les traits caractéristiques) respectivement des Italiens et des Roumains, à décrire comment s'actualisent ces traits dans les relations de travail et à plaider en faveur de la connaissance et de la gestion efficace des différences culturelles.

3. La manière dont les représentants de l'espace culturel italien perçoivent le milieu professionnel roumain

En général, les Italiens affirment que les principaux motifs pour lesquels ils ont investi en Roumanie ont été les perspectives de développement et la liberté d'action des entrepreneurs. Avant de réaliser l'investissement, ils ont analysé d'abord les réglementations économiques, ensuite le risque politique.

En ce qui concerne les relations avec le milieu d'affaires roumain, un nombre restreint d'Italiens travaillent directement et collaborent avec des investisseurs roumains. Ils considèrent que les entrepreneurs italiens ont une vitesse plus grande d'exécution des projets, une expérience plus vaste, un meilleur sens de l'organisation et une majeure précision.

Quant à la main d'œuvre roumaine, celle-ci est considérée assez compétente. Comme modalités de perfectionnement professionnel, les dirigeants italiens choisissent aussi bien pour le personnel italien que pour le personnel roumain les cours de spécialisation sur le lieu de travail et les cours de formation en Italie.

Devant faire un choix parmi plusieurs qualités figurant sur une liste, seuls 25% des investisseurs italiens attribuent aux Roumains des qualités telles que la précision, la ponctualité, l'opérativité, le sens de la communication, la flexibilité et l'attitude positive dans les relations avec les étrangers. Toutefois, la plupart des employeurs apprécie l'habileté manuelle des ouvriers roumains, même s'ils considèrent que le temps de réaction de ceux-ci est lent.

En revanche, entre 75% et 100% des employeurs italiens pensent que les travailleurs italiens peuvent être appréciés pour la ponctualité, l'opérativité, la précision, le sens de la compétition et le temps rapide de réaction. Suivent des qualités comme le sens de la communication, la disponibilité d'effectuer des heures supplémentaires, celle d'apprendre une nouvelle langue étrangère et la bonne attitude dans les rapports avec les étrangers.

Devant indiquer les points forts et les points faibles des Roumains, les Italiens apprécient le fait que les Roumains parlent plusieurs langues étrangères, qu'ils apprennent rapidement l'italien et qu'ils ont une bonne formation théorique. Mais, à leur avis, les Roumains n'obtiennent pas de bons résultats dans la pratique, sont caractérisés par un manque d'intérêt, ne se rapportent pas au futur, ne sont pas créatifs, rencontrent des difficultés dans les interactions avec les collègues et consomment de l'alcool pendant leur programme de travail.

En général, les Italiens croient que les principales différences entre les employés roumains et les employés italiens et les aspects auxquels les Roumains sont déficitaires peuvent être identifiés au niveau de la ponctualité, de la vitesse et de la précision dans l'exécution des tâches, de l'expérience, de l'engagement, du zèle et de l'intérêt pour le travail.

Bien qu'ils affirment qu'ils parlent assez bien le roumain, les investisseurs italiens préfèrent utiliser l'italien comme langue de communication dans l'entreprise.

Quant à la mentalité des Roumains, 50% des interviewés pensent qu'elle est différente de celle des Italiens et 50% affirment qu'elle est très différente. Aucun répondant n'opte pour les variantes « très similaire » ou « assez similaire ».

4. La manière dont les employés et les collaborateurs roumains perçoivent les représentants du milieu d'affaires italien

La majorité des répondants au second questionnaire sont embauchés dans des entreprises ayant du capital italien (86%) et occupent des positions d'économistes, techniciens, directeurs, juristes, secrétaires et ouvriers. Les autres (14%) sont des collaborateurs dans les domaines de l'assistance juridique, commerciale et des services immobiliers.

À la question « Quelles sont les qualités de l'investisseur ou de l'employeur italien ? », les répondants ont principalement choisi : les longues discussions, l'ouverture au dialogue, l'opérativité et la rigueur. Quant à l'investisseur ou à l'employeur roumain, celui-ci est perçu par ses anciens employés comme étant flexible, communicatif, permissif et caractérisé par l'esprit de compétition.

Les aspects auxquels les employeurs italiens et roumains ont obtenu un score similaire sont les suivants : l'ouverture au dialogue, la communication explicite, la ponctualité et la capacité d'apaiser les conflits. D'autres aspects communs, ajoutés par les répondants, sont : l'implication dans le déroulement de l'investissement, le désir d'obtenir du profit et l'inventivité.

Les plus grandes discordances regardent les longues discussions et la rigueur (propres aux Italiens), la permissivité et la flexibilité (propres aux Roumains). De plus, les répondants affirment que les Italiens sont plus habiles dans les affaires, se préoccupent davantage de la formation des employés, s'intéressent beaucoup aux nouveautés législatives et apprécient davantage le travail des employés, tandis que les Roumains se montrent plus compréhensifs et s'adaptent plus facilement aux diverses situations.

Chez leurs collègues italiens, les Roumains apprécient l'opérativité, la disponibilité d'effectuer des heures supplémentaires et celle d'apprendre une nouvelle langue, la ponctualité, l'esprit de compétition, la communication explicite, mais estiment qu'ils sont réticents dans les relations avec les étrangers, jasant et transmettent aux supérieurs hiérarchiques les discussions qu'ils ont eues avec leurs collègues roumains. Les répondants prisent également la spécialisation stricte, la connaissance, l'acceptation et le respect des règles, la discipline et les liens étroits avec les autres membres de la communauté italienne. Quant aux défauts, ils mentionnent le manque d'attitude collégiale et le fait que les employés italiens se lamentent beaucoup.

Parmi les premières différences de mentalité rappelées par ceux qui ont voyagé en Italie, on peut mentionner la propension à la propreté, le respect des règles, le respect de soi, la préoccupation pour l'élégance vestimentaire (surtout chez les hommes), le respect de l'heure du déjeuner, mais aussi l'avarice et la réticence envers les étrangers.

Finalement, 54% des répondants estiment que la mentalité italienne est différente de la mentalité roumaine, 28% considèrent que les Italiens sont assez similaires et 9% optent soit pour la variante « mentalité très proche », soit pour la variante « mentalité très éloignée ».

5. Conclusions

Quoique dans la vie quotidienne il semble que les Italiens et les Roumains se ressemblent beaucoup, en réalité l'on a affaire à deux modèles différents de perception du monde, qui dérivent d'un parcours historique, social et économique différent. Les différences culturelles deviennent visibles dans le milieu professionnel et donnent naissance à un style de travail typiquement italien et à un style de travail typiquement roumain.

Nous n'avons pas l'intention de faire une différenciation catégorique, mais nous pouvons extraire quelques caractéristiques déterminées par la manière dont chacun des deux peuples conçoit le monde, ainsi qu'elles résultent de l'attitude envers le travail.

L'empreinte culturelle de la communauté italienne inclut des traits comme : la préférence pour les longues discussions, la communication explicite, l'orientation vers le futur, l'individualisme, la discipline et le respect des normes et des règles, l'opérativité, la rigueur et la précision dans l'accomplissement des tâches, la spécialisation stricte, l'intérêt pour le travail, l'option pour l'italien comme langue de communication. L'entreprise est vue comme un système que la direction, mais aussi les employés doivent faire fonctionner.

L'empreinte culturelle de la communauté roumaine se caractérise par : la communication explicite, l'ouverture au dialogue, l'adoption très facile des langues de circulation internationale dans la communication d'affaires, la flexibilité, l'adaptabilité à diverses situations, l'habileté manuelle ou dextérité, l'orientation vers le présent et le passé, l'oscillation entre l'individualisme et le collectivisme, le laxisme en ce qui concerne la discipline et le respect des normes et des règles, le degré élevé de tolérance, la permissivité, la lenteur dans la réaction, un moindre intérêt pour la réalisation opérative, exacte et ponctuelle des tâches. Seule la direction est responsable du fonctionnement de l'entreprise.

Il est utile de connaître ces traits caractéristiques pour savoir surmonter les difficultés que suppose l'interaction des dirigeants et des employés au sein des entreprises multiculturelles. Les acteurs du milieu professionnel devraient acquérir une sensibilité interculturelle qui leur permette de transformer les différences culturelles en facteurs favorables à l'interaction, à la collaboration et au travail rentable.

Ces traits, dus aux évolutions historiques, sociales, économiques et culturelles des peuples, ne sont pas immuables. Des études ultérieures pourront refléter la dynamique des empreintes culturelles, étant donné les changements intervenus dans l'évolution de la Roumanie après l'intégration dans l'Union Européenne et les tendances de l'économie internationale.

LES COMPETENCES LANGAGIERES – SUGGESTION POUR UNE ADAPTATION STRATEGIQUE DANS LE MANAGEMENT DE L'ENTREPRISE

Constantin Felicia

Universitatea din Oradea

Facultatea de Stiinte Economice

La dynamique de la société actuelle privilégie la libre circulation des personnes et de l'information. L'Europe, sans les frontières physiques qui séparaient autrefois les peuples, fournit le sentiment naturel d'un espace global, aujourd'hui violemment frappé par la crise économique. Dans le contexte des réductions des budgets, les entreprises doivent se redresser par l'implémentation de stratégies compétitives. Le modèle de la roue compétitive de Marc Ingham permet d'envisager les ressources humaines et leurs compétences linguistiques comme une valeur ajoutée, facteur stratégique révélateur de différences. La formation langagière étant cependant dispendieuse, nous suggérons une solution équilibrée et économique: la formation aux compétences partielles en langues étrangères par l'intercompréhension linguistique.

Keywords: intercompréhension, management, stratégie, compétences langagières

L'EUROPE 2020 - la nouvelle stratégie globale européenne

Des syntagmes tels que « monde globalisé », « communauté planétaire », « village global », exotiques ou inexistantes à l'aube du XX^{ème} siècle, sont devenus aujourd'hui des lieux communs, usés par les analyses et vidés de sens à force des répétitions. Ces images de la globalisation doivent servir de toile de fond sur laquelle se lisent de nos jours la vie des individus et des organisations. Presque chaque famille de Roumanie compte au moins un membre qui est allé à l'étranger pour travailler ou pour faire du tourisme – et cela sans les entraves d'autrefois. L'idée de la libre circulation des biens et des personnes est complètement assimilée; les gens ne se posent plus le problème si *c'est possible* de travailler / voyager ailleurs, cette question étant remplacée par des préoccupations du genre *pourquoi, où, comment* ou *quand* le faire.

Tous ces propos, inattaquables il y a deux ans, portent aujourd'hui le gros fardeau de la crise économique déclenchée en 2008. Peut-être jamais le signal d'alarme n'a-t-il été si sonore, installant des priorités dans une stratégie multinationale. Publié il y a deux mois, en mars 2010, le projet « Europe 2020 » est la nouvelle stratégie pour une croissance intelligente, durable et inclusive décidée par les responsables européens.

La préoccupation sincère pour le devenir européen nous autorise à le lire plutôt comme un plan de sauvegarde pour une décennie décisive: *«L'Europe est confrontée à une période de transformation. La crise a annulé des années de progrès économique et social et révélé les faiblesses structurelles de l'économie européenne. Entre-temps, le monde bouge vite et les défis à long terme, comme la mondialisation, la pression sur les ressources et le vieillissement, s'intensifient»*²⁸⁷. (COM(2010) 2020: 3). Plus loin, la même analyse devient encore plus nuancée: *« La récente crise économique est sans précédent pour notre génération. Les progrès constants de la croissance économique et de la création d'emplois enregistrés au cours de la dernière décennie ont été annulés... notre production industrielle est retombée aux niveaux des années 1990 et 23 millions de personnes – soit 10 % de notre population active – sont*

²⁸⁷ Commission Européenne - EUROPE 2020 Une stratégie pour une croissance intelligente, durable et inclusive, COM(2010) 2020 , Bruxelles, 2010, consultable en synthèse sur

<http://ec.europa.eu/eu2020/pdf/COMPLET%20FR%20BARROSO%20-%20Europe%202020%20-%20FR%20version.pdf>, vérifié le 3 avril 2010.

actuellement sans travail. La crise a été un choc violent pour des millions de citoyens et elle a révélé certaines faiblesses fondamentales de notre économie. » (COM(2010) 2020: 6).

Face à ce tableau apocalyptique dont les traits définitoires sont *l'annulation* des années de progrès, de la croissance économique et de la création d'emplois, *les faiblesses* fondamentales, *la chute* de la production, *la perte* de millions d'emplois, plusieurs interrogations apparaissent naturellement: Quel est l'avenir des entreprises, nationales ou internationales, quelles stratégies de reprise et de développement devraient-elles implémenter afin de dépasser ce choc violent? Sur quoi intervenir? En quoi investir? C'est dans ce contexte que nous proposons d'encourager les entreprises à investir dans le personnel de l'entreprise, dans sa formation et ses compétences.

Parmi les sept initiatives phares²⁸⁸ imposées par « Europe 2020 » comme priorités dans la stimulation du progrès et d'une gouvernance économique crédible, nous trouvons un argument à l'appui de notre jugement. L'intérêt porté dorénavant de manière programmatique à l'implémentation d'une **stratégie pour les nouvelles compétences et les nouveaux emplois** permettrait aux personnes de développer leurs compétences tout au long de leur vie (COM(2010) 2020: 4). Ces compétences seraient un multiplicateur de valeur pour la personne, l'entreprise, le marché de travail et les relations qui s'y établissent, dans le sens de l'adéquation entre l'offre et l'emploi et la mobilité professionnelle.²⁸⁹

Pour l'instant la crise reste un indicateur d'inadaptation, et paradoxalement, devient un révélateur de stratégies d'adaptation et un ressort du changement.

La roue de la stratégie compétitive de Marc Ingham

Notre analyse se fonde en premier lieu sur un modèle bien connu dans la théorie du management, le modèle LCAG²⁹⁰ qui reste, malgré les reproches que lui sont faits, le premier modèle qui insiste sur le besoin d'une approche globale dans l'utilisation efficace des ressources et compétences distinctives dans l'espace économique.

Dans l'esprit du modèle LCAG, la roue de la stratégie compétitive, adapté par Marc Ingham d'après deux pionniers du management stratégique, Andrews (1971) et Porter (1980), relève une interdépendance de tous les facteurs impliqués dans une organisation.

Ingham note que dans son approche, le concept de stratégie « dépasse largement la définition de l'activité et le choix des produits-marchés et des activités pour inclure les principaux acteurs de l'environnement concurrentiel et socio-économique. La notion d'organisation recouvre les structures, les processus, les questions de leadership mais aussi les ressources de l'entreprise et les composantes distinctives dont elle dispose» (Ingham: 6).

²⁸⁸ Il s'agit, dans une énumération simple, des stratégies «*Une Union pour l'innovation*», «*Jeunesse en mouvement*», «*Une stratégie numérique pour l'Europe*», «*Une Europe efficace dans l'utilisation des ressources*», «*Une politique industrielle à l'ère de la mondialisation*» «*Une stratégie pour les nouvelles compétences et les nouveaux emplois*», «*Une plateforme européenne contre la pauvreté*».

²⁸⁹ Le même objectif, l'entrée sur le marché du travail, focalise les jeunes et le renforcement des performances des systèmes éducatifs dans le cadre du volet «*Jeunesse en mouvement*».

²⁹⁰ Le nom vient des initiales des chercheurs Learned E. P., Christensen C. R., Andrews K. R. et Guth W. D., auteurs de Business Policy, text and cases, Richard D. Irwin, Homewood, IL., 1965.

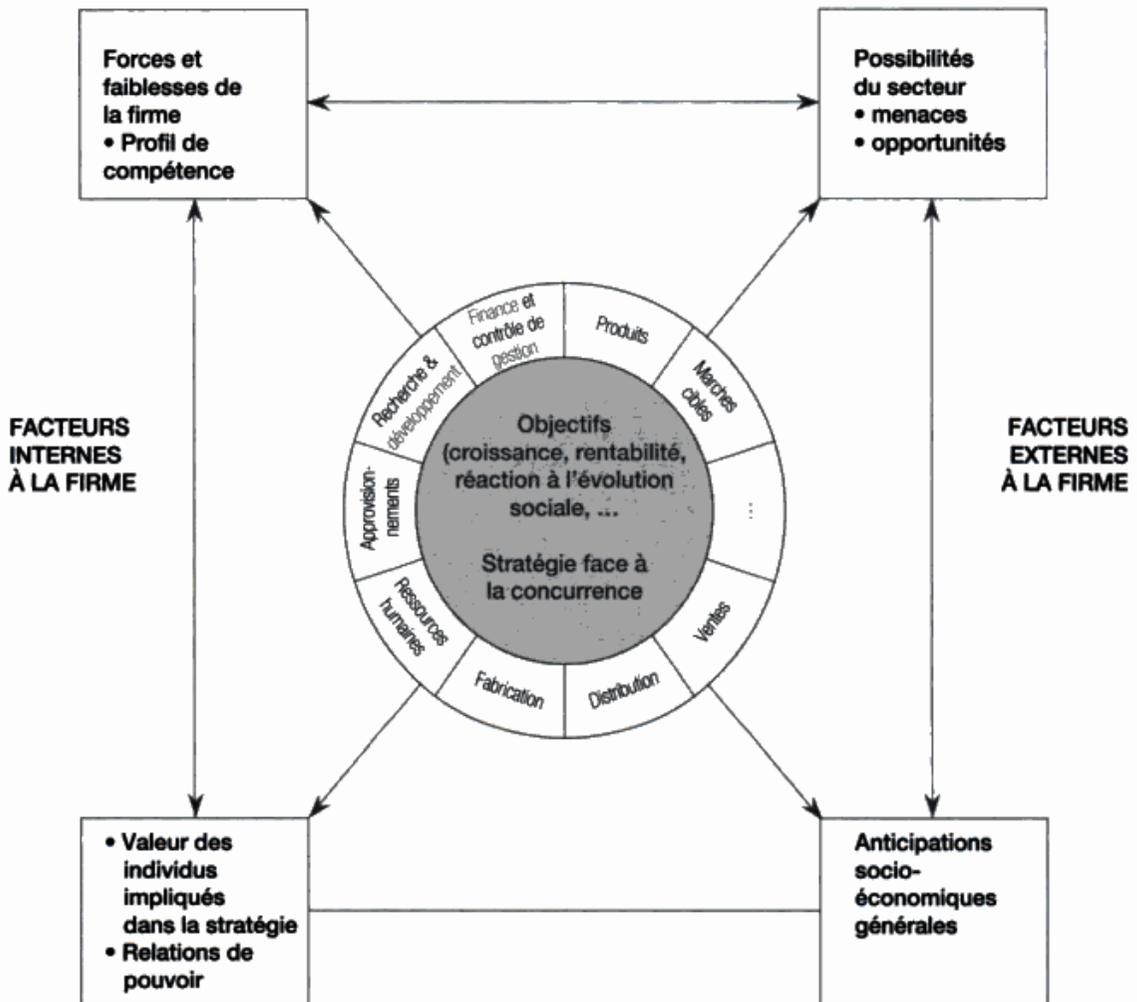

Fig.1 *Roue de la stratégie compétitive* d'après Marc Ingham (1995)

Nous nous permettons d'observer que la stratégie compétitive est comme un engrenage qui, actionné correctement, permet à l'entreprise de se débloquer et de rester sur le marché, produisant un avancement et une transformation; plus encore, tout ce mécanisme complexe et sensible ne serait pas à même de fonctionner en l'absence d'une bonne communication, l'équivalent d'une « huile » de qualité.

a). Au centre de la roue compétitive, en relation d'interdépendance, se trouvent d'une part les **objectifs** d'une entreprise soucieuse de faire face à la concurrence par une réaction adéquate à l'évolution sociale (croissance, rentabilité, etc.) et d'autre part la **stratégie** de la firme.

b). Tous les facteurs économiques – **finances et contrôle de gestion, produits, marché cibles, ventes, distribution, fabrication, ressources humaines, approvisionnement, recherche et développement** - sont ancrés au centre de la roue, dans les objectifs et la stratégie de management. Une relation d'interdépendance s'établit entre l'axe central et les rayons. Une intervention sévère sur une ou l'autre des composantes aurait un effet d'entraînement des distorsions.

c). Tout ce fonctionnement est cadré par un autre dispositif, plus général, qui est celui des relations entre les **facteurs internes à la firme** et les **facteurs externes à la firme**.

c.1). **Les facteurs internes** concernent d'une part les forces et les faiblesses de l'entreprise à travers l'identification des compétences distinctives par rapport à la concurrence

et d'autre part la valeur des individus impliqués dans la stratégie et les relations de pouvoir dressées au sein de l'organisation.

Dans la perspective de ce modèle, nous estimons les individus comme une ressource de l'entreprise et leurs compétences comme une composante distinctive. Ce sont les facteurs internes à la firme, générateurs de forces ou de faiblesses de l'entreprise mais aussi d'avantage compétitif. Nous constatons facilement que la dynamique de toute entreprise est extrêmement complexe et que « l'avantage compétitif des chances offertes à la firme de se faire une place de choix dans la concurrence et la synergie qui est une mesure de l'aptitude de la firme à réussir dans une nouvelle activité, jouent un rôle central dans le processus de croissance ». (Ingham: 7)

c.2). **Les facteurs externes** renvoient à l'identification des menaces et des opportunités du secteur, en lien avec l'anticipation socio-économique générale. Nous devons situer par conséquent notre réflexion sous le signe de la mondialisation qui a marqué le passage du national vers l'international, avec toutes les implications de renouveaux et d'adaptations stratégiques dans le management de la firme.

Attentif au processus d'accélération de **l'internationalisation** au début des années '90, Jean Brilman résumait les nouveaux mots d'ordre du management dans des directives qui restent encore actuelles « *Si vous êtes une entreprise nationale, devenez internationale! Si vous êtes une entreprise internationale, devenez mondiale!* » (Brilman: 22). Jean-Marc de Leersnyder (2002) observe²⁹¹ une tendance à la standardisation des managements: « Les principes du management tels qu'ils sont enseignés dans les business schools du monde entier tendent à se standardiser », suite à une tendance renforcée par des « réglementations de plus en plus pan-nationales » (in Dupriez, Simons: 5). A tous les niveaux d'entreprise: mononationales, semi-internationales, internationales, transnationales²⁹² (Hagedoorn et Schakenraad, 1995: 21), les roues de compétitivité se trouvent affectées dans un secteur ou dans un autre.

Les compétences langagières - composante stratégique dans la firme

Nous nous arrêtons en ce qui suit aux entreprises qui comprennent le trait inter-national et conséquemment inter-culturel et pluri-culturel. L'implantation d'une entreprise à l'étranger suppose automatiquement l'émergence de la problématique interculturelle et de l'apprentissage des compétences interculturelles, dans la gestion des particularités. Selon Brilman, dans le contexte international, l'homme d'affaires doit considérer *deux niveaux* de différences: *les différences de systèmes* (géographie, climat, démographie, organisation de la société, politique, économique, légale) et *les différences culturelles...*(Brilman: 357)

Les différences culturelles commencent avec *la langue* qui pose une empreinte sur la manière de penser. Dans la lignée de plusieurs études dans le domaine, Brilman affirme que la langue est *la base de la culture* et identifie dans les problèmes langagiers le plus grand défi de l'activité à l'international, remplaçant les anciennes entraves liées aux télécommunications, supplées par le progrès technologique. La langue est un facteur de différence et de différenciation, d'avantages économiques au niveau de l'entreprise et de l'individu L'œil de l'économiste observe finement « ceux qui opèrent dans leur langue maternelle ont un avantage considérable sur les autres en terme de facilité, vitesse, nuances. Les autres, dont la connaissance s'échelonne de nulle à bonne, accomplissent, en sus du travail normal d'écoute ou de formulation, un travail de traduction à la fois imparfait et fatigant. Ceux qui n'opèrent pas dans leur langue paraissent moins intelligents,

²⁹¹ Dans la préface signée à La résistance culturelle: fondements, applications et implications du management interculturel - publiée en 2002 par Pierre Dupriez et Solange Simons.

²⁹² Conformément à Lakehal « la firme multinationale ne se définit ni par la nationalité (multiple) de ses propriétaires ou salariés, ni par le nombre très élevé d'implantations, ni par la taille gigantesque de ses installations, ni par la part substantielle des profits réalisés à l'étranger. C'est une société de dimension internationale par sa stratégie et ses capacités financières face aux marchés mondiaux, disposant d'un siège installé dans le pays d'origine (société-mère) et d'un ensemble d'établissements appelés filiales-atelier ou unités de production et unités-relais, dans plusieurs pays ». Lakehal voit une relation de synonymie entre « firme transnationale » ou « firme multinationale ». (Lakehal: 325).

parfois primaires, moins professionnels car moins précis, plus lents...Le choix de la langue ou des langues dans une multinationale ou le changement de langue officielle est donc une décision majeure ». (Brilman: 359)

La langue a aussi une valeur instrumentale et d'activation. Partisan d'une approche de l'entreprise par la communication - qu'il caractérise comme *constante et mouvante*, Claude Duterme constate l'implication de tous les membres de l'organisation - dirigeants, personnels, actionnaires, syndicats - dans un procès communicatif vu comme « jeu d'interactions qui mobilisent et stabilisent le système ». La **communication** se trouve au croisement de plusieurs facteurs: contenus, opérations de transmission, flux informationnels, structure hiérarchique, nature du support (oral, écrit, média, etc.), dans le cadre d'une distinction classique entre la *communication formelle* (visant l'ensemble des informations transmises à l'intérieur de l'entreprise) et la *communication informelle* (constituée par les relations d'échanges linguistiques non-professionnelles). (Duterme: 11-27)

Vu la situation encore fragile du système financier, les difficultés à emprunter, à dépenser et à investir pour les entreprises et les ménages, l'état des finances publiques durement touchées, les déficits budgétaires et les niveaux de dette dépassant 80 % du PIB, le potentiel de croissance divisé par deux, le manque de financement et l'incertitude (COM(2010) 2020: 6), le choix de l'allocation des ressources à l'une ou l'autre des composante de la roue stratégique (Figure 1) s'avère problématique. Tous les facteurs économiques sont importants, mais plus que toute autre composante, la communication se glisse dans chaque secteur de la vie de l'entreprise et dans tout contexte hors travail. Elle est organiquement imbriquée dans chaque articulation et dans chaque séquence, ce qui exige le besoin de ressources humaines dotées, en autres, de compétences linguistiques.

Finances et contrôle de gestion, produits, marché cibles, ventes, distribution, fabrication, ressources humaines, approvisionnement, recherche et développement, objectifs et stratégie, relations entre facteurs internes et externes à l'entreprise... rien ne fonctionne sans communication. La roue est entretenue par une communication efficiente favorisée par des employés compétents linguistiquement. Surtout dans les organisations connectées à l'international, la préoccupation pour l'amélioration du potentiel linguistique, devrait devenir prioritaire. On remarque aussi qu'« il est difficile d'imaginer un changement de structure qui ne s'accompagne pas d'une adaptation subséquente de la politique de gestion des ressources humaine (Pichault : 10).

Formations linguistiques

Mais l'investissement dans la formation langagière des employés (dirigeants, cadres, fonctionnaires, etc.) est coûteux, si l'on estime les conclusions d'une étude sur les dimensions de l'industrie de formation langagière dans l'UE. La recherche commandée par la Commission européenne - « Study on the size of the language industry in the EU », *European Commission, 2009* - relève pour l'industrie langagière un chiffre d'affaires de 8,4 milliards d'euros en 2008 et prévoit d'ici 2015 un CA entre 16,5 et 20 milliards d'euros. Les observations de Karl-Johan Lönnroth, directeur général de la DG Traduction de la Commission, reprises par le site www.euractiv.com²⁹³, viennent à l'appui de la thèse que nous avons soutenue plus haut: les langues sont considérées comme un élément qui dynamise la croissance économique, plutôt qu'un coût supplémentaire, tant que l'on ne peut pas vendre son produit sans parler la langue du marché en question. L'étude montre d'ailleurs que beaucoup d'entreprises étrangères ne

²⁹³ <http://www.euractiv.com/fr/culture/industrie-linguistique-europenne-represente-84-milliards-euros/article-187821> vérifié le 3 mai 2010; pour consulter l'étude, disponible seulement en anglais, voir http://ec.europa.eu/dgs/translation/publications/studies/size_of_language_industry_en.pdf, vérifié le 3 mai 2010.

présentent pas leurs produits dans la langue des pays auxquels ils s'adressent, à cause du financements limités.

Ce qui est pourtant profit pour les entreprises de profil représente un coût pour les entreprises bénéficiaires. L'apparition de plusieurs offres d'apprentissage dans le domaine des langues étrangères prouve que sur ce marché il y a des concurrents qui créent des produits substitutifs des méthodes traditionnelles, grâce à leur habileté de venir à l'accueil des besoins des clients pour les produits différenciés. Si dans l'économie on peut parler de la fidélité pour une marque, dans l'enseignement des langues l'addiction à une méthode langagière a un autre statut: on pourrait parler plutôt d'un attachement à une méthode d'enseignement de la part du formateur moins disposé au changement, et non pas de la part de l'apprenant, plus ouvert aux opportunités d'amélioration des performances. Une simple recherche sur internet génère des millions d'entrées et permettent le choix de cursus adaptés au profil de l'organisation et des employés.

Les coûts seraient sérieusement limités si les responsables de l'entreprise prenaient le temps de se documenter et d'identifier les **programmes de formation appropriée**. Le point de départ serait l'identification correcte des besoins des employés en termes de compétences. Le plus grand nombre de situations ne supposent pas l'atteinte des performances au niveau des quatre compétences: les compétences de compréhension orale, d'expression orale, de compréhension écrite et d'expression écrite ne sont pas nécessaires en égale mesure à tous. La nature du travail et la perspective de travail de l'employé privilégient le plus souvent **les compétences partielles**.

Le programme ICE (Intercompréhension Européenne) démarré en 2001 à l'Université de Reims, Champagne Ardenne, a dévoilé au fur et à mesure sa capacité de répondre aux besoins des entreprises. L'intercompréhension est un concept complexe qui s'est enrichi ce dernier temps de plusieurs valences: méthode d'enseignement de langue, produit, phénomène, finalité ou démarche stratégique dans le cadre d'un management compétitif. En tant que méthode d'apprentissage de langues étrangères, l'intercompréhension offre aux apprenants l'accès à la compréhension des textes écrits dans une ou plusieurs langues non-étudiées antérieurement (l'appartenance à la famille linguistique de la langue maternelle en constitue un avantage), par un entraînement spécifique, déroulé pendant une période très courte. Sans détailler ici la méthode, nous nous limitons à donner quelques exemples des résultats possibles de l'intercompréhension, dans le contexte de l'entraînement des professionnel de l'entreprise au travail avec des langues étrangères non étudiées auparavant: la secrétaire qui est capable de lire un document palpable ou virtuel, écrit en 1, 2 ou 3 langues étrangères, le documentaliste qui trie et ressemble les documents, les chercheurs qui ont accès à des ressources publiées en langue étrangères non-étudiées par eux auparavant, les touristes qui lisent les brochures et les descriptifs, les ouvriers qui lisent des notices et des prospectus, les réunions à l'international où chacun parle sa langue étant compris par les autres, etc.

Eric Castagne qui, à côté de Jean-Emmanuel Tyvaert est le fondateur du programme ICE, avance d'ailleurs l'intention de démarrer « un projet global de formation de cadres d'entreprises internationales ». (Castagne, 2007)

Conclusion

Malgré l'incapacité de maîtrise complète d'une langue, «les compétences linguistiques sont indispensables pour établir des contacts et communiquer ». (Schneider, Susan C., Barsoux: 196)

Nous recommanderions une attention agrandie à cette composante prioritaire du management stratégique, liée aux compétences langagières des employés dans l'entreprise. Les firmes qui ne se sont pas préoccupées de l'état des compétences linguistiques de leurs employés - en conformité avec les besoins et les perspectives de développement de l'entreprise - devraient s'intéresser à la formation linguistique. Cela faciliterait *« l'acquisition et la maîtrise des ressources et compétences permettant à la firme de se différencier de ses concurrents, de déployer ses activités, d'innover ou de disposer d'une flexibilité suffisante pour s'adapter aux évolutions de*

l'environnement ou aux stratégies des concurrents ». (Tarondeau: 17). Le choix d'une formation axée sur l'intercompréhension est une solution équilibrée et économique, agréable et stimulatrice pour le monde de l'entreprise.

CREATING COMPETITIVE ADVANTAGE IN TOURISM BY KNOWING FOREIGN LANGUAGES

Dobrescu Claudia-Nicoleta

Facultatea de Științe Economice și Administrative

Costencu Mirela

Universitatea "Eftimie Murgu" Reșița

Facultatea de Științe Economice și Administrative

This paper tackles the importance of knowing foreign languages by the human resources employed in tourist services, as well as their importance on the business environment, giving a special attention to the way in which the foreign language becomes an important competitive economic factor. The main purpose of this paper is to prove that knowing one or several foreign languages and using them efficiently is essential for the human resources in tourism. These should know as many foreign languages as possible and improve the already existing linguistic skills in their attempt to settle new human relationships regardless of the position they hold in the tourism organization. If today, speaking one foreign language may prove enough and is considered quite common, in the near future, possessing adequate linguistic skills may imply knowing two or more foreign languages.

Keywords: foreign language, tourism, competitive advantage, linguistic skills.

Cod Jel: M12

Need access to information and mobility in the contemporary world, together with the importance of effective communication with each other, have made at least study a foreign language to become an indispensable element in equipping each human resources to cope with the challenges of a society based on knowledge. One way of general training to each individual study a foreign language is to contribute in a specific manner to general training, in particular by developing communication skills in a foreign language but also by developing cognitive skills in general awareness cross-cultural issues, broadening the horizon of knowledge, increased self-esteem, and increase motivation for lifelong learning.

Knowing a foreign language is essential for human resources working in tourism. To ensure a high standard of customer service levels, but also adopts new employees to organizational values, tourism organization should pay attention when it comes to selecting staff, especially in terms of language knowledge.

To gain a competitive advantage, organizations must maximize tourism performance and innovation, constantly using all their talents and human resources. Thus, since there is more staff that has language, the more tourist organization can create competitive advantage in the market is positioned. On the basis of any human relationships underlying communication and to communicate effectively regardless of the language is a genuine competitive advantage for organizations that know how to use it.

Knowledge of foreign languages opens up new career opportunities, providing an advantage in light of any promotions or providing access to new and exciting responsibilities throughout his career. Human resources who speak several languages can communicate with more people in the world and this is one aspect which is increasingly important for many employers. Also, knowledge of several languages increases the chance to live and work in other countries.

In the globalize economy, the barriers to cooperation and international trade are gradually reduced, competitive organizations will be those who possess the human resources that use

multiple languages in the workplace. Therefore, people are looking for a job and know foreign languages have a competitive advantage and have more professional opportunities. Moreover, in every country there are populations who speak languages other than language. Extensive language skills can help ensure quality of service in many areas, but in tourism this is essential.

A European Commission study on the impact on EU economy of shortages of language skills in organizations estimated that 11% of exporting SMEs in the EU losing business because of language barriers. Language skills and intercultural improve the chances of getting a better job. In particular, knowing more languages provide a competitive advantage: HR organizations require interest tourist market becoming more competent in a number of languages to carry out specific activities, because human resources to perform activities Fri interest in permanent contact with people from different parts of the world. But human resources who know more languages can choose from a wider range of job offers, including jobs abroad. The study revealed that lack of language skills is the prime obstacle to working abroad.

From French, which was used heavily in the Romanian space by the eighteenth century, was passed today in English, the most used worldwide. Even if the English language has a leading role in the business world, knowing other languages will also offer EU organizations a competitive advantage and allow them to conquer new markets.

Language skills are an asset in all fields, not only for sales and marketing. All organizations, regardless of purpose or size, interact to a greater or lesser extent, with different categories of service providers and upstream suppliers. However, in many cases, organizations - especially medium and small ones - lack the knowledge and resources to incorporate languages into their business plans. Multicultural staffs need adequate training in language that is part of the organization and the organization should go further and find creative ways of using language resources that have their multicultural staff, but often in a form latent

As stated in the Forum, companies and business associations could usefully develop strategies to improve language skills for different functions. Management strategies such language will also have a positive impact on the language industry providing translation, interpretation and multilingual technology. It would also be in the interest of organizations to invest in language training and, with national, regional and local authorities to establish public-private partnerships to assist businesses, especially small and medium organizations to finance Language courses and developing new ways to improve the strategies in foreign language.

Romania's integration in the EU has led to the elimination of borders, allowing Romanians and foreigners to move freely within the Community, which means that our country is frequently visited many and Romanians visiting more and more other countries.

In this context, particularly in tourism, human resources providing services of interest are vitally necessary in order to know as many languages to communicate effectively. On the set, another change occurred in the labor market, as many companies came to Romania in order to invest, grow, and to seize market outlets here. This means that multinational companies need human resources to achieve particular goals and staffs need to know to communicate with them in the same language, human resources, know foreign languages to collaborate more easily, and for this purpose, benefits are numerous.

There is empirical evidence that skill in several languages fosters creativity and innovation: multilingual human resources are aware that problems can be resolved differently, depending on the linguistic and cultural context and can use this ability to find new solutions.

Knowledge of foreign languages is a prerequisite to employment of human resources for tourism, until recently, this requirement was characteristic only of certain tourist sectors. Among the knowledge required are English, French, German, Spanish or Italian, but lately noticed a steady increase for other languages, which until recently have had few followers.

According to a study presented by representatives of the International House, over 10% of Romanian very well knows English. Compared with EU countries, where average people who

know very well English is 22%, in our country only 10.5% of those questioned responded that this language very well mastered.

A percentage of 17.8% of respondents considered the country well know English language compared to a rate of 47% of EU citizens. Respondents said that their perception, the most important source of language learning is the school, at a rate of 40.1%.

For tourism in general and certain positions in the field in particular, knowledge of one or more foreign languages is essential to human resources, this leads to effective communication with foreign people. However, tourists assess the quality of human resources and tourism organizations in terms of language knowledge, leading to a certain extent the degree of return of tourists (provider effective communication with staff is one of the criteria by which tourists evaluate their leisure time or vacation leave).

Era of globalization we live in permanent contact with other people via the Internet to access information transmitted in different languages just because many people can understand them are some reasons why knowledge is useful and beneficial language. Knowledge of foreign languages is it one or two, or more, can not have any negative affect, and on the contrary, the gains can be significant.

The present world has become small and manageable, in the era of modern means of transport and communication. The modern mass tourism brings millions of people each year to other countries. The economy, trade and transport are internationally intertwined, and mergers of large organizations do not represent any longer a rarity at the present time. More and more supranational organizations arise. States unite to form larger groups, such as the European Union. The word of the moment seems to be integration. Therefore, at least in the united Europe, a common language is necessary and the idea of multilingualism is becoming more and more important. In Europe today it is no longer enough to only master one language but someone must be able to at least speak one or two foreign languages fluently. The role of this common language seems to be inherited by the English language, because it is estimated that nearly two billion people routinely use English and the USA currently enjoy a dominant position in the world, politically, militarily, and economically. The Paper presents the influence of English words and the English Business vocabulary on the German Business environment.

Key Words: Business English, Lingua Franca, Semantics, International Business Context, German Business Environment

Einleitung

Die heutige Welt ist klein und überschaubar geworden, im Zeitalter modernster Verkehrs- und Kommunikationsmittel, welche schnellste Verständigung und Information ermöglichen. Der moderne Massentourismus führt jährlich Millionen Menschen in andere Länder. Die Wirtschaft, der Handel und der Verkehr sind international verflochten, so dass Zusammenschlüsse großer Organisationen in der gegenwärtigen Zeit keine Seltenheit mehr darstellen.

Immer mehr übernationale Organisationen entstehen. Staaten vereinigen sich zu größeren Verbänden, wie zum Beispiel die Staaten Europas zur Europäischen Union. Das Wort des Momentes scheint Integration zu sein. Deswegen ist, zumindest in dem vereinten Europa eine gemeinsame Sprache nicht mehr wegzudenken, welche nach der Auflösung der Grenzbarrieren, auch einen Fall der Sprachbarrieren mit sich bringt. Trotzdem gewinnt aber auch die Idee des Plurilinguismus im vereinten Europa immer mehr an Bedeutung (man denke da an die Einführung der Linguistischen Pässe). Es reicht also im gegenwärtigen Europa nicht mehr aus nur eine Sprache zu beherrschen, nebenbei muss man mindestens eine weitere Fremdsprache fließend sprechen können. Die Rolle der gemeinsamen Sprache scheint der englischen Sprache zuzukommen, da fast über zwei Milliarden Menschen, gut ein Drittel der Erdbevölkerung, laut Schätzungen routinemäßig mit der englischen Sprache in Berührung kommen und die USA gegenwärtig eine Vormachtstellung in der Welt, sowohl politisch und militärisch, wie auch wirtschaftlich genießt.

1.1 Geschichtliche Faktoren

Ein wichtiger Faktor in Sinne des Einflusses des Englischen auf die deutsche Sprache und Kultur ist die politisch-militärisch-wirtschaftliche Vormachtstellung der USA in Europa, zunächst in West-, nach dem Ende des Kalten Krieges zunehmend auch in Osteuropa, und die sich daraus ergebende massive Beeinflussung der europäischen Kulturen und Sprachen. Im besiegten und besetzten Deutschland war diese kulturelle und sprachliche Beeinflussung noch weitaus stärker und nachhaltiger als im übrigen Europa (Besatzungszonen), was zum Teil auch dadurch bedingt war, dass viele deutsche Intellektuelle durch die zwölfjährige Diktatur absurderweise die gesamte deutsche Geschichte entwertet und kompromittiert sahen, und versuchten sie zu verdrängen. Die Führungsschichten der Bundesrepublik orientierten sich daher von Anfang an ideologisch und kulturell an der atlantischen Führungsmacht.

1.2. Die wirtschaftlichen Faktoren

Um den Einfluss des Englischen auf der deutschen Sprache, und der Wirtschaftssprache überhaupt, darzustellen, muss man vorerst die wirtschaftlichen Faktoren, (und vor allem die außenwirtschaftlichen) berücksichtigen, welche Deutschland beeinflussen. Bei Deutschlands Handelspartnern steht Frankreich an erster Stelle, die USA und Großbritannien gemeinsam übertreffen es allerdings. Im Übrigen tauchen, abgesehen von den USA, an außereuropäischen Ländern lediglich Japan und die Volksrepublik China bei den Importen auf, was demonstriert, wie sehr trotz aller „Globalisierungsaktivitäten“ der „Exportweltmeister“ Deutschland doch eine in erster Linie europäisch und erst in zweiter Linie eine global agierende Ökonomie hat²⁹⁴.

Chemieunternehmen, Autohersteller und -zulieferer, Maschinenbauer und IT(Information technology) -Firmen schließen sich zu Verbände zusammen, so dass Produktion, Forschung und Entwicklung (Research & Development) meistens ins Ausland verlegt werden. Und internationale Geschäftstätigkeit erfasst selbst Kleinbetriebe wie etwa die Entwickler von Computerspielen in allen Funktionsbereichen ihres Unternehmens von Finanzierung, Einkauf und Produktion bis Marketing und Absatz. Schon Tucholsky stellte fest: „Was die Weltwirtschaft angeht, so ist sie verflochten.“²⁹⁵ Bei vielen Firmen wird es schwierig, eine Nationalität festzulegen. Sie verkaufen, forschen, entwickeln und produzieren in vielen Ländern „je nach profitabelster Kombination aus Kapital, Arbeitskraft und Gesetzgebung.“²⁹⁶ Englisch wird generell zur Firmensprache, wie bei Bertelsmann, Beiersdorf, DaimlerChrysler, der Deutschen Bank und der „Zürich“ Versicherung oder zur Verkehrssprache zwischen verschiedenen Teilen des Unternehmens wie bei VW und Bayer. Selbst bei französischen Weltunternehmen wie Alcatel, Axa und L'Oréal hat sich Englisch als Firmensprache durchgesetzt. Verträge und technische Dokumentationen werden nur auf Englisch verfaßt, Konferenzen auf Englisch abgehalten.

In den letzten Jahrzehnten haben weitere Faktoren den Einfluss der USA auf der Welt bestimmt: die Computertechnik. Der stark zunehmende Einsatz von Computern an Arbeitsplätzen, und auch die private Nutzung von PCs in den letzten Jahren, ist mit großer Wahrscheinlichkeit eine der Hauptursachen für die zunehmende Verbreitung des Englischen weltweit, da die größten Erfindungen rund um den Computer aus den Vereinigten Staaten kamen. Die Software von Microsoft war zunächst nur in der englischen Version erhältlich, ebenso, wie englischsprachige Websites das World Wide Web von Anfang an dominierten.

1.3 Die sprachlichen Faktoren

Es heißt, dass jeder vierte Erdbewohner inzwischen Englisch fließend und kompetent spricht. Faktisch stehen den rund 100 Millionen Menschen, für die Deutsch sowohl Mutter- als auch Amtssprache ist, etwa siebenmal so viele gegenüber, die Englisch als Mutter- bzw. Zweitsprache oder als Fremdsprache fließend beherrschen. Weltweit gibt es 1 Mrd. Englisch- lerner²⁹⁷. Das Land mit der gewaltigsten Zuwachsrate ist derzeit China, in den Ländern der ehemaligen Sowjetunion lernen 50 Millionen Englisch²⁹⁸. Fast jeder Jugendliche Europas wächst heute durch den Schulunterricht mit dem Englischen als erster Fremdsprache auf. Also ist die internationale Sprache da. Weltweit ist von Englisch als der Lingua Franca Universalis (Universelle Fachsprache) der Gegenwart die Rede. In der weltweiten Buchproduktion ist der Anteil englischsprachiger Bücher mehr als doppelt so hoch wie der in jeder anderen Sprache.

Auch Linguisten sahen in der „Flut der Amerikanismen“ kein Problem, keine Gefahr, vielmehr wurden sie zu Fürsprechern, zu Ideologen der neuen Entwicklung, in deren Bann sie selbst standen. Unter dem Eindruck der strukturalistischen und funktionalistischen amerikanischen Linguistik hatte die deutsche Linguistik und Sprachkritik seit den 60er Jahren eine völlige Abkehr von der bis dahin vorwiegend historischen und sprachloyalen Betrachtungsweise vollzogen. Sämtliche Wörter der Gegenwartssprache und gerade auch die sogenannten Fremdwörter dürften nur nach ihrer aktuellen kommunikativen Funktion, d.h. nur nach ihrem gegenwärtigen Nutz- und Gebrauchswert für den Sprecher bewertet werden. Das bedeutet also, dass z.B. Computer und Rechner, happy und glücklich, sorry und Verzeihung, Ticket und Fahrkarte, Information und Auskunft zunächst einmal grundsätzlich gleichberechtigt und gleichwertig sind. Bei einer sprachkritischen Beurteilung und Bewertung dieser Wörter dürfe ihre Geschichte, d.h. ob sie deutscher oder fremder Herkunft seien, nicht die geringste Rolle spielen. Wichtig sei nur, ob und inwieweit sie im jeweiligen Verwendungszusammenhang kommunikativ, funktionell und effizient seien. Und da könne das entlehnte Wort durchaus kommunikativer, funktioneller und effizienter sein als das deutsche Wort.

2.1. Argumente für den Gebrauch von Anglizismen

Menschen, die dem Gebrauch englischer Begriffe gelassener gegenüberstehen, vertreten die Auffassung, viele Dinge könne man im Deutschen nicht ebenso gut ausdrücken. Zudem sei Sprache ein lebendiger Organismus, der ständigen Einflüssen und Veränderungen unterworfen sei, während der Versuch der „Reinhaltung“ ein Verharren beim Vergangenen sei. Außerdem gebe es überhaupt keine „reine“ Sprache: Seit man überhaupt von einer deutschen Sprache reden kann, steht diese in ständigem Kontakt mit verschiedenen europäischen Sprachen, denen sie Tausende von Wörtern entlehnt hat. Schließlich sei der Kampf gegen das Denglische eher ein Scheingefecht, da es eigentlich um allgemeinen [Kulturpessimismus](#) und einen latenten [Antiamerikanismus](#) gehe.

Der Gebrauch eines Anglizismus ist immer dann angebracht, wenn zur Bezeichnung des Gemeinten ein deutschsprachiges Äquivalent fehlt. In vielen dieser Fälle erspart die einfache Übernahme des fremdsprachlichen Ausdrucks eine semantisch ungenaue Übersetzung. Auch aus rein ökonomischen Gründen bietet sich der Import des fremdsprachlichen Ausdrucks an, wenn es (noch) kein deutsches Wort für den zu bezeichnenden Sachverhalt gibt. Zahllose Beispiele lassen sich sowohl in der Fachsprache, wie in der Allgemeinsprache finden: So benennt der wirtschaftssprachliche Fachbegriff Outsourcing die Übergabe von Firmenbereichen, die nicht zum Kernbereich eines Unternehmens gehören, an darauf spezialisierte Dienstleister, und auch Productplacement bedürfte der Umschreibung durch „im Film und Fernsehen eingesetzte Werbemaßnahme, bei der ein Produkt beiläufig, aber erkennbar ins Bild gebracht wird“. (oft wird aber der deutsche Ausdruck Schleichwerbung benutzt) Das im Zuge der gewachsenen Bedeutung

²⁹⁷ Karl-Heinz Stoll, *Megasprache Englisch - Nischensprache Deutsch ?*, 2000, S.11.

²⁹⁸ *Ibidem*.

des Umweltschutzes entlehnte Recycling ist eben nicht mit „Wiederverwertung“ oder „Aufbereitung“ identisch, sondern bezeichnet das Zurückführen einer stofflichen Substanz in einen bereits vorhandenen Kreislauf.

Denglisch-Befürworter halten es außerdem für positiv, dass neu entstandene Begriffe, etwa in der Technik, international einheitlich verwendet werden. Gerade im Internet fördere dies die Verständlichkeit. Für Menschen, die Fremdsprachen erlernen oder sprechen, stelle es eine große Erleichterung dar, wenn neue Begriffe (Neologismen) nicht übersetzt werden müssen. Wirtschaftsräume, die sich sprachlich dem vorherrschenden angloamerikanischen Sprachraum anpassen, genießen Wettbewerbsvorteile gegenüber isolierten Sprachräumen, was letztendlich Arbeitsplätze sichere.

Wichtige Funktionen erfüllen Anglizismen auch, wenn sich damit häufige Wortwiederholungen vermeiden, Aussagen stilistisch variieren oder syntaktisch straffen lassen. Je nach Äußerungskontext oder Textsorte kann auch der unübersehbare Trend zur Kürze im Sprachgebrauch – nicht nur in E-Mails wird der Telegrammstil gepflegt – einen Anglizismus rechtfertigen. So beansprucht der Trucker gerade zwei Sprechsilben, während es der „Lastwagenfahrer“ immerhin auf fünf Silben bringt. Entsprechendes gilt für die Synonyme Jointventure und Gemeinschaftsunternehmen und Management - „Unternehmensleitungen“. Letztlich entscheidenden Aufschluss über den Gebrauchswert eines Anglizismus bringt die Frage, ob das Fremdwort von seinen (möglichen) Adressaten eindeutig und ohne Schwierigkeiten verstanden wird. Ein Anglizismus sollte folglich vermieden werden, wenn Verständigungs- und Verständnisschwierigkeiten wahrscheinlich sind.

Leute, die dem Denglisch gelassen gegenüber stehen, unternehmen zum Teil den Versuch, Denglisch-Kritiker herabzuwürdigen, indem sie ihnen offenkundig unsinnige Übersetzungsversuche vorhalten bzw. unterstellen (*motherboard* = „Mutterbrett“). Denglisch-Kritiker hingegen versuchen, deutsche Wörter, die vor dem Auftreten eines bestimmten Anglizismus bereits vorhanden waren, weiter zu verwenden oder neu zu beleben bzw. Wörter zu finden oder zu erfinden, die stimmig und alltagstauglich sind (*motherboard* = „Hauptplatine“). Diese Vorgehensweise überzeugt dort, wo ein verständlicher Begriff gefunden wird. Puristen würden jedoch auch hier einwenden, „Platine“ könne kaum als ursprünglich deutsches Wort bezeichnet werden. Abgesehen davon können nicht alle dieser Versuche als gelungen bezeichnet werden, da es an allgemeiner Anerkennung und Verbreitung mangelt.

2.2. Argumente gegen den Gebrauch von Anglizismen

Fragwürdig wird der Gebrauch von Anglizismen, wenn sie nicht von sprachlichen Gründen bestimmt werden, also keine besondere inhaltliche, stilistische oder syntaktische Funktion haben. So müssen Anglizismen oftmals zur Prahlerei und Imagepflege herhalten, weil sich Sprachteilhaber davon eine Aufwertung des eigenen sozialen oder intellektuellen Ansehens versprechen²⁹⁹. Bei näherer Betrachtung gibt es für zahlreiche Anglizismen deutsche Entsprechungen und längst etablierte Lehnwörter: Die häufig befahrene Datenautobahn bedarf kaum einer sprachlichen Abwertung zum Datenhighway. Ein Feeling ist ein Gefühl, der Airport bleibt ein Flughafen, ein Deal ist nicht gewinnbringender als ein Handel. Die Rückmeldung ist gewiss nicht weniger treffend als das Feedback. Die News sind präziser entweder mit „Nachrichten“ oder „Neuigkeiten“ übersetzt, ein „nicht zuletzt“ ist sogar kürzer als last, (but) not least, und auch relaxen bietet im Vergleich zu „aus-,“ oder „entspannen“ keinen semantischen Mehrwert. Die nicht-deutsche Aussprache der englischsprachigen Wörter ist einer der Hauptgründe für die Ablehnung von Anglizismen. Die deutsche Sprache lebt und erfährt durch die Übernahme treffender Ausdrücke aus anderen Sprachen eine Bereicherung. Diese Erkenntnis

²⁹⁹ Claudia Döhner, *Für und wider des angloamerikanischen Einflusses auf den deutschen Wortschatz*, 2000, S.4.

hat heute in ihrer Anwendung auf Begriffe der Wirtschaft, der Technik und der Wissenschaft, deren Übernahme im Zuge der Globalisierung unvermeidbar erscheint, eine besondere Aktualität. Der Ende 1997 gegründete und schnell auf 10.000 Mitglieder angewachsene „Verein Deutsche Sprache“ (VDS) kämpft gegen „Denglisch“ bzw. „Engleutsch“ und wählt jeweils einen „Sprachhunzer des Monats“ und einen „Sprachpanscher des Jahres“. 2000 wurde die zweifelhafte Ehre dem Rektor der Münchner Universität zuteil für seinen Vorschlag, „Departments“ einzuführen. 1997 hatte den damals noch "Sprachschuster des Jahres" genannten Preis die Hamburger Modeschöpferin Jil Sander erhalten, für die früher genannte Aussage. Wenn man sich die Sätze jedoch etwas genauer ansieht, stellt man fest: Es sind deutsche Sätze, ihre Grundstruktur ist deutsch, die Amerikanismen sind Fremdkörper. Auch die „Moonshine“- und „Sunshine“-tarife der Telekom haben den begehrten Preis erhalten. 1998 erhielt den "Sprachpanscher" der Telekom-Manager Ron Sommer für eine Werbeaktion mit Sunshine- und Moonshine-Tarifen, City-Call, Free-Call, German-Call. Für ähnliche Leistungen wie Ron Sommer ist ein Jahr später der damalige Vorstandschef der deutschen Bahn AG Johannes Ludwig als "Sprachpanscher des Jahres" ausgezeichnet worden.

Gemäßigtere Kritiker akzeptieren generell, dass sich mit wachsender Mobilität der Menschen auch die Sprachen vermischen. Sie geben aber zu bedenken, dass es der Alphabetisierung nicht gerade dienlich sei, wenn die bei Nichtmuttersprachlern durchaus geschätzte ziemlich lautgerechte Schreibung des Deutschen aufgeweicht werde, weil beispielsweise englische Wörter (wo es kaum eindeutige Beziehungen zwischen Schreibweise und Aussprache gibt) unverändert übernommen würden (siehe *computer* vs. „Kompjuter“ u. a.). Bei Begriffen aus Sprachen mit nichtlateinischen Schriften (z. B. Griechisch, Russisch, Japanisch) werde schließlich auch nicht die Originalschreibung beibehalten.

3. Der Einfluss des Englischen auf die deutsche Wirtschaftssprache an Beispielen

In der Gegenwart spielt der zunehmende Bedarf nach einem internationalen, ja globalen Verständigungsmittel eine große Rolle. Als Ursache dafür wird immer wieder die Globalisierung genannt. Globalisierung erfordert eine Globalsprache - und diese Globalsprache ist die englische Sprache. Ihren Siegeszug als Globalsprache hat das Englische 1919 begonnen. Der 28. Präsident der USA, Thomas Woodrow Wilson, hatte Englisch als zweite Vertragssprache neben Französisch für den Versailler Vertrag durchsetzen können³⁰⁰.

Vor allem die Bereiche Wirtschaft, Wissenschaft und Bildung sind es, die mit großem Tempo auf Englisch als Globalsprache hinarbeiten. International warnen Linguisten schon lange vor den Folgen der Globalisierung und den weltweiten Vernetzungen wie dem Internet. In vielen Bereichen der Wirtschaft, der Wissenschaft und der Bildung dient Englisch bereits nicht nur international, sondern auch national als Lingua franca. Harald Weinrich, Mitglied der "Deutschen Akademie für Sprache und Dichtung", bringt das auf einen Nenner: "Verschiedene Wirtschaftsunternehmen mit klingenden Namen, jedoch multinational fusioniert und mit Firmensitz irgendwo in Byzanz, haben es in den letzten Jahren für richtig erachtet, Englisch als Konzernsprache einzuführen."³⁰¹ Ein Beispiel: Die Lufthansa Technik AG hat einem Techniker mit Entlassung gedroht, wenn er weiter deutsch statt englisch im dienstinternen Schriftwechsel verwenden würde. Klar und unbestritten ist, dass die Verkehrssprache der Piloten und Lotsen Englisch ("Airspeak") sein muss.

In der Werbung ist sogenanntes „Denglisch“ ganz normal. (slogan, headline, product placement, billboard, direktmarketing, coupon, publicity, tele-shopping, PR). Das liegt natürlich daran, dass dieser gesamte Wirtschaftszweig aus einem englischsprachigen Kulturgebiet stammt. Die Werbeagenturen gehen davon aus, dass die beworbene Zielgruppe so viel Englisch beherrscht, um ihre Werbebotschaft zu verstehen. Das mag bei Werbung für die IT-Branche vielleicht noch

³⁰⁰ Christian Meier, *Sprache in Not ?*, 1999, S.9.

³⁰¹ Thomas Niehr, *Anmerkungen zu einer populären Anglizismen-Kritik*, 2002, S.1.

stimmen (z.B. IBM: "Solutions for a small planet"). Desweiteren ist man in den Werbeagenturen beharrlich der Meinung, dass sich die englische Sprache wesentlich besser verdichten lasse als die deutsche, sie sei komplexer und treffe besser den Punkt. Betrachtet man jedoch die folgenden Werbesprüche, so fällt es sehr schwer, das zu glauben: "Nichts bewegt Sie wie ein Citroen", "Neckermann macht's möglich", "Nichts ist unmöglich! Toyota". Schon allein durch die Verwendung des Stabreims lassen sich originelle, witzige Werbesprüche texten. Eine Funktion von Werbesprüchen ist, durch Abweichung vom gewohnten Sprachgebrauch Aufmerksamkeit zu erzeugen. Das erreicht man sowohl durch englische als auch durch deutsche Werbesprüche.

Aber nicht nur dieser Zweig, sondern die gesamte Wirtschaft wird sprachlich von der Supermacht beeinflusst. Auf dem internationalen Markt macht man sich dann doch eher mit "Outsourcing" (Ausgründung), "Joint Ventures" (Gemeinschaftsunternehmen) oder "Cost-Benefit-Analysis" (Kosten-Nutzen-Analyse) verständlich, um den "Break-even-Point" (Gewinnschwelle) überschreiten zu können. Ein "Goal" (Ziel), das natürlich nur mit viel "Support" (Unterstützung) erreicht werden kann. Darum "recruitet" (anheuern) das "Human Resources Department" (Personalabteilung) nach dem "Career Check" (Lebenslaufbewertung) nicht nur "Consulter" (Berater) oder eine "Office-Managerin" (Sekretärin), sondern auch "High Potentials" (hoch qualifizierte Nachwuchskräfte) in edlen "Outfits" (Kleidung), die ihren "Eigenvalue" (Wert) kennen und "Soft Skills" (Schlüsselkompetenzen wie Team- oder Kommunikationsfähigkeit) mitbringen. Und wenn die dann dank ihrer "Performance" (Leistung) oder "Mailings" (Aussendungen) einen "Leverage-Effect" (Hebelwirkung) erreicht haben, stimmt - hoffentlich - ihre "Work-Life-Balance" (ausgeglichenes Leben) und der "Cashflow" (Zahlungsfähigkeit) des Unternehmens. Und falls nicht, werden die "Young Professionals" (junge Fachkräfte mit Berufserfahrung) zwar aufgrund mangelnder "Credibility" (Glaubwürdigkeit) "vom Boss gefired" (entlassen) ³⁰². Für die meisten solcher Anglizismen spricht das oben genannte Argument der Bezeichnungsangemessenheit: Anstatt nach einer häufig längeren und umständlicheren deutschen Übersetzung zu suchen, bedient man sich, indem man die Bezeichnungen der Herkunftssprache übernimmt, der Sprachkonvention der fremden Sprache und erreicht so in Bezug auf das Bezeichnete Eindeutigkeit. Aber, Computer, Service point, monitor, Facility manager, cargo, newcomer sind länger als "Rechner", "Auskunft", "Bildschirm", "Liegenschaftsverwalter", "Fracht" oder "Neuling".

Man findet aber Anglizismen aus der Wirtschaftssprache auch in der Alltagssprache, sie begegnen uns im täglichen Leben. Begriffe wie Onlinebanking, alle Arten von Service,, Teamwork, Know-how, Marketing und Workshop sind jedem vertraut. Für die firmeninterne Kommunikation in global agierenden Unternehmen ist die englische Sprache sinnvoll. Ein Nebeneffekt dieser Entwicklung ist jedoch, dass viele Amerikanismen aus der Fachsprache der Wirtschaft in die Alltagssprache übergehen, weil wirtschaftliche Prozesse im Alltagsleben der Menschen eine immer größere Rolle spielen. Der "Manager" fällt heute kaum noch auf, aber auch Wörter wie "Aktiensplit", "Broker", "Boom", "Börsencrash" gehören mittlerweile zur Alltagssprache. Allerdings wird der Anteil der Amerikanismen in der wirtschaftlich geprägten Alltagssprache erheblich überschätzt.

5. Schlussfolgerungen

Die heutige Anglisierung scheint auf den ersten Blick auf einzelne sachliche oder soziale Bereiche beschränkt. Beim zweiten Blick aber sieht man, dass niemand mehr un sie herumkommt. Die Lebensbereiche in denen die Internationalismen häufig vorkommen, sind : die Wissenschaften, die sich internationaler Konkurrenz stellen, der Computerbereich, der Bereich Reise/Verkehr/Tourismus, viele Zonen der Wirtschaft, die stark trendbestimmte Bereiche Werbung, Mode, Musik. In diesen Bereichen ist heute ein großer Teil, in den extremeren Fällen

³⁰² Claudia Döhner, *Für und wider des angloamerikanischen Einflusses auf den deutschen Wortschatz*, 2000, S.6.

schon die Mehrzahl aller sinntragender Wörter englisch. Das Englische dringt über alle Kanäle in unsere Sprache. Die Ursachen für die Verbreitung amerikanischer und britischer Fachausdrücke sind vielfach beschrieben worden. Durch die Globalisierung der Wirtschaft, den starken Einfluß von Popkultur, Werbung und Computertechnik auf unser Alltagsleben haben englische und amerikanische Ausdrücke und Satzstrukturen in die deutsche Sprache Einzug gehalten. Jugendliche haben heute einen weitaus größeren Wortschatz als die Generationen vor ihnen, aber aktiv benutzen sie weniger Worte. Es ist zu bezweifeln, ob durch Verbot von unnötigen Fremdwörter der aktive Wortschatz mitsamt deutscher Worte vergrößert wird. Es ist doch viel mehr zu begrüßen, wichtige Wörter aus dem Englischen, die Unsinnig wären zu übersetzen, zu übernehmen und gleichzeitig bewährte Wörter zu behalten. Sprachveränderungen konnten und können aber weder von Organisationen noch durch Verordnungen aufgehalten werden - das gilt auch für das Englische. Im Unterschied zu früheren Jahrhunderten, als Fremdwörter zumeist nur in der Sprache bestimmter sozialer Schichten (z.B. Adlige, Bildungsbürger) vorkamen, betreffen sie heute nahezu die gesamte Bevölkerung. Und das nicht nur in bestimmten Teilen der Welt, sondern global: Englisch ist die erste Sprache überhaupt, die in der ganzen Welt dominant ist, und Anglizismen sind daher häufig zugleich Internationalismen.

Neue Erfindungen bedeuten natürlich auch neue Benennungen und es liegt auf der Hand, das diese Wörter zunächst englisch sind, wenn die neu zu benennenden Produkte in den USA entwickelt wurden. Doch es sind auch Vorteile in der Sprache selbst zu finden. Englisch hat zwar ein riesiges Vokabular, doch kann man von einer „leichten Erlernbarkeit bis zu einer kommunikativ befriedigenden Verständigung“ sprechen. Die Sprache ist außerdem beliebt, weil Begriffe aus dem Englischen oft „kürzer und so bequemer anzuwenden“ sind³⁰³. Die englische Sprache verfügt über eine große Fülle an einsilbigen Wörtern und „cash klingt nun einmal flotter als Bargeld“. Auch von der „phonosymbolischen“ Kraft englischer Wörter ist öfter die Rede, man findet sie in Wörtern wie crash, boom, bounce oder splash.

Aber die deutschen Ausdrücke bieten nicht nur den Vorteil, anschaulich und sofort verständlich zu sein. Sie lassen sich auch mühelos in vollständige Sätze einbauen, dort bewegen und variieren.

THE IMPACT OF THE ENGLISH ECONOMIC TERMS IN THE BUSINESS ENVIRONMENT

Museanu Elena

Romanian – American University

Coancă Mariana

Romanian – American University

In terms of quantity, the English (American) influence in the economic language is striking, remarkable. The adjustment of these terms is brief, relative, which is not a factor favoring the assimilation of loans, but is permissible, in principle, for Anglicisms. In what concerns the need for these loans, it can be deemed that the demarcation between “necessary loans” and “luxury loans” is not yet solid. Low frequency or isolated Anglicisms may be classified into the second category (some may even affect proper specialized communication). Even if enough Anglicisms recorded in the economic press will not remain in Romanian, “the era of the Internet, of globalization”³⁰⁴, we may consider a greater influence of English in the economy (perhaps similar to computer science).

Keywords: Anglicisms, economic terms, specialized communication

I.1. Our research is focused on analyzing the importance of economic terminology for broader socio-professional groups. An observation that emerges is the representative presence and use of *English terms* in texts which seek their spread beyond the field of specialists. Such texts belong, in general, to a certain type of media – the “popularizing” press, eventually the press of “scientific popularization”. The interest in such cases is amplified when there is an obvious extra linguistic reasoning, such as the case of a part of economic terminology in Romania since 1990, a period characterized by profound economic changes. These extra linguistic realities sometimes need to be defined by explicit terms (and the scientific terms must generally be mono-semantic and, therefore, precise). Explaining the meaning of specialized terms to ensure the accuracy of their interpretation and use by laypersons requires greater than in other terminology, careful analysis of the relation between specialized definition, lexicographical definition of and texts³⁰⁵. The analysis has started from a corpus of English terms³⁰⁶ which distinguish themselves by high frequency and, hence by their significance for expressing various concepts. The general economic press or the economic popularizing press represents an objective source for determining important English terms.

A survey has been carried out upon the economic press intended for laypersons. English terms, frequently used in the business environment, have been excerpted, which have been classified according to their occurrence in various publications or weekly newspapers: **Ziarul Financiar**, **Capital (Capital TV)**, **Adevărul economic**, **Săptămâna financiară**, **Averea**, **Bursa**, **Banii Noștri**, **Business Standard**³⁰⁷. These terms with English form, marked as novelty both by form and meaning, are generally mono-semantic, which grants them an obvious specialized nature. The presence of specialized English terms can be a challenge as they occur frequently in mass media and the layperson has no means (dictionaries do not list them, in general) to understand

³⁰⁴ See A.Stoichițoiu-Ichim 2006: 24 – 25.

³⁰⁵ Concerning various issues of scientific terminologies in terms of the interest for linguistics, on one hand, and for ordinary communication, see A Bidu-Vrânceanu 2007.

³⁰⁶ The analysis hereby will consider the works analyzing the importance of the English influence in the current Romanian. See in this respect A. Stoichițoiu-Ichim 2006.

³⁰⁷ To be mentioned that this publication overtakes TV shows of channels specialized in economy (Money Channel)

their mere broad meaning. However, some contexts attempt an explanation of the term's use, which triggers the advantage of some sort of decoding and even assimilation. For example: "if last year only TV channels were SOLD-OUT (their advertising space had been already sold – ed. note), **Capital**, 2007, no. 29, or a YIELD of 7.25%, namely return of 7.25%" (paraphrasing), **Capital**, 2006, no. 27, pp. 17 or "Tax DUMPING, respectively a lower taxation level than the European average....", **Saptamana financiara**, 2006, June 19, pp. 14 or "EPS – EARNING PER SHARE", **Bursa**, 2007, no. 87, pp. 3, etc. However, it is not a rule to attempt explaining the new English terms in the context where they appear. The focus is on what happens with the other classes of English terms.

I.2. The Anglicization is a trend in existing languages, namely to let the vocabulary assimilate the English influence. This is a highly interesting phenomenon given the internationalization trend, which displays a new dimension of the contact between languages. We should underline here the significance of English words, which we have also analyzed in our approach of the economic terms deriving from French³⁰⁸. Considering a different approach, most of the terms falling into this class (such as BUSINESS TREND, TARGET, etc.) are deemed by A. Stoichitoiu-Ichim 2006 as "luxury loans", which does not arise from our analysis. What interests here is, at what extent, some terms – noted by specialists, appear as less necessary.

Therefore, experts insist that Anglicisms are loans both from British English and American English, which – for different and complex reasons – are "under adjustment"³⁰⁹. Therefore, they cannot be classified in the category of *completely assimilated loans*, nor as non-assimilated called **xenisms** or **foreignists**³¹⁰. Other experts consider Anglicisms as "foreign words that maintain the foreign look in spelling, pronunciation or inflexion"³¹¹. According to the latter perspective, adjustment problems would not constitute a failure of this category of loans. The analysis of the economic terms of English origin carried out hereby is useful to determine the influence of the English language in the Romanian vocabulary, and especially in the economic vocabulary, although "certainly many of these words will not remain in the language as they do not meet the requirements for assimilation in the Romanian language"³¹². The current Romanian press uses many Anglicisms whose definitions are not found in general or specialized dictionaries, although they belong to different terminologies, which proves that in some cases, they have exceeded the boundaries of strict specialization, migrating to the common language.

I.3. Based on broad materials³¹³ provided by the aforementioned widespread press, we will handle the following issues regarding Anglicisms: their form adjustment – in terms of phonetics, spelling, morphology (II and III); terms are mainly grouped according to their higher (II 1) or lower (II 2) frequency. Given that economic Anglicisms are used as simple terms, as well as in complex forms of different types (composed and syntagmas), we will also attempt to classify the material according to this approach (IV). The Anglicisms' decoding by laypersons could be favored if these terms are to be listed in dictionaries (specialized, but mainly general), however the analysis does not have a positive answer for such requirement (V). Finally, the semantic areas to which belong the economic terms deriving from English words could increase their linguistic chances and, implicitly, the significance of such type of influence in the Romanian language.

³⁰⁸ See. A.Stoichitoiu-Ichim 2006: 16 – 17.

³⁰⁹ See. A.Stoichitoiu-Ichim 2006: 29.

³¹⁰ See. A.Stoichitoiu-Ichim 2006: 28, even if the solid demarcation of these classes is deemed difficult, the incomplete adjustments keeps its significance (see A.Stoichitoiu-Ichim 2006: 34), which is not an advantage in terms of loans' implementation.

³¹¹ See discussions in A.Stoichitoiu-Ichim 2006: 32.

³¹² See A.Stoichitoiu-Ichim 2006: 19.

³¹³ We shall not list here all occurrences recorded, but only in strictly necessary and relevant situations.

II. We will try below to see what issues arise from the English words from the economic press. Our intention is to ascertain the difficulties Anglicisms have to adjust to the Romanian phonetic, inflexion system, etc. fluctuations in their writing, meaning extending or restricting and similar situations.

1. A first class of Anglicisms, whose presence is noticed repeatedly and which appear quite often in the economic press (in every issue and even several times in the same newspaper) gathers the following terms: TREND, BROKER, BRAND, LEASING, BUSINESS, RETAIL (RETAILER, RETAILING), RATING, TRAINING, HOLDING, TRUST, SPONSOR, DEALER (DEAL), TARGET, DISCOUNT, TRADE, JOB, BOOM, DUMPING, PLANNING etc. We have listed in the following several examples for these terms, highly used in the economic press under investigation and, therefore, in the economic environment:

„The Bucharest Stock Exchange might resume an *upward* TREND”, **Business Standard**, 2007, no. 92, or „a closing of almost 1.3400 of the EUR/USD rate might lead to a continuation of the *downward* TREND”, **Capital**, 2007, no. 23, pp.34, „TREND The domestic media market is developing by integrating operations in large entities”, **Capital**, 2007, no.7, pp.20. We can note the term’s linguistic integration both by sound and spelling forms, which do not pose any issues, and, also, by an inflexion typical to Romania; moreover, a positive role is played by the term’s establishment in somewhat stable syntagmas.

„BROKERS expect increases after the nine month results”, **Business Standard**, 2007, no.92, or „Basically, the BROKER, not the client shall demand the release of the statements of account. In short time, all agencies of BROKERAGE companies in the country will be able to demand such services”, **Capital**, 2007, no.15, pp.25. In this case, the form of English loans does not trigger any sort of problems, which can be deemed as an advantage, together with the necessary specialized meaning.

Another frequent term of LEASING: „Personnel LEASING is a segment which has significantly contributed to the development of both companies”, **Capital**, 2006, no.22, pp.22, or „My clients, whose LEASING contract for non-European cars would have ended in January...”, **Capital**, 2007, no.7, pp.6. (We can notice here a sort of definition or explanation of the term LEASING). The term poses some issues as regards its form (differences between writing and pronunciation), but its considering and broad significance at the level of ordinary speakers has led to its integration due to the concept thereof.

The term BUSINESS: „The increase is due to the involvement of NEW BUSINESS in a field that is about to emerge on the market”, **Business Standard**, 2007, no. 88, pp.19, „The watchword seems to be concentrating BUSINESS operations under the umbrella of a trust”, **Capital**, 2007, no. 7, pp.20, „For BUSINESS clients, it is highly important to simplify the offer, **Capital**, 2006, no.22, pp.20”. This term has one of the most increased frequencies: titles of pages, articles of the economic press impose it through stability. The term withstands competition with its older and very frequent synonym: AFACERE.

Other terms, more recently appeared, such as RETAIL try to occupy a significant position based on their frequency: “EUR 3 billion represents the investments of major RETAILERS, expected in the coming years in Romania ... Kaufland, Auchan, Real and Interspar also land in the Romanian RETAIL environment”, **Capital**, 2006, no. 22, pp.61, or „a group of investors will build a mixed center, with luxury apartments, offices and RETAIL on the ground floor.”, **Capital**, 2007, no. 7, pp. 5, or in **Business Standard**, 2007, no. 88, pp.19 „Programs for RETAIL and shopper marketing have been those boosting the BUSINESS”. Also, in this case, the form issues and even a less necessary meaning do not hinder the term’s high frequency. A correlation is noted with a form with which can be associated in terms of form and semantics (RETAILER) and, especially in the last quote, we note the association, the simultaneous presence of several English terms in a close context (some of them frequent such as BUSINESS, others – isolated such as **shopper marketing**).

For terms such as: „TRAINING for the employees of the Commercial and Sales Departments. The successes obtained by Butan Gas Romania in the first six months of this year are mostly the outcome of such *specialized classes...*”, **Banii Noștri**, 2005, no. 34, pp.10, where they explain the English term with the help of a synonym Romanian expression. The same we see in **Bursa**, 2007, no. 87, pp.8: „Egedex brings an innovative concept of TRAINING solutions through specialized training programs for various professional fields...”. The word TRAINER shares the same situation, with a Romanian plural: “The Company has over 40 years of expertise in human resources development consulting and over 3000 TRAINERS (TRAINERI) certified in over 38 countries.”, **Business Standard**, 2007, no. 88, pp.13. The frequency of such terms (especially TRAINING) is quite high and the linguistic means concerning its implementation are similar to the examples discussed above³¹⁴.

2. The second class we have identified, gathers English terms with a lower frequency of even isolated occurrences (one, two occurrences and not necessary in every issue): PROVIDER, FREE-LANCER, PACKAGING, FACTORING, CONSULTING, LOW-COST, START-UP, KNOW-HOW, OUTSOURCING, OFF-SHORE, SOLD-OUT, BOND, COMMODITIES, OFFSET, YIELD, LOHN, HEDGING, TOKEN, HUB etc. The specific English spelling is highly obvious, with pronunciation issues in Romanian and difficult decoding, except for terms which are of interest for the common language and whose meaning becomes known through extra linguistic knowledge, for instance LOW-COST flights. We list below several examples in this respect:

“... Waiting for heavy OFFSET investments”, **Capital**, 2007, no. 29; „Yahoo! Has recently purchased a START-UP Company specialized in movie publishing”, **Săptămâna Financiară**, 2007, July, 9; „... capitals circulated through OFF-SHORES by current magnates...”**Capital**, 2006, no. 36, pp.8; „Teodor Droșcaru is convinced he can make the difference on the FREE-LANCER’s market”, **Banii Noștri**, 2005, no. 34, pp.17; „... he worked as designer, afterwards he switched to FREELANCING, because he didn’t manage to handle projects.”, **Capital**, 2007, no. 6, pp.22; „... movement of the dollar increase was synchronous with the steep decline in oil, gold, copper and other COMMODITIES...”, **Capital**, 2006, no. 21, pp.34; „FACTORING companies are most interested in this products, as they intend to insure the invoices purchased from their clients”, **Capital**, 2007, no. 7, pp.17.

III. 1. The phonetic and graphic adjustment of English terms depends on several factors: entry into language, linguistic consciousness of speakers (knowledge or lack of knowledge of English). The international character of these terms probably grounds their use in the original form (just to be an easy communication tool between specialists and not only³¹⁵). We have tried to show in the examples cited in II such adjustment problems. The result is that in most cases, English terms trigger graphic and phonetic problems.

2. The Romanian writing and pronunciation occurs for very few economic terms, such as: TREND, HOLDING, SPONSOR, FACTORING or TRUST – as assimilated term. Otherwise, the terms, we have selected, have English writing and pronunciation (BROKER, LEASING, BUSINESS, RETAIL TRAINING, RATING, BRAND etc.), as we have commented during the previous analysis. As seen from the Anglicisms’ definition (I 2), experts agree, in principle, their

³¹⁴ Even though some experts (v. A.Stoichițoiu-Ichim 2006: 61) consider them luxury Anglicisms.

³¹⁵ V B. Thiry 2004: 171-172, who quotes numerous Anglicisms from the current literature in the economic field: BUSINESS, BUSINESS PLAN, BROKER, CASH FLOW, DUMPING, FACTORING, HOLDING, JOINT VENTURE, LEADER, LEASING, LOBBY, LOCK-OUT, MANAGEMENT, MANAGER, etc. See also A. Stoichițoiu-Ichim 2006, pp.18-19, who gives several examples from the economic-financial terminology concerning the assault of Anglicisms in the context of relations with international institutions: RATING, CARD, CATERING, DEALER, STAND-BY AGREEMENT, LEASING etc.

incomplete adjustment to the Romanian phonological and spelling system³¹⁶. Causes can be **objective** (distance between the Romanian and English linguistic system, restricted movement) or **subjective**³¹⁷ (insufficient knowledge of English and convenience). The terms we have analyzed, highlight such issues.

Some English terms present various degrees of adjustment through articulation, but unadjusted through orthography³¹⁸, such as: LEASING, BRAND, BUSINESS, RETAILER, BROKER, KNOW-HOW, BOOM, OUTSOURCING, etc.

3. Another problem regarding morphological adjustment, in addition to those already reported, deals with the Romanian grammar mark to be added in a graphic form³¹⁹, which draws attention on the foreign nature of the term, trying to replace the absence of a phonetic adjustment. As regards the gender of nouns (which are the most numerous), most terms designating inanimate fall within the Romanian neutral: TREND(s), BRAND(s), BUSINESS(es), TRAINING(s), RATING(s), etc. Male English words are fewer, but they cannot be overlooked. For example: BROKER, DEALER, PLANNER, TRAINER, PROVIDER, FREE-LANCER, etc. Female English terms are not in the material under research.

IV.1. The interest for Anglicisms and their implementation into Romanian may be justified by the need expressed by their meaning. From this point of view, the focus is on the semantic areas where they belong.

A category of terms distinguished by their frequency in the press under survey is represented by the *name of professions* (capacities), usually held by economists in national and multinational companies, borrowed almost entirely from English, probably from a desire to express more precisely the specialized economic meaning (particularly with respect to international relations), or conversely, out of convenience or snobbery (to impress the reader or the audience).

We list below several *names of professions* commonly found in the investigated material:

TOP MANAGER, GENERAL MANAGER, EXECUTIVE MANAGER, MARKETING ASSISTANT, INTEGRATION COMMUNICATION DIRECTOR, DEPUTY MANAGING DIRECTOR, HEAD OF PLANNING, CLIENT SERVICE and NEW BUSINESS DIRECTOR, BUSINESS DEVELOPMENT MANAGER, ACCOUNT PLANNING MANAGER, COUNTRY MANAGER, SENIOR TAX MANAGER, MANAGING DIRECTOR, ACCOUNT MANAGER, ACCOUNT EXECUTIVE, ACCOUNT PLANNER, DEALER, CUSTOMER SERVICE SPECIALIST etc. Some of these terms are defined or analyzed in general or specialized dictionaries³²⁰ (*manager, broker, dealer, account executive, account manager, customer service specialist*).

A detailed analysis shows that only few of these terms are necessary loans.

2. Another class of Anglicisms, which occur often in the economic press, is represented by the types of companies met in the press under analysis: LEASING *companies*, OFF-SHORE *companies*, ASSET MANAGEMENT *companies*, PRIVATE EQUITY *companies*, JOINT-VENTURES, BROKERAGE *companies*, RETAIL *companies*, RATING *companies*, etc.

The same class includes names of companies headquartered in Romania and which have English names: the *international company* WILSON LEARNING, BIG FOUR, HEAD HUNTER MMV *Company from Galati*, MENTOR TRAINING *Company from Piatra Neamt*, PROFESSIONAL *Company*, MANPOWER *Company*, etc.

³¹⁶ See A.Stoichițoiu-Ichim 2006: 32.

³¹⁷ See A.Stoichițoiu-Ichim 2006: 35.

³¹⁸ See. A.Stoichițoiu-Ichim 2006: 22, who notes the tendency of keeping and even going back to the English spelling (for instance, LEADER).

³¹⁹ Phenomenon also noticed by A.Stoichițoiu-Ichim 2006: 47, especially regarding plurals' expression.

³²⁰ We refer to DEX, as general dictionary, Dictionar de Economie 1999, and also Dicționar de terminologie a profesiilor, C.Călărașu, Ed. Universității of Bucharest, 2004.

The economic concepts expressed by English terms are represented in the relevant examples above.

V. The Anglicisms' meaning issues can be many and varied and we will approach (additionally to those already debated) those which are important for assessing their status in the economic terminology. The frequency and the ability to assign *denotative* values to meet the referential and communicative functions of specialized languages may be factors favoring the implementation of several economic terms of English origin³²¹.

The semantic areas of Anglicisms from the economic press display predominantly a denotative interest (names of professions: TOP MANAGER, GENERAL MANAGER, EXECUTIVE MANAGER, MARKETING ASSISTANT, etc. or institution names: WILSON LEARNING, Big Four, etc.). Designating new necessary economic concepts is not always obvious, which may lead to the removal of many of these terms from the Romanian language³²².

Moreover, the general interest of regular speakers for economic terminology leads to the economic Anglicisms' implementation into the common language. This expansion results into the development of connotative meanings, which may affect the terminology's accuracy. We have not noticed such situations in the wide-spread economic press, which can be distinguished only on different types of texts (without specialized profile and only for specialized terms such as TREND, BRAND).

VI. Based on the analysis above, we may reach the following conclusions:

In terms of quantity, the English (American) influence in the economic language is striking, remarkable.

The adjustment of these terms is brief, relative, which is not a factor favoring the assimilation of loans, but is permissible, in principle, for Anglicisms.

In what concerns the need for these loans, it can be deemed that the demarcation between "necessary loans" and "luxury loans" is not yet solid. Low frequency or isolated Anglicisms may be classified into the second category (some may even affect proper specialized communication³²³).

Even if enough Anglicisms recorded in the economic press will not remain in Romanian, "the era of the Internet, of globalization"³²⁴, we may consider a greater influence of English in the economy (perhaps similar to **computer science**).

THE IMPACT OF LANGUAGES ON THE ONLINE BUSINESS ENVIRONMENT

Museanu Elena

Romanian – American University

Coancă Mariana

Romanian – American University

This paper deals with an analysis of the English language, as lingua franca of the Internet, mainly online business environment. If a business has already developed a Web site, it is important to translate the site into the target language of a particular foreign market. It sounds easy, but is a literal translation all that's required for a different culture? We shall see in the next parts of this paper. Indeed, nowadays, the whole humanity has at its disposal an exceptional, very powerful medium. The new communications technology is causing a revolution in many aspects of our lives, and its future effects are still unforeseeable. English is an integral part of business communication, job opportunities and globalization. Cultural translation goes beyond mere linguistic translation, since it involves designing a Web site that is sensitive to the cultural differences, between the originated country and the target country. If you ask any search marketer what the main issue is when trying to optimize website(s) for Europe he will tell you: language.

Keywords: English, languages, Internet, global, business transaction, culture, e-commerce, localization

JEL code Z 19

1. English- lingua franca of the Internet

Firstly, English is an effective method to communicate business transactions for a successful career. There are various ways of communication such as verbal and written form. Verbal communication conducted through phone can be used for telemarketing. For example, Ford Motor Company, American Express. Call centres in banks also use written form of communication. For example, the ABN AMRO bank, in spite of being a Dutch bank it has established itself in more than 53 countries and it is conducting business transactions in English.

English is the most commonly used language of international commerce, politics, science, diplomacy, and the most commonly used language on the Internet. It is a “lingua franca”, or vehicular language, i.e. a language spoken and utilized outside of the country or countries of its origin, as opposed to a vernacular language, i.e. a language spoken within and amongst native speakers in the country of origin. English, like other lingua franca of the past, is often used as a second language to effect common communication for a specific purpose (such as diplomacy) between people for whom the lingua franca is not their first language.

English is one of the most widely used languages in today's world and has a great impact on a successful career and also online transactions(marketers, on the one hand, and consumers, on the other hand). Due to rapid modernization and westernisation, the popularity of the English language has increased. It is internationally used and globally accepted. “English is being recreated every minute of every day, in billions of conversations in every country on earth; in countless books, films, television and radio programs, on the internet—recreated organically: that is, in ways that grow out of its extraordinarily, perhaps incomparably, rich history and flexibility.”(Robert Dessaix, 21/01/2006) English is an integral part of business communication, job opportunities and globalization. Although some say that English is not a commonly used language, statistics prove that increase in business transactions, job opportunities and

advancement in globalization are due to the wide influence of the most commonly spoken language, English. These two phenomena - the advanced computer technology and English with its status as a world language - are brought together in one whole and form something that is really exceptional and unique, something that is multinational and the most global thing ever in the whole of human history: they form the Network-of-networks, the Internet, and English as its lingua franca appears to be the network's inseparable part.

2. Importance of Going Global

With the ability of the Web to instantaneously reach a global audience, many e-commerce and e-business companies have attempted, or are attempting, to expand their markets beyond their home countries. As the number of Internet users grows at an exponential rate around the globe, there are great opportunities for companies to grab a share of the global market through the Web. Currently about 49% of the Internet population is estimated to be non-English speakers.

Expanding business through the Web may not require physically setting up offices physically in different regions or countries. If a business has already developed a Web site, it is important to translate the site into the target language of a particular foreign market. It sounds easy, but is a literal translation all that's required for a different culture?

According to Adam Jones, director of customer programs at SimulTrans, a translation company based in Silicon Valley, there are five basic localization strategies:

1. Use only U.S. English;
2. Translate portions of a given Web site into a target language;
3. Translate the entire Web site into a target language;
4. Culturally localize the site for a target audience; and,
5. Develop content in a target country, independent of the U.S. site.

The first three strategies involve linguistic translation of Web sites whereas the last two strategies involve cultural translation. Cultural translation goes beyond mere linguistic translation since it involves designing a Web site that is sensitive to the cultural differences between the originated country and the target country.

Localization of an e-commerce site also goes beyond the localization of a mere Web site. It involves more than just files residing on a server; it involves the entire infrastructure necessary for transaction, distribution, and customer services, which is often unique to a specific country and tied to a specific culture. Each country in the world has a distinct social system and culture. Nothing cannot be generalized in discussing specific localization strategies for a particular country.

3. Is English still present in international electronic commerce, is it still relevant to other cultures?!

It is important for all businesses to establish trusting relationships with their consumers. Companies

with established reputations in the physical world often create trust, by ensuring that consumers know who they are. These businesses can rely on their established brand names, to create trust on the web.

New companies that want to establish online businesses face a more difficult challenge, because a kind of anonymity exists for companies trying to establish a web presence.

Most companies now realize that the only way to do business effectively in other cultures is to adapt to those cultures. The phrase “think globally, act locally” is often used to describe this approach. The first step that a web business usually takes to reach potential consumers in other countries, and thus in other cultures, is to provide local language versions of its website. This

may mean translating the website into another language or regional dialect. Researchers have found that consumers are far more likely to buy products and services from websites in their own language, even if they can read English well.

Only 370 million of the world's 6 billion people learned English as their native language.

An important element of business trust is anticipating how the other party to a transaction will act in

specific circumstances. That is one reason why companies with established brands can build online

businesses more quickly and easily than a new company, without a reputation. The brand conveys some expectations about how the company will behave. For example, a potential buyer might like to know how the seller would react to a claim by the buyer that the seller misrepresented the quality of the goods sold. Part of this knowledge derives from the buyer and seller sharing a common language and common customs. Business partners ideally have a common legal structure for resolving disputes. The combination of language and customs is often called culture. Most researchers agree that culture varies across national boundaries and, in many cases, varies across regions within nations. All companies must be aware of the differences in language and customs that make up the culture of any region in which they intend to do business. Businesses that successfully meet the challenges posed by trust, language, and culture issues still face the challenges posed by variations and inadequacies in the infrastructure that supports the internet throughout the world. Internet infrastructure includes the computers and software connected to the internet and the communications networks over which the message packets travel. In many countries other than the United States, the telecommunications industry is either government owned or heavily regulated by the government. In many cases, regulations in these countries have inhibited the development of the telecommunications infrastructure or limited the expansion of that infrastructure to a size that cannot reliably support internet data packet traffic. English has always been the dominant language of the Web and electronic commerce, with an estimated 63.5% share of the world's online population. But a significant number of internet users either do not speak English or prefer to use their native language for Web transactions. According to Euro-Marketing Associates(EMA), a consulting firm specializing in multilingual marketing, non-English speakers also represent" the fastest-growing group of people online today." EMA estimates that 55.7 million people are part of the non-English segment, including millions of U.S. and Canadian residents who switch to Spanish, French, or some other languages at home.

One of the surprises in the Euro-Marketing statistics is that just two languages- Spanish and Japanese make up almost half of the non-English Web marketplace, a ratio that differs significantly from the actual number of native speakers for these languages.

4. The European online business environment is more than just using different languages

If you ask any search marketer what the main issue is when trying to optimize website(s) for Europe he will tell you: **language**. Europe consists of fifty countries. The European countries which are part of the European Union together already have 23 official languages.

Europe has many countries and many languages. Some say there are over 200 official languages to take in account. Others also look at the dialects and then count over a 1000. So language really is a big issue when optimizing sites for Europeans. The Europeans have different lifestyles, which means they also have different online behavior. One thing you have to keep in mind is that every country in Europe has its own culture. And though they might speak the same language, they feel they are completely different. Let's combine the two issues discussed above: language and culture.

There are more countries in Europe with that issue: in both Germany and Austria for example they speak German. But the language barrier is bigger than just the differences within the

language. For example, when targeting Austria, which is located just below Germany, it's tempting to set up a German site and use it to target the Austrians also. After all, the language is quite similar. However, chances are you will not get much traffic from Austrians. Why? Simply because the Austrians do not trust the German websites. If they see the shop is on a German .de domain they will be more reluctant to buy a product than when it's on an Austrian domain. Just because they have a different culture. The same might go for trying to sell products to a Dutchman and targeting him with a Belgian site.

In some countries there are even differences within the country. Take for example Spain, where Basques and Catalan really are living their own lives and where most feel not connected, even hostile in some cases, towards the country itself. A quick example to show how much: last year the Spanish national soccer team won the European Championships. Where in Madrid people were celebrating on the streets, in Barcelona it was relatively quiet. It was after all the Spanish team which had won, not the Catalan team.

The "problem" of focusing exclusively on languages in Europe is that its not one country, one language. It's one country, many languages. Take the Netherlands for example. With only 17 million people living on a little piece of ground which the official language is Dutch, but Frisian is also accepted as a official language. Next to that there are about 8 or 9 dialects, but when optimizing for websites you don't have to take those in account.

How to handle all of these language and cultural differences when optimizing for Europe? According to Bas van den Beld, a well-known web strategist, each search marketer should research the differences in languages, by knowing the history of the areas one is targeting and getting domains and writing sites for every specific country. We would like to add that in our opinion language is the most important asset of a website, if it is not understood by the online consumers, eventually the market share could sometimes fall dramatically.

5. The European Commission's policy regarding the role of languages in Europe's business environment

The Commission defines language as an integral part of a person's identity and culture. It argues that learning foreign languages also necessitates understanding other people and their way of thinking to oppose intolerance, xenophobia and racism.

Progress towards the "mother tongue plus two foreign languages" goal is slow. Half of the EU citizens polled in a recent Euro barometer survey say they can hold a conversation in at least one language other than their mother tongue. At the top of the class come the Luxembourgers (99%), Latvians and Maltese (93%) and Lithuanians (90%), while Hungarians (71%), citizens in the UK (70%), Spain, Italy and Portugal (64% each) tend to master only their mother tongue. The Commission also suggests that higher education institutions play a more active role in promoting multilingualism among students and staff as well as the wider local community. It warns that the trend in non-English-speaking countries towards teaching through the medium of English instead of through the national or regional language may have "unforeseen consequences" for the vitality of those languages.

The role of intercultural communication skills in global marketing and sales strategies is growing. Reacting to evidence that European companies are losing business because they cannot speak their customers' languages, the Commission published a study on the impact of the shortage of language skills on the EU economy in December 2006.

The study clearly revealed the link between languages and export sales, indicating that a language strategy is a significant element of the overall success of every European business. The Commission is well aware of the importance of effective language policies in supporting business development, and calls for language certification to be standardised throughout the EU.

More recently, a report presented by European business leaders in July 2008, entitled 'Languages mean business: companies work better with languages', found that EU businesses risk losing competitiveness as other countries start outperforming them in language skills.

The report, presented by the Business Forum for Multilingualism, chaired by former EU Commissioner Viscount Etienne Davignon of Suez-Tractabel, found that emerging economies, primarily in Asia and Latin America, are quickly acquiring the solid language skills necessary to compete successfully.

Europe will thus have to promote formal and informal language learning more effectively to keep up, it says, estimating that as much as 11% of European SMEs lose business every year as a direct result of linguistic and intercultural weaknesses.

On a more positive note, the EU's language industry is worth €8.4bn and is set to grow by 10% annually over the next few years after having recorded one of the highest growth rates of any industrial sector despite the economic crisis, according to a European Commission-backed study published in November 2009 (EuRActiv 30.11.2009).

6. Conclusions

If the earliest days of the Websites, at the onset of the 1990s, were dominated by English-language content as well as users, this situation is rapidly changing. In the mercurial world of the Web, where sites appear and disappear overnight and where not even the major web portals individually or collectively can provide access to all the available pages, it is impossible to be precise as to how many individual languages are represented currently on the Web. The New Babel: Language Barriers on the World Wide Web and the Babel Team results revealed a dominant position for English; nevertheless, close to two home pages out of ten were in some other language. When the enormous number of pages available on the Web is taken into account, another figure about which no precise estimate can be offered, but certainly well in excess of one billion (for a discussion of the problems of estimating the Web's size (Dahn 2000) this nevertheless represents a vast amount of information unavailable in English. German, Japanese, French, and Spanish all accounted for more than one percent.

A later analysis was conducted by FUNREDES: the Networks and Development Foundation. It estimated that English accounted for around 60 percent of web pages, a considerable decline from the earlier Babel study. On this basis, it then estimates the percentages for six other European languages. In all cases, their presence on the Web is proportionately higher than in the Babel study. All but one account for more than two percent of web pages. Furthermore, more than 19 percent of web pages are in languages other than these top seven:

Position	Language	%
1.	English	60
2.	German	6.3
3.	Spanish	4.85
4.	French	4.39
5.	Italian	2.77
6.	Portuguese	2.14
7.	Romanian	0.19
	Other	19.36

The EU's new multilingualism strategy, published on 18 September 2008 and entitled 'Multilingualism: an asset for Europe and a shared commitment', emphasised the importance of language skills in addressing challenges as diverse as globalisation and increased mobility and immigration. It sought to mainstream EU language policy across a number of existing policy areas, including the education, media, research, social inclusion and competitiveness fields.

The strategy highlighted the importance of language skills in improving the EU's social cohesion and prosperity in the context of the Lisbon Strategy for Growth and Jobs.

Recognising the growing importance of emerging markets for EU companies, the communication stressed the need for workforces to possess knowledge of the language of the regions in which they operate. It also highlighted the role of language skills in improving the employability of Europeans.

Moreover, given that 2008 was designated European Year of Intercultural Dialogue, the strategy emphasised the role of languages in removing barriers to interaction between cultures. We have already mentioned that cultural translation goes beyond mere linguistic translation, since it involves designing a Web site that is sensitive to the cultural differences, between the originated country and the target country. All the companies must be aware of the differences in language and customs that make up the culture of any region in which they intend to do business.

DOUBLESPEAK AND EUPHEMISMS IN BUSINESS ENGLISH

Pop Anamaria Mirabela

University of Oradea, Faculty of Economics

Modern English speech, while not always, is supposed to be uncommonly frank. Doublespeak and euphemisms are cultural phenomena as well as linguistic concepts. Both are deeply rooted in social life and have a great influence on social communications. Doublespeak has become part of the general language, shaping the context in which it is used. As a linguistic concept, euphemism has fast won close relationships with the western culture, and it reflects the life and values of English people and their history.

Keywords: communication, business, doublespeak, euphemisms

JEL classification: Y90.

1. Introduction

Human beings rely on symbols to construct their individual perceptions of the exterior world. Language itself results as the individuals need to communicate with their group their realities within the confines of a set code understood by each member of the group. When conducting the social communications, according to then polite principle, people always some implicit and elegant expressions to replace those that are violent and vulgar. In a knowledge-driven economy, like that of the 21st century, artifacts of written and spoken communication (i.e., texts, in a general sense) have acquired importance as a form of capital. Organizations are also in the business of producing and brokering information. They use texts to interact with clients, with government institutions, and with other organizations. Often, these texts act as rhetorical proxies for individuals, organizations, or other constituencies who may be physically absent. Yet, unlike people, texts are resistant to change and the damage that they may cause to business relationships can be difficult to undo.

American linguist William Lutz, co-author of the SEC's *Plain English Handbook*, author of *Doublespeak* and 16 other books on writing in clear language and professor emeritus at Rutgers University, in his "Life under the Chief Doublespeak Officer", said, "If there's one product American business can produce in large amounts, it's doublespeak."³²⁵ Euphemism is a sociolinguistic phenomenon with a wide application in English language. According to Lilia Borlongan-Alvarez, in an article entitled "The trouble with business gobbledegook" for the *Philippine Daily Inquirer* (20 March 2010) "[T]he current global financial crisis which has led to the mass firing of employees has spawned popular euphemisms which both government and private organizations find convenient to use to protect the latter from embarrassment or legal action."³²⁶

2. Definition and Usage of the Terms

2.1. Doublespeak

Doublespeak (sometimes called **doubletalk**) is any language that deliberately disguises, distorts, or reverses the meaning of words, resulting in a communication bypass.³²⁷ Such language is associated with **governmental**, **military**, and **corporate** institutions. Doublespeak may be in the form of bald **euphemisms** ("downsizing" for "firing of many employees") or deliberately ambiguous phrases ("**wet work**" for "**assassination**"). What distinguishes **doublespeak** from other euphemisms is its deliberate usage by governmental, military, or corporate institutions or in

³²⁵ <http://www.freerepublic.com/focus/news/812924/posts>, Last visited: 13 February 2010.

³²⁶ http://services.inquirer.net/print/print.php?article_id=20100320-259870, Last visited: 30 March 2010.

³²⁷ <http://en.wikipedia.org/wiki/Doublespeak>, Last visited: 2 April 2010.

other words **doublespeak** implies an intent to mislead or deceive while **euphemism** implies an attempt to soften something harsh. The term *doublespeak* was coined in the early 1950s. It is often incorrectly attributed to George Orwell and his 1949 dystopian novel *Nineteen Eighty-Four*. The term does not appear in that novel, although Orwell did coin *newspeak*, *oldspeak*, and *doublethink*, and his novel made fashionable composite nouns with *speak* as the second element, which were previously unknown in English. Doublespeak may be considered, in Orwell's lexicography, as the vocabulary of Newspeak, words "deliberately constructed for political purposes: words, that is to say, which not only had in every case a political implication, but were intended to impose a desirable mental attitude upon the person using them."³²⁸ Successfully introduced **doublespeak**, over time, becomes part of the general language, shaping the context in which it is used. Lutz explains why doublespeak is counterproductive to democracy, why people need to stop being passive consumers of deceptive language and what they can do to fight back. "Clear language is essential so that both parties understand what they are agreeing to. In any contract that you enter into, you have to understand what your obligations and rights are under the terms of that contract," says Mr. Lutz. "If a company writes a contract in such a way that consumers think they understand what their obligations are, but in reality don't, they may agree to something they don't understand, and ultimately cannot fulfil. When companies use anything other than straight-forward clear language to describe the terms of an offer, they're not dealing honestly in the marketplace, in they are setting up consumers to fail."³²⁹

The following list contains some examples of doublespeak in current business English usage, with etymologies and examples of clearer, simpler words which are being avoided. Yet, this list can never be more than illustrative, and there is an ongoing debate whether all of the examples below are doublespeak.

-layoff, downsize, RIF (reduction in force): mass dismissal of employees, usually due to business restructuring or economic conditions. e.g. U.S. Bechtel, the company building Romania's Transylvania Highway, has decided to put off plans for massive *layoffs* until after April 15 when it is expected to also decide on the number of employees to be sacked.³³⁰

-headcount adjustment e.g. Nokia Siemens Networks has completed the preliminary planning process to identify the proposed remaining headcount reductions necessary to reach its previously announced synergy-related *headcount adjustment* goal.³³¹

-realignment e.g. Two Procter execs promoted, one to retire, in *realignment*...³³²

-rightsize e.g. Lansing can't resolve its long-term budget crisis without *right-sizing* the Department of Corrections.³³³

-also counselled out, made redundant, let go, dismissed, terminated, services are no longer required, for firing in general. e.g. If, at any time in your career at Touche, the partners ever seriously questioned the possibility of your eventually joining their ranks, you would be "*counselled out*," or laid off. Consultants might be "*counselled out*" at any time of the year, but during the annual period in which promotions, raises and bonuses were determined, there was always a flurry of such dismissals.³³⁴

³³⁴ <http://financecareers.about.com/od/changingjobs/a/layoffadvantage.htm>, Last visited: 10 April 2010.

-job flexibility: lack of job security (where job security means an actual or implied promise of continued employment). e.g. *Job flexibility* has helped Britain weather the recession...³³⁵

-outsource: dismissing in-house employees to hire cheaper labour provided by another organization. e.g. A report by Pierre Audoin Consultants (PAC) says that Romania and other Eastern European countries are virtually ignored by U.K. companies but are predominantly the first *outsourcing* choice for the rest of Western Europe.³³⁶

-replacement workers: scabs or strikebreakers in labour disputes. e.g. *Replacement workers* are poison to organized labour. In effect, they sabotage a union member's right to strike, at least insofar as that right was understood and expressed in the comments of Justice Brandeis.³³⁷

2.2. Euphemisms

Neil Postman in his book, *Crazy Talk Stupid Talk*, suggests that a **euphemism** is an exalted term used in place of a down-to-earth term, or "an attempt to give prettier term to an uglier reality."³³⁸

A **euphemism** is a substitution of an agreeable or less offensive expression in place of one that may offend or suggest something unpleasant to the receiver, or to make it less troublesome for the speaker, as in the case of doublespeak. According to Postman, "euphemisms are a means through which a culture may alter its imagery and by so doing subtly change its style, its priorities, and its values." Lexicographer Bergen Evans of Northwestern University, believes that euphemisms persist because "lying is an indispensable part of making life tolerable."³³⁹ The English word **euphemism** is found for the first time in a book written in 1656 by Thomas Blount, *Glossographia*.³⁴⁰ It comes from Greek *euphèmos*, which is itself derived from the adjective *euphèmos*, "of good omen" (from *eu*, 'good', and *phèmi*, 'I say'). Etymologically speaking, a **euphemism** is linked to taboos, and traditionally consists in replacing the original signifier, perceived as being offensive or unpleasant, by another one; it is often referred to as a "veil" or a "shroud" thrown over the signified, as if to conceal it.

2.2.1. Types and Formation of Euphemisms

With the development of language, euphemism is evolving day by day, new expressions being formed. Euphemisms may be formed in a number of ways. The formation of euphemism, on a certain degree, follows some principles, although some language phenomena are not reasonable but come into use frequently. Many euphemisms are figurative, many having been or are being the cause of semantic change. Some show remarkable inventiveness of either figure or form and some are indubitably playful. Euphemism can be achieved through antithetical means, e.g. by circumlocution and abbreviation, acronym or even complete omission and also by one-for-one substitution; by general-for-specific and part-for-whole substitution; by hyperbole and understatement; by the use of learned terms or technical jargon instead of common terms, and by the use of colloquial instead of formal terms. Many learned terms and some technical jargon is either borrowed from another language or constructed from one: for English, they are mostly derived from Latin or Ancient Greek.

2.2.1.1. Lexical device - Due to different types of morphemes and word formation, lexical device can be applied to the formation of English euphemism.

1. Acronym- Acronym is made up of the first letters of an expression. In the formation of

³³⁵ <http://www.telegraph.co.uk/finance/comment/tracycorrigan/7462265/Job-flexibility-has-helped-Britain-weather-the-recession.html>, Last visited: 10 April 2010.

³⁴⁰ Cf. Burchfield, R., *An outline history of euphemism in English*, in D.J. Enright (ed.), *Fair of Speech: The Use of Euphemisms*, London, Oxford University Press, 1985, p.13.

euphemism the first letters of taboo words or unpleasant words are taken out and then put together to get rid of rudeness. **CLM** – Career Limiting Move; **COB** - Close of business; **RFP** – Request for proposal; **EOD** – End of the day.

2. Analogy - Analogy creation can account for similar forms in the conjugation of words. Basing on certain words, the new expressions are coined with similarity in meaning. This means is mainly used to form euphemisms in the field of professions. Take the word **engineer** for example, **engineer** originally refers to “skilled person who control an engine or engines, esp. on a ship or air-craft.” Later it is extended to “person who designs, builds or maintains engines, machines, bridges, railways, mines, etc. In euphemism, “engineer” is greatly adopted, such as *telephone engineer* (telephone repairer), *automobile engineer* (mechanic), and *custodian engineer* (trash cleaner). By the device of analogy, it beautifies the title of some indecent professions and shows respect to them.

3. Borrowing - English language in its development has managed to enrich its vocabulary by borrowing words from other language. **Uber** – Very. As in, I’m *uber* excited about this merger.

4. Negation - Negation in euphemism formation mainly adds prefix to show the opposite meaning. **Outsourcing** – Sending work outside your office. Often means sending work to be done abroad. **Disconnect** – Lack of understanding on an issue between two people. On the one hand it prevents hurting the listener; on the other hand it achieves the speaker’s intention as well as drives a better communication.

5. Substitution - Substitution is to take something similar to replace the real situation. **On board** - Agree with something. Or commit to be a part of something. **Magic bullet** – The perfect solution to a problem. **Interface** – Let’s meet. Let’s talk. **Heavy lifting** – Doing the hard work. **Hot button** – An important issue. **B School** - It’s “Business School”.

2.2.1.2. Syntax Device - Syntax refers to the study of the rules governing the way words are combined to form sentences in a language, or simply, the study of the formation of a sentence.

1. Metaphor

By application of metaphor, a rhetoric device, many expressions are described vividly. For example, “taxes” have become nowadays such an unpleasant civic duty that people use different euphemistic terms for this word. Therefore, it is not surprising that there is an amusing range of terms for **taxation**: “access fees/charges”, “carbon footprint contributions”, “civic assessment fees”, “direct universal service support”, “economic incentives”, “economic stimulus packages”, “environmental externality factors”, “impact fees”, “income shifting options”, “innovative sources of financing”, “late fees”, “redistribution of wealth alternatives”, “redeployment of revenue”, “restructuring of budgets”, “revenue enhancements”, “service charges”, “socially-responsible public investments”, “social support subsidies”, “transfer payments”, “universal service charges”, and “value-added revenue opportunities”.³⁴¹

2.2.2. Business Euphemisms

Euphemistic language pervades the workplace and almost all business dealings: **involuntary separation, letting go, downsizing, re-engineering, restructuring, and streamlining** are preferred to “layoffs.” The word **challenge** is used to actually refer to “a problem.” “Recession” is used to mean a “depression.” When one is given the **pink slip**, he or she is “fired!” And a company **disinvests** when it fact it “closes a retail outlet in a community.” It is quite acceptable in some situations if euphemisms in business are used to identify a chain of command such as in the use of **chief executive officer** instead of “boss.”

³⁴¹http://www.squidoo.com/entertaining_euphemisms#module10221385 , Last visited: 24 March 2010.

Air Cover - When a senior manager agrees to take the flak for an unpopular decision, while someone lower in the chain of command does the dirty work. e.g. “As an executive development expert, I’ve facilitated dozens of 360 degree leadership assessments, team development, and new leader assimilation processes. Along the way, I have learned that leaders get dinged if they don’t provide *air cover* to their direct reports.”³⁴²

Alpha Pup - A market research term referring to the “coolest kid in the neighbourhood.” e.g. “If the *alpha pups* go for it, we’ll sell millions of them.”³⁴³

Business Ecosystems - When companies in the same markets work cooperatively and competitively to introduce innovations, support new products and serve customers. e.g. “... I described how the Australian lending industry was a great example of friction-loaded *business ecosystem* and how LIXI standards are aimed at reducing some of that friction.”³⁴⁴

Cookie Jar Accounting - An accounting practice where a company uses reserves from good years against losses that might be incurred in bad years. e.g. “Microsoft has an interesting, if dubious, *cookie jar accounting* scheme where profits from successful quarters aren’t reported so that less successful quarters can be padded.”³⁴⁵

800-Pound Gorilla - A company that dominates an industry short of having a complete monopoly. e.g. “BlackRock Is Now the *800-Pound Gorilla*”³⁴⁶

Ideation- Brainstorm session. e.g. “When setting up *ideation* sessions, we encourage invitations to other divisions. These newcomers will analogize a lot, relating what they hear to their own experiences.”³⁴⁷

Market Cannibalization - When a company’s new product negatively affects sales of its existing, related products, i.e., it eats its own market. e.g. “When Bayer made a debut of its ‘maximum strength’ aspirin, the new product ate into sales of classic old standby Bayer Aspirin. Bayer officials said *market cannibalization* was the only way to retain and build market share against new Extra-Strength Tylenol.”³⁴⁸

Pain Points - A favourite of consultants used to describe places where an organization is hurting due to poor operating structure, technology or inefficiencies. e.g. “If you ask reflective questions instead of questions that can be answered with yes or no, prospects usually share more information with you. This increases your chances of uncovering *pain points* that can eventually lead to sales.”³⁴⁹

Pockets of Resistance - Another borrowed military term that describes a person or group that attempts to stall, block or kill a project. e.g. “Our process includes: ... [A]chieving assimilation: coaching, problem solving, and addressing persistent *pockets of resistance*.”³⁵⁰

Reverbiagize - To reword a proposal with the hope of getting it accepted by people who did not like it the first time around. e.g. “Don’t worry about coming up with a new idea, we’ll just *reverbiagize* the old one.”³⁵¹

³⁵¹D.W. Martin, *Officespeak: The Win-Win Guide to Touching Base, Getting the Ball Rolling, and Thinking Inside the Box*, New York: Simon&Schuster, 2005, p.79.

Tszuj (Pronounced “zhoozh”) - To tweak, finesse or improve. It is an expression made popular by TV stylist Carson Kressley, meaning to add a special flare to an outfit or hairstyle. e.g. “*Tszujing* the cost-benefit tables can get you in a lot of hot water if you’re not a math whiz who loves to tweak via trial and error.”³⁵²

³⁵²Ron Sturgeon, Gahan Wilson, *op.cit.*, p.62.

3. Conclusion

Throughout time, language has progressively evolved and also the language and methods used by individuals who have the power to manipulate the views of the people and sway thought and behaviour. Doublespeak represents a very real danger to society that already holds influences over people's actions and thoughts because it distorts reality by creating false communication based on contradictions, misleading words, phrases and unnecessary complexities. On the other hand, it is considered that euphemism enriches the English language, and is one of the agents of the change and development of the language as well.

EINFLUSSE DES ENGLISCHEN AUF DIE DEUTSCHE WIRTSCHAFTSSPRACHE UND JUGENDSPRACHE

Sacara-Onita Adina

Universitatea din Oradea, Facultatea de Științe Economice

The paper presents the historical evolution of borrowings in the German language from the Greeks or Romans to the 20th century. The paper underlines the English borrowings present in the everyday speech from academic milieu to teenager medium and its social impact. The paper focuses on economical terms used in an economic magazine called Siemens Welt and on an teenagers everyday speech in magazine Bravo.

Keywords: borrowings denglisch economic terms teenager speech.

Durch ihre zentrale Lage in Europa wurde die deutsche Sprache über die Jahrhunderte durch andere Sprachen beeinflusst. Bereits in der Frühzeit der deutschen Sprachgeschichte finden sich fremdsprachliche Ausdrücke, vor allem aus dem Griechischen und Lateinischen.

Aus dem Lateinischen sind z. B. viele alltägliche Wörter, vor allem aus Architektur, Religion, Kriegswesen und Weinbau entlehnt. Auch die griechische Sprache hat das Deutsche in Religion, Wissenschaft und Philosophie stark beeinflusst.

Später war es dann vor allem die französische Sprache, die großen Einfluss auf das Deutsche ausübte. Im hohem Mittelalter kamen viele Bezeichnungen – vor allem in Verbindung mit dem Rittertum – aus dem Französischen ins Deutsche.

Im Spätmittelalter und in der frühen Neuzeit finden sich viele gelehrte Bildungen lateinischer Herkunft (z. B. *Centrum, Disciplin, Klasse, Universität*)

Im 17. und im 18. Jahrhundert herrscht wieder der französische Einfluss vor (*Alamodewesen*). Frankreich war in dieser Zeit die kulturell führende Nation Europas. Ausdrücke wurden u. a. übernommen in den Bereichen der Diplomatie und Verwaltung (*Depesche*), des Handels (*Fabrik*), des Transportwesens (*Karossee, Chaise*), der Esskultur (*Bouillon, Kotelett, Konfitüre*), der Mode (*Frisur, Garderobe*) sowie des gesellschaftlichen Auftretens (*Etikette*).

Nach dem Dreißigjährigen Krieg wurde an vielen Höfen französisch gesprochen und selbst preußische Könige beherrschten diese Sprache besser als Deutsch. Um 1750 berichtet Voltaire vom Hof des Preußenkönigs Friedrich II.: „Ich bin hier in Frankreich: Man spricht unsere Sprache, das Deutsche ist nur für die Soldaten und die Pferde“

Das 19. Jh. ist gekennzeichnet durch die Ablösung der französischen durch englische Wortschatzerweiterung. Großbritannien galt als Vorbild u. a. im Bereich der Wirtschaft (*Trust*) und der Presse (*Interview, Reporter*). Das Verkehrswesen verwendet weitgehend noch französische Ausdrücke (*Billet, Perron*), wobei allerdings auch hier der angelsächsische Einfluss auf dem Vormarsch ist (*Tender, Tunnel*). Ende des 19. Jh.s löst das Englische das Französische als Gesellschaftssprache weithin ab, was auch im Fremdwortschatz seinen Niederschlag findet: *Dandy, Flirt, Smoking, Cocktail*.

Man war – schreibt Peter von Polenz - *Gentleman, Snob, Dandy* oder *Selfmademan*, gehörte einem *Club* an, benahm sich *fair*, fand die Dinge *allright* oder *tiptop*, trug den *Cutaway, Frack, Smoking* oder die *Breeches*, aß *Beefsteak, Toast, Keks* oder *Pudding*, trank in der *Bar* einen *Whisky, Sherry* oder *Cocktail*, trieb *Sport*, spielte *Tennis* oder *Hockey*, machte *Picknick* und erlaubte sich einen *Flirt* oder gar einen *Spleen*.

Im 20. Jh. gewinnt das Englische auch in Form des Angloamerikanischen weiter an Bedeutung und wirkt bis in den privaten Lebensbereich hinein: *Bestseller, Jazz, Make-up, Pullover, Rocker, Sex, Teenager*.

Ab Mitte des 20. Jahrhunderts nahm in Deutschland das Englische zunehmend Einfluss auf die deutsche Sprache (Anglizismen). Diese Entwicklung wird von einigen skeptisch betrachtet, insbesondere dann, wenn es genügend deutsche Synonyme gibt. Kritiker merken auch an, es handle sich oftmals (z. B. bei Handy) um Pseudo-Englisch.

Auch technische Zwänge bei der Synchronisation englischsprachiger Filme üben mittlerweile einen Einfluss auf das Deutsche aus. Um Lippensynchronizität zu gewährleisten, werden Worte und Redewendungen kreiert, die zuvor im Deutschen nicht üblich waren, sich dann aber später in der Umgangssprache durchsetzen (z. B. „Oh mein Gott“ statt „Um Gottes Willen“ als Übersetzung für „Oh my God“). „Verdeckte“ Anglizismen“ gibt es mittlerweile auch aus anderen Gründen: So ist der heute sehr gebräuchliche Ausdruck „nicht wirklich“ die wortwörtliche Übersetzung von „not really“ und bedeutet demzufolge soviel wie „eigentlich nicht“ – allerdings hat sich der Ausdruck inzwischen verselbständigt. (aus Wikipedia, der freien Enzyklopädie.)

Früher hatte man noch Rollschuhe. Heute kaufen die Eltern ihren *Kids* lieber *Inline-skates*, alles andere wäre schließlich *out* und vollkommen *uncool*. Ihre Freunde rufen sie auf dem *Handy* an, ob man sich mal wieder zum *shoppen* verabreden könnte, um ein neues *Outfit* für die *Party* zu suchen. Danach gehen sie vielleicht zum *Hip Hop Event*, falls sie nicht damit beschäftigt sind, zu *jobben*, im *Internet* zu *surfen*, oder einem anderen *Hobby* zu frönen.

Englische Wörter sind aus unserem Alltag nicht mehr wegzudenken. Englisch ist nicht nur die *Lingua Franca* der Welt, sie verändert auch andere Sprachen.

Wer meint, das Englische im deutschen Wortschatz bliebe, wie in obigem Beispiel, auf die Sprache der Jugend beschränkt, der hat verpasst, dass der Rektor der traditionsreichen Münchner LMU die Fakultäten und Fachbereiche der Universität in *Departments* umbenannt hat und man heute schon beim täglichen Einkauf im Supermarkt an zahlreichen *Specials*, *Family Packs* und *Body Lotions* vorbeiläuft. Einigen scheint das gar nicht aufzufallen, andere protestieren heftig gegen die „Invasion“ von Anglizismen, die sie zu beobachten meinen. Der „Verein deutsche Sprache“ (VDS) etwa verlieh dem Münchner Uni-Rektor kurzerhand die Auszeichnung zum „Sprachpanscher“ des Jahres 2000 und startete nebenbei eine Unterschriftenaktion gegen „Denglisch“. Hat denn die englische Sprache tatsächlich einen so großen Einfluss auf das Deutsche, dass man schon vom „Denglischen“ sprechen kann? Einige Sprachforscher meinen: Ja, die deutsche Sprache würde durch den starken Einfluss des Englischen sogar „pidginisiert“. Andere sehen in der Aufnahme von Anglizismen in den deutschen Wortschatz eine Bereicherung und meinen in Aktionen wie die des VDS nichts als sprachliche Xenophobie und Kulturchauvinismus zu erkennen. Wer hat Recht, und wer liegt falsch? Schon die Fragestellung verrät: Eine eindeutige Antwort auf die Frage kann es nicht geben.

Sprache ist eine zu komplexe Sache, als dass es möglich wäre, solche klaren Verhältnisse schaffen zu können. Doch diese Arbeit hat sich auch nicht zum Ziel gesetzt, Urteile zu fällen, sie möchte eine Übersicht über die Veränderung der deutschen Sprache durch den englischen Einfluss verschaffen und mögliche Erklärungen für die bisherige Entwicklung beleuchten. Ein Vergleich mit unserem Nachbarland Frankreich soll aufzeigen, wie unterschiedlich verschiedene europäische Länder auf das „Phänomen Anglizismen“ reagieren und wie sich die Internationalismen im fremden Sprachgebrauch verändern, beziehungsweise wie sie verändert werden. Ein Blick in die Zukunft ist leider nicht möglich, denn was Prognosen der Sprachentwicklung angeht, kann nie eine sichere Aussage getroffen werden. Trotzdem sollen hier die Meinungen verschiedener Publizisten und Institutionen zur Zukunft der deutschen Sprache berücksichtigt werden.

Das eigentliche Bestreben dieser Arbeit ist die Schärfung des Bewusstseins im Umgang mit Sprache. Wenn es ihr gelingt, die Faszination der Sprache, nicht nur als Informationsträger, sondern als eigenen, lebendigen Organismus ins Gedächtnis zu rufen, dann wäre das Ziel erreicht, nicht nur in schulischer Hinsicht der Aufgabenstellung dieser Facharbeit genüge zu tun, sondern auch einen Dienst an unserer Sprachkultur zu leisten.

Zur Illustration des Vorkommens des Englischen in Wirtschaft und Marketing wird hier die SiemensWelt, die Mitarbeiterzeitschrift der Firma Siemens verwendet.

Bereits auf der zweiten Seite der SiemensWelt findet sich eine reiche Auswahl an Beispielen für den Gebrauch des Englischen in deutschen Publikationen. Die Zeitschrift ist dort nämlich in Rubriken eingeteilt, die folgende Namen tragen: „Coverstory“, „Team“, „Partner“, „Trends“, „Business“ und „Family“. Zusätzlich werden noch Seiten mit den Bezeichnungen „Zoom“, „Mailbox“, „Blackboard“ und „Spotlight“ angekündigt. Es handelt sich hierbei jedoch keineswegs um eine englischsprachige Zeitschrift, auch wenn sie auf dem Titelbild als „International Edition“ bezeichnet wird. Die Artikel sind, bis auf die zahlreichen Anglizismen, in deutscher Sprache verfasst. Begriffe wie *Management*, *Investment* und *Trend* lassen sich in fast jedem Artikel finden.

Ein Bericht über ein Projekt der Firma in Afrika enthält etwa den Satz: „Unternehmen wie Siemens sind hier Trendsetter.“ Besonders viele englische Begriffe werden in Artikeln gebraucht, die von Abteilungen und Konzepten der Firma berichten. „VDO verstärkte den Bereich Production and Logistic Systems und Demag Delaval das Industrieturbinengeschäft des Bereichs Power Generation.“

Die in der Zeitschrift aufgeführten Tabellen enthalten fast gar keine deutschen Wörter. „Ebit-Margen-Ziele der Bereiche“, eine Liste mit Zielsetzungen verschiedener Abteilungen der Firma führt unter anderem diese an: „Information and Communication Networks“, „Automation and Drives“, „Transportation System“ und „Medical Solutions“.

Auch die Werbeanzeigen in der Zeitschrift, oder zumindest ihre Werbesprüche, sind fast sämtlich englischsprachig. „Enter the race“ wirbt für ein einen „Netracer“, „commitment“ für „Fujitsu-Siemens-Computers“.

Man findet Anglizismen in der Wirtschaftssprache aber nicht nur in Fachzeitschriften. Sie begegnen uns im täglichen Leben. Begriffe wie *Onlinebanking*, alle Arten von *Service*, *Controlling*, *Teamwork*, *Know-how*, *Marketing* und *Workshop* sind jedem vertraut.

Dieter E. Zimmer führt in seinem Buch „Deutsch und anders - die Sprache im Modernisierungsfieber“ einen besonders illustrativen Satz über Englisch in der Wirtschaftssprache an: „Praktische Erfahrungen im Total Quality Management und/oder Business Process Re-engineering haben unsere Senior Berater/innen als externe Consultants oder in einem in-house-Team erworben.“

Das nächste Gebiet, an dem der Einfluss des Englischen auf die deutsche Sprache veranschaulicht werden soll, die Jugendsprache, unterscheidet sich in seinen Themen und seiner Zielgruppe stark von denen der Wirtschaft und ist deshalb gut geeignet, die ausgedehnte Verbreitung englischer Wörter im deutschen Sprachgebrauch zu demonstrieren.

Als Anschauungsmaterial zum Thema findet hier die Jugendzeitschrift Bravo Verwendung.

Besonders interessant für diese Untersuchung ist der „Bravo-Foto-Roman“, da darin Geschichten aus dem Alltag junger Jugendlicher erzählt werden. Der darin vorkommende Text sollte also zumindest bedingt repräsentativ sein für die Sprache von Jugendlichen allgemein.

Der Einfluss des Englischen auf die Jugendsprache ist in den Dialogen der dargestellten Mädchen und Jungen nicht zu übersehen. „Easy! Ich hab doch sein Handy!“ meint ein Mädchen in der Geschichte. Außerdem finden sich Bildunterschriften wie

„Meike stürzt wie eine Irre zur Haustür und sieht einen Boy auf einem Bike flüchten...“ oder, zwei Seiten später, „Meikes Bruder macht sofort ein Date mit dem Typen aus...“.

Auch im Rest der Zeitschrift finden sich zahlreiche englische Ausdrücke, besonders im Bereich rund um Musik und *Stars*. Die *Outfits* und der *Style* der Idole wird dort besprochen, die *Newcomer* und die *Megastars*.

Im Bereich rund um populäre Musik, der ein wichtiger Bestandteil der jugendlichen Kultur und Sprache ist, lässt sich der Einfluss des Englischen auf die Sprache nicht übersehen. Das könnte natürlich auf die Dominanz des Englischen in den Liedtexten selbst zurückzuführen sein.

Deutschsprachige Musik scheint wenig beliebt zu sein, bedenkt man, dass sogar eine Vielzahl deutscher Musiker auf Englisch, statt in ihrer Muttersprache singen.

In einer Ausgabe des Jugendmagazins „jetzt“ gibt es eine Rubrik, die sich „gute frage“ nennt. Jede Woche wird die Frage eines Lesers abgedruckt, dazu mehrere Antworten, ebenfalls von Lesern eingeschickt. Die „gute frage“ der Ausgabe 42/2000 lautete: „Ich finde, Pop Songs mit deutschen Texten hören sich kacke an. Du auch?“

Die Frage selbst, sowie die Tatsache, dass sie gedruckt wurde, sprechen eigentlich für sich und gegen die Beliebtheit deutschsprachiger (Pop-)Musik.

Martin Gauger, Romanist an der Universität Freiburg meint dazu: „Man muss einem 10-jährigen nicht mehr erklären, warum er Englisch lernen soll. Er ist schon durch die Musik motiviert.“

Wird ein englisches Wort in den deutschen Wortschatz übernommen, so behält es nicht immer seine ursprüngliche Bedeutung und Form. Da sich Englisch und Deutsch in ihrer Grammatik und Morphologie unterscheiden, werden Anglizismen häufig in ihrer Orthographie und Flexion an die deutsche Sprache angepasst. Gleichzeitig werden manche Regeln der englischen Sprache in die deutsche übernommen.

SOME THOUGHTS ON WRITING SKILLS

Sim Monica Ariana

University of Oradea, Faculty of Economics

Writing is one of the central pillars of language learning and should be of major interest and concern to teachers, students and researchers. This paper is intended to be a plea for writing and explores issues regarding instruction and evaluation of writing skills of nonnative speaker students. It examines expectations of nonnative speakers writing quality and performance on writing proficiency exams, as well. Finally, it is trying to ring a bell about this skill that has been neglected in spite of its importance when it comes to foreign language acquisition.

Key word concepts: language, English, teacher, student, writing, skills

Cod JEL lucrare: F29, Y8

General background. Of all the language skills, writing is the most difficult challenge for language teachers because students have less experience with written expression. Stimulated by audio-visual materials throughout their lives, students are novices in the discipline of writing. Making writing an ongoing part of foreign language acquisition from the first day in class will help ensure student success.

The purpose of learning a language is to improve the learner's four skills of listening, speaking, reading and writing, to achieve the ultimate goal of mastering the language. Every time skills are mentioned, they are ordered according to the moment they occur in the teaching-learning process. Writing is the skill that has to be well approached only after the other previous three have already been employed. Nevertheless, it seems that because it is the last one in the series, most of the times it remains neglected.

Why are writing skills important?

First of all, writing skills help the learner to become independent, comprehensible, fluent and creative in writing, important abilities which help learners put their thoughts in a meaningful form and to mentally tackle the message in a proper manner.

When it comes to writing in a foreign language, it is even more challenging. Writing English clearly is an important goal for all English learners. It is not only because writing well- be it your own language, or a foreign one - clarifies your mind and orders your thoughts, but also because the ability to represent yourself well on paper will help you secure a job in the future.³⁵³ Most multinational firms use English to communicate with clients. Professional staff regularly have to write documents in English, although they are not native speakers. Despite having a good level of spoken English, many of them have not considered the elements of good writing. Therefore, most of them tend to write as they speak, or to translate from their first language. The outcome is documents which are unclear to the reader or use an inappropriate style. There are also often grammatical mistakes caused by first language interference.

Moreover, how you write, the style, cohesion, tone, attitude say a lot about you as a person, and headhunters, employers know this. It is not just what is on the paper that distinguishes one resume from another in a competitive job market. Presentation, clarity, and professionalism in a foreign language can help distinguish you from the rest. Thus, good English writing can open doors in almost any field you might choose in the future (as not so many people can write it well). A survey conducted among 64 American companies revealed that half of them pay

³⁵³ Paige Johnson Tan, *The Importance of Writing Well: A Justification and How-to Guide*, <http://people.uncw.edu/tanp/writingwell.html>

attention to writing when considering a person for employment or promotion.³⁵⁴ That is why, nowadays, the growing trend worldwide is oriented toward establishing stricter standards of writing proficiency, an issue that directly affects students who are nonnative speakers of English. Whether you are a teacher of English, a student or a businessperson, (academic) writing skills are necessary in today's world. All kind of papers, like essays, reports, presentations, research papers, to pick up just some examples of documents, need to be written in the correct style, so to say the academic style, which would be the final target. When used appropriately, the academic style presents a polished and professional image.³⁵⁵

Traditionally, institutions have attempted to address nonnative speakers writing needs differently, and where it may once have been possible for nonnative students to graduate without being expected to write as well as students who are native English speakers today's trend mandate (theoretically, at least) that they be held to the same standards of writing proficiency as native speakers.

"While trying to improve math, science, and technology in our schools, we've neglected writing," said Commission member Gaston Caperton, president of the College Board, which founded the Commission on writing in America³⁵⁶. "Writing is a fundamental professional skill. Most of the new jobs in the years ahead will emphasize writing. If students want professional work in service firms, in banking, finance, insurance, and real estate, they must know how to communicate on paper clearly and concisely."³⁵⁷ And this is said by Americans about English, their native language. Writing in a foreign language poses a lot more other problems, as speakers of different languages have different writing challenges that come from their own native language. Writing well in English can make the difference when finding a job. Speaking of jobs, nowadays applicants are asked for proofs, real document to support their declared knowledge of English. So learners have to sit for all kind of tests that assess their ability to use English, writing skills included.

How to improve writing skills? They are not just a set of basic skills people are taught at school. Writing and reading, listening and speaking are an integral part of each educated individual's life since they all mean communication. Written communication, in its turn, is another tool for people to express their ideas, and learn about those of others. Writing well is sure to earn respect.

Like all learning problems, difficulties in writing in a foreign language can be devastating to a student's education and self-esteem. If a learner fails to develop certain basic skills, he will be unable to write with the speed and fluency required to excel as these demands increase. Usually the normal steps in the progress of the learning process are tests and all sort of exams that are to prove their level of English. Writing is part of these tests. Paradoxically, this skill is not so much taught, rehearsed, improved even if everybody seems aware of the importance of writing, as shown above. Tests and language exams reveal this flaw of the instruction process. When preparing for them, students find themselves unequipped with the necessary knowledge to pass these exams. Not to mention what happens after graduation, when they actually need to get employed, so it is no longer about sitting for an optional exam like PET, CAE, BEC, TOEFL etc. Finding out the reasons for which learners consider writing a more difficult skill to approach and teachers, equally as a more challenging task to teach can be of a great help to overcome these shortcomings of the instruction process.

³⁵⁷ Writing Skills Necessary for Employment, Says Big Business, http://www.writingcommission.org/pr/writing_for_employ.html

Naturally, for many English students learning to write fluently in English is much more challenging than learning to speak fluently. Even for advanced level learners, written communications can come much more slowly in English than spoken communications. The reasons for this are as follows: written communication is more formal, spoken communication allows for more 'mistakes', expectations are much higher for formal written English. Another reason for which some individuals might find it difficult or impossible to write, is that written language takes on many different *registers* depending on the function of the written word. Often, these functions are totally foreign to spoken language and can thus be considered 'artificial' to the speaker. These functions are often only used in written speech and are therefore even more abstract to some individuals than the already difficult transcription of simple spoken language into an alphabet.

Learning some basic tips of effective writing can help the learners. Effective writing:

- is focused on the topic and does not contain unnecessary or loosely related information;
- has an organizational pattern that enables the reader to follow the flow of ideas because it contains a beginning, middle, and end and uses transitional devices;
- contains supporting ideas that are developed through the use of details, examples, vivid language, and mature word choice;
- follows the conventions of standard written English (i.e., punctuation, capitalization, and spelling) and has variation in sentence structure.

Consequently, the whole writing activity should be reconsidered and structured in ways that help students learn to produce cohesive and coherent discourse on their way to become self-sponsors of their own writings. Writing tasks should not remain mere 'compulsory' tasks that just have to be done by both students and teachers as well; writing activities can turn into challenging, interesting, creative moments of the teaching-learning process.

Of course, there are differences between a research paper, a memo, and an answer on an essay exam; students may like some of these activities and reject others. However, they all share certain common features: they go somewhere; they argue something; they have a direction and it is only the teacher's task to draw the student's attention and to raise the student's interest towards writing.

Students need to be able to write all type of tasks; they have to be aware of the limits between formal and informal style, they have to develop the ability to recognize the audience expectations and requirements. In order to achieve all these, there are issues to be approached, and clarified and here is the moment and the time of the teacher. The learner has to be conducted so as to raise his awareness on the audience, to develop his/her academic writing skills (outlining, summarising, reporting and arguing, paraphrasing and synthesizing), he needs to be given some theoretical knowledge about writing from which he will later on benefit, he has to become aware of the issues such as the differences between written and spoken language, coherence, etc. Unfortunately, at almost all levels of the educational process, our system lacks all the above mentioned aspects. There is a kind of inexplicable reluctance and sometimes even fear of approaching writing. And it is maybe just because teachers themselves did not go through such kind of a training themselves. Academic writing is the ultimate goal and challenge of both teachers and learners.

Academic writing is formal writing. Most of the written pieces students are asked to produce refer to this particular style of expression. Many novice writers find it difficult to distinguish informal writing from formal writing. Informal writing is just at hand because it is more familiar. Informal writing is fine for diaries, blogs, personal letters or emails to friends. However, students working on papers for school, exams, scientific papers, presentations, business writing generally are required a more formal style.

Academic writing skills, can, anyway, be learnt, improved if students focus on several key areas; it differs from writing in high school.

1. Essay writing. It is interesting to notice that in most of the cases when teachers actually teach writing, we have to deal with the so-called ‘five-paragraph theme’ which is really a good thing. Students know that such a writing assignment begins with something general, narrows down in the middle to discuss specifics, and then branches out to more general comments at the end. In the classic five-paragraph theme, the first paragraph starts with a general statement and ends with a thesis statement containing three issues; each body paragraph discusses one of the issues in turn, whereas the final paragraph sums up what the student has written. It is a great way of learning how to write an academic essay; it is the easier or simpler version of the academic writing that requires stating an idea and supporting and arguing it with evidence. “Writing five-paragraph theme is like riding a bicycle with training wheels”³⁵⁸ and the difference between high school writing and further academic writing probably relies on that in high school the stress is on the who, what, when, where, whereas further academic writing asks the student to think the how and why.

Students have to know certain technical aspects of writing an essay, for example. They need a little bit of theory as input, somehow like a prefabricated recipe that they can adapt, improve, and feel free to employ whenever they are asked to write.

The title of the paper should suggest not just the topic of the paper but also the thrust of the argument, if possible. An essay of longer than three pages should probably have a title, or covering, page. This should include, at a minimum, the title of the paper, student’s name, the course name and number, teacher’s name and date of submission.

The Opening A good paper should have an opening that is interesting to the reader. It has to be something intriguing that you can grab the reader’s attention.

The Main Statement of the Essay A thesis statement should also be included in the opening as well; it briefly presents the main argument of the essay (this may be a how or why answer, a policy recommendation, or an opinion). Importantly, after the thesis statement, the paper should then tell the reader how the writer intends to demonstrate his argument or justify the opinion or recommendation asserted (an important aspect that many authors forget).

The Body In the body of the paper, the student should support his thesis. It is important after each point to link back to the thesis and refresh the reader with what you have told him so far. *The Conclusion* should not bring any new information. Rather, the conclusion should re-state the main thesis and show the reader how it has been demonstrated.

There are some common problems students should be let known of. For instance, writing a *paragraph* is not a natural skill, but a learned skill. Students should simply follow a structure: paragraph usually containing a general idea in one sentence, and 4 - 5 supporting sentences which expand this idea by giving explanation, details, and examples to support the main idea. Paragraphs are used to separate main ideas. A new paragraph signals to the reader that a new idea is about to be discussed.

Spelling becomes a widely spread reason why people dislike writing. However, it does not mean that we take it for granted and do nothing with language learners to improve the situation. Spelling, as any other language skill has to be given our thorough attention. Some people are naturally good spellers. Others worry about spelling but they have to realize that correct spelling is really only vital when we are writing final copies of assignments or other documents. The most important thing to remember about spelling is that it's a skill you learn by writing and seeing the words on the page. Proofreading is the key to a correct spelling.

Summarising and paraphrasing are difficult skills to acquire for our students at the beginning of the writing activity, since our education does not emphasise them properly.

³⁵⁸ *College Writing*, <http://www.unc.edu/dept>, last visited 10 April 2010

On the other hand, the after-writing steps are also extremely important for; consequently, students should be introduced to *strategies* such as revision, peer feedback, critical evaluation and group work gradually and the teachers should show the students the beneficial sides of these procedures, since our students seem neither familiar, nor inclined towards group work and critical evaluation.

2. *Formal letters.* A totally different story is that of writing technical, formal documents, like letters, memos, reports, that students tend to consider as easier assignments. Nevertheless, students seem to come to such conclusions only after having been presented a basic, simple, and clear summary of writing rules. In English there are a number of conventions that should be used when writing a formal letter, starting with its layout, the right place and content of the address, date, references. Furthermore, the letter should be as simple and as clear as possible; its length should be correct, not longer than necessary, whereas contractions proper to informal writing should be avoided.

The first paragraph should be short and state the purpose of the letter (be it an enquiry, request, memo or complaint etc).

The body of the letter should contain the relevant information that initiated the writing of the letter. Most of letters in English are not very long, so retain only the essential information; ideas should occur logically, clearly and cohesively.

The Last paragraph of the formal letter should state what action you expect the recipient to take. In addition, students have to be aware of the difference between formal and informal styles of writing. Even within academic writing, there are different levels. Good writers think about their purpose in writing and their readers when deciding how formal their text should be. It might help students a lot to imagine a sliding scale which measures the level of formality.

Extremely informal -----Extremely formal

Eg. diary, reminder

Eg. legal document

The facts tackled above represent only a very concise way of presenting a formal letter; this, together with samples and then the actual work on the composition are the stages towards exquisite pieces of writing. They are necessary; otherwise, set in front of a task (like the one below³⁵⁹) learners find it almost impossible to achieve it at the required level. The task does not seem extremely complicated. Still, taking a look at the right column we can see what is being actually assessed. If students are not familiar with this type of approach, they can easily fail. Sometimes the trouble is that teachers themselves are not prepared enough to train students, to support them and finally to assess their work.

<p>Question</p> <p>A restaurant in your region is to open shortly and the owner has placed the following advertisement in your local newspaper:</p> <div style="border: 1px solid black; padding: 5px; margin: 10px 0;"> <p>RESTAURANT STAFF NEEDED...</p> <p>...For a busy restaurant located in the main tourist area</p> <p>number of vacancies available, including:</p> </div>	<p>Content</p> <p>Should mention the post applied for, relevant skills and previous and personal qualities. Could also mention when available to attend interview.</p> <p>Range</p> <p>Language suited to a letter of application, e.g. correct use of present and past simple tenses for describing past experience(s). Standard expressions as 'I am writing with reference to...': 'I look forward to hearing fr</p>
---	---

³⁵⁹ The complete text of the assignment is taken as proof from Certificate in Advanced English Paper 2 Writing, www.flo-joe.co.uk/cae/students/writing, last visited 12 April 2010.

<p>Junior Chef</p> <p>Waiter/Waitress</p> <p>Restaurant Manager</p> <p>Hours of work: 6 - 12pm, Mondays to Saturdays.</p> <p>Please send us a letter explaining which post you are interested in. We should consider you for the job. Interviews will be held a week from the date.</p>	<p>'Should you need further information....'</p>
<p>Write the letter of application. (Around 220-260 words).</p>	<p>Organisation</p> <p>Should have the layout of a formal letter, with appropriate opening (e.g. 'Dear Sir or Madam', 'Yours faithfully'). Should start with writing in the first paragraph. (e.g. 'I am writing to apply for the post of restaurant manager, which was advertised in The Daily Chronicle'). The second, third (and possibly fourth) paragraphs should describe your relevant experience and personal qualities as well as your general suitability for the job. N.B. In the exam there is no need to write addresses.</p> <p>Register</p> <p>Fairly formal. Should be consistently polite throughout.</p> <p>Target reader</p> <p>The reader would be persuaded that the applicant had the relevant experience, and would consider inviting the applicant for an interview.</p> <p>Language accuracy</p> <p>Should not contain major errors that lead to misunderstanding by the reader.</p>

The teacher's attitude toward correction, the way in which he offers it to students, and students' own feelings about the teacher in general are significant factors in the effectiveness of the writing process. Teachers should focus more on process and give multi-draft assignments; they should teach students how to use feedback to improve their writing skills. Moreover, teachers should provide feedback that addresses the specific needs and expectations of students. Some students need feedback on the content, style, and rhetoric; others may use corrective feedback of their lexical and grammatical expression.

Conclusion The paper has stated some thoughts about the teaching of writing in the nowadays context oriented toward establishing stricter standards of writing proficiency; it suggested some ways for teachers to help students become better in their writing, be creative and competent. It is a necessity for writing activities to be structured in ways that help students learn to produce cohesive and coherent discourse on their way to become better writers and critics of their own writings. Finally, the primary focus of writing practice should not be only on the correct word or phrase, but on the whole communication process that help improve the quality and image of the student himself.

INTERCULTURAL COMPETENCES AND INTERCULTURAL DIALOGUE. CASE STUDY ON ACADEMY OF ECONOMIC STUDIES BUCHAREST

Suciu Marta-Christina

Bucharest Academy of Economic Studies

Faculty of Economics, Economics & Economic Policies Department

Dărăbănt Maria

Bucharest Academy of Economic Studies

*Faculty of International Economics Relations,
Foreign Languages Department*

Trocmaer Neagu Ana-Maria

Politehnica University of Bucharest

Management Department

Ivanovici Mina

Bucharest Academy of Economic Studies

Faculty of Economics, Economics & Economic Policies Department

The paper debates the topics of intercultural competences and intercultural dialogue. The main research whose results are being disseminated through this paper are part of a national research project, "Equality of chances and intercultural dialogue", project granted by competition and which benefits from the expertise of a dynamic team of University Professors and lecturers as well as enthusiastic PhD students. The authors present the results of their academic and research activities involving students (both Romanian and foreign) studying Economics in foreign languages (at the Faculty of Business Administration taught in foreign languages, English section within the Bucharest University of Economics).

Key words: intercultural dialogue, intercultural competence, intercultural sensitivity, knowledge-based society

The article's JEL code: A20, A22,A23,A29.

1. Introduction

MOTTO: "We want to go beyond multicultural societies, where cultures and cultural groups simply coexist side by side, where they live 'parallel lives'. We need to become intercultural societies where plurality of cultures cooperates in dialogue and in shared responsibility. 2008 as the European Year of Intercultural Dialogue is an important part of the effort to move beyond tolerance and towards a genuine intercultural Europe." (Ján Figel, Commissioner for Education, Training, Culture, and Youth, Intercultural dialogue as a long-term priority for the EU, "Intercultural Dialogue as the Fundamental Value of the EU", Ljubljana, 7 January 2008)

The issues of intercultural dialogue and intercultural competence play a key role in shaping and reshaping the future. Intercultural rhetoric uses cultural difference to build knowledge and support wise action. This paper examines examples of good practices used to design an intercultural dialogue, to manage diversity, and to build *intercultural knowledge competences* within one of the most important higher education institutions from Romania.

Promoting *a diverse multiethnic student groups* demands more elaborate pedagogical approaches to facilitate every student's acquisition of *intercultural competencies within the framework of intercultural dialogue*. Due to its importance 2008 was declared the *European Year of Intercultural Dialogue*.

Drawing from a case study regarding learning in foreign languages economics subjects and one based on learning a foreign language dedicated to support economics competences the paper argued that *intercultural communication* and *dialogue* can play a key role for a knowledge-based society. The paper stresses the need for *intercultural communication education (ICE)* that concerns several academic disciplines - psychology, social psychology, sociology, education, media studies, cultural anthropology and management (Stier, 2003).

2.Higher Education and intercultural dialogue. From intercultural sensitivity to intercultural competence and effectiveness

Recent debates tended to be more practically oriented. Good intercultural teaching practice (for example in languages) focus on the intercultural competence which requires shifting from "intercultural awareness and sensitivity" to "intercultural effectiveness" (Salo-Lee, 2007). A constructive intercultural dialogue within a university is becoming essential to perform successfully in the long-run. Universities should promote "cultural respect" that requires respect for all persons involved in intercultural communication, regardless of their origins and cultural choices. G. Chen and W. J. Starosta (1996) describe a model which focuses on four elements: communication skills, personal attributes (including the capacity for "social relaxation"), psychological adaptation (including the ability to cope with stress), and cultural sensitivity. Kim (2001) examines the importance for intercultural communication of: cognitive components, affective components and operational components.

Intercultural competence can be divided into: *content-competencies* and *processual competencies* (Stier 2003). *Content-competencies* have a one-dimensional or static character and refer to knowing a specific aspect. *Processual competencies* consider the *dynamic character of intercultural competence* and its *interaction context* (Hall 1976; Stier, 2004). This *knowing how-aspect* of intercultural competence, involves *intrapersonal* and *interpersonal competencies*. *Intrapersonal competencies* involve *cognitive* and *emotional skills*, coping with diverse feelings - xenophobia, frustration, ethnocentrism (Gudykunst 2003).

Interpersonal competencies refer to *interactive skills* being aware of one's own interaction style (*communication competence*) and adequately responding to *contextual meanings* (*situational sensitivity*). *Intercultural communication education (ICE)* should enhance students' understanding of the *dynamics of intercultural interactions*. It should enable them to obtain *intercultural competence*. *Intercultural Programmes' Student Outcomes (IPSO)* refer to *meta-competences* and extend beyond 'knowing that' and 'knowing how-aspects of culture'.

Instead they are about *knowing why and or even knowing why one knows why*. The *Features of Academic Curricula and Teaching Orientations (FACTO)* make up a fertile ground for *intercultural learning* and acquisition of *intercultural competence* (Stier 2006).

3.Intercultural Competence when all the subjects are taught in foreign language and when we deal with diverse multiethnic student groups. The cases of the Faculty of Business Administration (taught in foreign language), at the Bucharest University of Economics

The majority of courses offered in our universities are taught in Romanian. However, there are faculties where all the subjects are taught in foreign languages. We focused our research on the *Faculty of Business Administration (taught in foreign languages)* that offers courses taught in foreign languages (English, French, German). This faculty was created in 1990 and now there are both Romanian and foreign students (from more than 50 countries). We consider that this faculty is *an example of good practice* for a *multilingual university* that facilitates *intercultural dialogue*. We had applied the questionnaire method.

In the case of the *Faculty of Business Administration (taught in foreign languages)*, English section we applied a questionnaire on a number of 98 respondents, all of whom are students at the *Faculty of Business Administration (taught in foreign languages)*, English section, at the Bucharest University of Economics. Most of the respondents taking part in this study are aged 19 years old (64% out of a total of 98 students) and they are first year students. As for the respondents' nationality, at the *Faculty of Business Administration (taught in foreign languages)*, 86% are Romanian. 4% of the respondents did not declare their nationality, while the others have Israeli (3%), American (2%), Turkish (2%), Lebanese (1%), Palestinian (1%), and Belarusian nationality (1%). Their citizenship is almost the same as their nationality with very few exceptions. Most of the Romanian students (having Romanian citizenship and/or nationality) have Romanian parents. Almost all of the foreign students have parents of different nationalities from the Romanian one with only very few exceptions (one Israeli student having parents of Romanian nationality). The nationality declared for the parents are: Lebanese, Israeli, Romanian, Palestinian, Belarusian, Turkish, American and German, while 6% of the respondents chose not to declare their parents' nationality and citizenship.

When asked *whether they interact with foreign students or not*, at the *Faculty of Business Administration (taught in foreign languages)* the large majority declared that they do interact with foreign students (Romanians and foreign students alike)-figure 1.

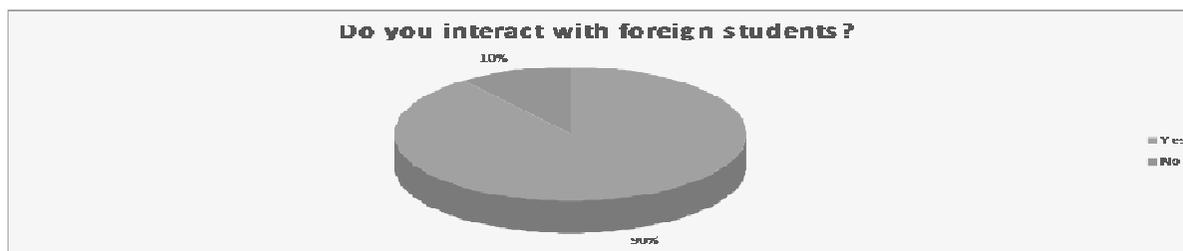

Figure 1. Answers of students from the *Faculty of Business Administration* to the question "Do you interact with foreign students?"

However, 10% of the respondents did not give a positive answer. It seems that they feel just like they *coexist* in a "multicultural situation" (Taylor, 1992; Semprini, 1997). It is very likely that their answer explains or reveals the lack of communication with their foreign colleagues despite the fact that they are students in the same year and series with foreign students. All of the negative answers were given by Romanian students meaning that all foreign students interact with Romanians and not only with students of their own nationality and/or citizenship. Out of the 88 students having stated that they interact with foreign students, 71% said that they interact with less than 10 foreign students, 13% said they interact with more than 11 students but with less than 50 students and only 1% said they interact with more than 50 foreign students. However, a part of the respondents (15%) did not provide any figure at all. The circumstances under which the students of the *Faculty of Business Administration (taught in foreign languages)* declared that they interacted with foreign students were: university activities (an expectedly large proportion 71%) and other activities and circumstances (17%) – figure 2.

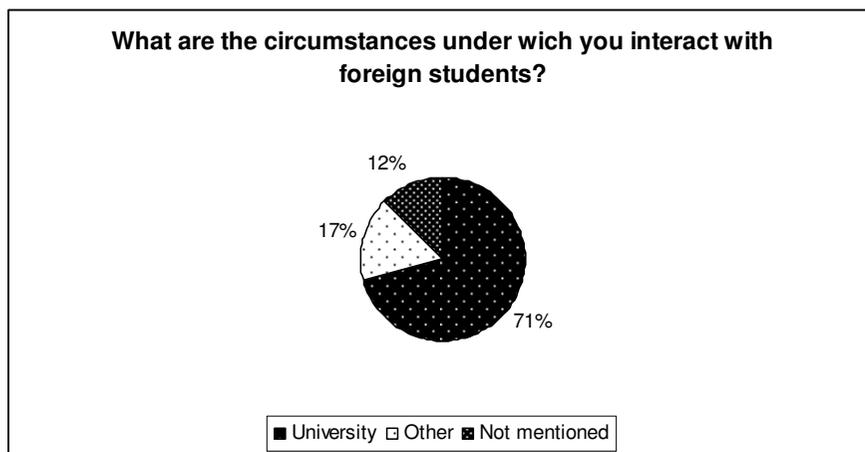

Figure 2. Answers of students from the Faculty of Business Administration to the question “What are the circumstances under which you interact with foreign students?”

12% of the respondents, however, did not want to state what these circumstances were. Within the category “other circumstances” fell: leisure activities, extracurricular activities or both.

When asked to point to the main difficulties that foreign students face, the answers were almost equally shared among the four alternatives: understanding the language (27%), adapting (23%), socializing (23%) and the academic environment (27%). Asked to say what policies or measures they would suggest in order for the Faculty/University to improve or resolve such difficulties, students said that the best policy to be applied would be promoting courses to boost intercultural dialogue and sensitivity focusing on the cultural specificity of each student (37%). Then followed the organization of workshops with all the students of different nationalities (25%), special preparation programs (22%) and the dissemination of materials with useful information (15%). It is more than obvious that the need for more communication would be a possible solution to these difficulties.

When asked to provide more such solutions, students suggested the following: mixing students of different origins (nationality, citizenship) in groups and series; organizing tour guides for foreign students; “showing around” sessions for first year students; organizing more language courses (Romanian); offering more language courses (other than English and Romanian); organizing trips to facilitate communication among students of different nationalities; group and team-building activities; sports events; cultural workshops in music, arts; team projects; different workshops; English as compulsory communication language; socializing and extracurricular activities; brainstorming sessions; better prepared administrative personnel; special advisers for foreign students; after school classes; making more room for NGOs to deal with this problem; encouraging more communication in seminars; having more dialogue in classes; cultural exchange programs and intercultural activities; spending more time with Romanian students; informal meetings for students; culturally-diverse menu at the cafeteria; Romanians offering volunteer to help foreign students adapt.

Asked whether there is any specific policy meant to promote intercultural dialogue in the university, in the case of students in economics the large majority (60%) admitted having no idea about any such policy, while 28% said there is such a policy and 12% said there is no such policy. This question is very useful in understanding the degree of information of students on such issues. For the question “How much does your University/faculty focus on supporting management of diversity, inclusive treatment and equal opportunities?” the answers were: “a lot” (11%), “to some extent” (45%), “not enough” (27%), “I don’t know” (17%).

For the question “*What are the communication difficulties that you encountered in the relationship with students of other nationalities?*” the answers were: different perceptions on things (41%), “*the language*” (24%), “*the culture*” (18%), “*preconceived opinions*” (16%), other (1%).

When asked *whether there are any benefits for students to be taught in a foreign language*, at the *Faculty of Business Administration (taught in foreign languages)*, 87% said there are benefits, 3% said there are no benefits, while the remaining 10% did not know what to answer - figure 3.

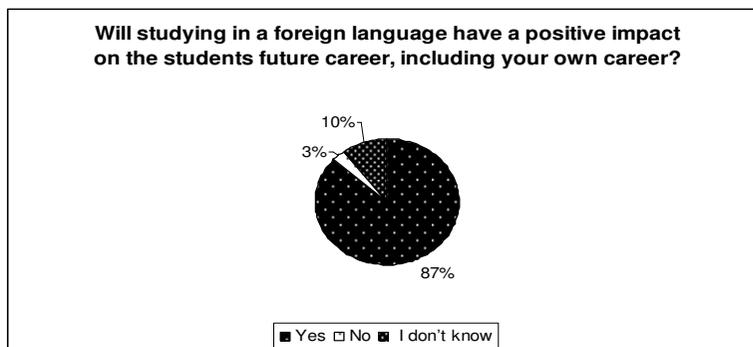

Figure 3. Answers of students from the Faculty of Business Administration to the question “*Will studying in a foreign language have a positive impact on student’s future career ?*”

Most of the positive answers (32%) were in favour of a better preparation to face any future challenges related to intercultural dialogue. 25% of the answers referred to better and improved language skills due to courses taught in a foreign language; 22% of the answers pointed to an easier socialisation due to courses taught in a foreign language; 20% of the answers referred to openness to communicate. Other students (2%) suggested that enlarging career opportunities and learning about other cultures would be other benefits. The respondents consider that the academic curricula taught in foreign languages are adapted to internationally agreed contents and standards (58%). 23% marked the “*not the case*” variant, while the remaining 19% chose “*I do not know*”.

When asked what students should focus more on in order to make the best of the intercultural dialogue to work in favour of stimulating creative and innovative potential of foreign students, their answers were: displaying an inclusive and supporting behaviour (33% for economics and 29% for engineering), forming diverse teams (23%), having an international experience of their own in order to understand cultural diversity (19%), asking for their help (11%), just being tolerant (9%), learning their language (5%).

Conclusions

In our case study students were very confident and said that studies in foreign languages and studying a foreign language like English could contribute to make them *feel better prepared to face any future challenges*. Some suggested that intercultural competences and dialogue could be a means of better adapting to a foreign country, as well as an opportunity to study topics of professional interest in the original. *The interpersonal aspect* was not ignored, as many students mentioned *socializing easier* as a plus of studies in foreign languages, while a lot of students remarked that students participating in such studies were *much more open to communication*.

We consider that we need to work on various fronts: *first*, making people and universities aware of what they can gain from *lifelong learning investing in language training* and in adopting a strategic approach to *knowledge management based on intercultural dialogue and competences*. *Second*, as English is seen more as a ‘*basic competence*’ that everyone needs in the labour market.

URBAN DEVELOPMENT & CREATIVE COMMUNITIES AS A PREREQUISITE FOR TOLERANCE AND INTERCULTURAL DIALOGUE

It is obviously that all over the world, mostly after 2000, a new approach for urban development and for regional development emerges. We choose Romania taking into account also the idea that it has old tradition in cooperation mostly within the areas near the borders where diversity and multicultural environment can allow more space for diversity management and for tolerance. One of the main challenges for the creative communities and for the creative industry sector and for those who engage within is how to encourage longer-term growth of these small lifestyle businesses. It seems that there is quite difficult to identifying creative workers due to their diversity (understood in a complex sense, in terms of cultural diversity that is more relevant for creative communities than ethnic, religion or other way to look traditionally for diversity).

Key words: urban development, regional economics, creative cities, creative communities, creative economy

The article's JEL code: R11, R58, R59.

1. Introduction – the necessity to promote, implement and develop the creative economy during crisis time

The global crisis that has made its presence felt since 2008, has already affected to a large extent all sectors of activity, regardless of country, region or continent. It has not avoided the creative sector or creative domains. Despite the potential of the creative economy to generate wealth and create jobs and growth, the creative economies must face the same threats that all economies face. The question is to what extent it affected the creative sector and what are its prospects for development in today's context.

As the global crisis affected without exception all areas and industries of the economy, the creative economy could had not avoid this major global change. The current social and economic landscape could be described broadly by the disappearance of a large number of jobs and the remaining being at risk, businesses which go bankrupt, owners that move etc. All these phenomena occur simultaneously worldwide in all industries.

Moody's (Economy.com) published a report on the recent economic activity in the United States of America. The report investigated 381 metropolitan regions, out of which 302 were already in strong recession and 64 were at risk of recession. When the research was conducted, only 15 of those 381 regions were still experiencing economic growth. The regions which were the least affected, according to the survey, were those regions rich in oil and other natural resources (e.g.

Texas and Oklahoma), who were *saved* by declining energy prices. As well, the Washington DC region still provides and creates new jobs in law and administration, due to nationalization of financial companies and fiscal expansion (Florida, 2009). At the opposite pole are the regions less associated with massive funding, which are most affected by the crisis.

In this context, sooner or later, all world regions will be affected by the recession, to some extent and for a certain period. As the crisis deepens, some regions will be more affected than others. Moreover, it is likely that certain regions or cities will have fully recover, reaching back their past performance, and others not to come back ever again. One thing is certain, however, that the world economy is deteriorating, and the response of different regions to these new conditions is various.

Similarly, *The Big Economic Crisis* or the *Great Depression* of 1929 began as a banking crisis caused by insolvent mortgages and complex financial instruments. Soon, however, the effects of this crisis widened and affected even the real economy, giving rise to a very high rate of unemployment (e.g. unemployment rate in New York was 25% and in some countries exceeded 30%). At that time, the oil industry, building railways and the steel industry were well developed. This is the context in which appeared *the dawn* of a new period of innovation and industrial growth. A similar opportunity may be identified today for the creative economy, since it can play a key role in the current crisis, its ability to revitalize, which was already proven during the periods of growth and expansion.

One of the root causes of the crisis is the increasing difficulty of the West to offset internal exhaust by attracting resources from other parties. Exhausted, the West founded the globalization of markets (especially financial markets) to attract resources from elsewhere, enabling it to maintain the same standard of living, but created a financial bubble at world scale. Everybody was interested in the fictitious and uncontrolled growth that was going: on the one hand, Western economies could maintain their growth, governments assured full employment today with the money of the tomorrow taxpayers, companies provided the required products without increasing the wages, employees were finding jobs, shareholders were getting significant value gains, the poorest had access to housing, banks gained enormous profits, United States effortlessly maintained their supremacy, the southern countries were involved in the growth with the help of U.S. imports and the world financial system stored much of the world added value.

The creative economy combines creativity with the commercial sense and research. The development of creative businesses is directly linked to the dynamics of the *new economy*, which becomes informational, global or networked. The new economy is based on knowledge – intellectual property – and contributes to the welfare of a nation. If the cultural industries were not substantial sources of revenues and economic growth before, during the past few decades they led to the revival of many European regions where the traditional industries had disappeared and left behind a desert landscape and a decaying society. It is the case of *Newcastle-Gateshead* urban conglomerate in Great Britain, former mining region; at present, this region is flourishing due to the development of the creative industries, and examples can be offered from many other geographic regions in this respect. It was thus proved that the creative economy has a major role in any society through social inclusion, urban regeneration and personal motivation they generate. Hundreds of years before art and culture did not represent productive activities, even though they used to have intrinsic value. Gateshead and Glasgow placed the creative industries and the cultural activities at the centre of their development strategies.

2. Creative cities, creative communities and creative regions – people and places that fire the engine of the entire economy – revitalization power

While the concept 'creative' is ubiquitous in everyday life, the concept of a creative city reflects a variety of examples with special applications of creativity to urban economic progress. For

purposes of this writing, the creative city will be viewed as engine for creative regions and as a general movement that uses the application of this concept primarily in the revitalization of cities and whole regions in terms of strengthening the competitiveness of cities that are based on creative community potentials.

The city in the 21st century takes precedence in terms of the number of residents who live in it. Certain sociologists who deal with the phenomenon of the city go so far as to claim that the global society in the 21st century is going through great paradigmatic change, because it is making a transition from a society of the national state to a society of the city.

Cities have always been and still are the focus of modern society and they are socially, culturally and economically dynamic entities and they are the engines of regions where they are placed.

One of the ideological mantras of globalization is that it does not matter where you are. The technology is "*aligning*" the playground-market and the world has become flat global village. Some authors as Pine and Gilmore (1999) argue that increasing competition in the market means that 'goods and services are no longer enough' and that producers must differentiate their products by transforming them into 'experiences' which engage the consumer. Today's global economy has its "*peaks*" of experience. Moreover, the highest "*peaks*" of experiences are cities and regions that are drivers of world economy, those that attract talented, educated people from all over the world, generate knowledge and largely contribute to global innovation, and each are very closely related activities of a group of people by Richard Florida, urban theorist, called "*creative class*." The main sources of the creative potentials in cities and regions are their people. What makes the creative city? It is people - people interacting with people (Hawkins, 2002).

"Today, we need creativity to be able to connect, collect and measure the impact of different spheres of life for a holistic understanding of the city i.e. how it materially affects our perceptions, in order to grasp the delicate ecological system of our lives and make it sustainable. We need, in other words, the skills of a broker, a person who thinks through several disciplines, which is in a network and connects - we need '*softer*' skills' (Landry, Bianchini, 1995).

Contemporary cities see their development through different models: intercultural city, environmental city, green city, slow city, cool city, etc. All these models are linked to changes with the economic and social aspects of the city starts from creative individuals and independent organizations to different administrative and policy systems.

Creativity is available to each city through their creative individuals and if the city promotes creativity and enables those individuals to show in public their creativity the city space would be enriched and more creative. Creativity is not a concept that can easily be caught. According to this in some cities and countries that are still going through transition and that are struggling with basic problems as it is lack of infrastructure and lack of sources for serious social problems, creativity is hardly acceptable. Although creative solutions usually cost very little they have big effect that shows example from the world such as Montpellier (Landry, 2000)

3. The stakes of the creative economy in the emerging countries of Southern and Eastern Europe. The case of Romania

In Romania, the concept of creative economy, as well as the one of creative industries and cities, is still at the beginning of its research; there are no broad researches or specifically focused works on this topic, as it is the case in those countries that initiated and promoted this concept.

The existing statistics at national level in Romania do not allow a fine and precise classification that outlines the creative industries exclusively as it is the case in Great Britain and Australia. Rather, activities in Romania are divided according to a broader classification.

Thus, several blooming creative activities in Romania cannot be separately interpreted due to the

classification procedure and statistical reporting. The general conclusion regarding the creative economy and industries in Romania is that the structure of classification of the economic activities in Romania does not particularly focus on them.

Actions aimed at developing Romanian creative economy and creative cities must take place in a wider context, an *international* one, in the South-eastern Europe space or even in the European Union. Nordic countries are the most eloquent example of such cooperation among nations, which can only lead to the development of the creative economy and cities.

One Romanian town – *Iasi* – was *elected the creative town in Romania*. This project was part of a larger *Central and Eastern European programme*, conducted by *the British Council*. The purpose was actually to map the creative industries in this creative town in order to create awareness about these companies and bind them all in a network. We hope soon other cities will be considered as creative cities and creative communities. Why not Oradea that is also an multicultural community where we can apply intercultural sensitivity tolerance and intercultural dialogue principles.

The measures taken in Romania in support of the creative industries are not part of a national strategy or policy. However, there have been several incentives for the software industry for some years whereby the profit was not taxed on such activities. Moreover, the crafts are supported by a national programme whereby craftsmen can benefit by financing provided the activity remains basically and mostly manual and it preserves the traditions.

In Romania the concepts of the creative economy and creative cities are still at early stage even though there is a time of discussing the creative economy on a highest level in the country.

Exploitation of knowledge and creative skills is one of the most lucrative industries in the world; the only problem is that in Romania it is not easily converted into capital. Lack of awareness of the importance of creativity in companies on the one hand, and outdated education system that does not encourage the development of creativity, on the other hand, are the main problems of the creative industries in these countries, participants emphasized the forums.

Conclusions and recommendations

In the content of the new urban development perspective creative cities, creative communities and creative regions are place where we can hope to find a reliable and sustainable source for long-run sustainable competitive development even during crisis time. Like Phoenix bird recovering from its ashes, creative communities have a real potential in order to identify the real source for regional sustainable development among the creative corridors and creative cities. According to the sustainability of interventions and involvement of the population, creative cities can act properly like fire engines for the long-run sustainable development of the whole region to which they belong.

In Romania, the concepts of creative economy and cities are still in early developing stage and they are still based on enthusiasm of creative organization and individuals.

The awareness of companies and individuals in majority is not high enough and creativity is seen as waste of money and time.

Authors are optimistic and hope for the best perspective for their country, Romania.

That is why as researchers we had done our best to promote this new approach within our country and we are very happy that we obtain on competition bases some research funds for a national research project (IDEI 1224) specially dedicated to the topic of "*The creative economy & knowledge-based society. Challenges & opportunities for Romania*". This project started in 2007 and is running also in 2010.

As teachers we also promote this topic among our students on all the Bologna Process levels (undergraduates, Master and PhD Programmes). One of the authors is a PhD candidate who had chosen to the research project topic for the PhD dissertation paper.

We are convinced that by promoting creative economy new approaches among students when these students will graduate they will do their best in order to promote this approach in Romania. Or at least they will not block other's people initiatives that will support creative economy promotion both at the national and regional level.

The regional and territory dimensions have a special meaning for the cotemporary development. And the creative & innovative communities can make the difference also for Romanian regions on their way towards a creative & innovative economy.

LE DEVENIR DE L'INFORMATIONNEL ET DES PROJETS DANS L'ENSEIGNEMENT DU LANGAGE ECONOMIQUE

Tamaş Cristina

Université « Ovidius » Constanta

Département de langues modernes pour les facultés non-philologiques

Informatics, especially the Internet represents a new approach for the teacher interested in new methods of teaching foreign languages. More and more attracted to the Internet, the students will combine what is necessary with what is pleasant in learning rapidly a language for special purposes. In this paper I have presented the objectives of teaching French language for the Economics starting from an authentic material on the Internet: Lafarge Group which is a multinational enterprise and a world leader in building materials, with a branch in Romania, Constanta County, Medgidia town.

Mots-clés: informatique, Internet, sciences économiques, site, authentique, entreprise

Cod JEL: A12, A19

L'information est un enjeu incontournable du maintien et du développement de la domination des acteurs du secteur économique. Sans elle, la gestion et le renouvellement des produits et des marchés, l'organisation de leur diffusion et de leur consommation à l'échelle de la planète ne seraient pas possibles. L'information étendue et profonde est si bien captée par le secteur économique, que c'est à lui principalement que revient le mérite des réussites incontestables qui n'existeraient pas sans elle. L'économie est dopée à l'information sous presque toutes ses formes: technoscientifique, géographique, médiatique. Toutefois, cette domination de l'information a réussi à créer des domaines spécialisés du point de vue du langage nécessaire à appréhender les problèmes fondamentaux et globaux. Morin note que: «sous la pression de l'économie, le tissu complexe de la société a été tailladé en petits morceaux; difficile de reconstituer l'ensemble. Aux économistes, l'économie, aux démographes, la démographie»³⁶⁰

Selon les exigences de la société contemporaine, on doit souhaiter l'ouverture du lexique économique et son intégration dans une communauté plus ample, celle de l'université mais également dans le milieu des affaires. De la sorte, l'économie et son langage au service de l'être humain devraient nous conduire à civiliser la terre en une société moderne qui favorise la compréhension du langage spécialisé économique mais aussi des mécanismes qui y agissent.

L'informationnel dans l'économie est une conquête de complexité sociale. Elle institue à la fois des règles pour les individus, des impôts qui assurent le contrôle des entreprises, des régulations qui empêchent l'évasion fiscale.

Or, les nouveaux enjeux d'une économie informationnelle mondialisée doivent transmettre aux étudiants en sciences économiques tous ces termes spécifiques des mécanismes en fonction.

Dans la *perspective actionnelle*, les étudiants en sciences économiques sont à envisager non seulement en leur qualités d'individus mais, à la fois, dans le rôle d'acteurs sociaux ayant à traiter une multitude de situations communicatives auxquelles ils se confrontent à l'avenir dans une entreprise, et qui exigent l'accomplissement d'un certain nombre de tâches. Pour les mener à bien, ils mobilisent une série de compétences dont ils disposent déjà et, en parallèle, en acquièrent d'autres.

³⁶⁰ Morin Edgar, Naïr Sami, *Politique de civilisation*, Ed. Arléa, Paris, 1997, p. 288.

La définition d'objectifs communicatifs impose comme nous l'avons vu, la prise en compte des besoins du public visé. Sophie Moirand³⁶¹ conçoit un schéma fonctionnel menant à la formulation des objectifs en faisant distinction entre objectifs situationnels et objectifs communicatifs – la traduction des objectifs situationnels en objectifs communicatifs se réalisera à coup d'identification des divers paramètres, par leur mise en relation à des éléments verbaux et non verbaux de la communication et par analyse des éléments verbaux (ou de discours) produits en pareilles circonstances.

Entre les objectifs généraux le professeur visera les suivants:

1. initier au fonctionnement des rapports sociaux de travail dans une entreprise.
2. entraîner à la compréhension des documents écrits/oraux statuant les rapports du travail.
3. former à la rédaction de documents dans l'expérimentation FOS par l'Internet doit se mettre d'accord avec ses étudiants pour répondre le mieux à la question: qu'est-ce que les apprenants doivent connaître, savoir et surtout savoir faire pour mener à bien les activités de communication découvertes sur un site. Donc, ils devront être familiarisés en avance avec les différents volets parmi lesquels:
 - a) connaître les rapports dans le travail et la communication interne de l'entreprise.
 - b) maîtriser le discours c'est-à-dire savoir comment se débrouiller dans telle ou telle situation de communication: vocabulaire, constructions syntaxiques, aspects stratégiques, conventions de rigueur etc.
 - c) savoir comment fonctionne un certain type de négociation, comment se déroule un rendez-vous d'affaires
4. connaître le contenu des affaires de l'entreprise envisagée
5. comment se fera l'évaluation de ces activités de communication selon quels critères?

Le principal *objectif thématique* sera dicté aux étudiants et il constituera le cadre dans lequel le professeur insèrera les autres objectifs et les actes de parole. Dans notre cas l'objectif thématique sera: prendre connaissance des divers moyens de communication orale et écrite employés par une entreprise multinationale qui a son propre site et qui veut faire une promotion correcte en vue de son bon fonctionnement.

Quant aux *objectifs discursifs*³⁶² le professeur identifie les définitions et explique les différences entre les moyens écrits et oraux (il va annoncer les étudiants du film promotionnel qu'ils doivent écouter plusieurs fois).

Puisqu'on est mis dans une situation dans laquelle l'Internet devient un partenaire pour l'étudiant, les objectifs linguistiques seront identifiés ensemble avec les actes de parole. Donc, dans l'évaluation ou l'autoévaluation les étudiants seront invités d'identifier les types de phrase dans la communication dans l'entreprise (affirmative, interrogative, passive, impersonnelle).³⁶³

L'explication du professeur est nécessaire pour ces tâches: Quand et dans quel contexte on a exprimé l'obligation (l'interdiction, la permission etc.)?

D'habitude, nos étudiants sont de *Niveau B1+* qui correspond à un degré élevé du Niveau seuil, ils réussissent à comprendre et utiliser un nombre de descripteurs relatifs à la quantité d'information échangée. Ils sont capables de prendre des messages sur des demandes de renseignements ou expliquer une difficulté, apporter l'information concrète exigée dans un entretien, mais avec une précision limitée; donner son opinion sur un article, un exposé, une discussion etc. et répondre à des questions de détail complémentaires, ou les résume; mener à bien un entretien préparé en vérifiant et confirmant l'information, même s'il faut parfois faire

répéter l'interlocuteur lorsque sa réponse est longue ou rapidement énoncée; décrire comment faire quelque chose et donner les instructions détaillées; échanger avec une certaine assurance une grande quantité d'informations factuelles sur des questions de son domaine. Donc, on peut entrer ensemble sur l'Internet à l'adresse <http://www.france-entreprise.fr/> où nous allons découvrir *l'annuaire des entreprises françaises sur l'Internet*.

Là-bas on a le choix entre *Alimentation et boissons*, *Antiquités* ou bien *Économie* (Affaires de commerce extérieur, Consulting, Courrier d'affaires, Emploi et ressources humaines, Renseignements économiques et enquêtes, Services, Services financiers...)

L'annuaire développe aux étudiants la compétence interculturelle et offre une vue d'ensemble sur les critères en fonction desquels les entreprises peuvent être classées. Grâce à ce site on peut voir la liste des plus grandes entreprises françaises, cotées en bourse et qui font parties de l'indice Stoxx50.

Le professeur présente l'histoire de l'entreprise *Lafarge* qui est présente aussi en Roumanie à Medgidia, département de Constanta. *Lafarge* est un groupe français de [matériaux de construction](#), leader mondial dans son secteur, suivi par [Holcim](#). Il est présent dans trois activités principales : [béton](#) et [granulats](#), [ciment](#), [plâtre](#), et dans 79 pays. Son chiffre d'affaires, en 2008, s'est élevé à 19,033 milliards d'euros, dont 57 % dans le ciment, 35 % dans le béton et les granulats et 8 % dans le plâtre. Le groupe emploie environ 84 000 personnes dans le monde sur 2 187 sites de production. La compagnie des Ciments Lafarge a développé des ciments spéciaux de renommée internationale. Lafarge est leader mondial des matériaux de construction.

C'est en [Ardèche](#), en [1833](#), que naît l'activité du cimentier Lafarge après la reprise, par son fondateur [Léon Pavin de Lafarge](#), d'une activité familiale lancée en [1749](#) dont l'usine exploite une carrière de pierre à chaux dans la montagne Saint-Victor dominant le [Rhône](#) entre [Le Teil](#) et [Viviers](#). Dès [1864](#), le site livre 11 000 tonnes de chaux pour le [Canal de Suez](#), c'est le premier chantier d'envergure internationale pour l'entreprise. En [1919](#), l'activité est transformée en société anonyme sous le nom de *Société anonyme des chaux et ciments de Lafarge et du Teil* et dès [1939](#), Lafarge devient le premier cimentier français et progressivement l'un des leaders mondiaux. En [1980](#), la fusion avec l'entreprise [belge](#) Coppée donne naissance au Groupe Lafarge Coppée et en [1997](#), elle acquiert le britannique [Redland](#) ce qui permet à Lafarge d'entrer dans le marché des [tuiles](#). Le [12 juillet 2001](#), l'acquisition du groupe britannique [Blue Circle Industries Plc](#) (BCI) permet à Lafarge de devenir le premier producteur mondial de ciment devant le Suisse [Holcim](#). Pour financer cet achat, Lafarge revend sous forme de LBO l'essentiel de sa branche de matériaux de spécialités, rebaptisée [Materis](#). Le [29 juin 2004](#), Lafarge décide de doubler la capacité de sa cimenterie de [Dujiangyan](#), en [Chine](#), pour la porter à 2,4 millions de tonnes, et signe un accord de partenariat avec Shui On Construction Materials Limited (SOCAM), cimentier chinois coté à [Hong-Kong](#). En [2007](#), Lafarge SA annonce le rachat de la division ciment du groupe égyptien [Orascom](#), [Orascom Cement](#) pour 8,8 milliards d'euros mais est condamné, la même année, avec la société [Vicat](#) pour entente illégale⁶ et abus de position dominante collective sur le marché de gros de l'approvisionnement de la Corse en ciment.

Le [2 juillet 2008](#): *Lafarge Couverture* devient [Monier](#) après la cession de l'activité Toiture à [PAI partners](#) et le [19 août 2008](#), dans le cadre du plan de nationalisation de l'industrie du ciment, du président [vénézuélien](#), [Hugo Chavez](#), Lafarge conclut un accord de cession de ses filiales vénézuéliennes.

Le [28 juillet 2009](#), dans le cadre du plan global de désinvestissements du Groupe, Lafarge annonce la cession de ses actifs Ciment et Granulats & Béton au [Chili](#) (Lafarge Chile SA et Immobiliaria San Patricio ainsi que la cimenterie de La Calera) au groupe [péruvien](#) [Brescia](#), pour une valeur de 555 millions de dollars US.

Le groupe, qui comprend plus de 1 240 sociétés détenues majoritairement et environ 230 sociétés détenues sous forme de participations, est très décentralisé. Il est organisé en trois branches:

- [ciments](#), la direction générale se trouve à [Saint-Cloud](#) ainsi que les services techniques France alors que les services techniques à l'international se trouvent à [L'Isle-d'Abeau](#).
- [granulats](#) et [bétons](#),
- [plâtres](#).

Chaque branche regroupe l'ensemble des unités de son domaine d'activité sur le plan mondial.

Les unités ont une compétence limitée à une zone géographique, généralement un pays, pour une activité donnée. Le siège du groupe, situé à [Paris](#), comprend la direction générale, le comité exécutif et l'ensemble des directions fonctionnelles.³⁶⁴

Si nous allons cliquer sur l'Entreprise Lafarge on peut découvrir tout le lexique nécessaire pour la présentation et la promotion d'une société: agenda, Cours de bourse, Groupe, Développement durable, Recherche et Innovation, Clients et Activités, Actionnaires et Investisseurs, Journalistes, Candidats etc.

Par exemple, dans les communiqués de l'année 2010 nous apprenons que *Lafarge* (leader mondial des matériaux de construction, qui occupe une position de premier plan dans chacune de ses activités: ciment, granulats & Béton et Plâtre), dépasse son objectif de réduction de ses émissions de CO₂ dans le monde. Pour tenir ses engagements, Lafarge investit des montants importants dans la durée: plus de 800 M€ auront été investis ces cinq dernières années dans la réduction de l'empreinte environnementale industrielle des cimenteries du Groupe.

Ethique et gouvernance offre aux étudiants la possibilité d'écouter les modes de gouvernance qui font partie intégrante des critères de développement durable. Chez Lafarge, la gouvernance est réglée par des principes éthiques forts.

Trois axes se dégagent:

- la réussite des collaborateurs: l'objectif de Lafarge est d'aider chacun à réussir.
- l'amélioration permanente de la performance: Lafarge veille à optimiser continuellement ses produits et services.
- une organisation «multilocale»: les activités de Lafarge sont locales, mais s'inscrivent dans une logique globale.

Ecouter cette présentation constitue un volet de compréhension orale très important dans la communication professionnelle, et peut être exploité comme un matériel complémentaire. Du point de vue économique, il faut insister après l'écoute du discours sur le terme *gouvernance* que les étudiants peuvent noter. *La gouvernance* d'entreprise est constituée de l'ensemble des mécanismes d'orientation, de contrôle et d'évaluation qu'elle met en place. De façon plus précise, ce terme peut également désigner des règles de fonctionnement du conseil de la surveillance.

On peut indiquer aussi *le glossaire* du site http://www.lafarge.fr/wps/portal/2_6Glossaire, où ils trouveront le lexique concernant les termes spécifiques à l'activité de l'entreprise (ajout cimentaire, bauxite, cellule photovoltaïque, cendres volantes, co-incinération) mais aussi des termes économiques pour le groupe multinational (Organisation Internationale de Travail (OIT), Programme des Nations Unies pour l'environnement PNUE).

Il serait néanmoins utile que l'exploitation de ce site avec le Groupe Lafarge soit complété par des exercices d'exploitation, de consolidation et d'évaluation regroupés dans une banque (base) de données électronique). Lorsqu'on procède à l'évaluation, en fait, nous mettons l'accent sur le processus qui se construit en spirale ouverte sous les yeux des étudiants et leur professeur, toujours actif et disponible pour ajuster, réajuster et reformuler les activités proposées.

L'apprenant est donc bien le point de départ que ce soir vers l'enseignant ou vers un autre apprenant: ainsi, il peut apprendre à communiquer avec le groupe en présentant pour le début le profil de Lafarge, ensuite sa stratégie et l'équipe dirigeante.

³⁶⁴ http://fr.wikipedia.org/wiki/Lafarge_SA.

Le professeur, à son tour, peut intervenir avec des questions ouvertes, sur l'avenir de son correspondant: Est-ce que tu aimerais travailler dans une multinationale de type Lafarge? Pourquoi?

Apprendre aux étudiants à utiliser le site Internet de manière efficace autant en classe que dans leur travail individuel c'est faire le premier pas vers leur autonomie. D'ailleurs, les Projets «Langues Vivantes» du Conseil de l'Europe ont inclus dans leurs orientations fondamentales l'exploration et l'exploitation du concept d'autonomie et les stratégies pédagogiques susceptibles de contribuer à son application dans les systèmes d'enseignement/apprentissage des langues européennes.

MODALITIES OF INCREASING THE COSTS EFFICIENCY IN RENAL DISEASE TREATMENTS

Ștefan Petre

Enache Tasica-Daniela

"1 Decembrie 1918" University, Alba Iulia

Ducu Corina

"1 Decembrie 1918" University, Alba Iulia

" Presently, in Romania, the number of patients being treated of renal diseases is two times and a half less than the European average. In spite of all this, the main resources that Romania has to treat the renal diseases are used mainly for the treatment through hemodialysis, which is the most expensive treatment method. The present study intends to modify the proportions between the different renal treatment methods, in the sense of increasing the number of cheaper treatment methods (renal transplant, peritoneal dialysis) and decreasing the number of expensive treatment methods.

Keywords: patients, cost, treatment, renal transplant.

Cod JEL: E 21

1. Development models

a) The renal substitutive treatment in Romania as compared to the countries which report to the European Renal Registration

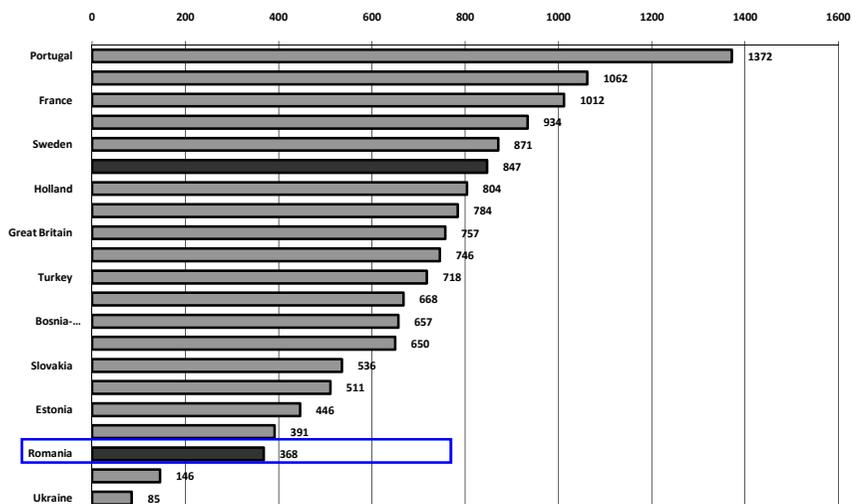

Figure 1. The prevalence of the patients treated through substitution methods against the renal diseases (patients treated to 1 million inhabitants) at 31st December 2007 in countries which report to the European Renal Registry³⁶⁵.

³⁶⁵ NDT Plus 2009 December; 2(6): 514–521.

a) The increase rate of the patients number

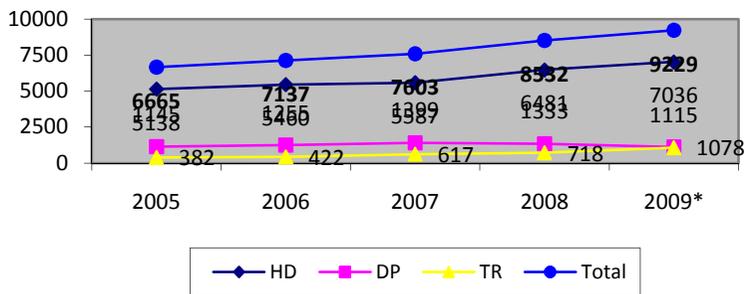

Figure 2. The dynamics of the number of patients treated through renal substitution methods in Romania between 2004-2009 (trimester 3)

Between 2005-2009, the average rate of increasing the number of patients was of 8% (Figure 5). Due to the economic conditions, an increase rate of around 5% is financially supportable between 2010-2014, with possible annual adjustments according to the available financing resources.

b) The report between the substitution methods of renal functions

The hemodialysis, the peritoneal dialysis and the renal transplant are the renal substitution methods to which one can resort complementarily according to:

1. the medical indications which are determined by the patients' pathological particularities, and also by their individual preferences;
2. the geographical, historical, cultural, religious and social particularities of each country which determine the population's and the doctors' attitude to each treatment methods;
3. the treatment costs for the system. As it results from **Figure 6**, the most advantageous economical method is the renal transplant, followed by the peritoneal dialysis and the hemodialysis.

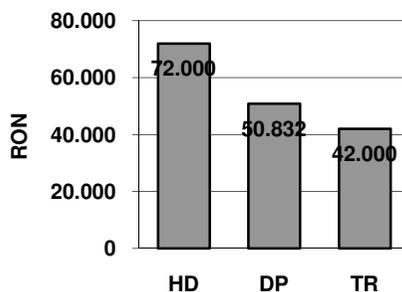

Figure 3. The costs of the hemodialysis (HD) treatment, the peritoneal dialysis (DP) treatment and the renal transplant (TR) treatment per patient a year, calculated according to the CNAS tariffs in 2009, and in case of the renal transplant are also included the expenses regarding the surgical intervention of treating the donator considered to be covered in 5 years.

4. the economic interests of the public or private dialysis providers determined by the returning conditions, which obtain profits from any of the methods.

As a result of the cumulated intervention of these factors, in Romania, the most used method is the hemodialysis (77% of the patients), followed by the peritoneal dialysis (12%) and the renal

transplant (11%). The tendency in the last 5 years is a preponderant increase of the renal transplant (+15%), followed by the hemodialysis (+8%) and the decrease of the peritoneal dialysis (-10% in the last 2 years). Consequently, **Romania's situation radically differs from the European one (Figure 7).**

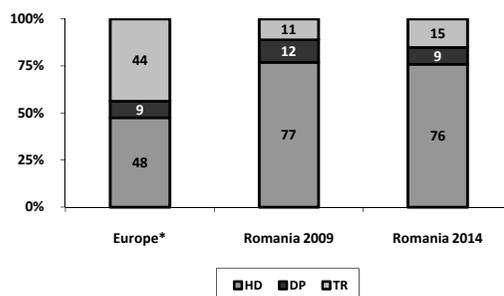

Figure 4. The utilization of the substitution methods of renal functions in Europe (European Renal Registry, 2007) and in Romania (2009 and the estimation for 2014)

c) Development models between 2010-2014

The modeling principles are:

1. The modeling duration was of 10 years;
2. A 5% increase of the total number of patients, starting from the number existent in 2009;
3. Maintaining the present indicators of patients: the gross indicator of mortality of 10%, transfer from the hemodialysis of 2% to the peritoneal dialysis and of 5% to the transplant, transfer from the peritoneal dialysis of 9% to the hemodialysis and 3% to the renal transplant, transfer from the renal transplant of 10% to the hemodialysis and of 5% to peritoneal dialysis.
4. Maintaining the present tariffs of the substitutive treatment methods: 72 thousands RON for the hemodialysis, 50.2 thousands RON for the peritoneal dialysis and 42 thousands RON for the renal transplant;
5. There were three models constructed:
 - a. **The "present - HD" model** based on continuing the tendencies in the last 5 years of using the substitutive treatment methods (annual increase of 5%, 1% for the hemodialysis and peritoneal dialysis, respectively a fixed number of transplants per year and respectively a renal transplant);
 - b. **The "predominant peritoneal dialysis – PD" model** in which the annual increase is of 5%, 20% and of 10% for the hemodialysis, peritoneal dialysis and renal transplant;
 - c. **The "predominant renal transplant – TR" model** in which the annual increase is of 5% and of 1% for the hemodialysis and peritoneal dialysis and the number of the financed renal transplants increased with 10% per year (**Figure 8, Figure 9**).

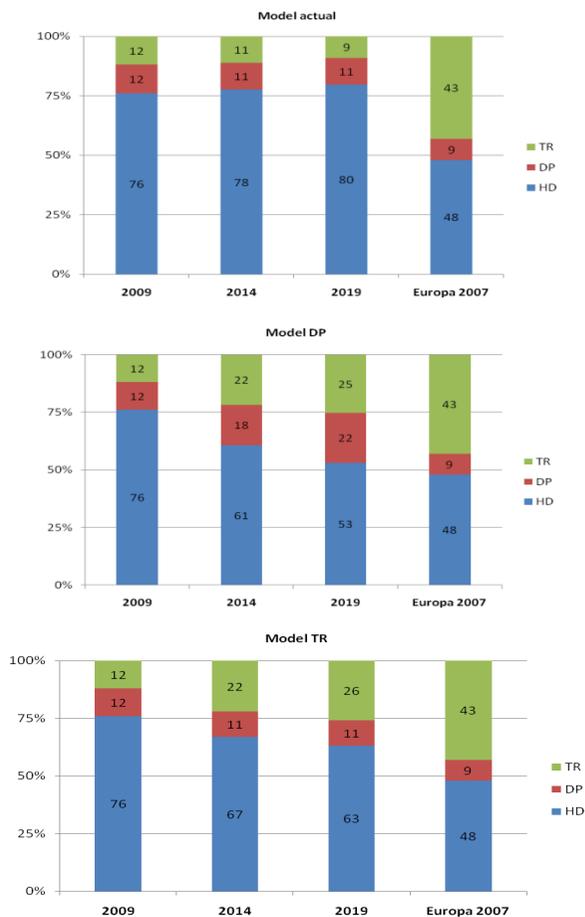

Figure 5. Comparison between the structures of the methods of renal substitutive treatment obtained in 2014, in accordance with the model chosen, reported to the one registered in Romania in 2009 and in Europe in 2007.

The data are given in percentage out of the total number of patients HD – hemodialysis, DP – peritoneal dialysis, TR –renal transplant.

In the **present model**, the hemodialysis is the predominant method (80% of the patients) at the expense of the decrease of the peritoneal dialysis from 12% to 9%, maintaining the renal transplant to an average of less than 10%. **The “peritoneal dialysis” model** increases four times the percentage of patients treated with peritoneal dialysis (22% in 2014 as compared to 12% in 2009), at the expense of the serious reduction of the hemodialysis (53% compared to 76%), permitting thus to increase the number of renal transplants from 12% to 25%. **The “renal transplant” model** reduces the number of hemodialysis (63 compared to 76%) and peritoneal dialysis (9% compared to 12%), but it helps to increase the renal transplant (26% compared to 12%). (Figure 8).

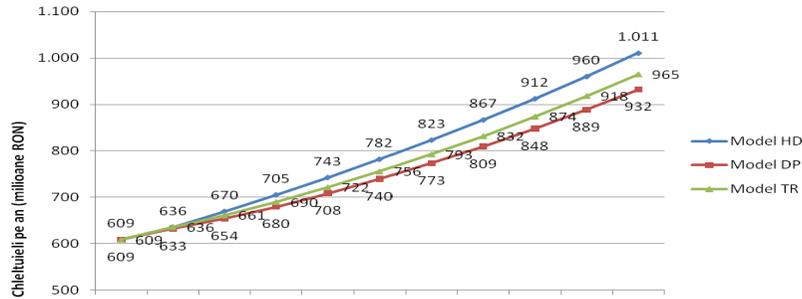

Figure 6. The costs estimation for the three models. HD – hemodialysis, DP –peritoneal dialysis, TR – renal transplant. The costs are calculated according to the tariffs of CNAS in 2009 and they are expressed in millions of lei.

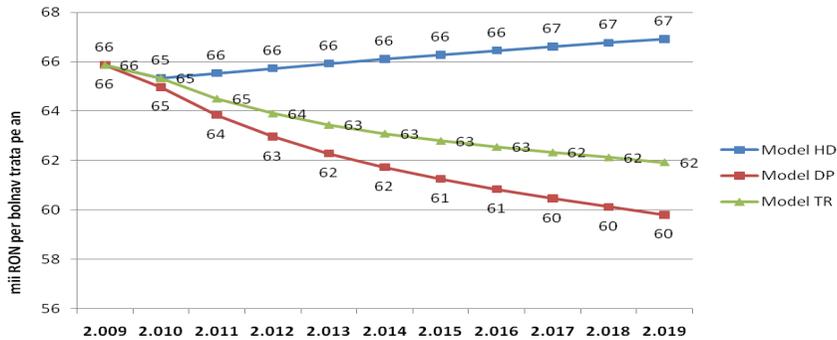

Figure 7. Comparison between the average expenses per year (thousands of RON) for a patient treated in the three models

The economic efficiency analysis shows the differences between the costs of the three models. The highest expenses are for the HD model and the lowest the DP model (Figure 10, Figure 11). As compared to the HD model, the expenses in 2019 would be lower with 18,700,000 Euro in the DP model, and with 10,800,000 Euro in the TR model. The yearly expenses for a patient treated would increase in the HD model, and would decrease with 10% in the DP model or with 8% in the TR model (Figure 10).

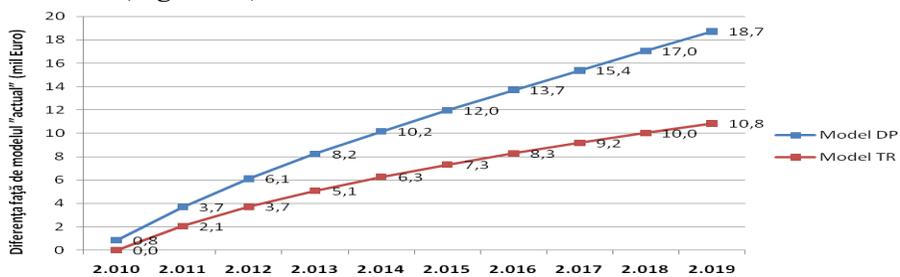

Figure 8. Differences in expenses (millions of Euros) between the "renal transplant" (TR) model, "peritoneal dialysis"(DP) model and the "present" model

b) The dynamics of the number of patients in the renal substitutive treatment

The dynamics of the prevalent patients at the end of the year is presented in Figure 12, and in Figure 13 we can observe the dynamics of the incident patients, in comparison with the two models.

The best program control of the CNAS would be achieved by monitoring the incident patients, and checking the entrance conditions in the program.

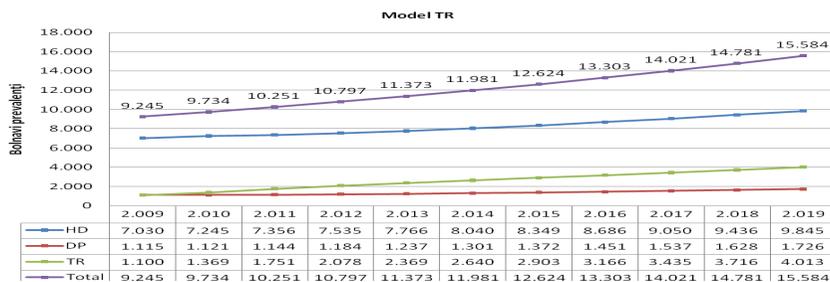

Figure 9. Dynamics of the patients prevalent in the two models

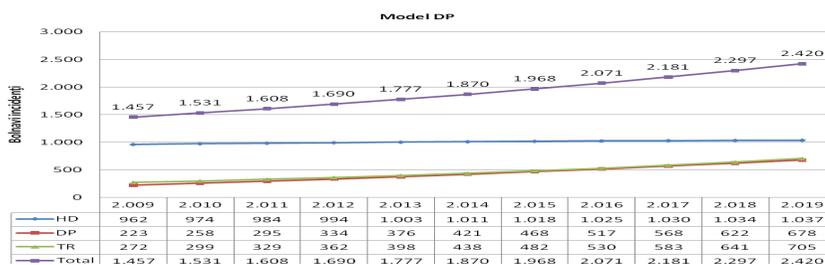

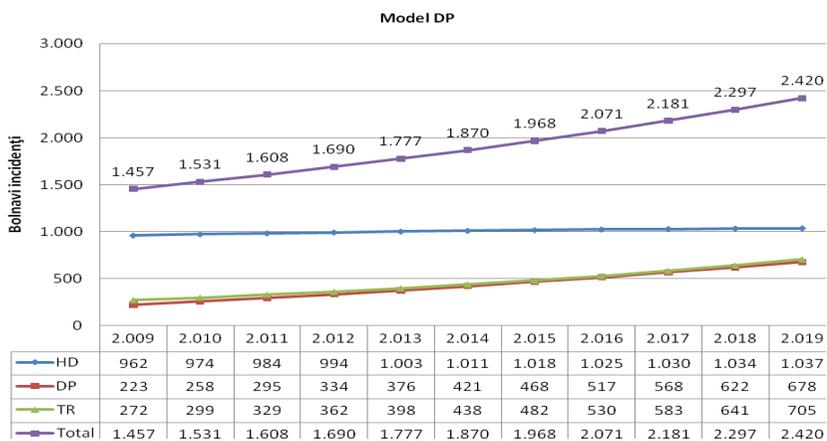

Figure 10. Dynamics of the patients in the two models

f) Measures for the modification of the present model

The treatment method is indicated by the doctor on the basis of various medical criteria and the accessibility of any other method, but the choice is made by the patient. The dialysis service providers may influence the process by increasing the facilities and the indirect pressures upon the personnel, according to the economic criteria of efficiency. At this time, the service package of hemodialysis solicited by the CNAS is the most complete and has the lowest tariff of all Europe, and the proportionally reduced financing of the peritoneal dialysis makes it less attractive from an economic point of view. On the other hand, the number of financed transplants is much too small, Romania holding the last position in Europe with 4 renal transplants to one million inhabitants, to an average of 35.

Consequently, in order to support the implementation of an efficiency model, in which the renal transplant could efficiently sustain the balance between the hemodialysis and the peritoneal dialysis, we need the following: Approving a large number of new transplants 10% higher in every of the following years; Setting up a Registry of the renal-transplanted patients, which can collaborate with the Romanian Renal Registry; Defining protocols of monitoring and treating the

transplanted patients; Defining common protocols with SMURD to ease the process of acquiring organs from the body donors (on average 4 deceases in traffic accidents per day in Romania!); Increasing the tariffs for peritoneal dialysis by at least 4000 RON.

During the last decades, market segmentation and intra-industry trade have become increasingly relevant. The underlying hypothesis of our work is that distinct articles have heterogeneous potential for vertical differentiation, implying that different patterns of international specialization should be identifiable. We carry out an analysis on revealed comparative advantage (through the Lafay Index) in specific sectors of interest. Then we highlight the emergence of diverse degrees of product quality differentiation among sectors (through the Relative Quality Index). Results confirm our hypothesis. Indeed it appears that only certain goods, for which the pace of either creative or technological innovation (or both) is particularly fast, present a high degree of vertical differentiation and market segmentation. This allows countries to specialize in a particular product variety and gain market power position for that variety. These findings should be taken in due consideration when designing trade policies.

Keywords: international specialization, Lafay Index, Relative Quality Index, creative sectors

JEL code: F1, F59, D4, Z1

Introduction

European countries are facing increased economic competition, resulting both from the overall globalization dynamics and from the European integration process. These phenomena are often considered as threats. However, a better understanding of international trade patterns and specialization trajectories could contribute to properly assessing these dynamics, so that to prevent us from drawing hurried conclusions about the presumed competitive pressures that high income countries face from emerging economies.

The analysis of international specialization patterns is essential in order to examine the revealed comparative advantages of countries and, therefore, their competitive potential in particular markets. However, given the increasing importance of differences in products’ quality as a driver of countries’ success in the global market (Bernard and Jensen, 2001; Bernard et al., 2003), it could be ambiguous to only take into account measures of international specialization based on export and import values (Baldwin and Harrigan, 2007), without considering the qualitative characteristics of traded goods.

For “quality”, we intend not only the physical features of the product (such as materials or technology embedded), but all features, tangible and intangible, influencing consumers’ economic valuation (Aiginger, 2001; Borin and Lamieri, 2008). For this reason, it is possible to measure perceived quality through the price that the consumer is willing to pay (Stiglitz, 1987).

The most frequently adopted proxy of price in international trade studies is the Unit Value (UV) of trade flows, defined as the ratio between the value and the quantity of imports/exports of a given product (or group of products).

The UV is often used as a quality indicator, though this approach has some limits (Mannarino et al., 2008). Firstly, products with the same price but different physical weight might show different UV independently from their relative qualities; despite that, it is often possible to find product-specific correlations between weight and quality. Secondly, a higher UV may also depend on a lower productivity level of a country; however this can only be true in the short run, while it is reasonable to think that in the long period countries may continue to be internationally competitive with a high UV only if it is justified by higher quality characteristics. Lastly, a country gaining a market power position in a specific product could increase its UV even without improving the product quality.

In our analytical framework, we consider vertically differentiated products and consumers preferring higher quality varieties. These hypotheses allow for: a) market segmentation and intra-industry trade; b) advantages in terms of productivity, resulting in exports which have higher unit values (Baldwin and Harrigan, 2007).

Accordingly, we carry out our analysis first by examining which countries are internationally specialized in particular products of interest and then by investigating the revealed quality characteristics of the various products for different specialized countries.

International Specialization and Relative Quality Measures

We are interested in finding out which countries are specialized in given products. These have been selected with the aim of representing different macro-typologies of products, in order to be able to assess if a correlation exists between the possibility for a given product to be vertically differentiated (hence allowing for market segmentation and intra-industry trade) and significant difference in quality levels.

We carry out this analysis, adopting the Lafay Index (Lafay, 1992) as an index of international specialization and a Relative Quality Index as a measure of differences in quality levels.

We choose to adopt the Lafay Index, rather than other indices as popular as this one (such as Balassa, 1965), since an appropriate investigation on international specialization patterns has to take into account both exports and imports, if we consider the increasing weight of intra-industry trade and “international fragmentation of production”³⁶⁶ in the global context.

For a given country i and for any given product j , the Lafay Index takes the following form:

$$LFI_j^i = \left(\frac{x_j^i - m_j^i}{x_j^i + m_j^i} - \frac{\sum_{j=1}^N (x_j^i - m_j^i)}{\sum_{j=1}^N (x_j^i + m_j^i)} \right) \frac{x_j^i + m_j^i}{\sum_{j=1}^N (x_j^i + m_j^i)}$$

where x_j^i and m_j^i are respectively exports and imports of product j for country i towards and from the rest of the world, and where N is the number of products.

The Lafay Index considers the deviation of product j normalized trade balance from the overall normalized trade balance, weighted by the share of trade (imports plus exports) of product j on trade balance. Given this definition, the sum of Lafay Indices for all sectors of a given country must be zero.

The existence of a comparative advantage is revealed if the index assumes positive values, whereas negative values show de-specialization. The greater the absolute values, the higher the degree of specialization/de-specialization.

Different countries having the same Lafay Index for a given product could nevertheless be specialized in different varieties, that is in vertically differentiated typologies of that product.

³⁶⁶ The mechanism by which firms delocalise part of their production to foreign countries, thus generating trade flows of intermediate goods.

In order to add this information to our analysis, we introduce the Relative Quality Index, measured as:

$$RQ_j^i = \frac{UV_j^i - UV_j^W}{UV_j^W}$$

where UV_j^i is the unit value of product j exports for country i and UV_j^W is the average unit value of product j exports for the world. RQ_j^i takes positive values if the UV of the exported goods from country i to the world market is higher than that of the world.

Methodology and data

The underlying hypothesis of our work is that distinct items show heterogeneous potential for vertical differentiation, which permits producers to carry out strategies of price discrimination and market segmentation and hence, at an international level, allows countries to specialize in producing and trading qualitatively differentiated varieties of the same product.

This hypothesis implies that different patterns of international specialization should be identifiable. Some sectors should be coherent with the traditional international trade theories, which predict that specialized countries, enjoying higher productivity level, will trade low-price products. Other sectors should conflict with this conclusion, since, when a specific market is vertically differentiated, some specialized countries may have a comparative advantage in producing and trading low-quality and low-price varieties, while other countries may specialize in high-quality varieties. And that results in exports that have higher, not lower prices (Baldwin and Harrigan, 2007).

For that reason we use a thumb rule (qualitative, descriptive criteria) to select various articles (corresponding to the HS four-digit level codes³⁶⁷) which in our opinion correspond to products representative of sectors with diverse vertical differentiation potential.

We analyze data through the indices introduced in the preceding paragraph. For each chosen item (HS four-digit code), we identify international specialized countries, through the Lafay Index³⁶⁸. For these countries, we highlight the quality characteristics of their traded goods, by calculating the relative quality index³⁶⁹. Then we draw some conclusions about our hypothesis that particular sectors have a great vertical differentiation potential and we try to make some considerations about the possibility to define common characteristics of these sectors.

Since this paper represents just the first step of a more comprehensive work, we carry out the measurements only on a few items, taken as examples within their respective categories of products. We intend to further develop this analysis, in a more systematic and detailed way, in order to find more robust empirical results for our future work on this topic.

We then present graphics which show how, for various items, we find different forms of correlation between the Lafay Index and the Relative Quality Index.

³⁶⁷ As our source of data, we use the International Trade Statistics of the International Trade Center (UNCTAD/WTO), which classifies goods through the Harmonized Commodity Description and Coding System (2002), a six-digit code system, comprising approximately 5,300 article/product descriptions, arranged in 99 chapters, grouped in 21 sections.

³⁶⁸ In order to single out only countries that have an higher degree of specialization, we set a threshold for the Lafay Index equal to the average value of the LFI for each item.

³⁶⁹ Even though we have conducted a full analysis on all of the countries for both LFI and RQ, we use the resulting data only for countries which result specialized in each sector (countries above the LFI threshold).

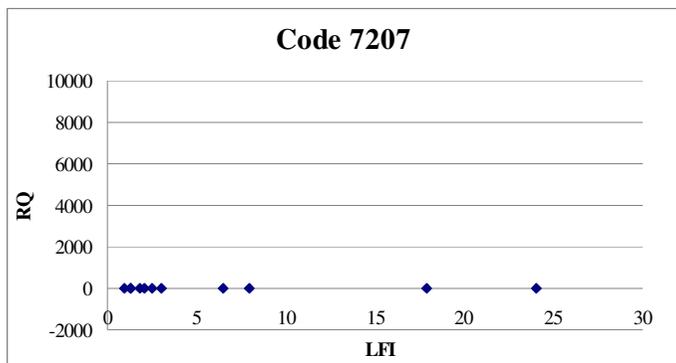

Fig. 1: Code 7207 - Semi- finished products of iron or non-alloy steel

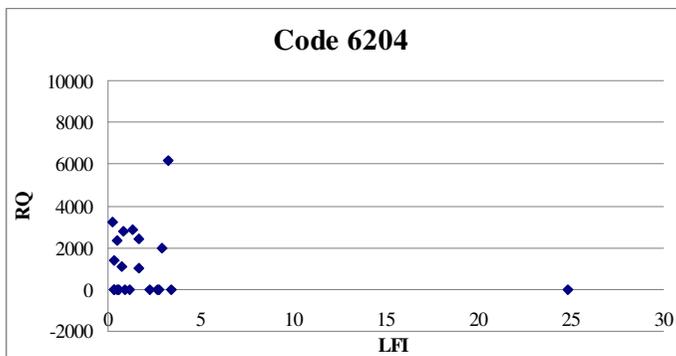

Fig. 2: Code 6204 - Women's or girls' suits, ensembles, jackets, blazers, dresses, skirts, divided skirts, trousers, bib and brace overalls, breeches and shorts
Note: Viet Nam, Bangladesh, Cambodia, Thailand and the former Yugoslav Republic of Macedonia are among the specialized countries. However we are not able to calculate the RQ because the data of their exports in quantities are not available

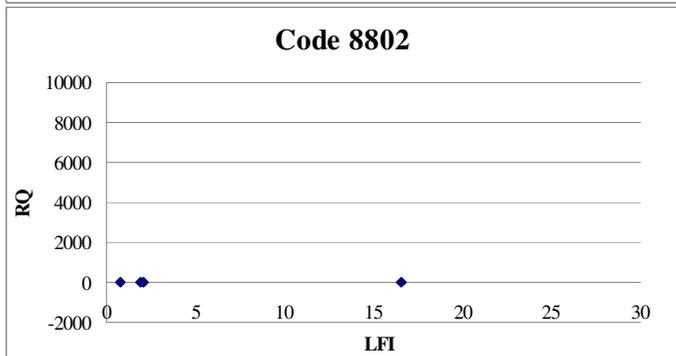

Fig. 3: Code 8802 - Aircraft and spacecraft
Note: USA, Canada and Saudi Arabia are among the specialized countries. However we are not able to calculate the RQ because the data of their exports in quantities are not available.

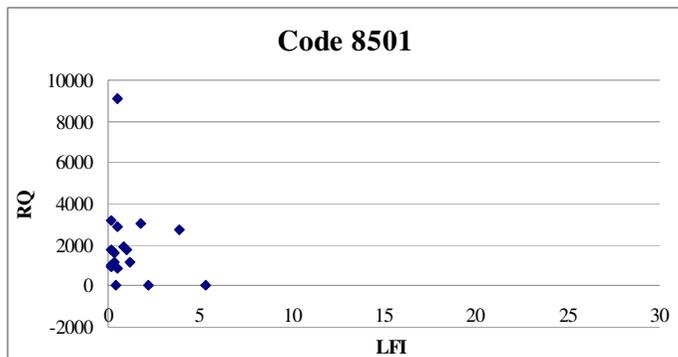

Fig. 4: Code 8501 - Electric motors and generators

Data analysis

Even though the analysis is conducted on a few items, we think that some interesting considerations could nevertheless be made about how different patterns of international specialization emerge from the analyzed sectors.

Figure 1 reveals the specialization pattern for item “Semi- finished products of iron or non-alloy steel”, which is representative of groups of products which are characterized by neither a high level of technological or scientific content nor by creativity and innovation skills of human capital. This item shows that all specialized countries, independently from the value of the LFI, have an homogeneous degree of quality. No country carries out a strategy based on quality differentiation and non-price competitiveness.

Figure 2 shows the specialization pattern for item consisting in women’s clothing, which is a typical “creative” sector³⁷⁰. This group of products exhibits a huge degree of heterogeneity with regard to the RQ, even for similar LFI. There are two particularly interesting cases: the outliers in the graphic are China, which has an extremely high level of LFI (24,83) but a negative RQ value (-0,59), and Italy, which (similarly to others specialized countries) presents a significantly lower LFI (3,23) but the highest level of RQ (6154,87). These evidences permit to infer that the specific characteristics of “creative goods” make them suitable for a high degree of market segmentation, which allows countries to specialize in particular product varieties. For that reason, countries which follow such a different specialization pattern may not be considered in direct competition.

Figure 3 highlights the specialization model of “Aircraft and spacecraft”. This kind of articles represents products for which scientific knowledge and technological skills, as well as a high availability of financial capital, are fundamental. This implies that, first of all, only seven countries result to be specialized (a LFI above the average value) and, secondly, the intrinsic tangible and intangible characteristics of the goods do not allow for qualitative heterogeneity.

Figure 4 points out that item “Electric motors and generators” does not show a marked degree of specialization, but presents a relevant level of RQ heterogeneity. This case represents those sectors in which different paces of technological progress and the possibility for some countries to produce with low factor costs lead to vertical differentiation. The role of a fast-paced technological innovation in international competitiveness is thoroughly analyzed for the Italian case by Furia (2008), who, accordingly to our findings, identifies a high correlation between export performance and the level of investments in R&D and in highly skilled human capital.

Conclusive remarks

The traditional international trade theory predicted that countries revealing a competitive advantage in a given sector should ship those goods at a competitive price. However data often contradict with this assertion. In fact, during the last decades, vertical differentiation, market segmentation and intra-industry trade have become increasingly relevant. In this respect, not only scientific and technological progress, but also creative innovation reveals its importance.

We have found that data are coherent with our hypothesis that intrinsic tangible and intangible characteristics of specific goods (for which creative or technological innovation permits vertical differentiation) make them suitable for a high degree of market segmentation, which allows countries to specialize in a particular product variety and gain market power position for that variety. For this reason, countries which follow such a different specialization pattern may not be considered in direct competition.

Such a shift in our understanding of international specialization should design trade policies, in a way to prevent us from drawing simplistic conclusions about the presumed competitive pressures

³⁷⁰ For the definition of “creative sector” we make reference to European Commission, 2006.

that high income countries face from emerging economies, even in the European integration context.

Since this paper represents the first step of a more comprehensive and ambitious work, our purpose is that of widening this framework, conducting the analysis in a more systematic and detailed way and developing specific analytical tools for a focus on “creative sectors”, in order to assess their potential for vertical differentiation and for guaranteeing a market power position.

LABOUR MARKET FLEXIBILITY IN TERMS OF INTERNAL MIGRATION³⁷¹

Faculty of Economics*

Modern economies have a high dynamics because of the rapid fluctuations of macroeconomic variables and parameters. Moreover, globalization emphasises the interdependencies among national economies, increasing their production capacities but, at the same time, making them more vulnerable to external perturbations. Shocks resulting from this turmoil can be absorbed depending on the degree of macromarket flexibility: goods market, labour market and money market. This flexibility becomes even more important for the member states of some optimal currency areas (OCA) because it considers both the mobility of production factors and the symmetry of business cycle transmission; i.e. the correlation of macroeconomic policies. The authors of this paper intend to analyse the situation of the internal mobility of workers as a basis for labour market flexibility.

Keywords: *labour flexibility, internal migration, theories of migration, determinants of migration, migration modelling.*

JEL Code: *J11, J31*

1. Theoretical Framework

Flexibility can be defined as the speed with which the labour market responds to any shock that the economy could face at any moment (Logos, 1994; Pissarides, 1997; Forstater, 2000). This implies a triple approach: **wage flexibility**, **worktime flexibility** and **worker mobility**. The scholarly literature (Scheremet, 2000; Laffargue, 2000; Hughes Hallett & Viegi, 2000; Dellas & Tavlas, 2002) has analyzed how flexibility differences on the labour market among regions and countries influence the shock absorption. A shock which initially has a symmetric effect in the whole European and Monetary Union (E.M.U.) will evolve in an asymmetric shock if a region adjusts faster than other.

In the employer's perspective the need for flexibility is perceived as *to ensure an adequate flow of personnel*, correlated with the technological process carried on, in terms of innovation as a main source of competitiveness. *The need for flexibility of the employee* is an expression of *his/her labour mobility on the labour market* in order to be able to fully assert his/her abilities, to optimize his/her choices between leisure and worktime, with the ultimate goal of maximizing his/her welfare.

Worker mobility represents an important issue to ensure the labour market flexibility and it is understood both as a shift of workers from one activity/profession to another, and as a spatial

³⁷¹ *This article is a result of the project „Doctoral Program and PhD Students in the Education Research and Innovation Triangle”. mobility. Both approaches of worker mobility are directly connected with the migration phenomenon since the motivation of job search represents the main source of human migration. If we take into account the place of origin/destination, the delimitation between internal migration and external migration has interesting nuances in terms of international integration structures. Therefore, for the developed part of the European Union (particularly the Eurozone) the interstate migration plays the same role as the internal migration: streamlines the labour force flows, compensates deficits with surpluses for professions, specialisations and locations of labour demand and supply and, implicitly, influences the economic and social homogeneity of E.M.U. Instead for the new member states, especially for Romania and Bulgaria, the difference between internal migration flows and external ones is very important in terms of economic consequences. Internal migration affects the increase in mobility and, therefore, the labour force flexibility, whereas external migration causes loss of labour force and human capital to home countries (Ailenei, Cristescu, 2010). As a member state of the E.U., Romania committed to join the Economic and Monetary Union in the medium term, which requires structural adjustments, apart from the fulfilment of nominal convergence conditions. These adjustments should allow the flexibility and functional efficiency of macromarkets.

2. Theories of Migration

The complexity and diversity of contemporary migration requires different theoretical approaches, seemingly heterogeneous to form a unitary particular theory.

Thus, *the neoclassical theory* explains migration flows through the differences between the poor and the rich areas of a country or, of the world. Migration flows become the equilibrium mechanism of deficits and surpluses on the labour market. This implies a microeconomic approach of migration which emphasises the decision-making process by which the rational individual assesses the possible monetary gains, mediated by the probability of finding a job at the place of destination, compared with gains in the place of origin. But the individual also takes into account the relocation costs. Also, potential migrant estimates the benefits of movement towards different locations for a limited time.

The *new theory of migration* is related to the research made by Oded Stark and it brings two major changes to the previous theory: it pulls out the individual from its relative isolation and the wage difference stops playing the key role. The new view states that the migration decision belongs to the family and it is subordinated to the minimizing risk strategy thanks to the diversification of income sources. The solution takes account of the imperfect functioning of the institutions and minimizes risks to household income.

The *dual labour market* argues that international migration is the effect of labour demand unavoidably related to characteristics of developed economies. It assumes the existence of a dual labour market that includes a *primary sector* with stable jobs, good working conditions, generous benefits and the possibility of upward mobility and, a *secondary sector* with unqualified jobs, hard or dangerous working conditions and weak possibilities of increasing mobility. In this sense, immigrants become the labour force who can successfully fill shortages of workers in the secondary sector, without causing negative consequences of structural migration.

The *approach in terms of social capital* considers an old theme (that of networks) in a new perspective, its potential benefits being more a future burden. "Each act of migration alters the social context in which are taken future decisions in a typical way that makes additional relocations more probable" (Massey and others, 1993). If a net migration rate is also a net gain in human capital stock then the impact on economic growth will be positive (Friedberg & Hunt, 1995; Shioji, 2000).

3. The Determinants of Migration³⁷²

According to Van der Gaag & Wissen (2003), the different factors that determine the migration flow can be classified in four main categories: *gravity variables*, *economic variables*, *labour market variables* and *environmental variables*.

Gravity variables

The approach is specific to the gravity models of the spatial and regional economics (Reilly, 1931; Fujita & Thisse, 2003) and uses as variables the population size and distance. Empirical evidence of the positive effect of population size on internal migration is relevant and consistent with the gravity model (Adrienko & Guriev, 2004; Hanson & Spilimbergo, 1996; Larson & Mundlack, 1995). Population density may provide an alternative specification (Van der Gaag & Wissen, 2003); however, this measure turns often to be a push factor than an attractive determinant (Anjomani, 2002; Shen, 1999). Distance is considered a fundamental explanatory variable which proxies the migration costs (Greenwood, 1985, 1997; Greenwood and Hunt, 2003).

Economic variables

A high economic prosperity means also more activities, services and opportunities for people living in a certain area. Moreover, dynamic centres attract mostly young people, who are widely recognized to be highly mobile. The most representative (and common) economic variable is the *per capita gross domestic product* (GDP). Empirical literature provides strong and robust evidence of the impact of per capita income on internal migration (Greenwood, 1997). Other variables are used to measure the impact of the cost of living on internal migration. Basile and Causi (2005) include *the index price*, but its impact turns to be statistically not significant.

Labour market variables

Another variable that is often included as explanatory variable in migration analysis is *the unemployment rate*. In fact, contrary to the per capita income, the empirical literature suggests that the impact of unemployment on internal migration is not clear. Pissarides and Wadsworth (1987) find that in UK “at higher overall unemployment rates, migration propensities are reduced”. Juarez (2000) finds similar result for Spain and identifies a threshold level above which the push effect of unemployment is reduced. Hatton and Tani (2005) find that unemployment rate differentials did not affect the net interregional migration in the UK during the period 1982-2000. Finally, a meta-analysis of migration studies regarding the European countries conducted by Ederveen & Bardsley (2003) shows a weak reaction of net migration rates to differential in unemployment rates.

Environmental variables

The reason why people decide to move from one region to another one may be related not only to economic factors. The last group of variables that can affect internal migration flows is quite broad and is related with the quality of life. In this sense, these kinds of variables reflect all those factors that can affect the quality of life. All these factors concern *the public safety, social services, environmental quality, political and many other aspects*. Porel (1982) studied the relative importance of these factors versus the economic variables, finding empirical support both for the former and the latter.

4. Models of Internal Migration

Related to the theoretical support and selection process of the determinants there are so many models that analyze the migration flows.

Thus, *Sjaastad (1962)* developed a micro model where migration decision is modelled as an investment in human capital, heterogeneity among individuals being also emphasized. The migration decision in the interregional migration context is represented by the following expression:

³⁷² Ivan Etzo [2008] – *Internal Migration: a Review of the Literature* - ideas.repec.org.

$$NPVM_{i,j,0} = \sum_{t=1}^T \frac{B_j - B_i}{(1+r)^t} - \sum_{t=1}^T \frac{C_j - C_i}{(1+r)^t} \quad (1)$$

Where:

i denote the region of origin and j the destination region, B denotes the total benefits, C the total cost related to the respective region, r is the discount rate and T is the lifetime period. In this framework, each individual (person or family) decides to move to region j if the present value of the total benefits to move is higher than the present value of the cost of moving.

The benefits are represented by the income earned by the migrant in the two alternative places, which in turns is a function of the personal skill level.

Harris and Todaro (1970) introduce imperfections on the labour market in the context of internal migration from rural to urban areas. Unemployment rate and wage differentials between the rural and the urban sectors are the key elements of migration. The employment rate in the urban sector represents the probability to find a job and individuals maximise the expected utility function. Thus the individual, that is assumed to be risk neutral, decides to migrate from the rural to the urban sector if and only if:

$$\sum_{t=1}^T p_u(t) * \frac{w_u}{(1+r)^t} - c > \sum_{t=1}^T \frac{w_r}{(1+r)^t} \quad (2)$$

Where:

p_u is the employment rate in the urban sector, namely, the probability to earn the wage w_u , the term c denotes the migration costs and w_r is the wage in the rural sector.

Another way to evaluate internal migration flows includes some aggregate variables such as *population, GDP, unemployment rate* etc. The main reason is that, contrary to micro data, macro aggregate data are more accessible and often (especially for developing countries) the only data source available (Cushing and Poot, 2004). Indeed, the gravity model (Lowry, 1966; Lee, 1966), which is one of the first formal model of migration, remains the most common theoretical framework in empirical migration analysis (Greenwood & Hunt, 2003). The **modified gravity model** widely used in the empirical investigations on migration determinants takes the following form:

$$M_{ij} = \beta_0 + \beta_1 * D_{ij} + \beta_2 * P_i + \beta_3 * P_j + \beta_4 * Y_i + \beta_5 * P_j + \beta_6 * U_i + \beta_7 * U_j + \varepsilon_{ij} \quad (3)$$

Where:

M_{ij} indicates the migration flows from place i to place j , D refer to distance, P is the population size, Y is the income and U is the unemployment rate.

A further development in macro migration modelling is represented by **the systemic approach** (Alonso, 1978). In contrast with gravity models, systemic models take into account the overall geographical system and not only the characteristics of the origin and destination places. The systemic model presented by Alonso in the "Theory of Movement" (1978, 1986) is a generalization of the modified gravity model in (3). The Alonso's model takes the following form:

$$M_{ij} = v_i * D_i^{\alpha_i - 1} * w_j * C_j^{\beta_j - 1} * t_{ij} \quad (4)$$

Where:

M_{ij} is migration from origin i to destination j , D represents the opportunities of i and C represents the competition in j , a high degree of competition makes the destination j more attractive for all the system; α and β are the elasticity of response to D and C , respectively; v_i and w_i refers to

population size of the origin and destination place, respectively; t measures the ease of movement between i and j .

5. Database and Methodology

The authors have proposed to analyze the territorial mobility of workers in Romania using as proxy variable the internal migration. Thus, we have correlated *net migration balance* with some economic variables frequently used in literature: *the unemployment rate, average gross nominal monthly earnings and nominal GDP* (at NUTS 3 level). In order to accurately capture the correlation between the migration balance and the indicators mentioned above, we have used absolute deviations from the average for the explanatory variables:

$$\text{Dif}(x_i) = \frac{x_i - \bar{x}}{\bar{x}},$$

Where:

$\text{Dif}(x_i)$ – differential of x

x_i – value of x variable for each NUTS 3 level

\bar{x} – average level of x

In these circumstances we used an equation of regression of the following form:

$$BM_i = a \cdot DUR_i + b \cdot DW_i + c \cdot DGDP_i + \varepsilon_i \quad (5)$$

$i = 1, 2, \dots, 42$ NUTS 3

Where:

BM_i – the migration balance

DUR_i – unemployment rate differential

DW_i – wage differential

$DGDP$ – GDP differential

ε_i – estimation error

The authors have considered that the most important factors in migration decision should be: *wage differential and unemployment rate differential*, but they have also tested all combinations of the three regression factors mentioned above. Tests were conducted on a panel regression model that includes data at NUTS 3 level during 2004-2008 for the correlation between the migration balance, the unemployment rate and wages, and during 2004-2007 for the correlation including GDP. The results of our econometric tests are illustrated in table 1.

Table 1- Results of econometric tests for some regression models of migration flows

Variable	Model 1	Model 2	Model 3	Model 4
Unemployment rate differential	-0.153693	-0.192725	-0.187557	-
[t-stat]	-0.842040	-0.782695	-0.744431	
Wage differential	3.016787	3.012692	-	2.999817
[t-stat]	3.535704	2.672443		-0.175902
GDP differential	-	-0.045545	0.165773	-0.025464
[t-stat]		-0.314743	1.285522	2.640522
C	-0.012454	-0.014993	-0.014903	-0.015058
[t-stat]	-0.083054	-0.103476	-0.094200	-0.101674
R squared	0.224976	0.216874	0.092095	0.196475

As you can see the best results are achieved by model 1. Yet, even in this situation the strength of the correlation is small ($R^2=0.225$), which indicates **high spatial rigidity of the labour force in**

Romania. As for the other models the correlation level is even smaller (with negligible values in the 3rd model), but with the Durbin-Watson test indicating error autocorrelation.

6. Conclusions

Internal migration of workers represents a very important phenomenon to ensure the labour market flexibility. There are a lot of factors that influence migration, as there are also some obstacles. Testing some of the economic factors for Romania has revealed a strong rigidity of the labour market, even though wage differentials seem to motivate workers to change address. Barriers related to real estate market, family ties and social environment prevail regarding the mobility of workers in Romania. This means that *our labour market is still quite far from the functional model of the developed E.U.*

UNEMPLOYMENT – A SOCIO-ECONOMICAL ISSUE ON THE LABOUR MARKET

Gal Anișoara
University of Oradea
Faculty of Economic Sciences

Roșca Mihaela Gabriela
University of Oradea
Faculty of Economical Sciences

This article is a presentation of the imbalance between demand and offer on the labour market. The young represent the category most affected by unemployment. By means of workforce occupation policies the state intervenes so as to stimulate demand for new work places.

Key words: labour market, unemployment, unemployment rate, unemployment intensity.
JEL Code: J60

1. The Labour Market – The Economic Frame of Unemployment Manifestation

The labour market represents one of the most complex forms of existing markets in economy because the negotiated factor is work. This factor consists of an assembly of bio-psychological, demographic, educational-professional, and behaviour characteristics that clearly differentiates it from any other factor in the exchange relations from the other markets.

The labour market is by definition inelastic. This in the sense that neither does workforce demand modify to the same extent as the nominal salary does, i.e. really, nor does the workforce offer vary depending on a price-cost ratio. Some specialists explain this characteristic as demand and offer depend on many other factors besides the economical ones.

The labour market does not work like an ordinary (free) market, and because of legislative restrictions, conditions imposed by law - within the boundaries of which it functions. Moreover, the functioning of this market is influenced by the specific action of social partners (patrons, unions) and by the force ratio between them.

A. C. Pigou claims that when salaries decrease entrepreneurs can invest more contributing to the increase of work demand. He attributes the cause of permanent unemployment between the two world wars to the rigidity of salaries. The nature of the relation between the salary and workforce demand is essential to establish balance on the labour market under conditions of perfect competition and perfect mobility of workforce; this nature of the relation will be very simple, it will always act as a powerful tendency of the salary-demand ratio that would permanently present itself so as everyone is occupied³⁷³.

“The key problem of economic life – economist Lionel Stoleru notes – is the attempt to achieve at each step the correspondence between the balance level of goods and services, and the level of full occupation, but such a gauge can not be tolerated because one can not afford to joke with full occupation; no civilisation could bear for part of its members to find a regular job with an ordinary income, while another part is condemned to extreme poverty because it is not given any opportunity to earn a salary; this is not only an issue of economic balance, but one of justice, social balance and a political one as well.”³⁷⁴ Studying and evaluating the processes on the economic market as dimensions, structures, and tendencies are important in defining active occupation and social protection policies under their various aspects.

³⁷³ Pigou, A. C., *The Theory of Unemployment*, p.252, apud J.M.Keynes. *Teoria generală a folosirii mâinii de lucru, a dobânzii și a banilor*, Editura Științifică, București, 1970, p.288.

³⁷⁴ Stoleru Lionel, *L'équilibre et la croissance économique*, Dunod, Paris, 1969.

Contemporary labour market may be either in a balance situation (full occupation) or in that of imbalance, namely under-occupation or over-occupation. To understand the two imbalance phenomena terms like full occupation, voluntary or involuntary unemployment must be clarified first.

Most times, the contemporary *unemployment phenomena is approached and analysed as an "imbalance between workforce demand and workforce offer (demand lower than offer) an imbalance between the potential active human factor actually used, therefore a relatively active overpopulation"*³⁷⁵.

As a macroeconomic phenomenon, *unemployment stands for "a negative economic phenomenon characterized by the incapacity of a national economy to ensure jobs for all its citizens apt for work"*³⁷⁶.

This approach to unemployment is in fact a sequel of the analysis of demographic-economic issues on the one hand, and the financial-economic and investment ones on the other hand. Just that work resources (workforce offer) as well as work need (workforce demand) are filtered through the exigency and rules of unique remuneration and salary. That is why, irrespective of the approach angle and tackling of the subject, *unemployment is a disfunction of the national labour market*.

Unemployment exists and it is a fundamental problem of modern society, because when people are looking for a job they may offer their activity for a nominal salary that is lower and may lead to a reduction in price level. Because of unemployment, there are costs for a society and psychological effects for people who cannot find a job³⁷⁷.

Economists reserve the concept of unemployment for people who are *voluntarily* unemployed. That is to say, people are unemployed if they are actively seeking jobs but unable to find them, as opposed to people who have *voluntarily* opted out of the labor market to pursue activities like raising children, going to school, or traveling³⁷⁸.

Young persons, especially those who abandon school at an early date, continue to face many challenges in different stages of transition from work to training and the labour market.

Unemployment among the young most of times results in and mismatch between the outcomes of educational systems and the demands of the labour market. Those young who continually need to pace a nonlinear trajectory on entering the labour market are insufficiently taken into account, and they often end up being hired in very poor conditions. They especially do not pay enough attention to the needs of those young persons who, due to personal, social, cultural or economical reasons, are given less opportunities, and their participation in the social life is significantly restricted accordingly.

In recent decades most European economies have experienced significant changes in the population age structure which altered the relative position of young versus prime-age workers in the labour market. Over the period 1970-2000, the ratio of the youth population to the adult population increased in most countries during the 1970s and 1980s and then fell in the following decades. Average unemployment rates for young people also increased significantly, up to the late 1980s, and then slightly decreased in the following decades, while adults' unemployment varied only marginally. Over the same period European countries showed substantial changes in educational achievements: both the average number of years of education and the share of individuals with higher education increased significantly. Countries with traditionally low levels of education (at the start of the period) have

³⁷⁵ Bădulescu, Anca , *Ocuparea și șomajul: între abordări teoretice și realități contemporan*, Editura Universității din Oradea, 2006, p.13.

³⁷⁷ Dickens Edwin – *Unemployment. Encyclopedia of Social Problems*, 2008, SAGE Publications, 21.nov.2008

³⁷⁸Idem p.1.

been catching up, with the number of highly educated people growing in absolute and relative terms³⁷⁹

These patterns have stimulated extensive research and a fierce debate on the economic effects of changes in the youth share of the population and its relationship with the rise and the persistence of (youth) unemployment. The terms "baby boom" (and "baby bust") have been used in the literature to indicate the substantial increase (decrease) in the size of younger cohorts and other similar changes in the population age structure, while "generational crowding" has been often used to define the worsened economic conditions for the younger cohorts (OECD, 1986; Korenman and Neumark, 2000). Similarly, another strand of literature has tried to investigate the effects of the "education boom" and skill-biased technological progress on both unemployment and earnings (E.U.-IRS, 2002; Bertola et al., 2002; Brunello et al., 2000; Flinn, 1993)³⁸⁰.

There are two salient features of many writings on human capital in developing countries. First, a fraction of the educated workforce migrates to developed countries. Since educated workers are one of the scarcest resources in developing countries, it has been argued that the migration of educated workers is a "brain drain" for the developing countries (for a systematic review see Bhagwati and Wilson, 1989). Second, in a number of developing countries, a large fraction of the educated workforce is unemployed. For example, in their influential development economics textbook, Gillis et al. (1996) allude to the Sri Lankan experience as a striking example, noting that half of the country's new university graduates were unemployed in the 1970s. The phenomenon of educated unemployment in those developing countries contrasts sharply with the pattern of unemployment in developed countries³⁸¹.

The increase or decrease of occupation in one country or another does not identify with the decrease or accentuation of unemployment. To have a global picture close to reality we have to consider levels of variations in population occupation. Therefore the notion of unemployment must be correlated to indicators regarding the supply and flow of the active population, as well as unemployment duration and repartition.

The unemployment insurance protect employees against the unemployment risks. However, there is a problem regarding this matter : persons that receive unemployment benefits minimize their efforts of searching a job. There are proves that the level of the unemployment benefit has consequences on the number of the unemployed persons³⁸².

In their seminal work on unemployment insurance, Shavell and Weiss (1979) establish that, because of moral hazard, benefits must decrease throughout the unemployment spell, approaching zero in the limit. In an influential paper, HN, extend the analysis of Shavell and Weiss, increasing the number of policy instruments available to the government. Together with the sequence of benefits paid to the unemployed workers, they introduce the possibility of contingent wage taxes after reemployment. They show that in the optimal program the reemployment tax is increasing in the length of worker's previous unemployment spell. Other authors extend this model in several dimensions (e.g. Hopenhayn and Nicolini, 2002; Zhao, 2001; Pavoni, 2003). The literature on optimal unemployment insurance is relatively new, yet quite extended³⁸³.

2. Distinctive Aspects of Unemployment

³⁷⁹ Frederico Biagi, Claudio, Lucifora, *Demographic and education effects on uemployment in Europe, Labour Economics*, 2007, p. 2

³⁸⁰ idem

³⁸¹ C. Simon Fan, Oded Stark, *International migration and "educated unemployment", Journal of Development Economics*, nr. 83/2007, pp. 76-77

³⁸² Sebastien Menard, *Optimal Unemployment Insurance with Inseparable Optiona* (original title: *Asigurarea de șomaj optimă cu preferințe neseeparabile*), *Economics letters*, no. 93/2006, p. 267

³⁸³ Nicola Pavoni, *On optimal unemployment compensation*, *Journal of Monetary Economics*, no. 54/2007, p. 1615

Unemployment can be characterized by several aspects:

- *the level of unemployment* which is calculated varying on account of two indicators, namely: unemployment mass and unemployment rate.

Unemployment mass consists of the number of persons which, at a given moment, meet the conditions to be included in the category of the unemployed. In other words, it consists of the active, available population, respectively that unoccupied workforce.

Unemployment rate, as approximate measure of the phenomenon, is calculated as percentage of unemployment mass (the average number of jobless persons) and one of its reference parameters. Such parameters are: active population, active available population, workforce (working population plus unemployment), working population, occupied population as employees.

A huge literature in economics focuses on unemployment compensation as a social institution (e.g., Atkinson and Micklewright, 1991; Holmlund, 1998). These economic studies theorize and test the effects of the different institutional design of unemployment compensation on the level or duration of unemployment³⁸⁴.

- *Unemployment intensity* is another feature of the unemployment phenomenon. Depending on this one can distinguish: *total unemployment*, which supposes losing the job and full activity stoppage; *partial unemployment*, which consists in diminishing the activity of a person, especially by reducing the duration of working weekdays under the stipulations of the law in this respect, simultaneously with reduction of remuneration; *disguised unemployment* to be found especially in underdeveloped countries where many persons have an apparent activity and low productivity.

- Another element is *unemployment duration* or *period of unemployment* from the moment one lost their job to resuming working. There is no law-stipulated duration of unemployment duration, but in many countries there are regulations for the extent of the dole payment. This period tends to increase, growing up to 18-24 months.

- *Unemployment structure* or its different components represent another feature. This is formed by classifying the unemployed persons according to different criteria: level of qualification, field of activity, the socio-professional category they belong to, sex, age, age-groups, etc. as a result of studying unemployment in sex and age-group categories it was pointed out that women are more affected by unemployment than men, also, young individuals and adults over the age of 50 are more affected comparatively to the rest of the active population.

International statistics is using the following unemployment rates:

Global Standard Rate (BIM) which is calculated as a ratio between the number of jobless persons in BIM terms and total active population; it has the largest encompassing sphere being the most frequently used in international comparisons.

Standardized Global Rate (CEE) is the ratio between the number of jobless persons and the active civil population;

Standardized Global Rate (OECD) is determined as a ration between the number of jobless persons and total active population.

Partial Unemployment Rate refers to a certain category of workforce or to a certain geographic or administrative region, which is calculated as a ratio between the number of unemployed persons coming from that certain category and the active population in the same category.

Full (Compound) Rate of Unemployment and Visible Under-occupation is calculated as a ratio between working hours used inappropriately of the jobless and of those in visible under-occupation (persons that have a workplace but who involuntarily work part time) and total available time or utilized working hours.

³⁸⁴ Wonik Kims, *Enfranchisement and the welfare state: Institutional design of unemployment compensation*, The Journalul of Socio-Economics xxx, 2007, p. 3

With the aid of these indicators the two forms of unemployment in a country or another are determined, at a certain moment, along a period of time or another.

3. The Role of the State in Workforce Occupation

Evolution in recent years shows that the role of the state in the workforce issues, its occupation, solving work conflicts are changing.

The state, for instance, in some countries manifests the tendencies to intervene less as a partner in tripartite negotiating and more as an autonomous moderator in bilateral negotiations between patrons and unions. Most certainly, situations remain diverse in different countries, at least according to some reports and studies of the International Work Organisation (OIM). The state must not give up its role as national interests' guarantor, including with respect to the stimulation of creating new jobs, observing salary evolution (i.e. tempering via other numerous levers, excessive sector claims), and, what we find very important, promoting autonomous and bilateral negotiations between patrons and unions.³⁸⁵

Thomas J. Dohmen in *Regional Science and Urban Economics* propose the following stylized facts.:

- Job flows in the labor markets are immense.
- Most of the cross-country differences in unemployment rates can be ascribed to variations in long-term unemployment, and most of the rise in European unemployment can be attributed to an increase in the duration rather than to a higher inflow rate into unemployment.
- The outward shift of the Beveridge curve suggests that it has become harder to match workers and firms, possibly because workers are less prepared to move regions and spend less effort on search across regions.
- Aggregate rates of homeownership are positively correlated with unemployment.
- Private renters move relatively more than owners.
- High-skilled workers experience fewer and shorter spells of unemployment.
- Skilled workers migrate more.
- High-skilled workers also search more and prefer employed search.
- Regional migration is higher during economy-wide booms and is lower during recessions³⁸⁶.

Workforce Occupation Policies represents an ensemble of measures elaborated by the state to intervene on the labour market to stimulate demand of new jobs diminishing imbalances and malfunctioning on the labour market. *Passive workforce occupation policies* start at the level of occupation considered at a given moment and aim to find new solutions to hire the exceeding workforce (e.g. reducing work duration, diminishing retirement age, increasing mandatory schooling period, restricting immigrants, increasing jobs with daily working-hours and atypical ones). *Active occupation policies* imply measures, methods, procedures to increase the degree of occupation (e.g. stimulating investments, improving educational and professional orientation, stimulating mobility of active persons towards other jobs, encouraging scientific research, extending economical, social, and ecological activities).

Unemployment compensation programs are an important ingredient of social welfare policies in developed economies. These programs have been widely criticized because of the adverse effects they can have on worker's incentives to search for a new job³⁸⁷.

³⁸⁵ Dumitriu, Dan , *Forța de muncă în lume*, Editura Conphys, București, 1998.

³⁸⁶ Thomas J. Dohmen, *Housing, mobility, and unemployment*, *Regional Science and Urban Economics*, no. 35, 2005, pag. 307

³⁸⁷ Nicola, Pavoni, *On Optimal Unemployment compensation*, *Journal of Monetary Economics* no. 54/2007, p. 1612

Conclusions

Social equity and justice on the one hand, productivity, competition, economic growth, motivation, and investment in human resources, in the education and welfare of people on the other hand are the major pillars and resistance structures of an efficient transition with bearable and justly distributed costs, a transition beneficial to the entire population.³⁸⁸

The creation of new work places takes place in the same time with the growth of existing activities of the economy ; new work places are created especially in the industrial area; as much as the labour market becomes more flexible as much the job offer becomes more diverse, a reconsideration of the structure of the workers takes place and the capacity of small investors becomes bigger. Although the unemployment strongly influence the social protection policy³⁸⁹.

The Academy of Economic Studies

The Faculty of International Business and Economics

The current study presents the results of research on the disparities existent between the overall level of economic development and the level of development of basic public services at a regional level: public transport (railroad transport and road transport) and the endowment with drinking water installations, natural gas and sewerage systems, with a case study on the eight Romanian development regions. For evaluating the general level of economic development and public services at a regional level we have used a complex index, considering: GDP/capita and unemployment rate as indicators of overall economic development and density of public roads/square kilometer; density of railways per 1000 square kilometers; localities provided with natural gas; localities with drinking water installations; localities with public sewerage installations, as indicators of development of public services.

Keywords: local development, public services, regional disparities, regional development indicators

JEL code: O 11, O 18

Introduction

The globalization of the economy, the increasing phenomenon of delocalization of enterprises, the trend towards decentralization of public services, the growing autonomy of local communities are major aspects of the evolution of contemporary society.

Regional and national territorial development, the reduction of disparities in local development, the promotion of social and economic cohesion represent strategic objectives of regional development, both at the EU level, as well as at the level of each country.

Meeting these objectives involves, among many other aspects, giving a diagnosis, which should be as precise as possible, of the current stage of overall economic development and of the development of public services in particular.

1. Regional development and the role of public services

Local (regional) economic development is defined by increases in the capacity of the local (regional) economy to create wealth for the inhabitants of the respective region or locality³⁹⁰.

These increases can be obtained by maintaining or developing existing businesses, as well as by the appearance of new businesses, which use local natural resources and ensure the rise of employment in the region.

³⁹⁰ Kane M., Sand P., *Economic Development: What Works at the Local Level*, Washington D.C., National League of Cities, 1988, p.4

Thus, among the most important objectives comprised in economic development programs and strategies, we can mention³⁹¹: *the increase in the number of jobs at a regional level; the increase in the incomes of local budgets*, by rising revenues from local taxes and duties; in turn, the increase in revenues in the budget of the local administration will lead to the improvement of public services and infrastructure; *compensating for market shortcomings*.

The productivity of local businesses can be substantially increased if some weak points of the market are identified and counterbalanced by specific development programs. These weaknesses are: insufficient information supplied by the private market regarding the solutions for the improvement of business productivity; the lack of interest or insufficiency of funds of private enterprises for research and development, training and requalifying labor force, the development and modernization of infrastructure, the protection of the environment, etc. So as to meet these objectives, local authorities can promote different programs specific for the development of local economies, such as³⁹²: *programs for attracting and stimulating investments; business support strategies; new business development programs*.

Regional development represents a complex phenomenon, with impact on the entire economic, social, political and cultural life at the level of a region³⁹³. The relations between local development and public services are complex, of interdependence and mutual influence. Thus, all regional development programs can encourage and stimulate the development of public services. For instance, programs meant to attract and stimulate investments for the development and modernization of local infrastructure will have benefic effects on the improvement of public transport services, telecommunications, healthcare, etc. Moreover, business support strategies and new business development programs will contribute to the increase of local GDP, will create new jobs and on this basis will add to both the revenues of the population and those of the local budgets, by stimulating the demand for public services – customized services (culture, education, healthcare, etc.), as well as collective services (lighting, fire department, the police, etc.). On the other hand, the level of development and the quality of public services conditions to a great extent local development. The contribution of education in the forming and development of human resources is significant in this respect, as its quality influences local development in an essential manner. The following services are just as important for local development: healthcare, research and development, water supply, sewage and wastewater treatment, heating, public transport, the protection of the environment, etc.

2. Changes in the level of regional development and of public services in Romania in the 2000-2008 period

Meeting the objectives of territorial development and reduction of the disparities in local development involve, in the first stage, the evaluation (which should be as accurate as possible) of the current stage of overall development, and that regarding public services, of territorial units. So as to underline changes in the level of local development and that of public services in our country, we have analyzed the evolution of *a complex index* which took into consideration both aspects of *structural development*, and poignant demands related to *basic public services* which condition local development, namely: public transport, drinking water distribution, heating and sewerage. The model, inspired from the methodology used for basing resource allocation on regions so as to reduce disparities in their level of development³⁹⁴, uses two types of indicators: *economic development indicators* and *indicators for the development of public services*. The overall economic development indicators are: GDP/capita and the rate of unemployment,

³⁹¹ Bartik T.J., *Economic Development Strategies*, Upjohn Institute Staff Working Paper no. 93-33, Michigan, 1995

³⁹² Ionciă M. (coord.), *Strategii de dezvoltare a sectorului terțiar*, Ed. Uranus, București, 2004, p.71-74

³⁹³ Dincă D., *Servicii publice și dezvoltare locală*, Ed. Lumina Lex, București, 2008, p.92

³⁹⁴ Ministerul Integrării Europene (The Ministry of European Integration), *Planul Național de Dezvoltare 2004-2006 (The National Development Plan 2004-2006)*

whereas the indicators for the development of public services are: road density, railway density, the number of localities with natural gas facilities, localities endowed with drinking water installations, and the number of localities with sewerage systems.

So as to reflect the inequalities between regions, the indices at a regional level (except for the unemployment rate) have been calculated as rapport between the values at a regional level and the value at a national level. The index referring to the unemployment rate was computed as a rapport between the average at a national level and its value at a regional level, as the unemployment rate is a negative indicator of development, and the lower it is at a regional level compared to the national average, the more favorable the situation for the respective region. Each index obtained was multiplied by a weighting coefficient which expresses the importance of the respective criterion. According to this model, the Regional Development Index (I_r) was computed, by using the formula: $I_r = C^{PIB} * I_r^{PIB} + C^{RS} * I_r^{RS} + C^{DD} * I_r^{DD} + C^{DCF} * I_r^{DCF} + C^{GN} * I_r^{GN} + C^{AP} * I_r^{AP} + C^C * I_r^C$, where C^{PIB} , C^{RS} , C^{DD} , C^{DCF} , C^{GN} , C^{AP} , C^C represent, respectively, weighting coefficients for GDP/capita, the unemployment rate, the density of public roads, railroad density, the share of localities endowed with natural gas facilities, drinking water, sewerage systems; I_r^{PIB} , I_r^{RS} , I_r^{DD} , I_r^{DCF} , I_r^{GN} , I_r^{AP} , I_r^C the development index of the above-mentioned indicators for the region 'r'. In the computing of the indicators referring to *overall economic development*, the GDP/capita and the unemployment rate whose evolution is presented in Table 1 were taken into consideration.

Table 1: The evolution of economic development indicators

Region		2000				2008			
		GDP/capita (thousand RON)	I^{PIB}	Un-employment rate (%)	I^{RS}	GDP/capita* (thousand RON)	I^{PIB}	Un-employment rate (%)	I^{RS}

Source: Computed based on data from the *Romanian Statistic Yearbook*, INS, 2002, 2009

Note: * Year 2007

The maximum GDP/capita index, in 2000, as well as in 2008, was recorded in the Bucharest-Ilfov region, which is natural, if we consider the fact that this region hosts the capital of the country, the main administrative, commercial, banking, education, residential, tourism, business center of the country. The following positions were occupied in 2000 by the Center and Western regions, which, respectively, enjoy a solid endowment with production factors, and have valuable natural potential and better qualified human resources, with a more 'occidental' attitude towards work. In 2008, the same two regions recorded GDP/capita values higher than the national average; however, the hierarchy changed, as the Western region surpassed the Center region. The North-East region (including the counties: Bacău, Botoșani, Iași, Neamț, Suceava, Vaslui) was on the last position from the point of view of economic development, both in 2000 and in 2008. Moreover, regarding unemployment, the most difficult situation – both in 2000 and in 2008 – was recorded in the North-East region as well. Although it has valuable natural resources,

especially concerning potential in tourism, the region has not managed to use them efficiently. The lowest unemployment rate was recorded in the Bucharest-Ilfov region, where the labor supply is definitely superior to that registered in the other regions of the country. The disparities in the level of development of public transport services were highlighted by calculating the respective indices, presented in the table below:

Table 2: The evolution of indicators regarding the development of public transport

Region		2000				2008			
		Roads per 100 km ²	I ^{DD}	Railways per 1000 km ²	I ^{CF}	Roads per 100 km ²	I ^{DD}	Railways per 1000 km ²	I ^{CF}
1	North-East	36.2	1.100	40.9	0.885	36.6	1.067	43.9	0.971
2	South-East	29.6	0.900	37.2	0.805	30.7	0.895	48.9	1.082
3	South Muntenia	34.3	1.043	49.3	1.067	36.5	1.064	36.3	0.803
4	South-West Oltenia	34.8	1.058	34.3	0.742	36.5	1.064	33.8	0.748
5	West	31.8	0.967	62.8	1.359	32.1	0.936	59.1	1.308
6	North-West	33.9	1.030	48.2	1.043	35.4	1.032	48.8	1.080
7	Center	29.4	0.894	43.1	0.933	31.4	0.915	39.2	0.867
8	Bucharest-Ilfov	45.2	1.374	194.4	4.208	48.9	1.426	153.2	3.389
9	Romania	32.9		46.2		34.3		45.2	

Source: Computed based on data from the *Romanian Statistic Yearbook*, INS, 2002, 2009

In 2000, five regions – the first being the Bucharest-Ilfov region – benefited of a road density exceeding the national average, with corresponding indices higher than 1, and the following hierarchy: 1.374 for the Bucharest-Ilfov region, 1.100 the North-East region, 1.058 West Oltenia, 1.043 South Muntenia, and 1.030 for the North-Western region. Differences between these indices and the economic development indices are noticeable, which leads us to the hypothesis that the national road network also serves social purposes, connecting people and helping them to communicate. In 2008, the road density increased, but by very little, both on the entire country and divided by regions. Romania has an extremely disadvantageous situation from this point of view, with serious consequences on economic development and on the transportation needs of the population. Concerning territorial disparities, the same five regions as in the year 2000 recorded values higher than 1 for the indices of development of these services.

Regarding railroad density, the region Bucharest-Ilfov records a figure four times higher than the national average, Bucharest being the main railroad hub of the country. The second position in 2000 is occupied by the Western region, with an index of 1.359, followed by South Muntenia (1.067) and North-West (1.043). The worse situation, both in 2000 and in 2008, was recorded in the South-West Oltenia region (counties Dolj, Gorj, Mehedinți, Olt and Vâlcea). In 2008, railroad density per 1000 square kilometers, both on the entire country and in some regions, namely: South-Muntenia, South-West Oltenia, West, Center and Bucharest-Ilfov decreased, due to the decline recorded in our country in recent years concerning railroad transport, which was surpassed by other forms of transport (especially auto transport). In 2008, the second position in density of railways (after Bucharest-Ilfov) was occupied by the Western region, followed by South-East and North-West.

Services of *distribution of drinking water, natural gas and sewerage systems* play a major role in local development. Their evolution is shown in the following table.

Table 3: The evolution of indicators regarding the development of distribution services for drinking water, natural gas and sewerage systems

Region	2000						2008					
	% of localities with:			I ^{GN}	I ^{AP}	I ^{CAN}	% of localities* with:			I ^{GN}	I ^{AP}	I ^{CAN}

Bucharest Ilfov	5.6	15.4	14.0	0.889	0.819	3.333	82.9	58.5	53.7	2.238	0.876	2.247
Romania	6.3	18.8	4.2				25.6	66.8	23.9			

Source: Computed based on data from the *Romanian Statistic Yearbook*, INS, 2002, 2009

Note: *Municipalities, towns, communes

Regarding endowment with *natural gas*, in 2000 the Central region was situated on the first position, with almost a quarter of localities endowed with natural gas, followed by the North-Western region, with an index higher than 1 – 1.222. In 2008, although we have taken into account only municipalities, towns and communes, their endowment with natural gas is still modest, except for the Central region (with almost 60% endowment with natural gas of municipalities, towns and communes, and Bucharest-Ilfov, with more than 80%).

The analysis of the existence of *drinking water installations* shows that in 2000 the greatest index is recorded by the North-Western region, with a share of localities having drinking water installations of over 30% (compared to Romania's 20% average). A positive situation is registered also in the South-Eastern regions (a 1.649 index). All the other regions, including the Bucharest-Ilfov region, are below the national average, thus showing a critical situation. In 2008, if we take into account only municipalities, towns and communes, the situation seems to be much more favorable. Only one region, South-Western Oltenia, has a share of under 50% of these types of localities endowed with drinking water installations. The largest share of municipalities, towns and communes endowed with drinking water installations in 2008 is held by the South-Eastern region (approx. 83%), followed by North-West (approx. 80%), while the lowest index was recorded in the region South-West Oltenia.

An extremely difficult situation is met in the *sewerage systems* field, the share of localities endowed with this type of installations varying from a maximum of 14% in the Bucharest-Ilfov region, to a minimum of 2.2% for the South-West Oltenia region, in 2000. Although in 2008, as in the case of drinking water and natural gas distribution services, the reporting methodology for the endowment with such services has changed, including only municipalities, towns and communes, the shares of localities with public sewerage installations remain modest, respectively a maximum of almost 54% for Bucharest-Ilfov and a minimum of 14.5% for South-West Oltenia.

So as to compute the complex index of economic development and that of public services, we granted a greater importance for the synthetical indicator GDP/capita, attributing a weighting coefficient of 0.5; for the unemployment rate – a share of 0.2; for road and railway density, natural gas endowment, drinking water and sewerage systems, 0.06 each. The results of these calculations are presented in the following table:

Table 4: The economic and public services development indices by regions (I_r)

	Region	2000	2008
1	North-East	0.742	0.763
2	South-East	0.914	0.874
3	South Muntenia	0.887	0.845
4	South-West Oltenia	0.789	0.737
5	West	1.021	1.143
6	North-West	1.074	1.071
7	Center	1.177	1.070
8	Bucharest-Ilfov	2.027	2.335

As expected, the Bucharest-Ilfov region recorded, both in 2000 and in 2008, the highest index of overall economic development and public services development. In 2000, the Central region was situated on the second position, registering above-average values for overall economic development indices and for indices referring to natural gas endowment and sewerage systems. Moreover, the North-Western region benefited in 2000 of an index with a value higher than 1, with values above the national average for all indicators, excepting the GDP/capita index. Also a region closer to the Occident, the Western region was on the third position in 2000, with above-average values for overall economic development indices, for railroad density and sewerage systems endowment. The last position was occupied in 2000 by the North-Eastern region, with a 0.742 index, due especially to the general level of economic development. In 2008, it 'loses' this position to the South-West Oltenia region, which recorded values below the national average for railroad density, natural gas endowment, drinking water installations and sewerage systems.

Conclusions

Meeting local economic development objectives, as well as those related to the reduction of disparities at a regional level, involves as a prerequisite the evaluation of the current level of development. In the evaluation of the current level of overall economic development and that of basic public services, the calculation of a complex index based on essential indicators for characterizing the regional level compared to the national average, evinces the existence of significant differences in the territorial profile. In the category 'expected results' we can note the fact that the Bucharest-Ilfov region is on the first position both as overall economic development level and regarding public services; the North-Eastern region is situated on the last position in 2000, and on the last but one in 2008; the Western, North-Western and Central regions record a level of economic development and development of public services above the national average. An unexpected occurrence is that the difference between the maximum and minimum values of the complex index of economic development and of public services has increased in 2008 (1.598) compared to 1.285 in 2000, instead of decreasing. This leads us to the conclusion that the actions of the 2000-2008 period regarding the aspects of development researched have not met their target, and much more effective measures for the reduction of the difference in regional development in our country are necessary in the future.

STRESS AT THE WORK IN ROMANIAN BANKING SISTEM

Breje Cristina

University of Oradea, Faculty of Economics

In a period when the banks are struggling to survive we can realize that stress management becomes a problem. Stress at work can bring real business problems, management and labor productivity can be seriously affected and the level of motivation and conflict between colleagues may weaken professionalism. One of the most important factors in reducing stress levels of employees is helping them maintain a healthy balance-service Life. To effectively manage stress we need to know the causes that led it, which are symptoms of stress, how to effectively manage time at work and which are the ways to reduce stress level. Long-term stress cause psychological, behavioral, physical effects for the employee and also the banks results would suffer.

Key words: stress, human resources, work, motivation

JEL codes: J240;J280

Literature Review

Work

Work is and has always been an active and decisive factor of production whereby all other factors of production are driven, combined and employed effectively. People with their abilities and skills, with their experience and acquired knowledge, are the producers of all economic goods.

Work Productivity

The productivity of the workforce is a decisive factor for a bank to be successful. Productivity, at its turn, depends on the quality of the workforce. In a dynamic and competitive world man is faced with all types of stress.

Human resource is complex, it cannot be weighed easily, and for it to be effective it requires constant efforts of support and development on the part of the company. The work force in the banking system is a priceless asset, it is crucial for the success, performance and competitiveness of a bank. The workforce in the banking system is very important in promoting the products and the services of a bank unit. In the banking system the only element that matters in the long run for the economic growth is the human resource. The advantage of competitiveness in the long run gives the quality of the workforce. Each strategy of development must start with the human resource and education. The profits of the Romanian banking system in 2009 dropped to 772, 3 million lei (a little less than 200 million Euros), as apposed to 4, 4 billion lei (1, 2 billion Euros) representing the profits of the banking system in 2008³⁹⁵. The drop in profits is due to a decrease in the economical activity which led to the closing down of many companies and to the provisioning by the banks of credit loss. Last year the number of employees in the banking system dropped by 3.724. In 2009 the number of employees in the central offices decreased by 256 employees respectively by 1.20% to 20.394 people. Romania currently has a solid banking system, which did not display weaknesses in its system during the financial crisis, but the fact that the banks are trying to maintain their profits renders us more aware that work related stress became a problem.

Work-related stress

The notion of *stress* was introduced to physiology in 1930 by Hans Selye, who defined it as being the organism's non-specific answer to pressure or request³⁹⁶. This notion refers not only to a theoretical issue but approaches a real and critical aspect of our lives. *The European Agency for Safety and Health at Work* defined it as follows: "work-related stress is experienced when the demands of the work environment exceed the employees' ability to cope with (or control) them."³⁹⁷ Work-related stress can be defined as the most harmful physical, psychical and behavioral response which emerges when the demands of the job do not match the resources, the abilities or the needs of the employee. Stress is not a disease; it is an intense and unpleasant state which in the long run can have negative effects on mental and physical health, on performances and productivity. Stress is not only the effect of negative events; it can be the result of daily tensions. The fact that we concentrate when we work can lead to improvement in performance and to work satisfaction, by achieving the established goals. Work-related stress can sometimes be considered a positive element and mistaken for a competition, but these two notions are not identical. Competition gives us energy and motivates us to improve our work. When a competition ends we feel relaxed and content. Stress is a state of tension which occurs when a person responds to the demands of the work environment, family and other external sources when these are generated by his/her internal needs, obligations and self-critique. This situation is convenient for neither the employees nor the company. Stress is both additive and cumulative. It cumulates in time to the point of a crisis outbreak when symptoms emerge. Untreated, the symptoms can lead to illness and even death. Stress causes considerable disorders at the level of productivity, creativity and competitiveness. Every one of us can be the victim of work-related stress, regardless of the field of activity or the size of the organization we work for. Stress is a psychological reaction to the inherent demands of the stress factors which has the potential of making a person feel anxious and tensioned, because he/she is not able to cope with these demands. Some employees consider stressful work conditions as being "a necessary evil". Still, the company has to cope with the pressure on the part of the employees and to ensure their health in order for it to remain productive and profitable within the conditions of the current economy. There is stress resulting from employees being overloaded or under loaded. A moderate quantity of stress stimulates the body, but going beyond the physical and emotional limits of stress coping, causes not only a drop in one's performances but also a drop in one's ability to communicate and collaborate. The number of poor decisions increases, whereas the willingness to assume and fix the mistakes decreases. Stress is a personal and subjective reaction to tension, depending on each person's perception of both the size of the problem he/she is facing and the personal ability to cope with it.

Stressful working conditions are currently associated with an increase in absenteeism, employees being late to work, and their intentions to leave work, all these having a negative effect on the company. Stress ranks second when it comes to frequently reported health problems at work, affecting 22% of the workers belonging to the 27 member states of the European Union. Research shows that stress is a factor prevalent in a ratio of 50% - 60% in all lost workdays. The report of the European Commission reveals that 70 % of the Romanians are faced with high work-related stress and that they work weekly more than 48 hours as established by European regulations. Stress at work can be related to age, sex, working field, and work status. The highest

³⁹⁶ Selye, H. *The Stress of Life*, New York, McGraw-Hill, 1956.

³⁹⁷ Factsheet 22: Work-related stress, European Agency for Safety and Health at Work; <http://osha.europa.eu/en/publications/factsheets/22/view>

levels of stress can be noticed among middle age workers, and the lowest among older and younger workers. Physical violence is most frequently reported by workers aged 25-39, while harassment and unwanted sexual attentions are reported by the younger employees. Women are more exposed to harassment than men, but the prevalence of physical violence is similar for both sexes. Among employees stress is dependent on the type of work contract. Workers with permanent work contract display the highest levels of stress.

Stress always stems from combining three key characteristics:

- the prevalence of stress factors;
- personal resources to cope with stress factors;
- types of reaction to stress

Stress can be caused by different stressors at both the workplace and outside. It can have different causes and manifestations.

Causes of stress

Among stress causes we can mention: health, fatigue, lack of personal organization, lack of control, deadlines, the fear of failure, insecurity at work, the feeling of not fitting in with the culture of organization, traffic, driving, money, the ageing process, unfinished things, unclear direction in profession or life, a disorganized environment at home or work, relationships. Each manager and employee must know the factors that lead to stress, how it can be identified and how it can be done away with.

There are stress factors that are equally felt by each employee. Interpersonal conflicts are a strong factor, especially for those strong tendencies to avoid it. The whole range of conflicts, starting from personality clash and ending with fights among groups, is likely to cause stress. Among the causes of stress rank to a larger or lesser extent the inner triggers of personality, which are found in our subconscious and which control our actions: hurry, please others, be perfect, strive yourself, and be strong. These triggers are conveyed by children's parents when they are young.

Another stress factor at work is the way in which individuals perceive the possible results of their professional activity. If the results are considered both uncertain and important, such as signing an important contract, drafting a crucial report, or merely the ability to "please the boss", enhance the chances for the onset of stress.

In the family- work conflict, the stress stems from a clash of roles- that of being a member of a family and that of being a member of an organization. The Romanian society undergoes changes that have a negative impact on professional and family life. Because the traditional roles in family and at work have changed, both men and women desire to build a career and at the same time to achieve their personal family goals. A rise in the level of expectations and the living costs make a lot of people work harder, despite the personal needs and responsibilities that they acknowledge and state. The imbalance between the professional and family life affects the employee, the family and the organization he/she works for. For many families time management has become a problem, particularly the aspects regarding the carrying out of shared family activities, dividing the time between work and family. Both men and women are influenced by the impact of the conflict between work and family. The consequences of this conflict manifest themselves at the level of the employee in the decrease of professional performance and the increase of physical and emotional health, and at the level of the organization by a decrease in productivity, the rise of absenteeism, and of the number of quitting people. The lack of effectiveness at the professional and personal level of the employees represents a major problem for human resource specialists and managers. They can develop and implement organizational practices whereby to create an optimum work environment for the employees, women and men, with considerable benefits for the bank.

Among the stress factors at work in the Romanian bank system we can mention:

- the style of leadership: a poor communication and lack of information within the company, the lack of clear-stated objectives, the lack of support on the part of the team of managers, employees not being involved in changes occurring at work;
- decision and control: a poor involvement in taking decisions, the lack of control over one's work;
- the role in the organization: the unclear status in the organization, contradictory objectives and priorities, a great level of responsibility at work;
- work schedule: inflexible work schedule, unplanned overtime work, shift work, excessive extra work, the unexpected overloading of work tasks.
- career: uncertain career evolution, frustrations in the development of the career, uncertain status and a lack of acknowledgement, the uncertainty of the job, insufficient training programs, changes in the job within the organization;
- the relationships at work: poor relationships with superiors, lack of communication, interpersonal conflicts, harassment, verbal aggressiveness, physical or social isolation;
- work tasks and pace: lack of control over the work pace, overloaded or under loaded work tasks, lack of a priority of activities;
- work performance: a decrease in work performance, lack of decision, irritability;
- workload;
- time;
- work intruding;
- telephone;
- flood of emails;
- the cult of performance;
- changes;
- the man being a stress factor for the man: clients, lack of politeness, daily aggressiveness, work atmosphere, harassment;
- deadline pressure can become extremely stressful, deadlines for projects done in collaboration with other people who did not fulfill their tasks on time can become a source of stress for the employer who though has fulfilled his/her tasks cannot hand in the work in time.
- Too many "bosses". When an employee has several superiors, each of whom asks him/her to do a series of reports or actions, some of these even overlapping or coming into contradiction, he/she becomes disoriented, being confused as to whom he/she should submit or what he/she should do.
- supervision by means of cameras. The "big brother" effect is extremely strong particularly in initial phase when employees become aware that their every move is being noticed and analyzed by means of cameras.

Personal resources to cope with stressors

Personal resources to cope with stress are represented by the cognitive, emotional and behavioral capacity of each individual to reduce, control, or tolerate internal and external demands which exceed the organism's automatic capacity for response. Most of the times, it stems from the self-evaluation of one's own resources to face the events considered to be negative or threatening. Individual factors such as self-esteem, assertiveness, optimism, or the feeling of self-sufficiency, are protection factors against stress. The European Working Conditions Surveys from 1991-2005 show that there is a continuous growth in the number of respondents who report that they work at least around 0.75% of the time at very high speed³⁹⁸

³⁹⁸ European Foundation for the Improvement of Living and Working Conditions
Fifteen years of working conditions in the EU: Charting the trends, Office for Official

Some people are acutely reactive to stress, other people can experience symptoms in time. Acute reaction can take different forms: panic, anxiety, increase in the pulse rate, sweat, dry mouth, or trembling. In the long run stress can cause: headaches, dizziness, seeing disorders, skin itch, pain in the back of the head and shoulders. Differences in individual characteristics such as personality and way of dealing with problems play an important part in the way we are influenced by stress factors- some are more influenced and some less. Personality can have a major importance stress sensation. It affects both the degree of perception of possible agents as being stressful and the type of ensuing reactions. Most people like to think that they are in control of what happens to them. They are more likely to face directly the stressors because they start with the premise their response can change something. Those who do not keep everything under control are more prone to adopt strategies meant to reduce anxiety which give results only in the short run.

Stress symptoms can be: physical symptoms, intellectual symptoms, emotional symptoms, behavioural changes.

The effects of stress at work can manifest behaviorally, physiologically as well as psychologically.

Behavioral effects materialize in ways of dealing with problems. In the short run, these could be: irritability, disorganization, poor work organization, alcohol, and tobacco and food abuse. In the long run, they could materialize in: drug abuse, intolerance towards other people, ineffective work and time organization, inability to take quick decisions, overweight/underweight.

Psychological effects involve first of all, emotional and cerebral processes. In the short run, they manifest themselves through poor memory, low self-esteem, and inability to concentrate; in the long run: depression, memory problems, poor tolerance, panic attacks, and anxiety.

Physiological effects in the short could be: sweat, cold and trembling hands, dry mouth, quick and superficial breath, red face, stomach ache, and in the long run: hypertension, allergies, headaches, heart attack.

Tendencies

Lately some changes have been registered in the structure of work time because of the information-based society, work time floods free time, there are no clear-cut borders due to e-mail and blackberry. The fact that employees can fulfill certain tasks from their homes; they can access electronic mail from work, from no matter where, extends professional stress over to free time.

The financial crisis which led to Wall Street crash left thousands of specialists in the banking system jobless, other thousands sharing the same fate. A research conducted on 1.200 top managers, shows that 65% of these people state to have managed in their careers by sacrificing their family lives. Building organizational programs intended to balance work and private life, have to bear in mind the following changes: there is a growth in the number of single parents, of divorces, of women who work, of couples wherein both partners have a career, of fathers involved in the upbringing of children.

In Europe, 28% of the employees experience a high level of stress at work. Stress at work leads to a growth in the risks of anxiety, depression or burnout. Working conditions that negatively affect the mental health of employees include negative management style, low social support, time pressure, repetitive tasks, interpersonal conflicts, insecurity of the job, lack of control and autonomy.

The most frequent problems of mental illness in European countries are anxiety and depression; it is estimated that by 2020 depression will be the main health problem among adults and children in developed countries.³⁹⁹

Legislation

The European Commission applied certain measures meant to guarantee the safety and health of workers. The frame directive (89/391) stipulates fundamental regulations in the field of work safety and health; the obligation on the part of employers to ensure safety and health at work, including references to effects of work-related stress. All member states have implemented this directive in their legislations and some have issued guides to prevent work-related stress. In conjunction with the approaches of the frame directive, in order to do away with or reduce stress employers have to:

- prevent stress risks at work;
- evaluate stress risks at work through identifying those demands and pressures of activity which might generate high and long-term levels of stress and through identifying the possibly affected employees.
- To adequately take measures to prevent stress induced harm.

Work-related stress can be avoided and efforts to reduce it can be highly profitable. Evaluating stress risks at work involves the same basic principles and processes such as evaluating the other risks at work. Including the employees and their representatives in the process of assessment is essential to their success; they have to be consulted in order to identify the causes of stress, the groups that are potential victims, and also the solutions that need to be adopted in order to help.

The stages of assessment of risks can be summarized as follows:

- identifying the risks;
- establishing the people who can be affected by stress and in what way they can be affected.
- assessing the risk through: identifying the measures that have already been sufficient and if they are not sufficient, establishing additional measures that can be adopted;
- reexamining these assessments at on a regular basis

Managers with a sound thinking have an attitude of collaboration between the employee and the manager in achieving the professional and personal benefits both for the company and the private lives of employees and managers. These managers are guided by three major objectives⁴⁰⁰:

- the clear information of the employees regarding the business priorities and encouraging the employees to establish personal priorities;
- acknowledging and supporting the employees for their roles and responsibilities at work and outside work;
- the permanent improvement of employees' performances and of the organization at the same time with reaching the personal objectives of the employers.

In order to create a healthy work environment banks have to direct their shares in favor of employees' health which will result in benefits for the company. A healthy organization is an organization with a low rate of illness, of disabilities of the workforce, with a low level of stress at work and a high level of productivity. A healthy organization acknowledges employees' rights, creates opportunities for career development and has an organizational culture that emphasizes the employee. The first step in establishing the level of pressure that would lead to an optimum productivity resides in a constructive dialogue between the managers and working teams.

³⁹⁹ Green Paper - Improving the mental health of the population: Towards a strategy on mental health for the European Union, 2005

⁴⁰⁰ Harvard Business Review on Work and Life Balance, 2000

Monitoring the communication in view of establishing the excess of conflict will allow the managers to be better equipped in order to make the necessary changes.

Prevention of work-related stress in Romanian banking system:

Stress can be fought against almost in every situation through a convenient combination of recreational exercises, physical exercises, a healthy diet, a better time-keeping and the improvement of social abilities. First of all we have to reduce the stressors; preventive measures for maintaining a healthy balance could be:

- identifying then changing the way in which we perceive the stressors;
- learning to say 'I can't, I don't know how to, I need help';
- being surrounded by optimistic people;
- laughing;
- ensuring a healthy diet: avoiding excess of sugar, fats, salt, caffeine and alcohol;
- putting a greater emphasis on rest;
- exercising;
- respecting breaks. A short walk, a conversation with a fellow worker on topics other than work or a simple relaxation technique;

Preventing stress at work is one of the main aspects of the fundamental objective of International Labor Organization in promoting as many opportunities as possible for men and women to get a decent and productive job in conditions of freedom, equity, safety and human dignity;

Ways of managing stress in the banking system:

- information regarding the sources of stress;
- becoming aware of reactions to stress;
- developing abilities and behaviors of stress management: developing assertiveness, a positive communication with other people; identifying and sorting out conflicts when they emerge, learning the methods to sort out problems and taking decisions, learning relaxation techniques;
- establishing and maintaining an adequate social support;
- developing a healthy lifestyle: keeping a normal weight, exercising on a regular basis, giving up on alcohol and tobacco;
- boosting the self-esteem: establishing priorities and limits, taking part in activities that grow one's self-esteem, establishing realistic goals;
- time management.

EUROPEAN LABOUR PRODUCTIVITY AND CORPORATE E-LEARNING ACTIVITIES: AN EMPIRICAL ANALYSIS

Bucciarelli Edgardo

University of Chieti-Pescara, Department of Quantitative Methods and Economic Theory

Pagliari Carmen

University of Chieti-Pescara, Department of Quantitative Methods and Economic Theory

Muratore Fabrizio

University of Chieti-Pescara, Department of Quantitative Methods and Economic Theory

Abstract

The purpose of this analysis is to test the hypothesis which growth in workers' competency level is affected by educational, training and workplace features. We focused above all on the corporate e-learning activities and labour productivity, in order to identify differences between European countries. Our findings showed some statistical significances related to six variables concerning a macro view of knowledge and innovation in the workplace, whereby we highlighted the comparison of mutual positions of European countries on the basis of a potential component of investments in human capital which is e-learning. According to statistical significativity we specifically noted that most Northern European countries have a comparative advantage in terms of labour productivity and direct investments than those in the south.

Keywords: corporate e-learning, European labour productivity, principal component analysis.

JEL code: J24.

1. Introduction

It is well-known that the composition of the EU and that of the euro area have changed tremendously over the recent years, with the relative proportion of larger countries shrinking. Among the 15 countries the euro area comprised in 2008, three of them were large countries (Germany, France and Italy), one of middle size (Spain) and the remaining 11 were of small or very small dimension and this remains true whether size is considered in demographic or in economic term (Laurent and Le Cacheux, 2006). It is also common knowledge since Olson's (1965) seminal work that, when collective action is needed in whole group's interest, the decision making process becomes all the more arduous as the group is bigger and more heterogeneous, especially sidewise. The smaller countries will usually tend to make advantage of their small size sometimes also in adopting opportunistic and free rider strategies. Those trends are getting even stronger within the current EU and euro area's institutional framework, because of such decision-making process rules as unanimity and the thresholds adopted for qualified majority voting, or the "open method of coordination" whose different variants - more especially those on employment policy, social protection and even more importantly, those on the implementation of the reformed "Lisbon Strategy" - encourage competition between member states and tend to make collective decision-making difficult, if not impossible, also in the field of labour politics and investments in human capital resources such as education & training activities (Welsh E., *et al.*, 2003; Black S. and Lynch L., 2004; Daelen M., *et al.*, 2005).

2. Methodology and analysis

We performed a quantitative analysis reckoning with several variables related to 2008 for EU member countries and their aggregates. The variables considered are: GDP *per capita* in PPS, corporate e-learning applications for training and education of employees, labour productivity per person employed, total investments as percentage of GDP, business investments as percentage of

GDP, direct investments flows as percentage of GDP. The first is a descriptive analysis and in table 1 we reported the results of this preliminary stage:

Variables	Minimum	Maximum	Mean	Variance	Skewness	Kurtosis
GDP	41,30	276,40	102,8029	1939,428	1,940	6,558
Corporate e-learning	13,00	54,00	28,7576	109,002	0,639	-0,263
Labour productivity	37,20	175,80	95,0886	869,469	0,430	0,707
Total investments	16,30	33,40	22,9371	16,613	0,966	0,418
Direct investments	-48,50	261,20	9,9647	2074,273	5,333	30,467
Business investments	13,80	27,70	19,6125	11,599	0,726	0,022

Table 1: descriptives statistics (source: our elaboration on Eurostat data, 2010).

Considering the year 2008, the first variable investigated is the GDP *per capita* in PPS⁴⁰¹. This variable was analyzed for European countries and for its qualified aggregate EU-27, EU-25, EU-15, Euro Area and other countries. The GDP has a minimum value of 41.30 while the maximum level is 276.40. This shows a high variability between countries, which is confirmed by the index variance of GDP. In this case, 41.30 is referred to the value of GDP in Bulgaria together with the Czech Republic, Estonia, Greece, Cyprus, Latvia, Lithuania, Hungary, Malta, Poland, Portugal, Slovenia, Romania, Slovakia, Turkey and Croatia. Turkey has a GDP not compliant with the European Union average. Moreover, the value of kurtosis gives an idea about its very high amount and therefore with a greater distribution of countries on tail areas of normal distribution which is confirmed by the index of symmetry which restrains an asymmetric outcome compared to normality. These conclusions can be deduced similarly respect to the variable of direct investments as a percentage of GDP since its minimum value is negative at -48.50 reached by Iceland and its maximum level is reported by Luxembourg at 261.20. This dispersion of the data shows a high variability with asymmetry and kurtosis somewhat distorted compared to normal distributions. Instead, variables such as corporate e-learning applications, labour productivity, total investments and business investments provide values quite normal with a range of potentially more manageable. Before addressing a regression analysis on the phenomenon under observation, we calculated a matrix correlation (table 2) to emphasize the major variable correlations between variables:

Variables	GDP	Corporate e-learning	Labour productivity	Total investments	Direct investments	Business investments
GDP	1,000	-0,201	0,909*	-0,440	0,776	-0,435
Corporate e-learning	-0,201	1,000	-0,182	0,253	-0,090	0,239
Labour productivity	0,909	-0,182	1,000	-0,575	0,565	-0,525
Total investments	-0,440	0,253	-0,575	1,000	-0,182	0,954*
Direct investments	0,776	-0,090	0,565	-0,182	1,000	-0,207

⁴⁰¹ This indicator has been rescaled, i.e. data are expressed in relation to EU-27 = 100. The volume index of GDP *per capita* in Purchasing Power Standards (PPS) is expressed in relation to the European Union (EU-27) average set to equal 100. If the index of a country is higher than 100, this country's level of GDP per head is higher than the EU average and vice versa.

Variables	GDP	Corporate e-learning	Labour productivity	Total investments	Direct investments	Business investments
GDP	1,000	-0,201	0,909*	-0,440	0,776	-0,435
Corporate e-learning	-0,201	1,000	-0,182	0,253	-0,090	0,239
Labour productivity	0,909	-0,182	1,000	-0,575	0,565	-0,525
Total investments	-0,440	0,253	-0,575	1,000	-0,182	0,954*
Direct investments	0,776	-0,090	0,565	-0,182	1,000	-0,207
Business investments	-0,435	0,239	-0,525	0,954	-0,207	1,000

Table 2: correlation matrix (source: our elaboration on Eurostat data, 2010).

In table 2 we pointed out with an asterisk the two most significant correlations which are represented by the following: the GDP compared to labour productivity and total investments compared to business investments. In fact, these latter variables demonstrate an almost perfect correlation between them, showing an excellent direct relationship. A less significant correlation, but still positive, is also between GDP and direct investments. The other variables have converged to correlations rather insignificant and even some kind of relations are negative. We noted that labour productivity is negatively related to total investments, business investments and corporate e-learning activities: this indicates a discrepancy between the variables under study⁴⁰² bringing back a reverse relation because when a variable grows, the other reacts in the opposite way. Once the correlation analysis, we moved to that of regression⁴⁰³. The following table reports the regressions analyzed and their results:

Variables: dependent – independent	r	R square	Coefficient β	T
Corporate e-learning – GDP	0,102	0,01	-0,024	-0,564
Labour productivity – GDP	0,924	0,853	0,605	13,641
Business investments – Total investments	0,96	0,922	0,79	18,817
Corporate e-learning – Business investments	0,582	0,338	1,099	4,107
Corporate e-learning – Labour productivity	0,074	0,005	-0,031	-0,426

Table 3: model summary (source: our elaboration on Eurostat data, 2010).

This inspection confirms the previous investigation conducted with the correlation. In fact, for some variables we have an excellent goodness of fit of theoretical data to those observed, for other variables it occurs to a lesser extent. The following highlights the regressions individually identified from best fit, indicating the dependent variable at first and then the independent one:

1) Labour productivity – GDP: in this regression analysis, the results show a strong direct relationship between the two variables. This indicates that when GDP rises, the labour productivity increases; so those countries with a higher GDP have even an increased general economic activity. The results confirm an excellent response to the goodness of fit and

⁴⁰² Labour productivity with total investments, labour productivity with business investments and labour productivity with corporate e-learning activities.

⁴⁰³ Note that the regression coefficient values and the correlation coefficient values overlap, as the constant $y=bx$ has been omitted from the model.

significativity of regression coefficient, as the test on the hypotheses⁴⁰⁴ stands on a large enough value being equal to 13.641.

2) Business investments – Total investments: this analysis also confirms a good direct relationship between the two variables and whereas total investment increases, there is a proportional raise in business investment. Even in this case, countries with greater investments mainly gear the same on business investments⁴⁰⁵. The results of test of the regression coefficient confirm the significance of analysis reaching a value exceeding 18.

3) Corporate e-learning activities – GDP: we obtained a relationship quite zero which would indicate a relative neutrality of the variable GDP compared to the one referring the activities in corporate e-learning. In fact, the increase of GDP in European countries do not get more investment in corporate e-learning. It would seem that the use of e-learning systems in education & training firms activities is mainly influenced by other socio-economic and cultural features; verifications of the analysis also confirmed the meaningless of the parameter studied.

4) Corporate e-learning activities – Business investments: this study shows a good direct relationship between the two variables. The results are established at a mean values level and the test of verification of the regression coefficient is significant. It follows that corporate e-learning activities are influenced more by business investments and then countries which largely invest in this regard will also use a part of them in corporate e-learning training systems. So e-learning applications are also affected indirectly by GDP, as the same business investments are greater in those European countries with a higher GDP.

5) Corporate e-learning activities – Labour productivity: this elaboration is inconclusive at the level of statistical tests as increasing in labour productivity, investments in corporate e-learning systems appear inconsistent. Verification of the regression coefficient explains the irrelevance of the analysis reaching a low value close to zero. This result may appear confusing and it will require an our future study.

Once regression analysis is carried out, we moved to principal component analysis. Considering the six variables presented above, we calculated eigenvalues in order to call attention to the variability:

Component	Initial eigenvalues			Extraction sums of squared loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	3,343	55,716	55,716	3,343	55,716	55,716
2	1,323	22,057	77,773	1,323	22,057	77,773
3	,891	14,846	92,619	-	-	-
4	,359	5,979	98,598	-	-	-
5	,055	,919	99,517	-	-	-
6	,029	,483	100,000	-	-	-

Table 4: total variance explained (source: our elaboration on Eurostat data, 2010).

The table 4 reveals that the first two eigenvalues explain a percentage of 77.7 about the referring distribution, and considering a third eigenvalue, we reach a percentage of 92.62 about variability explained. It can be inferred that the first two eigenvalues are sufficient to expound the variability

⁴⁰⁴ The test statistics (T-statistics), which represents the model testing hypothesis, is not significant for values ranging from -2 to +2.

⁴⁰⁵ The values referred to “total investment” and “business investment” represent percentages of GDP and, hence, are influenced by GDP of each countries.

of our study as the 77.77 per cent of variability described is still a good result analysis. In order to interpret the outcomes obtained from principal components is crucial to dissect the matrix of correlations between the components themselves and the variables which contributed to their setting up. Below are given these correlations:

Variables	Component	
	1	2
GDP	,884	,419
Corporate e-learning	-,335	,293
Labour productivity	,894	,214
Total investments	-,789	,560
Direct investments	,651	,628
Business investments	-,777	,555

Tabel 5: component matrix (source: our elaboration on Eurostat data, 2010).

Table 5 sets a focal point on the importance of variables than the first two principal components. The first principal component shows up a high interest in relation to the variables GDP and labour productivity, which can be explicated as a factor connected to the productivity of the European countries. The second main component has, on the whole, quite low values with more relevance to direct investments as percentage of GDP. We synthesized the first component in “labour productivity” (component 1) and the second one in “direct investments” (component 2). Below is a chart summarizing the analysis with two main components representing the reference coordinates and the position of European countries compared to the two main components. Furthermore, these countries were divided into four clusters calculated by the method of Euclidean distance between countries:

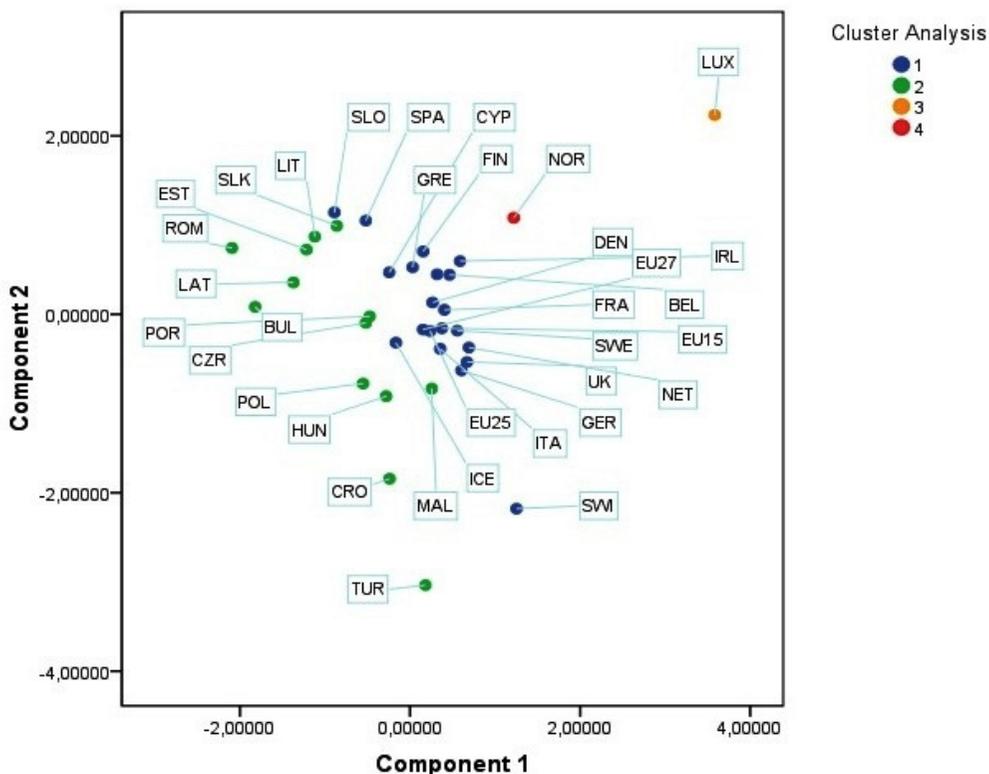

Figure 11: PCA and cluster analysis (source: our elaboration on Eurostat data, 2010).

From figure 1 we gather a number of considerations. The first principal component (labour productivity) shows a range of variation ranging from -2 to +4. While the second principal component (direct investments) has a range of variation ranging from -4 to +2. The first cluster is composed of a single European country that is the case of Luxembourg. This country ranks at the top and right of the figure 1 showing the overall higher rate of labour productivity and investments compared to other European countries. A second cluster is represented by Norway, even though it seems close to the remaining clusters, it still remains at a high level of productivity and investments. The third cluster is represented by most of European countries, which in this case show a positive productivity and investments lower than Norway and Luxembourg. The countries in this cluster are: Slovenia, Spain, Ireland, Italy, France, Finland, Ireland, Belgium, Denmark, Sweden, United Kingdom, the Netherlands, Germany and Switzerland. The latter (Switzerland), although it has a positive labour productivity, holds negative investments. The fourth cluster concerns the European countries which present a negative productivity and investments. The last cluster pertains countries such as: Slovakia, Estonia, Lithuania, Romania, Latvia, Portugal, Austria, Czech Republic, Bulgaria, Poland, Hungary, Malta, Turkey and Croatia. Turkey, in particular, contains the lowest values among European countries with negative investments and output null and void.

3. Concluding remarks

The objective of our study was to analyze the different European countries based on the six variables taken into account. The variable GDP *per capita* in PPS has affected especially the countries distinguishing from each other. For example, Luxembourg has the highest GDP *per capita*, followed by Norway. These two countries appear to have a labour productivity and direct investments higher than others. But fundamentally the most significant cluster is certainly the

third, namely the one where we find countries such as Italy, France and Germany, which are in a situation similar to the average of the EU in terms of labour productivity and direct investments, but in a possible future scenario will certainly reach higher levels, in spite of the current global crisis. Indeed, considering the wider time span 2003-2007 (Bucciarelli, Giulioni, Muratore, *et al.*, 2008) it is emerged a larger growth of GDP and investments for these three countries. In conclusion, all the European countries go through a phase of stable productivity of the work which needs to be reinforced by processes of research & development and of innovation. It is a sort of best practice the unsatisfactory result found for the variable corporate e-learning, which shows for many EU countries a meagre tendency to new technologies of the latest corporate training. If there were a more implementation of education and training there would be a better development of labour productivity (Becker G. S. and Murphy K. M. 1992; Acemoglu D. and Zilibotti, 2001; Daelen M., *et al.*, 2005).

It is ten years after Lisbon and in the year dedicated to poverty alleviation that this paper is written in order to investigate the implications of the decisions regarding poverty reduction taken by the EU. We present a simple comparison of the "risks of poverty" in European countries in 2000 and 2008, before and after transfers, and our finding is a positive effect of the policies towards poverty alleviation, even if the risk of poverty is increasing. By studying the correlation between percentage of people that fall below the poverty line and GDP per capita, we do not observe a whole diverse situation in Europe, with only few minor differences between rich and poor countries. We also discuss the importance of alternative approaches in estimating poverty, by means of a multidimensional method which considers a multitude of aspects in the quality of life.

Keywords: poverty, risk of poverty, GDP, European Integration, Globalization.

JEL code: I3, P3

1. Introduction

"Solidarity is one of the guiding principles of the European Union, meaning that all citizens should be able to share in the benefits of prosperous times, while also sharing the burden of times of difficulty."⁴⁰⁶

The European Council, held in Lisbon in March 2000, identified the fight against poverty and social inclusion as one of the key commitments of the European Union and its Member States.

To this end, the European Council has designated 2010 as "the European Year⁴⁰⁷ for Combating Poverty and Social Exclusion⁴⁰⁸", in order to give voice to the concerns of people who have to live with poverty and social exclusion, and promote discussion on these issues. The international economic and financial crisis that revealed major impact from 2008 is having and will have long-run consequences for growth and employment in the EU. The most vulnerable part of our society will suffer most from these effects. In this work we want to integrate the issues of average

⁴⁰⁶ Eurobarometer survey on poverty and social exclusion, 2009.

⁴⁰⁷ Since 1983, every year was defined, by the European Council, as a "European Year" with the aim to inform the citizens of Europe and to pay attention to social themes, in order to change mentalities and behavior of citizens.

⁴⁰⁸ Decision n° 1098/2008/EC of the European Parliament and of the Council of 22 October 2008 on the European Year for Combating Poverty and Social Exclusion (2010).

income and public purposes, in order to analyze them more thoroughly. Indeed, both of them relate to and explain a problem that afflicts significant shares of population of European countries, as well as the rest of the world: the problem of poverty.

2. Measuring poverty

In order to assess the effectiveness of a policy, it is necessary to observe changes in the level of poverty over time: this means that poverty must be, in some way, measured. According to Sen (1976), the measurement of poverty consists in solving two distinct problems: the identification and the aggregation. In the economic literature the first problem has been solved by using income as a proxy. In fact, in 1905, Lorentz introduced the Lorentz curve to describe as income might be compared in terms of inequality. By using income, in 1880 Charles Booth introduced the notion of poverty line in order to distinguish people living in London from those in poverty and in comfort. This threshold was defined in 1891 by Rowntree in terms of a minimum level of income that was necessary to access to the basic needs. During the last century, studies on measures of poverty have followed essentially two different approaches: the construction of an indicator and the ordering of distribution. Nevertheless in both path, income or consumption expenditures were considered as the only variable representing the welfare level of an individual. The first approach has produced several indices (Clark, Hemming and Ulph, 1981), which are essentially based on dividing the population into two subgroups depending on whether the income is below or above a threshold value. However, the second one has dealt mainly with ordering and distribution of income and, in order to eliminate a degree of subjectivity, several postulates were introduced (Sen, 1976; Tsui 2002; Bourguignon and Chakravarty, 2003). There are two main ways of setting poverty lines absolute⁴⁰⁹ or relative⁴¹⁰, subjective⁴¹¹ or public standards⁴¹². In 1995, at the World Summit on Social Development in Copenhagen⁴¹³ scientists have defined extreme poverty as: “[...] a condition characterized by severe deprivation of basic human needs, including food, safe drinking water, sanitation facilities, health, shelter, education and information”. In 2004, the European Council⁴¹⁴ presented a relative definition of poverty “[...] Because of their poverty they may experience multiple disadvantages through unemployment, low income, poor housing, inadequate health care and barriers to lifelong learning, culture, sport and recreation. They are often excluded and marginalized from participating in activities (economic, social and cultural) that are the norm for other people and their access to fundamental rights may be restricted”. We observe that, while extreme poverty affects only certain groups within the EU, the most widespread form of poverty within the EU tends to be relative poverty, both in monetary and non-monetary terms. The characteristics of relative poverty can vary between genders, age groups, household types, etc. In this light, a genuine poverty measure should depend on an income indicator as well as on non-income indicators.

3. The risk of poverty: evidence from data

One particularly interesting aspect of the quantitative distribution of income is the one concerning the living conditions of the poorest people. The analysis of poverty pays attention to the size and characteristics of the left tail of the distribution, while ignoring other aspects.

⁴⁰⁹ The absolute standard (basic needs approach) is usually used to define poverty in developing economies by World Bank and Onu.

⁴¹⁰ According to this criterion, poverty state is defined in relation to the community standard life average, so, to be poor means having less than other.

⁴¹¹ In the subjective standard, individuals or families are poor if they declare themselves to be poor.

⁴¹² The public standard requires that the maximum level of income is set by exogenous measures of public welfare assistance

⁴¹³ A/CONF.166/9 - Final Report of the World Summit for Social Development- Copenhagen, 1995.

⁴¹⁴ European Commission, Joint report on social inclusion, 2004.

Our analysis starts considering the “risk of poverty” in UE in two different years: before (2000) and after (2008) the implementations of Lisbon strategies, in order to collect some evidence about the effectiveness of these strategies. In particular we calculate the percentage variation of this indicator. Then we analyze the correlation between income level and percentage of population which falls below the poverty line (computed relative to the country).

The EU is a relatively rich and prosperous part of the world, with an average GDP per capita of \$32.600 and a rate of unemployment of 9,2%, compared to U.S. \$ 46.400 and \$ 32.600 for Japan, with respectively 9,3% and 5,6% of unemployment rates (2009, CIA, The World Factbook). Nevertheless, it is estimated that around 80 million Europeans (19 million of whom are children, the gender gap is approximately two percentage points) live at risk of poverty⁴¹⁵, which is about 17% of the population⁴¹⁶. Nevertheless in the economic analysis we are interested in knowing how income is distributed among people. In Europe the average Gini coefficient is lower (31, 2006) than the other two examples above (45 for U.S., 2007, and 38,1 for Japan, 2002, CIA), but it takes different values in different countries.

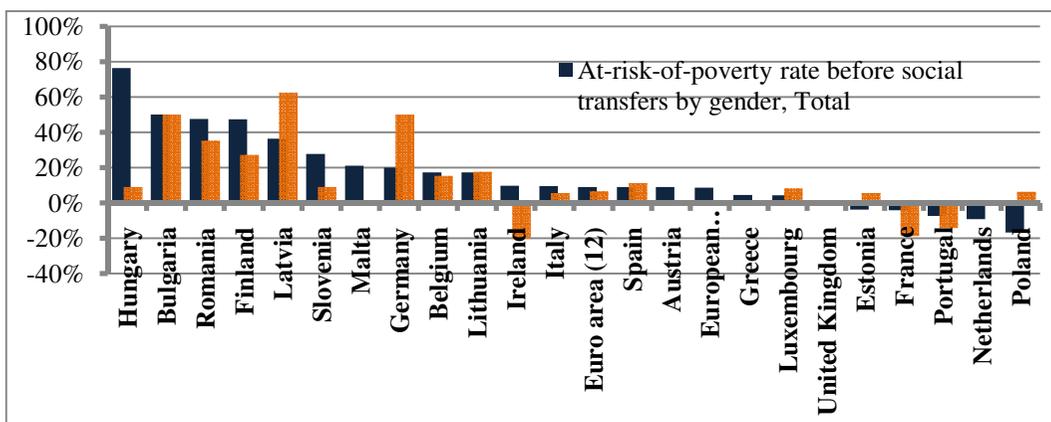

In some Eastern European countries the Eurostat index “Inequality of Income Distribution⁴¹⁷” is almost double compared to Western countries. In this first group of States, characterized by low income, high inequality means a higher risk to fall in poverty. Several studies on the relationship between globalization and changes in the indices of poverty (Sala-i-Martin, 2002) showed an increase in poverty levels, because of growing inequality in different countries. There are in fact vulnerable groups, which already constitute the poorest part of population, that cannot benefit from the improvements in levels of economy, such as taking advantage from larger international exchange relationships or exploiting human capital to achieve better social and economic position. By and large, the process of globalization has reduced absolute poverty levels in the world, in a complex relationship, that led in some cases to greater concentration of income and wealth. This relationship is however complex and intricate, since these two phenomena have been evolving in recent years. This paper underlines the role played by poverty on future possibilities for community development, joint and harmonious. Using Eurostat data we highlight the increase in the level of risk of poverty that is evident in many member countries, especially in calculating the pre-transfer. This refers in particular to Eastern European nations like Hungary, Bulgaria, Romania, and northern countries like Sweden and Finland, which have increased their chance of falling in poverty from a rate of 40% to over 70%. On the other hand, the number of countries with a decreasing level of this index during the same period were few and with low values. Concerning the importance of EU and national policies for integration and growth, it is necessary to examine the data after transfer, to assess the effectiveness of at least national relevance, which is also the remit of national decision-makers. Countries with high levels of increase in the first indicator, Sweden and Finland, but also Denmark, Ireland, Hungary and Austria, reach more than 50% decrease in risk of poverty before and after the transfers, bringing the indicator "At-risk-of- Poverty rate after social transfers" well below the European average, which for the year 2008 was around 17%.

⁴¹⁵The ‘at risk of poverty’ indicator identifies households or people who fall below a certain income threshold, the EU sets this cut-off at 60% of the median income.

⁴¹⁶European Commission, Joint Report on Social Protection and Social Inclusion 2008.

⁴¹⁷Eurostat defines the “Inequality of income distribution” as the ratio of total income received by the 20% of the population with the highest income (top quintile) to that received by the 20% of the population with the lowest income (lowest quintile).

Fig. 1 - Change (%) of indicators at risk of poverty before and after the transfers in 2000 and 2008

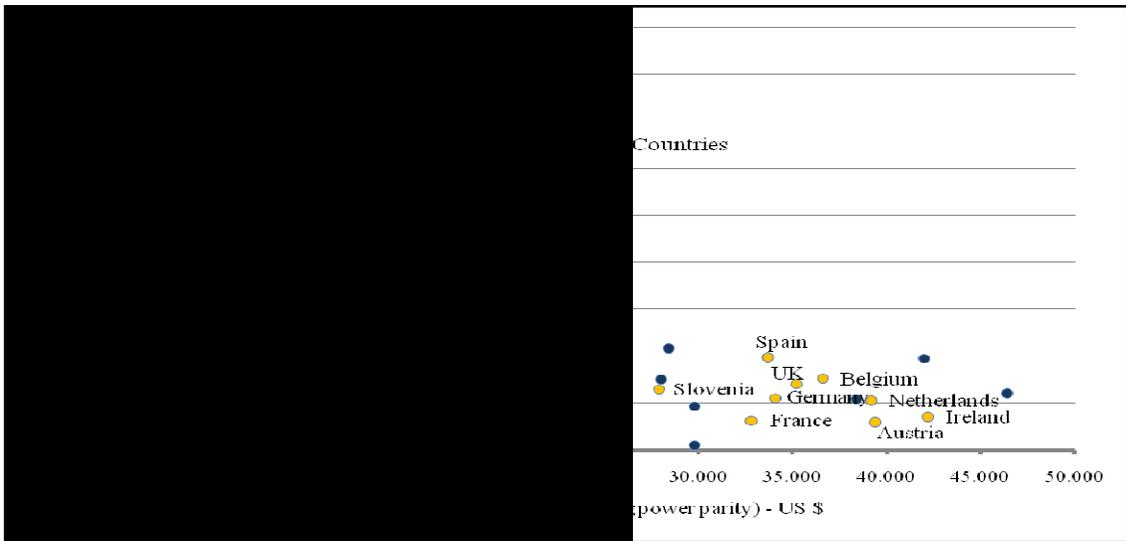

The level of risk increases for women, on average 1 to 3 percentage points, and decreases with improvements in education, especially in Eastern countries such as Romania and Bulgaria, where people with primary education had about 40% of risk of falling below the national poverty line; however, this is reduced to less than 5% for those countries showing a higher level of human capital. Differences persist among social groups within States, which, as already discussed in Lisbon, are a disturbing factor to the growth process, as they form areas of marked differences between single countries, both in terms of wealth and labor productivity, which affects the mutual relations of exchange and cooperation. As it is clear from the data, the role of education in Europe is essential, also due to the approach taken in the strategies that should improve the socio-economic background in the EU, directed to invest into the knowledge economy and human capital formation and establishing a solid foundation for long-run development.

Finally, it is important to consider the “poverty risk” for particular social groups, the children and the elder, which in most member States support a higher than average risk of poverty, markedly in Eastern countries (Eurostat 2010).

In the following chart, we observe the location of many worldwide countries arranged according to the variable “Population below poverty line”⁴¹⁸, compared with the level of GDP per capita (in purchasing power parity, US \$). The EU member states are located mostly in the richest segment, in many cases marking minimum levels of population in poverty (less than 15%). Moreover, several Eastern European countries are characterized by median income levels between \$ 11.500 (Romania) and \$ 21.200 (Slovakia), but they share similar levels in poverty rates with other richer countries (with minimum levels for Lithuania and Estonia to around 5%, less than some richer countries, and maximum for Romania, 25%) (CIA, The World Factbook).

⁴¹⁸ National estimates of percentage of the population falling below the poverty line are based on surveys of sub-groups, with the results weighted by the number of people in each group, definitions of poverty vary considerably among nations. (CIA)

Fig. 2 - Graph of Population below poverty line vs. GDP per capita PPP (US \$) of the corresponding country (recent years available)

4. Conclusive remarks

The measurement of poverty, and more generally of social problems, is one of the liveliest topics in economic statistics, as evidenced by the commitment made by Eurostat and the European Commission. However, as mentioned earlier, the estimation of poverty involves complex methodological choices, sometimes fragile, and too conventional. These observations must be considered when interpreting the data and building on them intervention policies.

Data show that, generally, at high levels of GDP per capita correspond a low poverty risk, but this is not true for each country. Some consideration must be given to the positive variation of the poverty risk in 2000 and 2008: firstly, we observed a positive effect of social policies brought by the EU, in agreement with the member States. Secondly, also because of global economic slowdown, there is still a high percentage of people at risk of being in poverty, or to remain marginalized from different aspects of social life.

Many economists (Sen, 1976; Tsui 2002; Bourguignon and Chakravarty, 2003) do not consider the average income level, as well as its distribution, an appropriate method to estimate the poverty. They study poverty as a multidimensional phenomenon which takes into account not only the monetary factor but also non monetary factors (as health, educational, life expectancy...). In this way, the unidimensional threshold is substituted by a multidimensional one that allows to define as poor people that have an adequate income but do not have access to some of the so-called “basic needs”. Appropriate social policies should therefore consider a variety of aspects of social and economic life, especially in the EU, where in addition to integration between countries, it is necessary to achieve cohesion and equal conditions of life among all EU citizens.

TRENDS REGARDING THE DEVELOPMENT OF THE COMMERCIAL ACTIVITY IN ROMANIA

Catana Adina
University of Oradea
Faculty of Economics

World economy is experiencing some important transformations, mainly due to the rapid evolution of the informational and communication technologies. In the last years, new technologies flooded the production processes. They have allowed the improvement of the processing and use of the economic information and the general acceleration of the economic flows.

The technical progress interferes with the economic activity through the re-engineering of the production lines, the revolution in the field of building materials and store, shopping center, malls and industrial hall building, the considerably shorter time period these are being built and they become available for the commercial activity, the revolution in the field of supply, merchandise storage and manipulation, the appearance of different types of intelligent machineries and equipment, merchandise storage software improving the way the client is served at the counter. The industrial revolution determines a reorganization of the economic activity, a resetting of the trade economic activity by directing the trader towards the client using new commercial techniques and strategies.

Key words: technology, technological revolution, technical progress, development, production, trade, improvement of the trade activity.

COD JEL: E21, E22

Conceptual aspects regarding trade

The notion of commerce has a complex contain, determining a economic function that consists of buying raw materials or products to sell them in the same physic stadium, but in conditions convenient for the buyers. The same notion, defines the profession of a group of economic agents, who take action on the market determining the trade acts.⁴¹⁹

Commerce, through its functions and through the nature of the activities developed, represents the main component in the system of the national economy, and represents that economic activity of mediation of the economic goods trade, through commercial specialized enterprises, both inside the borders of a country and in relation to other countries. The economic category of commerce has a very complex contain and plays an important role on both social and economic plan. On social plan it has a strong psychological loading, through promoting commercial ethics, forming the taste and the education of the clients, studying the consumer's behavior in taking buying decision⁴²⁰.

Also trade represents a point of contact between citizens and the local community, through which pass the most recent information, in terms of life styles, cultural schemes and common activities⁴²¹.

Commerce, as a branch of an economy, is assimilated to the goods way, activity that appears between production and consumption, with the mention that the circulation of goods has several

productive aspects, as a result of the activities which represent an extend of the production process, such as: manipulation, transport, storing, portioning, stowage, etc., operations that increase the value of goods⁴²².

Modern contemporaneous economy is characterized through a high rhythm of development, in which commerce is in the center of all economic activities. Development is lengthened to commerce, market relations, thing that led to a globalization of market and to a harmonization of the interests of participants. In a global approach, the economic category of commerce includes interior and exterior trade, with their main components: import, export, re-export and transit activities⁴²³.

The influence of the technology of information and of communication over commercial activity

World economy passes through a period with strong transformations, mainly generated by the fast evolution of informatics technologies and by communications. Electronic commerce becomes fast a spectacular component of globalization; the expansion of electronic transactions could represent an major opportunity for commerce and development⁴²⁴. This process can be the source of an important number of success histories through which developing countries and their enterprises can reach new levels of international competitiveness and participate actively at the global informational economy. The international community must support developing countries and their efforts for a better understanding and knowledge of the various aspects of electronic commerce, technical, legislative, social and cultural aspect. The phenomenon electronic commerce prefigures to stay an important field on the international agenda for a long period of time, because of the deep macroeconomic and social implications that begin to be better understood. The nowadays performers of commerce turn their attention to developing the dimensions of electronic commerce⁴²⁵.

In order to evaluate the potential impact of electronic trade over economic and social development of developing countries will be studied aspects regarding the size, the purpose and the growing speed of the electronic commerce, the tendency of this type of commerce and the way in which this affects the economic activity⁴²⁶.

The main implications of electronic commerce are⁴²⁷, the following:

- It allows the increase of connectivity in economy. The possibility to connect to the Internet permits communication and doing transactions from all around the world at any time.
- It allows the opening of the commerce. In the opened electronic commerce as the Internet support which he develops on, consumer is as well involved, he has a new role, being a partner in creating products.
- It changes the relative importance of time through accelerating the production cycles, through offering organizations possibilities to collaborate to product and sell and the consumer to develop its transactions in a short period of time.
- It transforms the market changing the way of business development. This kind of traditional intermediary are replaced, there appear new products, new markets, lengths between business partners. The work organization is changed, through the apparition of some new knowledge distribution canals, interactivity between people is opened at their workplace, it appears the need of more flexibility and adaptability.

⁴²⁵ Idem ,pp50.

⁴²⁶ Idem pp.50.

⁴²⁷ Idem pp.50

Even though at present electronic commerce continues to face with the limits of implementation methodologies in the economies of some countries, its role and impact over the economic activity stays a major reality⁴²⁸.

A result of the Internet commerce consists of costs reduction and research, diminishing the distance between seller and buyer, developing individual profiles for buyers. This desiderate will come true in a climate of trust between buyers and sellers that is based on assuring the security of confidential data. Electronic commerce and other communication technologies decrease the importance of time as a factor that determines the structure of the economic and social activity. Time is saved, you can buy more efficient and the buyer does not interrupt his activity at the workplace.

The reason why business-to-business commerce has raised is because of the special impact that it had upon associated costs to the inventory, sales execution, product procurement, distribution costs, and lengths with the banks.

Another source of the efficiency of the electronic commerce is the opportunity for the “limit borders” of new entrances, business models, technology changes, which separate an industry from another⁴²⁹.

The advantages that come from a business on the internet are: significant decrease of distribution costs and sales administration costs, improvement of the services offered to the clients and the automating of orders and permanent up-dating information about products, eliminating errors, the speed of information. For business people there are a series of opportunities in electronic commerce: they can create their own firms can give information about themselves on the internet page, they can exploit Internet as a different distribution canal, they can build a new business centered only on global network, can establish new business contacts.

The evolution of industrial developed societies is determined by several aspects⁴³⁰. An aspect would be the acceleration of the development rate in technological areas who have determined fast changes in products and processes. A second aspect would be the speed of global commerce, thing that gives individual companies a much more flexible market, but also much more unsecure to compete on it. A third aspect is the frequent fluctuation in lifestyles and the consumers preferences owned to the communication means and international travels, etc. Another aspect is represented by the new values, ambitions and attitudes towards work, that come from the desire of employees to participate at solving problems and elaborating organizational decisions.

If we look towards computer development in the last 30-40 years, we can see the accelerate change of the world⁴³¹.

From its first operation, in 1920, computer has reached only in 1964 the commercial feasibility and success. In a similar way, the transistor needed decades to be incorporated in commercial products, like audio means, navigation instruments or computers. The silicon microchip integrated circuits have followed the same transformation through a shorter process, from innovation to commercial use. In the last three decades, the changing rates became shorter and faster transformations of technical progress in commercial products⁴³².

Progress in organizational culture of the manager. Technological change

Success companies use *integrated design management*, as a mean to assure that all the products, communications and services of the organization use to the business in general⁴³³.

Acceleration rates of changing have asked an organization and improved process to grow the adapting capacity of the companies to the new conditions. In order to accomplish this, there are three business strategies⁴³⁴:

The first one refers to the total understanding regarding market development before design development. Another strategy refers to the concentration on commercial transformation and viable of ideas, innovation on commercial success products. Another aspect supposes the design of an organization well integrated to support the development of the product in an environment of changing conditions, with product systems or cascade development form a product to the next one.

The term of design and especially “fabrication design” implies aspects⁴³⁵ as:

Basic characteristic of the system (lot, flux line, etc.)

Available processes (e.g.: smelting, turning, etc.)

Storage capacity and goods manipulation

The attitudes and qualifications of the workforce

The level of usage of processes and machines

Quality standard and control procedures

Materials used and detail storage

Retail market evolution under the impact of technical progress

Recipes of a store implementation, aspect of technical progress

Technological revolution is surprised in all commerce forms, either en detail or en gross sales.

Technical progress involves in economic activity through introducing new technology in the production lines, revolution in the field of construction materials and stores building, commercial centers, malls and industrial sites, period of time considerable smaller where they built and become more available for the commercial activity , revolution in the field of goods supply, storage and manipulation, the invention of new types of machines and intelligent equipment, inventory software with spectacular effects upon the development speed, reorganizing, reallocation of the economic activity of commerce, methods who shorten the time of implementation of a store.

The passing from traditional commerce to the modern commerce is another effect of technical progress, because of the production at industrial scale, of the possibilities to group thousands of goods assortments on areas of thousands of square meters, sophisticated machines and qualified staff and intense prepared to monitor and assure the good development of the technological flux. An effect of technical progress is the evolution of retail market, which in Romania has reached to consist of a total number of 1192 stores in 261 towns (at 31 September 2009), towards 582 stores opened in 103 towns, in 15 November 2006.⁴³⁶

The tendency on the national retail is of growing, thing revealed by the market quota of 37.50 % that hold the first 25 de retailers in Romania, comparatively to percentages as 90% in Finland, Sweden - 82%, Slovenia - 82%, Ireland - 81%, Estonia - 79%, Austria - 79%, Germany and

⁴³³ Idem, pp56.

⁴³⁴ Idem pp.57.

⁴³⁵ Idem pp172.

France - each 70%⁴³⁷, market quotas that are hold by the first 5 retailers in the enumerated countries.

The strategies used by the multinational companies from the modern commerce, regarding supplying and selling the goods, goods on the shelf, the way of supplying the shells with goods for an efficient buying, the introduction of computerized equipments and of high technology for manipulating and the transport of the goods inside the stores which replace more and more staff, the high technologies and software used for the goods inventory, to monitor the activity, have contributed to the birth of some types of new stores, standardized, unitary conceived at the level of the entire market area where they develop their activity: hypermarket, supermarket, minimarket.

The high technology introduced into building process, development and innovations from the field of building materials determine the possibility to realize buildings of diverse structures, in very short periods of time.

The same standardized form of organization is met in all the departments of such a selling point, the structure of stores, the organization of the product department, equipment with commercial furniture, equipment used, human resource departments regarding qualified personnel through standardized programs specially conceived for this types of stores, performing logistic systems which corroborated determine the easiness of implementation this stores format: some locations are equipped with electronic labels on the shelf, that assure firstly the competitiveness of the prices and secondly the lack of differences between the price on the shelf and the one that you get when you pay.

*Platform for fruits and vegetable*⁴³⁸, is a new modern logistic system.

The implementation of a concept performing through which this type of platform becomes the unique costumer of the supplier, and for the store one of the most important suppliers. The main difference towards the regular system consists of the fact that the demand activity is centralized, receiving and delivery towards the platform (the transfer of ownership and quantitative and qualitative checks are done on the platform).

The main advantages of this type of platform are the following :

- administrative work reduction (shortage of time for orders, operations, checking documents several times);
- improvement of the parameters length to stocks (rotation, stock zero);
- the reduction of losts in shops through improvement the quality of the products received;
- qualitative and quantitative reception at the level of articles is made on the platform;
- reducing the time necessary for reception in stores and increasing the time destined to selling;
- reducing the minimum quantity ordered by the store.

Through the implementation of this platform are aimed some objectives:

- checking and improvement of the quality and refreshment of the products;
- the homogeneity of the quality and refreshment of the products between stores;
- reducing the stock zero;
- reducing the minimum order;
- obtaining smaller prices for shopping because of buying a big volume and because of the existence of a single point of delivery for the supplier;
- the possibility to make speculative shopping and store them temporary in better temperature conditions;
- reducing the time necessary to the reception et the stores and the concentration of the staff on selling;

⁴³⁷ „Fabrica de bani” magazine, article” ‘Când devenim ostaticii unei piețe libere?’’07.02.2008.

⁴³⁸ www.metro.ro

- reducing the number of sales to stores;
- reducing the losses in stores through verifying and improvement the quality of the products;
- reducing the administrative costs.

Conclusions

- business-to-business commerce has raised because of the special impact that it had upon costs associated to inventory, sales execution, products procurement, distribution costs, lengths with banks;
- success companies use the *management of integrated design*, as a way to make sure that all their products, communications and services of the organizations the business generally speaking;
- growing the number of stores as a result of the technical progress, has determined the apparition of some new standardized stores, unitary conceived for all their branches.

The world economic crisis which started in 2008 was felt, as is normal, in Romania. Most of the experts consider it is a major international economic crisis, with multiple negative effects on world economies. In this context, highlighting the impact of domestic and international economic recession on SME activity in Romania is of particular importance. The present paper analyze the perception of Romanian entrepreneurs regarding crisis, providing an interesting insight in the future of Romania's economy.

Key words: economic crisis, Romania, SMEs, entrepreneurs

JEL classification: D8, L2, M1

1. Introduction

Considering the current situation of Romanian SMEs, it can be drawn the conclusion that a significant part of small and medium Romanian enterprises deal with special problems. Like in other countries in the world, they have hardly dealt with the economic crisis until now, which can be explained by the fact that SMEs are generally more vulnerable at contextual turbulences than big companies.

**Figure 1 Dynamics of the activity of SMEs during the period
October 2008 - March 2009**

The analysis of **companies by regional localization**, shows that the economic agents in the North West region have the highest share of companies that went bankrupt (19.02%), those situated in the Centre register an increased share of SMEs that diminished their activity (72,63%), companies in the North East register a superior percentage of organizations functioning at the same parameters (27.84%), and the enterprises in Bucharest are pointed out by the large number of economic units that developed during the October 2008 - March 2009 (8.07%).

Table 1 Dynamics of the activity of SMEs based on the development regions they belong to

No.	Dynamics of the activity of companies during the period October 2008 - March 2009	SMEs grouped by development regions:							
		North East	South East	South	South West	West	North West	Centre	Bucharest
1.	SMEs that went bankrupt	15.68%	16.73%	18.64%	9.51%	17.45%	19.02%	17.89%	12.40%
2.	SMEs that reduced their activity	54.88%	51.84%	53.64%	65.12%	62.98%	58.36%	72.63%	53.57%
3.	SMEs operating at the same parameters	27.84%	23.67%	24.55%	21.71%	18.72%	19.67%	9.47%	25.96%
4.	SMEs that intensified their activity	1.60%	7.76%	3.18%	3.66%	0.85%	2.95%	0.00%	8.07%

The classification of **SMEs by size categories** (table 2) shows the following:

- bankrupts are registered inversely proportional to the size of the companies, and the percentage of SMEs that restricted their activities increases simultaneously with the increase of their size. Somehow surprising at first sight, this situation is explained by the fact that, usually, the increase in the size of the organization leads to the diminution of its vulnerability to nefarious contextual evolutions, as well as to the reduction of flexibility, of its capacity to quickly adapt to the changes of the business environment;
- small enterprises hold an increased weight of companies that developed their activities (5.03%) and register an inferior percentage of units functioning at the same level (21.50%).

Table 2 Differentiation of the activity dynamics of companies by their size

No.	Dynamics of the activity of enterprises during the period October 2008 - March 2009	Size of companies		
		Micro-enterprises	Small enterprises	Medium enterprises
1.	SMEs that went bankrupt	15.15%	14.87%	12.75%
2.	SMEs that reduced their activity	55.98%	58.61%	63.19%
3.	SMEs operating at the same parameters	24.63%	21.50%	22.03%
4.	SMEs that intensified their activity	4.24%	5.03%	2.03%

The analysis of **economic agents by their field of activity** highlights the following important aspects: SMEs in the tourism sector hold the highest share of companies that restricted their activity (72.31%); organizations in the industrial sector register an increased share of enterprises that went bankrupt (17.71%); companies in the transport sector register a higher percentage of entities functioning at the same parameters (28.82%), and enterprises in the services sector contain more economic agents that developed their activities (7.01%).

Table 3 Dynamics of the activity of SMEs by activity sectors

No.	Dynamics of the activity of SMEs	SMEs by activity sectors					
		Industry	Constructions	Trade	Tourism	Transports	Services
1.	SMEs that went bankrupt	17.71%	10.15%	14.96%	15.38%	11.18%	15.04%
2.	SMEs that reduced their activity	58.47%	60.60%	58.23%	72.31%	54.12%	54.16%
3.	SMEs operating at the same parameters	20.61%	24.78%	23.81%	9.23%	28.82%	23.80%
4.	SMEs that intensified their activity	3.21%	4.48%	3.01%	3.08%	5.88%	7.01%

2. Psychological impact of economic crisis on entrepreneurs

Taking into consideration the fact that the psychological dimension of the crisis has a major impact on the performance of economic activities, it is important to have a view on the extent to which Romanian entrepreneurs are psychologically influenced by the recent drastic recession. The research showed that **42.92% of entrepreneurs are threatened by the crisis to a medium extent, 27.26% of them are affected to a small extent, 24.22% of businessmen feel the economic decline to a large extent, and 5.60% of persons are not afraid.** See figure 2.

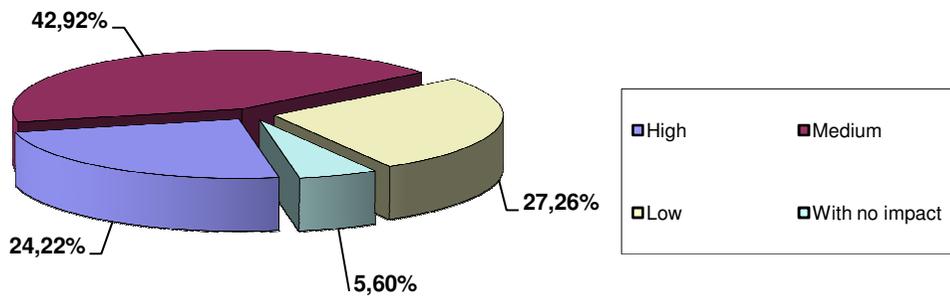

Figure 2. Psychological impact of the economic crisis on entrepreneurs

Analyzing the psychological dimension of the crisis by the regional localization of **SMEs**, we mainly notice the following:

- the largest number of entrepreneurs that feel threatened by the recession to a large extent is registered at companies in the Centre region (47.37%);
- enterprises in the North West hold the highest percentage of businessmen not affected by the crisis (8.65%) and afraid of the recession to a medium extent (50.96%);
- economic agents in the South West region include more persons on which the impact of the crisis is reduced (31.98%). See additional information in table 4.

Table 4 Psychological impact of the economic crisis on entrepreneurs by development regions the SMEs belong to

No.	Psychological impact of the crisis on entrepreneurs	SMEs grouped by development regions:							
		North East	South East	South	South West	West	North West	Centre	Bucharest
1.	High	26.09%	27.27%	27.42%	20.24%	24.32%	15.38%	47.37%	23.36%
2.	Medium	45.11%	41.56%	48.39%	42.91%	41.89%	50.96%	31.58%	39.75%
3.	Low	23.91%	27.27%	19.35%	31.98%	27.03%	25.00%	17.54%	30.33%
4.	No impact	4.89%	3.90%	4.84%	4.86%	6.76%	8.65%	3.51%	6.56%

Taking into consideration the **size of companies**, it is mainly noticed that:

- medium enterprises hold the highest share of decision factors that do not feel affected by recession (5.74%);
- the frequency at which entrepreneurs are affected by the crisis on average gets higher proportionally to the size of enterprises;
- micro-companies register the highest percentages as regards businessmen that see the economic crisis as a major impediment (25.30%) and those that are psychologically affected to a small extent (28.92%).

Table 5 Psychological impact of the economic crisis on entrepreneurs by the size of SMEs

No.	Psychological impact of the crisis on entrepreneurs	Size of companies		
		Micro-enterprises	Small enterprises	Medium enterprises
1.	High	25.30%	22.86%	22.95%
2.	Medium	40.10%	46.29%	46.72%
3.	Low	28.92%	25.43%	24.59%
4.	No impact	5.68%	5.43%	5.74%

As it can also be seen in table 6, the classification of SMEs by the **field of activity** mainly highlights that:

- SMEs in the tourism sector have an increased percentage of entrepreneurs that are a little poor-spirited by the crisis (40%) and a lower weight of persons affected by the economic recession to a medium extent (32%) and not at all affected (4%);
- companies operating in the industry sector have higher shares of entrepreneurs that feel the economic recession more intensely (26.98%);
- enterprises in the transport sector register the highest percentage of companies within which businessmen feel threatened to a medium extent (49.12%);
- organizations in the services sector register an increased number of persons who are not at all psychologically influenced by the economic decline (6.70%).

Table 6 Influence of economic crisis on entrepreneurs by the activity sectors of SMEs

No.	Psychological impact of the crisis on entrepreneurs	SMEs by activity sectors					
		Industry	Constructions	Trade	Tourism	Transports	Services
1.	High	26.98%	25.23%	24.45%	24.00%	19.30%	23.66%
2.	Medium	44.19%	48.60%	41.08%	32.00%	49.12%	41.96%
3.	Low	24.19%	21.50%	28.61%	40.00%	26.32%	27.68%
4.	No impact	4.65%	4.67%	5.87%	4.00%	5.26%	6.70%

The analysis of the way in which the crisis is affectively perceived, by the performances obtained by SMEs in 2008 as compared to 2007 (table 7), shows the fact that the entrepreneurs with superior results feel the severe economic decrease to a smaller extent as compared to those with inferior and identical performances, which can be explained by the safety due to a better financial situation.

Table 7 Differentiation of the influence of economic crisis on entrepreneurs by performances obtained in 2008 as compared to 2007

No.	Psychological impact of the crisis on entrepreneurs	Performances of the company in 2008 as compared to 2007		
		Superior	Identical	Inferior
1.	High	20.95%	21.25%	39.36%
2.	Medium	44.49%	43.60%	38.30%
3.	Low	28.94%	27.79%	20.21%
4.	No impact	5.62%	7.36%	2.13%

3. Entrepreneurs' opinions regarding the peak of the crisis

As it is already known, national and world economic evolutions have a cyclic character, the increase/expansion periods alternating at various time periods with stagnation, recession and sometimes even crisis periods. Economic crises often evaluate in "U" shape, which means that after a decrease it takes a certain period until the economic increase begins. As regards the current economic crisis, there are many opinions of specialists regarding its peak, internally as well as internationally. Taking into consideration the entrepreneurs' opinions regarding the crisis peak in Romania, the situation is as follows: 58.40% of businessmen estimate that the maximum level of the crisis will be reached in 2009, 34.09% of the researched persons believe that the peak will be in 2010, and 3.85% of them forecast a maximum point in 2011. Detailing the opinions by quarters shows that 24.70% of entrepreneurs forecast that the highest intensity of the crisis will be in the 3rd quarter of 2009, 21.25% of the persons believe that the recession peak will be in the 4th quarter of 2009, 16.40% of businessmen anticipate a maximum level in the 1st quarter of 2010, and 11.17% of the researched persons consider that the peak will be reached in the 2nd quarter of 2010.

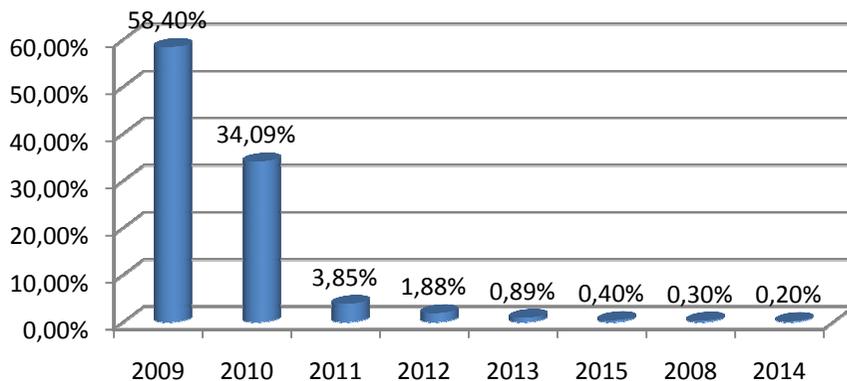

Figure 3 Entrepreneurs' opinions regarding the peak year of the crisis

The examination of **companies by regional localization** shows the following:

- SMEs in Bucharest register the highest number of persons believing that the crisis peak in our country will be in 2009 (67.23%);
- enterprises in the South area register the highest percentage of entrepreneurs believing that the peak will be in 2010 (45.61%) and the lowest percentage of those who forecast the peak for 2009 (49.12%);
- entrepreneurs in the West more frequently indicated year 2011 (8.82%), and those in the North West more often estimated that the maximum level of the decline will be after 2011 (7.53%).Details can be seen in table 8.

Table 8 Differentiation of entrepreneurs' opinions regarding the year when the crisis will reach its peak, by the development regions the SMEs belong to

No.	Year when the crisis will reach its peak	SMEs grouped by development regions:							
		North East	South East	South	South West	West	North West	Centre	Bucharest
1.	2009	57,71%	51,32%	49,12%	54,44%	61,76%	56,99%	54,55%	67,23%
2.	2010	39,43%	39,47%	45,61%	34,27%	27,94%	26,88%	41,82%	28,15%
3.	2011	1,71%	2,63%	3,51%	4,84%	8,82%	8,60%	1,82%	2,10%
4.	Other period	1,14%	6,58%	1,75%	6,45%	1,47%	7,53%	1,82%	2,52%

5. Conclusions

- During the period October 2008 - March 2009 more than half of the SMEs (57.58%) reduced their activity, 23.39% of the companies operate at the same parameters, 14.80% of the companies went bankrupt and 4.23% of economic agents intensified their activity
- Enterprises that went bankrupt register higher percentages within SMEs younger than 5 years (15.85%), companies in the North West region (19.02%), micro-enterprises (15.15%), limited liability companies (15.20%) and companies in the industry sector (17.71%)
- The shares of the enterprises that intensified their activity are higher within SMEs of 5-10 years (5.64%), economic agents in Bucharest (8.07%), medium companies (5.03%), limited liability companies (4.44%) and services companies (7.01%)

- 42.92% of entrepreneurs feel threatened by the economic crisis to a medium extent, 27.26% of them are affected to a small extent, 24.22% of the researched persons are affected to a large extent, and 5.60% of businessmen are not afraid of the recent severe recession

- Percentages related to entrepreneurs affected by the economic crisis to a large extent are higher within younger companies (27.27%), companies in the Centre region (47.37%), micro-enterprises (25.30%), joint stock companies (29.55%), SMEs activating in industry (26.98%), organizations with inferior performances in 2008 (39.36%) and female persons (25.23%)

58.40% of entrepreneurs estimate that the maximum level of the crisis will be reached in 2009, 34.09% of the researched persons anticipate that the peak will be in 2010, and 3.85% of them forecast a peak in 2011

THE AGEING OF THE POPULATION OF ROMANIA IN THE EUROPEAN CONTEXT

Demographic ageing appeared in the modern society and designates an important increase in the elderly population segment in the total of the senior population and has implications for all sections of the society. The main cause of this phenomenon is transition from the traditional system of population's reproduction, with high birth rates, to modern regime, with both low birth rates and mortality. On long term, these new demographic tendencies will affect both the educational system, in the sense of reducing the number of pupils and students, as well as the expansion of the demand for health services and social protection.

Keywords: ageing population, natality, demographic tendencies, life expectancy.

Jel classification: E24 - Employment; Unemployment; Wages; Intergenerational Income Distribution; Aggregate Human Capital

Demographic ageing appeared in the modern society and designates an important increase in the elderly population segment in the total of the senior population and has implications for all sections of the society. This process emerged in Western Europe in the 19th century in France to be more exact. Gradually, it spread in the majority of the developed countries from an economic and social point of view and continues even today.

The main cause of this phenomenon is the transition from the traditional system of population's reproduction, with high birth rates, to the modern regime, with both low birth rates and mortality. So fertility (the average number of born children per woman during the procreation period) is in a constant decrease, while life expectancy is increasing slowly but continuously. It is obvious the fact that under these circumstances, the main outcome of this development is the increasing weight of the elderly population. If the diminution of the fertility and natality narrows the base of the demographic pyramid, the extension of life expectancy "thickens" the top of the pyramid.⁴³⁹

Romania's population is in a constant decline, being affected by the phenomenon of ageing, a phenomenon which occurs in most EU member states. Since 1990 the population segment aged up to 14 years declined simultaneously with the expansion of the segment older than 65 years old. For the first time in the last 40 years, in the year of 2002 - 2003 the percentage of senior people (over 60 years old) reached the same value that was recorded by the 14 years old segment, approximately 18%. The number of births decreases continuously, thing which began to be reflected also in the decline of the population from category between 15 and 19 years old.

New social and economic realities have contributed to the decrease and then continuation of a low natality level. All civilized countries face an accelerated diminution of the birth rate and fertility, and Romania confronts itself in this area with the same problems as the developed countries from the West and the East.

The downturn of the standard of living, the unemployment, uncertainty and stress are factors specific to the transition period. Also, recent developments of the natality are not foreign from a different perception of the existence which comes to be characterized by individualism and the consumption society, representing at the same time, a component of a broader process of demographic and psycho-social change that is known as “the second demographic transition”.⁴⁴⁰ From 2.2 children per woman in 1989, a value slightly higher than the one required for a simple replacement of generations, the total fertility index dropped to just 1.3 children per woman in 1995 and in the following years maintained itself with slight variations at this level. In other words, the fertility pattern of the last 10 years shows a decrease of approximately "one child per woman" in comparison with the last decades of the communist period.⁴⁴¹

We believe that among the decline agents that influence the downturn of the birth rate are:

- the emergence of modern contraceptive;
- women's emancipation and the increasing of its participation at economic activities outside the household;
- the increase of the duration and of the level of education;
- the weakening of the cultural norms' influence;
- increasing social mobility;
- high cost in raising a child;

As can be seen from the above chart, the mortality rate registered during 1990 - 2008 a downward trend. In the developed countries, measuring mortality rate represents an important indicator of the growth and care in hospitals and not only. Florence Nightingale⁴⁴² identified for

⁴⁴⁰ http://www.euractiv.ro/uniunea-europeana/articlesdisplayArticle/articleID_8263/Incotro.html

the first time ever in 1860, the importance of measuring mortality rate. These rates are monitored in many clinics and are used especially to improve care services. In this context we can affirm that Romanian hospitals also registered evolutions of this indicator, but not as remarkable as in the developed countries.

After analyzing the natality and mortality rate we can be observed that the natural population increase in Romania starting with 1991 registered negative results and generally keeping a diminution rhythm.

Throughout history, Romania has recorded among the greatest oscillations in respect to the birth rate and mortality. Hereby in 1869 Romania had 8.9 million inhabitants, in 1900 were 11.1 million people, in 1930 were 14.3 million living in Romania and in 1989 23.3 million citizens. In the matter of the birth rate there were 40 persons per a thousand inhabitants in 1920, while mortality registered exorbitant values of 20 per a thousand inhabitants. Children between the ages of 0 and 5 years old represented for quite some time, half from the deceases' total.⁴⁴³

Starting with the year of 1990, birth rate in Romania was overran by the mortality rate, the country's population descending the registered maximum of approximately 23,2 millions of persons to less than 21,5 at the end of 2008.

Another worrying aspect regarding labours' emigration from Romania is the departure of people with ages between 18 and 50 years old along with their families and minor children of these ones. The loss of the labour force in this manner doubles, because young resources of our country are used by the foreign countries in which the people emigrate.

If we add up the number of emigrants between the years 1990 – 2008 and relate it to number of the total population from Romania we can observe that over 18 percent of the total population have emigrated and this on in a proportion of 90% were part of the active persons category from the labour market with ages between 18 and 45 years old.

Romania must face a new challenge that is not going to be easy to manage in the future, a challenge generated by the ageing population. At the moment there are about four people with the age that can give him/her the status of a working person on the labour market for each person over 65 years. Keeping the same growth rhythm of the birth rate and life expectancy, in the year 2060 there is going to be only two working people with active age for each pensioner.

The dependence degree of the elderly population, calculated by relating the age category that exceeds the age of 65 years to the active population, will grow in Romania from 21.3% to 65.3% in 2060.

Source:<http://epp.eurostat.ec.europa.eu/tgm/table.do?tab=table&init=1&plugin=1&language=en&pcode=tsd420>

The average exit age from the labour market in Romania, registered a continuous increase reaching from 59, 8 to 64, 3. In this context, Romania recorded the highest values of the average exit age from the labour market, a value of 64, 3 while the medium at European Union level in 2008 was of 61,4. In the current economic crisis and considering the continuous ageing of the population, we believe that in Romania this will go on registering an increase until the age of 65 years old.

Conclusions:

On long term, these new demographic tendencies will affect both the educational system, in the sense of reducing the number of pupils and students, as well as the expansion of the demand for health services and social protection. The ageing process of the population will exert a negative influence on the entire economy, as the number of inactive people would unbalance even further the economic situation, in the way of burdening the social insurances system. The South and the South - West regions confront themselves with an accentuated phenomenon of population's ageing, recording the highest share of people over 65 years, in the total of the population (16.5% and 16.2%), waiting for an amplification of this trend. The highest share of the young population segment is recorded in the North – East Region (18.3% in 2005, slightly declining from the 20.5% percentage in 2002) and the lowest share is in the West Region (14.9% in 2005 versus

17% in 2002) and in the Bucharest – Ilfov Region (11.7%). On July 1, 2005, at a national level there were 94.6 seniors per 100 young people. The South, Southwest, West and Bucharest-Ilfov regions registered a higher rate than the national average one, and in the South and Bucharest-Ilfov, the number of elderly people exceeds the one of the young.⁴⁴⁴

Also, the data presented by the European statistics office indicate an ageing of the population, particularly generated by the reduction of the fertility and the increase of life expectancy. This process will affect all EU states, meaning that the share of the population over 65 years in Romania will increase from 14.9% from the beginning of this year to 35% in 2060.

Throughout the European Union, between the 1st of January 2008 and 2035, the population is expected to grow by 5.1%, from 495 million people to 521 million people, but by 2060 the upward trend will reverse, so the population will decline to 506 million people.

After the year 2015, mortality rate in the European Union's and implicitly in Romania too, will exceed the birth rate, the only factor that will contribute to the increase of the population being migration.

If this downfall rhythm of the natality will maintain itself in the EU, the ageing phenomenon of the population will accentuate. People over 65 years will represent 30% of the total population in 2060 compared to 17.1% today, while the share of population over 80 years old will increase from 4.4% to 12.1% during the same period of time.⁴⁴⁵

The study reached five major conclusions:

1. immigration in order to replace workforce cannot prevent the ageing of the population and its consequences.

2. national policies can slow the fertility decline in favourable circumstances.

3. only one type of political intervention will not necessarily slow down the decline of the fertility. 4. the thing that works in one country might not work in another. The social, economic and political contexts influence the impact of the policies. Therefore, policies are not directed toward it, but that have as a target improvements in broader terms, may have beneficial effects on fertility.

5. policies referring to population have a slower effect and therefore may be less politically attractive⁴⁴⁶.

A large part of the economic literature is unanimous in believing technological progress and openness to foreign trade are key variables to trigger the processes of stable and persistent economic growth. An in-depth analysis of these factors, thus, becomes necessary both to meet the challenges of the international market, and to strengthen the European integration process.

This paper aims to provide an empirical analysis of the interaction between foreign trade and technological progress by performing a multidimensional scaling. This technique is used to produce a graphical representation of the 27 EU member states, in accordance to the degree of similarity or dissimilarity between them.

The indicators used, and the indexes calculated, reflect the different degree of internationalization of each country's economy, the regulation of trade flows, investment in specific R&D and technological progress.

Keywords: International trade, integration, technological progress

JEL code: F1, F4, O1

1. Introduction

Arguably, investment in research and development – either of public or private nature - is the main engine of innovation and progress in technology and one of the crucial sources of sustainable and stable growth over the long term.

Throughout history, economic growth has unfolded in a number of progressive stages, marked by dramatic improvements in technology, which have allowed direct increases in labour productivity and ensured growth and greater prosperity for larger and larger shares of population.

Technological progress has been included in major studies in the field of economic growth, both within the neoclassical approach (Solow 1956) and the more recent endogenous growth theory (Lucas 1988; Romer 1990), that best explained the processes of technical change and growth by using the proper economic tools of analysis. As this literature predicts, improvements in technology available to workers are able to generate prolonged economic growth, especially when technologically advanced means are used by a highly skilled labour force.

Of course, the developmental stage of the economy makes the process of investment in research and innovation non-homogeneous, which may consequently impact on growth rates with different outcomes. This means that special conditions must exist for which the productive investments above mentioned have the desired effects.

In the context of economic growth a significant role is played by exports, which positively affect the long-run rate of growth through a variety of channels. By building and

strengthening relationships with foreign partners, countries may gain comparative advantages, have incentives to specialize in larger markets, exploit appropriate economies of scale, and absorb technology and knowledge from abroad.

In this connection, Grossman and Helpman (1991) analyse the positive effect of openness to foreign trade, not only as being induced by the exchange of technologies and ideas (Chuang 1998), but also as resulting from effect of increased competition in wider markets, with the need to invest in research and development in order to retain competitive advantages and improve efficiency.

In addition, companies that decide to participate in international trade are those that may gain productivity advantages through constructive processes, such as learning-by-exporting (Goldberg & Pavnik 2007). Other studies (Young 1991) focus on the role played by learning-by-doing, which results from specialization and optimization of production. Human capital has also come into prominence as a major source of market integration (Chuang 2000; Frantzen 2000; Wang 2007).

An important channel for the exchange and circulation of knowledge is, therefore, represented by international trade. In this context a central role is played by information and communication technologies in a twofold manner: on the one hand, they have enabled the expansion of economic relations, on the other they represent a growing share of global trade. There is, indeed, a reciprocal relationship: exchanges allow the acquisition of more knowledge, and this favours in turn the process of import-export. In this light, exports of ICTs represent an indicator of technological progress, for only countries that have continuously committed resources to R&D over the years can compete in a difficult and evolving market and be successful in this sector. The U.S. are an enlightening example, being net exporters only in the most technologically advanced sectors.

This notwithstanding, economically backward countries have the opportunity to receive knowledge and technologies through transnational exchanges, without incurring the initial cost of developing innovations.

2. Methodology and results

Multidimensional scaling (MDS) is a useful tool through which it is possible to produce a graphical representation of a pattern of objects, in this case the 27 EU member countries, based on the degree of similarity/dissimilarity between them.

The goal is to provide a representative map that best approximates the distances observed between countries, concerning international market openness, barriers to foreign trade, investment in specific research and support to technological progress.

This statistical method attempts to build a configuration of the various entities, merged in a small number of dimensions. This is done by defining relations between countries in terms of proximity/distance with respect to the indicators considered. The resulting positioning map has the property to partition the countries into homogeneous groups, so as that the degree of association between two countries is maximal if they belong to the same group and minimal otherwise.

We considered a matrix of 27 countries and 9 indicators, representing 3 distinct sets of variables: openness to international trade, trade barriers and investment in R&D and human capital (Tab. 3). The model's goodness of fit was assessed via the RSQ⁴⁴⁷ (0,95) and the S-Stress⁴⁴⁸ (0,10). The two-dimensional model was judged to be acceptable according to the values of the Kruskal's Stress index, reported in Table 1. Further investigation provided additional basis for choosing a two-dimensional solution: the "elbow" rule suggests to choose the number of dimensions in

⁴⁴⁷ RSQ indicates the proportion of variability explained by the corresponding dissimilarity distances.

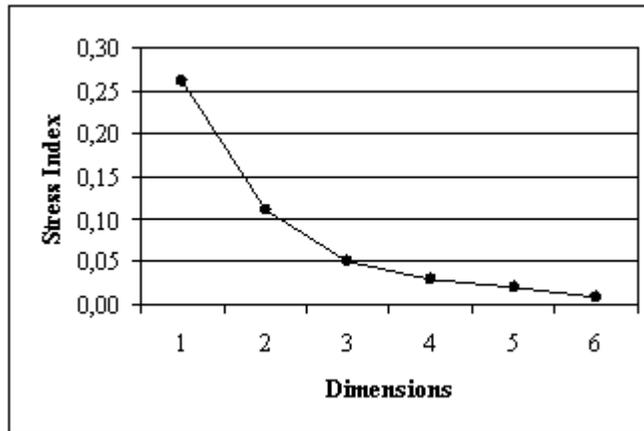

⁴⁴⁸ As general rule, results are found to be robust when the size k achieves an S-stress value lower than 0,15.

correspondence to where the diagram yields an “elbow”, beyond which the broken line flattens (Fig. 1).

Tab. 1 – Stress index and map configuration

Dimensions	Stress Index
1	0,26
2	0,11
3	0,05
4	0,03
5	0,02
6	0,01

Fig. 1 – Scree plot

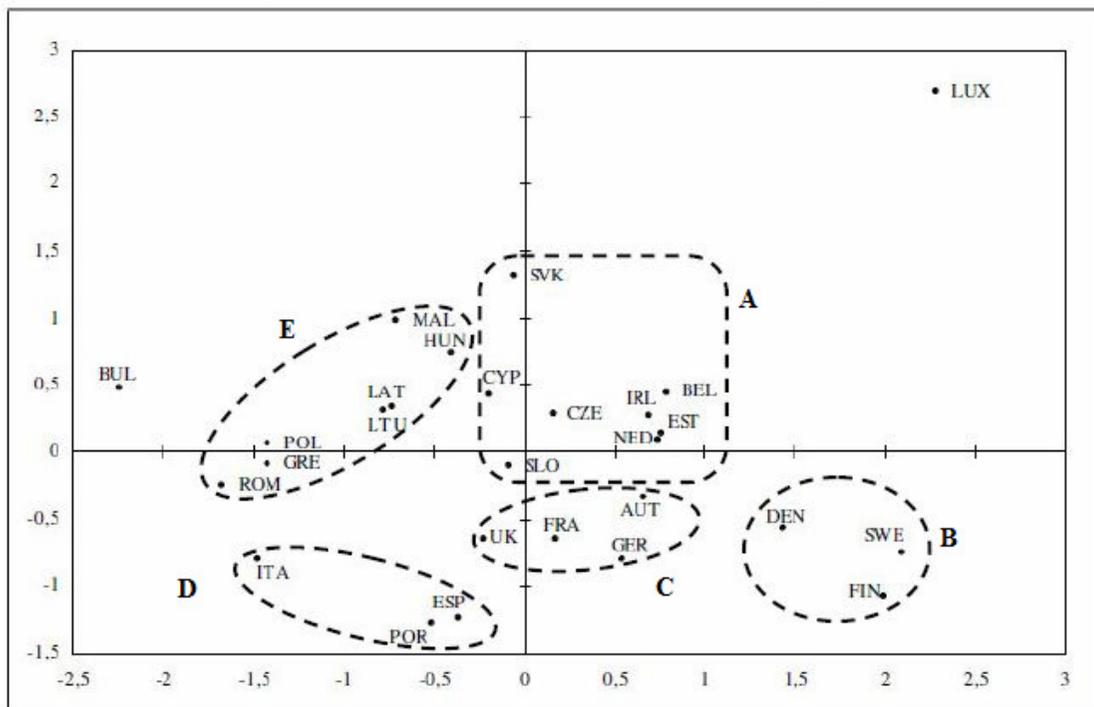

Tab. 2 – Correlations between variables and dimensions

Variables	Dimension 1	Dimension 2
Human resources in science and technology as a share of labour force	0,76	0,01
Research and development expenditure (% of GDP)	0,77	-0,46
Share of government budget appropriations or outlays on R&D	0,46	-0,66
Exports of goods and services (% of GDP)	0,46	0,86
Imports of goods and services (% of GDP)	0,25	0,90
Foreign Direct Investment (FDI) intensity	0,40	0,65
Burden of custom procedures (Rating scale 0-7)	0,90	0,01
Prevalence of foreign ownership (Rating scale 0-7)	0,72	0,24
Prevalence of trade barriers (Rating scale 0-7)	0,81	0,23

The correlations between dimensions and variables (Tab. 2) were useful for naming the axes. The resulting two-dimensional image is shown in Fig. 2. The horizontal axis represents the variables concerning technological progress and trade restrictions, the vertical one the variables related to trade flows. At the bottom of the chart are the Scandinavian cluster (B), which shows high technological values but low volumes of import and export; the grouping of central Europe (C), with levels of technology and trade close to the average values of the sample; and the cluster of Southern Europe (D), which is low on the measures of trade volumes, investment in R&D and human resources in R&D. The two clusters at the top of the chart constitute the best compromise

for the observed variables. Cluster A consists of countries which score fairly in terms of investments in the research field and highly in terms of technological progress and trade flows. The last grouping, cluster E, is made up of mainly Eastern countries which have achieved good positions in the recent past, thanks to grants and funding from EU and domestic investment.

Fig. 2 – Cluster of countries in a two-dimensional space

3. Conclusive remarks

The analysis has shown the relationships between investments in R&D and openness to international trade in the EU member states. The arguments presented above suggest that, under proper conditions, these variables are crucial to secure growth and prosperity of countries.

Among the countries that have most benefited from integration are Eastern European countries, that are rapidly approaching Southern Europe. The economic growth these countries are nowadays experiencing is in turn a useful vehicle for further integration, which is helping fill in the gap between European countries and release the brakes for future joint development.

This paper investigates the European economic integration within the frame work of the 2000 Lisbon Council with the aim of studying the dynamics affecting the social and economic life of European Countries. Such a descriptive investigation focuses on certain significant variables of the new theories highlighting the importance of technological innovation and human capital. To this end the multivariate statistic technique of Principal Component Analysis has been applied in order to classify Countries with regard to the investigated phenomenon.

Keywords: Knowledge Economics, European Integration, Human Capital, Principal Component Analysis (PCA).

JEL codes: F40, I20, O10

1. Introduction.

Globalization and the challenges of the new knowledge-based economics mark a watershed in the history of the European Union. The subsequent changes affected all sides of common life and have modified European economy, also because of the recent enlargement. Therefore the Union should perceive and efficiently pattern such changes so to promote the best integration of the member States. To this end a shared strategic target and a common program shall necessarily be set among European Countries, allowing the creation of the infrastructures needed for the best knowledge production, spread of innovation and a broader cooperation, so to initiate the due reforms for an integrated social and economic development of all the Countries. By means of the multivariate statistic technique of Principal Component Analysis (PCA), this preparatory analysis describes the current conditions of the production and social structure of the EU-27 Countries further to the 2000 Lisbon Council directives. The key principles of such a strategy have been here retraced also with reference to the literature highlighting the impact of technological and knowledge processes on economic development (par.2). In the second part of this paper the principal components analysis is introduced in order to show the Countries' performances with regard to the reference phenomenon (par.3). Lastly, the main results of the analysis are shortly summarized (par.4).

2. The new challenges of the EU.

The European integration has led - and still leads today - to fundamental changes both in the production structure and in the way of conceiving the production process. This is clearly a direct and inescapable consequence of the development and the rapid spread of globalization and internationalization starting from the late '80s and the early '90s, as never before in human history. Therefore it is important to focus the attention on the processes of space concentration of Research and Development and innovating activities, as well as on the production and spreading of knowledge processes among and inside each Country. This is why there is a broad literature

strongly supporting the idea that the mechanisms for the production and spreading of knowledge play an important role in affecting the economic development⁴⁴⁹. The technological process, strictly connected to knowledge processes, thus becomes a key element in understanding the micro and macro fundamentals of economic growth, of industrial structures development and of the concentration of economic activities in the European Countries. Consequently, knowledge economics aims at studying knowledge as an economic good, applied by virtue of the properties of such an atypical resource which also regulate its production, spread and reproduction. Apart from historic economists such as Smith, Marx and Schumpeter, who in a way have investigated knowledge, there are many significant writers who contributed to the development of knowledge economics, among others (Hayek, 1945; Arrow, 1962; Simon, 1982; Machlup, 1984; Foray, 2000). The idea of knowledge from an economic point of view has been changing year after year; indeed from complementary (exogenous) resource of the economic growth it turned into a basic and endogenous input of the economy itself (Solow, 1956; Romer, 1990). So, a knowledge-based economics can be defined as such only if knowledge itself is produced, distributed and innovated within institutions and social structures. It is necessary to underline that, in order to foster development in a competitive socio-economic environment there shall be adequate institutions supporting the promotion of innovative actions. Furthermore, it is necessary to encourage the training of innovation-oriented professionals with the right mix of basic and advanced skills, supporting lastly the most dynamics and competitive economic parties. The economic reforms agenda set out in the 200 Lisbon strategy is of the utmost importance in this sense. It has been clearly stated the target of making European Union the most competitive and dynamic knowledge economy before 2010, and for the first time knowledge has been detected as a pillar issue, despite the strategy opens onto all fields of the economic policy⁴⁵⁰.

3. Dataset and method of analysis.

This paragraph introduces the analysis of the data which, by means of the multivariate statistic technique of Principal Component Analysis, it is possible to lead a preparatory and descriptive investigation of the studied phenomenon⁴⁵¹. Regarding the reference dataset (dataset World Bank, 2007), the following EU-27 variables have been chosen EU-27: GDP per capita (GDP); Foreign direct investment, net outflows (FDI_{no}); Foreign direct investment, net inflows (FDI_{ni}); ICT expenditures (ICT_{exp}); Internet users (Int_{users}); telecommunication revenues (Telecom); ICT goods (ICT exports – ICT imports); School enrollment tertiary (Education); Patent applications (Patent); Labor force with III education (Ad_{labor}); R&D expenditures (RD_{exp}); Percentage of enterprises using e-learning applications for training and education of employees (e_{learning})⁴⁵². These variables have been chosen on the basis of the ideas stated and shared by a broad theoretical and empirical literature (Becker, 1964; Krugman, 1991; Kessels, 2001; Mason, 2005; Mattoscio *et* Colantonio, 2006) and according to the issues this paper aims at examining. The results of such an analysis are referred to hereafter (Tab.1). The main contribution of the three first components is thought to be enough to explain 74% of the total information⁴⁵³.

449 It is commonly thought that stimulating knowledge processes through technological change and human capital, both factors affecting productivity, generates virtuosities.

450 The strategic targets of the Lisbon Council are listed below: innovation and entrepreneurship; welfare reform and social inclusion; human capital and labor retraining; equality of opportunities for women employment; labor and products market liberalization; sustainable development.

451 For a thorough understanding of such a technique see Vitali (1991) and Fabbris (1997).

452 The source for e-learning applications is Eurostat (2007).

453 This study has been performed using the heuristic criterion of global variance, although the same results have been obtained with the two other criteria (screen plot and Kaiser's decision rule).

Table 6- principal components; 12 components retained

Component	Eigenvalue	Proportion	Cumulative
1	3.832315	31.93596	31.93596
2	3.247632	27.06360	58.99956
3	1.680528	14.00440	73.00396
4	1.148609	9.571742	82.5757
5	0.665355	5.544624	88.12033
6	0.443592	3.696603	91.81693
7	0.350664	2.922202	94.73913
8	0.246862	2.057187	96.79632
9	0.165956	1.382967	98.17928
10	0.147640	1.230330	99.40961
11	0.068685	0.572377	99.98199
12	0.002161	0.018009	100.0000

Source: our elaboration

The next table (Tab.2) highlights the variables with the greatest impact on each principal components. The first one is mainly affected by purely economic variables thus it can be explained in the sense of openness to international market. The second one, on the contrary, can be interpreted as the contribution of technology to economic development. Lastly, the third one could stand for a synthetic index of the level of human capital.

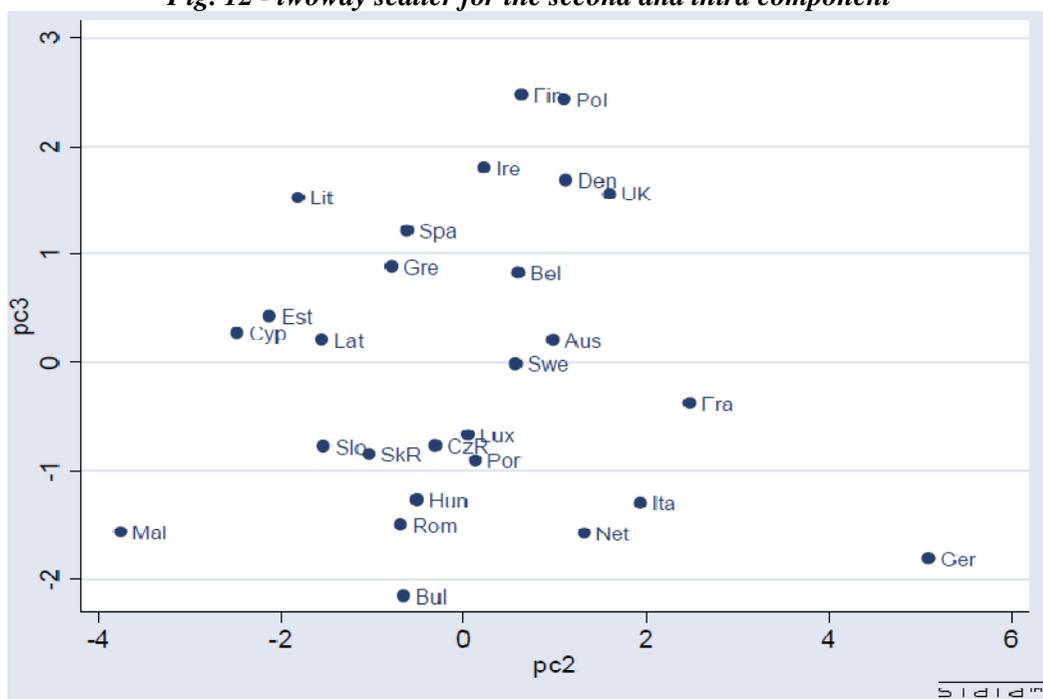

Table 7 - Scoring coefficients

Variables	pc1	pc2	pc3

elearning	-0.448	-0.095	0.721

Source: our elaboration

In order to achieve a global assessment of the socio-economic development of European Countries, and specifically of the dynamics of technological innovation (consequent to a raise in knowledge processes) and of capital, the classification resulting from the analysis and drawn according to the second and third components are also shown. The scores of the principal components referring to the studied Countries have been marked on a bi-dimensional scatterplot for a greater information visibility and so to point out their distribution with reference to the information given by the two components.

Fig. 12 - twoway scatter for the second and third component

Source: our elaboration

4. Conclusions.

As far as knowledge and human capital investments (and the subsequent development of technological innovation) are concerned, this analysis has given the following results: first, Finland, Poland and Ireland represent a greater investment in human capital. Second, the trend of Deutschland, followed by France, Italy and Holland, due to a better level of technological skills. Third, Denmark and the United Kingdom have the best balance among the components. Lastly, a group of Countries (Greece, Spain, Lithuania, Cyprus, Latvia and Estonia) shows a negative result in terms of technological development. The remaining Countries studied have a negative outcome for both components.

It is worth to underline that this analysis is only a first step in such an investigation and shall not be considered as exhaustive in order to thoroughly understand the reference dynamics, it can simply be useful for further and more detailed investigation.

IMMANUEL WALLERSTEIN'S WORLD SYSTEM THEORY

Cosma Sorinel

„Ovidius” University Constanța
Faculty of Economic Sciences

World-systems analysis is not a theory, but an approach to social analysis and social change developed, among others by the Immanuel Wallerstein. Professor Wallerstein writes in three domains of world-systems analysis: the historical development of the modern world-system; the contemporary crisis of the capitalist world-economy; the structures of knowledge. The American analyst rejects the notion of a "Third World", claiming there is only one world connected by a complex network of economic exchange relationship. Our world system is characterized by mechanisms which bring about a redistribution of resources from the periphery to the core. His analytical approach has made a significant impact and established an institutional base devoted to the general approach.

World system, core, semi-periphery, periphery, external regions

World-system theory is a macro sociological perspective that seeks to explain the dynamics of the “capitalist world economy” as a “total social system”.

World-system theory is both a political and an intellectual endeavor. It simultaneously falls into the fields of historical sociology and economic history. In addition, because of its emphasis on development and unequal opportunities across nations, it has been embraced by development theorists and practitioners.

Immanuel Wallerstein's name is associated with this approach. He first published the paper *The Rise and Future Demise of the World Capitalist System: Concepts for Comparative Analysis*, in 1974. Then, his most important work - *The Modern World System I: Capitalist Agriculture and the Origins of the European World-Economy in the Sixteenth Century* appeared in three volumes in 1974, 1980, and 1989. This is his landmark contribution to sociological and historical thought and spawned debates lasting three decades over the best way to interpret history, society, and economy in global perspective.

His work is methodologically somewhere in between Marx and Weber, both of whom were important inspirations for his own work.

The time when Wallerstein's work appeared development, modernization theory, was under attack from many fronts. He himself attacked it and tried to create an alternative explanation. He aimed at achieving a clear conceptual break with theories of ‘modernization’ and thus providing a new theoretical paradigm to guide the investigations of the emergence and development of capitalism, industrialism, and national states.

Criticisms to modernization include

- the reification of the nation-state as the sole unit of analysis,
- assumption that all countries can follow only a single path of evolutionary development,
- disregard of the world-historical development of transnational structures that constrain local and national development,
- explaining in terms of a-historical ideal types of “tradition” versus “modernity”, which are elaborated and applied to national cases.

In his *Modern World-System*, Wallerstein mainly draws on three intellectual influences. There is Karl Marx, from whom took over the dichotomy between capital and labor, the staged view of world economic development through stages such as feudalism and capitalism, belief in the accumulation of capital, dialectics and more. Then there is the French historian Fernand Braudel, who had described the development and political implications of extensive networks of economic

exchange in the European world between 1400 and 1800. And also there is the dependency theory, most obviously its concepts of "core" and "periphery"; and — presumably — the practical experience and impressions gained from his own work regarding post-colonial Africa.

From Marx, Wallerstein learned that (1) the fundamental reality of social conflict among materially based human groups, (2) the concern with a relevant totality, (3) the transitory nature of social forms and theories about them, (4) the centrality of the accumulation process and competitive class struggles that result from it, (5) a dialectical sense of motion through conflict and contradiction.

World-system theory owes to the *Annales School*, whose major representative is Fernand Braudel, its historical approach. Wallerstein got from Braudel's his insistence on the long term (*la longue durée*). He also learned to focus on geo-ecological regions as units of analysis, attention to rural history, and reliance on empirical materials from Braudel. The impact of the *Annales* is at the general methodological level.

World-system theory is in many ways an adaptation of dependency theory. Wallerstein draws heavily from dependency theory, a neo-Marxist explanation of development processes, popular in the developing world. Dependency theory focuses on understanding the "periphery" by looking at core-periphery relations, and it has flourished in peripheral regions like Latin America. It is from a dependency theory perspective that many contemporary critiques to global capitalism come from.

Other important influences in Wallerstein's work, still present in contemporary world system research, are Karl Polanyi and Joseph Schumpeter. From the latter comes world system interest in business cycles, and from the former, the notion of three basic modes of economic organization: reciprocal, redistributive, and market modes. These are analogous to Wallerstein's concepts of mini-systems, world-empires, and world-economies.

Historically speaking, the modern world system, essentially capitalist in nature, followed the crisis of the feudal system and helps explain the rise of Western Europe to world supremacy between 1450 and 1670.

Before the sixteenth century, when Western Europe embarked on a path of capitalist development, "feudalism" dominated West European society. Between 1150 and 1300, both population as well as commerce expanded within the confines of the feudal system. However, from 1300 to 1450, this expansion ceased, creating a severe economic crisis. According to Wallerstein, the feudal crisis was probably precipitated by the interaction of the following factors: fall or stagnation of the agricultural production, the reaching of the peak level of the economic cycle of the feudal economy; a change of climate conditions which brought low agricultural productivity and epidemics within the population.

In response to the feudal crisis, by the late fifteenth and early sixteenth centuries, the world economic system emerged. The new capitalist world system was based on an international division of labor that determined relationships between different regions as well as the types of labor conditions within each region.

For Wallerstein, "a world-system is a social system, one that has boundaries, structures, member groups, rules of legitimation, and coherence. Its life is made up of the conflicting forces which hold it together by tension and tear it apart as each group seeks eternally to remold it to its advantage. It has the characteristics of an organism, in that it has a lifespan over which its characteristics change in some respects and remain stable in others...

Life within it is largely self-contained, and the dynamics of its development are largely internal". A world-system is what Wallerstein terms a "world economy", integrated through the market rather than a political center, in which two or more regions are interdependent with respect to necessities like food, fuel, and protection, and two or more polities compete for domination without the emergence of one single center forever.

His world-systems theory provided a model for understanding both change in the global system and the relationship between its parts. He was among the first to suggest that we depart from the relatively newly developed unit of the nation-state and to study global interaction instead. In his own first definition, Wallerstein said that a world-system is a "multicultural territorial division of labor in which the production and exchange of basic goods and raw materials is necessary for the everyday life of its inhabitants."

This division of labor refers to the forces and relations of production of the world economy as a whole. Wallerstein proposes four different categories, core, semi-periphery, periphery, and external, into which all regions of the world can be placed. Of them four, two are of the uttermost importance: core and periphery. These are geographically and culturally different, one focusing on labor-intensive, and the other on capital-intensive production. The core-periphery relationship is structural. Semi-peripheral states acts as a buffer zone between core and periphery, and has a mix of the kinds of activities and institutions that exist on them.

The core regions benefited the most from the capitalist world economy. For the period under discussion, much of northwestern Europe (England, France, and Holland) developed as the first core region. Politically, the states within this part of Europe developed strong central governments, extensive bureaucracies, and large mercenary armies. This permitted the local bourgeoisie to obtain control over international commerce and extract capital surpluses from this trade for their own benefit. As the rural population expanded, the small but increasing number of landless wage earners provided labor for farms and manufacturing activities. The switch from feudal obligations to money rents in the aftermath of the feudal crisis encouraged the rise of independent or yeoman farmers but squeezed out many other peasants off the land. These impoverished peasants often moved to the cities, providing cheap labor essential for the growth in urban manufacturing. Agricultural productivity increased with the growing predominance of the commercially-oriented independent farmer, the rise of pastoralism, and improved farm technology.

On the other end of the scale lay *the peripheral zones*. These areas lacked strong central governments or were controlled by other states, exported raw materials to the core, and relied on coercive labor practices. The core expropriated much of the capital surplus generated by the periphery through unequal trade relations. Two areas, Eastern Europe (especially Poland) and Latin America exhibited characteristics of peripheral regions. In Poland, kings lost power to the nobility as the region became a prime exporter of wheat to the rest of Europe. To gain sufficient cheap and easily controlled labor, landlords forced rural workers into a "second serfdom" on their commercial estates. In Latin America, the Spanish and Portuguese conquests destroyed indigenous authority structures and replaced them with weak bureaucracies under the control of these European states. Powerful local landlords of Hispanic origin became aristocratic capitalist farmers. Enslavement of the native populations, the importation of African slaves, and the coercive labor practices such as the *encomienda* and forced mine labor made possible the export of cheap raw materials to Europe. Labor systems in both peripheral areas differed from earlier forms in medieval Europe in that they were established to produce goods for a capitalist world economy and not merely for internal consumption. Furthermore, the aristocracy both in Eastern Europe and Latin America grew wealthy from their relationship with the world economy and could draw on the strength of a central core region to maintain control.

Between the two extremes lie *the semi-peripheries*. These areas represented either core regions in decline or peripheries attempting to improve their relative position in the world economic system. They often also served as buffers between the core and the peripheries. As such, semi-peripheries exhibited tensions between the central government and a strong local landed class. Good examples of declining cores that became semi-peripheries during the period under study are Portugal and Spain. Other semi-peripheries at this time were Italy, southern Germany, and southern France. Economically, these regions retained limited but declining access to

international banking and the production of high-cost high-quality manufactured goods. Unlike the core, however, they failed to predominate in international trade and thus did not benefit to the same extent as the core. With a weak capitalist rural economy, landlords in semi-peripheries resorted to sharecropping. This lessened the risk of crop failure for landowners, and made it possible at the same time to enjoy profits from the land as well as the prestige that went with landownership.

According to Wallerstein, the semi-peripheries were exploited by the core but, as in the case of the American empires of Spain and Portugal, often were exploiters of peripheries themselves. Spain, for example, imported silver and gold from its American colonies, obtained largely through coercive labor practices, but most of this specie went to paying for manufactured goods from core countries such as England and France rather than encouraging the formation of a domestic manufacturing sector.

These areas maintained their own economic systems and, for the most part, managed to remain outside the modern world economy. Russia fits this case well. Unlike Poland, Russia's wheat served primarily to supply its internal market. It traded with Asia as well as Europe; internal commerce remained more important than trade with outside regions. Also, the considerable power of the Russian state helped regulate the economy and limited foreign commercial influence.

Dependency theorists first articulated a relationship of "unequal exchange" in which the rich nations of the world enforced trade relationships with the poor, in which the former extracted surpluses from the latter.

Among the most important structures of the current world-system is a power hierarchy between core and periphery, in which powerful and wealthy "core" societies dominate and exploit weak and poor "peripheral" societies.

Technology is a central factor in the positioning of a region in the core or the periphery. Advanced or developed countries are the core, and the less developed are in the periphery. Peripheral countries are structurally constrained to experience a kind of development that reproduces their subordinate status. The differential strength of the multiple states within the system is crucial to maintain the system as a whole, because strong states reinforce and increase the differential flow of surplus to the core zone. This is what Wallerstein called *unequal exchange*, the systematic transfer of surplus from semi-proletarian sectors in the periphery to the high-technology, industrialized core. This leads to a process of capital accumulation at a global scale, and necessarily involves the appropriation and transformation of peripheral surplus.

On the political side of the world-system a few concepts deem highlighting. For Wallerstein, nation-states are variables, elements within the system. States are used by class forces to pursue their interest, in the case of core countries. Imperialism refers to the domination of weak peripheral regions by strong core states. Hegemony refers to the existence of one core state temporarily outstripping the rest. Hegemonic powers maintain a stable balance of power and enforce free trade as long as it is to their advantage. However, hegemony is temporary due to class struggles and the diffusion of technical advantages. Finally, there is a global class struggle.

The current world-economy is characterized by regular cyclical rhythms, which provide the basis of Wallerstein's periodization of modern history. After our current stage, Wallerstein envisions the emergence of a socialist world-government, which is the only-alternative world-system that could maintain a high level of productivity and change the distribution, by integrating the levels of political and economic decision-making.

As a conclusion, it is relevant to notice what Wallerstein said in an interview on his book *European Universalism*, in March 2008,: "Rather, we have lived in a "world-system" since the beginning of the époque called modernity in the 16th century when the capitalist economy was born in an embryonic form in a small part of the world, Europe. The world is thus a unit of analysis vaster than the state. The capitalist system has gradually succeeded, by its internal

processes, in extending itself to the totality of the world. You can in fact see that, since the end of the 19th century, the whole world has been governed by this capitalist system, to this day. Studying this world-system, in my opinion, makes it possible to enrich the approach of social sciences, by considering states as elements constituting themselves within this system. But they are not the only elements of the system, in which races, classes, nations, households, etc. also exist. All are institutions within this capitalist world-economy. Above all, this concept allows me to show that, like any structure, it has gone through various phases: initially its emergence and establishment, then its development, finally the moment of its structural crisis, before that of its disappearance. I think that we are currently living this moment of structural crisis, and, while I won't venture to guess a precise date or time, we shall witness (perhaps twenty-five to fifty years from now) its disappearance – or rather its replacement by another thing. One cannot say by what, for the time being, but the process is inexorably moving.”

L'EUROPE SAINT-SIMONIENNE

Cosma Sorinel

*L'Universitaté „Ovidius” Constanta
Facultaté des Sciences Economiques*

Many people have been preoccupied with Europe ever since the beginnings of time. Their ideas can be traced back as far as ancient mythology, as attempts to explain the world. But as of the 18th century, they looked at it differently, as an organized, unified, political institution. Numerous essays have influenced the history of the “European” idea, among them the work of Saint-Simon who, in 1814, thought of a European Parliament governing the national parliaments. In his essay on reorganizing the European society he brought forth ideas such as Europe rebuilt as a confederation, the establishment of a “general parliament” responsible for making decisions concerning the common interests of the whole European society. He strongly believed that putting the great political issues to the test is the aim of all contemporary efforts. If the previous century’s philosophy was revolutionary, the 19th’s century’s philosophy had to be organizing.

Keywords: Industrialization, modernization, social engineering, European Parliament

Claude Henri de Rouvroy, compte de Saint-Simon est sans doute une figure remarquable de la sociologie. Tout de même, le titre de père de la sociologie est souvent attribué à son compatriote, Auguste Comte, qui a lancé le terme « sociologie » dans son ouvrage *Cours de philosophie positive* (1830-1842). Mais au niveau des idées, c’est bien Saint-Simon qui est la première et la plus riche source d’inspiration pour la sociologie. Comte a été son ami et plusieurs fois co-auteur pour quelques publications.

Chez Saint-Simon on retrouve les grains de tous les courants de la pensée du dix-neuvième siècle. Les idées du socialisme à venir se trouvent dans ses ouvrages au début de leur carrière. Le socialisme qu’il représente est souvent appelé socialisme étique ou utopique. Il cherche à établir des sociétés co-opératives modèle. Il est mort vingt-trois ans avant la publication du Manifeste du Parti communiste par Marx et Engels.

Après sa mort, ses disciples (parmi eux Prosper Enfantin) on continué à développer ses idées. Leurs principes étaient de plus en plus communistes (l’abolition de la propriété privée ou la collectivisation de la société) et mélangeaient aussi les idées religieuses de Saint-Simon. Mais leur succès n’a pas duré et le Saint-simonisme comme doctrine politique et religieuse a échoué. Saint-Simon a introduit le concept de l’industrialisation et il a écrit sur le développement social et la différenciation. Il a écrit sur le rôle des classes tout au long de l’histoire et a analysé comment les élites doivent s’adapter au développement social.

Dès les années 1820, Saint-Simon voit dans le début de l’industrialisation le moteur du progrès social. Saint-Simon était à la recherche d’un nouveau système social qu’il a appelé système industriel, opposé au système féodal et militaire précédant. La nouvelle société serait égalitariste avec la division du travail à remplacer les divisions sociales.

Pragmatique, il prône un mode de gouvernement contrôlé par un conseil formé de savants, d’artistes, d’artisans et de chefs d’entreprise et dominé par l’économie qu’il convient de planifier pour créer des richesses et faire progresser le niveau de vie. Il appartient aux capitalistes d’œuvrer à l’élévation matérielle et morale du prolétariat.

Ça se passait au moment où les pays de l’Europe de Ouest démarraient le processus de modernisation. C’était la période où les fabriques devenaient la nouvelle institution dominante dans certaines communautés locales en expansion. La place de travail et l’habitation étaient séparés et les villes avec leur banlieues devenaient réalité quotidienne pour une génération qui avait vécu dans une communauté villageoise. La classe née par la naissance du capital vivait une

bonne vie, mais la grande majorité de la population n'étaient capables de garder un standard raisonnable que pendant leurs meilleures années de travail.

En dépit de ses qualités destructives, la Révolution française serait le précédent d'une période de créativité scientifique. Dans cette nouvelle ordre, la société serait gouvernée par un groupe hiérarchique de technocrates connu comme le Conseil de Newton qui aurait un pouvoir international.

Précisément, une telle volonté de rationalisation du pouvoir, basée sur la prédominance de l'activité économique, est un précepte que l'on retrouve tout particulièrement dans le socialisme saint-simonien. La réflexion de Saint-Simon sur le rôle des dirigeants, sur l'organisation de la société, et sur la place accordée aux « masses » dans celle-ci.

Le monde est, selon Saint-Simon, entré dans une nouvelle phase historique, caractérisée par l'industrialisation. Saint-Simon considère en effet que la production et l'organisation du travail sont les buts ultimes de la société « moderne », qu'il observe au XVIII^e siècle.

Sur ce plan, le socialisme est encore une fois plutôt proche du libéralisme, à tel point que Saint-Simon prendra soin de se distinguer des théories libérales par l'invention du terme « industrialisme ».

L'industrialisme de Saint-Simon combine pourtant idées socialistes (par exemple, il veut organiser le travail afin d'assurer l'amélioration de l'existence des plus défavorisés), et idées libérales (ainsi, l'organisation économique doit absolument être distincte et indépendante de l'organisation politique).

Ce qu'il veut en réalité, c'est que l'industrie s'organise par elle-même, à l'abri des interventions nécessairement maladroites des pouvoirs établis. Et le moment viendra où l'administration des choses pourra remplacer entièrement le gouvernement des personnes. Pour préparer ce moment, dit Saint-Simon, il faut confier le pouvoir politique aux industriels. Dans la thèse du remplacement du gouvernement des personnes par l'administration des choses, on retrouve l'idée du dépérissement de l'Etat.

Cette vision du monde, et du rôle collectif exigé de la part des individus, aboutit logiquement à considérer la société comme un laboratoire permanent de recherches et d'expérimentations visant à diriger les populations dans le sens désiré.

C'est dans ce contexte que s'est développé ce que l'on appelle l'ingénierie sociale, c'est-à-dire un ensemble de domaines et de disciplines permettant l'analyse et le développement de techniques cherchant, au mieux, à prévoir les actions et réactions des individus, au pire, à influencer directement ces derniers, et à modifier leur comportement.

La vision saint-simonienne de l'organisation sociale, politique et économique, tout comme l'ingénierie sociale qui lui correspond, aboutit à la subordination des individus à un processus déterminé par la Science et l'Industrie, processus dans lequel l'Etat (républicain) ne peut pas, à terme, être le principal élément organisateur de la société.

Le syncrétisme idéologique se poursuit donc, non seulement en matière économique, mais également dans la nécessité de domestiquer le pouvoir politique, finalement considéré comme un « trouble-fête ». Henri Denis précise même que pour Saint-Simon, le problème social sera résolu lorsque les techniciens de l'économie capitaliste recevront le pouvoir.

L'ouvrage qu'il a écrit en 1814 avec Augustin Thierry - *De la réorganisation de la société européenne, ou de la nécessité et des moyens de rassembler les peuples de l'Europe en un seul corps politique, en conservant à chacun son indépendance nationale* - contient ses idées pour une Europe fédérale dominée par des idées françaises de rationalité révolutionnaire et des idées anglaises d'organisation industrielle. Il n'a par compris que le succès industriel anglais était dû aux idées de liberté économique et sociale qui étaient directement opposées aux idées révolutionnaires françaises.

Et dès années 1814-1815, Saint-Simon montre non seulement de l'audace politique, mais en plus du courage personnel : que ce soit en 1814, pendant l'occupation des troupes alliées dans Paris,

ou en 1815 pendant les Cent Jours ou après Waterloo, quand il proclame que l'union de la France, de l'Angleterre et de l'Allemagne est nécessaire, et que c'est la seule voie pour le développement et la paix en Europe.

« Vouloir que l'Europe soit en paix par les traités et les congrès, c'est vouloir qu'un corps social subsiste par des conventions et des accords ; des deux côtés, il faut une force coactive qui unisse les volontés, concerte les mouvements, rende les intérêts communs et les engagements solides. » Avant le Congrès de Vienne il a publié *De la réorganisation de la société européenne* où il a théorisé une Europe unie sous la forme d'une confédération comme le premier pas vers une association universelle.

En 1814, on était en plein Congrès de Vienne, les souverains d'Europe essayaient de trouver la recette miracle pour éviter le retour des guerres atroces que l'Europe avait connues sous Napoléon. Et Saint-Simon présente une idée neuve, osée : réconcilier Français et Anglais pour créer, autour de la France et de l'Angleterre, une Europe stable et économiquement forte grâce au libre-échange. L'Allemagne devra suivre dès qu'elle aura trouvé son unité.

Un beau projet, mais que le Congrès n'accepta pas, lui préférant l'équilibre des grandes puissances, le fameux concert européen. On aurait peut-être évité trois guerres sanglantes. Cent cinquante ans plus tard, on bâtit l'Europe autour de la réconciliation franco-allemande.

Le concept à la mode de « réseau » fut utilisé, dans son sens moderne, pour la première fois, par Saint-Simon entre 1800 et 1820. Les ingénieurs et industrialistes saint-simoniens érigèrent le principe de l'« organisation - réseau » en véritable religion. Des réseaux de communication auraient dû faciliter le développement de ce nouveau système par la libre circulation des idées et des richesses.

Ainsi chez Saint-Simon, le réseau est un concept avec lequel est pensé le changement social. Il y a une volonté revendiquée d'un changement de société. Le concept de réseau permet de déceler l'endroit le plus propice où faire porter l'action politique dans un système social pour obtenir la plus grande efficacité de changement. L'invention même du concept de réseau par Saint-Simon a précisément pour but la transformation sociale au profit des industriels ; faire ce que la Révolution française n'a pas achevé de faire.

Dans un deuxième temps, les saint-simoniens vont dégrader le concept en objet. Ainsi les réseaux de communications considérés par Saint-Simon comme un moyen de transformation sociale et politique permettant la valorisation du territoire, devient chez ses héritiers le but premier ayant pour effet le changement social et politique. De moyen, les réseaux techniques sont devenus une fin. Pour les héritiers de Saint-Simon, les réseaux de communications sont intrinsèquement producteurs de rapports sociaux et font donc nécessairement évoluer la société vers l'utopie saint-simonienne, l'Association Universelle.

Beaucoup d'industrialistes, de banquiers et d'ingénieurs ont été influencé par Saint-Simon et ont eu des contributions significatives au développement des réseaux des voies ferrées, des compagnies de l'eau, de télécommunications.

Les services publics sous la forme des réseaux étaient une condition importante pour la création des richesses mais aussi pour la cohésion sociale et territoriale. Au 19^e siècle, la révolution industrielle paraît à mettre en danger la cohésion interne de la société.

Le texte, *De la réorganisation de la société européenne*, destiné aux Parlements de France et d'Angleterre (1814), propose ce que l'on appellerait aujourd'hui un « axe » franco-britannique, sous la forme d'une confédération appelée à s'élargir à d'autres régimes parlementaires, avec, pour coiffer le tout, un Parlement européen servant de moteur à une unification du Vieux Continent.

Ce Parlement serait construit sur le modèle britannique, avec une Chambre des Communes réunissant les représentants des associations locales, et une Chambre des Lords ayant des membres nommés par un Monarque européen.

Fervent admirateur de l'Angleterre politique et industrielle, Saint-Simon prône le modèle anglais pour son Europe future. Il propose donc:

- une Chambre des députés du Parlement européen, pour légiférer en matière d'intérêts particuliers, bâtie sur le modèle de la chambre des Communes ;
- un Roi de l'Europe (par exemple le roi d'Angleterre) et son Premier ministre électif, pour exercer les pouvoirs d'intérêt général, comme les infrastructures, l'éducation, les impôts communs ;
- une Chambre des Pairs européens, pour régler les conflits et les abus - et éviter de glisser soit vers le despotisme, soit vers l'Etat populaire.

Le Parlement qu'il place au sommet de son édifice a 240 membres : « L'Europe aurait la meilleure organisation possible si toutes les nations qu'elle renferme, étant gouvernées chacune par un parlement, reconnaissaient la suprématie d'un parlement général placé au-dessus de tous les gouvernements nationaux et investi du pouvoir de juger leurs différends ».

L'utopie de l'« Association universelle sous le point de vue de l'industrie », l'exploitation du globe terrestre par les « hommes associés », travaillant, sous une impulsion commune, à l'accomplissement d'un but commun. La planète doit être « administrée » par les industriels comme une « grande société d'industrie » et non plus « gouvernée » par un État tutélaire. Cet axiome fonde le « savoir positif » sur la gestion des hommes qui doit aider à enrayer la crise du « savoir négatif » des Lumières et de ses dérivés révolutionnaires. Légitime lorsqu'il s'agissait de saper l'ordre ancien, l'attitude critique est devenue contre-productive pour créer un nouvel ordre social et assurer le « passage du système féodal et théologique au système industriel et scientifique ». Dans cette doctrine gestionnaire de sortie de crise, les « réseaux spirituels » ou de crédit et les « réseaux matériels » ou de communication ont une fonction organisatrice de ce grand corps qu'est l'organisme social.

Abstract: In a limited way of approaching the term “market” is defined as a certain geographic place, a physical point where, at certain hours and certain days, buyers and sellers meet in order to buy and sell goods. For example, tourism has become one of the major international trade categories. Over time, an increasing number of destinations have opened up and invested in tourism development, turning modern tourism into a key driver for social-economic progress, through the creation of jobs and enterprises, infrastructure development, and the export income earned.

Key words: Services, market, services market, international tourism, commercial services, goods and services.

JEL Classification: L8, L83

1. Service market – a key to economic development, well-being and social prosperity

The large majority of people think that the term “market” appoints to agro alimentary places where peasants sell their products directly to customers. In other words, the market represents a certain geographic position, a physical point where, at certain hours and certain days, buyers and sellers meet in order to buy and sell goods. Considering the market as a material, concrete place is a limited way of approaching this term.

At present, the world “market” has more meanings even if it originally comes from the reason of those points of sell, which can be found today in certain places.

Nowadays, in developed economies, only a small part of selling and buying activities are carried out in concrete markets, the majority of them being achieved through retail and wholesale, import-export firms, salesmen, agencies of large companies. In such cases, the word “market” does not mean anymore a point that can be geographically and physically located, but the universality of relations that take place between the representatives of approaching the term “market”. If today specialists speak about market analysis, market making, labour market, capital market, oil, copper, cereal market, consumer goods and services market, the physical points of sell for products are no longer taken into consideration, but there is a desire for observing a higher or lower buying trend relating to a higher supply.

In conclusion, we can say that nowadays the term “market”, in its abstract sense, refers to general economic relations established between producers that provide production conditions within the market economy and consumers representing human necessity bearers, associated with people’s capacity of buying offered goods which are suitable for them, relations with frontiers not necessarily defined only through geographic area or conventional product classifications.

Selling and buying actions, pointed out through market economic relations, together with processes linked with the structure of demand and supply objectives, are in connection with the space and time they are taking place.

These entire functions specific to the market make possible the optimum exchange of different products, achieving in this way the main role of the market. But it is utopian to state the fact that markets are able to mediate these functions and role in an ideal way. Extreme situations, periods of under and over-production of major technical discoveries demonstrate the fact that markets are no longer able to automatically fulfill the role of economic stability regulator. But beside these limit situations political economy reached the conclusion that even in the so called "normal periods" the stability on certain markets can not be defined as being optimum. That is why today it goes without saying that the state has to interfere in several markets more or less intensively. This interference is obvious generally on the agricultural market, in mining, in the credit system and transport.

Sawn in the light of goods nature that represents the objective of commercial transactions, the goods market under the form of flows has as object both physical/substantial products and non-substantial products. Services as a socio-economic domain is one of those that offer invisible, abstract products which can be defined quantitatively only part and indirectly. However, just like the other useful economic goods producing activities, services had formed in time a personal market for the "products" they provide defined through factors with specific manifestation and determined by geographic, socio-economic and politic nature.

Sawn in the light of contemporary sense of the word market, the service market represents the economic sphere of interface between the interests of service suppliers materialized into service production and the interests of service buyers materialized into consumption. And as in case of services supply and consumption happen at the same place, the interference is going to be transformed in superposition in time and space of these to factors through service consumption.

But even if the service market is alike through its functions and role to other existing form of the market in general, however there are several particularities that distinguish it from the others, referring to quantitative or qualitative aspects:

- a) service market does not include in all the sphere of services because there are non-good services of noncommercial service formed of public and private services firm of public and private services that are not marketable and free of charge services provided by people to themselves;
- b) the difficulty is measuring the dimension and dynamic of service market comparatively with possibilities in this field regarding substantial product market comparatively with possibilities in this field regarding substantial product market.

Consequently, in order to determine supply, demand and the volume of transactions on the service market we must appeal to a succession of indicators. For example, in order to evaluate the tourism market as a representative subsystem of service market we have to use a subsystem of indicators regarding tourism resources both through the occupation point of view (the number of cultural-historical moments, average annual value of fixed and circulating funds, production capacity in tourism, working time) and through the consumption point of view (labor expenses, rent, total expenses, expenses generated by arranging and maintaining tourist objectives). We must also use the subsystem of indicators regarding the economic and social effects of tourism activities (net revenue, earnings from offering tourist services, contribution to national income and growth of the social labor productivity) ;

- c) The particular meaning of qualitative elements in estimating the position of a producer of country on the service market. For example, in comparative evaluation of tourist services regarding accommodation provided by several types of tourist structures, a special position are going to have qualitative criteria, meaning: convenience, safety, hygiene,

conditions for developing social relations, the diversity and quality of complementary food services, the fervency and quality of cultural artistic and recreation services;

- d) The particular way of competition expressed on the service market, which presents the following aspects:
- if in case of physical product market competition is firstly materialized in price, value being determined by subjective needs of each individual and the rarity of a certain product, in case of service market the rarity of the service does not have a significant role in price determination and accordingly not within competition because services are not homogenous and can not be compared. Therefore, competition by price is more varied, price estimation being related to several qualitative, physiological aspects often influenced by personal relation between service provider and customer. Consequently, taking into consideration the permanent differences among services regarding their quality prices used by different firms are various, but their fairness in accordance with production overheads is neither proved nor invalidated;
 - the greater frequency of monopoly and oligopoly situations determined by considerable entering and output costs form the service market, by objective economic difficulties regarding free entrance in the branch and capital free circulation;
 - each service enterpriser has a variety of means able to distinguish him from his competitors, first of all through quality even if it is not always entirely perceived by customers, and secondly through ambience from the firm and the personal relation maintained by the service provider with his clients, also having in mind geographical placement that very often represents the main criterion in service choosing;
 - in case of service market, transparency is limited by the immaterial feather of services, the reality that prevent competitors to know the secrets of superior technologies of producing and organizing their services or to understand the object of the dumping policy. At the same time, service consumers are not able to compare rigorously the price-quality relation for every service on the market because of time restrictions.

2. International tourism challenged by deteriorating world economy.

Though not immune to the economic woes, tourism has so far resisted the economic downturn better than other sectors, such as construction, real estate and car manufacturing.

International tourist arrivals reached 992 million, in 2008 up from 904 million in 2007, in representing a growth of 2%. This overall growth builds on the strong results of the first part of the year, before the collapse of the financial markets and the subsequent recession. The second half of the year showed an abrupt shift in trend, with international arrivals flat or showing negative growth in each of the last six months of 2008. Overall, the 5% between January and June gave way to a 1% decline in the second half of the year.

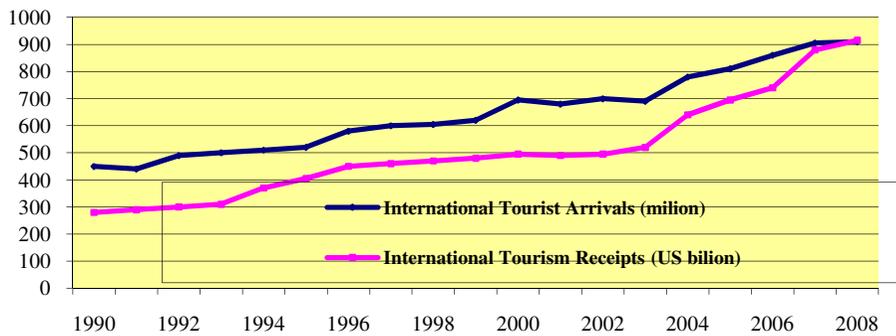

a. International tourist arrivals and international tourism receipts.

All regions had positive growth except Europe, which suffered stagnation in arrivals (+0.3%). The best performance was seen in the Middle East, where international arrivals reached 55 million, a rise of 18% over the previous year. Africa grew at half the rate of the previous year, but still registered an above-average growth of 4%. The Americas grew 3%, boosted by the strong performance of Central and South American destinations and the strength of traffic to the USA in the first half of the year. Asia and the Pacific saw a significant slowdown in arrivals as compared to its previous bumper year, growing just over 1% in 2008.

International tourism receipts rose by 1.7% in real terms in 2008 to US\$ 944 billion (642 billion euro). Receipts from international passenger transport are estimated at US\$ 183 billion, bringing the total international tourism receipts including international passenger transport (i.e. visitor exports) to over US\$ 1.1 trillion, corresponding to US\$ 3 billion a day. This represents around 30% of the worldwide volume service exports and 6% of overall exports of goods and services.

(Data as collected by UNWTO. 2009)

For destination countries, receipts from international tourism count as exports and cover transactions generated by same-day as well as overnight visitors. However, these do not include receipts from international passenger transport contracted from companies outside the travelers' countries of residence, which are reported in a separate category, 'International Passenger Transport'. Although the availability of comparable international data is somewhat limited the export value of international passenger transport has in recent years been estimated at around 16% of the combined receipts from international tourism and passenger transport, corresponding in 2008 to some US\$ 183 billion against US\$ 164 billion 2007.

This takes total receipts from international tourism, including international passenger transport, to US\$ 1.1 trillion in 2008. In other words, international tourism contributes over US\$ 3 billion a day to the world economy.

Visitor expenditure on accommodation, food and drink, local transport, entertainment, shopping, is an important pillar of the economies of many destinations, creating much needed employment and opportunities for development. More than 8- countries earned over US\$ 1 billion from international tourism in 2008.

In real terms, i.e. adjusted for exchange rate fluctuations and inflation, growth in international tourism receipts corresponded to 1.7% only slightly lower than the growth in international tourist arrivals. After the substantial growth in 2006 and 2007 – of over 5% in both years – this represents a considerable slowdown.

All regions shared in the increase in tourism receipts in absolute values. In real terms growth was in all regions much weaker in 2008 than the before with the exception of the Middle East, which registered a double-digit growth of 17%. Asia and the Pacific grew by 2.7% (compared to +9.8% in 2007) and the Americas increased by 5.0%, slightly less than 2007's 6.3%. Both Europe and Africa (-1% each), however, suffered negative growth in receipts in real terms.

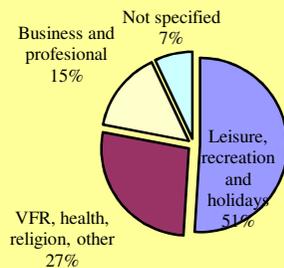

b. Motivations of visit and means of transport.

Travel for leisure, recreation and holidays accounted for half of all international tourist arrivals (51% of a total of 467 million arrivals, in 2008). Some 15% of international tourists reported traveling for business and professional purposes and another 27% traveled for other reason, such

as visiting friends and relatives (VFR), religious reasons pilgrimages, health treatment, etc. The purpose of visit for the remaining 7% of arrivals was not specified. Slightly over half of travelers arrived at their destination by air transport (52%) in 2008, while the remainder traveled over the surface (48%)- whether by road (38%), rail (3%) or over water (6%). Over time, the trend has been for air transport to grow at a faster pace than surface transport, so the share of air transport is gradually increasing.

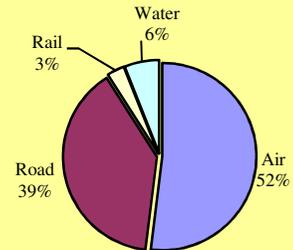

Tab. 5 (Source: World Tourism Organization)

Inbound tourism by purpose of visit, 2008

Tab. 6 (Source: World Tourism Organization)

Inbound tourism by means of transport, 2008

c. *No major changes in the top ten*

When ranked according to the two key tourism indicators- international arrival and international receipts- it is interesting to note that eight out of ten top destinations appear in both lists, even though they show marked differences in terms of the types of tourists they attract, as well as their average length of stay and their spending per trip and per night.

There were only slight changes in the ranking of the 'World's Top Tourism Destinations' in 2008. The top three places- both by international tourist arrivals and international tourist receipts- were still occupied by the USA, Spain and France, albeit in a different order. France continued to lead the ranking of the world's major tourism destinations in terms of arrivals, but ranked third in receipts. The USA ranked first in receipts, earning US\$ 110 billion and regained its second position in arrivals, which it lost to Spain after 11 September 2001. Spain dropped to third place in terms of arrivals but maintained its position as the second biggest earner worldwide, and the first in Europe.

China and Italy both held on to their 2007 position in terms of arrivals and receipts, with China ranking fourth in arrivals and fifth in receipts, while the reverse was true for Italy. The UK ranked sixth in arrivals and dropped to seventh place in receipts, after being overtaken by Germany (which ranked ninth in arrivals). Turkey moved up one rank in both categories, occupying the eight position in arrivals, and ninth in receipts. Completing the top ten ranking in arrivals were Ukraine (7) and Mexico (10) and in receipts, Australia (8) and Austria (10).

The top ten tourism earners last year accounted for 49% of the total estimated US\$ 944 billion in international tourism receipts. Their perspective share of international tourist arrivals was slightly lower at 45%.

Abstract

Cities represent today the intrinsic socio-economic complexity of local systems. Looking at the performances of urban systems enable us to explaining the main factors of territorial development. By moving from the theory of “progressive systems”, and assigning to the cities some of this theory’s properties, it is possible to outline a methodological perspective to capture the emerging phenomena describing the cities’ performances. Keeping this view in mind, the aim of the paper is facing the intrinsic socio-economic complexity and heterogeneity of cities within the EU integration policies.. In order to better qualify this issue, we provide a multidimensional scaling approach, as a quantitative method useful to compare the several urban performances by letting a cluster evidence among the EU cities emerge.

Key words: Urban trajectories, progressive system, multidimensional scaling.

JEL codes: R10, R11

1. Introduction

It is widely believed that cities are a key driver of local development and a special unit of analysis in explaining the economic trajectories of a country. Cities represent today the intrinsic complexity of an socio-economic systems because urban areas are the places of human economies and the majority of agents productive and consumptive activities. In this sense the State of European Report (Urban Audit, 2007) underlie the role of cities as laboratories because of they are places where economic and societal changes are often experienced first and most profoundly. Moreover, as hubs of globalising world economy, bigger cities generally contribute to competitiveness, growth and jobs (OECD, 2006).

The relevant literature about cities shows a thematic and methodological eclecticism in order to highlight the way in which the city has been interpreted in urban economics (see Capello, 2008, for a critical review). Among the several features that a city shows it can be traced city as: an agglomeration of relations and externalities; a place with endogenous capacity to allocate resources efficiently; a place of interaction; an complex economic system. Actually the modern and critical economic theorisation of the city shows an enrichment of the classical and neoclassical principles whit new theorization, that have more recently produced an heterodox interpretation of urbanization using (i) a cognitive approach; (ii) a complexity approach. In the former case the city is seen as innovation and knowledge milieu (Aydalot, 1986; Camagni,1999; Feldman and Audretsch, 1999; Maillat et al. 1993). In the latter case the city is conceptualized moving by the complex system theory (see Nijkamp and Reggiani,1999 for a critical review).

With the introduction of complexity among the issue of urban development, the boundaries between urban economics and other social sciences are notably weakening in order to describe the cities’ performances. Keeping this view in mind, the aim of the paper

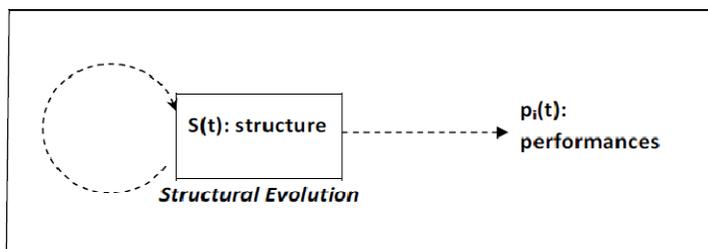

is to outline a methodological perspective to study the economic development of cities, so in section 2 we adopt a “progressive system” approach and define its methodological assumptions. According to the causal relation “structure-performances” in section 3 we define the “structure” thanks to a set of indicator provided by Urban Audit data. This paper copes the intrinsic socio-economic complexity and heterogeneity of cities within the EU integration policies. In order to better qualify this issue, in section 4, we provide a multidimensional scaling approach, as a quantitative method useful to compare the several urban performances by letting a cluster evidence among the EU cities emerge.

2. Cities as progressive system

City is a complex open system because is the coming out of heterogeneous interactions among several elements, these interactions originate a peculiar behaviour that is an *emergent* phenomena that could not be analysed focusing only on the single behaviour of the interacting elements (Bertalanffy, 1972). Moreover this phenomena and the following interactions coevolves progressively during the time, assigning a specific characteristic to the city as a system. Keeping this in mind in order to cope with the eclecticism of theoretical and methodological contributes, more and more present within the scientific literature, we decided to conceptualize the city as a complex system by moving from the theory of “progressive systems” (Calafati, 2007).

Thinking of cities as complex open systems bring us closer to outline a new research programme on performances’ analysis. As a matter of fact, assigning to the cities some of this theory’s properties it is possible to outline a methodological perspective to capture the emerging phenomena that originate from the cities. That is to say that conceptualizing the city as progressive system means that, in order to evaluate the emerging development trajectories, it is necessary to delineate three pertinent levels of description that are: (i) the structure of the system; (ii) the metabolic processes of the system, i.e. the processes that organize inputs as matter, energy and information into goods and services functional to the system’s objectives; (iii) the regulation mechanisms of the system.

Fig. 13- From structure to performances

Source: Calafati, 2007

In this work, the issue we are talking about regards the deep causal relationship between “structure and performances”. In virtue of that cities’ development trajectories have to be described and consequently analyze in the way of the specific urban system structure. These epistemological choice very reflect itself in a clear methodological perspective, that we have tried to adopt in this paper. That is to say that, at this stage, we are focusing on the first of the three levels of description of the city as progressive system. So what we present at this first step is a delineation of 15 cities’ structure adopting a seminal set of *ad hoc* indicators describe, in a very first experimental way the heterogeneity of different urban system and then to process data in a multidimensional scale analysis.

3. Cities' structure and dataset

Starting from the data collected in the Urban Audit project in order to compare statistics and indicators for European cities, we have construct a data set able to delineate the “structure” of 15 cities according to the information and data available. This exercise represents a first experimental exploration of the paper methodological assumptions, by moving from the causal relation “structure-performances”. In this cases we try to provide a first step in the description of the “city as progressive system” performances, at this moment represented basically in a meta-theoretical way.

Starting from the intrinsic heterogeneity of cities structure, in order to cope with the EU integration processes we have chosen the Multidimensional Scaling Analysis (MDS) as a quantitative method useful to compare the several urban performances by letting a cluster evidence among the EU cities emerge. That is to say that the MDS shows a series of similarities defined by cluster of heterogenic urban performances.

MDS includes several techniques of multivariate statistic analysis starting with a data matrix, cases per variables, in witch variables provide information about specific properties obtained from cases. By moving from this matrix and comparing all the couples of cases in regarding of their properties, it could be point out a new matrix in which all the comparisons emerge. The output is a proximity relation of cases, organized in triangular matrix set by the differences between the couple of cases contained in the first data matrix. In this way the MDS provides a data representation able to point out in specific modality the complexity of the relationships behind the first data matrix. This quantitative choice operate a reductionism that entails a sort of information's lack, that is to say that there is less correspondence whit he phenomena observed. By the way it provides the identification of the best coordinate in a two-dimensional space that represent the best adjustment to the proximities observed in the data. In any cases the error (distortion) of the MDS analysis can be measured by the *Stress* indicators.

About the 15 cities observed (Tab.1) we selected a group according by the demographic homogeneity, focusing the analysis on medium urban system. Then we selected 8 indicators regarding the economic, demographic and social dimensions. So the analysis is based by observing the following variables: total resident population, density population, GDP per capita, employment rate, summer smog (nota: number of day in which the level of ozone exceed the threshold fixed in the air), public green space (square meter per capita), percentage of journeys to work by car, number of crimes (per 1000 persons).

Table 8 - Reference Dataset

Cities	Tot. Resid. Population	Pop. density	GDP per head	Employment rate	Summer smog	Public green space	Journeys to work by car (%)	Num. of crimes
Wien	1,598,626	3,855	19,607	0.64	23	11	0.41	29.39

Berlin	3,387,828	3,789	23,458	0.58	6	27	0.44	159.3
Frankurt	646,889	2,608	73,932	0.64	19	18	0.43	182.6
Munchen	1,249,176	4,030	53,073	0.72	22	32	0.41	90.81
Budapest	1,695,814	3,230	16,622	0.6	11	43	0.71	68.11
Rome	2,553,873	1,987	21,225	0.57	48	15	0.57	69.2
Milan	1,299,439	6,986	27,988	0.63	46	15	0.46	91.24
Amsterdam	739,104	4,439	38,897	0.7	4	35	0.41	142.99
Madrid	3,099,834	5,127	79,516	0.65	28	7	0.47	36.66
Barcelona	1,578,546	15,770	80,894	0.63	3	4	0.32	34.71
Valencia	785,732	5,764	73,320	0.64	1	3	0.58	39.57
Stockholm	761,721	4,052	59,244	0.69	1	96	0.33	206.81

Source: Urban Audit (2004)

These variables was chosen because of their meaningful within the data set available and according the main literature in terms of: (i) sustainable development (Daly, 2001, Grossman

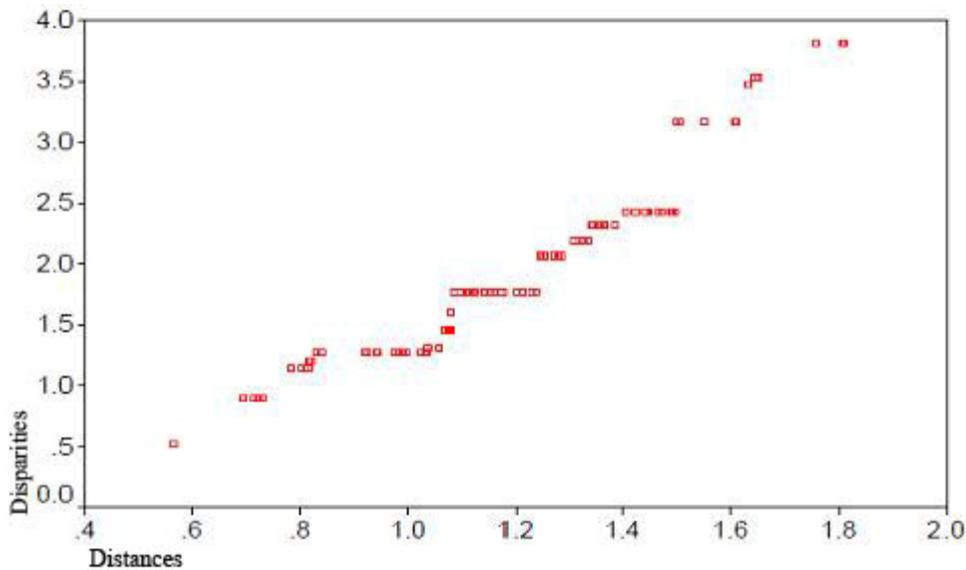

1955, Hamilton and Atkinson, 1996, La Camera 2005); (ii) socioeconomic development (Glaeser et al. 1992; 1999, Becker et al. 1964; 1999, Jacobs 1968).

From this table is possible to note, even if an approximate way, a kind of heterogeneity among the observed cities. That is to say that, for example, as regards GDP per head or population density or number of crimes, a different dimension of the cities' structures emerges. Even these are only proxies in a explicative exercise, comparing cities with similar number of people (i.e. Milan and Munchen, or Wien and Barcelona, etc), it is possible to observe some differences in terms to the others variables. This supports the concept of cities as progressive system that we have examined in this paper.

4. MDS findings

Performing a standardization (interval 0-1) on all the values to prevent the influence of the metric in order to get the index of dissimilarity, we provided the proximity matrix based on the original one. After, we have proceed the analysis fixing the number of dimensions (K=2), achieving therefore a Stress Index⁴⁵⁴ equal to 0.171 (according to the condition of Kruskal). Significativity of the model is, moreover, confirmed form the value of RQS Index (Squared Correlation), which is 0.82. The figure 1 above shows how the model could be implemented in our case, according to distribution of the coordinate of points, that are in proximity of the first square bisector.

Fig. 14 – relation disparities-distances

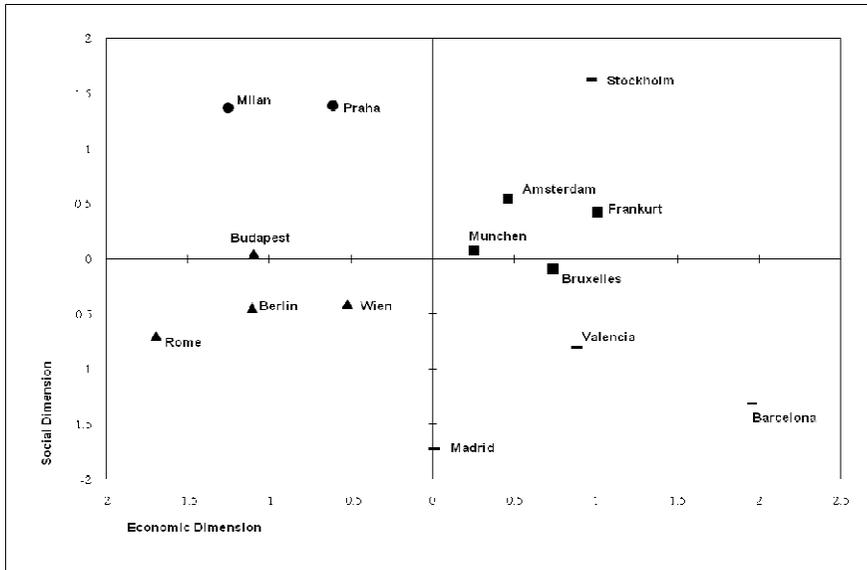

Source: our elaboration

The final map coming out from MDS shows a simple and intuitive finding a meaning to the representative space, labelling the Cartesian axes in relation to “semantic” position of the variables. That is to say that the configuration of the cities along the map is in function of the two main characteristics: social dimension and economic dimension (Fig.2)..

⁴⁵⁴ Kruskal Stress formula 1 varies between 0 and 1. When it assumes 0, data have a perfect performance. Generally a good result of the k dimensions is obtained when the Stress Index presents a value lower then 0.1. The outcome is satisfactory when the value is smaller then 0.2 (De Lillo et al., 2007).

Fig. 15 – urban configuration in a two-dimensional space

Source: our elaboration

As the graphic shows, the MDS provided the presence of three groups of cities and four outliers (Stockholm, Valencia, Madrid and Barcelona). Despite the mentioned observations about heterogeneity of cities structure, it is still plausible for the purposes of analysis to represent a kind of homogeneity among some cities subject of our study. Amsterdam, Munchen, Frankurt and Bruxelles seem to show an almost similar social-economic profile and better than other cities observed. The opposite situation is found instead for the group composed by Rome, Berlin, Wien and Budapest, which highlight a negative standard for both analyzed dimensions. Finally it is opportune to underline also the situation presented by the group Milan – Praha, which social dimension seem to assume a predominant weight within of own structure.

5. Final remarks

With the help of a Multidimensional Scaling analysis (MDS), the work in progress presented in these pages obtains an seminal mapping of an emergent process of UE cities' clusterization. By moving from the EU integration policies the main goal of this work is to reflect on the importance of urban size (structure) for urban performances going beyond the meta-theoretical approach in literature. The second main goal is to provide a methodological tool to let some homogeneity (thanks to the cities' clustering) emerge, coping the heterogeneity of EU cities performances. In these sense, at this first stage this analysis should therefore be used as a experimental tool for a better understanding the heterogeneity of urban performances, expressed in terms of different cities' structures. For this reason it could be useful to highlight the question of which EU integration policies are most appropriate for different types of structures.

Even if the paper provides an empirical analysis of the city as progressive system it is based on a sample data set, the next step is to find more relevant data and try to evaluate the binomial heterogeneity-homogeneity with the help of a family of artificial neural networks known as Self-organising Maps (SOM), obtaining an original mapping of EU cities moving by the idea of multi-dimensional similarity in different urban systems' structures.

DEMO-SOCIAL DETERMINANTS OF EUROPEAN CONSUMER BEHAVIOUR

Danu Marcela-Cornelia

University "Vasile Alecsandri" of Bacău

Faculty of Economics

The components of demo-social macroeconomic level but especially in the continental context were decisive action on both exponents of the supply and the demand; the businessman need to know features, character and effects of these variables on the functionality they produce while the European market and national.

From the range of the demo-social components, I referred to the social classes, the reference groups, the area of residence, taking into consideration reality that these components carries on business in general, particularly on the consumer, a long-term determination so, their knowledge as fair provides managers can develop policies and strategies consistent with these conditions.

Keywords: demographic-social determinants, social class, reference groups, family, residence environment, inter-variable correlations

JEL codes: D10, D31, J11, R11, R21.

Demo-social variables in the context of the business environment

One of the components business environment, with long-term influence on quality and its dynamics, is the social environment. Although the demo-social environment components have a slower time than other components, the system configuration and the features of the current global economy, changes occurring in European economies, the suite of financial, economic, natural environment crisis, however, and more once again motivates the businesses to take into account trends in the business environment variables.

Beyond the demographic changes recorded in the potential of countries in the world, the geographical distribution of population density, its natural movement, are significant trends in terms of social class, reference groups, family, environment residence option for European countries economy. These variables interfere with objective and subjective motivations outlining the buying and the consumer decision.

Social class, reference groups, family – between theory and reality

In recent view of the sociologists⁴⁵⁵, the concept of **social class** highlights:

- positioned and equipped unequal social classes within the economic system;
- social class identity strongly marked by class, in terms of time, culture, community.

In general, membership of a particular class is given by individual occupation⁴⁵⁶. A classification of socio-economic groups have highlighted that in group A (3%) place the upper middle class, head of household having a senior managerial, administrative, professional; group B (10%) is reserved for the middle class of family head having intermediate managerial functions, administrative or professional; C1 class (24%) and C2 (30%) are most consistent in terms of number and head of the family occupying positions below supervisory, administrative, professional, skilled labor respectively; working class is in Group D, has 25% of the population, head of the family is included in semi-specialized and non-specialized labor; the lowest level of subsistence is approx. 8% of the population and includes certain categories of pensioners, casual and unskilled labor, etc..

⁴⁵⁵ Chauvel, Louis, Le Retour des classes sociales, Revue de l'OFCE, 2001, vol.79, issue 4, p.315-359.

⁴⁵⁶ Blythe, Jim, Consumer Behavior, Uranus Publisher, 1998, p.116-117.

The social class was defined by Max Weber as the group of individuals sharing a specific causal component of their life opportunities; this component is defined by degree of ownership of property and the possibilities for the revenue and operating in the conditions of the commodity markets and labor markets. Already in the 60s the idea of disappearance of social classes, with the arguments:

- in the political – the power distribution across the entire set of population and de-structuring political behavior according to social strata;
- in the economic sphere - the tertiary sector increased the extent of which did not match any class system;
- raising living standards and consumption that leads to the disappearance of identifiable consumer segments.

Those who showed, subsequent, the disappearance of the social classes, they reasoned it this way:

- reduction of the economic and educational inequalities;
- restricting border access to consumer and to the cultural elements with increasing social mobility;
- hierarchical structure of classes in separate groups, identifiable and enforceable against, much less obvious, hence, minimize the conflicts between classes and even states of class consciousness.

The social classes have importance on economic activities, however, increased social mobility and reduced of the wealth concentration dilute the traditional boundaries between classes and reduce the cultural differences between them.

Given the large socio-professional categories - farmers, traders and small businesses, professions, employees and workers in the past 30 years, the composition of the working population analysis shows that middle and upper classes of employees grows and the number of workers decreases - in 2000 were approx. 30% of the population, compared with 40% in 1969. While the tertiary sector rather than being hierarchical, not creates an easily identifiable class system; the analysis of the workers and employees shows that employees are, structurally speaking, workers in services; in general, when considering the number of workers and employees observed that in the past 30 years is relatively stable in the active population.

The social classes create patterns of decision making⁴⁵⁷. The research shows that in rich families is a trend towards the decision making by those men, while in low-income families are matriarchal tendencies manifest, the wife take financial decisions, including those related to purchasing goods and services. Middle class families are showing trends in democratic decision making.

Regarding the changes in wages, they are very important in understanding the evolution of society. After 1970 due to increased income middle class at the continent, it became an important class of economic and social environment.

Across Europe, the income situation in different countries reflect the large differences existing both between rich and poor social strata and between the developed and ex-communist.

Regarding the income distribution inequality, calculated as the ratio between the total income of 20% with highest income and total income of 20% with lowest income, the dynamic profile since 1997, the situation of our continent reflect that⁴⁵⁸:

- In the year 2008, large discrepancies between income in the countries: Latvia (7,3), Romania (7), Bulgaria (6,5), Portugal (6,1), Greece, Spain, Lithuania, United Kingdom (all over 5). Polarization spectrum wealth lies not only on ex-communist countries but also on some developed EU countries.

⁴⁵⁷ Blythe, Jim, Consumer Behavior, Uranus Publisher, 1998, p. 131.

⁴⁵⁸ Eurostat, 17.03.2010.

- The same year, the smallest discrepancies between income levels are specific in countries: Czech Republic, Slovakia, Slovenia, Sweden (all with values below 3.5). The situation highlights the respective national economies macroeconomic options, obtaining GDP sectors of national economy, given that countries with strong tertiary sector employs a high proportion of the population in this sector and its higher income compared with countries with rates still high obtaining employment and GDP in agriculture. On these grounds we can add the different national labor productivity and, not least, the development of the country.
- In the period 1997-2008, the development of this situation has been fluctuating in all countries, none having a continuously decreasing or increasing trend over the interval.
- The level of our country is strong polarization of wealth, well above the EU average (5) and, in 2006, has increased.

Reference group is "an individual or group of individuals who significantly affect a person's behavior"⁴⁵⁹. Reference groups develop standards, rules, under which consumers assess their attitudes and behavior. For example, primary groups consisting of people we see most often (family, friends and close colleagues), is usually the mouth-to-mouth communication, triggering and purchase decision of the individual, regardless of nature of demand; groups side (people who meet occasionally and with which we have some common interests) are not noticeably affect the purchasing behavior of individuals but are important for managers in terms of potential workforce, to support the common causes, etc.. Are significant for business are the groups because individual membership wishes to belong, is very powerful in influencing its behavior; in some cases, group membership is the financial aspirations of individual power. By their nature and characteristics the companies looking to set up and possibly retain individual components of the official groups like clubs or associations. The process of market segmentation and target market involves setting the implicitly groups that appeal to individuals who are in implicitly because of age, gender, culture, education, etc. ..

The entrepreneurs have the knowledge typology of the reference groups to a market level and composition of each of them to develop the market strategies and policies compatible their tastes, preferences and requirements.

Family is the most powerful group that influences the consumer decisions. In many European countries, family is defined by parents and their children although, the influences are the grandparents, aunts, uncles, cousins, too. This last option is specified the Latin countries and of Southern Europe than Northern countries where the family is independent⁴⁶⁰. In Europe coexist four different family systems: liberal, authoritarian, egalitarian, nonegalitar, according bounded or not the dominant character of established links and relations values between brothers.

Regarded as the reference group, the family has several features, namely:

- direct contact between family members;
- common use;
- the subordination of individual needs;
- the purchasing agent - in the person of one family member.

Lately, Western Europe⁴⁶¹ became increasingly apparent increase in single person households; more people marry later and have fewer children and more families decide to not have children; an increased divorce rate and more increase in single parent families (Belgium has the highest divorce rate, Romania - among the lowest).

Another change in family structure that determines the buying decision process and consumption is increasing the number of couples who are not married and unmarried officiating. Such households have accelerated the dynamic. In Sweden, the households consisting of one person represented since 1994, 40% of all households. Obviously, such households have special needs

⁴⁶⁰ Adăscăliței, Virgil, Euromarketing, Uranus Publisher, București, 2004, p.72-73.

⁴⁶¹ Catană, Gh.A., Marketing - market success philosophy, vol.I, Dacia Publisher, 2003, p.255-259.

(smaller apartments, portions of 1-2 people, cheaper furniture, etc..), observation that no business should escape. In some countries (Netherlands, Great Britain, etc.) were adopted laws allowing marriage between homosexuals.

The involvement of women in economic and social life is a business reality of our continent; has increased the number of active women, strongly influencing family consumption - cooking is increasingly rare, is preferred food ready, increase the demand for microwave ovens and other appliances electrical change traditional roles of husband and wife in the family. Women do not cook, instead of the client are banks, auto repair shops, etc.. while men are more and more chores, go shopping, caring for children, etc..

In this context of changes in family structure, the European family financial resources have increased while time resources have decreased. Thus, the modern formulations and marketing of products aimed at concentrating purchases in a single space and minimize time purchase led to vigorous development of direct marketing.

Family adopt different roles depending on the state of purchase or consumption decision; the importance of the user occurs at the initial stage and the final purchase decision is taken in common. If the family, both parents have jobs, making the decision will probably be common. According to the investigations, families where the male partner is the only employee present trend of male dominance and those where both spouses are employed, decisions are made jointly.

Option to area of residence of people in Europe

Worldwide, the '90s have come large population movements between countries. In Europe, this phenomenon was caused by the collapse of communist countries in central and east. Phenomenon will probably continue, but most countries are more strongly protected in the wave of immigrants.

Also, another distinctive feature from one country to another, with implications for doing business, is to demarcate the urban-rural population segments. On the European continent's urban population, representing a significant market segment, with a specific pattern features buying, consumer lifestyle, etc.. has growth potential. Europe is among the most urbanized continents, having cca.75% of urban population⁴⁶². Over ¼ of the EU is intended to present urban use. But the differences are essential, so if in Iceland, Sweden, Netherlands, Great Britain, Denmark, Belgium, Luxembourg, Malta, the urban population in total population is high, however, in others, such as Greece, Ireland, Slovenia, Poland, Slovakia, Croatia, Romania, Bosnia-Herzegovina, Albania, Moldova, down to 60-50%. It is estimated that by 2020, approx. 80% of Europeans will live in urban areas and in the continent's 45 countries, seven of them in the urbanization ratio will be over 90%. Logical consequence is the need to increase demand for land areas affected housing, commercial premises, etc.. We are witnessing to the phenomenon of urban sprawl in Europe; the phenomenon takes place but different from one country to another, from one region to another; lead to changes of substance in lifestyles and consumption patterns on a continental scale.

Generally occurs when urban sprawl and land use conversion rate for urban population growth rate exceeds a certain area and within a certain time. Recent studies show that the area of European cities over the past decade grew by more than 5% increase, equivalent to three times the area of Luxembourg. The strongest urban expansion was observed in countries or regions with high population density and huge development - Belgium, Netherlands, Germany (south and west), Italy (north), France (Paris) and in countries with rapid economic growth - Ireland, Portugal, Germany (East), Spain (Madrid).

The urban sprawl has been determined, at the level of our continent, to the regional development policies promoted at EU level - have been directed to poor regions of the EU cohesion funds and

⁴⁶² European Environment Agency, Urban sprawl in Europe, Copenhagen, Report No, 10/2006.

structural development and modernization of infrastructure; along with numerical growth of urban population the continent's major cities began to develop small towns and surrounding areas or rural areas more developed along the transport corridor and along coastal areas in connection with river valleys. General motivations of the escalation phenomenon among urban sprawl trends are micro and macro socio-economic: increased the quality of transport systems, increasing land prices, higher housing preferences, the demographic trends, national and European traditions, customs and the cultural, attractiveness of the urban areas, and not least, increasing population mobility in the single space. Although urbanization in general, increasing the concentration of population and economic life, accusations is, particularly on environmental quality scale, there are a number of advantages and opportunities that it creates this phenomenon; it was found that land-use and consumption different forms of energy tend to be lower in urban areas than in areas with scattered population; the urban waste management benefits of economies of scale. Most of European cities and utilities have solved problems but the risk of pollution manifested in all forms is increased - air, water, noise and, in some cases, visual pollution, are realities of this.

Another trend is the growth of two times the space for a person, compared with 50 years ago. From the '80, surface built-up areas in many countries in Western and Eastern Europe increased by 20% while population grew only by 6%. One problem that stands out is the mobility and the accessibility, such European policy makers as a key driver of Europe's territorial cohesion. Number of European street transportation miles will increase by 40% between 1995-2030. Monitoring the degree of new entrants into the EU population is not in the other; the degree of congestion of the roads but costs have risen sharply. Development of local infrastructure, national and European will continue be in attention to decision makers in regional development, regarded as the very basic premise of local economic development, regional, union. The vision of urban development that meets environmental and social considerations in territorial planning policies envisaged by obtaining positive effects: policy coherence at all stages of its progress, expanding collaboration among agencies at all levels of responsibility, efficient use of structural funds EU cohesion and related environmental regulations in order to mitigate and limit urban sprawl, minimize mistakes and market failures leading to urban sprawl, in particular, towards land and housing prices soaring, the collection and dissemination of good practice in the development of compact cities, providing green spaces in urban areas, etc..

In Romania, due to the large differences between the socioeconomic life of rural and urban population migration phenomenon continues to town. In cities there is movement toward the upper class residential suburbs, while still congested areas inhabited by popular class.

The urban population enjoys a higher income level than the rural population but the issue of economic and social disparities in the urban environment can not be ignored; however, European countries examined do not face this problem as much with other countries of the world and the analysis reflected the distribution of correlations between income inequality and other socio-economic variables. We conducted this analysis to the 27 EU countries plus Norway and Iceland (Table 1) ⁴⁶³, ⁴⁶⁴, using statistical correlation coefficient.

Tab.1. Resident population in urban income distribution and inequality in EU countries + Norway and Iceland

Countries	Population resident in environment urban %	Inequality distribution income	Countries	Population resident in environment urban %	Inequality distribution income

Source: www.esa.un.org and ec.europa.eu/eurostat, 2008 year

Resulted as follows:

- between the unequal distribution of income and gross value added produced in the tertiary sector (the most important and dynamic in the continent) the relationship is inverse, low intensity;
- between the unequal distribution of income and labor productivity the relationship is reversed, low intensity;
- between the unequal distribution of income and degree of urbanization of countries examined is the reverse link, average intensity (- 0.35).

Finally, those variables affect different and cumulative income inequality in the distribution of our continent; not to be missed determine which exercise the economic development of countries, quality business, quality and operability of the legal and institutional environment, macroeconomic policies of social protection but an accumulation of reasons such as personal, psychological.

Conclusions

Each of the demo-social determinants exposed here, reflects the overriding necessity to be alert to market dynamics and transformations, including duration, with reason, the idea that business should be thinking on long term; the overall market but the segment and types of consumers, must always known, especially with the lack of supervision as it can lead to action by the competition. Or competition in the European business environment is very dynamic, with accents sometimes offensive and aggressive, willing to know the smallest details of individual behavior but also the whole European market and work to attract, convince and possibly retain customer.

CAUSAL RELATIONS BETWEEN NATURAL RISK AND BUSINESS RISK

Danu Marcela-Cornelia

University "Vasile Alecsandri" of Bacău

Faculty of Economics

After a period marked by economic and financial crisis, the objectives and the priorities focused on restoring the balances, the correlations and the proportions of macroeconomic policy makers have focused attention to optimizing the relationship between man and nature. The environmental crisis installed affects the variables of the global economy system and compared with the economic crisis, its consequences are more perennial, more complex and dangerous. Environmental crisis management is based on truthful, complete and current informations regarding the interdependencies between natural risk and business risk within the system of risks that accompany our individual and societal existence.

Keywords: system risks, pure risk based on natural, natural risk with anthropic determination, risk-cause, risk-effects, business risk.

JEL codes: M21, Q51, Q53, Q54, Q56

The general coordinations regarding the natural risk

In the system risks, the natural risk is part of the range of pure, uncertain risk, in its many forms that determine and influence the life and work of the individuals, businesses, environmental. The pure risk is the result of natural major forces action and/or determining the psycho-socio-economic and political (anthropic)⁴⁶⁵. If, initially, in economic theory was made the opinion that this type of risk is not foreseeable danger to society⁴⁶⁶, today, environmental deterioration, climate change and the knowledge economy becoming more involved in environmental management, bring to light new features of the pure risk. So, in some cases, the predictability of their achievement is very low or even zero, but in most of the cases, the expert forecasts indicate the potential risk; what is uncertain and difficult to quantify, is the severity and the extent in time and space effects.

A significant feature of the pure risk is the result of achieving: if the risk decision can result in gains or losses, in situation of the pure risk the purpose can only be negative, destructive, harmful or even disastrous. The random element in such risks determine the difficulty or even inability boundary and assessing the possible losses and the control of the risk.

Natural risks can be:

- Pure, natural based: earthquakes, hurricanes, floods, volcanic eruptions, sea currents, solar radiation, dynamic factors of climate (atmospheric circulation, monsoon circulation, etc.).
- With anthropic determination (economic, social, political, psychological): air pollution, greenhouse effect, air humidity, ozone layer, acid rain, atmospheric phenomena venture with slow onset (arid climate, desertification, snow, ice , etc.)..

Each of those risks is treated in interrelation of cause and effect; the causes can be varied, the effects also; can not be said that one issue has caused only a consequence, the spread is imminent, in time and space. Causality and determination of the risks is certified and that, in literature but in real life, both the causes and the effects are considered risks - for example, the risk of flooding – risk of an area calamity. Thus each risk is engaged in the risk management

⁴⁶⁵ Danu, M.C., Business Risk, Plumb Publisher, Bacău, 2001, p.71.

⁴⁶⁶ Colson, G., Gestion du Risque, E.A.A., Paris, 1995, p.21-28.

system so that, the effect a type of risk is due to another instantaneous, short or long time, and so on.

The effects of the business risk – causes of the natural risk

Pure natural risks based stem from accidental or fortuitous events, depending on environmental vulnerability, hovering mostly beyond the decision makers and others involved. An important aspect is the change in socio-economically produced by major risks, in terms of production, consumption, distribution of wealth nations. It should shift to small business consumers of energy and raw materials, less polluting, and focusing attention to recycling and reusing the consumer goods as long a time. It also is important to establish the human efforts towards the maintenance and preservation, cultural heritage, artistic, ethnographic, scientific, etc.. and the protect to the contact with pure risks, potential major.

If the pure natural risk are the least caused by the human factor, the pure risks with anthropic determination are generated by the human activity, the costs of their achieving being incurred in present and the consequences in future. Thru size, scale, stretching across time and space, the pure risks with the anthropic determination can be major (high dimension and low frequency) or minor (some of which take place at the enterprise level).

Given the period 1987-2007, the main trends in manifestation of the risk associated or derivatives from the business environment and their impact on the environment were⁴⁶⁷:

- In 1987 the population had a significant impact on reducing ozone, but the situation improved in 2007; as a result of increases the consumer demand, during 1987-2007, increased emission of gases, having negative impact on climate change; if air pollution in 1987 was notable, particularly in urban areas in 2007, amid increasing the urbanization, grew the degree of pollution. The water pollution is an another negative effect of the irrational human intervention on environmental conditions and ultimately on their living conditions. If in developed countries the purification, the water treatment stays in the spotlight makers to ensure a healthy water, in poor countries raising problems in connection with the water sufficiency. The water pollution, may have the forms: toxic, bacterial oxidative, thermal, it is difficult to master or to control, have harmful effects on the human and animal health, leading ultimately to address other serious risks: the emergence of diseases, diseases - cholera, hepatitis, etc.. the disappearance of aquatic life, atrophy of body functions.

- At the beginning of the period, the agricultural production had a negligible influence on the ozone layer, but methyl bromide in 2007 was an important part of the decline of the ozone layer; in the period 1987-2007 the agricultural production has contributed to climate change through emissions of methane and N₂O and lately by their growth; if in 1987 the agriculture affected air pollution by emissions of ammonia and pesticides, in 2007 it was found that these emissions have increased proportionally with increasing the agricultural production. The agriculture, through intensive and irrational use of the pesticides, herbicides, artificial fertilizers, growth promoters, affects surface freshwater, soil, shallow groundwater, and long-term, deep water reserves, spontaneous and cultivated wildlife and vegetation, and on, the food, so the man. Outside the landscape change, the modern agriculture, based on intensive technologies and techniques developed for land use and farming industries implicitly assumes recourse to mechanization, use of chemical fertilizers, the substitute feed, etc., new means genetic selection of species, varieties, etc..

- The deforestation and forest fires affecting had a negligible influence on the stratospheric ozone decline over the period 1987-2007 but, contributed to the continued growth of GHG emissions; to the degree of air pollution, the deforestation especially forest fires have negatively impacted by CO, PM, NO_x. One of the atmospheric risk phenomena with slow developping is the desertification. Among the causes of desertification are important: the global or regional climate

⁴⁶⁷ Global Environment Outlook GEO - 4, Environment for development, UNEP, 2007, p.45

change, over pasture, deforestation so negative human involvement in the use of space in which they live and work; the propagated risks are: massive soil erosion and, sooner or later the desertification. The consequences are the most severe on the natural environment and, further, on the lives of populations in developing countries who choose the alternative of adaptation to conditions at the bearable limit or the abandonment of their nomadic life and anchoring into the sedentary life of a community. The progressive achievement of this type of risk has such profound and lasting implications on the individuals, both in terms of the rudimentary lifestyle, even primitive, with all ensuing gaps and the psychological risk with fingerprints on subsequent generations.

- During the reported period, the industrial production had an enhanced influence on the quality of the environment, to the ozone layer and climatic changes, due to the lower emissions; in terms of impact on the air pollution, if in 1987 he was important, in 2007 this risk had dispersed due to the increasing industrial production in some regions of the world and decreasing in others. Direct result of air pollution are the acid rain that threaten the forests and the housing, agriculture, the lakes (extinction of the lacustrine fauna), etc.. Prevention or mitigation of this risk is only possible by limiting emissions of sulfur dioxide from large industrial facilities or transportation. Being the phenomenon by which heat is trapped in lower layers of the atmosphere, resulting in a gradual warming of the planet, concomitant to the decreasing of the temperature in the stratosphere, greenhouse effect has origin as the water vapor, carbon dioxide, methane, ozone, chloro fluoro carbonates and other gases. Their concentration started to increase after 1800, so that after 1990 the average total value was with 25% higher than pre-industrial period. If the emissions would grow in the current rate, global temperatures would rise by 0.30 degree per decade, which would contribute to the desertification in the Sahel, cyclones, sea currents, etc.. An issue that raises more and more interest of the specialists but also of the business man is the waste. Endangering the environment with the transport and the storage of hazardous materials, increases the risk and the vulnerability which the modern society must cope with. With the development of the production, started by the industrial revolution, the trends were concentration, specialization in production followed by the concentrating, waste accumulation. In many cases, however, they were converted into secondary products⁴⁶⁸, used or even in the new products. Amplification of the process product specialization resulted in obtaining waste more complex and dangerous, increasing the risks derived from their existence simply.

- The tourism practiced unbalanced, irrational, can lead to excessive concentration of population in certain areas and endangering the ecosystem concerned.

- Energy production had little influence on the ozone layer over the range examined, however, the negative impact on the increased climate change; the energy production is an important cause of increasing air pollution, which, between 1987 -2007, has spreaded the globe.

- The transports had a bad contribution to the ozone layer in 1987 slightly were improved in 2007; on the climate change, the negative effects of gas emissions from transport were multiplied, in 1987 the transports have negatively acted on the air pollution (through emissions CO, PM, NOx) and in 2007 had a different impact from the one region to the another, from the one pollutant to the another. The consequences of displacement of the vehicles are: harmful gas emissions, recycled waste production, pollution concentration in large urban, the adverse effects on human health. Although the highest rate of increase in the number of cars has been registred in Europe, followed by Asia-Pacific region, the highest number of cars hold Europe and North America. Air quality is threatened in the developing countries, particularly where concerns and means of defense, protecting human health and living environment are minimal. Also, pollution from the maritime transport of petroleum products, mineral or other is very serious. In case of

⁴⁶⁸ Giardini, O., Certainty Limits - Facing Risks in the New Economy of Services, Edimpress-Camro Publisher, București, 1996, p.89-91.

stranding transportation such, the vegetation and the marine life are the first affected; plus the natural agents that can move to the coast oil stains, chemicals, etc..., causing the marine disasters.

- The negative impact of the consumption basic goods on the ozone layer decreased between 1987-2007 - and was maintained on climate change; on the other hand if the amount of biomass in 1987 was on air pollution effects in general in 2007 its growth has occurred mainly in rural areas. For luxury goods, consumption effects of ozone damage were decreased in terms of gravity; climate change has evolved from “major” to “dissemination of the growing emissions”; on the air pollution have negative effects in growth.

Simultaneously with the accumulation of industrial waste, widening consumption for the growing population whose needs are more difficult to satisfy, but it meant increasing quantitative and qualitative waste produced. The harmful effects of the existence of waste whether sterile or industrial, municipal, special (for incineration), toxic, nuclear, etc., can mention: disasters or sinister caused by the defective products continue functioning, whose physical wear is very high (explosions, fires), contamination of water, soil, air source due to the storage or discharge into areas that are not allowed, the visual pollution caused to the natural landscape and the proximity of some institutions, monuments, hotels, etc. All these risks come within the human domain and have adversely effects on the individual health and life. Furthermore, the incidences of the visual pollution on the individual are reflected in the risk of image on some sightseeing, cultural and non repetition of experience what obviously has repercussions on the company, organization. Because of the many effects arising from their existence, one of the major concerns of the current services economy is the prevention of waste and recycling

The minimizing of the business risks stemming from the global businesses, affecting the natural environment can be achieved using the instruments: technical progress and an operational regulatory environment. Thus, in recent years, the scientific researches and the technical innovations offer solutions to mitigate the downward trend of the ozone layer, more efficient use of energy sources and reducing dynamics of the climate change and as well the pollution shrinkage; the legal and institutional environment has evolved from a formal presence in tracking of the health effects of global business world to a living presence, active presence, mainly in developed countries.

Effects of natural risk – causes of business risk

From all the range of risks which operating in one way or another on the individual or his social environment, the pure risks, based on natural, have the most severe consequences and are the less frequent. Some of them have already made their presence felt by very serious consequences, others with slower progress will be felt by the future generations. Due to the multitude of these types of risk and their cost to society, is more acutely felt need to develop worldwide solidarity, the creation and strengthening global awareness that human activities are becoming increasingly interdependent.

Like pure risks based on natural, the natural risks with anthropic determination are systemic conditioned with other risks, both natural and entrepreneurial. Causal links between the changes in the natural environment and the anthropic environment can be highlighted as follows⁴⁶⁹:

- The air pollution in the form of the concentration and the deposition of pollutants recorded in the period 1987-2007, decreased in developed countries and maintenance in the developing countries; the exposure to this type of risk increased in developing countries and declined in the developed countries; effects on human welfare are on: health (respiratory and heart diseases, premature death and morbidity, asthma in children), the food security (low yield crops), the security and the physical security (border conflicts), the socio-economic situation, other effects (lower tourism potential, visibility, atmospheric effects, etc.). The soil acidification and

⁴⁶⁹ Global Environment Outlook GEO - 4, Environment for development, UNEP, 2007, p.50-51

eutrophication effects are: food security - increasing decline of forests and ecosystems, the minimizing of the potential of fisheries, safety and physical security - corrosion of materials and loss of biodiversity, socio-economic development - infrastructure maintenance costs, the decreasing of the touristic potential, etc.. Formation and concentration tropospheric ozone in the northern hemisphere will increase the effects: on the environment - exposure of the cultures, of the human and natural ecosystems and further on the health of individuals - respiratory problems, mortality and morbidity; on physical security - loss of biodiversity; regarding the economic and social status - low income, especially to the poor, all kinds of restrictions.

Increasing the levels of concentration of toxic air (heavy metals, PAHs, VOCs) has effects on air quality and for the people - cancer diseases; the food security is threatened by the contamination of food and socio-economic impact involves increasing health costs. Increasing the emissions of POPs will increase the deposition in natural ecosystems, the bioaccumulation in the food chain threatening food security, human health, the sustainability of fishery resources and in terms of socio-economic - minimizing trading of the fish species, increase the vulnerability of polar bears, etc.. For developing countries, pollution, generally, air, in particular, affects the exposure of population, growing of the mortality and a respiratory diseases and economically - the vulnerability of poor communities, impact on women and children.

- Climate change manifested by the stabilization of GHG concentrations will have consequences on the environment, such as: increasing of the air and water temperature, extreme weather events, precipitation, melting ice, ocean acidification; to the people are estimated the deaths amid stress, the different types of disease. The economic and social risks are: the risk of starvation, the decreasing of the agricultural production, the increasing of vulnerability of people, especially the poor, loss of property, threats to the livelihoods of communities. A survey of the managers' perceptions regarding the effects of climate change on business done in 2008⁴⁷⁰, shows four types of risk considered significant: legal risk, physical risk, the risk of image, the risk of litigation. Of these, the legal risk was found the most dangerous followed by the physical risk; the legal risk has a high level in the fields of automotive, construction materials industry, mining, metallurgy, oil and gas, transportation, utilities; a medium level in: aviation, chemical industry, financial sector, manufacturing. The physical risk is assessed as having high negative effects in the domains: agriculture, forestry, health, pharmaceuticals, insurance, tourism and the average level in construction, construction materials industry, finance, retail. The risk of image is claimed as medium in the in aviation domain. The natural risk produced in business environment requires makers to develop strategies to prevent, counteract it. The preparedness of the businesses environment to minimizing the impacts possible of the natural risks is considered to be very good in the fields of telecommunications, food and beverages, chemicals and very weak in transport, health, tourism, aviation, financial sector.

- The decreasing of ozone from stratosphere and maintaining the concentrations of ozone in the stratosphere will result in maintaining the radiations, ozone depletion at the poles and for people - cancer of the skin, eyes and immune system hazards. Food safety will be affected by decreasing fish stocks (especially phytoplankton) and food production. From the perspective of socio-economic impact translates into: decreased time spent outdoors, changing lifestyles, increasing spending to prevent exposure to ultraviolet radiation, etc..
- Loss of biodiversity and degradation of the ecosystems, as natural risk with anthropic determination, have the impact on business the different types of risk, such as⁴⁷¹:
- physical risk (reflected in reduced productivity, failure or shortage of resources and increased costs, particularly for companies that depend on the potential of plant, animal genetic material, etc., interruption or cessation of activities due to natural disasters products);

⁴⁷⁰ Climate changes your business, KPMG's Review of the business risks and economic impacts at sector level, 2008, p.36-39

⁴⁷¹ Biodiversity and business risk, World Economic Forum, Jan.2010, p.5, 8, 9

- legislative risk (manifested by restrictions on access to land and resources affected by natural risks, litigation, governmental limitations on the exploitation of resources, higher prices for products from areas threatened by loss of biodiversity);
- market risk (manifested mainly by changing consumer behavior);
- the risk of image (of firms exploiting resources or produce outputs with a negative impact on biodiversity);
- financial risk as a result of reduced cash flow, increasing the costs to firms concerned; risks on the marketing channels (the control of channels, increased costs).

Among the economic consequences of biodiversity loss and degradation of ecosystems, it notes: loss of bee colonies in the U.S., in 2007, meaning the \$ 15 billion financial losses; the soil erosion in Europe produces the economic damage of 53% per year; the pests cause the damages to the U.S., UK, Australia, India, Brazil, South Africa, agricultural, around of the 100 million dollars annually.

Of pure risks, natural disasters are the most serious; the volcanic eruptions lead to amplification of tidal level, lava flow, deaths in overpopulated countries, clouds of ash; the Katrina hurricane⁴⁷² hit the U.S. in September 2005 causing physical damage, economic, financial, psychological - most oil installations from the Gulf of Mexico were shut down, were increased the global oil prices, fell the GDP of U.S., it lost approx. 500,000 jobs in the New Orleans area and Gulf of Mexico, the financial losses estimated to the \$ 100 billion. Eyjafjalla eruption volcano in March 2010 caused the loss of European tourism 1.72 billion aviation industry losses of 200 million and closed the airspace of 12 European countries; by delays to the employees there have been losses of labor productivity € 1.5 million, suffered losses in areas: air transport industry, tourism, oil prices, courier service and perishable goods⁴⁷³.

The management of the natural risk should be included in the overall strategy of the firm⁴⁷⁴; a study realized by l'Economist Intelligence Unit in March 2008, on a number of 320 managers worldwide, reflect that 41% of respondents take into account the natural risks in launching policies new products, 32% in the selection of suppliers or customers, 26% in the penetration of foreign markets and 19% in shares acquisition or merger. Managing these risks depends on the quality of national business environment, the type of activity, the company's history and, not least, the ability of the entrepreneur.

Conclusions

Even if the action of natural factors can not be stopped, may be limited. Managers are required to apply effective risk management programs to reduce the frequency of occurrence and the severity of the risk. As it concerns the consumer, the achievement or the not of the natural risk and the perception on his consequences are dependent to the specific natural, economic, social and political conditions from the environment in which he lives and the particularities cultural, behavioral, personality, lifestyle desired or accepted, individual. Both for the companies and for the consumers, preventing, countering, mitigation of the natural risk effects and the relationships with mutual determination with the business risk is possible by using the information correct and lucid. Management of natural risk is based on the undeniable reality that the natural environment and managing this relationship supports the development of business and default risk-taking business. Management of business risk may not be operational without identification, assessment, treatment and control of all types of risk facing the company, primarily, to natural. Is a two-way relationship.

Transition from school to work is a major research topic in the last. The main reason is related to the fact that after graduating finding a job is difficult and more often the graduates occupy vulnerable positions.

In Romania, one year after graduation, the insertion rate is 60,9% for university graduates and 35% for those with secondary education. This paper examines the process of insertion of higher education graduates in the Romanian labor market, focusing on economic profile graduates and using a national survey conducted on a sample including the 2003, 2005 and 2007⁴⁷⁵ promotions.

Keywords: labor market, insertion, youth unemployment

JEL: J01, I23

1. Literature review

The process of integrating young people into the labor market it is not smooth, in nowadays being accompanied by a period of turbulence and uncertainty. Young people are a great resource for the development of society, but this potential is not fully exploited because of the labor market inefficiency. According to the report published by the EU (2008), the youth position on the labor market is difficult not only in Romania but across Europe.

Currently, young people aged between 15 and 24 represent 18% of world population (1,2 billion, the United Nations World Report, 2007). Although the overall situation of young people has improved, there is growing concern that many of them cannot prosper. Inability to help young people reach a healthy adulthood may lead to their exclusion and marginalization.

The transition from school to work means the process of insertion/integration of graduates, of young people leaving the education system, on the labor market. Specialists believe that young people transition from school to work has become more protracted and difficult now than it used to be several decades ago (OECD, 1996, 1998). Currently, youth transition to work has become more complex, fragmented, extended, with a highly individualistic accent, depending more on personal skills for negotiating (Cartmel et al., 2002). Accordingly to an OECD (1998) study youth integration is not smooth, being often accompanied by a period of turbulence and uncertainty.

It is widely accepted that labor market integration of young people play a decisive role in determining their economic and social welfare and their future development. In this direction, the concept of transition from school to "decent work" was developed (ILO 1999 definition:

⁴⁷⁵ Research contract no.91-020/2007 PN-II Partnerships in priority areas, *Determinants of labor market insertion of higher education graduates*, coordinated by the National Scientific Research Institute for Labour and Social Protection (NSRILSP)

productive work in conditions of full equality of liberties, security and dignity, while labor rights are adequately protected and valued, together with the widest coverage of full social security schemes).

Bucker (2008) considers that uncertainty regarding the evolution of labor productivity is an important factor that slows down the process of integrating young people into the labor market and that is why education plays an important role.

Labor market flexibility plays an important role in the process of absorption of newcomers. This shows its ability to respond to changes occurring in the economic and social environment. Relations between labor market and other markets are made difficult by the labor market rigidity. Labor market flexibility is a necessity arising from new developments in the labor market such as the euro adoption. Several European countries have found a way to reconcile stability, flexibility and security and to create more jobs without sacrificing work quality (Denmark, Finland, and Italy). Countries with high flexibility have higher employment rates especially among the youth and faster conversion rate of temporary employment into permanent employment (in the last three years, approximately 65% of temporary job became permanent in Denmark, and 55% in the Netherlands).

In 2008 EU made an analysis on the young people integration in the labor market and divided the EU countries into four groups according to the youth labor market functioning and their major inconveniences. In this case we had: a) *friendly* labor markets which is characterized by high employment levels among young people (Austria, Denmark, Sweden, Finland, Netherlands, England), b) rigid labor markets (France, Belgium, Germany, Luxembourg and Slovenia), c) split labor markets (Greece, Italy, Portugal, Spain and Poland), d) major dysfunction between the training and the labor market (Czech Republic, Estonia, Hungary, Lithuania, Lithuania, Slovakia, Cyprus, Malta, Romania and Bulgaria).

2. Methodology and database

The data used was obtained as a result of studies conducted under the research contract no.91-020/2007 PN-II *Partnerships in priority areas, Determinants of labor market insertion of higher education graduates*, coordinated by the National Scientific Research Institute for Labour and Social Protection (NSRILSP), in which the authors have participated as members of the AES research team (consortium partner). The methodology used for data collection consisted of a survey at the national level in the second half of 2009. 2100 youth who graduated in 2003, 2005 and 2007 were interviewed.

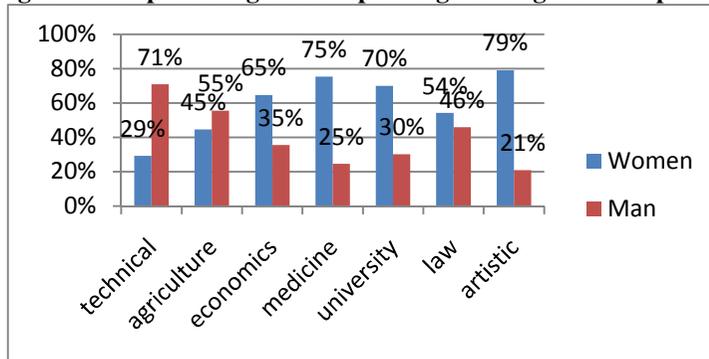

3. General characteristics of economic education graduates

Choosing the right major is very important for successful integration in the labor market. According to the 2009 ARACIS (the regulatory authority for higher education in Romania) report, the most important four factors determining the preference for a certain college are: *interest in the field, desire to know, wish to have high income, and wide public prestige that the university enjoys*. In relation to these factors, economic higher education occupies a privileged position, given the fact that during the 2008-2009 (and beyond) academic year most youth opted for economic sciences (32,4%), university-pedagogic sciences (29,3%) and technical sciences (19,7%). Preference for economic education becomes even more obvious when higher education is done in the public sector, where most students are enrolled for economic (44,3%), university education (26,3%) and juridical education (24,6%), according to the National Statistics Institute. As for the influence of family environment in choosing the career, matching the education level of parents with those of their children provide important clues (according to National Institute of Statistics). Thus, it was observed that 87,4% of young people from families with higher education background have a similar educational level. Among young people whose parents had an average educational level, 67% also had secondary education and only 21% higher education.

Depending on the graduated profile we can say that: for medicine graduates, the head of the family is, at a 47% rate, a faculty graduate, the same situation is found for the artistic and technical field (23% and 22% respectively). For other profiles, including the economic section (31%), the head of the family is a high school graduate. We can say that education level of parents greatly influence their children education level.

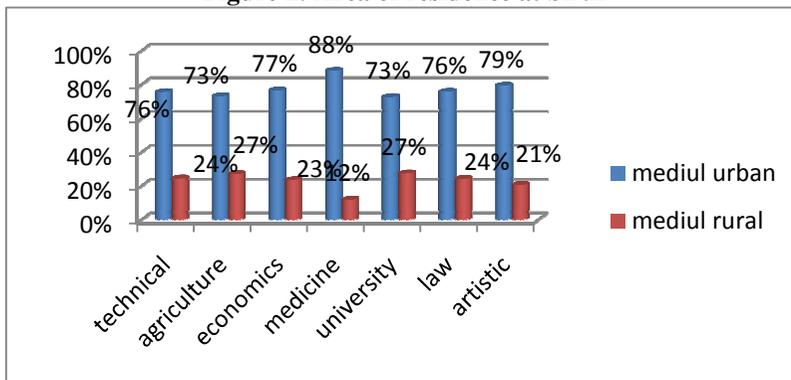

Regarding the respondent gender, it can be seen in the figure below that men specific fields are technical and farming. Economic profile graduates are largely (65%) female (Figure 1).

Figure 1: Respondent gender depending on the graduated profile

Most respondents live in urban areas (76%), which mean that access to education can be influenced to a large extent by the individual background. For the economic field only 23% came from rural areas (this being one of the lowest percentages in relation to the graduated profile, Figure 2).

Figure 2: Area of residence at birth

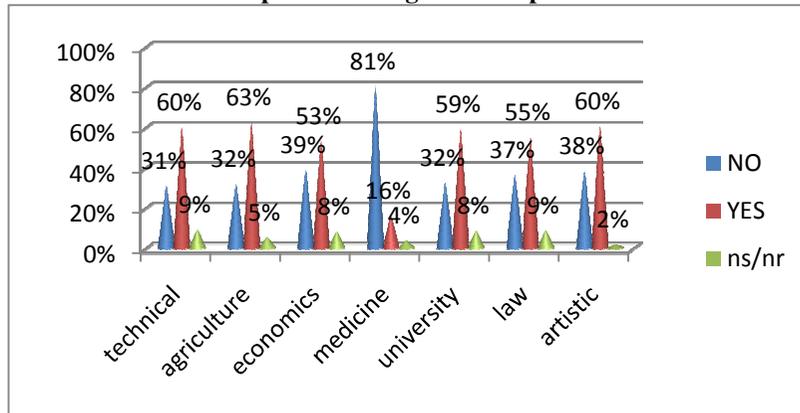

The participation in permanent education programs to complement the knowledge gained is relatively small. Thus about 1/8 of the investigated graduates have attended postgraduate courses (304), of whom the vast majority (86,5%) are master graduates. It is noted the increasing in the number of those attending postgraduate courses as a result of the Bologna process implementation. The post graduate profile may be presented in some defining lines:

- Graduates of university studies (30,7%), economic studies (27,6%), technical studies (17,0%), legal studies (9,5) and medicine studies (8,9);
- Faculty graduate – 92,9%;
- Public education graduate – 77,5%;
- Daily frequency graduate – 82,3%.
- First faculty graduate – 99,2%.

Analyzing respondents' opinion on occupational mobility, territorial and job stability there is a greater tendency to occupational mobility and territorial mobility than on external mobility. Of course, this desire is associated with a higher salary. However, surprisingly, the dominance came from those who prefer the job security and lower pay than an unsafe workplace and a higher salary. The authors interpret this situation by the worsening economic conditions at the time of the survey. Depending on the graduated profile, those with a lower mobility are those who have graduated medicine, due to the fact that they can change their occupation more difficult. The difference between those who want and those who do not want to change their occupation is the smallest for economic graduates (53% against 39%), due to close relationship between various opportunities offered by the labor market and employment benefits.

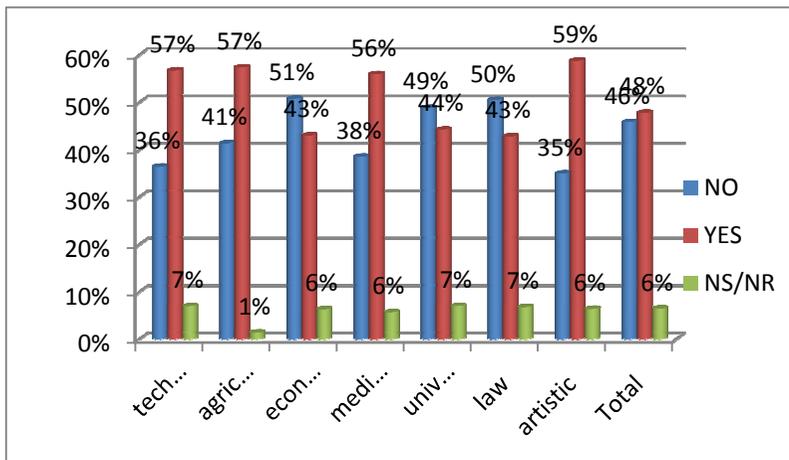

Figure 3: Structure of graduates who wish to change their occupation for a better job compared to the graduated profile

Regarding external mobility, 48% of the respondents would leave the country for a better job, while 46% would not. We believe that the small difference between the two options is given by the inertia of the social and cultural (including language) environment change and the narrow specialization of the Romanian labor market (which would indicate poor market integration in relation to that of the EU).

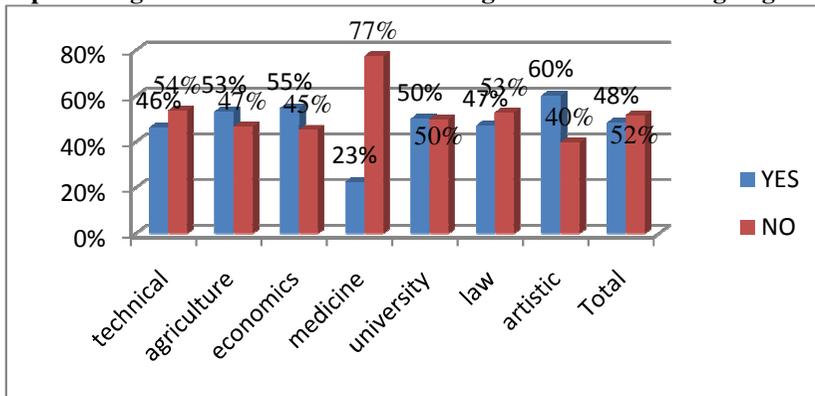

Analyzing the same problem, but depending on the area completed (Figure 4), it is noted that the vast majority of economics, law and university graduates would not want to go to another country, while other graduates would be willing to leave the country. This situation shows us that the first fields of studies are too much customized to the requirements of the Romanian labor market, while the other fields are more universal, having a bigger opening to the EU labor market (Figure 4).

Figure 4: External Migration depending on the graduated profile

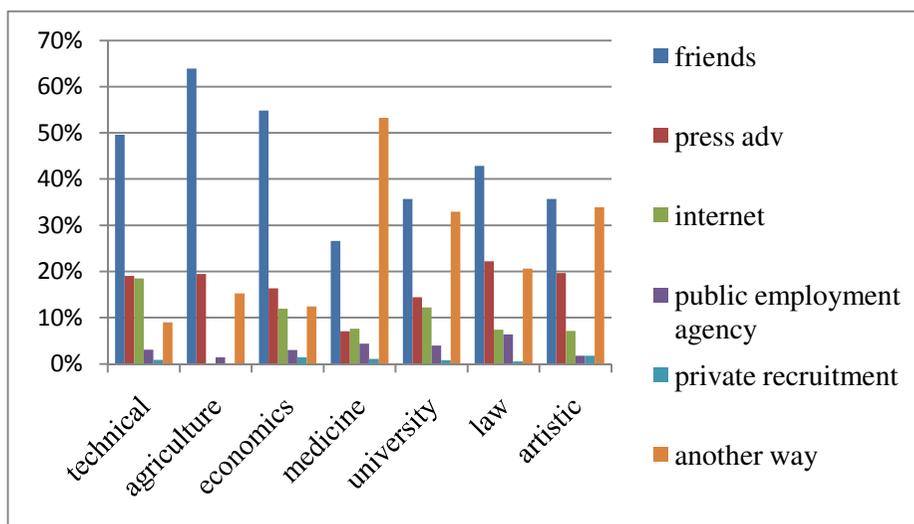

An important factor for the young graduates insertion in the labor market comes from professional experience. From the chart below we see that 52% of the respondents had worked before graduation. Compared with the graduated profile, we find that the medical graduates (77%) and those in the artistic field (60%) did not work while the economic graduates (55%) have worked. Young people want to work mainly because they need money (due to increased economic and social needs), because they wish to impress or show that they can take care of them.

Figure 5: The percentage of those who worked before graduation according to graduated profile

Regarding the way of job searching, most of the respondents used their acquaintances, friends (44%). From the figure below we see that economics graduates have the same trend, the difference being made only by medical graduates who have appealed mainly to a different way than the one listed in our questionnaire. This might suggest the existence of certain functional rigidities on the Romanian labor market. These rigidities are compounded by large disparities between residential environments in relation to the origin of higher education graduates, indicating an underdevelopment of the rural potential.

Figure 6: Searching for a job

4. Conclusions

Young people insertion in the labor market appears to be more difficult today than in the near past. This causes unemployment and partial unemployment among young people to be a global problem. Young people represent 25% of the global population of working age but totals 43,7% of the total unemployed - almost one out of every two unemployed is aged between 15 and 24 years.

There are many who blame the labor market rigidities for this situation as there are opinions that young people are excessive hedonism victims. Beyond the possible explanations, the phenomenon is quite serious since the youth are the main source of renewal for society and economy, the traditional promoters of progress. If the phenomenon tends to confirm on the medium and long term, than even the development of human society is in danger.

Romania is part of this trend of difficultly integrate the young people into the labor market. However, the success rate of higher education graduates is quite good (60,9%) compared with that of the high school graduates (35%). Choosing the economic profile has become the rule, this being even more evident for public education. This rationale is supported both by the family environment (due to secondary education domination among the graduate's parents) and the multitude of benefits and opportunities offered by this profile. However, the economic profile graduate is less mobile in changing the career and external migration. Mostly women, but moderate compared with the artistic profile, academic and medical graduates, the economic graduate has previous experience in the labor market than average, he comes from urban areas, rely on friends and acquaintances to acquire a job (but not as much as those from agricultural profile) and he is not so decided in changing the job.

The experiment engaging 50 participants was performed to model and identify the determinants of the players' risky behavior. Here, a questionnaire and a bimatrix game containing the negative/zero payoffs were used to identify the players' motives to play risky strategies. Besides the concrete form of the payoffs, the individual risk attitudes were also proved to be statistically significant for risky behavior of the players.

Keywords: Bimatrix Game, Experiment, Risk, Dominant Equilibrium, Maximin, Laplace Insufficient Reason Criterion.

JEL: C9, C91, C92, D84

1. Introduction⁴⁷⁶

An increasing amount of attention has been drawn in recent years to the rapidly growing branch of economics science named Game Theory and Experimental Economics. It is partly because of the fact, that they incorporate concepts such as irrationality and uncertainty, dismissed or marginalized by the classical economics. It also offers explanations to various “real life” economic situations. To do so, it often uses a powerful tool – matrix games. Games, simplified human interactions and situations, expressed in this form allow for conduction of clear, simple but still valid experiments. Players are asked to choose from the set of strategies. We may study their choices in order to better understand the dynamics of decision-making. Decisions over strategies often converge to equilibrium, such as the one described by John Nash, where mutually best response strategies intersect (Nash, 1951). To determine other potential sets of strategies to which the players may converge in the game, we may use techniques offered by the decision theory (see Hansen (2005) for an overview) such as maximin (Pruzhansky, 2003), which alongside with the Nash equilibrium, we use extensively in this paper. Other very interesting approach in the field of decision under uncertainty is a Laplace insufficient reason criterion. The Laplace's argument makes use of Jacob Bernoulli's Principle of insufficient reason. The principle is that if no information is available about the probabilities of the various outcomes, it is reasonable to assume that they are equally likely (Pažek, 2008).

⁴⁷⁶ Paper was supported by the grant VEGA No 1/0788/10

2. Model

Let $Q = \{1, 2\}$ be a set of players and sets $I = \{1, 2, \dots, m\}$ and $J = \{1, 2, \dots, n\}$ be their strategy space. The payoffs of player 1 and player 2 are defined by the matrices $\mathbf{A} = [a_{i,j}]_{i \in I; j \in J}$ and $\mathbf{B} = [b_{i,j}]_{i \in I; j \in J}$ respectively. Then, a two player game in normal form is defined as

$$\{Q = \{1, 2\}; I = \{1, 2, \dots, m\}, J = \{1, 2, \dots, n\}; \mathbf{A}, \mathbf{B}\}.$$

The strategies $i^* \in I, j^* \in J$ are the equilibrium strategies if for $\forall i \in I$ and $\forall j \in J$ the following holds: $a_{i,j^*} \leq a_{i^*,j^*}; b_{i^*,j} \leq b_{i^*,j^*}$. If the game has two or more equilibria denoted (i', j') , and (i^*, j^*) is the equilibrium strategies pair for which $a_{i^*,j^*} \geq a_{i',j'}; b_{i^*,j^*} \geq b_{i',j'}$ is satisfied, then (i^*, j^*) are called the dominant equilibrium strategies.

Alternatively, players can choose not to play the dominant equilibrium strategies, but rather to maximize the minimum guaranteed payoff, using the maximin criterion. In this case, player 1 (row matrix player) will select the strategy

$$i^0 \in I; \max_{i \in I} \min_{j \in J} (a_{i,j})$$

and player 2 (column matrix player) will respectively select the strategy

$$j^0 \in J; \max_{j \in J} \min_{i \in I} (b_{i,j})$$

The third option for both players is to play according to the Laplace insufficient reason criterion, where both players calculate their expected payoff of their strategy taking into account the equal likelihood of each outcome within the chosen strategy. According to this criterion, player 1 will select the strategy

$$i^L \in I; \max_{i \in I} \left(\frac{1}{n} \sum_{j=1}^n a_{i,j} \right)$$

and player 2 will respectively select the strategy

$$j^L \in J; \max_{j \in J} \left(\frac{1}{m} \sum_{i=1}^m b_{i,j} \right)$$

Our experiment featured a two player game with the following payoff matrices for treatment HIGH RISK:

$$\mathbf{A} = \begin{bmatrix} 5 & -8 \\ 3 & 5 \end{bmatrix} \quad \mathbf{B} = \begin{bmatrix} 6 & -9 \\ 4 & 5 \end{bmatrix}$$

For this pair of matrices according to our previous definitions the dominant Nash equilibrium strategies are $(i^*, j^*) = (1; 1)$. If players choose to maximize their guaranteed payoff, then they will select the strategies $(i^0, j^0) = (2; 1)$, and if they choose to play according to the Laplace insufficient reason criterion, then they will also select the strategies $(i^L, j^L) = (2; 1)$.

Treatment LOW RISK featured the following pair of matrices:

$$\mathbf{A} = \begin{bmatrix} 5 & 0 \\ 3 & 5 \end{bmatrix} \quad \mathbf{B} = \begin{bmatrix} 6 & 0 \\ 4 & 5 \end{bmatrix}$$

Just as in treatment HIGH RISK, the dominant Nash equilibrium strategies are $(i^*, j^*) = (1; 1)$, the guaranteed payoff maximizing strategies are $(i^0, j^0) = (2; 1)$ and the Laplace insufficient reason criterion strategies are $(i^L, j^L) = (2; 1)$. Since guaranteed payoff maximizing and Laplace criterions lead to the same results, we will not distinguish them further on.

Note that in both pairs of matrices the combination of strategies $i = 1$ and $j = 2$ results in a loss compared to any other combination of strategies. Therefore we will call these strategies risky and the opposite strategies $i = 2$ and $j = 1$ safe strategies in both treatments.

3. Experimental setup

Experiment was conducted as a classroom experiment at the Faculty of Economics of Technical University of Košice in the fall semester 2010. The experiment was run using ComLabGames software, which is designed to conduct experiments with players over the Internet. Every session lasted approximately 90 minutes and was conducted during the seminar of the optional subject Game Theory. A total of 50 undergraduate students participated on the experiment, of which 22 individuals participated on the treatment HIGH RISK and 28 individuals participated on the treatment LOW RISK. Among all players, 24 players were female and 26 players were male. Each treatment consisted of ten rounds. At the beginning of each session, supervisors invested 3 € into jackpot. Afterwards, each student was asked whether he wanted or not to participate on the jackpot. Supervisors then collected contributions of all the players that wanted to participate on the jackpot. The more someone invested into the jackpot, the bigger his claim on the final jackpot which included the 3 € invested by supervisors. The final payoff of each player was calculated by the supervisors according to his contribution on the jackpot and on his total score. Then, the players were asked to answer a short questionnaire, which was focused on the player's attitudes toward risk.

After, the experiment commenced. The software randomly and anonymously matched players into couples and then they started playing the matrix games. The payoff given by the matrices represented a score for the given round. After completing 10 rounds, the students were paid their final payoffs taking into account the total score they accumulated during the experiment.

3.1 Treatment HIGH RISK

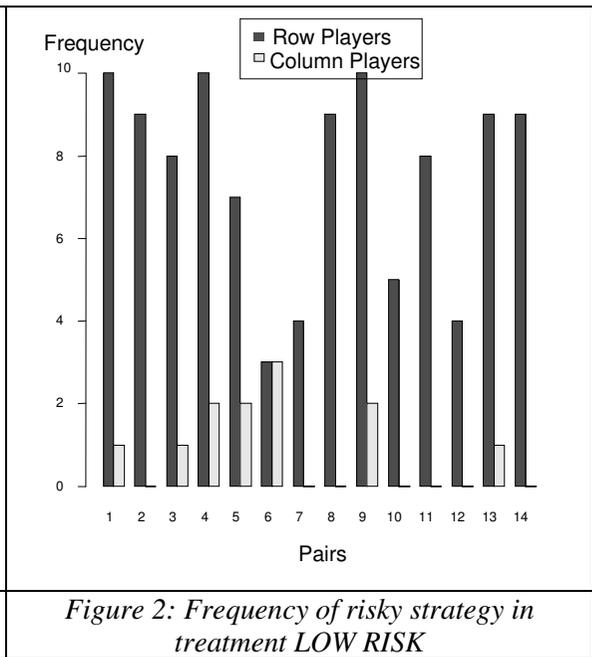

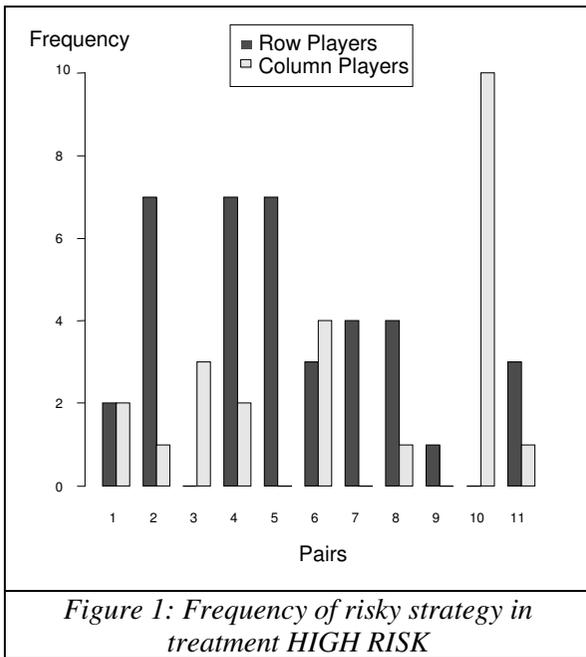

In treatment HIGH RISK the risk cell (the combination of risky strategies) contains negative payoff points (-8,-9) for both players. The hypothesis is: the presence of the risk cell containing negative points reduces the frequency of risky strategies of players in spite of abandoning the dominant equilibrium and lowering the total possible score of both players.

In treatment HIGH RISK, 14 females and 8 males participated. Results of treatment HIGH RISK are visualized in Table 1. Results show, that in the majority of cases (48,18 %) the combination of safe strategies was selected, meaning that players rather avoid the possibility of losses by reducing their gains and playing according to the maximin or the Laplace insufficient reason criterion.

	$j = 1$	$j = 2$
$i = 1$	30,00 %	4,55 %
$i = 2$	48,18 %	17,27 %

Table 1: Results in treatment HIGH RISK

Among row players, the risky strategy occurred more often than among the column players. Figure 1 shows the frequency of the risky strategy among row players and column players.

3.2 Treatment LOW RISK

In treatment LOW RISK the risk cell contains (0,0) points for both players. The hypothesis is: since the risk cell contains 0 payoff points and not negative points for the players, it will not reduce the frequency of risky strategies compared to treatment HIGH RISK. Thus, players will be able to reach the dominant equilibrium more often than in treatment HIGH RISK. In treatment LOW RISK, 10 females and 18 males participated. Results of treatment LOW RISK are visualized in Table 2. Results show, that in the majority of cases (67,86 %) the dominant equilibrium was reached. In other words, players played according to the dominant equilibrium criterion.

	$j = 1$	$j = 2$
$i = 1$	67,86 %	7,14 %
$i = 2$	23,57 %	1,43 %

Table 2: Results in treatment LOW RISK

Figure 2 shows how often the risky strategy occurred in the treatment LOW RISK. Compared to Figure 1, row players aren't risk averse any more.

3.3 Questionnaire

The questionnaire was aimed at determining players' attitudes toward risk. First two questions concerned the sex and the number of siblings of the players. Third question investigated the players' rate of trust toward banks, savings-bank, insurance companies and stock markets. Fourth question asked the players, whether they would buy some good or service from brand they did not know. Fifth question asked the players, whether they would be willing to lend money to a related person without knowing the purpose of the loan. Sixth question inquired whether players had borrowed something in the past and haven't given it back by now. Seventh question asked the players if they have used the services of a betting agency at least once. Eighth question verified whether the players actively participate in charity. Ninth question asked the players whether they would be willing to abandon their financial reward in favor of someone else.

4. Results and Discussion

This study was focused on the investigation of risky investment strategies in the context of the investors' personal characteristics. Here, gender and number of siblings as well as three trust and risk factors were investigated.

Based on the empirical analysis, in case of treatment LOW RISK female players used the risky strategy more frequently than male players ($F=1,027$, $p=0,048$). In treatment HIGH RISK this hypothesis proved to be statistically insignificant.

Investigating the influence of the number of siblings on the risky behavior of the players, proved that for the treatment HIGH RISK, selecting of the risky strategy was preferred by players having 1 sibling ($F=3,115$, $p=0,003$). In case of LOW RISK treatment, this distinction was not statistically significant.

The link between the preference of the risky strategy choice and the investor trust/risk attitude was also examined. In both treatments, the statistically significant differences in accordance to the mistrust factor "Investment into the unknown trade-mark good" ($F=0,876$, $p=0,045$ – HIGH RISK) and ($F=3,098$, $p=0,049$ – LOW RISK) were identified. If considering the trust factor „Active charity participation“, the risky behavior difference was also statistically significant ($F=1,089$, $p=0,034$ – HIGH RISK) and ($F=1,112$, $p=0,001$ – LOW RISK). Last investment factor „Using the betting agency services“ was also proved to be significant in both treatments ($F=0,845$, $p=0,009$ – HIGH RISK) and ($F=0,817$, $p=0,04$ – LOW RISK).

5. Conclusion

Based on the above presented research results, we can conclude that individuals expressing their positive risky attitudes in real situations, preferred risky strategies more frequently even in the experiment in both treatments.

Up to now we were only considering part of the social background and personal characteristics of players. However, we also proved that player preferences considering the risky strategy differed based on the treatment ($z= 3,53$, $p =0,002$). This means that players do not play by the same criterion in both treatments, but rather change the criterion they play by depending on the treatment they are faced with. In treatment HIGH RISK they played according to the maximin or the Laplace insufficient reason criterion and in treatment LOW RISK according to the dominant equilibrium criterion.

A NEW CHALLENGE FOR THE ROMANIAN COAL INDUSTRY: ELIMINATION OF THE STATE AID

Gruian Claudiu-Marian

West University of Timisoara

Faculty of Economy and Business Administration

According to the European Commission decision N 239/2007 the Romanian coal industry will receive state aid by the end of 2010. After this period public companies in this sector will finance the costs of current production and investment entirely by their revenue. This article presents a short literature review regarding the subsidization of coal industry, shows the evolution of the mining industry in Romania so far, and identifies opportunities for continuing coal production after December 31, 2010 without state aid. The paper concludes that the abolition of subsidies in is a positive measure but it must be taken gradually and responsibly, in order to ameliorate the negative effects on social and natural environment.

Keywords: coal industry, state aid, National Hard Coal Company

JEL code: Q30, Q38

1. Introduction

Reorganization of the Romanian coal industry is a problem that caught the attention of Romanian Government the two decades. Given the fact that 2010 is the last year for coal production direct subsidization (EC Decision N 239/2007), all economic and social actors directly concerned about the future of mining worked together to try solving this problem. The results of the cooperation were materialized in the development and implementation of Mining Industry Strategies (MIS: 2004-2010, 2006-2020, 2008-2020) that led to an improved situation and decreasing losses. Despite these efforts 2011 will be a difficult year for the continuation of coal extraction, particularly for the National Hard Coal Company.

2. Coal subsidization: short literature review

Coal subsidization is a well known government policy, used in many countries over time. Because of the geological conditions in most European countries the hard coal extraction costs are significantly higher than in other countries in the world. Subsidization is the only way to make domestic production competitive. Although it has been criticized for decades by many respectable economists the phenomenon hasn't completely disappeared but it has significantly reduced. One of the arguments against coal subsidizing refers to the fact that mining and the burning of coal is polluting and in stead of paying subsidies the governments should apply taxes to coal production and consumption (Anderson, 1995).

Germany, for example, has been subsidizing the hard coal mining sector since 1958, spending about EUR 128 billion between 1958 and 2002 and is considered the largest supporter of hard coal subsidization (Storchmann, 2005). There is no other subsidy that has been granted so many years at such a high level in Germany. Other European countries where hard coal subsidization persisted are Spain and Poland- the biggest coal producer in Europe with 84 million tones in 2008 (IEA, 2009).

A more recent article (Frondel M. et al, 2007) analyses the most cited arguments written against the abolition of hard coal subsidies in European countries.

The first argument is the security of energy supply. The authors criticize this argument sustaining that, as a consequence of liberalization, ascertaining secure energy and raw material supplies has now become the responsibility of the *private industry*, and this problem can be easily solved

using long term contracts and other modern methods. The growing of international coal trading is another assuring argument in this matter.

The second often used argument is the employment effect generated by mine closure in some regions. Against this argument it is mentioned the fact that the number of employees in the mining industry is considerably smaller nowadays than it was decades ago. For example in the Romanian mining industry were employed more than 300,000 people in the 80' compared to the few tens of thousands presently.

Other arguments against subsidizing refer to the opportunity cost of subsidies, negative effects on the environment and others.

Elimination of coal subsidies is also an important objective of by the European Commission. According to UE non-renewable resource policy the last year for coal subsidization in member states is 2010.

3. Romanian mining sector development and government policy

During 1970-1980, the mining sector in Romania was in full ascension offering well paid jobs and boost for the economic activity in many regions of the country. Mining activities have expanded in six of the eight regions of the country but were concentrated in the west and northwest (Bastida and Yupari, 2008). Socialist period strategy had a great influence on the development of mining in Romania. This strategy was based on self-support in ensuring mineral resources for the Romanian economy in order to reduce and eliminate imports. However mining was also an industry that received substantial subsidies employing over 350,000 people directly and 700,000 indirectly. (MIS 2004-2010).

During 1990-2007, the state spent the amount of U.S. \$ 6,156.4 million to support the mining sector, as shown in Table. 1.

Table No. 1: Public expenditures for the mining industry subsidization 1990-2007

Specification	Value (million U.S. dollars)
Subsides	4,125.20
Social transfers	316.9
Capital allowances	1,714.30
Total	6,156.40

Source: MIS 2008-2010

In addition, for the same period mining operating companies recorded a loss of U.S. \$ 1,729.4 million (MIS 2008-2010). For reducing the enormous public expenditures in this sector reorganization was impetuously necessary.

Closure of unviable mines was done in two stages. The first stage representing the period before the year 2000 was rather chaotic, paying more attention to economic issues and less responsibility for social and environmental impact. In the second stage, during 2001-2003, about 75 mines were closed and state support was given for protecting the environment and economy. In figures, by 2004, production was halted in 344 mines of which 82 were completely closed and the closure of 191 mines was outsourced to companies. The remaining 71 were preserved to be closed permanently later. (MIS 2004-2010). In early 2004 the number of people employed in mining reached 61,700.

However, subsidies to mining companies continued to be supported through two projects funded by loans from the World Bank:

1. "Draft Mine Closure and Social Impact Mitigation Project" worth U.S. \$ 44.5 million, financed by International Bank for Reconstruction and Development (IBRD) loan.

2. "Mine Closure Project, environmental restoration and Socio-Economic Regeneration, worth 120 million dollars, was financed by IBRD loan and approved by Law no. 167/2005 and extended over a period of 5 years. The project was divided into two components: component of mine closure and environmental and social regeneration. (Bastida and Yupari, 2008).

In 2004, employment in hard coal and lignite mining was approximately 60% of the entire workforce in the mining industry, of which 16,000 were employed in 12 underground hard coal mines, on the site of Jiu Valley and organized as the National Hard Coal Company (CNH). These mines have been continually receiving consistent subsidies from the government because their income was always below their expenditures.

Extraction of lignite and brown coal has proven to be more viable despite the fact that these types of coal have a lower calorific value than hard coal. Extraction was done by two public companies, the National Society of Lignite Oltenia (SNLO) and National Coal Company Ploiesti (SNCP).

Table No. 2 – The evolution of coal production in Romania

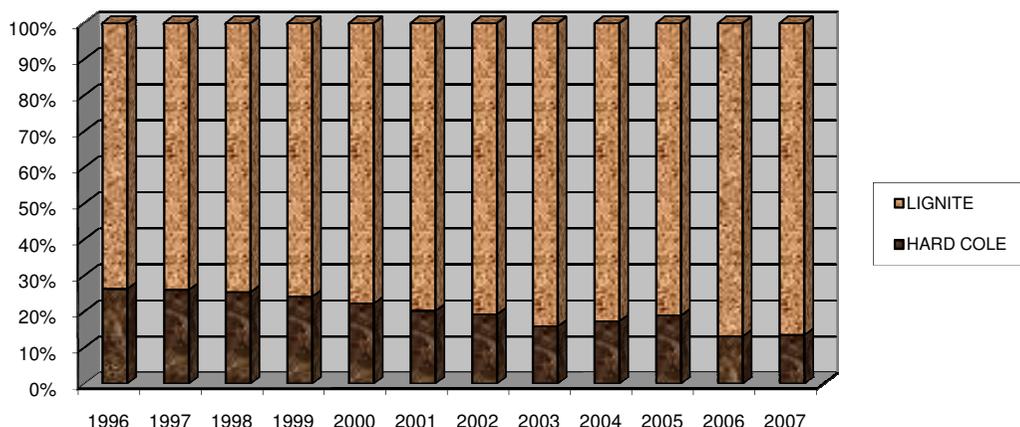

Year		1996	2000	2001	2002	2003	2004	2005	2006	2007
TOTAL COAL	million tones of oil equivalent*	8.065	5.601	6.239	6.117	6.536	6.192	5.793	6.477	6.858
	million tones	36.5	26	29.7	29.3	30	29.1	28.1	32.4	32.7
LIGNITE	million tones of oil equivalent*	5.944	4.354	4.979	4.942	5.499	5.12	4.698	5.628	5.933
	% in total (oil equivalent)	74%	78%	80%	81%	84%	83%	81%	87%	87%
HARD COAL	million tones	5.3	3	3.5	3.7	3.0	3.1	2.7	2.6	2.6
	million tones of oil equivalent*	2.121	1.247	1.26	1.175	1.037	1.072	1.095	0.849	0.925
	% in total (oil equivalent)	26%	22%	20%	19%	16%	17%	19%	13%	13%

* Oil equivalent (10.000 kcal/kg)

Source: MIS 2008-2010

The competitive advantages of lignite are the lower exploiting costs, smaller risks involved with the extraction process (especially in surface quarries) and the existence of higher technology and reserves. These advantages influenced the annual growth of the quantity of lignite extracted.

Figure No. 1 - Evolution of the ratio between the lignite and hard coal extracted (Both expressed in tones of oil equivalent – data from Table No.2)

4. The coal industry in the last period of state aid: 2007-2010

Starting January 1, 2007 the only coal producing company in Romania which has received state aid is the National Hard Coal Company (CNH). The objectives of this measure are to finance the company's current production and cover the costs of maintaining access to coal reserves underground Jiu Valley. European Commission notes that, in terms of financial restructuring, CNH will provide increased productivity by 2010, up to reaching a level that will ensure its operation without state aid (EC Decision 239/2007). Romanian authorities have indicated that they used some technical and economic criteria for establishing a list of units within the company to be included in the restructuring plan and, therefore, receive this support to continue their activity.

The total budget of this measure is Romanian LEI (ROL) 1,289,562,000, which is distributed in the period 2007-2010 as we can see in Table No. 3.

Table No. 3. Distribution of state aid during 2007-2010

	2007	2008	2009	2010	TOTAL
TOTAL state aid (ROL -thousands)	401,440	338,940	293,160	256,022	1,289,562

Source: EC Decision N239/2007

For better understanding the importance of state aid in the proper functioning of CNH we will continue by presenting the company's estimated income and expense during period 2007-2010. We will also present the evolution of one of the most relevant efficiency indicator often used in the mining industry: Expenses at ROL 1000 of goods production (Table No. 4).

Table No. 4 CNH main indicators 2007-2010

National Hard Coal Company	2007	2008	2009	2010
Estimated production costs (ROL / tone of coal extracted - tec)	642.2	617	595.4	582
Income (ROL/tec)	320	343.8	361	379
Differences=costs – income (ROL/tec)	322.2	273.2	234.4	203
State aid (ROL/tec)	289.4	243.7	204.6	173.1
Expenses at ROL 1000 of goods production (ROL)	2006.88	1794.65	1649.31	1535.62

State aid weight in Total production costs	45.1%	39.5%	34.4%	29.7%
--	-------	-------	-------	-------

Source: EC Decision N239/2007, author's calculations

By reading the table data we can observe a gradual reduction of the expenses to ROL 1,000 of goods production, from ROL 2006.88 in 2007 to ROL 1535.62 in 2010. Estimates of the decreasing evolution of this indicator in CNH are confirmed by other recent studies (Csiminga, 2009). This indicator's reduction of approximately 25% is achieved through a significant restructuring process in the fields of human resources and equipment. Although indicators evolution in Table. No. 4 is positive, there is a significant gap between last year's (2010) revenues and expenditures which makes it very difficult for the Company to continue production in 2011 without subsidies.

5. Perspectives of the Romanian coal industry after the year 2010

National Planning states that by 2020, electricity production based on coal should remain at 33% - 35% of the total production capacity. Therefore, a strong domestic market is available for hard coal and lignite.

Extraction of the latter is carried out since 2009 without subsidies, and the amount extracted has increased from year to year. The lignite quantity scheduled to be extracted annually is about 32 million tones per year and the reserves in the Oltenia region will ensure production at present capacities for the next 47 years (ESR 2007-2020)

The future production of hard coal is uncertain because of the bad financial results of the National Hard Coal Company, the only hard coal producer in Romania. The two major obstacles of this structure are:

- accumulated historic debt;
- low efficiency of business operation;

The historic debt of CNH is currently about EUR 1 billion of which 70% are penalties. This value represents about four times the value of the company's assets and it is impossible to be paid. The solution found by the Government for this problem is simply deleting these debts. Representatives of the Ministry of Economy, Commerce, and Business Environment are currently following the appropriate procedure to obtain a favorable notice from the European Commission in this issue.

The low production efficiency is influenced by the bad geological conditions and lack of modern extraction technologies (Ilias et al, 2008).

In order to increase the activity efficiency action is taken in the following directions:

1. *Reducing personnel costs*, which are approximately 70% of total expenditure by layoffs, the number of employees who left the system in April 2010, is 1420. This represents about 15% of CNH staff..

2. *Increasing productivity by investments in efficient equipment*. A recent literature study (Ilias et al., 2008) shows us that the mining activity could be viable in some of the units constituting the CNH by using modern mining methods and equipment. But the new technologies can not be adapted to all mines and therefore 4 of them would be closed after the year 2010 if there are no subsidies. Even for the 3 remaining mines installation and utilization of mining units is difficult and problems that occur can temporarily interrupt production and create fluctuations to the coal quantity delivered.

3. *CNH vertical integration* with the main clients: Electrocentrale Deva, Termoelectrica Paroseni, and a part of Hidroelectrica Society divided to create two large energy companies that will provide heat and electricity required throughout the country.

The third measure, the current government initiative, is criticized by the World Bank because of the coal-hydro-nuclear energy mix, saying that companies generating losses like some of the mines composing CNH will be in advantage on the behalf of profitable ones.

6. Conclusions and recommendations

Eliminating state aid in the Romanian coal industry will adversely affect the activity of the National Coal Company, customers and suppliers, as well as the economic and social environment of the Jiu Valley. The lack of a clear plan of activity after the end of 2010 generates concerns among CNH employees, small and medium enterprises in the area, local authorities and other economic and social actors.

The current situation in the Jiu Valley is difficult because of the lack of certitude. The activity is conducted “by inertia” and the measures taken to make coal exploitation more viable were only partially successful. This statement is reinforced by the lack of action in recent years for solving historical debts problem (so obviously necessary, regardless of the future), lack of a new collective labor agreement for the years 2009 and 2010, and no realistic business plan for the coming years.

Measures to be further taken will have to consider the following aspects:

1. *Strategic*: by considering the importance of energy independence of the country on long terms. This can be achieved in part through continued domestic production of hard coal. According to Romania's Energy Strategy for 2007-2020 coal reserves in the Jiu Valley region can ensure continuity of energy production at present capacities for at least 30 years.
2. *Economic*: by considering the impact of mining activity on other economic sectors. Because of the strong local impact, mining has the potential to promote complementary activities in other economic sectors in the region.
3. *Social* aspects require a special attention. Restructuring the mining industry involves reducing personnel. This measure affects the populations' current quality of life and the opportunities of future generations. The social aspect also includes health, education and training programs for former employees.
4. *Environmental*. Mine closure requires protection of public health and safety, alleviating or eliminating environmental damage and achieving a productive use of the land, a return to its original condition or an acceptable alternative. It is a complex procedure that requires planning and following specific steps.

Given the changes in key indicators of the CNH, presented in Table No. 4, in particular the expenses at ROL 1,000 of goods production for year 2010 that overcome revenues with about 50%, the company could encounter a financial jam during 2011 in the case of a complete elimination of subsidies.

Therefore I consider that the abolition of subsidies should be made gradually in the following years and combined with a restructuring and closing program. In addition to these measures the government should make parallel investments in the Jiu Valley infrastructure (especially for finishing construction of the road between Uricani city and Herculan resort) and stimulate private initiative in production activities and tourism.

FACTORS INFLUENCING INNOVATION IN SMES IN ROMANIA

Holban (Oncioiu) Ionica

*Alexandru Ioan Cuza University of Iasi and
Academy of Economics Studies from Bucharest*

Oncioiu Florin Răzvan

University of Agronomic Sciences and Veterinary Medicine of Bucharest Romania

Innovation is a broad concept and it is not in contradiction with tradition. Any entrepreneur, even when working in a traditional sector or businesses with strong traditions such as a family business can be innovative.

Innovation is not only pushed by the entrepreneur but is increasingly market pulled. Through an innovation entrepreneur it is wanted to influence his market structure or to develop new markets. Radical innovations introduce new business concepts, which require an ability to organize resources and competence in novel patterns. Enterprises extend their ability to develop new business concepts, their dynamic capability, by accessing external resources. This study proposes to investigate how the use of external resources varies in the course of SMEs innovation processes, and how deployment of external resources is influenced by the nature of the innovation as well as by the context of the innovation process.

Keywords: Small and Medium Enterprises, competitiveness, innovation.

JEL: O32,Q55

Introduction

In an increasingly complex business environment, organizations have been confronted with rapid changes in technology, competition, regulation and customer needs and demands. This has caused managers and researchers alike to search for new ways of developing organizational capabilities by continuous adaptation and anticipation of the need for change. Organizational learning, which promotes continuous adaptation and change, has therefore captured the imagination of managers seeking to survive the current turbulent operating environments.

Innovations may represent novelties in one or along several dimensions. They may provide new products or services to a market; they may introduce new technology to existing products; they may introduce new forms of organization of a SMEs or a value creation chain.

The focus here is on innovation processes that are more than minor improvements of existing products or processes. Our interest is the introduction of products or processes that are novelties to the degree that they represent new business concepts, and will require and provisions outside daily operations.

A new business concept is the spark that triggers the innovation process. It is on how the novel products or processes may be achieved from the platform of current products, that is, products and processes, combined with thoughts or estimates of the market new business concept. The new business concept is conceived from the current state of products and processes in the enterprise, the current markets and a perception of future market opportunities.

With the current rapid transformation of markets, enterprises would quickly stagnate and competitive positions without renewing. Such renewal is most often produced by several small adjustments, commonly referred to as incremental, stepwise or gradual innovations. In many cases, incremental innovations are implemented in the course of ordinary operational activities hardly noticed from day to day. However, the cumulative effect of incremental innovations is usually sufficient to maintain a competitive position when changes in markets follow predictable patterns.

Consistency between two major elements is decisive for a successful completion of the SMEs innovation process. The first element is the character of the innovation - what challenges does the innovation present. The second element is the capability of the SMEs to address these inherent challenges, that is, the capacity of the enterprise to muster resources and to act in a sufficiently dynamic way.

Literature review

Innovation is not confined to the area of entrepreneurship. Also other agents such as government agencies or non profit institutions can 'innovate' but in this paper we limit the discussion to innovation and entrepreneurship, operating in a market environment.

By definition, innovation processes address novel products or processes that require new capabilities or a new application of existing capabilities. Moreover, when the innovation requires interaction between an increasing number of components or subsystems, the complexity of the innovation process will increase rapidly.

The link between entrepreneurship and innovation has been established strongly since Joseph Schumpeter. Since then innovation is considered as an essential characteristic of entrepreneurship. The link is emphasized by any textbook on entrepreneurship, even introductory ones, such as for example Zimmerer and Scarborough in its fifth edition (2008): "Entrepreneurs also create innovations to solve problems they observe, often problems they face themselves".

The fundamental issue is the management of innovation processes, which differs from management in general (Salomo & Hölzle, 2007) due to the high level of uncertainty and application of novel competence.

However, in discussions on innovation there is a tendency to associate it with large, technologically advanced firms. This was already a sensitive point for Schumpeter, as can be read in the contribution of C. Freeman in the Palgrave dictionary: "Schumpeter (1928 and 1942) is often known for his emphasis of the advantages of large size and monopoly on innovative performance, whilst traditional theory has continued to stress the advantages of competitive market structures".

Business innovation processes require access to new resources, including competence (Bayer & Gann, 2007; Chell & Baines, 2000), which are frequently tapped from external sources. Many therefore consider better access to such external resources to be a vital policy instrument to support the innovative capacity of the business sector, especially for smaller enterprises. The term innovation system (Cooke, 2001) has often been used to describe the interaction between an individual firm, on the one hand, and firms and institutions that can provide such resources on the other hand. Innovation systems have received attention from researchers as well as policy-makers as possible instruments for improving the innovation capacity of enterprises. It is imperative that innovation systems are developed with a thorough understanding of how enterprises utilize external resources in their innovation processes.

During times of dramatic changes in the business environment or when SMEs exploited completely new opportunities, incremental innovations would not provide sufficient le for rapid and large transformations. We refer to these large transitions over a short time period as radical innovations. They are also referred to with terms such as discontinuous or really-new innovate (Garcia & Calantone, 2002; McDermott & O'Connor, 2002).

The innovation capacity of an enterprise thus rests on the foundation of its resources, which have been accumulated as a result of previous activities. These resources have been shaped by the needs of the past and are subsequently applied in the current innovation process to respond to the needs of the future. The ability to come up with novel solutions will therefore depend on an ability to adapt the resources in response to the new requirements of the innovation process (Eisenhardt & Martin, 2000; Pek-Hooi, Mahmood, & Mitchell, 2004; Teece, Pisano, & Shuen, 1997).

Eisenhardt and Martin (2000, 1107) define dynamic capability as “...the organizational and strategic routines by which firms achieve new resource configurations as markets emerge, collide, split, evolve, and die.” The dynamic capability is thus the process at the strategic level that enables the enterprise to change the content, structure and organization of the resources that are available to the innovation process. Correspondence between the dynamic capability and the dynamic change patterns of the business environment is essential for the long-term survival of the firm. Therefore, adequate flexibility in its dynamic capability constitutes a significant part of the core competence for a firm’s innovative sustainability.

However innovation is not only a matter of product differentiation or product management in general. It refers to all aspects of doing business. Entrepreneurs can be innovative with regard to any aspect of running their business including the production processes, the organization structure, finance management etc. Innovation can be successfully applied in ‘new’ sectors such as high-tech but as well in very ‘traditional sectors in industry, services and even agriculture. It can be successfully applied in new startups with an informal business culture but also in existing businesses such as family businesses with a tradition of several generations. Small as well as large businesses can be innovative with regard to their product, their technology, their organization or their financial management.

Government intervention within the European economic area

Businesses operate in a market within an open space such as the European Economic Area. When a national or regional government wants to design a policy to support entrepreneurship in general of innovation in particular, it has to focus on the businesses which are active on its territory.

This is a very important case for EU policy. On the one hand there is an argument in support of positive government intervention; on the other hand the European Commission has to watch carefully the rules of fair competition within the European Economic Area. The following quotations from European policy documents show that it is not easy for the European Commission to find equilibrium between these considerations.

“The identification of policy areas should be market-driven, in full respect of the need to preserve free and fair competition. Without excluding any areas from such initiative, there is a clear public interest in helping the emergence of solutions that would provide answers to citizens concerns. These would, in particular, be areas where public authorities play a critical role to eliminate existing barriers to market take-up of new products. However, this should not be at the expense of supporting innovation in more traditional sectors” (2006, p. 12)

Innovation is market driven and not only pushed by the firms. This has been recognized by the EU: its policy should be devoted to support ‘innovation management’ and to develop the promotion of markets. “‘Innovation management’ is a prerequisite for innovation to flourish in firms. Many enterprises, especially SMEs, encounter difficulties in planning, implementing and marketing innovative products and in innovating in their production processes. Innovation cannot work without taking people into account”. “Enterprises of all sizes should be more flexible in responding to rapid changes in demand, adapt to new technologies, such as ICT and e-business, and be able to innovate constantly in order to remain competitive”. (2005, p. 17)

The main motivation of the European Commission to accept state aid within the European Economic Area is the possibility of market failures. “Aid for projects covering fundamental and industrial research and experimental development is mainly targeted at the market failure related to positive externalities (knowledge spillovers), including public goods”. Other forms of aid are motivated in a similar way (2006, p.8)

Innovation and competitiveness in the Romanian SMEs

Innovation is a crucial concept involving creativity, organization and profitability but can it be measured? Is it possible to use operational concepts that allow measurement?

The creation of new businesses is necessary for the renewal and modernization of the economy but not sufficient. The new businesses also must be of 'good quality'. But what does that mean? One of the characteristics of this 'good quality' is the degree of innovation. Now the question arises: is it possible to measure the innovation?

From the first 10 states using the GDP for each inhabitant, only one has a social contribution in the net profit resembling ours, Suede, with 38%. Next we find Finland with 29,6%. But the first 5 states as a developed well being of the population has reduced ponders: Norway (16,3%), Island (13,7%), Switzerland (11,5%), USA (10,1%) and Denmark (2,2%). The data confirms a much tied connection between the work tax and the suburb economy, comparing that between the income tax and gray economy. The Northern states with large amount of social expenses in the brut profit have also increased suburb economies. Suede, Norway and Finland, have gray economies of 19%, while USA or Switzerland – only 8,8% of the total economy. In spite of reducing the income tax and those on the profit to 16%, Romania with assistance expenses of 38,6% has a suburb economy of 34,4%. It is very logical why a company manager to be very reticent to legalize his affair, as long as due to the "fiscal reform" it has a reduction for taxes, incomes and contributions by 2,2% of the brut profit, and not 9% as the governors say.

In Romania was created a vicious circle where the state is ensuring the minimum financial resources for stimulation of knowledge-based economy and only a few companies proved able to compete through innovation. Very often knowledge is strongly connected with people and all or part of it can do a major challenge. Innovation system is important for clarifying the area of innovation policy and also for fostering the interactions.

According to the statistics of Ministry of Education and Research until 2002, a number of 590 units were involved in the innovation system. Out of which 280 were research and development institutes and 310 joint-stock companies (public or private) with research -development as the main object of activity. Since 2003 the situation of research system was improve because, on the hand, Romania became a member of the European Patent Convention in March and, on the other hand, the Government took the Decision 406/2003 where there are present specific conditions regarding the eligibility of a firm or a department of research institution to be considered as an innovation entity. In the document is specifically that the applicants for such a status provide certain documentation in order to be accepted. So, being with that decision an innovation entity can be called innovation infrastructure unit, practical a new concept was introduced refers to technological transfer centers which are financed through a governmental program. That initiative is very important for creating the visibility of the entity which wants to invest in innovation. The current situation of Romania is highly dependent upon the visibility level and the research system that includes the research institutes, the research departments of universities, and research departments of the companies.

The specific situation in Romania regarding the research system was considered to be the only policy element, so, research and innovation are not approached as different process that address distinct markets and have a different timelines. This does not mean that the research units are able to move on the global technological frontier and increase their chances to apply innovation.

The initiative to the governmental level of innovative process based on the market strategies have the most important role in transforming the visible knowledge into marketable products and representing the economic opportunity of recombining knowledge. At top of that, more and more companies have involving in different stage of the innovation process. In order to stimulate the companies to start their learning process, the first necessary step is to ensure a higher visibility of the economic benefits that knowledge incorporation brings about.

In this direction in Romania the capital and financial channels for innovation activities can be the private venture capital. The availability of that capital does not depend only on financial issues, but also on other factors as follows:

- the risk propensity;

- the provider's capacity for technical evaluation;
- the provider's insertion on the innovation market.

The innovation infrastructure includes: incubators (infrastructure for start-ups), technological parks (experimental facilities), technical transfer centers and the system of intellectual property. Regarding the infrastructure the government consistent policy measures according to the recently launched National Plan for Developing the Infrastructure for Innovation and Technological Transfer. In this plan is mentioning the amount which is destined to co-finance centers of technological transfer, office for connection with industry, technological parks and technological incubators.

Ministry of Education and Research and the Ministry of Communications and Information Technology aim to attract to industrial parks with intention to create such parks in every Romanian city that has a university center. They estimate that around 50 business incubators have been created, but there are no monitoring mechanisms and no efficiency criteria or targets for them.

The whole set of documents released by the Romanian authorities regarding the evolution of research, development and innovation systems does not even address the issue of patents and it was only in 2004 that the grants are made conditional on patent applications.

Results and discussion

At the moment, companies hiring less than 10 employees produce more than 20% of Europe's value added and offers employment for approximately 50 million European Union' citizens. SME represent 98% of approximately all enterprises in Europe. Approximately 80% of their activities are carried out at a local or regional level.

Therefore, for Romania the small and medium businesses are representing the engine of the economic growth and a vector for disseminating the research and development results. The increase of the small and medium businesses sector had a positive influence upon the businesses environment reducing the unemployment rate and increasing the productivity. It is necessary for the Romanian state to rethink the fiscal system in order to better sustain the growth of the small and medium businesses sector taking into consideration that even though its major role in the development of the country is known and admitted the support is not likewise. We think of this considering that even though the number of the small and medium businesses in Romania has grown, the number of small and medium businesses to 1000 inhabitants is under the number from the European Union (in Romania the number of small and medium businesses to 1000 inhabitants is 25 and in the European Union is 64).

Strategies related to the environment characteristics, when an accentuate competition on the internal market and a rapid change rhythm in their activity domain can be associated with the orientation to the international market- between them it should be mentioned the niche's strategy, which presupposes their concentration on the products and services for which it is disposed competitive advantages as a result of their capacity of innovation, adaptability and personalization of the production in connection with the request exigencies.

Conclusion

Innovation is a broad concept. Innovation is not in contradiction with tradition. Any type of entrepreneur, even when working in traditional sectors or in businesses with strong traditions such as family businesses can be innovative with the product, the production process or any aspect of doing business.

Innovation is increasingly market pulled: entrepreneurs meet and want to solve a problem but at the same time the entrepreneur wants to influence his market structure or to develop new markets through his innovation. Policy has to protect intellectual property and to promote competition. There is a high correlation but not full coincidence between entrepreneurship and innovation.

The degree of innovation is monitored by policy makers. A high degree of innovation is considered to make the economy more 'competitive'. Innovation will not only support the development of new products or increase the productivity of labor and capital, but also bring more economic growth, employment, a better balance of payments, improve the labor conditions etc. There is clearly a link between microeconomic issues such as entrepreneurial startups and macroeconomic performance.

It is not easy to measure innovation. Businesses operate in international markets while policy makers focus on a territory. Very often the effect of a policy is felt beyond the territory of the government. In a large area such as the European Economic area there is much interdependence and many spillovers. This is especially the case in a small open economy operating in this type of market as is illustrated by the case of Romanian.

MAJOR MISUNDERSTANDINGS IN ECONOMIC CRISES, IN THE LIGHT OF KNOWLEDGE SOCIETY

Jivan Alexandru

West University, Timisoara, Romania

Faculty of Economics and Business Administration

Present study reviews certain main pro-active approaches and connections. Searching for root concepts, a number of current views on causes of today's crisis are selected. They are viewed through the criterion of their effects in practice, in a heterodox approach which is a critique of standard economic routine. Connections are made with the intellectual core of the knowledge society, in the context of the required interdisciplinary character of the scientific act. Requests for the economic analysis result: the economists should judge by a broader horizon. Practical conclusions also ensue, being generally applicable to the crisis management at macroeconomic and microeconomic level.

Keywords: economic crises, growth, intellectual factor, knowledge society

Cod JEL lucrare: E20, O40, Q01

1. Introduction

Two main mistakes (chapters 2 and 3) have to be coped with, as trying to understand present day's crisis and cope with its effects or act towards solutions to crisis generated troubles. We present a selection from the ideas issued in our research on the matter, inside the abstract and the key words, consistent with the requested dimensions of the text, focussing here on few main conclusions.

2. Production and service

Materialist misunderstanding may be called the *classical* one or *Marxist*, because it is materialism-bound. Common sense says that *production-proper* is a strong sure thing, as opposed to *immaterial activities*, which are impalpable and, therefore, considered uncertain. Such approach implies a defining preconceived neat superiority of industry as against the other lucrative sectors (especially services) in terms of productivity expectable increase. But we may not have the preconceived idea that services (like scientific research and education services, for example) would be less *productive* than industry, for the reason that they are the *producers* (generators) of the technical-scientific progress itself and ensure the staff for the accomplishment of the technical-scientific progress. Even if, as a rule, industry endorses the grater part of the profit that technical progress produces, nevertheless, research and education have the main *role, sine-qua-non* in generating general progress, despite of their less-than-in-industry income and gain. A big service (done to society or to one singular client) is none the less for being cheaper or pro bono, i.e. without payment *on the market* in the benefit of the person who serves (being so only in the formal "technical" recording). If it is cheap (sold on little money) or pro bono, it "produces" little income or little (or no) profit to the supplier, therefore it is considered (by the business man and by the economists) of little importance; even if it makes a *large* service to the customer! On the contrary, it is all the greater and *humane*⁴⁷⁷. Modern intellect-intensive services bring a specific contribution to development; they allow diminishing compulsions and growth re-launch. Intellectual services should not be perceived only as job creation sectors: they create the main value-added, even if not wholly recorded in the accounts of their performers. Such activities

⁴⁷⁷ Al. Jivan, "Services and Servicity", *Services World Forum Bulletin*, no. 3-4 (July-December 1993), 16-24.

have a fundamental role and essential functions for the whole of the economy: they allow it to get a superior level performance. But services need no more demonstration of utility beyond the *market test*. Moreover, many services are much more useful than certain most material productions, considering and respecting complex analysis and utility assessment criteria and taking into account multiple approaches: such as individualistic, societal, planetary. The relation of the tertiary sector with technical progress, here including the capacity of services to absorb technical progress and to increase productivity is settled for quite a while, most pertinently proven, despite of the preconceived idea of higher productivity of industry vs. services.

The problem is in the lack of qualitative judgements and therefore the profound causality and the “external” effects of economic acts is often ignored. But they are *not the services that generated the nowadays crisis*. The causes of the negative effects of the economic activity over human society in general can belong with industry sector too. A revision and correction of industrialism is necessary and should be *structural* and also in terms of *economic policy*.

3. Supply and Demand

Setting up priorities between demand and supply is the *second* big misunderstanding. This dilemma is the translation, into the field of economic policies, of some different approaches concerning the role of demand and supply in the market. It consists in the two opposite alternatives: the neo-liberalist one and the Keynesian one.

In the Keynesian approach, when the demand is considered to have priority, there is the *Keynesian* variant. It sets hierarchies between demand and supply, giving priority to consumption in the business circle. Most anti-crisis policies would stimulate economy by stimulating demand; and action taken is to such effect. In the Keynesian approach – so much boasted at the present day crisis – in order for production to rebound, i.e. in order to beat the crisis, *more consumption* is requested; to stimulate consumption for maintaining it at high levels is seen as vital for all type enterprisers, as a prerequisite of any supply, increase thereof re-launching production.

The question issued is here: *which consumption?* Any consumption may have good effects for the short-term run, i.e. it will bring in a certain amount of income for a certain number of producers, thus favouring certain types of production. So the role of stimulating production raises the question: which production, then? Activities will be enhanced that lead to or contributed to social economic welfare and to Mother Nature’s redemption? Or is it production that profits to some enterprisers, while side effects – if we rigorously consider the entire result - thereof make the investment all for the worse-off, thus generating consuming, rather than true investing? Dope and bomb demand can boost production, same as bread and butter. But in terms of preference, consumption should be favoured that does not prove detrimental, in the long run, for the overall environment, for constructive goals. Unfortunately, in fact, the egoistic decisions of the enterprisers do not always for constructive goals: the market fails in such targets. Therefore economic actors should have not only temporally limited selfish interests. Responsibilities can be only set at societal level: economic policies of co-interesting actors and adequate regulation, for coercing them.

On the other side, in the traditional approach, coming from the classics and kept and developed by neo-classics, the logic of the economic action (and also in the economics thinking) starts with supply. That is, *in order to beat the crisis saving is necessary*: savings allow each person to cope with price rises and the hard times an economic crisis is. Also, at the level of the macroeconomic system, savings allow for the investment novel technology takes, or research, or advertising (here seen as immaterial investment); any renewal aimed at re-launching economic activity takes investment.

But the question issued is: *which investment?* Is it stimulating consumption (like advertising is) and investment in consuming capacities? It may profit to a number of enterprisers, apt to thus produce more; yet such action will also result not just in *less planetary raw materials*; but also in

new *destructions* thereof (see inbuilt decay, dispensability, the concept of produce a-new rather than mend... costs being recorded *per supplier*, not *overall*, *global*, for the whole systems and planet). Or, rather, is it true investment, in the long run *globally constructive*, in the *recovery of the planet*, in *socially balancing*, and other organising goals, generally having anti-entropic effects? In the traditional (classical) economic model, technical progress tends to be distinctly shown versus *labour* and *capital* factors, or to be included in *capital*. Profit and interest are usually seen as varying with capital amount, economic growth is generated by material investment, which is about quantitative growth of tools, machines, money and other forms of capital employment for production which generates quantitative growth of production. But we must remember that the economic growth can be generated not just by such economic activity spreading, but better by growing returns. We emphasize that, despite of the standard approach, productivity and the quality of being lucrative are given by innovation, information, knowledge, science, brains, including the results of human capital formation and education. Therefore, growth is varying with inter-relational growth and with intellectual factor. Therefore, under the circumstances of a knowledge based economy, a more adequate presentation should take into account that labour and capital as well, have a *qualitative* component part, besides the quantitative one. Thus, two types of economic factors, differing from the orthodox ones, could be outlined, in a manner proper for the XXIst century: the *intellectual* factor and the *material* one, represented, the first one, by information, innovation, invention, knowledge, science, intellect, idea, initiative, enterprising spirit, know-how etc., and the second one, consisting in the material component parts of capital and the pure energetic, physical aspects of labour.

The essential idea of the liberalist way out of the crisis is the individual effort: for research and renewing, for finding solutions and generating progress, including implementation thereof, new production capacities etc.; saving (by avoiding and reducing individual consume) and investment can be seen like its sources, even from Ricardo's view. The bourgeois spirit, which existed before the consumption stage of the market economy, would actually economize, rather than consume: this was the condition for any enterprising, for any economic project, this was the thinking of Ricardo himself. Emphasising demand is beneficial to satisfying *real* needs, but creating an artificial demand, by paid digging-and-filling-up of holes (à la Keynes), or other such like palliative economic policies, is nonsense, even if generating short-term demand: it proves detrimental to the money system, to the economic system in general. Emphasising supply is not a bad thing in itself, i.e. just because it can find itself with no demand, in Keynesian terms (contradicting classical optimism of the Say's law).

This is criticisable, because a serious solution will not intemperately and unlimitedly pedal on emphasise supply: production can be destructive, if it produces bombs or dope, for instance. Thus, just like consumption, *investment* and *production* are also not all constructive and absolutely beneficial (over a large space and time span). In the same manner, consumption in itself should not be blamed for irreversible transformations, if manifested in answering real needs (like bread, cheese and wine - that cannot be put under question). It is destructive, though, if purposefully meant for increased production (like dig up holes and fill them up, à la Keynes; or throw away things, instead of mending them; or change fashion, in order to drop old clothes; or artificially create and stimulate "needs", like sex-change surgery, lifting, dope etc.): which fill a perverted market, with *artificial needs*, going contrary to *natural* market run. Of the above, there results that, today, saving should be understood in the widest sense of the term.

4. Concluding answers

The issue is: *what effects* do consumption and investment have? Not only the effects on the short-term run matters, but mainly the effects on the long run matter. Otherwise we deal in surface effects, i.e. sham actions, tools and methods involved.

Consumption should therefore be stimulated *only of non-destructive goods, environmental friendly and low-cost*. Such approach is valid for crisis-time and beyond. At all times, and acutely at crisis times, we should *save*; not for economizing sake, but mainly *for (i) diminishing destructive costs*; destructive costs are way out of line in our consumption society, even if accepted by the hedonistic speculative *homo-oeconomicus* spirit.). And we also should *save for (ii) long-term run investment* (so: not for any type investment).

Quite like about industry and services, there ensues that investment, on the one hand, and consumption, on the other, are not antagonistic: we simply must to change the analysis criterion; as both consumption and investment – always correlated – may produce effects, and those effects are the matter to be studied in detail; their nature is the fundamental criterion: are they constructive or rather consuming?

In the field economic activity and in the usual economic analysis as well, we are in the presence of the *narrow scope analysis fallacy*: targeting the *self-benefit here-and-now*, regardless of what may befall to *others elsewhere*, maybe in the future. In the logic of open economies, the main stay is in the environment of the individual person or entity. The reasoning underlying this fallacy is that the national, world-wide, planetary ensemble will somehow, some day take care of the side effects.

The trouble with the approaches that we discussed so far is the very analysis and perception criteria, based on which oppositions are assumed, regarding their auspicious causing role (or not) in crisis.

The *material* should not be preached over the *immaterial*, and *immaterial* must not be blamed; going back to industrialization is not advisable where it is already done, and industry and palpable goods should not replace services; services must not be reduced to a minimum. Neither is industry, per se, to be blamed *in corpore*, declaring services preferable and denying industrialization (especially where industrialization is poor; deindustrialization effects in Romania could teach everybody and every developing country a lesson).

Supply is not to be discouraged, encouraging demand (as in Keynes obsession with employment, employment meaning incomes, even if generating no value-added), with famous inflation effects (accepted, as per Philips' curve, or unaccepted, as per the neo-liberal thought). *Demand* is not to be discouraged, either.

Analysis *criterion* should be a different one, i.e. how the crisis should be viewed. Potential complex effects, variously analyzed (at individual, local and global level), including target-attainment must be pointed out and should become the main criterion; which means considering, besides the entrepreneur's income, "external" effects, covering *all* costs. Unfortunately, the analysis scientists make in economics often goes not deeper than the businessmen's approach and perception (the understanding being muck like that of the actors in economy). Scientists in other branches (philosophy, sociology, geography, politics etc.) can sometimes have wider horizon and, therefore, better understanding than economists. Economists would be all the better for a broader horizon: besides financial effects (*economic, generally*), other (that are not) could be considered by economic analyses, especially active on the long term run *over economy itself* (e.g. education); research can only be cross-sciences, in knowledge economy: *scientific* research must be inter- and multi-disciplinary. The criterion should be more rigorously set, based on target (desired), as well as unwanted (ignored by the individualist enterpriser) *ground* effects on the short, medium and long term run. Thus biased (i.e. considering the mix of implications), we can understand/clarify a number of aspects, facets and nuances that are affected by preconceived ideas, by routine and by ignorance.

For instance, like a first set of conclusions of our analysis, we can find that *immaterial economy* can be pure speculation, gaining on the poor sanctioned by the free market (being under the

coercion of the market⁴⁷⁸), and that credits may have no cover validation (such as, quite topical of late, in the context of global financial crisis). The conclusion is that part of the services can be crisis-encouraging. Such statement will not hold true for services *in general*, but for only *specific services*, which are apt to generate inflation; e.g. such services that do not have constructive, lasting *general* results. Certain of them can be positive on the short term run, i.e. for some individuals, not for all the people, not for the most of the saviours, i.e. not for those who grant, by economizing, the banking funds over which (private) banks are supposed to have the expertise to manager. But such economizers are now, during the crisis, also in sufferance. Consequently services can generate crises: *not because immaterial*; but just if they are destructive or merely speculative, i.e. non-creative, just transferring assets from certain entities in the advantage of other entities; or exploiting, i.e. absorbing alien income, for the short-term run benefit of a few, and detrimental for their environment. Concerning the *material economy*, we may as well find out that some material products are in fact gain at the expense of other individuals, or of Mother Nature: there do exist immaterial speculative activities, but also, there are industries, of the most material nature, which are destroying rather than constructive, equally destructive on the medium and long term run, i.e. when activity oriented in a consuming way) The fact that they are material does in no way grant them a *merely* advantageous nature (an “anti-crisis” character, in the meaning of present study).

Another set of conclusions concerns the fact that we can similarly prove consumption and supply able to generate crises, like it was shown previously.

Economic activities do not generate crises depending on whether they are material or immaterial; nor depending on some assumed priority in some far-fetched hierarchy between demand and supply; but depending of their aims, of the manner of accomplishing goals and, therefore, of overall complex effects thereof (i.e. actual complex and general effects). Effects and implications on the whole, and not truncated, should be considered, even if usually just some parts, shares or sides of such effects are seen, depending of convenience, conventions or self interest. So the criterion is the *constructive vs. non-constructive* nature of the concerned activity: it can be more or less investing, it can be more or less consuming - or even destructive.

6. Ending Remarks

The European concept of *knowledge society* implies an interdisciplinary vision, including the care for the social problem, for the planetary environment and such like, among which moral-institutional aspects are also important and also the inter-generational share of the planet. The interaction in economy and in society is made mainly by information and knowledge exchange among the elements of the system and with the context of the system. The economy is not limiting itself anymore to the immediate material needs of the individual. The vital requests being better accomplished, other needs (more subtle, more human, more intellectual and more spiritual than the previous ones) come out. The scientific and technological supply must go a step further, outrunning the necessities of material sectors, the growing of intellectual potential should bring the restructuring and the development of this new economy - based on knowledge.

In opposition with the classical *productivity*, we advanced and promote *servicity*, meaning social-economic efficiency and the priority of constructive qualitative aspects of agents' activity (as from the own merit of the economic actor), in an adaptation to our days of Manoilescu's conceptions on competitiveness and international trade. Remaining (lasting) in the thinking schemes inherited from the industrial revolution period, means loosing from analysis important correlations that could allow outrunning certain limits and contradictions of the world economy. Therefore, the intellectual resource should not be squandered by selling as simply *labour* (factor

Technical progress is a key factor in economic growth, mainly due to its productivity enhancement. It is a fact that most innovation and new technologies are created in developed countries. International trade and FDI are the main channels for technology transfer. Our objective is to determine the role of FDI in technical progress. In this paper, we start with two questions: is there evidence of significant contribution of technical progress to economic growth? And if there is, what is the role of FDI in technical progress? Using a production function approach, we estimate the TFP and we regress it on the stock of FDI, in a panel framework. We find evidence of positive correlation.

Key words: technical progress, Solow residual, FDI

JEL: O33, O47, F23

1. Introduction

The turmoil in the world economy during the last two years has reinforced research on economic growth and its determinants. This subject is all the more important in Central and Eastern Europe (CEE), since these countries had experienced high rates of economic growth in the years before the crisis. Trying to explain the long run economic growth, scholars have brought into attention the role of technical progress as the key for long term growth.

It is a fact that most innovation and new technology are created in developed countries. Therefore, the chance for developing countries is to import that technology. Unlike Western countries, CEEC are relatively far away from the production possibilities' frontier. That is the reason why they are more concerned with technology transfer and could benefit more from the productivity enhancement effect of technical progress. Furthermore, these countries have a real research-development potential, inherited from the communism, which allows for local adaptations and second rank innovation.

International trade and foreign direct investment (FDI) seem to be the most important channels of technology transfer. FDI is considered to be a crucial factor in economic growth and catching-up process in this region. There are even opinions suggesting that technology transfer through FDI is more important than the capital inflow itself (Hunya, 2000). Blomstrom and Kokko (1996) argue that FDI is also the cheapest channel for technology transfer. Unlike other channels, it simultaneously allows the transfer of tangible and intangible assets, being therefore one of the most effective international technology channels (Kinoshita, 2000).

The *objective* of our paper is to estimate the contribution of technical progress in economic growth in CEE and to evaluate which might be the role of FDI in technological change. We adopt a two step procedure. First, we use the growth accounting approach in order to estimate the Solow residual. Second, we run a panel analysis on 8 countries in CEE, trying to explain the sources of technical progress, more precisely the role of FDI. We find a positive correlation between the stock of FDI and total factor productivity.

We proceed with the paper as follows: section 2 presents the theoretical framework of estimating technical progress, using the Solow growth accounting approach. Section 3 presents the 2 step

methodology we have used, section 4 discusses the data and results obtained and section 5 concludes.

2. Theoretical framework

Measuring the stock and the technology transfer is a difficult task, given the fact that technology appears as a latent variable, which is not directly observable at plant level. Especially when dealing with know-how, several proxy variables are being used in order to estimate the technological level. Such variables are: research-development expenses, registered patents, share of high skill workers etc. What is of interest for economic research is not necessarily the technical level itself, but the change in technical level, more specifically technical progress.

The literature retains four main approaches in estimating technical progress: the production function approach, the index number approach, the econometric approach and the distance function approach. The vast majority of the literature uses the production function approach, namely calculating Total Factor Productivity (TFP). For reasons of comparability of results, but also of data availability, we will proceed in our research with this approach.

The production function is a microeconomic concept, indicating the mathematical expression of combining a set of inputs in order to obtain the maximum output. Even if every firm has its own production function, the concept is also being used at aggregate level, for explaining economic growth. Solow and Swan (1956) have based their famous growth model on a two input production function. This model explains economic growth mainly by accumulation of physical capital and labour. The share in economic growth not attributed to these two factors is accounted for technical progress. The sources of this progress are not explained by this neoclassical model, that is why it is called exogenous or unexplained technical progress.

Solow decomposes the observed growth of GDP in 3 components: the first two attributed to capital and labour, and the third attributed to a residual factor. This unexplained factor has been called **Solow residual** and accounts for changes in the technology being used.

The Solow standard model uses a neoclassical production function and tries to establish the share in economic growth due to capital, labour and technical progress. In order to better estimate the share in output growth due to technical progress, taking into account FDI, we have **extended the standard model** by including a third factor, which is intermediate inputs. The theoretical model we use is as follows:

$$Y_t = A_t F(K_t, L_t, II_t) \quad (1)$$

where Y is gross output, K capital, L labour, II intermediate inputs and t time. A_t is a variable that measures the technical level in the economy, on which we will base our technical progress estimates. In order to obtain a linear model, we took logarithms on both sides of equation (1), and then derived with respect to time, and we obtained equation (2):

$$\frac{\partial \ln Y / \partial t}{\ln Y} = \frac{\partial \ln A / \partial t}{\ln A} + \frac{A}{Y} \frac{\partial F}{\partial K} K * \frac{\partial \ln F / \partial K}{\ln K} + \frac{A}{Y} \frac{\partial F}{\partial L} L * \frac{\partial \ln F / \partial L}{\ln L} + \frac{A}{Y} \frac{\partial F}{\partial II} II * \frac{\partial \ln F / \partial II}{\ln II} \quad (2)$$

In order to empirically fit the model to the data, we need to re-estimate it in a discrete form:

$$\Delta Y = \Delta A + \alpha \Delta K + \beta \Delta L + \gamma \Delta II \quad (3)$$

ΔY , ΔK , ΔL , ΔII represent the growth rate of output, capital, labour and intermediate inputs. α , β , γ represent the factor remuneration shares in total output. For this reason, $\alpha + \beta + \gamma = 1$.

The variation in the A parameter is called *Solow residual*, or Total Factor Productivity (TFP), and is the expression of technical progress. A represents the percentage in the annual increase in output which is not accounted for an increase of labour or capital.

From equation (3), we can see that the growth rate of output is decomposed in the growth rate of TFP, given by the A parameter, and the weighted growth rates of capital, labour and intermediate inputs. All the rates are known, except for the variation in the A parameter. This variation is estimated as a residual, by subtraction, where the name of Solow residual.

From a theoretical point of view, the *TFP contains all the changes in output which are not accounted for by an increase in the quantities of K, L and II being used*. Therefore, besides the efficiency of using the production factors, TFP also accounts for changes in the quality of these factors. But from a practical point of view, TFP comprises much more than that. In empirical estimations, it acts as a residual that “collects” all the factors having generated economic growth, besides the quantities of K, L and II, which are not observable or have been excluded from the model (Neuhaus, 2005). For example, technical progress can be embedded in capital goods. The qualitative change in factors is therefore contained in the TFP, overestimating it, even though it should be included in the “qualitative growth” of inputs.

Estimations of the Solow residual, especially in the early literature, have been affected by several errors⁴⁷⁹. The parameter also residually contains errors of measuring inputs, imperfect competition effects, scale economies etc. Fortunately, several adjustments have been proposed in the literature, so that the Solow residual still remains the best way of estimating technical progress

A drawback of the production function approach is the hypothesis that firms act on the production possibility frontier, which implicitly assumes that the production function describes the maximum output that can be obtained with a given set of inputs. This might be close to reality in the long run, but in the short run there are real distances given by market conditions, labour training and employment, financing the necessary investment etc. More, this is in fact a microeconomic approach that can lose its accuracy by aggregation at a macroeconomic level. For these reasons, whenever possible, production functions should be estimated differently at sector and even plant level.

3. Methodology

Our methodology in estimating the technology transfer through FDI is a **two step procedure**. First, we need to confirm the **presence of technical progress**. Second, we are trying to establish the sources of that technical progress. To put it differently, **is FDI a source of technical progress?** Even if one might find evidence of technical progress, it doesn't necessarily mean that it is the consequence of foreign firms' activity in the national economy.

Step I. Estimating technical progress based on the production function approach

For calculating the growth rates we have computed the logarithmic variations between the 2 time periods t and $t+1$. For the factor weights, we have two possibilities. The first one, suggested by Thornquist (1936) is to calculate the average for the shares in t and $t+1$. Therefore, equation (3) becomes:

$$\frac{Y_{t+1} - Y_t}{Y_t} = \frac{A_{t+1} - A_t}{A_t} + \frac{\alpha_{t+1} + \alpha_t}{2} * \frac{K_{t+1} - K_t}{K_t} + \frac{\beta_{t+1} + \beta_t}{2} * \frac{L_{t+1} - L_t}{L_t} + \frac{\lambda_{t+1} + \lambda_t}{2} * \frac{CI_{t+1} - CI_t}{CI_t} \quad (4)$$

⁴⁷⁹ Initially, Solow (1957) had estimated for the USA that only 12,5% from the GDP growth was explained by factor accumulation, the rest of 87,5% being explained by technical progress. Griliches and Jorgensen (1967) have proved these estimations to be wrong, the Solow residual being overestimated due to omitted or unobserved variables.

The second approach, introduced by Nordhaus (2005), consists of using as weights in $t+1$ the exact shares in $t+1$, the argument being the use of “end of period” data. Considering that our data are not end of period, but average for the period taken into consideration, we have decided to use the first approach in calculating the weights. We can therefore see that the weights of K, L and II are not constant, but variant over time. On real data, and especially for aggregated functions, it is expected for the weights not to be constant.

Our objective is the estimation of the A parameter from the growth accounting equation. More precisely, the equation we used for estimation has the following form:

$$\Delta A = \Delta Y - \frac{\alpha_t + \alpha_{t+1}}{2} \Delta K - \frac{\beta_t + \beta_{t+1}}{2} \Delta L - \frac{\gamma_t + \gamma_{t+1}}{2} \Delta II \quad (5)$$

α , β and γ are the weights of capital, labour and intermediate inputs in gross output.

In elaborating our methodology, we identified two *estimation problems*. The first one refers to the reported values of output (being gross output or value added), which are nominal values. An increase in nominal value could mean a decrease in real terms, so in order to correctly estimate the Solow residual we need the real values. Another correction is needed for the weights, as we calculated them not as a quantity ratio, but as a value ratio.

In the case of estimating the Solow residual in the presence of FDI, there is always the risk that the productivity growth due to technology transfer could be compensated by losses due to the crowding-out effect (Blalock and Gertler, 2004). Since both of them come from the entry of multinational firms on the local market, we consider relevant for our research the net outcome.

Step II. Searching for the sources of technical progress

In the first step, using an aggregated production function, we try to establish if there is indeed technical progress and to what extent. For this stage, even if we find evidence of technical progress, we don't know yet which are the sources of such a progress. Once we have established the presence of technical progress, in a second stage, we will try to decompose this residual factor in order to identify the sources of technical change. One of these *potential sources is technological transfer through FDI*. There is an important body of literature who tries to identify correlations between FDI and changes in total productivity.

In searching of the sources of technical progress, there are two main factors that influence the technical level: the quality of inputs, and second, the way these inputs are being used in order to obtain the maximum output. Therefore, explaining the sources of technical progress has been the starting point in *endogenous growth models*. Romer (1986) was the first to argue the endogenous character of technical progress, building a growth model based on technology diffusion and learning by doing. He eliminated the problem of decreasing returns of capital from the Solow model, by assuming that every capital unit invested brings gain not only to the firm itself, but to the rest of the economy also. Technology diffusion, as a result from investment, was considered the source of long term economic growth.

This idea of technology diffusion as a consequence of investment has been extended by other authors also, in order to explain the role of FDI in economic growth. FDI is directly linked to capital stock accumulation, in both quantity and quality.

Numerous studies who applied growth decomposition have come to the conclusion that technical progress and capital accumulation were the main factors that drove economic growth in transition countries. As FDI proved to be an important channel in technology transfer and fixed capital formation in Central and Eastern Europe, we can argue that FDI has played a major role in economic growth in this region.

4. Data and results for Central and Eastern Europe

For estimating the Solow residual, we use data for 8 countries in Central and Eastern Europe, drawn from the **EU KLEMS database**. EU KLEMS Growth and Productivity Account is a database created by the European Commission, for the analysis of productivity at industry level in the European Union. Data is available for 27 countries (25 EU members, Japan and the USA). This is the only database at European level to contain series at industry level, constructed on the growth accounting methodology. To our knowledge, this is the first study made by Romanian authors to use this database. For FDI and gross fixed capital formation, we used EUROSTAT. Concerning the aggregation level of the data, the production function approach is more adapted for a microeconomic perspective. From a policy maker point of view, a sector or industry level would be more appropriate. The recent work in this field uses plant level data, where problems of quantifying technical changes and economic performance are less important and easier to correct. Being constrained by data availability, we will run our analysis on macroeconomic data. Aggregation problems at industry level are corrected by EU KLEMS by calibrating the variables, so that the contribution of each NACE Rev. 2 sector is taken into account.

In order to apply the decomposition of growth, we used the following *variables*:

Y - Output, expressed as gross output in current prices;

L – Labour, expressed as labour services, based on the hours worked and not on the number of employees;

K - Capital. EU KLEMS uses a special method in calculating the capital input. It is computed not as capital stock, but as capital services, weighted by types of assets.

II – Intermediate inputs, given by the value of materials, energy and services, also expressed in current prices.

The availability of intermediate inputs series has allowed us to estimate TFP based on the gross output. Another way of estimating the TFP would have been by value added. We have chosen using the gross output for 2 reasons. The first one is the fact that technical progress can be already embedded in the intermediate inputs used in production. An important part of FDI contribution to technical progress, besides capital accumulation, is the use of intermediate goods. Since our objective is estimating the contribution of FDI to technical progress, we can not ignore this potential channel for technology transfer. The second one, regressing output on labour, capital and materials, avoids the assumption of additive separability of material inputs, and therefore allows a certain generality (Arnold, 2005).

We used data for Hungary, Poland, Slovakia, Slovenia, Czech Republic, Estonia, Latvia and Lithuania, for the period 1995-2007. Our initial intention was to include Romania and Bulgaria also, but data is not available for these countries.

Each of the variables was expressed in national currency, in current prices. We first proceeded in deflating all the nominal series on the base of the appropriate price indexes, in order to obtain the real values. We therefore obtained the real evolution of quantities, inflation excluded.

Starting from the growth rates of real gross output for the period 1995-2007, we tried to estimate what percentage in growth was due to other factors than labour, capital and intermediate inputs. The residual factor that remains after subtracting all these evolutions is the expression of technical progress.

On the basis of equation (5), we computed the contribution of each factor in growth, for each country and every year. The mean values of these contributions are presented in Table 1. We present the data under the form of a mean aggregated production function, expressed in first order differences (growth rates).

Table 1. Aggregated production function estimates

Countries	Production function estimates on the basis of mean parameters
Hungary	$\Delta Y = 0.64 + 0.16\Delta K + 0.25\Delta L + 0.58\Delta CI$
Poland	$\Delta Y = 0.63 + 0.14\Delta K + 0.32\Delta L + 0.55\Delta CI$

Slovakia	$\Delta Y = 0.90 + 0.19\Delta K + 0.19\Delta L + 0.62\Delta CI$
Slovenia	$\Delta Y = 0.71 + 0.11\Delta K + 0.33\Delta L + 0.56\Delta CI$
Czech Republic	$\Delta Y = 0.76 + 0.15\Delta K + 0.22\Delta L + 0.63\Delta CI$
Estonia	$\Delta Y = 0.84 + 0.18\Delta K + 0.23\Delta L + 0.59\Delta CI$
Latvia	$\Delta Y = 0.76 + 0.22\Delta K + 0.24\Delta L + 0.54\Delta CI$
Lithuania	$\Delta Y = 0.87 + 0.24\Delta K + 0.27\Delta L + 0.49\Delta CI$

Source: Authors calculus, on the base of EU KLEMS data. The coefficients are computed as mean values for the yearly coefficients, 1995-2007.

For all the 8 countries included in the sample, the Solow residual has similar values, between 0.63 and 0.90. We can interpret these values as percentage points in output growth due to technical progress. This means that technical progress contributes to a little less than 1% point to the growth rates of output in the new EU member states. These are the absolute values.

We can see that the sample is quite homogenous in terms of absolute contribution of technical progress. Concerning the production factors, capital has a contribution between 14 and 24% to output growth, the highest values being for Latvia and Lithuania. For the two countries, the result seems to have 3 explanations. First, the decrease in labour supply (because of demographic and emigration issues) has led to a decrease in the contribution of labour. Labour has practically been replaced by capital. Second, the period taken into account was that of gross privatization, which has led to technological restructuring and increase in gross fixed capital formation. Last, once EU member states, important investment inflows have taken place, which reinforced capital accumulation. A small contribution of capital we find for Slovenia, compensated by a high contribution of labour. This is explained by labour intensive industries, also suggested by the sector distribution of output.

Since our objective was to determine the correlation between technical progress and FDI, we have proceeded with the analysis of the Solow residual, on the basis of an 8 country panel, for the period 1996-2007. The advantage of such a method comparing to classical regression is that it takes into account the unobserved country specific effects. As value for FDI, we have used the FDI stock, instead of inflows, because we considered that accumulated FDI, rather than inflow, is responsible for an increase in technology stock and contribution to output growth. As we previously discussed, a part of the technology is incorporated in capital goods. For this theoretical reason we have decided to also include fixed capital formation as a variable in the panel regression. The equation we estimated using STATA 10.0 was the following:

$$A_{it} = \beta_0 + \beta_1 FDI_{it} + \beta_2 GFCF_{it} + u_{it} \quad (6)$$

The Hausman test indicated that a fixed effect model would be more suitable than a random effect model. This means that the error term u_{it} has in fact the form $u_{it} = \mu_i + v_{it}$. The first term has no time index, referring to the country-specific, time-invariant effects.

The results we have obtained are the following:

$$A_{it} = 0.31 + 0.12 FDI_{it} + 0.52 GFCF_{it} + u_{it} \quad (7)$$

(0.041**) (0.088*) (0.423)

The preliminary results show a positive coefficient for FDI, even if it is significantly different from zero only at a 10% significance level (In brackets we have presented the p values associated with each coefficient). This means that for a billion euros increase in FDI stock, the residual parameter, more precisely TFP, increases by 0.12 percentage points. The coefficient associated with gross fixed capital formation it is not statistically significant. We are aware that the two exogenous variables are not independent, but could be in fact correlated (a part from FDI will result in GFCF). We consider these as preliminary results, in order to have a general idea about

the relationship between FDI and TFP. We are planning to improve our empirical part by correcting the model (6) with an interaction term between the exogenous variables $FDI \cdot GFCF$.

5. Conclusion

As a general conclusion regarding CEEC, they are in a convergence process towards the western productivity levels. After the collapse of the socialist regime, these countries have known important transformations, like: decrease in the contribution of labour to output, substitution of labour with capital and therefore increase in the contribution of capital. FDI has played an important role both in fixed capital accumulation and technology stock.

Using the new EUKLEMS database, we have shown that technical progress has generated between 13%-19% of output growth in the region and that the 8 countries are similar in this concern. In evaluating the role of FDI, we are cautious in interpreting the coefficients of the panel regression model. The only thing we can say is that ***technology and the stock of FDI are positively correlated***. This correlation does not imply causality. It only means that an increase in the FDI stock is accompanied by an increase in the technical level. These two variables can be linked either directly or indirectly, through other variables such as fixed capital formation, research expenses etc. We consider this to be a first step in analysing the implications of FDI on the stock of technology. A further, more detailed, analysis is needed in order to evaluate the possible sources of technical progress. When analyzing FDI as a determinant of TFP growth, we consider useful taking the analysis at industry level, to better correlate it with the foreign presence in the sector.

INVESTMENT IN HUMAN CAPITAL – AN INVESTMENT IN FUTURE

Facultatea de Ştiinţe Economice şi Gestiunea Afacerii

Dumitrean Crinuta Nicoleta

Economist Dr.

Abstract: The paper aims to study, reveal and understand one of the most important production factor, considered by some as being labor, understood nowadays as human capital. It is important to reveal and to demonstrate that the investment into human capital will have results with a very high return on investment, maybe not so seen in the first years to come just after the investment, but for sure as a big result and a cause for economic development. The investment into human capital can be determined by public or private investment. Either the case the result will be in favor of the national economy.

Keywords: investment, human capital, economic development, labor flows.

JEL codes: A10, A14, D24, I28.

1. Introduction

In economic perspectives, capital is generally thought to be assets that serve as resources for a company. The term human capital is a component of capital and has many definitions, with most relating to the knowledge, skills and abilities that people bring to a specific job within an organization (Young, McManus, & Canale, 2005). Some describe human capital as a “commercially valuable skill” (Marcus, Ippolito, & Zhang, 1998, p. 490), while others describe human capital as “the attributes of a person or people that are productive in some economic context” in an organization (Econterms, 2004) According to Nobel laureate Gary Becker, education is investment to us, which raises one’s productivity and thus the remuneration. Better known as Human Capital Theory, this concept describes its mechanism within the framework of economic analysis. (See Becker (1974)). What maybe Becker did not take into account is not only the benefit for the individuals, but also the benefit for the society and for the national economy as a whole. Those benefits can be expressed in value as remittances for those that are working abroad and sending money into the country and also at the level of knowledge, know-how, possible to be brought in the home country. We must say that is for sure those individuals, in which states are investing and in the end they are working elsewhere, the investment is not totally lost, or we must say that the investment is not lost at all and this because of at least two reasons. One, in the case that they are working abroad usually they are in the case of having remittances, which can be a very powerful and quite cheap way to invest in future generations. On the other hand if they are working abroad and let’s assume that they are not sending nothing back, at least they are producing more goods and services, so that the possibility of imports of cheap and very good, products from which is benefiting the entire society and not only the producer’s country.

We can, and for sure must see the education as an investment, an investment into the future, and also we must see the education as maybe the most important public spending policy, because, it has the most certain way to have the highest return on investment.

On the other way we must see the investment into education from the point of view of the training on the job. Maybe we should see this problem as a continuation of the education started in the early stages. More and more we are speaking about long life learning program as a follow up of the high school program and bachelor in the universities.

The other important way to analyze and to develop the investment into human capital is the return on investment. If in the first two cases it is quite easy to debate, because we think that it is quite impossible to measure the positive or negative effects, in the case of remittances for example those can be measured quite accurately together with the percentage from GDP to be invested into education. Maybe it is a link, maybe not, but for sure those two elements can lead to enough elements in order to link the degree of education, level of the education and the income for the national economy seen as remittances. For the countries on the way to development it is one important way to have cheap money.

2. Human capital theory

2.1. Education as an investment

According to the theory, one would pay for the education up to the point where the present value of the costs equate to the present value of the stream of income generated by the educational achievement. In the case of the university the total costs are composed of the costs with the tuition fees and the opportunity costs (for example the income at which the individual has to renounce in order to be able to take course). Of course this opportunity costs can be as to say recovered from the difference in payment that can result from a higher wage due to a higher qualification. Unfortunately this possible increase in wage is not certain, but, the loss of the wage in the university years it is. So the individual has to decide between a possibility and a sure thing. As other investment taking risks can lead to increasing revenues or higher losses. For instance the cost of a bachelor program in USA can go till the level of 30.000 – 50.000 US dollars in comparison to the cost of approximately 2500-5000 euro in a country on the way to development. Of course a degree obtained into a university considered to bring more knowledge can be the “cause” of a very well paid job. So maybe the effort is worth taking. Once again it is not sure. There are a few functions that can be used in order to determine the annual rate of return to education by using the years of education in order to obtain annual earnings. Those functions are called Mincerian wage function (Mincer (1974)).

Or an internal rate of return, a familiar concept in investment literature, may be derived for the case of education by equating present values of costs and benefits of education. The internal rate of return to education usually falls between 5 to 10 %, being greater than that of typical financial investment. (See, for example, Sveinbjorn et.al (2002)) However, many question the meaning of such economic returns to education. The educational credential is also known to act as a signaling device, since the future employee’s productivity is not revealed before the employment takes place. It is a proof of his/her ability at workplace. The empirical difficulty, however, is to verify whether education raises productivity as in the human capital theory or reveals it as in the signaling theory, since in either case education is likely to raise earnings. Still, it is probably safe to say that it has the both elements.

2.2. On-the-job Training

By and large everyone faces an initial period of difficulty when he/she starts working, which will gradually sooth away, and then the wage will eventually start rising. This suggests “there are certain skills you can only learn at workplace so that the longer you work the more productive you become,” and this is the idea of “On-the-job Training” or “Learning-by-doing.” Becker (1964) divided OJT into two types: general training and firm-specific training. General training is a training of skills which can be used in any firm and therefore the trained worker can raise his/her productivity in any firm, while firm-specific training cannot raise the worker’s productivity other than in the training firm.

This argument raises an issue about the incidence of OJT costs. The basic idea is as follows. If OJT is general then the worker can use the skill wherever he/she goes and thus it is worthwhile

for the worker to pay for it --- on the contrary, the training firm will not be able to recover the investment if the worker decides to leave and so there is no merit in paying for it. If, on the other hand, OJT is specific then it will not be in the interest of the worker to pay for it as this OJT does not affect his/her productivity anywhere else and thus it would be the firm to pay for the training. This distinction, however, is a highly theoretical one and in reality any OJT is likely to be a combination of both elements

3. Remittances

If we want to see the importance of the education we must present a few data's concerning the size and the importance for the remittances in the economies no matter those economies are weak or strong.

In each case we are speaking about huge sums of money, sums that sometimes are the same or even higher in comparison with the level of the budget for the educational field either the public or the private one. The migrant workers are accumulating knowledge in the countries in which they are going, they have access to technologies, sometimes transferring back home, sometimes not. Even in those cases some researchers are having doubts into linking the development with migration. In their perspective this link is much more complex and if it is not well achieved it can produce much more negative than positive effects. For some authors the gainers are the destination countries and not the origin ones. In our view all the time from the international trade benefits the most the country which is poorer and not the wealthy one, this being also a reason for the migration.

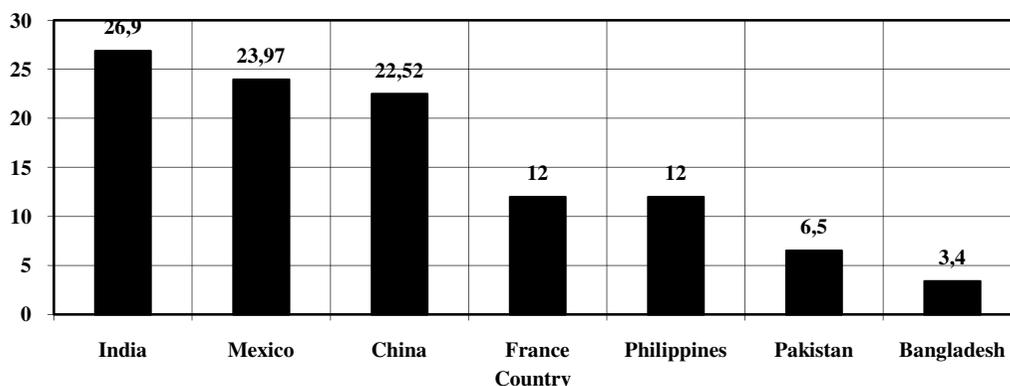

Remittances and their weight into the international trade for some countries

Country	Remittances (billion of US dollar)	% in EXPORT	% from IMPORT
Romania	750	9,0	6,3
Poland	2897	6,6	5,5
Hungary	1018	3,9	3,7
Cech Republic	408	1,2	1,1
Slovakia	366	2,8	2,3
Bulgaria	230	3,8	3,8
Slovenia	112	1,0	0,9
India	10280	21,6	17,3
Greece	7510	50,5	29,3
Mexico	6014	4,6	4,3
Turkey	5727	10,5	10,3
Egipt	4403	32,6	20,1
Portugalia	4031	11,6	8,8
Spain	3249	2,0	2,0

The level of the remittances in the first 7 countries of the world (2009) (billions of US dollars)

Country	India	Mexico	China	France	Philippines	Pakistan	Bangladesh
Remittances	26,90	23,97	22,52	12,00	12,00	6,50	3,4

Remittances

ROMANIANS REMITTANCES FOR 2000-2008 (BILLION OF USD)⁴⁸⁰

	2000	2001	2002	2003	2004	2005	2006	2007	2008
Total inflow, out of which:	96	116	143	124	132	4,733	6,707	6,800	7,000
Remittances of workers	2	4	7	14	18	3,754	5,506	-

Remittances of romanians between 2000-2008

4. Difficulties regarding the investment into human capital

There are a few problems to be discussed when a government is having investment into something. The investment into human capital is bringing together with common problems of the investments in general some other specific problems.

- Existing tax laws discriminate against the investment in human capital, sometimes they do not have a fiscal deductibility.
- Unemployment (i.e., sitting idly) causes human capital to deteriorate so the investment sometimes is not for life.
- There are hindrances to free choices of professions. In this situation it is possible that one investment to be fully lost if the individual is changing field.
- There is a need to provide funds for investment in human capital, and thus, long-term public and private loans should be made available to students. This can be a problem in the situation of low financing of the educational system or in the cases of financial crises when investing can represent a problem.
- There should be investments made in migration (i.e., in helping people settle and find education). This can be seen as a problem to be considered also when we speak about remittances.
- There has been a failure to adequately invest in those who sit on the periphery of society. This can be a problem when we are speaking about education as a cause and a necessity for the free market system.
- The return on public investment in human capital should not be returned directly to each individual. The individual will see a return in the form of wages, and will benefit from a strong economy.
- As a society, underdeveloped countries should be assisted to achieve economic growth, and to begin investing in human capital. This is a very important measure in order to be taken by those countries that are considered as being emergent countries and this can be a quite sure investment in order to diminish the gap to developed countries.

5. Ideas for future considerations

There is no doubt that the demand for higher education continues to grow globally. This comes together with the decrease in the population number and still the number of students is increasing a lot into these times.

Maybe the experience of those countries that have invested into education was an example, a good example for the emergent economies. Yes it is necessary to have funds in order to invest. And for sure when we are speaking about funds we need to take into account also the choice, to invest in education or in something else.

Maybe the investment in education will not show directly and obvious the benefits of the investment, in comparison with some other investments, for example in communication services. Yes we must say that the investment into education should represent a basic investment, a start for the other investments

The realization of return to educational investment is a long term process and it is not simple to quantify the outcome, which often results in underinvestment --- this is one of the reasons why free education exists particularly at primary and secondary education with governmental supports.

It is important that the companies should receive fiscal and financial support in order to invest in education. So a help provided by the governments, by the law regulators it is not only obvious but also necessary.

Paul Bouchard, in his article entitled "Training and Work; Myths about Human Capital" challenges seven basic assumptions used in the theory of human capital. Briefly, they are as follows:

Problem 1: Human Capital is in investment in the future.

-It is impossible to accurately predict future labor market needs. All the forecasting tools we have are problematic. Not only for the developed countries but also for the emergent ones and also at the regional level.

Problem 2: More training leads to better work skills.

-Organizations value particular skills and what these are often change over time. There are not necessarily 'better' skills, just ones that fit what serve the needs of the organization at the time. This is also a solution when we are speaking about structural unemployment. It can become a solution of requalification of the labor force.

Problem 3: Employees need to improve their skills.

-Work has not become more complex, in fact, with technology things have become 'easier'. The need to improve one's skills comes from having to compete in a job market with people who are in many cases over-qualified. So sometimes the need for qualification is not for increasing productivity but to become more competitive between workers.

Problem 4: Training enhances employability.

-Many individuals do not have access to training and thus access to jobs, while others may have access to training, but not to mobility within the organization.

Problem 5: Training can compensate for skill shortages.

-Bouchard argues there are not skill shortages, rather there is a skill-mismatch. In other words, for various reasons, individuals with appropriate skills do not find work. Three potential reasons for this are: labor market dynamics, structural discrimination, and employee self-selection.

Problem 6: Employment and unemployment are economic concepts.

-The labor market is NOT a market like any other. In all situations, but with very few exceptions, the supply of labor force will exceed the demand for labor force. So that the problem of qualification for workers it is a problem of becoming more competitive on this specific market. There are social forces present that keep people from having equal access to employment regardless of their skill and experience.

One the most important things to reveal about each economic crisis that can occur is to understand the past and the present and then maybe to try to predict the future. Economic crisis are not new, sooner or later they have common economic phenomenon and common causes and results. What is it not common are not the solutions. If some crisis can be described as crisis of over production or even oil crisis, the current one is more a consumption crisis. Is it possible to regulate the market? Is it worth? Will it be a solution? Maybe we can try but what we see is that all the countries that have tried a regulated national economy their increase was either small or none at all.

I. Le cadre théorique sur le libéralisme et l'interventionnisme économique

I.1. Le libéralisme économique.

On commence avec d'Adam Smith, le père de l'économie politique. L'une des principales idées de son œuvre: « Recherche sur la nature et les causes de la richesse de nations » (1776), c'est le libéralisme économique, plus précisément, la promotion du libre-échange, la concurrence non effrénée et de non-ingérence de l'État dans la vie économique.

Avant lui, avec « le passage du capital commercial dans la production, accompagnée d'une affirmation de la société capitaliste dans les XVIIe et XVIIIe siècles, étaient des penseurs et des praticiens qui ont fait campagne pour une politique économique libérale⁴⁸¹, comme : William Petty, David Hume, Condillac, Cantillon et bien sur les physiocrates.

Pour Adam Smith la liberté naturelle est juste et cette liberté naturelle conduit au plus grand développement que l'on puisse espérer, les capitaux seront utilisés d'une façon optimale, et la société va prospérer rapidement. C'est précisément la perturbation de l'ordre naturelle, la raison pour laquelle ne veut pas l'intervention de l'Etat dans l'économie.

Les principes sur lesquels est fondé le libéralisme économique Smithien ce sont : la main invisible, et le principe du « laissez-faire ». C'est-à-dire que les marchés s'autorégulent et obéissent à la loi de l'offre et de la demande à travers le prix qui va fluctuer. S'il y a une demande supérieure à l'offre, les prix vont augmenter, pour revenir à l'équilibre ; s'il y a une demande inférieure à l'offre les prix vont diminuer, toujours pour revenir au niveau de l'équilibre ou la demande est égale à l'offre. Ces choses sont possibles parce que la demande d'un produit est une fonction décroissante de prix, tant que l'offre d'un produit c'est une fonction croissante de prix ; ça veut dire que si les prix d'un bien augmentent il y aura une demande moins forte pour ce bien, et un offre plus forte, tant que si les prix d'un bien diminuent on aura une demande pour ce produit plus grande, et un offre pour ce produit plus petite. Donc, le prix c'est l'élément essentiel du marché parce que de lui dépend les quantités demandées, mais aussi les quantités offertes.

⁴⁸¹ G. Popescu – Evolutia gandirii economice, Editura Academiei Romane, 2004, pp 178.

Les économistes néoclassiques, comme Léon Walras, et leurs héritiers, ont pensé qu'une concurrence libre conduira au maximum de satisfaction. Mais par là il ne faut pas entendre le plus grand bonheur pour le plus grand nombre. Walras n'est pas Benthamien, mais il croit dans un droit naturel. L'équilibre est bon car il convient à la justice commutative. Walras ne va pas aussi loin que Pareto dans la formalisation de cette idée mais l'idée est déjà là.

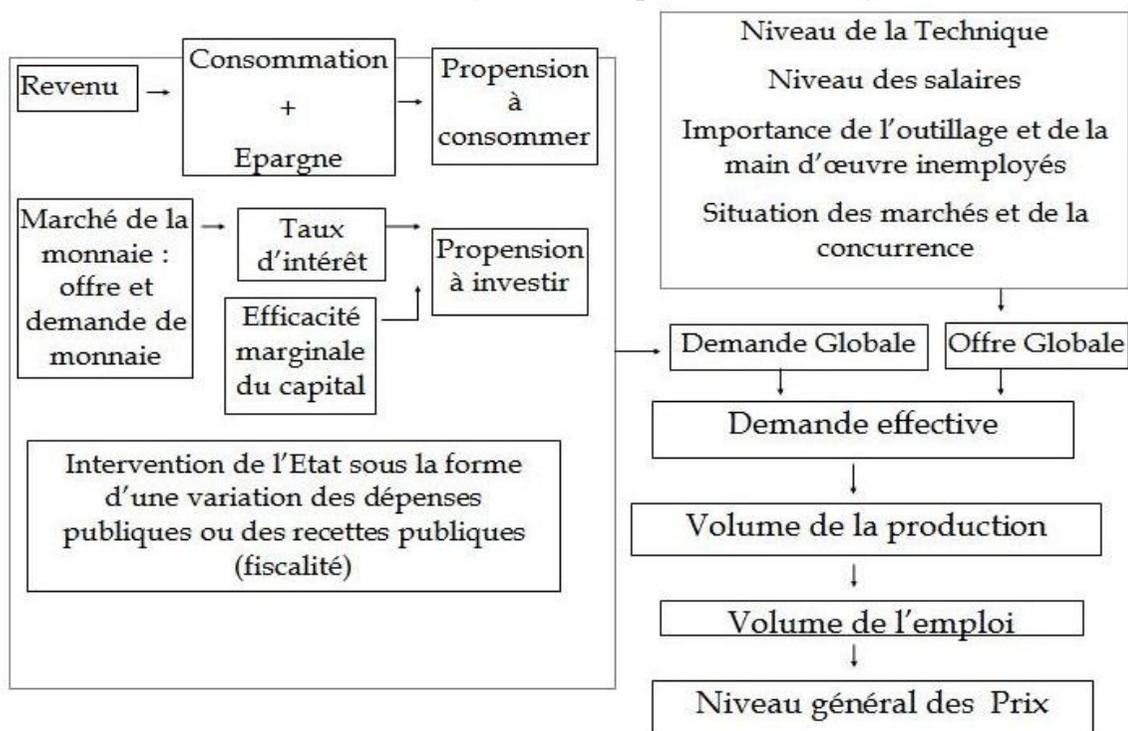

Ils ont mis l'accent sur la partie quantitative de l'économie. Le marché est présenté comme statique. Comme Daniel Villey disait : « Walras va mettre le marché en équations ». ⁴⁸² Mais, mettre l'économie en équations ca veut dire aussi l'abandon de la causalité. Ici, apparaissent les économistes de l'école autrichienne, Hayek en particulier, qui vont mettre l'accent sur la partie qualitative de l'économie, sur la causalité, sur la dynamique du marché, de la concurrence, comme dira Hayek plus tard une dynamique de la découverte.

Le principe selon lequel les marchés s'autorégulent, a été mis en œuvre dans les années 1980, aux Etats-Unis, soutenu par le président Ronald Reagan (1981-1989) et en Royaume Uni, soutenu par le premier ministre Margareth Thatcher (1979-1990).

1.2. L'interventionnisme économique.

Certains économistes ont remis en cause le bien-fondé d'autorégulation des marchés. C'est le cas, bien sur, de John Maynard Keynes, qui pensait que le marché n'est pas la modalité optimale d'allocation des ressources. A son avis, chacun actionne dans le marché selon les intérêts personnels, et les choses qui sont bonnes pour un individu ce n'est pas sur que ce sont bonnes pour tout le monde, pour la société en général (contrairement aux choses dites par Smith). Pour Keynes, l'intervention de l'Etat c'est nécessaire parce que les marchés vont aboutir a un équilibre de sous emploi, et cette intervention doit réduire le chômage.

L'intervention de l'Etat dans la vision keynésienne est présentée dans la figure ci-dessous :

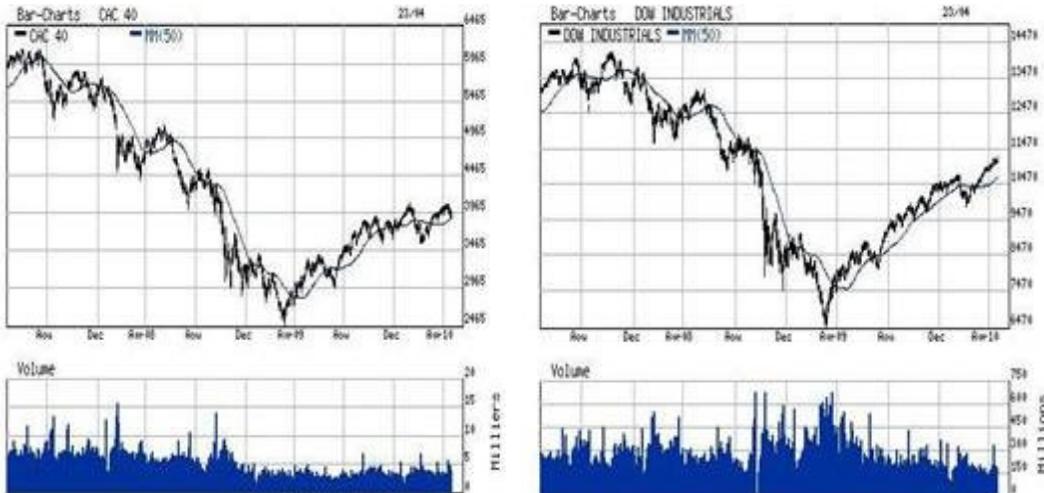

II.L'impact de la crise subprime sur les marchés des actions.

⁴⁸² D. Villey – Petite histories des grandes doctrines économiques, Paris, Neme, 1996, pp 198.

Pour mieux voir l'ampleur de la crise subprime on voudrait montrer comment ont évolué les marchés des actions dans cette période, de combien ont-elles chuté.

On commence avec l'indice américain Dow Jones Industriels, l'indice français CAC 40 qui ont les graphiques suivants :

Graphique 1 : Graphique historique a un jour, durée 3 ans pour Dow Jones Industriels et CAC 40, avec les volumes de transactions

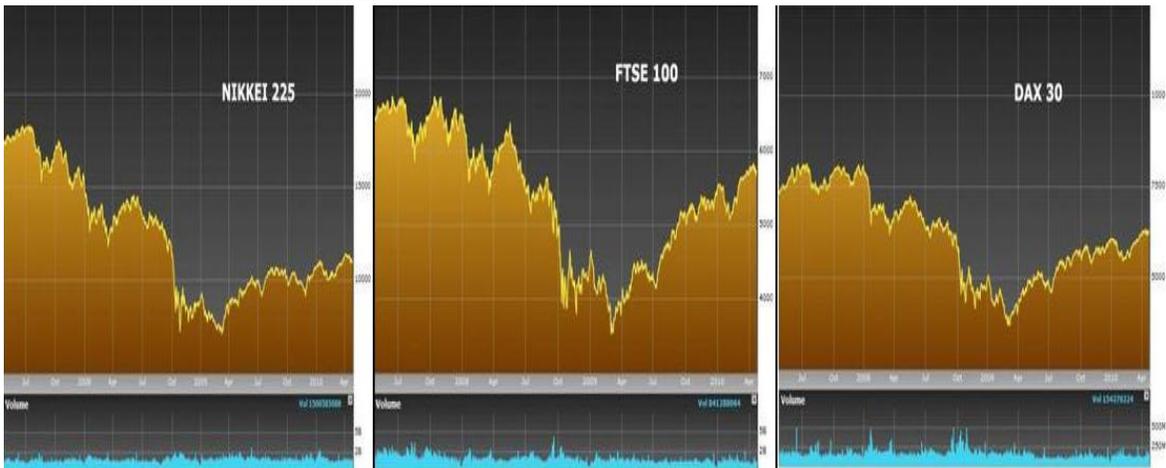

Source : Boursorama

Comme on peut voir sur le graphique, le niveau plus haut de Dow Jones Industriels c'était à 14198,10 Pts, et le niveau plus bas à 6469,95 Pts. Ca veut dire que l'indice américain a chuté de 54,43%.

Pour l'indice CAC 40, le niveau maximum c'était à 6168,15 Pts et le niveau minimum c'était à 2465,46 Pts. Donc, la bourse de Paris a reculé pendant la crise subprime de 60,02%.

Graphique 2: Graphique historique a un jour, durée 3 ans pour Nikkei 225, FTSE 100 et DAX 30, avec les volumes de transactions

Source : Bloomberg

L'indice asiatique le plus important c'est le Nikkei 225. Pour mieux voir comme les marchés financiers ont été touchés en Asie, on a montré aussi le graphique de cet indice, et son niveau plus haut c'était à 18297,00 Pts et son niveau plus bas c'était à 6994,90 Pts, donc le marché japonais a chute de 61,77%.

Le plus important indice européen est considéré l'indice anglais FTSE 100. Le niveau maximum c'était à 6754,10 Pts, et le niveau minimum c'était à 3460,71 Pts, donc une chute de 48,76%.

En fin, l'indice allemand a « tombé » de 55,97%, parce qu'il avait le niveau maximum à 8151,89 Pts, et le niveau minimum à 3588,89 Pts.

On a choisi les graphiques de plus importants indices du monde, pour mieux comprendre l'ampleur de la crise subprime sur les marchés « matures » des actions. On voyant tous ces importantes chutes de bourses internationales on peut conclure que la crise subprime a touché très fort le monde financier. A cause de ça, il y a pas mal du monde qui a perdu beaucoup avec ce recule de bourse. Pour ne pas se répéter cette chose, plein des économistes des gauches on proposé des normes de réglementation les marches financières.

III. Les règles proposées: mieux et peut-être plus.

III.1. La révision les normes comptables.

Des le début il faut qu'on dise que comptabilité a un rôle très important. Ce n'est pas difficile à constater que les normes actuelles de comptabilité sont pro cycliques et qu'elles favorisent les crises.

Les systèmes des actuelles de comptabilité déforment l'information. La loi fondamentale de la comptabilité : « copie fidèle de la réalité » est partiellement oublié. Par exemple, en Roumanie, un vendeur qui livre un produit aujourd'hui est obligés d'enregistrer en comptabilité, le montant de cette transaction comme une recette; mais aucun paiement n'a pas été fait et personne ne sait pas quand ou s'il se fera. Avec cette recette fictive les situations comptables seront embellites.

Actionnaires, investisseurs, spéculateurs attendent de bons résultats de sociétés pour acheter plus. Les entreprises sont conscientes de cette chose et que, pour survivre, elles ont besoin de fournir les résultats attendus et les états financiers figurant ainsi "faussée" et ainsi apparaissent les situations financières "déformés". Les entreprises, les comptables profitent des échappatoires laissés par la réglementation en vigueur. Cela s'est produit dans le cas Enron, qui a fait couler beaucoup d'encre.

Il a pas mal des opinions selon lesquelles l'International Accounting Standards Board (IASB) ne doit plus être une institution privée, et que les banques centrales doivent avoir aussi des représentants.

III.2. La réglementation des agences de notation et la réduction de leur influence

Il est préférable qu'il existe un nombre plus grand d'agences de notations⁴⁸³ dans plusieurs parties du monde, pour ne pas servir certains intérêts. L'amélioration de la concurrence entre eux serait plus que bénéfique. S'il y a plusieurs, elles doivent travailler mieux, donner de mieux rating pour avoir des clients.

Après, il faut réduire leur influence. C'est inadmissible que les banques ne font pas des travaux de notation interne, et qu'elles prennent toutes les informations de ces agences de notation sans les vérifier.

En plus, on ne doit pas oublier que les agences de notation sont payées par les entreprises pour lesquelles elles font la notation, le rating. Donc, c'est l'émetteur qui paye pour avoir le rating, et ici c'est un petit conflit d'intérêt. Cette chose doit être changée d'une façon ou l'autre. Par exemple, on pourrait avoir de représentants de l'Etat, dans la direction des ces agences. Est une chose connue qu'avant de faire faillite la Banque Lehman Brothers avait le meilleur rating.

III.3. L'amélioration de l'information des investisseurs et, aussi, du grand public

⁴⁸³ Elles sont trois et toutes les trois sont pratiquement américaines.

Ce n'est pas difficile à observer que l'information offerte par les sociétés, en général, manque la clarté souhaitable et beaucoup de gens ont du mal à déchiffrer cette information. On pourrait demander un minimum des informations que doivent être fournies, et aussi un niveau minimum de lisibilité.

Toujours il y aura une asymétrie d'information entre l'offreur d'un produit complexe et son client, mais cette asymétrie peut être limitée, en imposant des restrictions strictes pour tous les papiers remis au client. Ce aussi important d'avertir le client que certains produits n'ont pas reçu l'agrément du régulateur.

III.4. La redéfinition des modalités d'action des banques centrales

Les banques centrales ont un rôle très important dans le processus de développement économique. Elles peuvent provoquer une crise économique, mais elles peuvent aussi stopper une. Comment disait Patrick Arthus, qui conduisait à l'époque L'institut de recherche et des Etudes de Natixis: «Le monde est devenu différent, pas la philosophie des banques centrales»⁴⁸⁴.

Soit le cas de la crise subprime: si les banques commerciales peuvent emprunter des banques centrales avec un taux d'intérêt très bas, et elles savent que si elles ont des problèmes la banque centrale les aidera, les banques commerciales accordent des prêts à leurs clients sans se ressemblent sur eux. Le crédit a deux conséquences directes: a) une positive, parce qu'il multiplie les possibilités de financement avec le même montant d'argent ; b) une négative, car il y a le danger de multiplier la monnaie fiduciaire, résultant un gonflement de la valeur symbolique de la économie en comparaison avec sa substance matérielle. L'argent sans couverture qui alimente en spirale la valeur gonflé, nécessitant d'autres montants et des autres montants... jusqu'à ce qu'elle atteigne son point culminant. Et la crise a apparue. Le coût et disponibilité de crédit sont des facteurs importants influençant le niveau de l'activité économique: ils sont très probablement les facteurs les plus importants dans la détermination de la forme asymétrique de modelé boom / crash⁴⁸⁵. Le crédit à taux d'intérêt tres bas a gonflé toujours l'économie symbolique sans avoir couverture dans l'économie réelle.

III.5. L'harmonisation de la notion de fonds propres des banques

Comme disait Voltaire : « *Si vous voulez parler avec moi* définissez vos termes ». Donc pour mieux s'entendre il faut définir le concept des fonds propres de banques. Comme nous ne pouvons pas mesurer le poids, si son unité de mesure (le gramme) lui-même n'est pas pareille pour tout le monde⁴⁸⁶, nous ne pourrions pas bien comprendre les banques si leurs fonds propres ne sont pas pareille pour tout le monde.

Elles doivent travailler avec les mêmes notions. Ce serait une étape vers un marché unique des services financiers, ce qui implique évidemment une plus grande concurrence et une égalisation des termes.

Des règlements sur les normes et sur l'utilisation possible de capital pourraient être restaurée et, en plus, des règlements pour un capital minimum que les banques devraient avoir.

III.6. La sécurisation des marchés de dérivés

Le volume de ce marché de dérivé a été, avant la crise, dix fois plus grande que la valeur de PIB cumulé de tous les pays du monde. Impressionnant, n'est ce pas ?

⁴⁸⁴ P. Arthus – Les incendiaires - Les banques centrales dépassées par la globalisation, Librairie académique Perrin, Paris, 2007 pp. 87.

⁴⁸⁵ G. Soros, Criza capitalismului global, Editura Polirom, Iasi, 1999, pp. 118.

⁴⁸⁶ G. Popescu -O paradigma a crizelor economice; Volumul: Criza financiara si economica: cauze, efecte si solutii, 26 mars 2009, pp. 12.

C'est important de connaître plus des choses sur ces marchés, on pourrait standardiser ces genres de contrats et le faire passer par une sorte de « chambre de compensation ». Comme ça, on pourrait avoir un véritable marché.

Les choses sus-énoncés peuvent être appliquée seulement dans une période de crise, parce qu'autrement il y a presque tout le monde qui s'opposera en disant, pourquoi réglementer quelque chose qui marche tres bien ?

En conclusion, avec une meilleure règlementation, on pourrait arrêter l'effondrement économique, le crash économique, mais aussi nous ne pourrions pas nous attendre aux booms spectaculaires.

Abstract:

Among other aspects, the 2007-2009 financial and economic crisis had an impact on the Romanian labor force, too. The aim of this article is to analyze the macroeconomic determinants of the unemployment rate in Romania, using an econometric model. We use the GDP, net and gross wage, monetary policy rate, inflation rate, budget deficit, average RON/EUR exchange rate, export and import values to estimate the model. The analyzed period is 2000-2009.

Keywords: regression model, unemployment rate, net exports, monetary policy rate, inflation rate

JEL code: C22, C53, E24

Introduction

Taking into consideration the effects of the 2007-2009 financial and economic crisis on the unemployment rate in Romania (in Q3 2009 it reached the values of 6.8%, which is higher with 9.22% than the value measured in 2007, and with 21.57% than the value measured in 2008), and knowing the negative social implications of an increasing unemployment rate, we find it important to seek the determinants that lay behind these values. The aim of this article is to identify those macroeconomic factors that have the greatest impact on the Romanian unemployment rate between 2000 and 2009. We do this in order to be able to suggest measures of decreasing it.

1. Literature review

Boianovsky, M. and Presley, J. R. (2009) use the theory first mentioned by Robertson, D. in 1930 which states that there is a connection between the natural rate of unemployment and the monetary policy rate. As Robertson, D. shows, there is a direct connection between the cyclical change of prices, the output and the employment on the long run. Boianovsky, M. and Presley, J.R. starting from the price expectations of the economy, using the theory of money illusion, deduce a relation between the monetary base, the interest rate, the real wages and the unemployment rate. They also emphasize on the differences between the Robertson and Keynes theories regarding the unemployment, which in their view lays mainly in the way they look at the interest rate, which has an impact on savings, consuming, and finally on the unemployment rate.

Fitzenbergern, B. and Garloff, A. (2008) who analyze the problems of the labor market in Germany, come to the conclusion that the main reason of the high unemployment rate is the low value of wages. According to the neoclassical views wages are determined by the marginal product of labor, therefore the increasing minimal wages lead to a decreasing wage and increasing unemployment rate.

Kooros, S. K. (2008) identifies those macroeconomic variables that have a significant effect on the unemployment rate. He estimates a multi-variable regression model, using GDP, the monetary policy rate, the budget deficit, the inflation rate, and the nominal wages.

Mussard, S. and Philippe, B. (2008) come to the conclusion that the unemployment rate in time t depends on the GDP and inflation rate in time $t-1$. In the study it is shown that through the process of money multiplier the GDP is in relations with the unemployment rate.

Guha, D. and Visviki, D. (2001) in their empirical research conducted on the USA, using data from the years preceding the 2nd World War, come to the conclusion that inflation, and labor marginal product cause the increasing unemployment rate. They show that the marginal product is in stronger relations with the unemployment, than the inflation is.

2. Methodology and data

We estimated the model using the OLS⁴⁸⁷ method. To eliminate the autocorrelation we use the Cochrane-Orcutt procedure (Ramanathan, R., 2003).

In the model we tested 10 macroeconomic variables: seasonally adjusted GDP, net and gross wage, monetary policy rate, seasonally adjusted, cumulated inflation rate, budget deficit, average RON/EUR exchange rate, seasonally adjusted export, import and net export values. These appear in the literature mentioned above.

The source of the unemployment rate, average RON/EUR exchange rate and monetary policy rate is the monthly report of the National Bank of Romania⁴⁸⁸. For better results we use the logarithmic value of the unemployment rate. The gross⁴⁸⁹ and net wages⁴⁹⁰ are values calculated by the authors, using the National Institute of Statistics data. We consider the average number of hours worked in a month as being 170⁴⁹¹, therefore, we calculate the gross and net wages as the rate of the gross and net wages per month and the number of hours worked in a month. The seasonally adjusted net export, export and import values, and the seasonally adjusted GDP⁴⁹² and seasonally adjusted cumulated inflation rate⁴⁹³ data are taken from the National Institute of Statistics database.

The quarterly data come from Q1 2000 to Q3 2009 but because we use the moving average method to seasonally adjust the data, we lose 4 data; therefore, the number of observations is 35. The data from the sample are aggregated data that refer to the entire economy. The model is estimated using the Gretl⁴⁹⁴ econometric software.

3. The results of the empirical study

Leaving out the insignificant variables, we find that there are 3 determinants of the logarithmic values of the unemployment rate: seasonally adjusted net export, monetary policy rate, and seasonally adjusted cumulated inflation rate.

In *Figure 1* we can see the logarithmic values of the unemployment rate and the seasonally adjusted net export values between Q3 2000 and Q1 2009. We assume a positive correlation between the two.

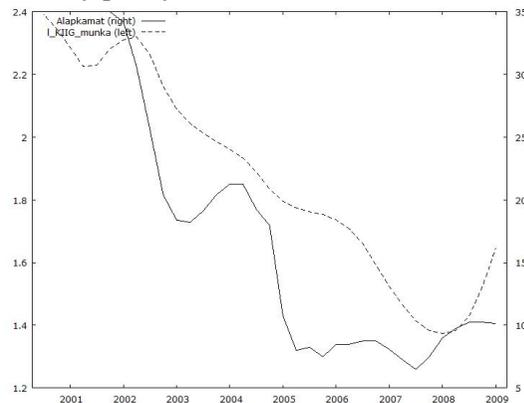

Figure 1: The logarithmic value of the unemployment rate and the seasonally adjusted net export between 2000 and 2009, quarterly data

Source: Authors' calculations, based on the National Bank of Romania monthly reports between 2000 and 2009 and the National Institute of Statistics TEMPO online database

In *Figure 2* we can see the logarithmic values of the unemployment rate and the monetary policy rate between Q3 2000 and Q1 2009. In this case too, we assume a positive correlation.

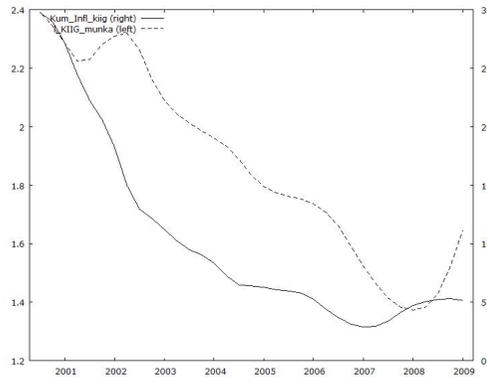

Figure 2: The logarithmic value of the unemployment rate and the monetary policy rate between 2000 and 2009, quarterly data

Source: Authors' calculations, based on the National Bank of Romania monthly reports between 2000 and 2009 and the National Institute of Statistics TEMPO online database

In *Figure 3* we can see the logarithmic values of the unemployment rate and the seasonally adjusted cumulated inflation rate between Q3 2000 and Q1 2009. In this case we assume a negative correlation.

Figure 3: The logarithmic value of the unemployment rate and the seasonally adjusted cumulated inflation rate between 2000 and 2009, quarterly data

Source: Authors' calculations, based on the National Bank of Romania monthly reports between 2000 and 2009 and the National Institute of Statistics TEMPO online database

The results of the Cochrane-Orcutt model are shown in *Table 1*. The dependent variable is the logarithmic values of the unemployment rate.

Table 1: Cochrane - Orcutt model

Explanatory (independent) variables	Coefficient	Standard error	t-statistics	p-value
Constant	2.05986	0.068052	30.27	4.82E-24
Net export	4.39E-05	4.57E-06	9.6	1.17E-10
Monetary policy rate	0.007846	0.00222	3.534	0.0014
Cumulated inflation rate	-0.01244	0.007077	-1.758	0.089
Average value of the logarithmic unemployment rate: 1.8555854				
Adjusted R ² : 0.994173				
F(3,30): 38.25734				
p-value (F): 2.24e-10				
Standard error of regression: 0.024371				
Durbin-Watson: 0.996650				

Source: Authors' calculations

According to the results of the adjusted R^2 and global F statistics we can conclude that the built model is a good estimation.

The function derived from the model is the following:

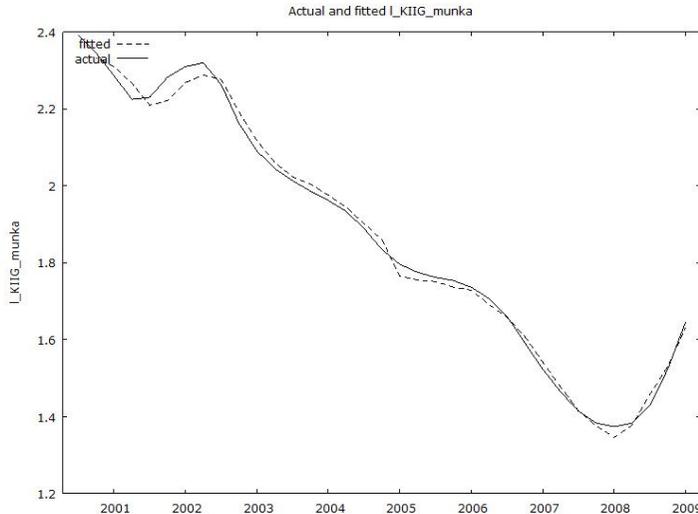

$$\text{Log_unem}_t = 2.05986 + 4.39 \cdot 10^{-5} \text{net exp}_t + 0.007846 \cdot \text{mon.pol.rate}_t - 0.01244 \cdot \text{inf.rate}_t + \varepsilon_t,$$

where $t = \overline{1,35}$ and ε_t is the residuum.

As we assumed, the seasonally adjusted net export and the monetary policy rates increase the value of the logarithmic value of the seasonally adjusted unemployment rate, the cumulated seasonally adjusted inflation rate decreases the value of the logarithmic value of the seasonally adjusted unemployment rate.

Figure 4 shows the fitted and actual values of the logarithmic unemployment rate. As we can see the fitted values are a good estimation of the actual values.

Figure 4: Actual and fitted values of the logarithmic value of the unemployment rate, between 2000 and 2009, quarterly data

Source: Authors' calculations

The increase in the net export causes the increase of the unemployment rate. This can be explained by the fact that in those periods, when the import values are high, the domestic currency is depreciated, therefore it is less attractive for investors, and therefore, unemployment increases.

The increasing monetary policy rate increases the unemployment rate, as well, because higher rates mean higher costs for the companies, that moderates economic growth and therefore increase unemployment.

However, the increasing inflation rate decreases the unemployment rate, which is in correlation with the result found by researchers quoted in the literature review.

Among the three variables, the coefficients of the independent variables are small, besides the inflation rate, so we can conclude that the inflation rate is the main determinant of the unemployment in Romania.

4. Conclusions

In our study, we analyze the macroeconomic determinants of the unemployment rate in Romania. For the estimation of the model we use quarterly data from the period 2000-2009. We find that the seasonally adjusted net export, the monetary policy rate and the inflation rate are those dependent variables that have a significant influence on the seasonally adjusted logarithmic value of the unemployment rate.

The positive and negative signs of the independent variables are those expected: the net export and the monetary policy rates increase the value of the unemployment rate, whereas the cumulated seasonally adjusted inflation rate is in correlation with economic growth, therefore decreases unemployment rate.

With the identification of the determinants of the unemployment rate we have a chance of proposing such monetary policies that can decrease the unemployment rate, mainly through the monetary policy rate, but also through the inflation rate. Moreover, we show that it is equally important to have a coherent foreign trade policy in order to be able to decrease the unemployment rate.

THE ELDERLY PATIENTS IN THE GERMAN HOSPITAL SETTING: FACTS AND FIGURES

Leuca Mirela

Faculty of Economics

University of Oradea

Fastenmeier Heribert

Klinikum Ingolstadt GmbH

The demographic evolution and its consequences – population ageing - have been the topic of multiple research studies and analyses in many countries, industries or political regimes. Health care systems have been faced with questions regarding future financing, organization and resource allocation under the impact of the demographic evolution. This time is the hospital sector in focus. Analyzing the situation in German hospitals on the basis of recent, detailed statistical data and studies, this paper provides information, data and figures on elderly hospitalized patients with regard to costs, diagnoses and operations and presents briefly implications of the demographic evolution and of an ageing population for hospitals.

Keywords: hospitalized elderly patients, acute hospital care, demographic changes.

JEL Classification Code: I10 J10 M10

1. Introduction

The health care system of the European countries has been undergoing major changes related to the financing of the health care system, the allocation of resources, the spectrum, structure and organization of the health care service provision and also the access of the population to these services in the last decades. These health care reforms together with other factors of influence have had a great impact on the hospital sector in the European countries. Data provided by the World Health Organization Regional Office for Europe show that both the number of hospital and of hospital beds per 100,000 inhabitants decreased in the great majority of the member countries of the European Union in the last decades, but considerable differences between the member countries still persist. The average length of stay in acute care hospitals also diminished considerably, whereas the inpatient health expenditure per capita has been almost continuously rising, with small exceptions, in the member countries of the European Union.⁴⁹⁵ But the hospital sector in Europe is also facing a major challenge provided by the demographic evolution – the European hospitals will be caring for more and more elderly patients with special and often complex needs. In Germany, the patients aged 65 years and older discharged from German hospitals accounted in 2008 for about 42% of the cases registered in the hospital diagnosis statistics, whereas the patients aged at least 80 accounted for almost 14% of all primary diagnoses.⁴⁹⁶ The data referring to total health expenditure by age and disease groups in 2006 show that the average health expenditure per capita for the population aged at least 65 years and less than 85 is about 2.1 times higher (6090 €) and for the population aged 85 years and over about 5 times higher (14 370 €) than the average health expenditure per capita within all age

groups (2870 €).⁴⁹⁷ What for an impact will the demographic ageing process have on the health care system and on the hospital sector? The studies, data and publications available have been so far aiming at quantifying the impact of the demographic changes on the health expenditure, organizational structure and allocated resources and on the evolution of the medical specialties. This paper presents and analyzes some of the results of studies published on this topic and recent statistical data available with regard to the diseases and operations of the elderly hospitalized patients in Germany, trying to underline their characteristics and presents briefly implications of an ageing population for the German hospitals.

2. Characteristics of hospitalized elderly patients in Germany

There are many publications trying to estimate or predict the impact of the demographic evolution and of an ageing population on the health care expenditure, hospital cases, capacities and costs. There are more theses with regard to the evolution of morbidity at high ages, such as the compression of morbidity⁴⁹⁸ or the medicalization thesis⁴⁹⁹. The German hospital diagnosis statistics⁵⁰⁰ shows that the diseases of the circulatory system (about 2.7 million recorded primary diagnoses) accounted for the highest number of primary diagnoses of the hospitalized discharged patients in 2008 in Germany, followed by the neoplasms (about 1.9 million recorded primary diagnoses), by the diseases of the digestive system and of the category injury, poisoning and certain other consequences of external causes (each about 1.8 million recorded primary diagnoses), by the diseases of the musculoskeletal system and connective tissue (about 1.6 million recorded primary diagnoses), the top 6 diagnosis categories ending with the mental and behavioral disorders (about 1.1 million recorded primary diagnoses).

Figure 1: Primary Diagnosis Categories by Age Groups (I).

Source: authors' own calculations based on available statistical data from Statistisches Bundesamt (2009a).⁵⁰¹

The analysis of the diagnoses data for the patients aged 65 years and over shows that the top 5 diagnosis categories are identical with those of all discharged patients, followed by the but the diseases of the circulatory system on the 6th place. The diagnosis categories mental and behavioral disorders, certain infectious and parasitic diseases, diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism, diseases of the skin and subcutaneous system and the diseases of the ear and mastoid process occupy the last 5 places in the top diagnosis categories for the group of patients aged 65 years and over. Figures 1 and 2 show that the highest frequencies of recorded primary diagnoses from the categories neoplasms, diseases of the musculoskeletal system and connective tissue and diseases of the ear and mastoid process are registered in the age group 65 – 70 years (patients aged at least 65 and less than 70 years).

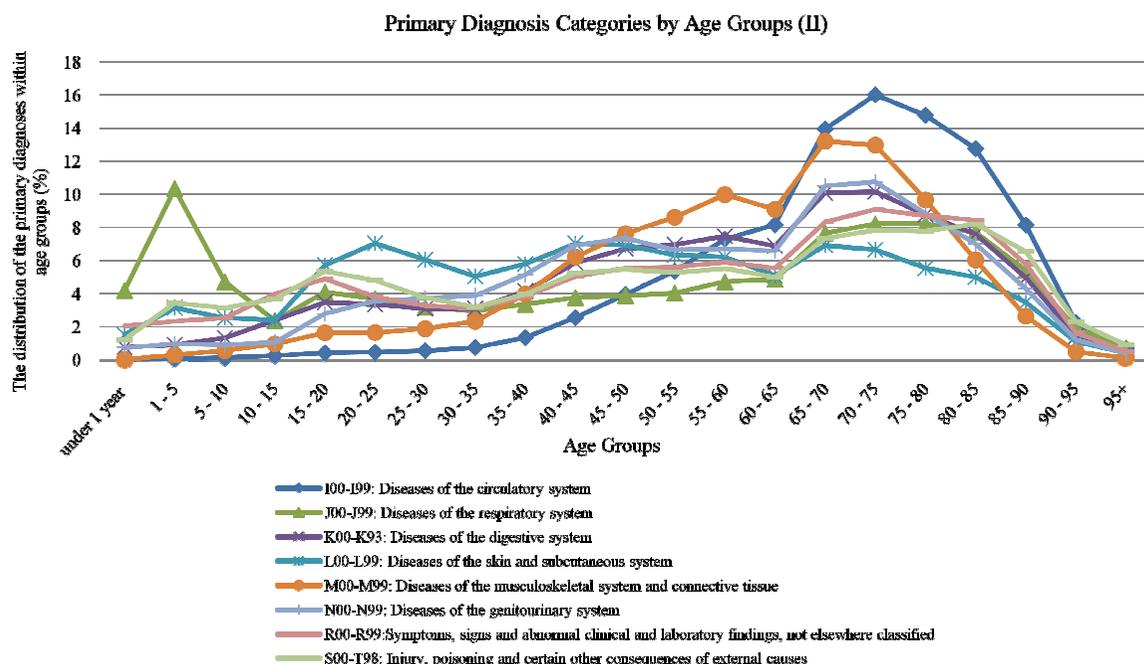

Figure 2: Primary Diagnosis Categories by Age Groups (II).

Source: authors' own calculations based on available statistical data from Statistisches Bundesamt (2009a).⁵⁰²

The highest frequencies of recorded primary diagnoses from the categories: diseases of the circulatory system, diseases of the genitourinary system, diseases of the digestive system, diseases of the nervous system, symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified, then endocrine, nutritional and metabolic diseases, and diseases of the eye and adnexa are registered in the age group 70 – 75 years (patients aged at least 65 and less than 70 years). The highest frequency for injury, poisoning and certain other consequences of
