It's not enough to be smart or highly educated. There are a lot of outstanding people, some of them geniuses, scientists who were honored with Nobel Prize in Economics, but nobody knows that some of them might have become rich (some of them never made a dime on the market) exclusively because of their discovered financial models or theories, except for conferences and interviews fees, selling books and teaching other people how to make money. It might be frustrating to see that others who dropped college have made multi-million fortunes on the market, and very well known scholars in the finance field, NOT. "*If all it took to beat the markets was a Ph.D. in mathematics, there'd be a hell of a lot of rich mathematicians out there*" - Bill Dries. "*No matter what kind of math you use, you wind up measuring volatility with your gut.*" Ed Seykota. Probably, the preeminent example that fundamentals are not everything is the collapse of the famous hedge fund founded by John Meriwether in 1994 – **Long Term Capital Management (LTCM)**. John Meriwether was one of the first traders to bring quantitative finance to Wall-Street and gained a measure of fame in Michael Lewis' book *Liar's Poker*, where he is described by Lewis as a Salomon Brothers Uber-trader and master of Liar's Poker⁹⁷⁶. The failure of LTCM is a cautionary tale about hubris, arrogance, overconfidence and the limits of modern financial theory. With an outstanding team of quant finance traders and scientists, including two Nobel Prize winners: Robert C. Merton and Myron Scholes, LTCM used complex mathematical models to take advantage of fixed income arbitrage deals (termed convergence trades) usually with U.S., Japanese, and European government bonds. Although from 1994-1996 LTCM returned more than

⁹⁷⁴ **Edwards, David** – "*What is Neurofinance*" – Brainwaves, Corante Weblog Columns, August 9, 2004 – source: - http://brainwaves.corante.com/archives/2004/08/09/what_is_neurofinance.php

⁹⁷⁵ **Balleine W. Bernard** – "*The Neural Basis of Choice and Decision Making*", The Journal of Neuroscience, August, 1. 2007, 27(31):8159-8160

⁹⁷⁶ Book Review of "*When Genius Failed: The Rise and Fall of Long-Term Capital Management* by **Roger Lowenstein**", Random House, September 2000 - http://www.bearcave.com/bookrev/genius_fails.html

30% a year, and their funds swelled to more than US\$ 7 billion, in 1998, they crashed and burned, endangering the US financial system (Federal Reserve Bank of New York organized a bailout of \$3.625 billion by the major creditors to avoid a wider collapse in the financial markets⁹⁷⁷). Because of the small differences in value of the assets arbitrage, LTCM had to take highly leveraged positions to make a significant profit. *“But the system wasn’t designed so that most people could beat it”*. They ignored two underlying assumptions behind the market models they used: markets are always liquid and markets tend toward equilibrium where “mispricing” are corrected. True, but the assumptions failed to be true during a market panic. The panic caused by the Asian and Russian Financial Crisis (1997 and 1998), made LTCM to liquidate many positions causing large losses, including the arbitrage positions between Royal Dutch and Shell shares. Because of the liquidity dry-up of the panic and high-leveraged positions, LTCM had nothing else to do but crash and burn. They didn’t expect panic to happen. According to Nassim Taleb: *“Rare events are always unexpected, otherwise they would not occur”*.

Meriwether was so confident about his market opinions and his quantitative financial analysis, that even if the market would go against him, he would not change his opinion. Often he would increase the size of his position, despite of the market opinions. If his mathematical models showed a mispricing, he remained confident that fair value would return, over time, so he kept his positions and even added to it. He believed in nothing but fundamentals. Meriwether ignored completely an old trading adage: *“Ninety percent of what we do is based on perception. It doesn’t matter if that perception is right or wrong or real. It only matters that other people in the market believe it. I may know it’s crazy, I may think it’s wrong. But I lose my shirt by ignoring it”*⁹⁷⁸. As Keynes used to say: *“Markets can remain irrational longer than you can remain solvent”*

The collapse of LTCM gave markets a tuff lesson about pride, arrogance, defiance, greed and hubris, making some market players say memorable words, like the one of Kaufman and Lenzner: *“Meriwether and his sidekicks had a bad case of hubris. As Kaufman puts it: „There are two kinds of people who lose money: those who know nothing and those who know everything.” With two Nobel prize winners in the house, Long-Term Capital clearly fits the second case”*⁹⁷⁹. *„It seems LTCM could have survived one Nobel prize – winner, but with two, they were doomed”* – Frederic Townsend. As a conclusion, we might consider the Ed Seykota’s joke: *“Some people seem to like to lose, so the win by losing money”*.

Some recent examples of other astonishing loses are⁹⁸⁰: Societe Generale (2008 – USD 7.2 bn – European Index Futures – Jerome Kerviel), Aracruz Celulose Brazil (2008 – USD 2.5 bn – FX Options), Sadia Brazil (2008 – USD 1.09 bn - FX and Credit Options), CITIC Pacific China (2008 – USD 1.89 bn – FX Trading), Amaranth Advisers (2006 – USD 4.6 Bn – Nat Gas Futures – Brian Hunter) and the list may go on. The collapse of Britain’s Barings Bank in Feb. 1995, is perhaps the most popularized financial collapse. Barings Bank was sold for 1 sterling pound to ING, because of the rogue trader, called Nick Leeson – a derivative trader on SIMEX.

Now, it is easily understandable why mapping a trader’s mind, why neurofinance is very important. Because of one single person, thousands of employees, several hundred thousands of customers and other collateral parties may go broke if the trader in charge does not perform well. And in most cases, the problem was not “outside” but “inside”. If Leeson lost, someone else won. Definitely won. Trading derivatives it’s a zero sum game. Will neurofinance be able to help us understand what was in Leeson’s mind? And in his counterpart’s mind? What made Leeson lose and what made the other one win? And how can we replicate the winner’s succes?

Jack Schwager, wrote in one of his books: *„Time and Time again, those whom I interviewed for this book and its predecessor stressed the absolutely critical role of psychological elements in trading succes!”* When asked to explained what was important to success, Jack says: *„The*

⁹⁸⁰ http://en.wikipedia.org/wiki/List_of_trading_losses

Market Wizards NEVER talked about indicators or techniques, but rather about such things as discipline, emotional control, patience and mental attitude toward losing". The message is **CLEAR: The key to winning in the market is internal, NOT external**"⁹⁸¹.

Neuroscience and neurofinance help us understand whether there is a mismatch between brain and financial markets, when trading. Although, in the decision theory and equilibrium theory, all risks are the same, the brain distinguishes at least two kinds of risk: risk generated by an unintentional source (a random generator, "nature", a financial market without insiders) and the risk generated by an intentional source (a strategic opponent, a financial market with insiders). The difference between them, manifests in the engagement of different functional regions of the brain and attitudes toward the source.

Decision neuroscience has made important progress over the past ten years, following the discovery of the role of dopamine neurons in prediction under uncertainty. Some treat with skepticism this subfield of finance, because it cannot be considered science. Neurofinance is based mainly in laboratory experiments. Lack of external validity is perhaps the most important reservation that people can have about laboratory experimentation.

Tools available to neurofinance, allow for understanding how people make financial and economic decisions, by analyzing how the brain works when these choices are made. By looking inside the brain, we may create a more realistic model of decision making and able to explain a much wide range of individual economic behaviors compared to the standard finance models. Some of **the neurofinance tools** are: ERP that record electrical activity of the scalp („event-related potentials" that measure brain response that is directly the result of a thought or perception – measured with EEG - electroencephalographic), ERF („event-related field" – that measure brain response that is directly the result of an event – measured with MEG - magnetoencephalographic), TMS - Transcranial Magnetic Stimulation, PET scans - Positron Emission Tomography, MRI – Magnetic Resonance Imaging, *fMRI*⁹⁸² - Functional Magnetic Resonance Imaging and other lesion brain studies. Neurofinance has progressed dramatically over the past years, following the discovery of the role of *dopamine*⁹⁸³ neurons in prediction choice under uncertainty.

Decision making by traders is highly emotional (Lo & Repin 2002), and it activates hormones such as testosterone and cortisol that have a direct influence on the very brain regions. Hsu et al⁹⁸⁴ (2005) has shown that dopamine projection in the ventral striatum is less activated under ambiguity than when probabilities of risk are known. Behavioral finance also confirms that humans treat pure risk and ambiguity differently. According to him, another activation emerges, namely, in the amygdala, that forms part of a circuit that has been associated with goal directed learning, a signal of a need to start learning. Amygdala has been for long time, viewed as the

⁹⁸² **Functional MRI or functional Magnetic Resonance Imaging (fMRI)** is a type of specialized MRI scan. It measures the hemodynamic response (change in blood flow) related to neural activity in the brain or spinal cord of humans or other animals. It is one of the most recently developed forms of neuroimaging. Since the early 1990s, fMRI has come to dominate the brain mapping field due to its relatively low invasiveness, absence of radiation exposure, and relatively wide availability. Source: <http://wikipedia.org>

⁹⁸³ *Dopamine* represents one type of neurotransmitter formed in the brain by the decarboxylation of dopa and essential to the normal functioning of the central nervous system. A reduction in its concentration within the brain is associated with Parkinson's disease. Dopamine is the primary neurotransmitter involved in the reward pathways in the brain. Dopamine is released by naturally rewarding experiences such as food, sex, use of certain drugs and neutral stimuli that become associated with them. Thus, drugs that increase dopamine signaling may produce euphoric effects. Many recreational drugs, such as cocaine and amphetamines, alter the functionality of the dopamine transporter (DAT), the protein responsible for removing dopamine from the neural synapse. ⁹⁸⁴ Hsu M, Bhatt M, Adolphs R, Tranel D, Camerer CF. 2005. Neural systems responding to degrees of uncertainty in human decision making. *Science* 310:1680–83

„fear center” of the brain. Fear may be the emotional expression of estimation uncertainty, just like arousal accompanies positive reward prediction errors (and relates to activation of the dopamine system). That is, fear may act as a dual signal, relaying both a caution not to bet on things unknown and a directive to find out more (Hsu et al. 2005)⁹⁸⁵. All these regions (amygdala, insula and the dopamine system) have in common perhaps the most important feature of the human condition: emotions. Studies have showed that subjects who fail to express emotional anticipation when making risky decisions (because of specific brain lesions) consistently opt for inferior financial choices.

Neurofinance literature analyses the role of affect in financial decisions. Lo & Repin⁹⁸⁶ (2002) found that professional securities traders experience emotional states characterized by high arousal market events such as high price volatility, using peripheral measures of arousal, like skin conductance and blood volume pulse. Lo, Repin and Steenbarger (2005) found that subjects whose emotional reaction to monetary gains and losses was more intense on both the positive and negative side, exhibited significantly worse trading performance⁹⁸⁷. **Kuhnen and Knutson**⁹⁸⁸ (2005) found that Nucleus accumbens activation preceded risky choices as well as risk-seeking mistakes, while anterior insula activation preceded riskless choices as well as risk-aversion mistakes. These findings suggest that distinct neural circuits linked to anticipatory affect promote different types of financial choices, and indicate that excessive activation of these circuits may lead to investing mistakes. So in another study of them in 2007⁹⁸⁹ they can predict what goods people purchase by measuring activation in the same areas of the limbic or emotional system. The manner a person likes a product, is correlated with activation in the nucleus accumbens, while charging excessive prices for the product, activated the insula. This is the main reason why companies have started to conduct **neuromarketing** and measure brain activation in order to see whether their products will be a success. In 2008⁹⁹⁰ another study of them, affirmed that nucleus accumbens (NAcc) activation spontaneously increases prior to financial risk taking. Using event-related fMRI, they predicted and found that anticipation of viewing rewarding stimuli, cues influence financial risk taking by altering anticipatory affect, and so identify a neuropsychological mechanism that may underlie effective emotional appeals in financial, marketing, and political domains.

Behavioral and neural studies of **temporal discounting**, (Zak, 2004), states that one of the major behavioral differences that exists between human and other animals is the ability to postpone immediate gratification for a future (possibly larger) reward. It is interesting to see the main types of discounting: exponential discounting that implies a constant preference between rewards should exist over time, and the hyperbolic discounting, that show a clear tendency to discount expected outcomes proportionate to their delays exists and often there is a preference reversal between the immediate and the delayed reward in the period of time just before the reward is due. Knutson et al (2009) tested a „future self-continuity” hypothesis that individual differences in the perception of one’s present self as continuous with a future self would be associated with

measures of saving in the laboratory and everyday life. Higher *future self continuity* predicted reduced discounting of future rewards and greater lifetime of accumulation of financial assets, promoting saving for the future⁹⁹¹. Shiv⁹⁹² et. al. (2005) tested the “*Myopic loss aversion*” hypothesis and showed that the lesion patients would be less risk averse and would be more profitable, since their brain lesions mitigated the affect associated with fear of money loss. McClure⁹⁹³ et al (2004), used fMRI to show that decisions based on instant reward activated parts of the limbic system associated with the dopamine pathways. They found that tradeoffs involving delayed monetary rewards largely activated regions of the lateral prefrontal cortex, the brain region associated with cognitive introspection, illustrating the important of the limbic system in the human decision making. Bossaerts (2009) suggests that emotions play a crucial supporting role in the mathematical computations needed for reasoned choice, rather than interfering with it, even if emotions may not always be balanced appropriately. Tom et al (2007) analyzed whether loss aversion were predicted by a measure of neural loss aversion in several regions, including the ventral striatum and prefrontal cortex⁹⁹⁴.

Should computers replace humans in financial markets? Bossaerts (2009) says no, because humans with all the limitations and maladapted brains to certain situations, they are better at certain tasks. Neurofinance should identify these limitations and help people replicate success. Computers should overcome only when humans cannot adapt. (It is very well known that most of the banks that play their money on FX have impressive robots that trade under certain algorithms). Neurofinance is bound to impact all of finance, with impact on household, consumer finance, college and retirement plans, corporate finance, microfinance, most of the market professionals and many other subfields of finance. As Kuhnen (2007) concludes, findings from neuroeconomics and neurofinance may also be used by policy makers, in order to increase social welfare. If government wants to encourage workers to save more for retirement, it may design financial policies that trigger the right part of the limbic system to induce the desired behavior. Or if they want to discourage some activities, they should institute incentives that trigger people risk-averse part of the brain, knowing how brain works when faced with uncertainty.

THE IMPACT OF EUROPEAN INTEGRATION ON THE ROMANIAN BANKING SYSTEM

Dragan (Santamarian) Oana Raluca
“Babes – Bolyai” University, Cluj Napoca
Faculty of Economics and Business Administration

This paper describes the evolution registered by the Romanian banking system over the last years in the context of accession to the European Union. The analysis presents the progress registered by our banking system, the main characteristics of Romanian banking activity after 2007 as well as a brief analysis of profitability indicators.

Keywords: European accession, banking system, profitability indicators

JEL Classification: G21

Introduction

The banking reform in Romania began in December of 1990 when the authorities have proposed the development of new banking legislation designed to obtain a modern banking system. In this way the old system was replaced with a system organized on two levels: the Romanian National Bank and commercial banks. Over the past years Romania's banking system experienced a dynamic economic development and economic growth.

One of the key elements in the process of nominal and real convergence imposed by the new economic environment was the National Bank of Romania. The accession to the European Union strengthened the performance of the reform, and NBR's activity became more and more efficient. Romania's adhesion to the European Union in January 2007 was a long awaited and prepared moment. It was neither the start nor the end of the long journey of European integration that the country had taken. Once Romania became a member of the European Union the National Bank of Romania became a member of The European System of Central Banks (ESCB).

Since 2007 the main preoccupations of NRB were: participation of our central bank in the ECB Euro system, improving banking supervision, implementation of Basel II principles, development and application of the convergence program, a monetary policy which aims at price stability.

National Bank of Romania, as a supervisor, acted in response to new threats caused by the financial crisis in the following way: by providing liquidity, by close monitoring of banks, implementing new measures to improve prudential regulatory framework and in collaboration with the Government signed some funding agreements with the International Monetary Fund and the European Union.

Consequences upon the banking segment due to the European accession.

Studies of the banking system performed within the field disclose positive results due to the accession. The financial and banking integration results are estimated from the following aspects: The union with a distinctive market of financial services and banking products, which offers business potential under the most encouraging terms, putting forward optimizing promises of the economic performances from the macro stabilization standpoint, of the higher efficiency levels and increasing people's wellbeing.

Macro economic stabilization under the circumstances in which banks operating in two countries may import assets in countries where there are financing opportunities, thus protecting thus national economy against possible bank distress.

Banking consolidation reflects structural modifications which might produce additional competitiveness within the monetary setting, increasing client's wellbeing, operational

effectiveness and profit in terms of reducing the expenses per product unit or bank service. Bank unions may improve the effectiveness of the entire activity of the banking segment.

The main characteristics of Romanian banking activity after 2007

The first year after the accession to the European Union was an excellent year for the banking market. The main result of the European accession was the increasing competition in the domestic market. Other favorable outcomes were the dynamic banking activity and the increasing attractiveness and diversification of banking products. There could be easily observed a competition between different banks in offering more sophisticated and complex services. There is a constant effort directed towards customer attraction and portfolio enlargement. Following this path banks began to offer “express” credits, by trying to tell in less than half an hour if the client is eligible for a credit.

There was an unmatched expansion of the banking network and specialized units dedicated to corporate and retail were opened. New agencies became operational for being nearer to the potential clients. The revitalization of banking products was successful due to the bank’s capability to offer promotional products which were easily accessible, and rapidly available. These are just a few signs that banks increase the market consistence.

The entry of the foreign banks on the Romanian national banking market improved the competition between banks, leading to high quality of services offered to clients by reducing costs, as well as requiring domestic banks to compete in their products range by creating new products and services. Levine Ross believes that foreign banks may improve the quality and availability of financial services in the domestic financial banking competition and may encourage the implementation of modern technologies. Foreign banks can serve to stimulate the development of the underlying banking supervisory and legal framework. They also can enhance a country's access to foreign capital.

In 2007 the Romanian market became a target for the European credit institutions. Romania’s addition to an integrative group as EU had a favorable impact on the banking system. Many foreign financial groups consider that the national market is favorable for the opening of new units. Several foreign banks opened bank branches in Romania. This operation was encouraged by restrictive monetary policy imposed by NBR. As the foreign banks must comply with the requirements of the country of origin they have significant cost advantages.

The presence of foreign banks raised the competition level and offered many new banking products and direct provision of services in Romania leading to changes in the structure of domestic banking system. The most spectacular market entry belonged to Millennium Bank, member of the Portuguese Millennium group. Also 2007 brought major changes for banks in the first echelon, at the middle of the year the largest merger on local banking market was completed. HVB Țiriac Commercial Bank merged with Unicredit Romania, whose newly established entity presently operates under the name of Unicredit Țiriac Bank S.A. It should be noted that in the same year BCR came under the control of Erste Bank. In the same period Belgium's Fortis received the operating authorization from NBR, The Iberian group La Caixa has opened a unit in the Romanian Capital. In addition, Finicredito Branch of the Portuguese group appears on the list of new branches. Beginning March 2008 the Romanian Branch of Blom Bank Egypt transferred its operations to the Romanian Branch of Blom Bank France S.A Paris.

In year 2008 has triggered the greatest financial crisis of the past 80 years. Originally called "credit crisis" by the specialists, this financial crisis is almost unprecedented. Although initially it was said that the Romanian banking system and economy will not be affected by this crisis, the negative impact has been felt since fall of 2008. Now, most opinions are leaning towards the conclusion that Romania is affected, but not directly and not as much as other countries that have a higher exposure to sub prime mortgage loans. At the start of the crisis, the Romanian economy had been driven through a period of several years of growth in high rates. The banking sector which has a dominant position in ours financial system had a good resistance to pressure manifested by the financial crisis. However, the global economic crisis had many negative effects

like: negative consequences on quality credit portfolio, worsening perceptions of risk, changes of interest rate of monetary policy, and interest rates charged on loans and deposits. Also a sharp contraction of non-government credit took place. Interest rates were changed and non performing loans increased. Tendency to extend the activity in new territory became lower and the number of employees became smaller.

In terms of banking structure the Romanian banking sector hasn't recorded significant changes in 2008 and the first quarter of 2009 (Table 1). DEPFA Bank Plc. Dublin opened a new branch in Bucharest and there were changes in the shareholding structure of ABN AMRO Bank, now called RBS Bank Romania S.A., after its takeover by the Royal Bank of Scotland. CitiBank România S.A. has changed its status becoming a branch of CitiBank Europe in Romania.

In 2009 in Romania there were 43 credit institutions, 32 Romanian legal entities and 11 branches of EU banking groups. In the context of the service market relaxation generated by Romania's accession to EU, BNR received notifications from 174 institutions from abroad willing to provide financial services directly in Romania.

Table 1: Romanian banking sector structure

	2005	2006	2007	2008	T12009
No. Credit institutions	40	39	42	43	43
No. banks with majority foreign capital	30	33	36	37	37
Branches of foreign banks	6	7	10	10	11
No. banks with majority private capital	38	37	40	41	41
Market share of top five banks	58,8	60,3	56,3	54,4	54,3
Herfindahl-Hirschmann index	1124	1171	1046	926	906

Source: Source: BNR-RSF 2008

The efficiency of the banking system is reflected in the degree of system's concentration. The degree of concentration is measured using the Herfindahl-Hirschmann index or market shares in terms of assets held for the five largest banks in the system. The banking systems with a higher degree of concentration are usually less exposed to a banking crisis. The Romanian banking sector was characterized by a high concentration degree even from the first years of the banking reform. Since 2006, the Herfindahl-Hirschmann entered on a slightly downward curve, giving the image of a moderate degree of concentration. In 2008 and first quarter of 2009 the concentration degree in Romania continued its decreasing trend and in March 2009 market share of top five banks in total assets recorded a decrease to 54.3 %. Market share of loans fell to 53.7 %. On the liability side, the degree of concentration for the top five banks in the system held a total of 53.91 % in deposits. In terms of share held by the five largest banks in aggregate assets Romania is close to the average of other EU Member States.

Impact of EU accession on bank intermediation in Romania

Banks are designed to mediate the relationship between those who registered a surplus and those who recorded a shortage of resources, transforming economies and monitoring credit lending processes. Along with Romania's EU entry an increase of financial intermediation was recorded, although growth of financial intermediation accelerated in 2007 it is still one of the smallest in the European Union. Financial intermediation quantified using credit indicator Non-government credit / GDP in 2008 reached a value of almost 40% of GDP. Romania recorded the lowest level

of financial intermediation among the new EU state members states at greater distance from the EU-15 (123,1%) or UE-25(118,9%). Financial intermediation quantified using the bank assets/GDP reached a value of 62% in 2008. Romania still exhibits a lower degree of financial intermediation compared to other countries in EU, indicating significant potential for future growth.

In terms of lending activity of the Romanian banking system over the past several years we can see some features. Even if in 2007 loan products abounded on Romanian banking market, the end of 2008 was marked by relative suppression of activity of private sector lending, retail and corporate alike. Retail credit has been affected by restrictive conditions imposed by the central bank new lending rules and by the economic-financial international context. Restricting lending to businesses was due primarily to the increase of difficulty to access bank funding. End of 2008 banking market had stiff competition in attracting deposits. Reached very high interest rates and led to increased credit costs. The first half of 2009 brought low-performing banking loans along with high financing costs, which generated economic pressure that recorded a sharp decline in the lending appetite.

The loans granted to the population registered a fast decrease in 2008 (only 30.5%, compared with 71 % in the previous year) and in the first quarter of 2009 (19% compared to end-March 2008). The same trend was noted in the case of credit non-financial corporations.

The non-governmental credit's structure registered after Romania accession to the European Union created some changes in terms of the currency in which the credit was granted. Analysis of credits given to population depending on the currency by 2006 showed a predominance of loans in lei. Since 2007 foreign currency loans dominated in a total of 53.05% share of total lending to the population. This tendency of loan currency is also seen in 2008. Foreign currency loans had a faster evolution than in local currency in most countries of Central and Eastern Europe. More attractive terms of financing and currency appreciation which tend to feature in transition countries may be possible explanations of growth in the foreign exchange component of non-governmental credit. Therefore, the predominant inclination in the structure of credits granted to population was the ones in foreign currency. In the area of the retail segment, the consumption credits represented 77, 1%, while the credits for dwellings held an inferior percentage of 19, 9% at the level of 2007, the last ones being mainly contracted in foreign currencies.

Within the retail component in 2008, the credit's structure according to their destination underwent major changes against the year of 2007. The consumption credits remained dominant, holding 74,3% from the total, with a slight preference for the national currency superior to the foreign currency one, while this component is much more represented in the dwelling credits holding up to the end of 2008 a percentage of 92,1% from the total of dwelling credits.

Specialists pay attention to analysis of bank performance, especially to concentration and profitability, because banking performance is best represented by profitability indicators.

Table 2: Evolution of indicators of profitability in the Romanian banking system in 2004 - 2009

Indicators	2004	2005	2006	2007	2008	2009
Solvency Ratio	20,6	21,6	18,1	13,78	12,34	14
ROA	2,4	1,9	1,5	1,3	1,4	0.2
ROE	18,5	15,2	11,7	11,4	15,9	2.7

Source: BNR-RSF 2008 and FMI, Global Financial Stability Report

A healthy bank system is built on profitable banks, this is the reason why understanding the profit sources and analysis of profitability indicators is really important. Since 2004 profitability indicators of our banking system had a descending trend. In 2007, the profitability of Romanian

banks followed the downward trend due to: the increase in the cost of investments and due to the narrowing of interest margins.

Solvency Ratio in the banking system in Romania registered a decrease in recent years. Solvency ratio or capital adequacy has been a constant preoccupation of bank management and prudential regulations because of its significance on the soundness and security of bank deposits. Solvency ratio remains at a higher level than the minimum threshold required by the prudential regulations applicable in Romania since 2007 and also on European and international level.

Return on assets – ROA is an indicator that best reflects the bank's management capability to use resources available in order to optimize bank's profit. This indicator finds a downward trend during the analyzed period for the Romanian banking system. In 2009 the ratio between net profit and total assets on annualized average dropped to 0.2% from 1.4% in December 2008.

Similarly, *Return on equity ROE* the indicator which constitutes the most significant expression of profit and highlights the results of bank management in its entirety, reached 2.7% at the end of December 2009 from 15.9% in December 2008.

Despite the decline recorded in the recent years for both indicators of profitability return rate on assets (ROA) and return rate on equity (ROE) evolution does not indicate deterioration of the banking sector profitability. The result of intensifying competition and the decrease of inflation lead to the decrease of the interest rates and implicitly of the income of the banks. In recent years banks accepted lower profit margins to consolidate market position.

Compared with EU countries Romanian banking system has a lower financial return than the European average, situation resulting from the reduction in recent years of spread between the assets and liabilities.

Conclusions

European Union can be seen as a well developed and solid economic structure. Romania's accession to the UE had a positive effect on the banking climate and also put pressure to achieve compatibility. The Romanian banking system suffered a major move on with the integration into EU, in terms of structure. The new banking entities appeared due to purchases and mergers, share of foreign capital participation has increased substantially and the presence of foreign banks raised the competition level. Despite this the international crisis had negative effects on the Romanian banking system and Romania's desire to adopt the euro revealed weaknesses in the system. To exit the crisis and to recreate a competitive, robust and efficient system a few changes must be made where weaknesses should be removed. Banks must prove that they are a trusted brand, their product portfolio must be constantly renewed and operate effectively in terms of costs. These are some requirements that banks must meet in order to remain competitive in the EU market. Due to the lack of external financing strongly felt because of the financial crisis, the banks should pay more attention to the selling activity.

Known as the 'Old Lady' of Threadneedle Street, the Bank of England is the central bank of the United Kingdom. Founded in 1694, the Bank of England is standing at the centre of the United Kingdom's financial system, and is committed to promoting and maintaining monetary and financial stability as its contribution to a healthy economy. In our opinion, it is very important to analyze the Bank of England's monetary policy strategy, starting from 1992 – adoption of the inflation target and the evolution of its monetary policy strategy, through an important feature – delegating operational accountability regarding the monetary policy in 1997 as well as the appropriate institutional framework. More over, it is important to analyze the Bank of England's performances before and after granting central bank independence.

Keywords: Monetary policy strategy, central bank transparency, central bank accountability, inflation reports, index of central bank independence and inflation targeting

JEL Classification: E50, E52, E58.

1. Introduction

The Bank of England's history is naturally one of interest, but also of continuing relevance to the Bank today. Events and circumstances over the past three hundred years have shaped and influenced the role and responsibilities of the Bank. They have moulded the culture and traditions, as well as the expertise, of the Bank which are relevant to its reputation and effectiveness as a central bank in the early years of the 21st century. At the same time, much of the history of the Bank runs parallel to the economic and financial history, and often to the political history, of the United Kingdom more generally.

In pursuing its goal of maintaining a stable and efficient monetary and financial framework as its contribution to a healthy economy, the Bank has two core purposes: achieving them depends on the work of the Bank as a whole. The Bank of England exists to ensure monetary stability and to contribute to financial stability:

- *monetary stability* – means stable prices and confidence in the currency; stable prices are defined by the Government's inflation target, which the Bank seeks to meet through the decisions delegated to the Monetary Policy Committee, explaining those decisions transparently and implementing them effectively in the money markets;

- *financial stability* – entails detecting and reducing threats to the financial system as a whole; such threats are detected through the Bank's surveillance and market intelligence functions; they are reduced by strengthening infrastructure, and by financial and other operations, at home and abroad, including, in exceptional circumstances, by acting as *the lender of last resort*.

In pursuing of both purposes the Bank is open in communicating its views and analysis and works close with others, including:

- other central banks and international organizations to improve the international monetary and financial system;

- the Treasury and Financial Services Authority, under the terms of memorandum of understanding, to pursue financial stability.

The Bank of England will also play its part in promoting an open and internationally competitive financial centre in the United Kingdom using its expertise to help make the United Kingdom financial system more efficient, where such efforts would be in the public interest and provided that they do not conflict with its primary responsibilities of those of other agencies.

The current governance and accountability is set by the 1998 Bank of England Act, which provides for a Court of Directors, a Committee of Non-executive Directors within the Court and a Monetary Policy Committee.

The Court of Directors is responsible for managing the affairs of the Bank, other than the formulation of monetary policy. The Bank of England has a statutory objective *to contribute to protecting and enhancing the stability of the financial system of the United Kingdom* and the Court, consulting the HM Treasury, will determine the Bank's strategy in relation to that objective. The Court's responsibilities under the 1998 Act include determining the Bank's objectives and strategy, and ensuring the effective discharge of the Bank's functions and the most efficient use of its resources.

The Monetary Policy Committee (MPC) – the Bank of England establishes the MPC as a Committee of the Bank, subject to the oversight of NedCo (Committee of Court consisting of all the Non-executive Directors, with a Chairman appointed by the Chancellor), and sets a framework for its operations. According to the Act, the Bank's objectives in relation to the monetary policy are to maintain price stability and, subject to that, to support the Government's economic policies, including its objectives regarding growth and employment. At least once a year, the Government specifies the price stability target and its growth and employment objectives. The MPC must meet at least monthly; its members include the Governor and Deputy Governors, two of the Bank's Executive Directors and four members appointed by the Chancellor.

2. Central Bank Independence

Over the last few years many central banks have made significant strides towards greater accountability and transparency. There has been a dilution of what Karl Brunner (1981, p.81) once called 'peculiar and protective political mystique' that has traditionally surrounded central banking. Central banks in countries which have recently adopted inflation targets have all become more open about the formulation and presentation of their monetary policies (Haldane, 1995). Similar movements have been evident among central banks recently granted greater independence through legislative changes; and in the United States the debate regarding replacement of the Humphrey-Hawkins Act – and its multiple objectives – with a single objective of price stability, and on the publication of the full transcripts of Federal Open Market Committee (FOMC) meetings. *How might we best explain this shift towards greater accountability and transparency? One answer is that greater accountability has run hand – in – hand with moves towards greater central bank independence: greater accountability is the government's quid pro quo for granting greater central bank autonomy. This is because independence delegates responsibility for monetary policy to an ultimately unelected authority – the central bank. So making this authority accountable for its actions insures against a democratic deficit.*

The logic of central bank independence can be noticed by looking at the different views of elected politicians and of central bank decision makers. Democratic leaders run for office promising change and improvement rather than continuity and stability, whereas an incoming head of a central bank will almost certainly want to continue the policies of a successful predecessor and will enhance his or her commitment to do so. Political independence and non-partisan monetary policy provide the promise of monetary policy stability over time, which in

turn stabilizes expectations on the asset market. Such stability and continuity are essential for a successful monetary policy (Dumiter, 2009 p. 26).

Central bank independence requires that the head of the bank has a term of office long enough to prevent government revision of the monetary policy decisions. However, such structural features of central bank's institutional design are only the starting point for central bank independence. If the government publicly attacks the central bank's policy, then the independence will certainly be incomplete (Dumiter, 2009 p. 26-27). The tenures of the British Governors starting with 1901 are presented in table 1.

Table 1 Former Governors of the Bank of England (1901 - Present)

Chairmen	Date of term
Sir Augustus Prevest	1901 – 1903
Samuel Hope Morley	1903 – 1905
Alexander Falconer Wallace	1905 – 1907
William Middleton Campbell	1907 – 1909
Reginald Eden Johnston	1909 – 1911
Alfred Clayton Cole	1911 – 1913
Walter Cunliffe	1913 – 1918
Sir Brien Ibrican Cokayne	1918 – 1920
Montagu Collet Norman	1920 – 1944
Lord Catto of Cairncatto	1944 – 1949
Cameron Fromanteel Cobbold	1949 – 1961
The Earl of Cromer	1961 – 1966
Leslie Kenneth O'Brien	1966 – 1973
Gordon William Humphreys Richardson	1973 – 1983
Robert (Robin) Leigh – Pemberton	1983 – 1993
Edward Allan John George	1993 – June 2003
Mervyn Alister King	2003 - Present

Source: By Author's.

In our opinion it is very important to measure central bank independence and inflation targeting with the *Index of central bank independence and inflation targeting* (Dumiter, 2009). The index has three main pillars: Political and legal central bank independence (PLCBI), Central bank governance and conduct of monetary policy (CBGCMP) and Central bank transparency and accountability (CBTA). Measuring central bank independence and inflation targeting in the United Kingdom was made by analyzing the central bank website, the central bank laws and statute, different norms and regulations and other publications and studies available on the central bank website and on the real practices of the development central bank in the period 1980 – 2009.

Regarding the first pillar PLCBI, the Bank of England has a high score (8.33 points out of 10 points), which means that the central bank has a high degree of political and legal independence due to the five years term of the central bank Governor, a lower level of the turnover rate of the central bank Governor (0.10) and a non - political vulnerability. However, we can identify some weaknesses regarding this pillar: the three years tenure of the MPC members and the authority of the Queen in the appointment procedures of the central bank.

With a total score of 7.13 points out of 10 maximum possible of the second pillar, Central bank governance and conduct of monetary policy of the Index of central bank independence and inflation targeting, the Bank of England has no authority in establishing the annual inflation target, we can observe the government prevalence over the monetary authority regarding a policy conflict. However, the most important features regarding this criterion are: price stability – the major objective of monetary policy, inflation targeting as monetary policy strategy, a high degree of instrument independence established by the 1998 charter, the central bank authority in establishing and managing the interest rate, the central bank autonomy in establishing, deciding and regulating foreign exchange operations and the explicit interdiction of government lending.

Central bank transparency and accountability has a total score of 8.37 points out of 10 maximum score, which means that the Bank of England has a high degree of transparency and accountability due to the explicit prioritization of the price stability objective, explicit institutional arrangements between government and central bank, the public availability of the time series for the main macroeconomic indicators and the model of the economy, publishing the Inflation Report, an important document designed and established by the Bank of England, which contains information about future projections of inflation and output, public explaining and justifying to the society the monetary policy decision and actions as well as the auditing of the central bank financial situations by external auditors.

3. Inflation targeting

The United Kingdom followed Canada in adopting inflation targeting, but under quite different circumstances. Canada came to inflation targeting gradually, through a process of experimentation and discussion. In contrast, British adoption of the inflation targeting approach was provoked by a crisis, namely the foreign-exchange crisis of September 1992, which resulted in the floating depreciation of the pound. Inflation targeting was adopted in Britain largely as a means of restoring the credibility of monetary policy lost in the speculative crisis and to provide an alternative nominal anchor.

The key features of inflation targeting in the United Kingdom are:

- The United Kingdom adopted inflation targets in the aftermath of a foreign exchange crisis, in order to strengthen the credibility of monetary policy and restore a nominal anchor. Like other countries, the United Kingdom's adoption of targets also followed a period of successful disinflation, which made hitting the initial targets relatively easy.
- Monetary policy in the United Kingdom under inflation targeting remains relatively flexible, an approach more akin to that of Canada than to that of New Zealand, where the central bank has somewhat less discretion in the short run. In particular, the monetary policy in the United Kingdom has responded to fluctuations in output and employment.
- The inflation target in the United Kingdom is defined in terms of the annual change in retail prices excluding mortgage interest payments, or RPIX. Attention is also paid to the price index RPIY, which is RPIX less the first-round effects of indirect taxes. Both RPIX and RPIY include food and energy prices, so that the target index has in practice been a compromise between headline inflation and a measure of `core` or `underlying` inflation. The agency responsible for constructing these two indexes (Office for National Statistics) differs from the agency that assesses whether the target has been met (Bank of England).

- Initially, the United Kingdom set a target range for inflation. Since May 1997 the target has been expressed as a point, but with `thresholds` on either side. If inflation breaches a target threshold, the Bank of England is required to provide a formal explanation to the government.
- Before the Bank of England achieved independence following the May 1997 election, it had little independent control over the instruments of the monetary policy; control was exercised instead by the Chancellor of the Exchequer. Under the pre-1997 targeting regime, the activities of the Bank were substantially limited to forecasting inflation and assessing past inflation performance. Rather than being a fully active policymaker, to a considerable degree the Bank functioned as the Chancellor's `counter-inflationary conscience`.
- In part because of its weak position before May 1997, the Bank focused its inflation-targeting efforts on communicating to the public its monetary-policy strategy and its commitment to price stability. In doing so, it relied heavily on publications such as the *Inflation Report*, an innovation that has been emulated by other inflation-targeting countries.

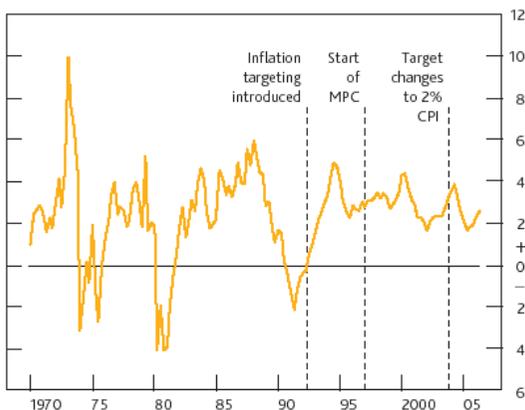

Figure 1 GDP evolution in the United Kingdom (standard deviation from previous year)
Source: Bank of England (2008).

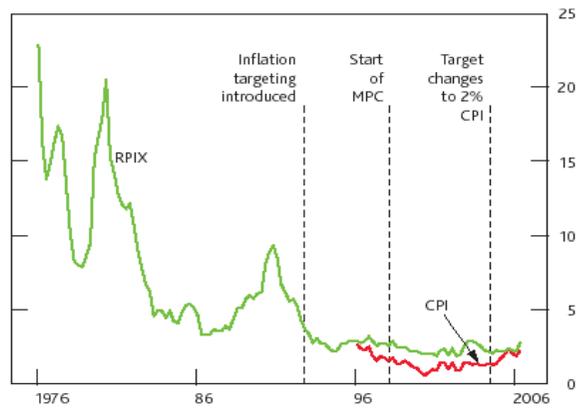

Figure 2 Inflation in United Kingdom (standard deviation from previous year)

The Bank of England's policy objective is to deliver price stability – low inflation – and, subject to that, to support the Government's economic objectives including those for growth and employment. Price stability is defined by the Government's inflation target of 2%. The remit recognises the role of price stability in achieving economic stability more generally, and in providing the right conditions for sustainable growth in output and employment. The Government's inflation target is announced each year by the Chancellor of the Exchequer in the annual Budget statement. The 1998 Bank of England Act made the Bank independent to set interest rates. The Bank is accountable to parliament and wider public. The legislation provides that if, in extreme circumstances, the national interest demands it, the Government has the power to give instruction to the Bank on interest rates for limited period.

The inflation target of 2% expressed in terms of an annual inflation based on the Consumer Prices (CPI). The remit is not to achieve the lowest possible inflation rate. Inflation below the target of 2% is judged to be as bad as above the target. The inflation target is therefore symmetrical. If the target is missed by more than 1 percentage point on either side – i.e. the annual inflation rate of CPI inflation is more than 3% or less than 1% - the Governor of the Bank must write an open letter to the Chancellor explaining the reasons why inflation has increased or fallen to such an extent and what the Bank proposes to do to ensure inflation comes back to the target. A target of 2% does not mean that inflation will be held at this rate constantly. That would be neither possible nor desirable. Interest rates would be changing all the time, and by large

amounts, causing unnecessary uncertainty and volatility in the economy. Even then it would not be possible to keep inflation at 2% in each and every month. Instead, the Monetary Policy Committee's aim is to set interest rates so that inflation can be brought back to target within a reasonable time period without creating undue instability in the economy.

Since 1992, the economic performances of the British economy have been improved (Figures 1 and 2), inflation recorded stable and lower level around the target. By adopting the inflation targeting regime, the RPIX inflation has been in average 2.6 % and the RPI inflation and average of 1.8 %. The Monetary Policy Committee (MPC) was created in June 1997, where the RPIX inflation was 2.4% and the PRI inflation was 1.4%, with a deviation of maximum one percentage point from the target. This fact represents a high performance of the British economy, and expected to happen once the institutional arrangements will be applied: the economic data from that period suggested that inflation will be 40% of the time with more than one percentage point above the target. More over, the inflation projection figures show a higher risk for inflation deviation from the target, more than one percentage point.

4. Conclusions

Improving the institutional arrangements (central bank independence) for the economic policy will be given a high priority by the British Government in order to deliver long term economic stability and rising prosperity. The Bank of England Manifesto commitment is to *ensure that decision – making on monetary policy is more effective, open, accountable and free from short - term political manipulation*. Within the overall responsibility for economy policy, including stability, growth and employment, and for setting the inflation target, The Government has been delegated the Bank of England operational responsibility in setting interest rates. Price stability is a precondition for high and stable levels of growth and employment, which in turn will help to create the conditions for price stability on a sustainable basis. To that end, the monetary policy objective of the Bank of England will be to deliver price stability (as defined by the Government's inflation target) and without prejudicing this objective, supporting the Government's economic policy, including its objectives for employment and growth.

INTELLECTUAL CAPITAL VALUATION USING MONTE CARLO SIMULATION

We present a simulation model in this paper to determine the value of intellectual capital. In frame of the simulation model we have used the Baruch Lev's intellectual capital valuation modell. We have built in the Baruch Lev model in a two-dimensional Monte Carlo simulation modell. We have determined the intellectual capital in case of some stock exchange company. The calculation are presented in case of a selected company.

Key words intellectual capital valuation, Baruch Lev, Monte Carlo simulation, two dimensional simulation

JEL code G12, G31, C15

1. The importance of intellectual capital

Nowadays an increasingly important factors of the value creation in developed economies are mostly invisible. These assets – staff expertises, process quality, computer programs, patents, brands etc. – are delivering a fast-growing contribution to corporate competitiveness. These invisible assets play a particularly important role in case of research- and knowledge intensive companies.

Thomas A. Stewart in his book "Intellectual Capital" (1997) redefined the priorities of businesses, demonstrating that the most important assets owned by the today companies are most often not the tangible goods, equipment, financial capital, or market share, but much rather the intangibles: patents, the knowledge of workers, and the information about customers and channels as well as the past experience that a company has in its institutional memory.

Some authors are referred these assets as intangible assets, others as intangible capital, and others as intellectual capital, however, they all think of the same category of assets. The terms “are widely used – *intangibles* in the accounting literature, *knowledge assets* by economists, and *intellectual capital* in the management and legal literature – but they refer essentially to the same thing: a nonphysical claim to future benefits. (*Lev, 2001*)

In the article „New Math for New Economy” (*Webber, 2007*) we can read: In case of the S&P500 index the market-to-book ratio of the companies constituent the index -- that is, the ratio between the market value and the net-asset value of these companies -- is now greater than 6. This means that the financial report number represents only 15 % to 16 % of the value of these companies. Even if the stock market is inflated, even if you chop 50 % off the market capitalization, you're still talking about a huge difference between value as perceived by those who pay for it day-to-day and value as the company accounts for it.

The beginning of the last century the ratio of intangible business capital to tangible business capital was 30% to 70% which has been changed into its opposite nowadays. In the past several years, there has been a dramatic shift, a transformation, in what the intangibles have become the

major assets of the value creation and growth. Nowadays, the intangibles are fast becoming substitutes for physical assets.

Today, many executives recognize the importance of intellectual capital as a principal driver of firm performance and a core differentiator. But not only enterprises are seeing the value in intellectual capital; governments are also recognizing the importance of it. The European Union, for example, aims for their membership countries to invest a minimum of three percent of their GDP into research and development initiatives in order to grow their intellectual capital and become more competitive in the knowledge economy. (*Joia, 2007*)

2. The intellectual capital statement

An increasing number of firms start to report their corporate intangible aspects even without the force of regulations. This trend is especially observable in Europe with various initiatives by the European Commission (in frame of projects such as METITUM, E*KNOW NET, PRISM). Another example is presented by the Danish Department of Trade and Industry, which produced guidelines of how companies can produce intellectual capital reports. In Austria the government has passed a law that all universities have to report on their intellectual capital, in the UK companies will be forced to produce an Operating and Financial Review outlining many intangible elements of their business, and countries as diverse as Iceland, Germany, and Spain have started their own initiatives. (Mouritsen et al., 2003; Bratianu, 2009)

Intellectual capital statements can serve to structure and assign priorities to knowledge management efforts within the organisation.

- The statement helps the organisation to focus on what it actually does to to develop its knowledge resources and what the effects are of such activities.
- The process of preparing an intellectual capital statement can help to create a culture of knowledge sharing.
- The statement tells the organisation what it must know and what it must excel at, what can be relevant for organisational development.
- The publication of intellectual capital statements can lead to better communication. It can signal the principles of knowledge management practised by a company, to both internal and external stakeholders.
- The intellectual capital statement can also help to attract new employees.
- The intellectual capital statement can also improve the communication between the company and its customers.

3. Methods for evaluation of intellectual capital

An enormous number of the theories, models and methods helping on understanding and measuring of the companies' intellectual capital refer to that there is no generally accepted theoretical model for understanding and measuring of the intellectual capital. (*Petty-Guthrie, 2000*)

There are several methods that can be used to determine the corporate value of the intellectual capital, such as

- Economic Value Added (EVA),
- Market Value Added (MVA),
- Tobin's Q Ratio,
- Balanced Score Card,
- Skandia's IC Navigator,
- Intellectual Capital Services' IC-Index,
- Technology Broker's IC Audit,
- Sveiby's Intangible Asset Monitor (IAM),

- Real Option Theory.

Baruch Lev said in an interview about the model, which was used to determine the value of company's intellectual capital, the followings: "I've developed a way to measure knowledge assets, intellectual earnings, and knowledge earnings. It's a computation that starts with what I call "normalized earnings" -- a measure that's based on past and future earnings. ... My approach looks at the past. Based on those forecasts, I create an average, and I call that average normalized earnings. From those normalized earnings, I then subtract an average return on physical and financial assets, based on the theory that these are substitutable assets. ... So when I subtract from the total normalized earnings a reasonable return on the physical and financial assets, I define what remains as the knowledge earnings. Those are the earnings that are created by the knowledge assets." (Webber, 2007)

To construct the simulation model we used the Baruch Lev's model. To determine the normalized earnings we used five-year historical data and five-year forecast data. (Table 1)

Table 1: The historical and forecast data to determine the normalized earnings

Title of data	2004	2005	2006	2007	2008

4. The results of the simulation

A two-dimensional (or second-order) Monte Carlo simulation is useful to estimate the “uncertainty” in the risk estimates stemming from parameter uncertainty. A two-dimensional Monte-Carlo simulation is a Monte-Carlo simulation where the distributions reflecting “variability” and the distributions representing “uncertainty” are sampled separately in the simulation, so that “variability” and “uncertainty” in the output may be estimated separately.

To execute the simulation model we have used the 'mc2d'⁹⁹⁵ package of R statistical system. The statistical results of the simulation are presented in Table 2. The histograms and boxplot diagrams of the net income on the physical, financial and intangible assets are presented in Figures 1-3. The result of the intangible assets' estimation are presented in Figure 4.

Table 2: The results of the simulation

Statistical indicators	Required rate of physical assets	Net income on physical assets (million HUF)	Required rate of financial assets	Net income on financial assets (million HUF)	Net income on intangibles (million HUF)	Intangibles (million HUF)
Minimum	5,54%	61 999	4,35%	72 228	-6 682	-49 783

Figure 1. Net income on physical assets

⁹⁹⁵ Monte-Carlo à Deux Dimensions

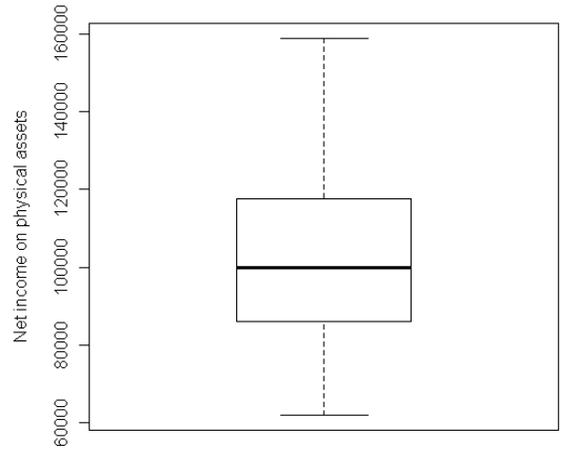

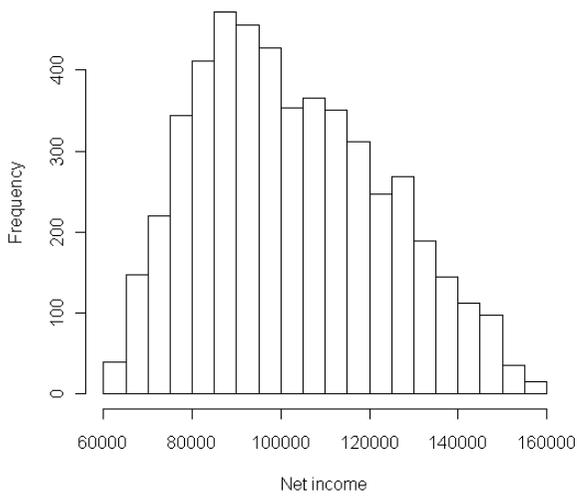

Figure 2. Net income on financial assets

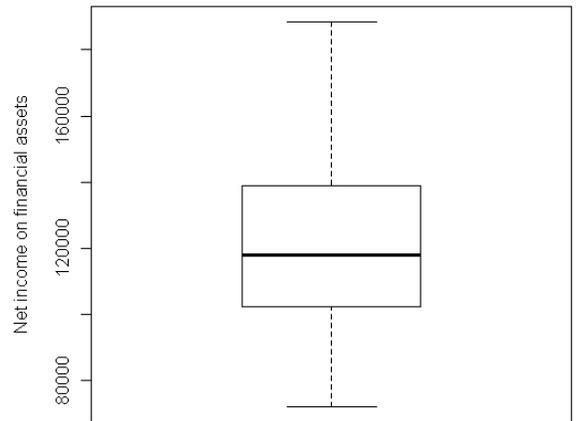

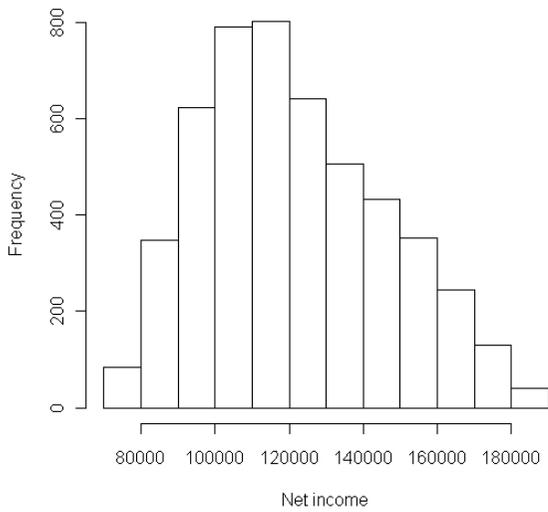

Figure 3. Net income on intangibles

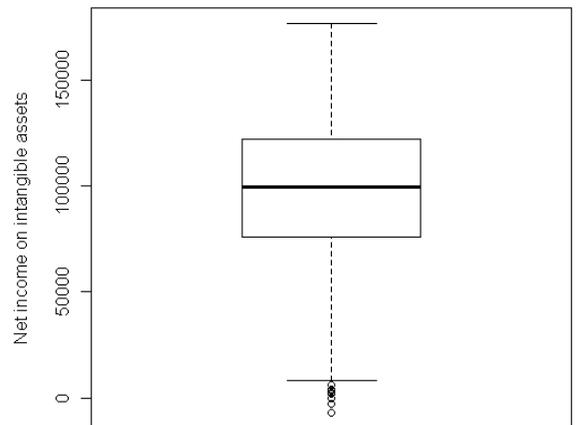

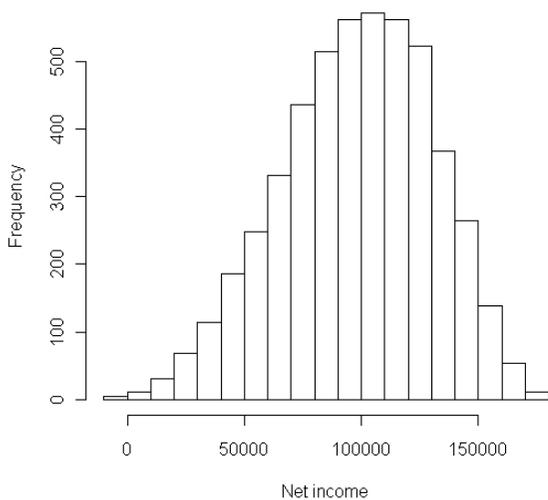

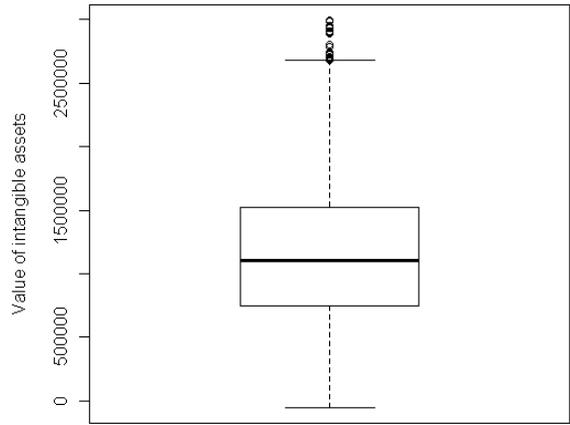

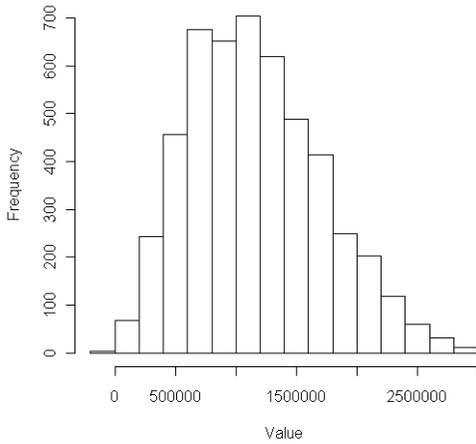

Figure 4. The value of intangibles

The calculation of modell:

$$\text{net income on intangible assets} = \text{Normalized earnings} -$$

$$(\text{require return on physical assets} * \text{value of physical assets}) -$$

$$(\text{require return on financial assets} * \text{value of financial assets})$$

$$\text{value of intangible assets} = \text{net income on intangible assets} / \text{require rate on intangible assets}$$

5 Conclusion

We present a simulation model in this paper to determine the value of intellectual capital. In frame of the simulation model we have used the Baruch Lev's intellectual capital valuation modell. We have built in the Baruch Lev model in a two-dimensional Monte Carlo simulation modell. We have determined the intellectual capital in case of a stock exchange company (Synergon).

To determine a 95% confidence interval for the mean was used the one sample t-test. The result of t-test in case of intangibles' value:

$$1\ 149\ 825 - 1\ 180\ 225 \text{ million HUF}$$

We can see that the interval has a very small scale. The sample estimate, namely the mean of intangible asset's value is 1 165 025 millioh HUF.

EUROPEAN MONETARY FUND - BETWEEN ILLUSION AND FUTURE INSTRUMENT FOR EUROPEAN FINANCIAL STABILITY

Fîrțescu Bogdan

Universitatea "Alexandru Ioan Cuza"

Facultatea de Economie și Administrarea Afacerilor

The finance crises that culminate with the Greece situation shows that majority of European countries are facing balance-of-payments difficulties and it is clear that actual mechanism couldn't face the situation. This paper wants to highlight some of the proposals related to the development mechanisms, such the creation of the European Monetary Fund or the design of the "European Mechanism for Financial Stability" (EMFS), which could include the EMF, showing also the actual mechanism of financing through International Monetary Fund (IMF). Some pro and counter arguments are furthermore taken into discussion.

Keywords: European Monetary Fund - EMF, International Monetary Fund – IMF, European Union – EU, sovereign defaults, financing mechanism, financial system.

Cod JEL: F36.

Actual stage of financial crises – foundation and argument for construction of the European Monetary Fund (EMF)

It is considered that actual financial crises have entered in a second phase, regarding the public debt crises, facing the threat of sovereign default. The case of Greece is frequently taken into discussion, but other countries are also confronting with large public debts. As Eurostat shows in its latest statistics⁹⁹⁷, in 2009, the government deficit and government debt of both the euro area (EA16) and the EU27 increased compared with 2008, while GDP fell. In the euro area the government deficit to GDP ratio increased from 2.0% in 2008 to 6.3% in 2009, and in the EU27 from 2.3% to 6.8%. In the euro area the government debt to GDP ratio increased from 69.4% at the end of 2008 to 78.7% at the end of 2009, and in the EU27 from 61.6% to 73.6%.

In 2009 the largest government deficits in percentage of GDP were recorded as follows: Ireland (-14.3%), Greece (-13.6%) the United Kingdom (-11.5%), Spain (-11.2%), Portugal (-9.4%), Latvia (-9.0%), Lithuania (-8.9%), Romania (-8.3%), France (-7.5%) and Poland (-7.1%). No Member State registered a government surplus in 2009. The lowest deficits were recorded in Sweden (-0.5%), Luxembourg (-0.7%) and Estonia (-1.7%). The data suggests a worsening in government balance relative to GDP in 2009 compared with 2008 in twenty-five states, and only in two (Estonia and Malta) an improvement.

At the end of 2009, the lowest ratios of government debt to GDP were recorded in Estonia (7.2%), Luxembourg (14.5%), Bulgaria (14.8%), Romania (23.7%), Lithuania (29.3%) and the Czech Republic (35.4%). Twelve Member States had government debt ratios higher than 60% of GDP in 2009: Italy (115.8%), Greece (115.1%), Belgium (96.7%), Hungary (78.3%), France (77.6%), Portugal (76.8%), Germany (73.2%), Malta (69.1%), the United Kingdom (68.1%), Austria (66.5%), Ireland (64.0%) and the Netherlands (60.9%).

The economic and financial evolution in EU16 and EU27 related to government activity evaluated in percentage of GDP for the last 4 years can be summarized in the table below (see Table 1):

⁹⁹⁷ http://epp.eurostat.ec.europa.eu/cache/ITY_PUBLIC/2-22042010-BP/EN/2-22042010-BP-EN.PDF, p.1-2, accessed on 23rd of April, 2010.

Table 1 – Government deficits (percentage of GDP) in 2006-2009

	2006	2007	2008	2009
Euro area (EA16)				
Government expenditure	46.7	46.0	46.8	50.7
Government revenue	45.3	45.4	44.9	44.4
Government debt	68.3	66.0	69.4	78.7
EU27				
Government expenditure	46.3	45.7	46.9	50.7
Government revenue	44.9	44.9	44.6	44.0
Government debt	61.4	58.8	61.6	73.6

Source: Eurostat, http://epp.eurostat.ec.europa.eu/cache/ITY_PUBLIC/2-22042010-BP/EN/2-22042010-BP-EN.PDF

Euro area annual inflation was 1.4% in March 2010, up from 0.9% in February, compared with the value recorded a year earlier the rate - 0.6%. The lowest 12-month averages up to March 2010 were registered in Ireland (-2.3%), Portugal (-0.8%) and Estonia (-0.7%), and the highest in Romania (5.0%), Hungary (4.8%) and Poland (3.9%)⁹⁹⁸. As shown above, macroeconomic indicators worsened in the last 2 years, suggesting the profound implication of financial crises in majority of the European States. These data indicates that actual European Union economic and financial mechanisms are still inadequate to face financial crises. As some authors suggested⁹⁹⁹, related to monetary policy of European Central Bank, an imperfect functioning may cause disproportionate inflation, while wrong fiscal policy decisions, such the excessive deficit procedure may induce a threat of sovereign default. It appears that Greece is the weakest, given its high public debt (about 120% of GDP) compounded by a government budget deficit of almost 13% of GDP, a massive external deficit of 11% of GDP, and the loss of credibility from its repeated cheating on budget reports.

Solutions for debt crisis and strengthening economic policy coordination in the Euro-zone

In actual case, it is suggested that given the intense pressure from financial markets, is likely that a tough fiscal adjustment agenda (or rather the promise that one will be forthcoming) might not be enough to avoid a ‘sudden stop’ of necessary external funding of the public sector. When this happens the EU will no longer be able to fudge the question of whether (and in what form) it can provide public financial support to one of its members¹⁰⁰⁰.

Some opinions propose that the crisis in Greece calls for standard remedies and the solution would be to bring in the IMF. A stand-by agreement involving conditional lending would provide financial assistance and fiscal adjustment measures which should restore confidence. However, Euro-zone and EU authorities appear to be against this¹⁰⁰¹.

Another proposal came from The European Commission that appear to support the creating a European Monetary Fund (EMF) to help Euro-zone countries facing balance-of-payments

⁹⁹⁸ http://epp.eurostat.ec.europa.eu/cache/ITY_PUBLIC/2-16042010-BP/EN/2-16042010-BP-EN.PDF. p. 1, accessed on 23rd of April, 2010.

difficulties. Officials of the EU agreed that “The Commission is ready to propose such a European instrument for assistance, which would require the support of all euro area member states”¹⁰⁰². Germany's finance minister, said in an interview that he would present proposals for a European monetary fund soon. He said that the Euro-zone needed an institution “for its internal stability”. This new body would not compete with the International Monetary Fund, he said, but would benefit from the IMF's experience and have comparable powers to the fund, he said. He said that accepting financial assistance from the IMF would be an admission that the Euro-zone countries were unable to solve their problems by themselves¹⁰⁰³.

An additional proposal came from the PES, together with the S&D Group at the European Parliament (on 2nd of March, 2010), suggesting a plan that implies a three step strategy to address the sovereign debt crisis and to strengthen economic policy coordination in the Euro-zone:

1. the Greek sovereign debt crisis must be solved without delay – it is necessary to establish an emergency credit facility mechanism at the European level, allowing Greece to re-finance its economy at a fair price;
2. the emergency mechanism must be converted, over the medium-term, into a permanent feature of the Euro-zone – creation of a crisis-management mechanism, the “European Mechanism for Financial Stability” (EMFS);
3. the development of further EMFS into a long-term framework for strengthened economic governance in the Euro-zone¹⁰⁰⁴.

As seen before, there are three possible mechanism:

- *International Monetary Fund (IMF) assistance*
- *creation of the “European Monetary Fund” (EMF)*
- *design of the “European Mechanism for Financial Stability”, that could include the EMF (not discussed in this paper below).*

The financing through IMF and characteristics of the “European Monetary Fund” (EMF) are discussed below.

Financing Mechanism through IMF lending

Upon request by a member country, an IMF loan is usually provided under an "arrangement," which may, when appropriate, stipulate specific policies and measures a country has agreed to implement to resolve its balance of payments problem. The economic program underlying an arrangement is formulated by the country in consultation with the IMF and is presented to the Fund's Executive Board in a "Letter of Intent." Once an arrangement is approved by the Board, the loan is usually released in phased installments as the program is implemented¹⁰⁰⁵.

IMF Facilities

Over the years, the IMF has developed various loan instruments, or "facilities," that are tailored to address the specific circumstances of its diverse membership¹⁰⁰⁶. Low-income countries may borrow on concessional terms through the Extended Credit Facility (ECF), the Standby Credit Facility (SCF) and the Rapid Credit Facility (RCF). Non-concessional loans are provided mainly through Stand-By Arrangements (SBA), the Flexible Credit Line (FCL), and the Extended Fund Facility (which is useful primarily for longer-term needs). The IMF also provides emergency

assistance to support recovery from natural disasters and conflicts. All non-concessional facilities are subject to the IMF's market-related interest rate, known as the "rate of charge," and large loans (above certain limits) carry a surcharge. The IMF facilities can be grouped as shown in Figure 1.

Figure 1 – IMF Facilities

The new concessional facilities for LICs were established in January 2010 under the Poverty Reduction and Growth Trust (PRGT) as part of a broader reform to make the Fund's financial support more flexible and better tailored to the diverse needs of LICs. Access limits and norms have been approximately doubled compared to pre-crisis levels. Financing terms have been made more concessional, and the interest rate is reviewed every two years. All facilities support country-owned programs aimed at achieving a sustainable macroeconomic position consistent with strong and durable poverty reduction and growth. Most important instruments are presented below.

The Extended Credit Facility (ECF) succeeds the Poverty Reduction and Growth Facility (PRGF) as the Fund's main tool for providing medium-term support to LICs with protracted balance of payments problems. Financing under the ECF currently carries a zero interest rate, with a grace period of 5 ½ years, and a final maturity of 10 years.

The Standby Credit Facility (SCF) provides financial assistance to LICs with short-term balance of payments needs. The SCF replaces the High-Access Component of the Exogenous Shocks Facility (ESF), and can be used in a wide range of circumstances, including on a precautionary basis. Financing under the SCF currently carries a zero interest rate, with a grace period of 4 years, and a final maturity of 8 years.

The Rapid Credit Facility (RCF) provides rapid financial assistance with limited conditionality to LICs facing an urgent balance of payments need. The RCF streamlines the Fund's emergency assistance for LICs, and can be used flexibly in a wide range of circumstances. Financing under the RCF currently carries a zero interest rate, has a grace period of 5% years, and a final maturity of 10 years.

Stand-By Arrangements (SBA). The bulk of Fund assistance to middle-income countries is provided through SBAs. The SBA is designed to help countries address short-term balance of payments problems. Program targets are designed to address these problems and Fund disbursements are made conditional on achieving these targets ('conditionality'). The length of a SBA is typically 12-24 months, and repayment is due within 3%-5 years of disbursement. SBAs may be provided on a precautionary basis—where countries choose not to draw upon approved amounts but retain the option to do so if conditions deteriorate— both within the normal access

limits and in cases of exceptional access. The SBA provides for flexibility with respect to phasing, with front-loaded access where appropriate.

Flexible Credit Line (FCL). The FCL is for countries with very strong fundamentals, policies, and track records of policy implementation and is particularly useful for crisis prevention purposes. FCL arrangements are approved for countries meeting pre-set qualification criteria. The length of the FCL is 6 months or 1 year (with a mid-term review) and the repayment period the same as for the SBA.

Financing Mechanism through EMF

The mechanism should refer to an implementation in 2 stages. During Stage I: any member country could call on the funds of the EMF up to the amount it has deposited in the past (including interest). The government of the country in question could thus issue public debt with a guarantee of the EMF up to this amount.

In Stage II any drawing on the guarantee of the EMF above this amount would be possible only if the country agrees to a tailor-made adjustment plan supervised jointly by the Commission and the Eurogroup.

This proposed mechanism¹⁰⁰⁷ intends to limit the moral hazard¹⁰⁰⁸ problem, because only countries that breach the Maastricht criteria have to contribute. The authors propose that contribution rates would be calculated on the following bases:

- 1% annually of the stock of 'excess debt', which is defined as the difference between the actual level of public debt (at the end of the previous year) and the Maastricht limit of 60% of GDP. For Greece with a debt-to-GDP ratio of 115%, this would imply a contribution to the EMF equal to 0.55%.

- 1% of the excessive deficit, i.e. the amount of the deficit for a given year that exceeds the Maastricht limit of 3% of GDP.

Countries with exceptionally strong public finances would not need to contribute because they would carry the burden. Their backing of the EMF (and the high rating of their bonds in the portfolio of the EMF) would be crucial if the EMF were called into action.

Authors argued that taxing countries under fiscal stress to fund the EMF would only aggravate their problems and most of the contributions would materialize a long time before solvency problems become acute.

An illustrative calculation estimates that the suggested funding mechanism, the EMF would have been able to accumulate 120 billion euro in reserves since the start of EMU – enough probably to finance the rescue of any of the small-to-medium-sized euro area member states¹⁰⁰⁹.

There are some issues to be discussed related to this proposal. A pro argument for the EMF is one suggested by the authors themselves - the EMF could provide for an orderly sovereign bankruptcy procedure that minimizes the disruption resulting from a default. Some specialists suggested that such mechanism is only a redistribution of funds from a group of prudential country to non-prudential one. There is also a technical issue – the Treaties do not agree such an institution. Such mechanism has also to have consistency and interdependency with other related elements, as being part of financial system¹⁰¹⁰. Finally, "EMF per se is not a solution for another crisis but could be part of a prevention mechanism, if it implements adequate support for

Faculty of Economics and Business Administration

The changing characteristics of the international financial systems starting from the second half of 2007 came as no surprise. Looking at the events in a synthetic manner, the main factors that led to the triggering and amplification of the crisis can be identified in the dramatic increase of new and more complex financial instruments, with increasing lack of transparency, in the conflicts of interest between market participants, in the imprudent lending practices in the financial services industry, in the deficiencies of rating agencies, together with the excessive confidence in the market's self regulation, the unrealistically low risk attributable to certain investments and, the inability to respond to early warning signals or to learn from the lessons of the previous crises.

Keywords: crisis, subprime loans, securitization, rating agencies

JEL codes: G01, G10, G15, G21

Subprime loans, as a triggering factor of the crisis

While not all mortgage loans may be automatically placed in the category of subprime mortgages, one can observe the proliferation of this kind of loans in the 21st century. Approximately 21% of the total mortgage loans, between 2004 and 2006, fell into the subprime category, as compared to the 9% level in 1996 (Golsbee, 2007). In the third quarter of 2007, subprime mortgage loans with variable interest rate, represented only 6.8% of the mortgage loans, but accounted for 43% of the loans for which the right for mortgage repurchase because of unpaid obligations had stopped. The subprime mortgages with fixed interest rate accounted for 6.3% of the total mortgages and only for 12% of those with cancelled right of mortgage repurchasing.

Objectively speaking, as long as the risks involved with such loans is closely monitored by creditors, imposing higher interest rates and guarantees, one can say that there was no imminent danger related to such loans. But, as in many previous crises, the relaxation of lending standards was one of triggers of the initial losses. Often, it was allowed for borrowers to enter into the possession of large sums of money that would later increase the borrowers' expenses, once the period of low interest rates expired and once the repaying of rates of capital had started (Dodd & Mills, 2008).

The reasoning that lied at the basis of such loans was found in the *increasing prices of real estate*. Thus it is considered that potential repayment problems could be reduced and even eliminated by the market value of the presented guarantees. If borrowers failed to repay maturing rates on time, the high value housing could facilitate refinancing the loan.

Specific developments due to the process of financial innovation

Concretely, the disruptions relate to the developments in the U.S. mortgage market and, for a better understanding of the transformations suffered, one should make a brief foray into history.

Thus, after the 30's crisis, based on the "New Deal" program of the Roosevelt administration, a public body-the Federal National Mortgage Association was created, whose objective was to increase the volume of loans and mortgages, thus stimulating the economy by all the positive effects that the development of the construction sector may have on it. Fannie Mae took over from the initial lenders the default and liquidity risk, which it could manage much better than the first line distributors credits, as it had a portfolio of mortgages much more diverse and more widespread at the national level than the usual banking institutions. This body could borrow funds itself on longer term than banks, which was likely to reduce the liquidity risk. In 1970, the Government National Mortgage Association another governmental institution, began issuing bonds collateralized by mortgage debt, which enabled the transfer of risk of default to the subscribers of such titles and relieve the federal budget of a substantial part of the debt incurred for financing of public programs for the construction of housing. These titles are placed on the capital markets, and their redemption at maturity is done directly from the owners. Also, in 1970, a new body was established, the Federal National Mortgage Corporation (Freddie Mac), to issue securities based on classical mortgage loans, but also to create a competitor to Fannie Mae, which was to be privatized.

In time, these institutions were able to mobilize significant capital for mortgage refinancing, their main operations aiming at acquiring and holding assets in prime mortgages, as well as the transformation of mortgage loans in a variety of debt securities collateralized by mortgages. This operation is called *securitization*, generally, a *technique that transforms less liquid financial assets into negotiable securities such as bonds*.

Mortgage securities that are based on mortgage loans from one lender, are usually issued through swap transactions in which the lender changes the package of mortgages for MBS. Mortgage securities backed by multiple creditors allow some creditors to pack mortgages in exchange for the receipt of mortgage securities representing a proportionate part of a larger package (Cerna, 2008). Generally, mortgage securities tend to provide coupon rates higher than the treasury securities issued by the U.S. Government. In part, this is because the interest rates charged for mortgages are higher than the interest rates offered by the U.S. government. At the same time, however, the higher interest rates of the mortgage securities also reflect the level of investment risk raised by the uncertainty due to the advance repayments. In the U.S., these mortgage securities are guaranteed by the GNMA, FNMC and FNMA. The mortgage pass-through securities issued and/or guaranteed by the organizations listed above are the most numerous and, are characterized by an AAA credit rating.

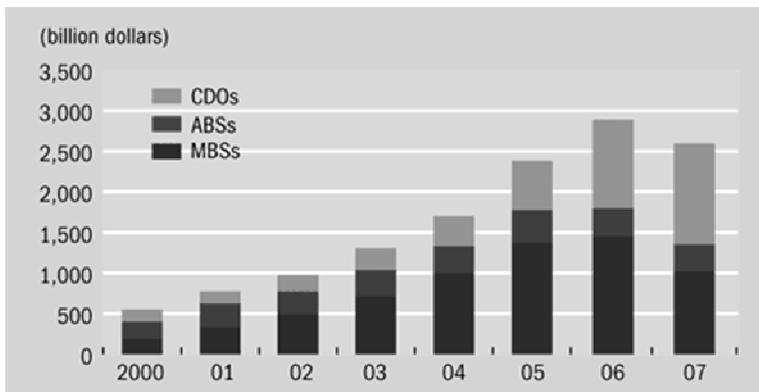

This structure of the market, based on organizations supported by the state, proved to be very profitable, and therefore attracted other financial institutions as well. Thus, if in 2003 the semi-completed 76% of the total issuance of debt securities backed by mortgages and other assets of the issuer, the remaining 24% representing the large financial corporations on Wall Street, in mid-2006, the share of the semi-public bodies decreased to 43%, while the share of private securities increased to 57% of the total. The major private issuers of this type of securities were the well known U.S. investment banks (Wells Fargo, Lehman Brothers, Bear Stearns, JP Morgan, Goldman Sachs, and Bank of America).

Parallel with this rapid and radical transformation of the market, there was a change in lending standards in the U.S. following the deregulation process. In this liberal framework, while Fannie Mae and Freddie Mac have continued to provide almost exclusively prime loans, the private corporations have increased their market share, mainly through the securitization of mortgages with high risk and of the so called "Alt-A loans" granted to solvent, but less reliable debtors than the first class customers. However, this increase in the quantity of securities backed by doubtful mortgages created a problem, because the main purchasers of such securities were institutional investors with a limited exposure to the holding of such securities. Consequently, only a small

proportion of claims with high risk could be sold to institutional investors in search of higher yields.

To address this issue there was adopted a strategy of dividing risks in more categories or "tranches" with separate administration, thus determining a widening of the market for mortgage debts with high risk. From a technical point of view, this operation consists in dividing the portfolio of claims into two parts: one characterized by a low risk level and, one with high risk level. To this end, firms on Wall Street have opted for a new financial instrument, created in 1987 by the financial investment firm, Drexel Burnham Lambert, called *collateralized debt obligations* (Bordo, 2007).

An essential difference between CDOs and other mortgage derivatives on one hand, and securities listed at stock exchanges and futures contracts on the other hand, is that the former are not traded on stock exchanges, but on over-the – counter markets (OTC). On these markets transactions are carried out directly between customers and dealers, unlike the stock market where sale or purchase orders are intermediated, as for the data about the volume of transactions and prices, these are not published officially. The price formation method has no transparency. It should also be noted that there does not exist a supervisory authority for OTC markets, that allows the identification of large or vulnerable exposures, nor do lenders of last resort exist, in order to provide the liquidity needed in special situations.

Issuance of structured credit instruments in the U.S.A and Europe

Figure no. 1

Therefore, the degree of risk involved by such securities has been ignored by investors who sought to obtain high profits. Until the spring of 2007, some top managers of financial companies have begun to concern about debt securities secured by subprime mortgages. But, given the still low interest rates and the high liquidity, the demand for structured credit products with AAA ratings and higher than normal yields, has continued to increase until mid-2007, as it results from Figure 1.

The development and generalized impact of the subprime mortgage crisis

The demand for real estate in the U.S. has increased considerably in the recent years, which led to a considerable increase in prices, which could be said that have almost doubled and even more from 1997 to 2006-2007. From 2003 to 2006 the property prices rose by no less than 30%, (Kodres, 2008).

Price evolution together with the exponential growth of prices after 2000 put the U.S. housing prices in a speculative bubble, the increase being determined by expectations regarding future price increases, rather than by economic foundations. The explanation lies in the fact that the homes were purchased for their future anticipated price level, price that could offset the initial yield offered. On the other hand, this increase was driven by the increased volume of mortgages granted, by the eased access to these credits and also by the development of the construction sector in the period of economic prosperity.

In 2005-2006 interest rates began to rise and housing prices to decline moderately in many U.S. regions. As a result, outstanding loans rose as the initial terms have expired and variable interest rates rose. The inability of borrowers to honor the installments of maturing mortgages resulted in the mass start of the sale of properties by property holders and credit institutions. The market was flooded of houses from liquidation of mortgages, while new houses were not sold so well either, which led to a further decrease in the value of homes. Selling these houses below their market value (and obviously the price of acquisition or accepted value of collateral) has increased the default rate of loans and the incapacity to recover the total claims by credit institutions (Bordo, 2007).

The mortgage market crisis actually began when investors with very large debts, such as hedge funds have tried to adjust their exposure or, to exit the losing positions, which made the high risk mortgage backed securities' market to become illiquid. In this way, in August 2007, hedge funds were seen stuck on unfavorable positions, and this just when they had to pay the premiums required by their brokers. The situation has worsened even further, because with the termination of transactions, there were no market prices any more, to serve as benchmarks, or other means to determine the value of the securities contained in various tranches of risk (Corbu, 2008). The consequence of the shown disruptions was that hedge funds stopped their transactions, while the CDO market and the credit related derivatives have virtually ceased to exist.

Regarding the banks financing the initial lenders, they have ceased their support, which made the latter unable to meet payment obligations related to the stock of mortgage loans granted. Finally, potential buyers and home owners could not get mortgages any more, which has put them in the situation of not being able to pay for construction work performed. In turn, constructors, which have previously got loans to build homes for sale, could not sell their homes and therefore could not repay loans, etc.

All these phenomena have resulted in a strong contraction of demand in the construction of housing, with all the series of negative implications for the economic growth. The fact that hedge funds and other investors did not buy high risk mortgage debt any more has shown that all these claims were no longer considered secure forms of investment. Accordingly, securities prices have dropped and their issuers have not been able to procure the necessary funds for the repayment of mortgages and other types of loans they have contracted from big banks and financial corporations. In this way, when the credit resources were exhausted, in the financial system appeared a new request for additional loans.

Taking into account the consequences of these developments, beyond the losses of the U.S. economy, spectacular bankruptcies, causing millions of unemployed and affecting all sectors, another more serious problem appears, namely the repercussions of the U.S. crisis on international financial markets and world economies. The propagation of the crisis effects appears as an unquestioned reality, through a simple fact that, currently, we can no longer speak of an isolated financial crisis in the U.S., but rather of a global financial crisis, which through the implications on the real economy, has become a generalized economic crisis.

The role of Rating Agencies in crisis triggering

The rating agencies have played an important role in the triggering of the crisis. A feature of this sector is the lack of a consistent standard for assessing the ratings for structured securities. Lack of such a standard of evaluation may lead to arbitrary decisions. The lack of single standards of evaluation, the lack of legislation to penalize the assessment practices that allow changing the rating from one day to another, the lack of competition, the conflict of interest that appears at the financing of a ratings evaluation project, are sufficient grounds to trigger a crisis of loan markets.

Rating agencies were in no position to rate securitized transactions (CDO and MBS), backed by subprime mortgages. The high ratings given to these securities were justified by various improvements in the lending sector, by the greater value of the collateral than of the loan itself, as well as by the existence of the investors in securities willing to take over the risk of losses. On the other hand, rating agencies have asserted that they only took into account the risk of default, and not liquidity risk or market risk, which investors often tend to neglect. Some critics of these agencies say that conflicts of interest also appeared in this process, because rating agencies are paid by companies that organizes and place such instruments to investors, companies like investment banks (Crainic, 2007).

Another criticism brought to rating agencies, is that these agencies have always been late in discovering the signals of a crisis. The situation is similar to that of Enron, when rating agencies have been unable to notify the company's tremendous exposure. Agencies' inability to distinguish signals of the subprime crisis has determined both the U.S. and the EU authorities to improve the regulatory and monitoring framework of their activities and, not least to make them legally responsible for their actions.

Conclusions

The financial crisis can be viewed, in a very broad way, as a state of imbalance, over certain limits, among different parts of the market. Some financial crisis may be predictable, while others are difficult to predict. The ongoing financial crisis, which has developed since the summer of 2007, according to many experts, was expected. The problem that developed was not whether it will actually happen, but when it would begin. The factor that triggered this crisis is represented by the U.S. subprime market.

During the pre-crisis period, low interest rates, high liquidity, low volatility of financial markets and a general feeling of satisfaction, have encouraged many categories of investors to assume much higher risks. The changing characteristics of the international financial systems starting from the second half of 2007 came as no surprise. Many supranational institutions (The International Monetary Fund, The Bank for International Settlements, The European Central Bank) have pointed out that risk is undervalued and that a reverse evolution is progressively more possible.

Looking at the events in a synthetic manner, the main factors that led to the triggering and amplification of crisis can be identified in the dramatic increase of new and more complex financial instruments, with increasing lack of transparency, in the conflicts of interest between market participants, in the imprudent lending practices in the financial services industry, in the deficiencies of rating agencies, together with the excessive confidence in the market's self regulation, the unrealistically low risk attributable to certain investments and, the inability to respond to early warning signals or to learn from the lessons of the previous crises.

THE EVOLUTION OF THE ROMANIAN ECONOMY IN THE CONTEXT OF THE INTERNATIONAL CRISIS

Heteș Roxana

Miru Oana

West University of Timișoara

Faculty of Economics and Business Administration

The financial crises that have emerged and developed in the recent decades have been characterized, mostly of an international dimension, with shocks quickly propagating through capital markets, through the international banking activities and, through the money markets. Regarding the impact of the current crisis on the economy of Romania, the contagion effect was transmitted through several channels, but a proper framework in this respect was created by the internal context, mainly the excessive debt. To counteract the increasingly visible effects at the level of macroeconomic indicators, the measures taken by authorities have aimed primarily at the IMF support, being essential, in the following period, to register an improvement of the current situation because, otherwise, this could constitute a real threat towards adopting the euro, putting into question even the quality of Romania's EU membership.

Key words: crisis, recession, causes, policies, remedial measures

JEL codes: G01, G15, G18, G21, G28, E58

The international crisis context

The initial outbreak of the crisis on the U.S. market has highlighted a number of vulnerabilities of the mortgage market, which's overlap made the modest initial increase in the volume of loans outstanding to shake the entire U.S. financial sector - the largest in the world - and also to affect the whole world. In a synthetic manner, there can be identified as elements of vulnerability the following:

- the failure caused by placing the titles from tranches with high risk to investors who already had large debts themselves;
- the initiators of mortgages are poorly capitalized financial institutions and are not subject to prudential regulations;
- the lack of transparency of the OTC market, which resulted in the inability of market participants to identify the risk category which the various mortgages carried and the impossibility of quantification of respective risks according to their specifics;
- the OTC markets have also suffered an acute lack of liquidity. As a result, instead of being flexible to price volatility, as it is implied by the concept of "perfect market", these were closed just when the object of the transactions lost its attractiveness, and buyers began to withdraw.

The crisis has not stopped to the U.S. economy, but also propagated to Europe as well, the first country affected by events in the U.S. being the UK, with problems of Northern Rock, which caused a panic among bank depositors. In an overview, we can say that the current crisis has initially propagated only to developed countries, particularly through the acquisition by European banks of derivative products backed by subprime mortgages, as well as through the increasing market for securities backed by assets. Initially emerging countries have avoided a crisis, maybe due precautions taken following the Asian crisis. But, when the crisis began to affect the real sector, emerging countries have also started to be affected through the trade links with developed economies. Also, through the presence of international financial institutions in these countries, the problems suffered by it in the parent country have passed on to the activities in emerging countries. The same has happened to the nonfinancial multinational companies (Dodd & Mills, 2008).

When the inevitable happened, all those exposed were caught, apparently unprepared. Both in the U.S. and in other countries affected by crisis, central banks have sought various ways to limit the effects of financial crisis and prevent its propagation in the real sector thus causing economic recession. However, not all measures have been successful. Starting with the U.S., central banks have used enormous sums of money to save banks from bankruptcy. In addition to the efforts of each individual central bank, given the systemic nature of the crisis, there can be identified several common lines of action of central banks in the U.S. and EU, respectively: banks' recapitalization, deposit assurance and interbank credit guarantee, takeover by the state from banks of toxic asset, the nationalization of banks and introduction of new regulations.

The EU wants the establishment of a centralized financial supervision; while officials from several countries require the application of more effective and accurate risk management practices. Implementing a more robust set of regulations regarding capital adequacy, strengthening liquidity management practices, improving the standards of risk classification and

protection against them and, last but not least, creating a new global financial system, now represent, beyond any doubt, unquestioned needs.

Analyzing the causes, implications and generalized remedial measures promoted by the authorities, the following conclusions could be outlined regarding the current crisis:

- In the attempt of defining it as a real financial crisis or as a pseudo crisis, we may take into account the fact that the recent losses suffered by hedge funds and other players represent pseudo crises. However, the propagation of the crisis on the interbank market and the lack of liquidity for the banking system brought the threat of a real crisis, justifying the FED and ECB interventions. Unlike these, the Bank of England followed a strict Bagehot policy, maintaining its discount operations, but with a penalty rate. Massive withdrawal of funds from Northern Rock on September 14th, 2007 have not reflected the inability of the central bank to act as a lender of last resort, but the perceived problems of public deposit guarantee schemes and the uncoordinated actions from the Financial Stability Authority and the Bank of England.
- By reducing the interest rate between September and December 2007, the FED has acted properly by temporary moving from inflationary problems to recession problems. The relaxation of interest rates is not dangerous as long as the monetary policy is credible. However, once the danger of a recession disappears, the monetary authority should revert to anti inflationary policies and increase interest rates, in order to maintain credibility. The ECB and the Bank of England, although were facing a generalized lack of liquidity in the financial system did not initially reduce interest rates, but injected liquidity into the system through the money market.
- The FED reacted to the boom in asset prices in their bust period. It could have preventively acted to reduce the likelihood of sudden price fall, with adverse consequences on the economy.
- The financial crisis on the U.S. market could have been avoided if the FED would not have provided such high volume of cash in the 2001-2004 periods. It began injecting liquidity into the economy in response to shocks (dot.com crisis, terrorist attacks on 9/11) that could have lead to financial crisis, but when they found that no such crises occurred, the additional funds remained on the money market.

The impact on the Romanian economy

The economic crisis which affects Romania today is mainly an internal crisis, with a main excessive debt as a main cause. The international financial crisis represents only the trigger for the Romanian crisis because it has affected the funding sources.

To understand why Romania faces an overconsumption crisis, a presentation of its premises is necessary. Thus, in the past nine years, Romania has shown economic growth and, in seven of them with annual rates that have exceeded 5%. Even if investments have risen in the recent years, the public and private sectors grew at a higher rate, therefore becoming the main driver for domestic demand. This alert evolution rapidly attracted significant changes mainly in the consumption standards of the population which aimed to be consistent with the evolution of the Romanian society. All these influences have led to a strong emphasis of external deficits.

If, however, we also consider the context in which the Romanian economy has helped consumption increase, it can be observed that the massive capital inputs have led to strong appreciation of the Romanian leu and supported favorable granting conditions for consumer loans for both population and companies. This has not been a concern because the expansion of small and medium sized companies is actually the engine of development of an economy. If you also add to it the bulk of foreign capital entry in the Romanian banking system (and financial system, as a whole) it becomes very clear that the rapid expansion of credit to non-government sector (households and businesses) was inevitable (Tătaru, 2008).

This phenomenon has occurred in the same manner as in all emerging economies in Central and Eastern Europe, as Romania had a real annual non-government credit growth (in lei and foreign currency denominated) of over 30-40%. It can also be observed that it is not the public budget that is liable for, first, the size of the external deficits, as the share of the budget deficit compared to the current account deficit is significantly reduced. The size of the current account deficit is the reason why the rating agencies have put Romania in the group of countries in which investments are very risky.

The current financial crisis has propagated to the Romanian economy through the following channels: trade, financial, trust, exchange rate and through the wealth and balance sheet effects. Through *the trade channel*, export growth slowed down, and even reduced. *The financial channel* has limited the access to external financing and, thus restricted the volume of credit generated, and created difficulties in the private external debt service. In terms of the exchange rate channel, the reduction in external financing was reflected in the national currency depreciation. Because of the *confidence channel*, investors exited from Eastern Europe. Therefore the monetary and exchange markets there were moments of panic and speculative attacks, such as in October 2008, which made necessary the intervention of the NBR. Finally, through the wealth and balance sheet channel the net assets of population and companies have deteriorated, as a result of higher share of credits in foreign currency (related with the depreciation rate) and reduced prices of titles and real estate from speculative, unsustainable values (NBR, 2009).

The analysis of macroeconomic developments in the Romanian economy indicates that the global crisis began to manifest in Romania in the fourth quarter of 2008, but will enlarge this year. Thus, the GDP fell in the first quarter of this year by 6.2% over the same period in 2008. Detailed statistics on the GDP in the first quarter of this year show a contraction of activity in all sectors of the Romanian economy, except the construction sector. Agriculture, forestry and fishery declined in the first quarter with 10.9% compared to the same period last year, industry with 11.1%, the activity of trade, hotels and restaurants, transport and telecommunications have compressed by 7, 6% and financial activities, real estate, renting and business services fell by 3.8%. Constructions and have increased their volume of activity by 4.7%, but face a strong loss of speed (INSSE, 2009). It is expected that the slowdown will worsen in following quarters, so the constructions will see losses (Figure 1).

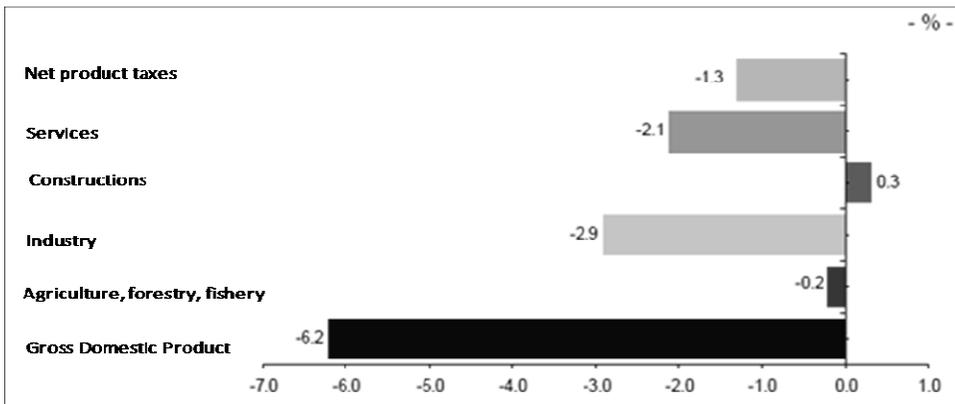

Figure 1 - Contribution of the main branches of activity to GDP (2009)¹⁰¹²

Regarding *the labor market*, it faces difficulties following the reduction of activity in the last quarter of 2008, especially at the level of registered unemployment. As a result, registered unemployment rate rose to 4.4% in December 2008, compared to 3.9% in September 2008. In the first quarter of 2009, the number of employees has continued to reduce. In April, however, the number of registered unemployed persons rose by just 1%, reaching 517.7 thousand persons (Figure 2).

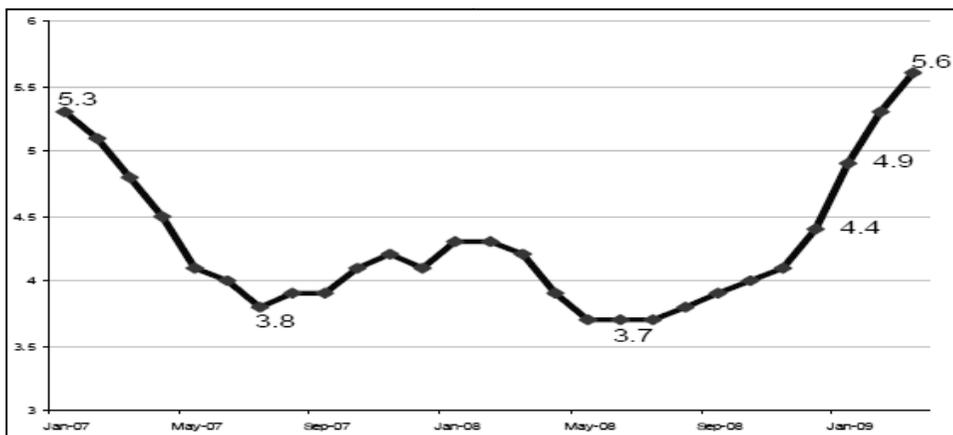

Figure 2 - Evolution of the unemployment rate (2007-2009)¹⁰¹³

The current account deficit increased by 1.3% in 2008, reaching a level of 16.9 billion e (12.3% of GDP) being financed in a proportion of 58.4% by direct foreign investment, which have totaled a 9.8 billion Euros, compared with 7.3 billion Euros recorded in 2007. In the first quarter of 2009, the current account situation has improved, with its decreasing deficit by 82.1% to the value of 709 million Euros. The current account deficit was fully financed from foreign direct investment, which totaled 1.456 billion Euros compared with 1.691 billion in first quarter of 2008 (INSSE, 2009). According to the forecasts of analysts at Bank of America Securities and Merrill Lynch, the current account deficit of Romania will reach a level of 5% of GDP in 2009, and not at 8%, as it had been previously estimated. For 2010, analysts

¹⁰¹² INSSE, Buletin statistic lunar no.5, 2009

¹⁰¹³ National Bank of Romania, Financial Stability Report 2008

forecast a current account deficit of 4.1% of GDP, as compared with 6.5%, as had been previously announced.

The *annual inflation rate* reached 6.3% in 2008, exceeding the target of 3.8% plus / minus one percentage point. In the first 3 months of the year 2009, the annual inflation rate reached a level of 6.71%. In the first four months compared with the similar period of previous year, the national currency registered a depreciation of 13.4% in nominal terms against the euro. Analysts Bank of America Securities and Merrill Lynch believe that this year, inflation will also exceed the target set by the NBR, of 3.5% plus / minus 1 percentage point, as they anticipate that inflation could reach 5.2% in 2009, and 4% in 2010 (Figure 3).

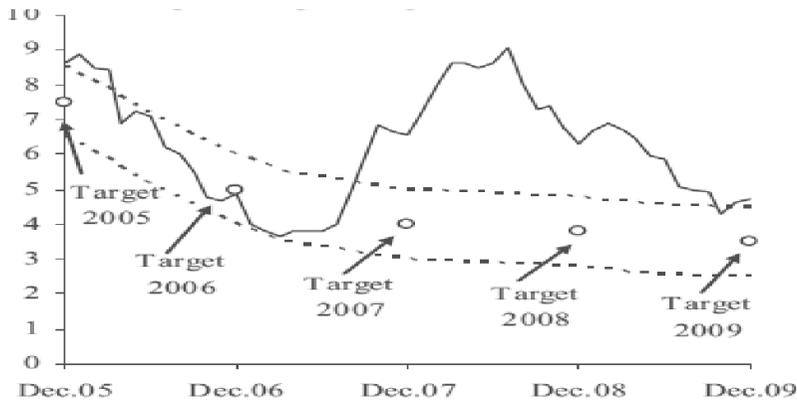

Figure 3- Inflation Developments, annual percentage change¹⁰¹⁴

To face the crisis, Romania has completed an agreement with the International Monetary Fund for a loan worth 20 billion Euros. The expected benefits to be derived from this loan are currency appreciation, regaining investors' confidence in the local economy and improving the country rating.

The risks associated with the IMF loan are immense for both those who granted the loan, and for those who receive it. The IMF and the EU should look more determined than ever to force the Romanian authorities to respect the rules, otherwise risking to see Romania turning into a financial black hole. The game is more than the failure to maintain standards of life and help the country return to a favorable rating for investments. The failure to implement a healthy economic plan, associated with a two years loan, could plunge Romania into economic recession, mass unemployment and rising inflation.

Conclusions

Generally, the financial crises that have emerged and developed in the recent decades have been characterized, mostly of an international dimension, with shocks quickly propagating through capital markets, through the international banking activities and, through the money markets. Falling on the same trajectory, the subprime mortgage crisis has not affected only the U.S. economy, but has crossed the ocean, affecting a large part of European countries, showing large contagion effects.

Regarding the impact of the current crisis on the economy of Romania, the contagion effect was transmitted through several channels (commercial, financial, confidence, exchange rate, the

¹⁰¹⁴ National Bank of Romania, Inflation Report, february, 2010

wealth and balance sheet effects), but a proper framework in this respect was created by the internal context, mainly the excessive debt. In other words, the economic crisis that Romania is crossing today can be considered mainly a domestic crisis, with the international financial crisis representing only an accelerating momentum in a direction which, however, would have proven inevitable. To counteract the increasingly visible effects at the level of macroeconomic indicators, the measures taken by authorities have aimed primarily the IMF support, being essential, in the following period, to register an improvement of the current situation because, otherwise, it could constitute a real threat towards adopting the euro, putting into question even the quality of Romania's EU membership.

MEASURING MODEL FOR BAD LOANS IN BANKS. THE DEFAULT PROBABILITY MODEL

Iuga Iulia

Facultatea de Științe

Socol Adela

Universitatea „1 Decembrie 1918” Alba Iulia

Facultatea de Științe

The banking sectors of the transition countries have progressed remarkably in the last 20 years. In fact, banking in most transition countries has largely shaken off the traumas of the transition era. At the start of the 21st century banks in these countries look very much like banks elsewhere. That is, they are by no means problem free but they are struggling with the same issues as banks in other emerging market countries during the financial crises conditions. The institutional environment differs considerably among the countries. The goal we set with this article is to examine in terms of methodology the most important assessment criteria of a measuring model for bad loans.

Keywords: assessment criteria, „Default” model, collateral, Basel II Accord

JEL code: G21

1. Introduction

The role of financial intermediaries such as banks is to channel savings to investors. In a modern economy, banks do this by maintaining a delicate balance between risk taking and managing risk. Bankers face information asymmetries when they engage in lending since only the borrowers know about the 'true' risk of their investment projects. However, there are several covenants that bankers can include in their credit contracts to overcome information asymmetries. [Bester \(1985\)](#) showed that collateral can serve as a signalling device, so that borrowers reveal their true riskiness by the amount of collateral they are willing to offer. To ensure that devices like collateral can be effective, laws that define collateral relationships and adequate institutions for enforcement are essential. More reliable collateral laws and arrangements could result in greater use of collateral to overcome asymmetric information and an overall reduction of risk. In a poor legal environment, a borrower might use the same asset as collateral in several lending agreements or might refuse to surrender the collateral in case of default. In this view, a better institutional environment will be associated with a greater willingness to use collateralised loans and more lending. This is consistent with results in the law and finance literature that show a positive relationship between good creditor rights and credit market development ([La Porta, et al., 1997, 1998](#)).

Focusing more on individual banks, [Kager \(2002\)](#) shows that the problem of bad loans persisted in many banks in transition economies.

EU banks have smaller solvency ratios and loan loss reserves but they maintain more liquid assets. The use of contingent liabilities is rare except for EU region banks. Finally, there are some differences by bank size or share. There is clearly an inverse relationship between the solvency ratio and bank size or market share. Also, the very large banks and those with shares over 10% make fewer short-term loans than others.

Banks with greater confidence in the banking environment or in countries with an objectively better legal environment for banking might be willing to take on more risk.

Interestingly, there is no clear pattern between estimated default probability and the institutional environment (Rainer Haselmann and Paul Wachtel, 2007). When bankers have better perceptions

of the quality of law and when the laws are objectively better, their default probability is higher. This suggests that bankers are willing to take on risky lending when the legal environment for dealing with bad loans is better. However, better perceptions of the courts and better law enforcement are associated with lower default probabilities. Also no clear pattern could be detected for the relationship between bank risk and credit risk.

2. Measuring model for bad loans

Regarding the design decision and the economic efficiency of implementing a measuring model, the general framework for its assessment must be taken into account. The most important assessment criteria are:

- a) the expected value of the model shows how valuable the model is expected to be in certain situations, having as sub-criteria the instructive value of the model, as well as the economies resulting from decisions that are made faster and better on the basis of the model;
- b) the initial costs show how expensive is the implementation of the model in a given situation considering the cost of adaptation and the costs for collecting the initial data;
- c) the structure of the model has as sub-criteria: adaptability, completeness, ease of testing, ease of understanding and the model robustness. *The completeness of the model* shows the extent to which the representative users of the model consider that the model explicitly or implicitly allows the treatment of all phenomena important and relevant for the investigated problem.

The understanding ease of the model shows how well and fast the user can understand the general logic of the model.

The adaptability of the model shows the ease with which you can change the value of the patterns and the structure of the model as response to the new conditions in which the model is used.

The ease of testing refers to the existent opportunities for validating the model for current applications.

The robustness of the model shows the extent to which it is possible to obtain correct results when the input data of the model exceed a certain order.

- d) *the use features show how easy it is to use the model and has as sub-criteria the following: the ease of communication and control, the volume of the data input and the time of response;*
- e) the context of use shows the extension to which the specific conditions where the models is used favour its acceptance by the managers and takes into account: the field of the analyzed problem, the considered decision type and the use frequency;
- f) the validity of the model represents the major assessment criteria for the model. An invalid model is not consistent with reality and leads to erroneous conclusions regarding the performance of the system.
- g) the consistency of the model reflects the extent to which the component elements of the process modelled by the relations between them were presented;
- h) the quality of the model is given by following the next main criteria: coherence, precision, efficiency, completeness and the efficient use of the model.

The banking activity balances risk taking and risk management. In general, the loss owed to the credit risk of a portfolio is defined as being the difference between the current value of the portfolio and its future value at the end of a given time horizon. Therefore, estimating the probability density function of the current portfolio losses implies the current value of the portfolio and the probability distribution of future values at the end of the planned time horizon. However, there is no single ideal method to measure the losses owed to credit risk. Two models for the loss owed to credit risk are used in practice:

1. default model (DM)

2. mark-to-market model (MTM).

„Default” model

To prevent the occurrence of bad loans, the Basel Committee on Banking Supervision elaborated an assessment model of credit risk (default model), which is recommended for all banks.

In general, the bad loans portfolio is defined as being the difference between: the current value of the portfolio and its future value at maturity.

In the case of this model, a credit loss occurs only when the borrower doesn't keep the day of maturity, meaning that he didn't reimburse the loan until maturity. In case the business fails, the loss of the credit would reflect the difference between the exposure of the loan and the present value of the future net recoveries. For this model, a bank must impose or estimate the possibility of risk distribution for each granted loan by taking into account three variables:

1. the associated exposure of the credit bank;
2. an indicator that shows the “default” possibility during the unfolding of the credit;
3. in the event of failure, the loss rate will be calculated. The lower the rate, the bigger the recovering rate of the credit.

The current and future value of credit instruments are defined for two states: *default* versus *non-default*. For a term loan, the current value is measured as bank exposure (accounting value). The future (uncertain) credit value depends on the whether the borrower will become unable to pay within the planned time horizon. If the borrower isn't insolvent, the future value of the credit will be measured as bank exposure at the end of the planned time horizon, adjusted so that it includes any payment of principal made during the planned time. Instead, if the debtor becomes insolvent, the future value of the credit (calculated as percentage of the credit value at the beginning of the time horizon) as will measured as:

$$1 - LGD,$$

where *LGD* presents the loss if the debtor becomes insolvent (*loss given default*). The lower *LGD* is, the bigger the retrieval rate of the credit will be.

There are expected losses of the credit portfolio and unexpected losses. An expected loss of the credit portfolio (μ) in the temporary assumed horizon is equal to the sum of expected losses for each type of credit (considered in its individuality) that forms the portfolio.

$$\mu = \sum P_i \times LEQ_i \times LGD_i$$

where, for the type of credit *i*:

LGD_i = loss in case of default; the expected loss rate in case of failure;

P_i = probability of default; unperformance probability (the expected “default” frequency);

LEQ_i = exposure to default risk; expected exposure of the loan.

The lower *LGD* is, the bigger the retrieval rate of the credit will be.

The standard deviation of the credit portfolio loss (σ) can be decomposed through the contribution brought by each type of individual credit:

$$\sigma = \sum \sigma_i \times P_i$$

where:

σ_i = the standard deviation of the losses of the type of credit *i*;

P_i = the correlation between losses of the type of credit *i* and the ones of the total portfolio.

The Π_i parameter holds the effects of the correlation of the type of credit i with the other types included in the credit portfolio of a bank. The higher Π_i is, the bigger is the standard deviation of the credit losses in the portfolio.

After the assumptions that:

1. exposure of a certain type of credit is known with certainty;
2. the failures of the client and the expected loss rates in case of failure are independent of each other;
3. the expected loss rates in case of failure are independent of the borrowers, the standard deviation of the credit losses for a certain type of credit i can be expressed as:

$$\sigma_i = LEQ_i \times \sqrt{\Pi_i (1 - \Pi_i) \times LGD_i^2 + \Pi_i \times VOL_i^2}$$

where VOL_i is the standard deviation of the expected loss rate in case of failure for the type of credit i .

These equations provide a conventional method to sum the risk of the total credit portfolio (within “default” mode) regarding the correlation between the losses of the i credit and the ones of the total portfolio, the expected loss rate in case of failure, the standard deviation of the expected rate in case of failure for the i type of credit and the expected exposure of the loan. They are also used to highlight those aspects of the credit risk estimation process that establish total trust in a credit risk model, namely:

- a) the accuracy of the parameter estimations as representations of the future;
- b) the validity of the presumptions of independence between variables (the presumption that certain variables are known without certainty) and the distributional presumption that introduces unexpected losses.

Regarding the aspect of the design decision and the economic efficiency, we found the “default” model elaborated by Basel Committee on Banking Supervision as being efficient.

In this model, for each granted credit, a bank must impose or estimate the possibility of risk distribution by taking into account three variables: the associated exposure of the bank credit; an indicator that will show the “default” possibility during the unfolding of the credit; the loss rate will be calculated in case of failure. The lower this rate is, the bigger is the retrieval rate of the credit.

The Basel II Accord acknowledges the techniques to reduce credit risk through collateral, securities and contracts derived on credit risk.

Regarding collateral, two methods to treat it are allowed:

The simplest approach is similar to the one given by Basel I, according to which the risk weighting of the credit is replaced by the risk weighting of the collateral, which can be lower than 20%.

The other approach to protect the bank against volatility of the collateral price is more advanced and relies on the adjusting of the collateral’s market price by introducing *haircuts*, which are either supplied by the supervisor (based on quantitative and/or qualitative criteria), or are calculated internally. Then, the value of the collateral adjusted by the market is deducted from the gross value of the given loan, thereby obtaining the adjusted exposure, which is afterwards multiplied with the associated risk weighting.

Thus, for a collateral transaction, the exposure after the *risk mitigation* procedure is calculated as follows:

$$E_{\square} = \max \left\{ 0, \left[E_{\square} \square 1 + H_e \right) \square C \square \left(1 \square H_c \square H_{fx} \right) \right] \right\},$$

where:

E^* represents the exposure value after the risk mitigation procedure;

E – the current value of exposure;

H_e – the *haircut* weighting applied to that exposure;

C – the current value of the received collateral;

H_c – the weighting applied to that collateral;

H_{fx} – the weighting applied to reduce *currency mismatch* owed to expressing exposure and the collateral in different currencies.

When the collateral consists of an assets cart, the weighting applied to the assets cart is:

$$H = \sum_i a_i H_i$$

where:

a_i represents the assets cart weighting (measures in monetary units)

H_i – the weighting applied to those assets.

According to both approaches, acceptable collateral represents:

- money or deposits;
- debt securities with at least a BB- rating, issues by governments or public entities;
- debt securities issues by corporations, with a rating of at least BBB-;
- equities or convertible bonds included on a main index;
- gold.

In addition, the advanced approach accepts convertible bonds that are not on the main index, but are transacted on a recognised stock exchange market, bonds without rating issued by banking institutions, collective investment schemes and mutual funds.

To accept these types of collateral, a bank must met standards regarding:

- the legal certitude of the used documents;
- the requirement that the assets used for risk mitigation will have a reduced correlation with the credits whose risk they reduce;
- the robustness of the management policies for collateral.

3. Conclusion

Certain groups of banks differ in their riskiness; for example, foreign, EU and large banks show a lower probability of default compared to their competitors. Nevertheless, these differences are not large and generally not statistically significant. This suggests that banking markets are relatively homogenous and no clear groups of banks with excessive risk taking can be identified.

THE ACTIVITY OF COMODITIES AND STOCK EXCHANGES: TRENDS, CHALLANGES, LIMITS

Matei Mirela

Ioniță Amalia

Petroleum and Gas University from Ploiești, România, Faculty of Economics

The international capital market is in a continuous change. The demutualization of commodities and stock exchanges has determined waves of mergers and acquisition between exchanges from different countries and different continents. The result is the establishment of strong exchanges` groups that have an important innovation power.

The international financial crisis generated devastating critique from the part of the policymakers, the media, the public and some top economists. So, in the future, the supervision authorities should control and regulate better the phenomenon of financial innovation.

Keywords: exchanges, demutualization, innovation, financial crisis

JEL Classification: G 24

1. Trends in the evolution of capital market

The commodities and securities exchanges are important actors at national and international level. The financial sector and the exchanges were brought in the attention of the world by the actual international financial crises. In fact, the international crises was determined by the financial innovation and the lack of supervision.

The last two decades have been brought new trends in the activity of commodities and stock exchanges:

- the increasing deregulation of trading activity (for example Big Band in London and the elimination of fixed commission in USA) that conducts to the intensification of competitiveness;
- the development of information technology and the main result consists in the replacement of traditional floor based trading with electronic trading; in addition, alternative trading systems and electronic communication network have been set up;
- the establishment of new commodities and stock exchanges in developed and developing countries; for example, there are successful exchanges in countries like India, China, Malaysia, South Africa but many new exchanges have rapidly disappeared or have not achieve their initial goals;
- the explosion of exchange traded derivatives markets; the derivatives contracts are no longer viewed as speculative instruments but they are used intensively for hedging strategies;
- the rise of alternative trading systems (ATS), first in the USA and recently in Europe;
- the growing presence of financial investors on commodities futures exchanges (“financialization” of commodities markets) generates the increase of the internationally traded commodities;
- *the strong competition between exchanges, banks and insurance companies that try to launch innovative products for speculative and hedging purposes;*
- the transformation of exchanges from non-profit institutions to joint stock companies and the listing of their shares;
- the explosion of mergers and acquisitions between exchanges from the same country or different countries, from the same continent or from different continents (the eloquent example is the merger between New York Stock Exchange and Euronext and the set up of the most important exchange group – NYSE Euronext Group); the results are the restructuring and the consolidation of this industry;

- the climbing of institutional investors that are important promoters of new financial products used to hedge the risks or to gain the proper results (Stoica, 2005, p. 81);
- globalization of exchanges` clients; these global clients ask for more standardization of fees, products and technology and this goal can be achieved through consolidation (WFE Report 2008, p. 63) and demutualization that permit a more customer-focus manner of exchanges (Akhtar, p. 36);
- the implication of exchanges in the regulation of public listed companies and the promotion of corporate governance principles among them, because they impose listing and disclosure standards, elaborate corporate governance recommendations or codes according with OECD Principles of Corporate Governance.
- the sustainable investment is a topic for many actors who play a role in shaping climate investment: policy makers, international organizations, professional bodies; the companies must have a social responsibility and in some extent, the exchanges promote specific environmental and social standards;

Taking in account the activity of exchanges, we observed the increased cooperation among exchanges through the sign of memoranda of understanding (MOUs); the main objectives of these MOUs consist in the information sharing in order to adopt the “best practices” in area like the clearing and settlement procedures, the development of contract specifications; self-regulation or joint listing of products (UNCTAD 2006, p. 9).

Another form of cooperation is the sign of commercial partnership contracts. For example, on December 2009, two important American exchanges - the NASDAQ OMX Group and BM&FBOVESPA from Brazil concluded a contract for the distribution of market data and the provisioning of NASDAQ OMX products and corporate services to public companies in Brazil. Based on this contract, these exchanges intend to develop a communications system through Brazilian and North American brokers will have access to cash equities traded to partner’s market.

Some of these trends are contradictory. For example, the regulatory role of exchanges is a major subject for discussions because of the demutualization of exchanges. Some specialists consider that there could be a conflict of interests between the major aim of exchanges - the profit and the regulatory responsibilities of exchanges, and the additional problem rise from the self-listing of exchanges.

The competition between exchanges is intense and after the conversion of exchanges to companies, their regulatory regimes could be a competitive parameter. Until now, there is no systematic evidence of this case, according with OECD.

The financial innovation is very intense on commodities and securities exchange. The result is the creation of many derivatives or structured products that are gambling instruments that increase risk without providing any real benefits to society. (UNCTAD 2009, p. 12). For these reason, many financial markets from developed countries are viewed as giant casinos.

The high complexity of the derivatives products determines difficulties in the evaluation of these instruments. The underestimation of the risk, the optimistic attitude of investors, the technological and financial innovation, the lack of proper regulation and supervision generate the actual financial crisis.

2. Demutualization of commodities and stock exchanges

Traditionally, many exchanges had been non-profit organizations owned by its members who had the privileges to trade specific assets in specific locations. In fact, the exchanges operated as a “club of brokers” and the members had the monopoly over the intermediation of securities` trade. Nowadays, the exchanges are implicated in a dramatic change of the organizational structure from mutualization institutions or members` associations to “for profit” entities.

Usually, this demutualization process implicates a public offering and public listing of shares of exchanges. By this way, the exchanges are own by investors rather than members. The main commodities and stock exchanges have as shareholders important institutional investors.

The first movement in this field was done by the Stockholm Stock Exchange in 1993 and since than, many commodities and stock exchanges (like the Australian Stock Exchange - ASX, Toronto Stock Exchange - TSE, Singapore Stock Exchange and Hong Kong Stock and Futures Exchanges, the Pacific Exchange, Chicago Mercantile Exchange) have track the same trend: the change or organizational form from mutual ownership structure to a share ownership structure (Akhtar, p. 35).

This phenomenon can be observed on all continents, on developing and developed countries, and on various exchanges where different types of securities are traded. The specialists (Aggarwal, p. 3) consider that this process is due to innovations and deregulatory events that characterize the last decade.

After the demutualization, the exchanges have made an additional step: they do a public offering and become listed companies. The Australian Stock Exchanges was a pioneer in this field and was one of the first securities exchanges that become a listed company.

The change of the business model of exchanges and the existence of ATS have bring new challenge for their managers. In order to improve their efficiency, new solutions are found: the consolidation through mergers and acquisitions; the cut down of the fees; the establishment of global trade facilities for the set up of 24 hours trading markets.

The World Federation of Exchanges has over 50 members (exchanges): 76% of members are for-profit, and 41% are publicly listed. The exchanges organized on profit basis are acting like a factory, with huge revenues, costs and employees.

In addition, being organized as a company, the demutualized exchanges can raise capital from different sources. In this way, the exchanges have the possibility to invest in technology. The movement from floor trading to screen (electronic) trading has implicated huge investment in information systems. Through demutualization, the separation of ownership and trading privileges guarantee a greater independence of exchange from its members

The negative effects of the international financial crisis balanced the efforts made by the management of for profit exchanges. For this reason, many exchanges have obtained profit in 2009, but we remark a relative decrease compared with the previous year (2008).

Table no 1 The net profit of some exchanges in 2009

	Net profit (in local currency)	Annual relative change
BME Spanish Exchanges	EURO 150 m	-21.3%
BM&FBOVESPA	BRL 881 m	-3.1%
Deutsche Borse	EUR 496 m	-52%
Hong Kong Exchanges	HKD 4,704 m	-8.3%
Johanesburg Stock Exchange	ZAR 366 m	-2.1%
New Zealand Exchange	NZD 38.71 m	+280%

Source: Focus 2/2010, Focus 3/2010, <http://www.world-exchanges.org>

After the demutualization, many exchanges have revised their commercial strategy and adopt different methods in order to cope with local and international competition and to gain profit. The methods consist in:

- the merger of two or more local exchanges that produces synergy effects but reduce the possible competition on the national capital market; this merger could determine a monopolistic behavior of the consolidate exchange, but the liberalization of capital movements permits the trade and the listing of securities abroad;

- the merger of different types of markets: cash and derivatives markets, securities and commodities markets; this trend is sustained by the necessity of development and of set up of a “one stop shop” for investors and brokers;
- the vertical integration of exchanges, clearing, depository institutions in order to reduce the costs for brokers and investors;
- international alliances with other exchanges in order to use same products or electronic platform.

Even the exchanges do not merge, they often the same electronic trading platform. For example, Euronext’s derivatives trading system: LIFFE CONNECT is used by Euronext and The Tokyo Financial Exchange (TFX) since 2004

3. The financial and innovation force of the exchanges` groups

The wave of mergers and acquisitions is a reality of our times. This trend is very intense in financial services and in the last twenty years, the commodities and stock exchanges are implicated in the establishment of groups that have broad business portfolios.

The integration in this field consists in the merger of exchanges from the same country or different countries or the merger of exchanges with settlement, depository and clearing institutions.

For example, NYSE Euronext that is the world's leading and most liquid equities exchange group, was set up in 2007 by NYSE Group and Euronext after many local mergers and acquisitions between exchanges like Archipelago Exchange, New York Stock Exchange, Lisbon Stock Exchange, London International Financial Futures and Options Exchange, Paris Bourse, Brussels Exchange or Amsterdam Exchange.

These financial groups dominate the international capital market taking in account indicators like equity market capitalization, value of share or bond trading, and the number of derivatives contracts concluded. Taking in account the figures from table no 1, we remark the force of Asian exchanges like Shanghai Stock Exchange, Shenzhen Stock Exchange or Hong Kong Exchanges.

Table no 2 Largest exchanges by value of share trading in the electronic order book

Exchange	USD bn	USD bn	% change
	2009	2008	In USD
1 NYSE Euronext US	17,521	27,651	-36.6%
2 NASDAQ OMX US	13,608	23,845	-42.9%
3 Shanghai Stock Exchange	5,056	2,584	95.7%
4 Tokyo Stock Exchange Group	3,704	5,243	-29.4%
5 Shenzhen Stock Exchange	2,772	1,242	123.2%
6 NYSE Euronext Europe	1,935	3,837	-49.6%
7 London Stock Exchange	1,772	3,844	-53.9%
8 Korea Exchange	1,570	1,435	9.4%
9 Deutsche Börse	1,516	3,148	-51.8%
10 Hong Kong Exchanges	1,416	1,562	-9.3%

<http://www.world-exchanges.org>

The international financial crises have affected the volume and the value of share trading at the most important exchanges from the developed countries. The interest of individual and institutional investors for shares has been decrease and the exchanges` groups coped in 2009 with dramatic cut down of share trading.

The investors have been focused to bonds that are less risky securities. Taking in account the consolidated data presented by World Federation of Exchanges for ten largest exchanges, only three exchanges (NASDAQ OMX Nordic Exchange, Istanbul Stock Exchange, Tel Aviv Stock Exchange) registered modest decrease of the value of bonds traded.

Table no 2 Largest exchanges by total value of bonds traded

Exchange	USD bn	USD bn	% change in
	2009	2008	USD
1. BME Spanish Exchanges	8,138	6,823	19.3%
2. London Stock Exchange	6,896	6,118	12.7%
3. NASDAQ OMX Nordic Exchange	2,419	2,942	-17.8%

4.	Colombia Stock Exchange	960	468	105.0%
5.	Korea Exchange	403	348	15.9%
6.	Istanbul Stock Exchange	402	406	-1.2%
7.	Borsa Italiana	313	256	22.1%
8.	Tel Aviv Stock Exchange	246	262	-6.4%
9.	Oslo Bors	227	124	82.8%
10.	Santiago Stock Exchange	188	167	12.6%

<http://www.world-exchanges.org>

In this period of crisis, we remark the return of investors to classic financial products, especially bonds, with low risk and complexity.

The intense financial innovation that is a reality of our times and the new financial products have developed quickly: the results was the transformation of international financial systems, the appearance of new opportunities for investors and intermediaries, new challenge for financial supervisory authorities, the upgrade of national financial laws and the improvement of international cooperation in the field of regulation.

The innovative products have been created as a reaction to risk, but the use of these products could generate risk and losses. Paradoxical, the „uncontrolled” use of derivatives had determined huge losses for banks like Barings Bank, Sumitomo Bank and Allied Irish Bank after the brokers had initiated excessive positions on derivatives markets.

Despite these financial scandals, the financial innovation has continues. For example, for the beginning of this year, the main exchanges groups announces the launch/list of new products:

-the BME Spanish Exchanges listed Turbo Pro warrants issued by BNP Paribas and linked to the IBEX 35 index;

-The Chicago Board Options Exchange list S&P 500 dividend index options;

- Eurex launched dividend futures on single stocks (on the constituents of the Dow Jones EURO STOXX 50)

- NASDAQ OMX launched new ETF based on NASDAQ-100Index;

- Deutsche Börse launched trading on Exchange Traded Notes;

- BM&FBOVESPA launched foreign exchange non-deliverable forward contract on its OTC market.

The results of the intense financial innovation on exchanges is the creation of product like exchange traded funds (ETFs), exchange traded commodities (ETCs), derivatives contracts on weather. Through these products, the companies and the public institutions have multiple choices to speculate or to hedge the financial risks.

After the start of financial crisis, many specialists have blamed the financial innovation, especially the OTC derivatives like the collateralized debt obligation (CDO) and the credit default swap (CDS). For example, Princeton professor Paul Krugman said, „hard to think of any major recent financial innovations that actually aided society, as opposed to being new, improved ways to blow bubbles, evade regulations and implement de facto Ponzi schemes.”¹⁰¹⁵ Paul Volcker, the Chairman of President Obama’s Economic Recovery Board, has asked: “How many other innovations can you tell me that have been as important to the individual as the automatic teller machine, which in fact is more of a mechanical than a financial one?”¹⁰¹⁶

All these reactions have affected the image of exchanges as generators of innovative financial products and have determined the decrease of investors` interest for OTC derivatives and exchange-traded derivatives.

¹⁰¹⁵ www.nytimes.com/2009/04/27/opinion/27krugman.html

¹⁰¹⁶ Paul Volcker: *Think More Broadly*, The Wall Street Journal, December 14, 2009

Conclusions

The financial sector is the central nervous system of modern market economies (UNCTAD 2009, p. 11). Taking in account the importance of financial sector for economy and the effects on international financial crisis, the financial innovation must be more controlled by the supervision authorities because some financial instruments are created with the goal to elude the regulation and to maximize the profits of investors and bankers.

In addition, some specialists like Stiglitz proposed the creation of a Financial Products Safety Commission in order to limit the proliferation of “dubious” or “opaque” financial products (that mask the risk to investors than to minimize it) and to stimulate the creation of standardized financial instruments that are more transparent and easy understood by investors. The financial products must have real positive effects on economy. So, the financial regulation reform must focus on the social efficiency of financial products and for this purpose, the international coordination is needed.

LIQUIDITY RISK MANAGEMENT IN CRISIS CONDITIONS

Mutu Simona

Babeş-Bolyai University, Faculty of Economics Science and Business Administration

Matiş Eugenia

Dimitrie Cantemir Christian University, Faculty of Economics Science

In order to measure the liquidity risk we have developed an analysis model, based on stress-testing scenarios, that shows the ability of the bank to face different types of liquidity crisis. The scenarios were designed for each balance sheet position for assets and liabilities: Ordinary Course of Business, Name Crisis (Mild Name Crisis and Severe Name Crisis), Market Crisis (Mild Market Crisis and Severe Market Crisis) that reflects banking sector crisis and persistent recession. This offers a dynamic image about the bank's liquidity in report with different types of liquidity scenarios, but also about the time horizon of analyze. The research also wants to highlight the most significant features to consider in order to implement an effective liquidity risk management and to achieve a more integrated supervisory framework.

Key words: liquidity risk, name crisis, market crisis, liquidity limits, gap analysis

The article's JEL code: G01, G21, G32, C63

1. Introduction

A series of studies on liquidity management have appeared during the financial crisis, many of them comparing the funding liquidity with the market liquidity. Drehmann and Nikolaou (ECB, 2009) found that the funding liquidity risk has similar properties as the market liquidity risk, both showing persistence at low levels with occasional spikes, the evidence being more stronger after the beginning of the turmoil in August 2007. They have analyzed 135 main refinancing operation auctions conducted between June 2005 and October 2008 in the euro area from 877 participating banks in the relevant auctions. Brunnermeier and Pedersen (2007) discovered that higher funding liquidity risk implies lower market liquidity during the turmoil. Also, the bank which has to raise liquidity in the interbank market has to pay a higher price in order to obtain it. In the extreme, prices may even be infinite if a bank is credit rationed (Stiglitz and Weiss, 1981).

The credit institutions have elaborated their own models for following and limiting the liquidity risk. Their procedure regards the following elements: more restrictive internal limits for the liquidity indicator, limits for establishing and monitoring the liquidity risk in report to a single person or group of persons, the bank's own indicators for liquidity risk, an information system that monitors the liquidity that is used by the top management. In order to measure the liquidity risk there have been developed a series of models, based on these scenarios, that shows the ability of the bank to face different types of liquidity crisis. This offers a dynamic image about the bank liquidity in report with different types of liquidity scenarios, but also about the time horizon of the analysis.

The banks from the Romanian banking sector have aligned to the central bank's requirements and each of them has elaborated its own plan for forecasting and limiting the liquidity risk. The alternative financing plan represents an important part of the risk administration process, taking into account the scenarios applicable after the turmoil.

2. Methodological approach

In order to measure the liquidity risk we have developed an analysis model, based on stress-testing scenarios, that shows the ability of the bank to face different types of liquidity crisis. Taking into account that the duration of a crisis has an important impact on the level of liquidity, we have analyzed separately a short period (1 month) and a longer period (1 year). Also, for

each scenario we have taken into account the next perceptions:

- the internal perception, which is applied especially to the name crisis, when only the bank knows about the existence of liquidity problems, from the internal indicators and the information. At this level it is more easier for the bank to attract supplementary resource at a reasonable cost;

- the external perception, when the whole market know about the problems regarding the liquidity situation in crisis period. At this level, it is difficult to attract supplementary resources at a reasonable cost, independently on the type of crisis, name crisis or market crisis.

The internal and external factors that release crisis in the Romanian banking system, show evolutions, which indicated that there is a potential liquidity problem for the banks. Because of this, the analyze result of their level and evolution can motivate the activation of the financing alternative plan. Due to the *internal perception*, the future estimations regard the following: the estimated cash-flow for RON and foreign exchanges, the net cash-flow result for the next five days at for the whole bank. Due to the *external perception*, are taken into consideration the following: macroeconomic indices; qualifying ratings for Romania and for the bank; indices showing unfavorable evolutions for the bank, worsen profit and losses reports; indices showing unusual evolutions on the monetary market like the instantaneously increase of the interest rate level and of the spreads (the difference between the monetary policy rate of BNR and ROVID overnight); indices regarding the functionality of the monetary markets and capital markets.

The daily cash flow report is based on the estimation of the banks' current account balance opened at the National Bank of Romania. It includes the following: inflows and outflows resulting from the transactions on the monetary market, interbank transactions on the foreign exchange market, readily marketable assets, volatile liabilities, demand deposits, maturing assets, interest receivable, asset sales, drawdowns, maturing liabilities, interest payable, disbursements on lending commitments, early deposit withdrawals. During liquidity crisis the cash flow would be adjusted with the new conditions regarding the pessimistic estimation of the early deposit withdrawals, the delay of the interbank settlements and also with the negative effects that occurs from the foreign exchange operations. When large volumes of deposits are at stake, outflows of funds should be assessed on the basis of probability, with past experience serving as a guide.

The existence of multiple currencies increases the complexity of liquidity management. A bank may face difficulty in raising funds or in selling assets in foreign currencies in the event of market disturbances or changes in domestic monetary or foreign exchange policies. In order to meet these requirements, the Risk Controlling Division of a bank may calculate and monitor the next liquidity indicators, for EUR, USD and RON and also at cumulative level in equivalent RON:

a) The liquidity indicator calculated as a report between the liquid assets for the next 7 days and the sight deposits of the individuals;

b) The liquidity indicator calculated as a report between the liquid assets for the next 7 days and the sight deposits of the individuals and companies, including the correspondent accounts of other banks (LORO);

c) The liquidity indicator calculated as a report between the liquid assets for the next 7 days and the total current accounts and the term deposits of the clients;

d) The liquidity indicator calculated as a report between the liquid assets for the next 7 days and the total current accounts, the term deposits of the clients, individuals and companies, including the correspondent accounts of other banks (LORO).

In the Romanian banking system most banks implement the following analysis and liquidity limits, adapted to the market conditions: short term liquidity limit based on the net cash flow for the next five days, liquidity limits based on stress tests scenarios, long term intergroup funding limits and the GAP analyze.

This liquidity analysis on crisis scenarios is the practical part of the research done, by presenting the liquidity limits, the immediate effects after the crisis starts and the measures taken for

improving the situation, but also for analyzing the efficiency of the results obtained after the application of stress-testing scenarios.

3. Case study of the liquidity limit based on stress testing

There are five liquidity scenarios, for each balance sheet position for assets and liabilities:

- Ordinary Course of Business (OCB): there aren't any internal or external problems;
- Name Crisis (NC): which could take the form of a Mild Name Crisis (MNC) characterized by the decrease of the profit and/or a negative perspective or of a Severe Name Crisis (SNC) characterized by the deterioration of the rating score with more than two units;
- Market Crisis (MC): which could take the form of a Mild Market Crisis (MMC) with mild recession and mild political crises or of a Severe Market Crisis (SMC) characterized by the banking sector crisis, severely and persistent recession.

For each scenario were established three sets of hypothesis:

- hypothesis regarding the primary and the secondary activity: what percent represents these activities in a class of products;
- hypothesis regarding the renewal of the positions: what percent from a class of products would be renewed with the given scenarios;
- hypothesis regarding selling or quick transformation in collateral and unanticipated withdrawals: what percent from a class of products could be sold or used as collateral (from assets) or early withdrawn (from liabilities) before its contractual maturity.

In the next tables are presented the percents for the hypothesis defined above, for one month period and for all of the liquidity scenarios.

The results of the liquidity limit, for a Romanian commercial bank, are presented for each combination between crisis scenarios, time horizons and currency (the final results include the 1 year scenarios):

- the volume of the outflows could be covered by the inflows generated by secondary liquid assets (A);
- the volume of the outflows could be covered by the inflows generated by the total liquid assets , primary and secondary (B);
- the volume of the outflows is higher that the inflows generated by the total liquid assets , primary and secondary (C)

4. Conclusions

Preoccupation with obtaining funds at the lowest possible cost and with insufficient regard to maturity distribution can greatly intensify a bank's exposure to the liquidity risk. Moreover, in practice, it is difficult to obtain funding when a dire need for it exists, especially that some unexpected situations also may have impact on liquidity risk, including internal or external upheavals, increased market activity, sectarian problems and economic cycles. All banks are influenced by economic changes, but sound financial management can buffer the negative changes. Management must also have contingency plans in the case that its expectations tend to be wrong, which identify the minimum liquidity needs and the alternative courses of action under different scenarios on short term liquidity limit based on the net cash flow, liquidity limits based on stress tests scenarios, long term intergroup funding limits and the GAP analyze. These scenarios may take into consideration, for each balance sheet position for assets and liabilities the ordinary course of business, but also the name crisis and the market crisis, from the mild ones to the severe ones.

THE BUCHAREST STOC EXCHANGE IN THE CONTEXT OF ECONOMIC CRISYS

Răscolean Ilie

University of Petrosani

The economy is a complex, which acts on many external factors, but internal and complex factors, depending on who can create economic balances or imbalances. An important element is capital to be managed carefully and seriously because it caused imbalances are among the worst in the economy and may even lead to economic collapse in one country. The existence of capital market is driven by demand for capital for current cash needs and investment and also be subject to a real process of saving as the foundation of capital supply. Fundamental institution of secondary capital market is the stock of securities.

Keywords: Stoc Exchange, shares, crisis, market economy, capital, capital market, futures, options, investments, investment funds;

Cod JEL lucrare: G14

The economic crisis that has shaken up the world currently has the focus or epicenter of the United States and then crossed the U.S. border is being felt around the world from Europe to Asia. Causes the onset of the crisis originated in the U.S. and experts know how the crisis began. It's actually part of the fall of the American financial system, could continue to affect the entire financial system in the world. It took the four oldest investment banks to be bought ridiculous amounts or declaring bankruptcy, as a giant insurance industry to be taken by the State, as two old mortgage credit institutions to enter bankrupt and the federal government to announce a rescue plan '700 billion dollars', to understand the mechanisms of the crisis.

There are specialists in the Romanian press, forming an analogy between the economic downturn we are going through and what happened in 1929 - 1930, both in terms of causes and its possible effects. From regulatory perspective, the current economic downturn has occurred and is evolving quite differently from the crisis that occurred 79 years ago. Causes of the 2008-2009 recessions are not the same as those from 1929 to 1930. Institutional mechanisms for intervention have evolved in recent decades, the global economic structure has changed profoundly, and the states cooperate with each other, which in 1929-1930 has not happened. However, the crisis appears to be controlled, but with a fairly high cost. In 1929 nobody has questioned an internationally coordination or market interventions, because dominant economic culture was different.

Global economic crisis is amplified each day and Romania felt that economic recession, which economists from major global and fail to find an antidote. And the man will feel the crisis in the companies in Romania. On the one hand those who have loans for development work or cover other needs, will awaken to the inability to repay these loans, while the possibility of undue payment of suppliers, especially for those who have made payments currency. Moreover, as global stock markets collapse and the Bucharest Stock Exchange lost a few days over two billion, the companies can not count on them as sources of funding, another option to cover financial needs is totally blocked. The first signal was registered by the capital market, which has experienced since the middle of last year, with the withdrawal of major foreign investors from all emerging markets.

The existence of capital market is driven by demand for capital for current cash needs and investment and also be subject to a real process of saving as the foundation of capital supply. Link capital market issuers of securities and other financial instruments for individual and institutional investors through financial investment companies. Capital market thus operates as a liaison mechanism between those who manifest the extra capital (investors) and those who need capital (broadcasters).

Capital markets are all mechanisms through which relationships and capital available and dispersed in the economy are managed by public and private entities The applicant any funds. In terms of its scope of coverage in the literature two approaches have been structured on the capital market: design of Anglo-Saxon and Continental European conception (of French origin). In Anglo-Saxon conception of capital market issue with money market and insurance market is known as a comprehensive term, financial market. The design classic continental European capital market has a complex structure, which includes money market, mortgage and financial markets. In this view represents the money market and short-term capital market environment, as represented by the interbank market and negotiable securities market and financial market is long-term capital market, which are issued and traded securities that serve as the underlying exchange capital. Mortgage market is a specific market financing of housing. Practice in Romania highlights option for Anglo-Saxon conception, that the capital market is part of the financial market.

Capital market is presented as a liaison mechanism between investors and issuers, whose decision to invest are given by two complementary objectives, namely: profitability, namely high fructification of capital and liquidity, ie recovery of capital stock as invested. Seen in the light production and marketing of equity securities market comprises two segments namely: the primary market, the market where newly issued financial instruments are traded for the first time, and the secondary market, the market traded financial instruments which are already in circulation.

Premises occurrence capital market in Romania have been created along with the promulgation of Law no. 31/1990 on trading companies, which provided the necessary legal birth and development of joint stock companies and also established a clear framework for the main products used on the capital market: shares and bonds. Under that law firms could share the savings calls for public funding or to increase capital. Thus we can define 1990 as the time of the primary capital market.

Then an important milestone was the adoption of Law no. 58/1991 on the privatization of companies, which need further revealed the existence of a secondary market, because financial markets brought a massive amount, bearer securities, which securities were not considered although they acted as to familiarize the public with securities. Fundamental institution of secondary market capital stock of securities. Against the backdrop of a tradition for over 70 years of commodity exchanges, which worked on the model of Western scholarship, the history of Romania recorded in 1881, the emergence of the first stock exchange.

This was due to the adoption of Law on scholarships, exchange mediator and mediator of goods. Made after the French model, the law governing the creation, by royal decree, the stock exchanges and commodities. Opening the Bucharest Stock Exchange, following the adoption of this law was held on 1 December 1882, the Chamber of Commerce building. Evolution of regulatory framework on capital markets was marked by the following steps: year 1904 - a new law that stock exchange operations are clearly defined and, as an immediate consequence, the public is increasingly convinced of the efficiency of investments in securities value; 1929 brings the law on stock, known as "Law Madgearu, who represented the unification of legislative grants regime in Romania and also a modern approach to the instrument.

After the conclusion of the economic crisis 1929 - 1933, with economic recovery, "Exchange effects, stock and exchange in Bucharest," and she knows an upward trend, representing the 1939 peak in the interwar period. Mentioned that at the time of 1939, traded, only 56 titles in banking

and transport insurance. End of the World War II, to turn around policy for Romania, meant the end of the capital market and stock market. Coup de grace for this highly dynamic sector of the economy was the economy of the nationalization process in 1948, which meant that by establishing state ownership disappears specific products: stocks, corporate bonds, domestic and foreign government securities (the equivalent in Lei - Gold). Revolution of 1989, which meant an important event in the history of Romania, stressed the reform program that followed it and needed to rebuild capital market and its institutions, including the Bucharest Stock Exchange. In Romania, the stock market was the reason why the emergence of creation to a market that match the needs of Romanian and foreign investors regarding investments and the role they played in the restructuring and privatization.

The fact that Romania has benefited from a stock market for half a century has made the development process to start from scratch without the benefit of their experience in the field. To create the stock market started to experience Romania and practice in developed countries, but also benefited from the help of international organizations in the U.S., Canada, UK, EU. Stock Exchange, as a basic component of the capital market in Romania, was reconstituted in 1995 and was financed at first by the state budget, provided that within three years of the establishment of fees applied to reimburse the transaction, the amount required to set up. B.V.B. is organized and operates in accordance with Ordinance 28/2002 and issued under its provisions.

Thus B.V.B. performs the following functions: The regulated market, providing investors systems, mechanisms and procedures for transactions in securities and other financial instruments as provided by law, performs and related trading activities, such as compensation, settlement, registration of rights and constitution transfer rights to the securities and financial instruments and all their related operations, conducts, and markets systems administrates specific stock exchange, is the training body for the purposes of the CNVM Regulation no. 1 / 2003, the professional certification of operators and specialists for regulated markets, organizing training courses for participants in the regulated market.

Bucharest Stock Exchange has become the top sectors affected by the crisis. From the beginning, the main market capitalization lost over ten billion, approximately 42% of the total. Limit exposure to the foreign investment funds collapsed, practically the most liquid stock quotes. Prices of securities issuers that make up the basket BET lost, on average, over 70%. But the most volatile segment during this period was the financial investment companies (SIF). Once, in 2006 and 2007 BET-FI mark assessments and 32.4% respectively 24.8% from the same stock early reports indicate a decline of over 85%. The global capital market history, links with the Bucharest Stock Exchange (BSE). He was born in 1881, following the adoption of the Law on scholarships, exchange mediator and mediator of goods, which provides for the establishment, by royal decree, the stock exchanges and commodities.

BSE crossed, in turn, the history of tough financial times. In 1929, Law Madgearu was adopted legislative regime governing the unification of Romania scholarships. After the crisis of the '30s, stock exchange effects and action in Bucharest, as was known, the highest increase in the history of wars. In 1939, 56 securities traded in banking, transport and insurance. With the establishment of the communist regime, specific securities transactions ceased capitalism. Nationalization of the Romanian stock exchange stopped work. Revolution of 1989 led to rebuilding and restoration of capitalism in Bucharest Stock Exchange by a group of specialists. BSE was re-established in 1995, the first trading day is November 20, 1995. Since reopening, has seen a continuous development. Currently, the BSE listed about 60 companies, including SNP Petrom, the Romanian Bank for Development, the 5 financial companies, BT, BRD, etc. October 8, 2008, "Black Wednesday". Loss of 2.5 billion dollars per minute. The financial crisis has affected U.S. and Romanian capital market. On October 8, for the first time in history, trading session on the Bucharest Stock Exchange was closed. Transactions were suspended due to a fall over the critical threshold of 15%. Since its opening meeting, the BET index lost more than 14.43 percent. Transactions at the Sibiu Commodities Exchange were also suspended. Two days later, the BSE

announced that it has extended status. Transactions were postponed until the end of the day. Closely linked to developments in the stock market, stock funds have fallen fast. Under these conditions, the net assets managed at end-September of the 17 equity funds was only 183.18 million lei, decreasing by about 54% to nearly 400 million lei as operated 14 funds in late 2007 . Further pension fund returns, but the insurance with investment component declined as a result of stock market exposure.

Bucharest Stock Exchange is also vulnerable as external financial disaster. Share value fell more than 7% and the stock market recorded the biggest loss in the last 3 years. BRD titles have seen the greatest decline - 14%, close to the minimum allowed by the Bucharest Stock Exchange. Value of firms listed on the Bucharest Stock Exchange increased by 10.15 billion lei in April, the second month in a row of solid growth but the market expects first-quarter financial results to assess the soundness of firms and their future developments. In late April, the regulated market capitalization stood at 48.6 billion lei (11.2 billion euro's), up 26% compared with the end of March, from 38.45 million lei. In the last week of April, the BSE listed shares jumped 3.7%.

The increase in April comes after that - even spectacular - in March, when the BSE's capitalization had risen to 39.5% (10.9 billion). "In April was the second month of explosive growth on the BSE, following which the market prices recovered earlier this year, and segment SIF (Financial Investment Companies) whether prices reached in mid-October 2008 Following a strong upward path, "said the weekly report of House of Prime Brokerage Transaction. Liquidity of the Stock Exchange regulated market has soared in April, up from 534.4 million lei, exceeding 13% turnovers made in February and March combined. In February, the stock exchanges amounted to 164.27 million lei, in March, they totaled 306.7 million lei. But after two months of strong growth, which followed the trend of foreign markets, the Romanian market of shares is made before the test in the first quarter financial results, which indicate the extent to which Romanian companies face a difficult economic period.

If's(Investment funds) increased by 71.8%, BET, which shows the evolution of the most liquid ten titles (blue chips) listed on the BSE, rose by 28.78% in April, up 3048.92 points, while market composite index, BET-C, reflecting the evolution of shares listed on the first two sections of the Exchange except If's, won 25.7%, to 1949.17 points. In April, SIF increased much more than the rest of the market sector reflects the BET-FI index, which reached 18,524.97 points at the end, marking an advance of 71.78% - 7740 points . At the end of March, investors could buy shares of SIF Banat-Cri (SIF1) the quotation of 0.481 lei, which would have brought a return of 112.06%, if they would be closed the last trading session April, when the price of securities reached 1.02 Euro / unit.

Turnover achieved in April with IF Banat-Cri actions amounted to 32.2 million lei. Although in April, SIF 1 titles have made the greatest efficiency of the market, most wanted their sector were SIF Oltenia (SIF5), which resulted in a liquidity of RON 97.18 million and it rose by 86 48% after their price jumped to 0.91 lei at the end of April, from 0.488 lei in March 31. Also, SIF Moldova (IF2) have leapt 79.81% in the last month and reached 0.775 RON quote, background of the third market liquidity, by 60.67 million lei. IF Transylvania (IF3) rose by 57.44% to 0.455 lei, while the value of these securities transactions was 32 million. SIF Muntenia (SIF4) recorded moderate growth of the SIF titles last month by 40.63% after their quotation rose to 0.6750 lei following exchanges of 26.15 million lei. In total, the actions of the five financial investment companies (SIF) in April drew total 248.3 million lei exchange, representing half the total market liquidity in this period.

BRD titles in the banking sector were the most stable. The banking sector has attracted between April 1 to 30 exchanges of 167.07 million RON, representing one third of stock market turnover. BRD - GSG (BRD) generated last month of stock market liquidity first, almost 100 million lei, and their quotation grew 16.8% to 7.30 lei. Instead, actions Of Transylvania Bank (TLV) have leapt 39.24% to the price of 1.10 lei onto a turnover of 51.4 million. Titles Erste Bank (EBS) rose

by 27.12% in April, to quote from 66.10 euro / unit and value traded amounted to 14.1 million. Bank shares trade Carpatina (BCC) totaled only 1.57 million lei, but their price rose the most in the banking sector, with 50.5%, to 0.124 lei. Observing changes in the last week of the year, BRD shares were noted, with an appreciation of 6.57%, while Erste Bank titles won only 0.30%. Instead BT and Bank Carpathian titles registered decreases of 5.98% and 8.15%. In April, were also noted several actions which, although not among the most liquid, could bring substantial gains to investors. Actions Altur Slatina (ALT) had one of the best developments in the market last month, with an appreciation of 110.94% to RON 0.0405, after exchanging only 809,370 lei.

Also, titles Biofarm Bucharest (BIO) have leapt 98.5% to 0.159 lei, support for 11.02 million lei transactions and actions Impact Bucharest (IMP) 2.4 drew liquidity million, and their price has climbed 84.5% to 0.369 lei. However, titles Oltchim (OLT) gained 81.18% to RON 0.308, after 663,700 lei exchange, while securities Broker (BRK) reached quotation of 0.196 lei, increasing by 67.5% the price set in late March 2009.

In conclusion the general trend of the Bucharest Stock Exchange in 2009 was a bad transaction to produce significant gains and spectacular stock with a downward trend. However in March April and May of 2009, financial investments companies (SIF), and showed positive developments, and shares of banking companies that have stable trends as investors who invested in these segments could earnings that may be considered important in terms of a global economic crisis. In early 2010, the major stock exchanges across Europe and the U.S. show signs of recovery, the New York Stock Exchange in early April 2010 showed even an increase that brought significant gains on certain segments of this market.

With all these signs Bucharest Stock Exchange has oscillating trend on average maintain neither increase nor decrease, for e.g. a week of indices increases, the decrease corresponds to a week or increases are quite small. However BSE can be seen as positive developments and investment in IF, the actions of the banks or in shares of pharmaceutical companies can bring in the first two quarters of significant gains in 2010.

EURO – CHALLENGES AND PERSPECTIVES FOR ROMANIA

Sandu Carmen

„Al. I. Cuza” University of Iași

Faculty of Economics and Business Administration

The process of preparation and adoption of the European single currency is one of the most important challenges that Romania has to face in the first decade as a full time member of the European Union. This process will test both the political and the administrative capacity, requiring very clear programs for the adaptation of European regulations and directives that will ensure real and nominal convergence. This process will surely prove to be a difficult one and it will bring a high degree of pressure upon the economic system in general. The worldwide financial crisis is making the process of single European currency adoption even more difficult for Romania. Although its effects are not directly felt in Romania, the disorder created within international markets can easily transform the management of economic and currency politics into an insecure and extremely difficult task.

Keywords: exchange rate, euro, Economic and Monetary Union, Euro Zone, convergence criteria, ERM II, NBR, ECB, financial crisis

Cod JEL: F15, F36

1. Introduction

More than 10 years ago, in May 1998, EU leaders took a historic decision, to secure an irrevocable economic integration in the Community: introduction, starting with the 1st of January, 1999, of the European single currency - euro. Today, the euro is the currency used daily by over 300 million citizens in 15 countries constituting the euro area (Austria, Belgium, Cyprus, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Malta, Netherlands, Portugal, Slovenia, Spain) and enrolled in a fierce competition with the U.S. dollar to gain supremacy in international financial markets.

The accession to the euro area will represent a second step of great importance for Romania, after the accession in the EU at January 1st 2007. The period 2007-2014 (2015) of preparation for the euro adoption represents a great opportunity to continue the reforms and reduce economic disparities, maintaining in the same time the macroeconomic equilibrium.

If the accession to the euro area is itself a strategic objective of great importance, the schedule for euro adoption represents a timing optimization problem in which the speed should be dictated by a costs-benefits analysis with the following restrictions: the fulfillment on sustainable bases of the Maastricht criteria, the accomplishment of a satisfactory level of real convergence and reducing the participation in ERM II at the compulsory period of two years.

The benefit of a country's accession to a monetary union is the enhancement of foreign trade, which then leads to a faster economic growth. Equally noteworthy are the positive effects resulting from an increased financial discipline, the significantly improved access to the capital and the stability offered by the capital market forming at a union level.

The crisis affecting at this moment the international financial system introduces an additional factor of uncertainty and if prolonged, it may complicate the process of adopting the euro in Romania. On one hand, the management of the real and nominal convergence process becomes more difficult; on the other hand, the current crisis may prove to be the most serious test for the European financial system and its currency, the euro.

In the following I intend to summarize and make some comments on the issues major process-related training to adopt the euro, on the timing of implementation and impact of the euro on the Romanian economy.

2. The strategy of transition to the single European currency

It is my opinion that before engaging in any discussion on the future adoption euro by our country, a strategy should be elaborated in order to identify the requirements for the Romanian economy to fully benefit from the adoption euro, the succession of measures to be taken in ensuring the fulfilment of these requirements and their implementation calendar.

The measures ensuring the fulfilment of nominal convergence criteria (Maastricht criteria) will be thoroughly examined and the adequate economic policies for the transition period through ERM2 will be established. The analysis of other countries' experience in passing through the process of adopting the euro currency or which are about to do so would be particularly useful to us, keeping however in mind the unique situation of each country.

After the adhesion to the European Union, the next strategic target for the Romanian authorities concerning the macroeconomic domain is related to the adoption of the euro currency. Estimated for the 1st of January 2015, the Euro Zone entry implies meeting some performance requirements concerning the macroeconomic indicators (nominal convergence stipulated in the Treaty of Maastricht). Although in order to fulfil nominal convergence it is necessary to observe 5 criteria, the macroeconomic theory shows that a consolidation of the disinflationary process would result in a high sustainability of the macroeconomic equilibrium, especially in Romania's case, where observing the convergence criteria concerning inflation rate and budget deficit remains one of the delicate problems at the economic level.

Table no.1: The Maastricht criteria at the level of Romania

(Nominal convergence indicators)

<i>Nominal convergence indicators</i>	<i>Maastricht criteria</i>	<i>Romania 2009</i>
Inflation rate (percent, annual average)	<1.5 pp above the average of the most performant 3 EU members	5,6
Consolidated budget deficit (percent of GDP)	below 3%	7,9
Debt (percent of GDP)	below 60%	21,0
Exchange rate (RON/EUR) (maximum procentual appreciation/depreciation compared to the average over 2 years)	+/- 15%	+1,6/-18,2
Long-term interest rates (percent per year)	<2 pp above the average of the most performant 3 EU members	9,7

Source: Eurostat, BNR (National Bank of Romania)

One of the superior forms of European integration and at the same time the most ambitious and risky project of European construction is the Economic and Monetary Union. Accordingly, any state adhering to the European Union intends to take part in this project sooner or later. On January 1st 2007, Romania and Bulgaria, the last two members adhering to the European Union, set themselves the same objective. When becoming an EMU member, Romania will replace the national currency – leu with the european single currency; but until reaching this advanced stage, it will have to meet all the criteria required by the adhesion to the Eurozone.

Adopting the euro implies participating to the Exchange Rate Mechanism II for at least two years, during which the national currency would have to show a high degree of stability as opposed to the euro. In establishing a coherent calendar for the adoption of the single currency, two fundamental decisions must be taken concerning the entry moment to ERM II and the duration of participation to this mechanism.

The European Central Bank recommends that acceding to ERM II mechanism should take place after the adhesion of the concerned countries to the European Union and that the duration of participation should not exceed the compulsory period of 2 years, which means that the country is to have a consolidated macroeconomic stability at the moment of accession. Furthermore, it is essential to sustainably fulfil the nominal convergence criteria.

As far as Romania is concerned, adopting the euro currency implies three stages. During the first stage – which precedes the entry to ERM II mechanism – it is necessary to consolidate disinflation, develop domestic financial market on a long term and achieve convergence of interest rates, to relatively stabilize leu exchange rate close to the long term equilibrium level and especially to deepen structural reforms.

The second stage – entering the ERM II mechanism – is estimated by BNR to take place in 2013. The moment has been chosen considering the need of fulfilling the nominal convergence criteria simultaneously with achieving significant progress in the real convergence process (convergence of GDP /inhabitant to purchasing power parity, convergence of income, productivity and socio-educational standards etc).

The last stage – Euro Zone entry – will take place around 2015. From that moment, Romania will take part in the coordination mechanisms of Euro Zone economic policies, having to observe the stipulations in the Stability and Growth Pact (mainly concerning public finance). Then, Romania will also adopt the common monetary policy of the European Central Bank, it will have to possess mechanisms of automatic economic balance (the flexibility of prices and salaries, a high degree of financial intermediation, business cycle synchronisation, labour market flexibility, perfect capital mobilization etc) and to increase the speed of fiscal policy reaction in order to absorb the symmetrical/asymmetrical shocks that domestic economy will have to face.

Adopting the euro currency in 2015 should represent one of the strategic objectives for Romania. Observing the stipulations in the Convergence Programme concerning the Euro Zone entry would represent a possible “reconciliation” between achieving nominal and real convergence¹⁰¹⁷. However, adopting the euro would become a more and more unlikely objective, unless Romania proceeds to a consolidation of the disinflationary process, an increase in Romanian export competitiveness, predictability and performance of fiscal policy on a medium term, a higher absorption of European funding and a consolidation of structural reforms.

There are certain factors that could optimize the Euro Zone entry. Meeting nominal convergence criteria plays an important part, but those factors which facilitate a solid performance in the Monetary Union are even more important. They include flexibility in product/service markets and markets of factors of production, consolidation of pension system and social security reforms and a fiscal policy focused on the mobility of factors of production under unique market conditions, including labour force migration.

In order to fulfil the criteria of real and nominal convergence it is necessary to continue making efforts in:

- consolidating a decreased inflation;
- forming long term domestic capital markets and achieving convergence of interest rates with those stipulated by the Treaty. On the grounds of capital account

¹⁰¹⁷ The Maastricht Treaty does not mention explicit criteria for real convergence, which involves reducing disparities between the countries on the price level and productivity, involving increase revenue in developing countries rising to the existing level in developed countries.

liberalization and of emergence of private pension funds, it is necessary to develop government bond market;

- achieving a relative stability of the leu exchange rate on the market. A higher degree of exchange rate stability can be reached by increasing credibility of the convergence process and by stabilizing prognosis regarding long term exchange rate.

In 2008, worldwide economy entered the most severe crisis since the Great Depression of the 1930's. The high degree of synchronization of the crisis affecting both developed and emergent countries proved the extent of interdependency between world economies. Beginning with the last trimester of 2008, the financial crisis spread quickly in Romania as well, in the context of a world economy evermore globalized and more precisely, in the context of a Romanian economy strongly related to the European one, making any negative external shock spread rapidly at an internal level.

During the first nine months of 2009, the evolution of the real economy was severely damaged by the economic and financial crisis, given the fact that we are a relatively small economy with a high degree of openness. Consequently, while in the IVth trimester of 2008, GDP increased by only 2,9% since the same period in 2007, during the Ist trimester of 2009, gross domestic product – in real terms, gross series – decreased by 6,2% from the Ist trimester of 2008, and this tendency continued to increase in trimesters II and III when the economy contracted 8,7% and 7,1% respectively.

Comparing with other EU member countries, analysts estimate Euro Zone entry date to 2015 for Romania and Bulgaria, 2013 for Lithuania and Poland and 2014 for the Czech Republic and Hungary. However, the estimates for these countries are not definite, since the adoption of euro could be either advanced or delayed. Euro Zone countries would want to be certain that they will not let “another Greece” join the club. According to analysts, only Estonia is likely to adhere to the Euro Zone in 2011. All the possible delays for the countries aspiring to the Euro area entry are caused by the financial turbulence in Greece.

With the opportunity of entering the Euro zone after over a decade of getting used to the single currency, ten European Union member states, including Romania, will have much to learn from the experience up to this point. But for this, economic reform measures will have to be taken early in order to ensure the achievement of a long term level of sustainable real convergence without which the path towards the euro could turn into a relatively bumpy road.

While some neighboring countries wish to rapidly benefit from the euro, National Bank of Romania representatives state that we would be unable to precipitate the adoption of the single currency. Some banking specialists claim that the transition to the euro would bring us more benefits than losses. For example, we would pay much smaller interests for loans and significantly smaller commissions on money transfers operated through banks. Many analysts think that the adhesion to the Eurozone should be accelerated. The real economy has “de facto” adopted the single currency up to 80%, given the fact that prices for many products and services are listed in euro and over half of the bank loans are in foreign currency and the corresponding interests are up to three times smaller than those in leu. A Deutsche Bank report also indicates that for some Eastern Europe countries, a more rapid euro adoption would mean certain advantages, given the actual problems of financial stability, thus eliminating the exchange rate risk. At the same time, both the government and the population would gain access to cheaper loans from a more liquid market.

3. Effects of euro adoption

In the first decade following the introduction of the single currency, the Eurozone enjoyed a significant decrease in inflation and long term interest rates but also an increase in employment and consequently a substantial correction of budgetary imbalances. At the same time, however, economy registered growth levels comparable to the decade preceding euro adoption, gross

domestic product per capita in the Eurozone still reaching only 70% of the one registered in the United States. The introduction of the single currency is obviously not the only one accountable for these facts which are also the consequence of a wide range of internal factors (community policies, including those introduced by the Economic Stability and Growth Pact, Lisbon Strategy but also individual policies and developments of member state economies) and external factors (deepened economic globalization, accentuated financial market integration).

Some positive effects of the introduction of the single currency which are undoubtedly found at several levels are particularly noteworthy and worth analyzing.

Firstly, the introduction of euro played a particularly important part in insuring macroeconomic stability. Founded with the primary objective of maintaining price stability in the Euro zone (defined through maintaining inflation rate under but close 2% on a medium term), the European Central Bank firmly implemented the single monetary policy leading to a consolidation of euro's credibility, to a long term price anchoring and to creating premises for sustainable economic growth.

Concurrently, introducing the single currency encouraged a decrease in financing costs both for private and governmental economic actors in the states that adopted it. Last but not least, euro improved Eurozone endurance to international financial turbulence, such as, for example, the "dot-com" crisis, the problems following 9/11 terrorist attacks and, more recently, in the context of the actual international financial crisis.

Secondly, euro contributed to intensifying economic and financial integration in the Euro zone. Commercial trade between Eurozone states now forms a third of the GDP corresponding to the Euro zone, against a quarter ten years ago, mostly due to the elimination of exchange rate volatility.

Moreover, foreign direct investment between participating states now reach a third of the Euro zone GDP, against approximately 20% ten years ago, up to two thirds of this increase being directly put on the account of the introduction of the single currency. These developments have, in turn, attracted many positive effects such as intensified competition and efficiency. As far as financial markets are concerned, the adoption of euro lead to a full integration of interbank money markets, as well as a deeper integration in securities market (mainly stocks and bonds). However, retail financial markets still remain fragmented mainly because of legislative and linguistic barriers.

Thirdly, the single European currency strengthened European identity worldwide. The euro became the second international currency and is used in 37% of the international currency exchange, constituting approximately one quarter of the international reserves, according to available statistics (many Asian countries do not publish their data on currency reserves). Keeping in mind the prospective broadening of the Eurozone through the adoption of the single currency by other ten states in the European Union, in the following years, euro will become the currency of the widest economic space in the world. But beyond its tangible effects, euro has become a symbol of united Europe with more than half of Eurozone citizens associating the European Union to the euro.

The risks generated by the introduction of the single currency in Romania are relatively few but they have a direct impact on everyday life and on the financial system. The most popular risk is related to the generalized price increase which would be due to the population's lack of familiarity with the new prices shown in the single currency and to the speculations regarding approximation errors.

Another risk related to the transition of the Romanian economy to the euro, as it is for all countries which make this step towards integration in the Eurozone, is establishing the proper quantities of short term liquidities in euro at the banking system level, considering a demand in cash of the single currency.

Another disadvantage deriving from the participation to the Monetary Union is losing the possibility to choose inflation rate and losing exchange rate as an instrument in eliminating macroeconomic imbalances.

At the same time, it should be mentioned that changing the national currency in favor of the single currency would mean losing control and power of decision concerning monetary problems and flexibility in taking decisions which would protect Romanian economy from external shocks. Finally, considering both the benefits and the risks regarding the transition of the Romanian economy to the single European currency, we can undoubtedly assert that the direction towards integrating the European Economic and Monetary Union, chosen by the Romanian political class is the right one and that on a medium and long term, this will contribute to obtaining certain advantages for the entire Romanian society.

4. Conclusions

Maintaining the credibility of the single European currency is a particularly complex process with a continuous development, which needs much more than a good functioning of monetary mechanisms inside the Eurozone.

It is not accidentally that the three phase integration process aims at constituting the “Economic and Monetary Union”. The two components are mutually conditioned: the effective implementation of economic policies and obtaining sustainable economic growth essentially depend on euro stability and credibility; to the same extent, maintaining inflation in the Euro area at a minimum level is conditioned by the existence of a coherent mix of economic policies which would facilitate reaching ECB primary objective. This last correlation is all the more difficult to optimize in practice as ECB single monetary policy coexists with fiscal, income and decentralized structural policies of the member states.

The current international financial crisis could also have negative effects upon the exchange rate, which is significant in terms of the convergence criteria, to have access to the Euro area. And from this perspective, the Romanian authorities consider the exchange rate to be essential in adopting the single currency. However, some analysts on financial markets have calculated that the rate could record huge fluctuations that might come into conflict with applications for convergence to the Euro area.

Faculty of Science*

This paper aims to examine the correlation between average interest rate and non-performing loans in the Romanian banking system during 2006-February 2010. We based our approach on the Pearson correlation coefficient and we realized an empirical study, which demonstrates how these relevant banking elements are connected. Also, the result of this research suggests that there are other indirect channels which affect the non-performing loans.

Key Words: Pearson correlation coefficient, Non-performing loans, Average interest rate, Credit-risk provisions.

JEL Codes: G21, E22, D63.

1. Introduction

Romania was affected by the deteriorating of the external economic environment, associated with the international financial crisis. Unfortunately, since 2007, we frequently use and hear the notion of financial crisis and the various causal factors at the heart of the crisis. There are in the specialized literature multiple trials to explain the elements contributing to the deterioration of the economic conditions, in their acceptance of the premises of the crisis.

We remark the major vulnerability of the banking domain, derived from its key position in the financial system. The loan portfolio quality deteriorated during the past periods and the bank reported higher levels of overdue and doubtful loans. We attend to a worsening of the payment behaviour of the banking borrowers. Romania is in a particular situation regarding the banking loans reporting. The national reporting standards impose higher coverage by provisions of bad loans in the annual financial reporting statement of the credit institutions from Romania than European requirements.

Based on these clues, the paper identifies the worsening of the banking loan portfolio and presents this deterioration like a matter of concern. An empirical study is included to demonstrate how the average interest rate and non-performing rate are connected. We develop a research hypothesis Pearson's correlation coefficient and we study the situation of the Romanian banking system during 2006-February 2010.

2. Theoretical background

In Romania, the non-performing loans¹⁰¹⁸ reveal past due amounted to 49.101,60 Bn lei in February 2010, and were up from 4.879,70 Bn lei in January 2006. The first variable of our study is the average interest rate. According to the National Bank of Romania's publications¹⁰¹⁹, starting with January 2007, average interest rates on deposits and loans and average interest rates on new business are calculated based on the provisions of National Bank of Romania Norms No.

¹⁰¹⁸ National Bank of Romania, *Monthly Bulletins*, February 2010.

¹⁰¹⁹ National Bank of Romania, *Monthly Bulletins*, 2006-February 2010.

14/2006¹⁰²⁰ concerning the statistics of interest rates applied by credit institutions, transposing the provisions of Regulation ECB/2001/18 concerning statistics on interest rates applied by monetary financial institutions to deposits and loans vis-à-vis households and non-financial corporations. Average interest rates are calculated as an arithmetic mean of annualized agreed rates weighted by the outstanding amounts of loans/deposits at the end of the reported month or by the extended/taken amounts during the reported month in relation to new business. The annualized agreed rate is the interest rate agreed between the credit institution and the customer for a deposit or loan, converted to an annual basis and quoted in percentages per annum. According to the provisions of the above-mentioned Norms, average interest rates are determined for the institutional sectors “Non-financial Corporations” and “Households” as well as for the following balance sheet items: loans (total), bank overdrafts, loans for house purchases, consumer loans, loans for other purposes (including loans for business consolidation extended to freelancers and household associations), overnight deposits, deposits redeemable at notice, deposits with agreed maturity and repos.

Regarding to the second variable of our research, we underline that Romania has a primary regulatory framework governing loan classification and provisioning since 2002¹⁰²¹ and multiple amendments. Any credit institutions have to classify their loans in one of the following categories: Standard, Watch, Substandard, Doubtful, Loss. In 2009 National Bank of Romania issued a new regulation¹⁰²², which established the more flexible criteria for loan classification and provisioning. According to this settlement, the collateral relating to exposures representing the principal of loans/investments classified under “loss”, where the debt service outstanding exceeds 90 days and/or where legal proceedings were taken against the operation or the debtor, shall be adjusted by applying the coefficients set by the lender for each type/case. The level of coefficients may not be higher than 0.25. The lender must have the laying-out documents for setting the level of coefficients laid down in the regulation. In accordance with the new regulation, the collateral relating to exposures representing the current/outstanding interest on the above-mentioned loans/investments shall not be taken into consideration, and the coefficient applied to the collateral amount shall be equal to zero. The amendment will translate into lower provisions for such assets, as the surplus is to be recorded under income, thus benefiting the health of financial and prudential indicators¹⁰²³.

The role of the interest rate in the banks is recognized by many authors. The values of assets and liabilities of financial institutions are considered subject to fluctuations in interest rate by Cox and Prasad¹⁰²⁴. They studied the differential impact in interest rate changes between assets and liabilities which is referred to, in banking, as interest rate risk. Of all threats to bank competitiveness this risk dwarfs all others. Banks traditionally have dealt with interest rate risk by restructuring their loan portfolios. The authors developed a model to measure interest rate risk, called the Degree of Interest Rate Sensitivity (DIRS), and demonstrated its effectiveness for banks to compete. The others authors¹⁰²⁵ examine the interest rate risk management (IRRM) practices of UK-listed companies. In particular, they examined the significance of interest rate

¹⁰²⁰ Published in Official Gazette of Romania no. 679/2006.

¹⁰²¹ Regulation no. 5/2002 issued by the National Bank of Romania, regarding the classification of loans and investments, as well as establishment, adjustment and use of credit-risk provisions, published in Official Gazette of Romania no. 626/2002

¹⁰²² Regulation no. 3/2009 issued by the National Bank of Romania, published in Official Gazette of Romania no. 626/2009

¹⁰²³ National Bank of Romania, *Financial Stability Report*, 2009, p. 33

¹⁰²⁴ Cox, R.A.K., Prasad, R.M. (1995). Bank competitiveness in the face of interest rate risk, *Competitiveness Review: An International Business Journal incorporating Journal of Global Competitiveness*, Vol. 5, Issue 2, pp. 84-89

¹⁰²⁵ Dhanani, A., Fifield, S, Helliard, C. and Stevenson, L. (2008). The management of interest rate risk: evidence from UK companies, *Journal of Applied Accounting Research*, Vol. 9, Issue 1, pp. 52-70.

risk (IRR) to these companies as well as the risk management practices adopted, including: the methods used to assess the level of IRR and the types of interest rate forecasts used in the process; derivatives activity; and corporate governance, reporting and control. The results of this research suggest that IRR is important to UK companies and that their IRR hedging strategies are geared towards managing shareholder considerations and protecting banking covenants and corporate credit ratings.

We identify the studies that seek to explain the evolution of the non-performing loans in the banking industries. For example, Hall¹⁰²⁶ presented his opinion about the truth in the scale of the Japanese bank's bad debt and tried to answer to the question: if the situation manageable? The author explained a concept of "accounting forbearance", which is used to mask the true level of the banks' bad debts. The banking industry's ability to handle the continuing bad debt problem, in the face of a significant impairment of economic capital and the market's relentless drive for full disclosure and transparency, also is assessed.

The others authors¹⁰²⁷ examined the factors which affect loss provision for loans and investment in Murabaha, Musharka, and Mudarabah for banks in the Gulf Cooperation Council (GCC) region. The effect of prior period earnings, legal and statutory reserves, size of the bank, level of debt, and loan and investment to deposit ratio on the loss provisions of banks are examined for the period 2000-2003.

In 2007, Bandyopadhyay, Chherawala and Saha¹⁰²⁸ empirically calibrated the default and asset correlation for large companies in India and elaborate its implications for credit risk capital estimation for a bank.

3. Empirical findings and interpretations

We studied the correlation between average interest rate and non-performing rate, based on the Pearson correlation coefficient.

$$p = \frac{n(\sum XY) - (\sum X)(\sum Y)}{\sqrt{[n\sum X^2 - (\sum X)^2][n\sum Y^2 - (\sum Y)^2]}} \quad (1)$$

It indicates the extent of relationship by a number between 1.00 and -1.00. The correlation is computed from pairs of scores for each individual in the sample; each individual has a pair of scores, one on each of the two variables on which the correlation is being computed. A correlation of one indicates a perfect relationship such that if we know that the individual has the highest score on one variable, we also know she has the highest score on the other. With a negative correlation, they track one another inversely. A correlation of less than one, either positive or negative, indicates that each member of a pair of scores attracts the other less than perfectly so that the highest score on one variable in a positive correlation might be accompanied by a medium high score on the other variable. The fact that the relationship exists as shown by a correlation does not allow us to infer that the relationship is causal. Often the relationship is the result of a third variable or a combination of other variables. Regardless of whether a relationship is causal, a correlation allows prediction; thus such relationships are extremely useful. An extensive body of literature describes predictors of various kinds: to enhance learning conditions,

to increase the effectiveness of teaching, to predict the stock market, to forecast college success. Unless the correlation is perfect, however, the predicted value is always less extreme - that is, closer to its mean - than the value from which it was predicted (Kratwohl, 1998). Our study is based on the real data, extracted from the annual reports published by the National Bank of Romania and the Monthly Bulletins from the mentioned period. We obtain in the case of the active banks from Romania, the following results for the Pearson correlation coefficient between average interest rate and non-performing rate.

Table no. 1 – The Pearson correlation coefficient between average interest rate and non-performing rate from Romania

<i>Year</i>	<i>The Pearson correlation coefficient</i>
2006	-0.76
2007	-0.71
2008	0.97
2009	-0.95
2010	-1

Figure no. 1 - Correlation coefficient between average interest rate and non-performing loans at the level of Romanian banking system during 2006-January 2010

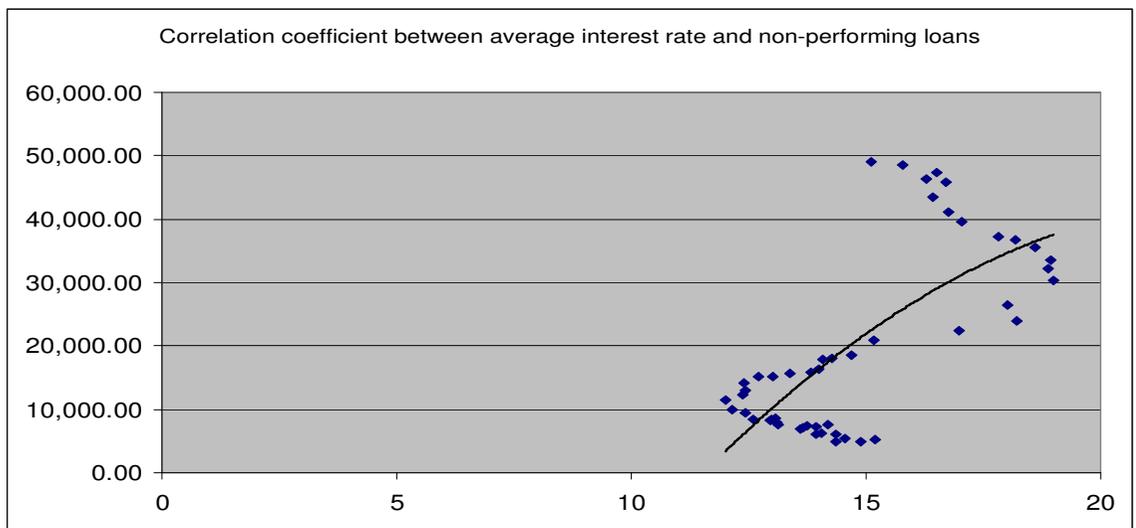

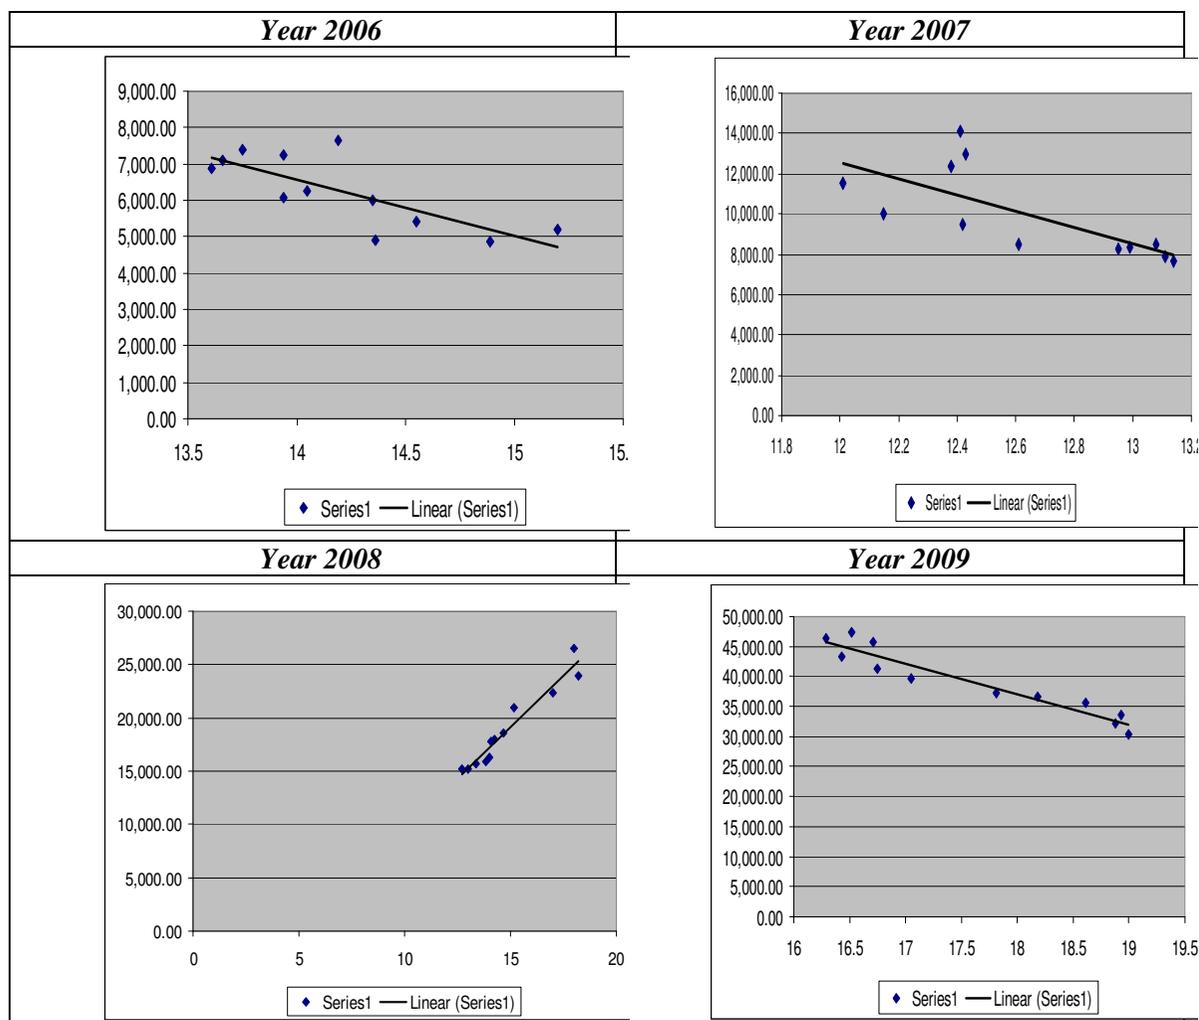

Figure no. 2 – Annual Correlation coefficient between average interest rate and non-performing loans at the level of Romanian banking system

4. Conclusions

In 2006 and 2007, the values of the Pearson coefficient correlation show a connection between variables. We suggest that there is an inverse correlation between the average interest active rate (cause variable) and the value of the non-performing loans (effect variable). In these conditions, we identify the others conditions that affect the debt service of the borrowers. The lack of banking settlements and regulation, in the mentioned period the primary banking legislation was improper¹⁰²⁹. Since 1st of January 2007, the new banking legislation¹⁰³⁰ lays down the principles concerning the taking up and pursuit of the business of credit institutions and financial investment companies within Romania's territory and their prudential supervision, as well as supervision of payment systems and financial instruments settlement systems.

During 2008-2010 (February), the different values of the Pearson correlation coefficient were obtained. The values very close to +/-1 show a direct and strong connection between variables.

¹⁰²⁹ Law no. 58/1998 on the banking activity, republished in Official Gazette of Romania no. 78/2005, as subsequently amended and supplemented

¹⁰³⁰ Emergency Ordinance no. 99/2006 on Credit Institutions and Capital Adequacy Published in Official Gazette of Romania, no. 1027/2006

We also suggest that there is an inverse correlation between variables, explained by the following causes: the fall of the prices of the loan collaterals, especially real estate; inflation pressure that contribute to the growing of the non-performing loans; unemployment and economic contraction.

FINANCIAL PROBLEMS IN A.D. XENOPOL'S WORK

Ștefănescu Florica

Universitatea din Oradea, Facultatea de Științe Socio-Umane

Many of Xenopol's studies, articles and economic papers fully prove his permanent interest in this area, so important for the life of a country.. This fact urged him to look into the economic state of his people, to search for its causes and formulate solutions, some of them among the most realistic ones, for its improvement, for the reduction of the gap that separated us from the most economically developed countries

Key words: taxes, budget, national wealth, consumption, public debt, money, banks

Classification JEL: B19, G17,G21

While the foreign trade of a country is, in Xenopol's opinion "the most reliable mirror of its economic situation"¹⁰³¹, "the finances of a country are undoubtedly the most visible sign of the direction of its government. These mirror especially the competence or the incapacity of its rulers."¹⁰³² Xenopol made this statement in the Preface to "Situația financiară a României sub guvernul liberal în 1887", a paper where we encounter numerous economic arguments by means of which he intended to underline the qualities of the Liberal government in ruling the country's finances. Even if this paper, and many others, contains numerous supporting judgments as well as some erroneous assessments like those concerning the fact that the Romanian is the least tax-burdened among Europeans, that Romania's public debt is the smallest on the continent, that bimetallism is preferable to monometallism, we believe that it was not his desire to justify liberal politics which represented the main cause of this situation, but the compatibility of his economic theories with the economic policy of the Liberals. We also believe that this is the reason for Xenopol's political joining the Liberal Party – from this position he was able to influence decision making and put into practice some of his planned solutions.

In this paper he tackled the budget's problems, those of the public debt and the gold's overprice. Other financial-banking aspects such as: duties and taxes, loans, banks, usury were developed in other studies and articles such as: "The Beer Industry and Taxation", "The Rural Bank", "Misunderstood Demagogy", etc.

Just like in our days, in Xenopol's time the state's income came mainly from duties and taxes, a fact that sustained his argument that "where the private individual (as tax-payer – our note) is rich, the country is rich, and where the country is rich, the state is rich".¹⁰³³ The state should have been rich because, as noted by Xenopol, the country needed roads, ports, railways, a strong army and many others for which the budgetary means had to be enhanced. But Romania's budget in 1880 was barely of 100 millions, to which one could add approximately 20 millions representing communal budgets, which proved to be far less than the country's need, thus one would often sell the state's estate, mortgage bonds, treasury bills.¹⁰³⁴

Xenopol's conclusion was that taxes were necessary, that it would be even dangerous "for the consolidation of the idea of state to undo this connection between the individual and the political body", that is the tax.¹⁰³⁵ Due to this reason, he considered humbug the proposals of Carp's government (a conservative one) to exempt from taxation the farmers who owned less than 6 ha

of land. Since very many farmers were in this situation, the state would have been deprived of an income of approximately 10 millions lei that couldn't have been replaced otherwise, believed Xenopol. Besides that, such a measure would have opened Pandora's Box; the farmers would have claimed other exemptions from their obligations toward the state, and the idea of duty would have diminished significantly. On the other hand, the farmers' exemption from a few leis a year representing land taxation wouldn't have improved too much their fate. Thus, according to Xenopol, what determined the conservatives to propose such a measure couldn't have been but their attempt "to cling by any means to the power they had no longer".¹⁰³⁶

In what a country's budget is concerned, especially that of Romania, Xenopol believed that it should be balanced, i.e. neither in a deficit which leads to public debt, neither in a surplus because in this situation on the one hand the government would be accused that it demands more than it needs, and on the other hand "the people seeing that its finances are so brilliant, would become lazy".¹⁰³⁷

Even if he did not give sufficient details and nuances regarding this problem of the budget, Xenopol understood very well that it cannot always be in a balance, that budgetary balance is just a tendency in its evolution. Thus he admitted that the country's budget was in a deficit between the years 1884/1885 and 1885/1886; but not because of the poor management or unsuitable measures taken by the liberal government, but because of the general crisis in Europe which affected our country, respectively due to the poor crops from some agricultural years.

With the obvious goal of proving the wise management of the finances by the liberals, Xenopol analyzed the way budgetary income can be increased, despite the reduction of taxes, or on the contrary, based on the increase of national wealth.

Thus he showed that in the period 1862-1886 the country budget grew up three times from 47 to 138 millions lei, proportionally with the increase in national wealth – expressed in the amount of foreign trade, an approximate and poor indicator but a necessary one when lacking more exact and relevant indicators – from 172 millions in 1862 to 515 millions in 1886. Xenopol's conclusion was that during all this time, especially in the 11 years of the liberal government (1877-1888), the taxes were reduced more than they were increased. We are speaking here about the tobacco duty, the licenses duty, the tax on salt, land taxation, individual tax or that on the means of communication; the railways fees were reduced, the state property was diminished by the distribution of farm land to newlywed couples or by selling land lots to the farmers and by the establishment of the Royal Demesne, so that the amount of all the reductions came to a total of 88 millions lei.

If despite these reductions, the state income continued to grow, it was all due, in Xenopol's opinion to a much better administration. Thus, the high priced leased tobacco was bringing the state only 8 millions in 1876, but in 1887, under State supervision, it was bringing an income of 20 millions lei; the railways which before 1877 consumed all they produced, as a consequence of the reduction of administration expenses and of the development of new lines brought to the country an income of 10.5 millions despite fee reduction.

Even if the state had increased its annual income by 28 millions lei by chasing in the taxes, by collecting a tax of 5% over wages and by supplementing the tax on alcohol, there were still "60 millions lei left by the government for the use of the tax-payers, from the revenue it had its right to cash in".¹⁰³⁸

As a consequence, concluded Xenopol, the increase of revenues is based on their right administration and on the growth of national income, the latter being supplemented among others, by the increase of indirect taxation, including monopolies, from 28 millions lei in 1876 to 66 millions lei in 1887, without a substantial growth in their taxes. The increase of about 40

¹⁰³⁸ Ibid. p. 217, (Our translation).

millions lei was due to the increase in consumption, therefore implicitly an increase of national wealth.

To show that Romania's population was no more burdened by taxes than the population of other countries, Xenopol made a comparative study between our country and several European countries similar to our own as surface and population, on the grounds that "the eagle doesn't resemble the frog"¹⁰³⁹, where he introduced two indicators: per capita taxation and per capita wealth.

Regarding the first indicator, with a 28 lei tax per capita (respectively only 19 lei per capita if one were to consider only the revenue from taxes), Romania was at the same level with Serbia but below the level of Denmark (37 lei per capita), that of Belgium (53 lei per capita) or Holland (62 lei per capita).¹⁰⁴⁰

Regarding wealth, with 100 lei per capita, Romania was at the same level with Italy, over the level of Serbia (50 lei per capita) but below the level of Belgium (527 lei per capita), of Holland (400 lei per capita) or Denmark (322 lei per capita).

Adding the two indicators, Xenopol reached the conclusion that the Serbian was 2.5 times more tax burdened than the Romanian as long as he paid 28 lei tax per year and traded for 50 leis, while the Romanian paid 19 lei and traded for 100 lei. More than the Romanian paid the Portuguese (1.5 times), the Italian and the French (2 times), and the Spaniard (3 times), and less than the Romanian paid the Belgian (4 times), the Dutch (3 times) and the Dane (2 times).¹⁰⁴¹

That the population of our country was not burdened by taxes was proved according to Xenopol by the ease with which these were perceived, forgetting that most of the farmers paid along the taxes owed to the state, a part of their crop to the land-owner, large interest for loans and they were further cheated by merchants, so their situation was the very one Xenopol himself described a few years later in "Starea economică a țaranului roman" (1903).

Another important aspect discussed by Xenopol regarding taxes and duties was represented by their functions, which, in his opinion, should not be reduced only to their fiscal function, but they should also have a contribution to encouraging the industry and even the hygiene state. For this it was necessary a differentiation among taxes and duties.

In the political context of the second half of the 19th century, Xenopol argued the fact that Romania couldn't afford applying protective duties at the border; in exchange it could give a series of facilities, deductions and exemptions from taxes, subsidies, loans with the purpose of encouraging and protecting some economic activities, especially industrial ones. There should be a similar differentiation of taxes, Xenopol argued, applied also to alcoholic beverages on grounds of health, hygiene with the purpose of protecting the population against the consumption of harmful drinks and for the stimulation of the consumption of beneficial drinks; all starting from the idea that "there is no such thing as a wise government which can kill its people because for the moment it can extract money from them by means of the poison it allows them to drink".¹⁰⁴²

In this respect, Xenopol makes an analysis in *Industria berei și impozitul* of the influence of taxation on the consumption of three alcoholic beverages: spirits, wine and beer, in our country and in other European countries; a relevant analysis, much appreciated in the newspapers of those days.¹⁰⁴³ He noticed that although beer contains much more nourishing substances than spirits or wine, thus being more useful, it contains less alcohol so it is less dangerous and, as opposed to

¹⁰³⁹ Ibid. p.221, (Our translation).

¹⁰⁴⁰ Xenopol mentions that in this estimation were not included the local taxes neither regarding our country nor the others— in our case the county and communal taxes).

¹⁰⁴¹ A.D. Xenopol, *Opere economice*, pp.219-220.

¹⁰⁴² A. D. Xenopol, V. C. Buțureanu, *Industria berei și impozitul*, I.V. Socec, București, 1895, p.18, (Our translation).

¹⁰⁴³ "Industria berii", an article signed "Nerva" in *Evenimentul*, IV, nr. 1590, from July 31, 1898, and nr. 1592 from August 2, 1898; the Xenopol-Buțureanu and Haret trial in *Ecoul Moldovei*, VI; Iași, 1896, nr. 19 from November 14, p.2.

spirits and wine it can hardly be forged; yet the tax on beer in our country of 40 lei per hectoliter was excessively large in comparison with other countries. The direct consequence of this situation was the fact that while beer consumption per capita in Romania was very low, of only 0.6 liters as compared to Holland – 50 liters or Belgium – 190 liters, the consumption of spirits per capita was among the highest, 4.56 liters compared to 4.20 l in Belgium, 3.50 l in Austria-Hungary, 1.04 l in Italy while only in Denmark, Germany, Switzerland and Holland was the consumption higher than in our country: between 4.58 and 8.25 l per capita. “In other words, our state protects the forgery of drinks, believes Xenopol, encouraging the spread of alcoholism and the population’s intoxication; whereas the only drink that has the most advantages and the least drawbacks is put on the black list, treated as a dangerous ingredient and hampered in its consumption through taxes three times excessive.”¹⁰⁴⁴

He also noted another fact, that spirits didn’t obey the law of demand’s flexibility, i.e. the rise in the price of this product as a follow-up of the increase of taxes didn’t limit the consumption. He found the explanation in the fact that any rise of taxes on spirits is compensated or even overrun by the cheapening of production costs as a consequence of the forgery of this product. The same thing is valid for wine too, even more so as the tax for this product was taken from the producer and not from the innkeeper, the one who forged the wine.

In these circumstances, Xenopol believed that the only way to protect the population against the poisons contained by “forged and unclean” drinks would have been the monopoly on alcohol which would have allowed state’s control over the alcohol production and the marketing of this product in closed bottles, therefore guaranteeing genuine drinks. Only then, a rise in price would have limited consumption, without causing state’s income to diminish, because although it would have sold less, it would have sold more expensively.

Convinced supporter of beer consumption, but also a member of Anti-alcohol League, Xenopol militated in favor of encouraging the beer industry, an agricultural industry, by reducing the taxes on this product, the existing one being considered irrational, unjust and harmful for the state. Irrational because it rose the price of beer, “so much that it transformed it into an ‘extra-luxury’ drink, turning people towards the consumption of spirits; unjust because it was settled arbitrarily: neither according to the alcohol concentration as was the case of spirits, neither according to the cultivated surface as was the case of plum brandy or wine; harmful because despite the high taxation it brought little revenue due to the low consumption. Thus, despite a population comparable in size to that of Belgium, where 10 million hectoliters of beer were consumed despite the low tax on beer (2.32 lei), the state would cash in almost 17 million lei a year in Romania due to the consumption of only 37.000 hectoliters; even in the case of a very high tax, the state would cash in only 1 million lei a year.”¹⁰⁴⁵

In opposition to M. C. Haretu, the author of *Degrevarea berei și monopolul alcoolului. Răspuns la ”Industria berei și impozitul lui Buțureanu și Xenopol”* (București, Editura Gobl, 1869), Xenopol adopted the theory of demand’s economy according to which the demand determines the production and since the tax is paid by the consumer, any rise of it would diminish the demand, limiting the production and the other way round. The exception to this rule is represented by forgeable drinks like spirits and wine, in the case of which the rise of the tax would lead not to an increase of the price but to the intensification of bootlegging and to the discovery of new methods of forgery meant to reduce the production costs, which in the end would threaten in an ever increasing degree the health of the population.¹⁰⁴⁶

An interesting and original proposition was formulated by Xenopol regarding the improvement of the farmers’ fate by including their debts generated by agricultural contracts in a more efficient and accessible taxation system. Xenopol harshly criticized the unbearable situation where the tax

¹⁰⁴⁴ A.D. Xenopol, V.C. Buțureanu, *Industria berei și impozitul*, pp.58-63, (Our translation).

¹⁰⁴⁵ *Ibid.*, p. 86.

¹⁰⁴⁶ The Xenopol-Buțureanu and Haret trial in *Ecoul Moldovei*, VI; Iași, 1896, nr. 19 from Nov. 14, p.2.

collectors, the mayors and the sub-prefects, being aware that the farmers could not pay their taxes, in order to ease their own job, would sell the entire village community to land-owners or land agents in exchange for the work to be carried out. This would happen because the farmers accepted this deal which not only paid their duty towards the state but sometimes gave them back some leftovers, yet this measure was profoundly unjust as long as the value of work was arbitrarily established, sometimes representing only half of its real value. In this situation not only was the farmer in a perpetual debt, sometimes for 4-5 years ahead because he couldn't discharge all his work obligations and because sometimes he would take loans from land-owners for current needs, but furthermore he didn't work his land and as a consequence of poor crops he would have to take further loans from the land-owner.

This state of facts could have ceased in Xenopol's view through the taking over by the state of the farmer's debts, through the release of "percentage carrying bonds to each land owner or land agent in accordance with the sums of money recorded in formal obligations".¹⁰⁴⁷ The state's compensation would have been realized through a special contribution of villagers, "compensation for debts". At that moment there appeared a difficulty regarding the taxation system itself: overall tax, easy to apply, would have been unfair because of the counties' debts, but also those of the farmers which were not the same and this would have meant that some of them would pay a part of somebody else's debt. Individual tax, on the other hand was impossible to apply. Thus Xenopol suggested a more equitable tax system, namely a type of taxation differentiated on counties, even on small rural districts or communes, all considering the number of inhabitants and the size of the debt. In fact, at the beginning of the 20th century, a series of judicial acts which were appreciated by Xenopol for their social impact would settle some aspects of the socio-economic field: the Law on individual tax, the Law on income taxation, the Law for the control of precious material objects, the Law for pawnshops, the Law for wine industry loans, the Law for the amendment of the Agricultural Loan – all of them replicated in their text concerning the parliamentary debates, along with the depositions, with the ministerial application instructions and a relevant commentary, in a volume edited by Benedict Voinescu, a volume on which Xenopol would present a report for the Romanian Academy in 1906.¹⁰⁴⁸

Regarding the public debt resulting from the loans contracted by the state, Xenopol believed that although it was rather high according to the state's budget, respectively of 13-30, it was at the same time also necessary considering its destination, which was mainly connected to direct or indirect production activities and in a less measure meant to cover the budgetary deficit.

The pages discussing the public debt make Xenopol a real master of numbers; yet they are not about a game of numbers, but about a serious analysis of the problem of public debt based on statistics data. He revealed the fact that although Romania's public debt increased during the liberal government with over 200 million lei compared to 1876, the year when the government changed, the annuity it had to pay remained almost the same; respectively it grew up with only 1 million lei because simultaneously with the rise in the government's credibility, the contracted loans were increasingly advantageous, therefore obtained at an ever lower interest rate.

For Xenopol the most important aspect was represented by the destination of the borrowed sums. In this respect he showed that the greater part was used to build railways, bridges, docks, military and weapon constructions, educational institutions.

"It is obvious that both the constructions and the railways are productive capitals", Xenopol said, thus "the railways are expensive for the state, but the profit for the country increases tenfold."¹⁰⁴⁹

He suggested the example of the railway that connected Fetești to the rest of the country and which had as a consequence the leasing of the real estates from Bărăgan that had not been valued until then, with prices five times bigger. But even the expenses for the army or education,

¹⁰⁴⁹ Id. "Situațiunea financiară a României sub guvernul liberal în 1887", p.231, (Our translation).

apparently unproductive, at a more careful analysis were proven to be indirectly productive. Thus Xenopol argued in favor of providing proper hygienic conditions both in barracks as well as in schools, so that the health of the young people would not be hampered. On the other hand, Xenopol reminded the reader of the negative effects of the neglect suffered by the French army before 1871, a fact that would cost France 10 millions in damages and two lost provinces, this underlining once more that these expenses are not really unproductive.

His deep love for the country that is visible in all his historical studies is to be met also in his economic studies, a fact that gives cohesion to all Xenopolian studies, regardless of the problem they debate.

BANKING PROBLEMS IN A.D. XENOPOL'S WORK

Ștefănescu Florica

Universitatea din Oradea, Facultatea de Științe Socio-Umane

Many of Xenopol's studies, articles and economic papers fully prove his permanent interest in this area, so important for the life of a country. By means of the measures suggested, he intended to give a new orientation to the economic development of agriculture, industry and commerce in the financial-banking field as a premise for the growth of the people's living standard, but also as a necessary condition for the political and cultural progress. In their essence, all these measures were intended to change the structure of Romania's economy.

Key words: taxes, budget, national wealth, consumption, public debt, money, banks

Classification JEL: B19, G17, G21

In what the overprice of gold is concerned that increased the annuity of the much debated public debt, it is analyzed and explained by Xenopol from the point of view of the causes that generated it. In his opinion these were both of a monetary as well as an economic nature.

The main monetary cause of gold's overprice was represented by the devaluation of silver, the latter being determined by a series of historical events combined with economic events. They represented the financial consequences of the French-German war, namely the obligation imposed on France to pay Germany 5 billions as war reparations. Germany used this sum, most of it in gold, to replace "its old currency the useless, effaced, silver dollars"¹⁰⁵⁰ with gold coins. Germany's devalued silver went to France or Belgium where it was transformed into coins of five silver francs. Being aware of the danger of being flooded with these coins, in 1873 France suggested to the other countries from the Latin monetary union established in 1865 (France, Italy, Belgium, Switzerland, all joined by Greece in 1868) for a first stage the restriction of the five francs coins battery, and later on the suspension of this coin battery, thus giving a strong blow to silver. Meanwhile, the discovery of a silver mine in the U.S.A. would enhance silver production with 2 million kilos a year, which would determine a supplementary devaluation of silver.

The final result of this series of events was according to Xenopol, the introduction of monometallism, joining England and Germany; later on it was introduced in the Latin union too. But Xenopol would prove using examples that this was only one of the causes of gold's overprice, but not the only one. He suggested an amendment to Gersham's law according to which the bad currency drives away the good currency. His amendment stated that the law was valid only when "the productive powers of a country are not capable of holding to the latter" (gold-our note).¹⁰⁵¹

How else could one explain the fact that in France for example, despite the circulation of both 4.5 billions in gold and of 3.5 billion silver francs at the same time, there was no overprice; while in Greece, a country from the Latin union, thus practicing a monetary policy similar to that of France, the gold overprice was at about 20-24% as a consequence of military spending caused in 1884 by the prospect of a war. Therefore, it was obvious that the economic cause used to accompany the monetary one in generating gold overprice; in other words, according to Xenopol: "gold is retained in those countries where it can be retained by the nation's productive powers and is driven away from those countries where such powers are not sufficient enough".¹⁰⁵²

¹⁰⁵⁰ A.D.Xenopol, "Situția financiară a României sub guvernul liberal în 1887", p. 233, (Our translation).

¹⁰⁵¹ Id., (1967) *Opere economice*, Ed. Academiei Republicii Socialiste România, p. 235, (Our translation).

¹⁰⁵² Ibid., p. 236, (Our translation).

This fact was visible in our country too, because each time the export grew in size, the gold's overprice dropped, but when the settling day arrived for the rent bonds or the land loans bonds, it rose again.

Xenopol believed he was right when he concluded that in our country the overprice was not due to silver circulation, but to the incapacity to hold on to gold, considering that the expenses were bigger than the production, our country being compelled to give away to foreign countries more gold values each year than it received back. Due to this aspect we did not have overprice until 1876, as long as the balance of trade was on surplus; the overprice appeared and held constant with an unfavorable balance of values, encouraged by the conditions of the Commercial Agreement with Austria-Hungary.

Xenopol's theory regarding the causes of gold's overprice was opposed to those who believed that the overprice was the result of the monetary policy of the liberal government which introduced the silver standard to replace the gold one on the occasion of the rubles' demonetization, of the foundation of the National Bank, of the issuing of the 30 million treasury notes and of some excessive operations of title loans (Lombard loans). Xenopol maintained that if this would have been the true cause of the overprice, then it would be easily removed by introducing the gold standard. But such a measure would have caused all the gold money to disappear from the country in a short interval of time, first of all in order to pay for the differences in the values' balance. This fact, showed Xenopol, would have also happened in the case of the issuing a large quantity of golden coins. Therefore he endorsed the maintenance of bimetallism in our country, because this would keep the coins inside the country, even if they were silver ones; and he also supported abandoning monometallism in Europe because in his opinion this would be the culprit for the gold's overprice. As underlined by G. Gane too, this idea, although a mistaken one, was quite widespread in Europe in the second half of the 19th century.¹⁰⁵³ Yet meanwhile Xenopol argued in favor of the improvement of our economic state, which would make the country keep the gold and thus diminish or even remove the gold's overprice.

Considering that money is "that special nerve of all things" always having "the strongest influence on the evolution of all business"¹⁰⁵⁴ and believing that "money isn't made but through work, and the work should reflect the degree of civilization that you want to represent"¹⁰⁵⁵, Xenopol gave a particular attention in his writings to the problems represented by loans, usury, banks and the monetary system. The first emissions of coins were made in Walachia during the reign of Vladislav I (1364-1377); in Moldavia during the reign of Petru Mușat (1375-1391); in Transylvania during the reign of Ioan Zapolya (1510-1540). The coin that was used in Walachia and Moldavia in the second half of the 17th century and in the first half of the 18th century was the "leu", a species of old dollar, a coin issued in the Netherlands, widely circulated in Central Europe. In our country the leu had Turkish monetary submultiples in Romanian terminology; 1 leu equaled 40 pennies, and a penny equaled 30 coins ("bani"). As a follow-up of the amassing money, the old leu disappeared from circulation, yet holding its status as calculation currency.¹⁰⁵⁶ For a long time a real monetary chaos ruled in the Romanian principalities, characterized by the usage of 70 foreign currencies, most of them effaced, worn out, pierced, without a regular currency exchange rate. They also were part of the mixture between the commercial capital with the usurious one in the usury houses, a fact that created a great confusion and caused great damages to producers. The Constitutional Regulations sanctioned this system where, next to a

fictitious monetary standard represented by the calculation leu or reckoning, there were used many foreign coins. Alexandru Ioan Cuza's attempt to create a national currency "the romanian", made of silver using the French model failed because "the issuing of coins was considered by the Turks as an attribute of sovereignty"¹⁰⁵⁷, but also due to the diplomatic troubles it would have caused, combined with the lack of financial resources.

Only in April 1897, through the Law for the establishment of a new monetary system and for the making of national coins, the old nominal leu was replaced with a real currency, also called leu but guaranteed by gold protection. This law expressed the Romanian monetary doctrine and had a political importance since it expressed the right of the principalities to their own monetary system, and an economic one since it assured a regular monetary circulation. Between 1867-1873 there have been introduced into circulation first of all the copper coin, then the silver one, and when they were about to introduce the gold coin the Russian-Romanian-Turkish war broke out. On a monetary level, this event had two major effects: the issuing of mortgage bonds, paper money and that of receiving in Romania rubles at a higher exchange rate than their real value, i.e. of 4 lei per ruble rather than 3.70 lei.¹⁰⁵⁸

Harshly criticized by the conservatives, the measure of issuing 30 million mortgage bonds was taken by the liberal government in the context of the budgetary deficits inherited from the conservative government and in the context of the impossibility to negotiate a loan while at war with the Turks. The operation proved to be a success, the bonds holding their exchange rate ad pari until they were withdrawn by the National Bank founded on the 1st of December 1880, without causing the state to suffer any loss. In addition, this operation made Romania be acquainted with paper money, get used to fiduciary circulation, thus being able to exit "the savage economic state where only the jingling metal is valued" and entering "the more cultivated economic life of civilized peoples".¹⁰⁵⁹ Only that the result obtained by issuing mortgage bonds was cancelled by the effect of introducing in our country the rubles, "bad foreign money", which next to the devaluation of silver on international markets and next to the unfavorable balance of trade, starting with 1876, led to the emergence, then the growth of gold's overprice. Even if, immediately after the peace treaty of San Stefano, the ruble was transformed into a coin of 5 Romanian lei, the situation was not mended because the new coin really valued only 4.5 lei, thus becoming a "Romanian ruble, even more dangerous as it was no longer a foreign one, but it endorsed our national form."¹⁰⁶⁰

As a consequence, this situation promoted usury, perpetuated the money lenders' abuses. These people were considered by Xenopol to be the conservative element regarding the capitals, since they opposed any law which would have established a maximum for the interest rates and any bank which would have decreased the interest rate.

At the same time Xenopol believed that usury was "one of the worst evils"¹⁰⁶¹ while the money lenders – a "greedy" and rather widespread category of "parasites" which dealt in "dishonest speculations".¹⁰⁶² This "evil" affected city dwellers as well as village dwellers, usury having various facets: from very high interest money lending to loans demanded by farmers on special situations: marriages, funerals, poor crops from land agents or land owners, loans that most often had to be paid back in work. But this work was poorly valued so that the farmer was in a constant debt.

¹⁰⁶² Id. *Studii economice*, p. 133, (Our translation).

As a consequence, Xenopol welcomed the measures taken by the liberal government against usury: one concerned the “cancellation of the penalty clause” and the reduction of the “conventional percentages provided by the legal limit”, and the second one, “defended wages’ surveillance and the aq pensions thus declaring them necessary and untraceable.”¹⁰⁶³

On a monetary level, the most efficient measure proved to be the foundation of the banks, first of all that of the National Bank of Romania. The first Romanian bank was the National Bank of Moldavia, founded in 1857 and bankrupt only three years later, a bankruptcy motivated by Xenopol through the employment by the above named bank of two types of incompatible banking operations: “land credit and discount”.¹⁰⁶⁴

In 1861 the liberal minister Golescu – Brătianu suggested establishing the Discount Bank, an ineffectual proposal due to the revocation of this ministry. The proposition was renewed in 1873, but this time by the conservative government; yet due to the lack of interest of the “conservative party” for the economic problems, it was ineffectual this time too, believed Xenopol.¹⁰⁶⁵

Only in 1880 the National Bank of Discount and Circulation is established, having two thirds private capital and one third state capital. This bank, the most important financial institution in the country, had supported industrial and commercial development and had given to the state convenient loans, thus contributing to the capitalist evolution of the Romanian economy and on a social level, to the development of the bourgeoisie.

As predicted by Xenopol, the National Bank proved to be extremely beneficial for farmers too. First of all because withdrawing from circulation mortgage bonds and replacing them with its own bonds, the bank would allow the state to gradually sell from its property small parcels especially to newlywed couples, thus canceling the mortgage bonds. Giving land to newlyweds and therefore passing a part of the state property in the hands of the petty farmers – all this done with the help of the National Bank – was meant to give a new boost to agriculture. But the National Bank was able to help farmers in another manner too, according to Xenopol. Thus, storing their crops in docks in exchange for some receipts (called “warande”), which certified the amount of grains deposited there, the farmers could have discounted the receipts for a minimum interest, i.e. obtaining a cheaper credit.

Another financial institution supported by Xenopol was the rural bank the foundation of which was accompanied in our country by the opposition of the land owners, who thus would have lost their quality of creditors for framers. It is beyond comprehension, said Xenopol that the land owners, once they have enjoyed the benefits of the establishment of the Land Credit which saved them from the menace of usury, did not admit of a similar measure for farmers. This was due to the fact that “what previously the money lenders represented for the property, now the land owners and the land agents represented for the farmers.”¹⁰⁶⁶ In Xenopol’s view, “the rural bank would be meant to help either communities or individuals with loans contracted under the best clauses possible, first of all the leasing of land properties and second the purchasing of land”¹⁰⁶⁷. At the same time with the facilities offered by the bank, to the Romanian farmer one should make very clear the clauses for refunding the loan, any delays or respites being excluded, excepting those stipulated by the law. According to Xenopol all this happened because of the “great flaw of the Romanian character” which is the “inaccuracy of fulfilling one’s duties”.¹⁰⁶⁸ At the same time Xenopol planed in view of the economic rebirth of our country, “a special bank for helping

Romanian craftsmen and tradesmen”¹⁰⁶⁹, having as a goal stimulating the small and medium industry in Romania.

As a conclusion we can say that Xenopol’s studies, articles and economic papers fully prove his constant interest for such an important domain in the life of a country. This interest was motivated by the importance for Xenopol of the people to which he belonged, its needs and hopes. This made him research the economic state of the Romanian people, its causes, and also formulate among the most realistic solutions possible for the improvement of this state, for the reduction of the gap that separates us from the economically developed countries. By means of the measures suggested, he sought to give a new direction to the economic development of agriculture, industry and commerce; all of this being a necessary condition to the increase in the people’s living standard. It was also necessary for the political and cultural progress which would ultimately determine the changing of the economic structure of the people’s life. The same reason made him get involved in politics, without having a special talent in this activity and without wanting to make for himself a political career. Yet this way he was able to assume an attitude, he could influence decision making on the economic level which he considered to be beneficial for the country.

In this paper, we have presented a corporate valuation model. The model combine several valuation methods in order to get more accurate results. To determine the corporate asset value we have used the Gordon-like two-stage asset valuation model based on the calculation of the free cash flow to the firm. We have used the free cash flow to the firm to determine the corporate market value, which was calculated with use of the Black-Scholes option pricing model in frame of the two-dimensional Monte Carlo simulation method. The combined model and the use of the two-dimensional simulation model provides a better opportunity for the corporate value estimation.

Keywords corporate valuation, free cash flow to the firm, real options, Black-Scholes option pricing model, two-dimensional Monte Carlo simulation, R statistics

1. Corporate valuation

There is an ever-increasing need for financial valuation services pertaining to nonpublic companies and subsidiaries, divisions, or segments of public companies. Nowadays, the main purpose of the companies to increase their corporate value. In order to measure the value creation of a company, namely the increase in value compared to previous one, it is necessary that we can properly estimate the company's current value. The new reality presents a challenge to business managers: the need to manage value and to focus as never before on the value their corporate-level strategies are creating. Copeland-Koller-Murrin (2000) write in their book: „*We believe that clear thinking about valuation and skill in using valuation to guide business decisions are prerequisites for success in today's competitive environment. ... Underlying it is our basic belief that managers who focus on building shareholder value will create healthier companies than those who do not. We also think that healthier companies will, in turn, lead to stronger economies, higher living standards, and more career and business opportunities for individuals.*”

The valuation plays a key role in many areas of finance - in corporate finance, mergers and acquisitions and portfolio management. In general, there are three approaches to valuation. The first, discounted cashflow valuation, relates the value of an asset to the present value of expected future cashflows on that asset. The second, relative valuation, estimates the value of an asset by looking at the pricing of 'comparable' assets relative to a common variable such as earnings, cashflows, book value or sales. The third, contingent claim valuation, uses option pricing models to measure the value of assets that share option characteristics. (Damodaran, 2002)

To build our company valuation model we have used a kind of the combination of the methods above-described by Damodaran. The combined methods were designed to obtaining more accurate results and to taking into account the forecast uncertainty during the calculations. Still combining of the methods are needing, because the company valuation is a complicated process.

As business structures become more complicated, business valuations become more complicated. As transparency in corporate financial reporting becomes more desirable and less attainable, business valuations become more complicated. And, as securities market cycles become more exaggerated and less predictable, business valuations become more complicated. (Reilly-Schweih, 2004)

The corporate valuation is also important to measure the performance of the management. Value creation is the ultimate measure of performance for a management team. (Copeland-Koller-Murrin, 2000)

2. The corporate valuation model

There are only three approaches to value any asset, business or business interest:

1. the income approach;
2. the market approach;
3. the asset approach.

There are no other approaches to value. However, there are numerous methods within each one of the approaches that the analyst may consider in performing a valuation. All three approaches should be considered in each valuation. However, it is not common to use all three approaches in each valuation. (Hitchner, 2003)

To determine the market value of the company we have developed a combined model whose main stages are presented in the *Figure 1*. On behalf of the more efficient estimation we had combined more known methods and the corporate value as the final result was calculated using the so-called two dimensional Monte Carlo methods with utilization of intermediate results of the specific methods. The raw data necessary to the modeling was collected from the financial statements some of the companies listed on the Budapest Stock Exchange. We chose companies belonging to the stock exchange with the intention to compare the calculated results with the stock market capitalization of the firms.

The value determination was carried out for five companies. However, due to size limitations of the article the details of the calculation are only presented for one company (*Danubius*).

2.1. Calculation of free cash flow to the firm

To preparation of forecasting which is necessary to determine the asset value of a company we have used the last five years data (2004-2008) of the firms downloaded from the Budapest Stock Exchange web-page. The calculations have been performed in Microsoft Excel 2007 and the R statistical system. R statistical system is an integrated suit for software facilities for data manipulation, calculation and graphical display. R is an environment within which many classical and modern statistical techniques have been implemented. (Venables-Smith, 2009) The commands of R can be executed from the Microsoft Excel, and we have used this possibility.

During the forecasting we have calculated those values which were necessary to determine the free cash flow to the firm (FCFF). We used the company's growth ratio to make the forecast of the data. The forecast was based on the company growth rate¹⁰⁷⁰ and marginal taxation rate¹⁰⁷¹. To generate the latter rates we have used the normal distribution with parameters based on the averages and standard deviations of the previous years' data. (*Table 1*)

The forecast results are in the *Table 1*. The FCFF values were calculated using the after-tax operating profit, as follows

$$FCFF = \text{After-tax operating profit} + \text{Depreciation} - \text{Investments} \\ - \text{Changing in non-cash working capital} \quad (1)$$

¹⁰⁷⁰ mean=9.14, sd=2.23

¹⁰⁷¹ mean=22.55, sd=6.93

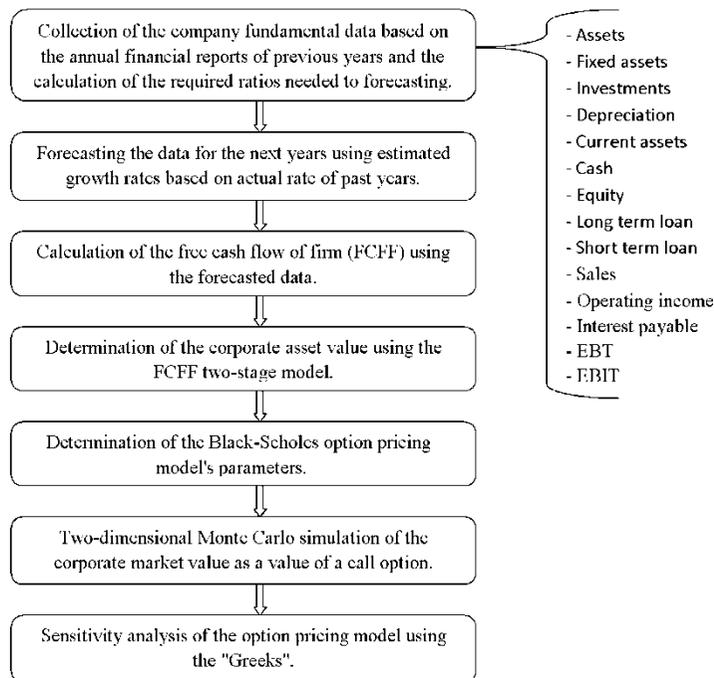

In case of Formula 1, the cash flow does not include the benefits arising from the interest payments, since the tax-saving effects of the credits has been taken into consideration in case of the determination of the cost of capital.

The corporate asset value was calculated by using of the Gordon-like two-stage valuation model, in consideration of the following relations:

$$V_A = \sum_{t=1}^n \frac{FCFF_t}{(1+r)^t} + \frac{P_n}{(1+r)^n} \quad (2)$$

$$P_n = \frac{FCFF_n * (1+g)}{(r-g)} \quad (3)$$

Figure 1: The process and the raw data of the corporate valuation

The growth rate (g) used to the determination of the terminal value (P_n) was calculated as an average of the forecasted growth rates (*the growth rate from 6th year - Table 1*). (Formula 3) The weighted average cost of capital (r – *required rate of return - Table 1*) was calculated as an average of the yearly weighted average costs of capitals. (Formula 2, 3)

2.2. Real options in corporate valuation

The calculation is essentially based on the assumption that the market capitalization of a company determines the market value of a joint stock company. Two essential factors play an important role in general to elaborate the market price: the actual performance of the company and the investor expectations. The riskiness of a company reflects in the volatility of the stock prices.

The new economy provides a challenge for the corporate decision-maker. Corporate valuation may no longer depends on traditional fundamentals but rather on future expectations. Investment strategies with high risks and uncertainty or irreversible corporate decisions coupled with managerial flexibility provide the best candidates for real options. Real options is a systematic approach and integrated solution using financial theory, economic analysis, management science, decision sciences, statistics and econometric modeling in applying options theory in valuing real

physical assets, as opposed to financial assets, in a dynamic and uncertain business environment. (Mun, 2002)

To determine the corporate market value we have used the Black-Scholes options pricing model. The value of a real options depends on five basic variables:

1. the value of underlying risky asset (**S**) – *corporate asset value*;
2. the exercise price (**K**) – *face value of the outstanding loans*;
3. the time to expiration of the option (**t**) – *weighted average maturity of loans*;
4. the standard deviation of the value of the underlying risky asset (**σ**) – **variance of the firm's share**;
5. the risk-free rate of interest over the life of the option (**r**) - **treasury bond yield rate adjusted to the option lifetime**. (Copeland-Antikarov, 2003)

Table 1: The corporate asset value calculation based on forecasted data
million HUF

Titles of data	Forecasted years				
	1	2	3	4	5
Growth rate	10,57%	8,49%	9,44%	8,22%	7,42%
Assets	91 363	99 124	108 482	117 398	126 111
Sales	49 417	53 615	58 677	63 499	68 212
Operating profit	2 324	2 521	2 759	2 986	3 208
Marginal taxation rate	32,35%	18,82%	29,02%	11,66%	28,10%
After-tax operating profit	1 572	2 047	1 958	2 638	2 306
Invested assets	83 767	90 882	99 462	107 636	115 626
Depreciation	4 937	5 357	5 863	6 344	6 815
Investments	4 685	5 083	5 563	6 020	6 467
Changing in non-cash working capital	274	297	325	351	378
Free Cash Flow to the Firm	1 551	2 023	1 933	2 610	2 277
Terminal price					38 625
Present value of FCFF	1 340	1 512	1 248	1 457	1 098
Corporate asset value	45 279				
growth rate from the 6. year	9,26%				
required rate of return	15,70%				

The weighted average maturity of loans was estimated with the using of the notes of the accounts of corporate annual reports. The variance of the firm's shares was calculated with the using the closing price of the company's shares what was downloaded from the web-page of the Budapest Stock Exchange. (Table 2)

To calculate the corporate value we have used the following formulas of the Black-Scholes model:

$$\text{value of the call option} = S * N(d_1) - K * e^{-rt} * N(d_2) \quad (4)$$

$$d_1 = \frac{\ln\left(\frac{S}{K}\right) + \left(r + \frac{\sigma^2}{2}\right) * t}{\sigma * \sqrt{t}} \quad d_2 = d_1 - \sigma * \sqrt{t} \quad (5)$$

2.3. Two dimensional Monte Carlo simulation

A two-dimensional (or second-order) Monte Carlo simulation is useful to estimate the "uncertainty" in the risk estimates stemming from parameter uncertainty. A two-dimensional Monte-Carlo simulation is a Monte-Carlo simulation where the distributions reflecting "variability" and the distributions representing "uncertainty" are sampled separately in the simulation, so that "variability" and "uncertainty" in the output may be estimated separately.

The developers of the two dimensional simulation model write in their model application guide (Pouillot, R. et al., 2010) the followings: „a QRA (Quantitative Risk Assessment) should reflect the „**variability**” in the risk and calculate the “**uncertainty**” associated with the risk estimate. The “**variability**” represents temporal, geographical and/or individual heterogeneity of the risk for a given population. The “**uncertainty**” is understood as stemming from a lack of perfect knowledge about the QRA model structure and associated parameters.” On basis of Cullen and Frey book (1999, p.3.), what can be regarded as the theoretical background of two dimensional simulation, the previous definition is supplemented by the followings: „In general, variability can not be reduced by additional study and measurement. Random and systematic measurement errors as well as reliance on models and surrogate indicators, all sources of uncertainty. ... In confronting variability and uncertainty a decision-maker stands to better understand the degree of variance in the full distribution of exposure or risk, the impact of various assumptions, data gaps, and model choice on decision making, and the most fruitful avenues for further study.” The input parameters of the simulation model are presented in Table 2.

Table 2: The input value of the simulation model

Corporate asset value		45 279	million forint
Average maturity of loans		5,54	év
Variance of the corporate shares	U		
minimum		8,85%	
mean		9,78%	
maximum		10,70%	
Outstanding loans	V		
minimum		21 310	million forint
mean		23 966	million forint
maximum		27 511	million forint
Five-year treasury bond yield	U		
minimum		4,50%	
mean		6,00%	
maximum		8,50%	

To estimate the stochastic variables marked U (*uncertainty*) and V (*variability*) letters we have used the triangular distribution with the parameter values in Table 2. (Kotz-van Dorp, 2004)

3. Results of simulation

To execute the simulation model we have used the 'mc2d'¹⁰⁷² package of R statistical system. The simulation statistical results are presented in Table 3. The statistical indicators of Table 3 show that the value of the coefficient of variation is very low, and the interquartile range¹⁰⁷³ is relatively small, which show that the estimated values are located in a relatively narrow interval around the mean and median around. All these can be easily seen in the boxplot diagram. To determine a confidence interval for the mean and median the program was used the one sample t-test and the Wilcoxon signed rank test with continuity correction. The calculation results are shown the Table 4. We can see that the intervals have a very small scale. To measure how the value of an option will change when one of the input variables changes while the others remain the same, we have used the „Greeks” (*delta*=0.7021, *gamma*=6.86*10⁻⁷).

Table 3: The statistical results of the simulation

¹⁰⁷² Monte-Carlo à Deux Dimensions

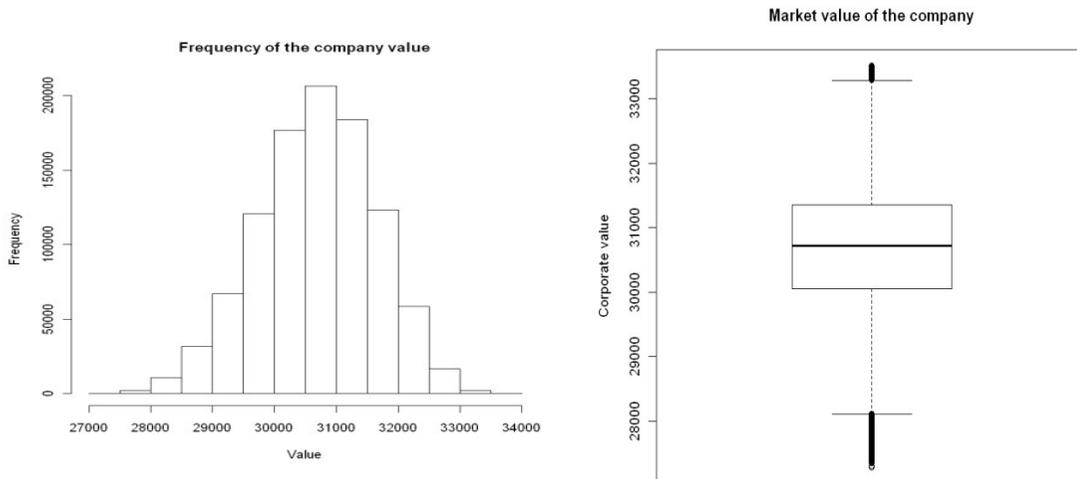

¹⁰⁷³ interquartile range = 3rd quartile – 1st quartile

Statistical indicators	Minimum	1st quartile	Median	Mean	3rd quartile	Maximum	Standard deviation	Coeff. of variation	Inter-quartile range	Kurtosis	Skewness
Value of the company	27 290	30 060	30 720	30 680	31 350	33 510	939	3,06%	1 290	-0,2228	-0,1972

Table 4: Confidence interval estimation for mean and median

Statistical indicators	confidence interval (95%)		estimated value
	lower bound	upper bound	
mean	30 683	30 687	30 685
median	30 700	30 704	30 702

Figure 3: The diagram results of simulation¹⁰⁷⁴

4. Conclusions

The performed calculations show that the constructed model can be applied in determining the market value of companies. The stock market capitalization of the company's shares was HUF 29,330 at the end of 2008, which is 2.49% less than the estimated average value. The model slightly over estimates the current market value.

The sensitivity tests carried out have confirmed the applicability of real options.

Probably we get better results of the corporate value if we would have a more accurate internal company information. We have obtained similar values in case of the other analyzed companies too. In each case, the estimate is well approximated in the current market value.

We believe that the presented model is useful to determine the value of the companies whose shares are traded on the stock exchange.

THE CORRELATION BETWEEN THE MARKET RISK AND THE LIQUIDITY RISK IN THE ROMANIAN BANKING SECTOR

Trenca Ioan

„Babeş-Bolyai”University Cluj-Napoca

Zoicaş-Ienciu Adrian

„Babeş-Bolyai”University Cluj-Napoca

A series of studies on liquidity management have appeared during the financial crisis, many of them comparing the funding liquidity with the market liquidity. The paper offers a dynamic image about the liquidity in the Romanian banking sector and its integration with the market risk, comparing the Value at Risk approach with the Liquidity at Risk approach. The research also wants to highlight the most significant features to consider in order to implement an effective liquidity risk management and to achieve a more integrated supervisory framework.

Key words: liquidity risk, market crisis, liquidity limits, Value at Risk, Liquidity at Risk

JEL code: G01, G21, G32, C63.

1.Introduction

This paper analyze market risk behavior in periods characterized by extreme events and propose a liquidity model in order to quantify and manage the risk that arise from the trading book. The most used model for quantifying the market risk is Value at Risk (VaR) initiated by Jorion (1997), Dowd (1998), and Saunders (1999). Even though it replaced less standardized techniques such as Asset and Liability Management and Stress-testing, it lacks a rigorous treatment of liquidity risk. The liquidity risk has two main parts: funding liquidity risk and market liquidity risk. The first one has received the most attention from the banks for its significance. But, the market liquidity risk, described as the risk that a bank cannot easily offset or eliminate a position without significantly affecting the market price because of inadequate market depth or market disruption (ECB, 2002) has gained more attention in the latest years.

A problem of the VaR models is that they don't take account of market liquidity risk, because they assume that the positions (currency rates, interest rates, stock index values, option volatilities) could be sold at a fixed market place, the midpoint quote, within a fixed period time (Laurence and Robinson, 1995). There are many studies in the related literature of incorporating market liquidity risk in the VaR models. Almgren and Chriss (2000) and Bangia et al (1999) proposed a dependent model strategy. Dubil (2001) proposed a model for determining optimal liquidation periods for different assets. Shamroukh (2000) highlight that scaling the holding period to account for orderly liquidation can only be justified if the holding period actually represents the liquidation period. Jarrow and Subramanian (1997) proposed a liquidity adjusted VaR measure that incorporates the liquidity discount, volatility of liquidity discount and the volatility of time horizon to liquidation, considering the effect of trade size and execution lag on the liquidation value of the portfolio.

In this article we present a framework for incorporating the liquidity risk into the VaR models. Section 2 presents the Value at Risk methodology, in accordance with the Basel II requirements. Section 3 describes the Liquidity at Risk methodology and reviews the techniques used to model the distribution of the returns. In section 4 is presented a case study which models the daily bid-ask spread for three important banks from the Romanian banking system, listed on the Bucharest Stock Exchange and section 5 concludes.

2.The Value at Risk methodology

Financial institutions have developed models for quantifying, comparing and aggregating the risk connected with different positions and portfolios. One of the most used methods is Value at Risk, which is defined as the expected maximum loss of a portfolio over some time period and for some level of probability. From a statistical point of view, VaR entails the estimation of the quantile of the returns' distribution. In other words, Value at Risk is the probability that returns or losses (ξ) are smaller than $-VaR$ over a period of time (T):

$$P_{VaR} = P(\xi < -VaR) = \int_{-\infty}^{-VaR} P_T \cdot \xi \cdot d\xi \quad (1),$$

where P_T is the probability distribution of returns over the time horizon T.

For a 99% confidence level the worst value is:

$$P_{99\%} = P_t \cdot e^{[E(r_t) - 2.33\sigma_t]} \quad (2),$$

where $E(r_t)$ and σ_t^2 are the first two moments of the asset returns' distribution.

In order to compute the VaR for a portfolio first we have to mark-to-market the portfolio and then to estimate the distribution of the portfolio's returns, which is a very challenging statistical problem. When the returns are normal, which is very rarely in practice, it is used the variance-covariance approach. When risk is recurrent VaR can be estimated by using historical time series and for new situations it should be modeled through EWMA and GARCH models. When risk is sensitive to rare events it is preferred the Extreme Value Theory. The main limitation of the VaR methodology is that the assumption of normal distribution can lead to large underestimation of the probability of extreme events, which affects the capital requirements. Also, the estimated distribution tends to fit central observations, while falling in fitting the extreme observations. The accuracy of VaR depends on how well the underlying markets have been simulated and how well each security has been modeled. Recent studies propose to analyze only the distribution of extreme returns, instead of describing the behavior of all of the returns (Ferreira and Lopez, 2004; Burns, 2002; Rombouts and Verbeek, 2004). Related to these studies is the EVT, introduced in finance by Embrechts (1997), although the basics were initiated by Fisher and Tippett (1928) when proposing the Generalized Extreme Value (GEV) distribution. The modeling of the financial variables through EVT was also studied by McNeil and Frail (2000), by Danielsson and De Vries (1997) which computed a model for calculating the VaR, taking into account the inconsistency of extreme values and by Huisman et al. (1997) which proposed a new estimator for the tail index.

3.The Liquidity at Risk methodology

Banks should possess a funding liquidity contingency plan in order to prevent insolvency, pass through stressful situations and maintain their reputation and credit rating. From all the proposed definitions of funding liquidity and market liquidity the next two ones are promising. Funding liquidity is the ability of a bank to maintain a prospective equilibrium between cash inflows and outflows, ensuring appropriate coverage of payments on the bank's liabilities (Erzegovesi, 2002). Market liquidity is the discounted expected price concession required for an immediate transformation of an asset into cash or cash into an asset under a specific trading strategy (Neuman and Demsetz, 1968). Jarrow and Subramanian (1997) consider the effect of trade size and execution lag on the liquidation value of the portfolio, proposing a liquidity adjusted VaR that incorporates the volatility of liquidity discount.

In order to incorporate the liquidity risk into the VaR models we would make an assumption that in stressed market conditions extreme events in returns and extreme events in spreads happen

concurrently. So, in calculating liquidity-risk adjusted VaR we incorporate both a 99th percentile movement in the underlying and a 99th percentile movement in the spread:

$$P_{99\%} = P_t \cdot e^{(-2.33\sigma_t)} - \frac{1}{2} [P_t (\bar{S} + a\tilde{\sigma})] \quad (3)$$

Assuming that the expected return $E(r_t)$ is zero, that the Liquidity at Risk can be written as follows:

$$LaR - VaR = P_t \cdot (1 - e^{(-2.33\theta\sigma_t)}) + \frac{1}{2} [P_t (\bar{S} + a\tilde{\sigma})] \quad (4)$$

where S_T is the relative medium spread ((Ask-Bid)/Mid) over the time horizon T, $\tilde{\sigma}$ is the volatility of the medium spread and a is the scaling factor, a multiple of the spread volatility, in order to achieve 99% probability coverage and θ is a correction factor that take into account the fat-tailed distribution.

4. Empirical study: analyzing the market risk and the liquidity risk in the Romanian banking system

In order to determine the VaR and the LaR we have modeled the daily data of the stock prices for three important banks in the Romanian banking system, listed on the stock exchange: Erste Bank (EBS), BRD Group Societe Generale (BRD) and Transilvania Bank (TLV), from 01.01.2007 to 31.03.2010. The observations of the closing price, bid and ask spread, are available on a period longer than that we took in consideration, but we have considered that the recent observations provides a better estimation on the risk of the portfolio. Also, we divided the data into two samples: the first sample is from 01.01.2007 to 31.08.2009 representing the “pre crisis” period and the second sample is from 01.09.2009 to 31.03.2010 representing the “post crisis” period.

The daily rentabilities were determined by logarithmation of the series of closing prices and present a lot of extreme variations that took place on the stock exchange market. Applying the Jarque Berra Test we will observe that the normal hypothesis is rejected. The distributions are leptokurtic, more sharpen than the normal ones, for all of the samples, a fact shown by the kurtosis coefficient. Analyzing the skewness coefficient we will observe that the distributions are shifted to the left, compared with the normal distribution. Applying the ADF and the Philipe-Peron tests it will be observed that the series composed of the closing prices values have one unit roots, which means that it is needed a first order differentiation in order to become stationary.

Table 1: The moments of the distributions

	EBS sample I	EBS sample II	BRD sample I	BRD sample II	TLV sample I	TLV sample II
Observations	265	323	403	323	403	323
Mean	-0.000359	-0.000202	-0.000136	-0.000241	-0.001671	0.001543
Median	0.000080	0.000000	0.000000	0.000000	0.000000	0.000000
Maximum	0.051403	00.51403	0.113482	0.139762	0.062160	1.434721
Minimum	-0.369786	-0.468803	-0.099820	-0.158523	-0.501279	-0.501279
Std. Dev.	0.037123	0.060703	0.017438	0.027437	0.025827	0.060477
Skewness	-0.975164	-0.784071	-0.057078	-0.565357	-11.15595	17.00904
Kurtosis	98.41873	54.69923	9.606578	11.33078	200.8467	427.6909
Jarque-Bera	342687.5	30483.70	1366.191	2211.710	1240438	5680052
Probability	0.000000	0.000000	0.000000	0.000000	0.000000	0.000000

According to all these factors, the distribution of the rentabilities presents fat tails, which correspond to the extreme variations that took place on the money market. Using the historical simulation method can lead to an overestimation of VaR, especially that the method describes the maximum expected loss. Here appears the “volatility clustering” phenomena, which can be remedied by the heteroscedasticity models GARCH.

In order to eliminate the linear structure we propose some ARMA models studying the residuals’ correlogram, for which the AIC and BIC criteria are minimum. In the pre-crisis period we found ARMA(7) for EBS, ARMA(3) for BRD and ARMA(4) for TLV and in the post-crisis period we found ARMA(5) for EBS, ARMA(6) for BRD and ARMA(7) for TLV. The remained residuals have a non-linear structure which was detected by the BDS test elaborated in 1987 by Brock, Dechert and Scheinkman, in order to check the stochastic non-linearity. The BDS test’s values are strong, which sustains the rejection of the normal hypothesis. This tendency reflects a degree of heteroscedasticity, which means that the present volatility depends on the previous volatility. Unless the data is filtered, this dependence will undermine the value of VaR. In order to eliminate the correlation between residuals we had to find some GARCH models. The best models identified were: GARCH(2,3) for EBS, TGARCH for BRD, GARCH(2,4) for TLV in the pre-crisis period and GARCH(1,2) for EBS, GARCH(2,3) for BRD, GARCH(3,4) for TLV in the post-crisis period.

In order to calculate the banks’ exposure to liquidity and market risk, we have incorporated the liquidity components into the VaR approach. It is observed that during the financial crisis the liquidity component has a higher contribution in the level of VaR. The results for the two samples taken into consideration are the following:

Table 2: Market and liquidity risk for the pre-crisis period

	EBS	BRD	TLV
Price on 31.08.2009	144.10	12.5	0.288
Return volatility (σ_t)	0.037123	0.060703	0.017438
Fat tail factor (θ)	1.2	1.3	1.25
Market component (VaR) $P_t \cdot (1 - e^{(-2.33\theta\sigma_t)})$	4.3796	2.5634	0.0937
Liquidity component of (LaR) $\frac{1}{2} [P_t (\bar{S} + a\tilde{\sigma})]$	0.0816	0.1043	0.0034
Total Adjusted Value at Risk	4.4612	2.6677	0.0971
% of liquidity component	1.8291%	3.9097%	3.5015%

Table3: Market and liquidity risk for the post-crisis period

	EBS	BRD	TLV
Price on 31.03.2010	125.10	15.6	2.31
Return volatility (σ_t)	0.027437	0.025827	0.060477
Fat tail factor (θ)	1.4	1.65	1.55
Market component (VaR) $P_t \cdot (1 - e^{(-2.33\theta\sigma_t)})$	4.9872	3.0105	0.1032
Liquidity component of (LaR) $\frac{1}{2} [P_t (\bar{S} + a\tilde{\sigma})]$	0.1207	0.2032	0.0048
Total Adjusted Value at Risk	5.1079	3.2137	0.108

% of liquidity component	2.3630%	6.3229%	4.4444%
--------------------------	---------	---------	---------

In order to test the post efficiency of the methodologies we have used the back-testing, by simulating the stress scenarios for the least 245 days. We have applied the quadratic loss function approach, calculating how many times the VaR has been exceeded. The results are presented below:

Table 4: Backtesting results for the market portfolio with and without liquidity risk

Exceptions from of VaR _{99%}	Pre-crisis		Post-crisis	
	Market risk	Market risk & Liquidity risk	Market risk	Market risk & Liquidity risk
EBS	4	3	6	4
BRD	6	4	6	4
TLV	5	2	5	3

The best methods, which are in the minimum risk zone (which means that VaR has been exceeded for no more than 4 times), are those that take into consideration the market liquidity risk. The other models that count only the bank's exposure to the market risk are in the medium safety zone (from 5 to 9 violations of VaR), which means that the banks need more capital allocation in order to satisfy the Basel II Accord requirements.

5. Conclusion

We confirmed our hypothesis that only advanced VaR models that incorporate the liquidity risk (LaR) could adequately measure exposure of the bank to market risk and satisfy the BCBS criteria in periods characterized by extreme events. Also, in forecasting VaR for exposures in crisis periods it should be used a shorter sample of data, the most recent one, in order to capture the large movements on the market. With regard to accuracy, the risk managers should be concerned with whether the model's ex-post performance is compatible with the theoretically desired level, applying permanently back-testing criteria.

The current paper presents some considerations regarding the monetary policy held by the central bank in order to obtain the declared goal of joining the European Monetary Union. The paper refers to the strategies included in the National Accession Plan, and in the Convergence Program established by the National Bank of Romania. Furthermore, the paper presents some of the recent developments and the technical developments.

Keywords: Monetary policy, National Bank of Romania, convergence

JEL Classification: E58, F15

1.Introduction.

The Romanian National Bank has been subjected to a transformation process over the last few years, that manifested itself under the influence of 3 factors: the reorganization of the central bank by transitioning from the monobank, centralized system to a more decentralized model, more adept for a market economy; adopting the communitary acquis and the efforts made to reach the real and nominal convergence criteria in light of the future integration process and the adoption of the single european currency.

Along with the communist regime removal, the transition to a market economy has involved extensive changes at institutional level. Two-tier banking system reorganization involved the NBR to regain the traditional functions typical of a genuine central bank. Thus, its commercial bank specific activities have been abandoned, which were taken over by another newly created entity - Romanian Commercial Bank.

The new status of NBR in June 30th, 1998, provides price stability as basic objective and seeks to standardize legislation. Since 1999, the main objective of monetary policy, target inflation's reduction to gain competitive advantage to the devaluation of the leu against the euro. long with this, we wanted to stabilize the leu exchange rate, given its importance as a nominal anchor.

Since 2001, NBR announced that it abandoned to disperse efforts to multiple targets, and focus on reducing inflation, leaving the Government, through various means, especially in budgetary policy, to deal with maintaining the foreign payment's balance equilibrium. This means not only a major change in the monetary authority's practice, but also a distribution of tasks and concern for the trade balance situation.

EU integration process has been a stimulating factor in speeding up reforms, real and nominal convergence criteria become important landmarks in efforts to maximize the degree of functionality of the Romanian economy. Priorities and objectives in line with Romania's intention to join the European Union were addressed in the National Program for Accession of Romania to the European Union (PNAR). It provides: strong reducing inflation, ensuring a sustainable

¹⁰⁷⁵ “Investește în omameni!” doctorand bursier în “Proiect cofinanțat din Fondul Social European prin Programul Operațional Sectorial Dezvoltarea Resurselor Umane 2007-2013”.

external position, maintaining the budget deficit under control, improve and reform its banking system stability.

Also, one of the main factors leading to repeated update of the Romanian banking legislation was the need to adopt the *acquis communautaire*. Legislative changes have mainly focused on issues such as: central bank independence, the adaptation of central bank's regulations to modernizing the payments system, prudential requirements on commercial banks' lending activity, bank accounts coding standardization, gradual liberalization of currency transfers, adaptation regulations to combat money laundering requirements.

NBR status in June 2004 contributed to the harmonization of Romanian legislation with the EU. News had in mind primarily the strengthening of central bank independence, price stability as a fundamental objective, prohibition of direct financing of public institutions by the Central Bank, harmonization of the NBR's procedures and instruments with the ECB's.

Strengthening NBR's independence is a prerequisite to achieve nominal convergence criteria, established by the Maastricht Treaty. In the literature, central bank's independence is defined as a series of restrictions regarding monetary policy, aiming government loans, the method of economic policies and the relationship between government and central bank, restrictions which favors the price stability objective.

Central bank's independence refers to a certain degree of independence in the choice of specific instruments for achieving objectives, not setting targets itself for monetary policy¹⁰⁷⁶.

Hayo and Hefeker argues that central bank independence is not a necessary and sufficient condition for price stability, citing as an alternative, a possible agreement between central banks and governments on this objective, or setting up a fixed rate regime, by linking the national currency of another currency¹⁰⁷⁷.

Both versions cannot be valid in the case of the CEB and at the same time, are unverifiable in the case of the NBR. Therefore, in the first instance, it could occur that both the Central Bank and the Government tacitly agree on the failure to comply with the price stability objective, at a certain time. This scenario could only turn out if the partners cannot call each other into account or be called upon by a third party. Also, judging by the way the European Central Bank System is organized each Central Bank should be in close contact with the Government, which could favor cartel behavior for certain members of the area.

The second alternative has been embraced in various forms by several transitioning countries, some of which have become members of the European Union in the meantime. Yet, it has been proven that there is no correlation between price stability and the fixed exchange rate system, the government's temptation to use exchange policy as a foreign commerce competitive edge could constitute an argument in this sense.

A certain practical miscorrelation between the NBR and the Government is easily visible, in so far as the independence of the Central Bank infers the joint setting of economic policy objectives. In certain instances, the Central Bank will try to patch up the Government's decisions.

The absence of a long term fiscal and budgetary strategy renders much more difficult NBR's attempt to reach its objectives regarding inflation rates, fact proven in later years by the repeated recalculation and failure to reach the set inflation target, due in most part to unilateral Government decisions regarding the enactment of a sole tollage rate. This measure has caused an increase in consumption rates which manifests itself by the augmentation of the non-governmental credit especially the consumption allocated one, thence increasing the inflationist pressure on the economy.

¹⁰⁷⁶ Debelle, G., Fischer, S., *How Independent Should a Central Bank Be?*, in: Jeffrey C. Fuhrer (ed.) *Goals, Guidelines, and Constraints, Facing Monetary Policymakers*, The Federal Reserve Bank of Boston, Boston, 1995. p. 195-221.

¹⁰⁷⁷ Hayo, B., Hefeker, C., "Reconsidering central bank independence", *European Journal of Political Economy*, no. 18(4)72002, p. 653-674.

In the attempt to better the decision-making process between the NBR and the Government, the inflation targeted regime adopted in the summer of 2005 by the Central Bank should find its correspondent in the multiannual budgetary scheduling strategy.

The NBR reform has also brought with itself a set of measures pointed at the betterment of the Romanian banking system, taking into consideration – in this sense – passing resolutions in regards to the minimum limit. As the disinflation, in Romania, entails drastic fiscal deficit diminution measures and a cautious income policy, economic specialists think it unwise to only keep the current deficit under control through budgetary and commercial policies.

NBR and the Government should choose to correct the entire setting of the economic policy to encourage durable economic growth, even though in the context of the current economic crisis¹⁰⁷⁸ achieving this would be a difficult task.

Basel II, completed in June 2004 after a series of changes, is structured on three pillars: minimum capital requirements, capital adequacy supervision, strengthening the supervisor's role, and the third concerns market discipline, changing the central bank's reporting requirements.

The objectives of Basel II aims to provide a flexible framework for determining capital requirements, adequate risk profile of credit institutions and strengthen financial system stability assumptions. In this sense, the central bank set a clear calendar for adoption of the new Capital Accord in the national banking system, including four phases of implementation: initiating dialogue with the banking sector, development of means for banking supervision in the Basel II standards, internal rating model's validation by NBR used by credit institutions to assess clients and existing loan portfolio, provisions application's verification of the Agreement in whole banking system.

Since August 2005, central's bank monetary policy strategy pursued inflation targeting.

It was adopted after completing a training process, whose final stage was the development and functional testing framework for economic analysis and monetary policy decision specifically direct inflation targeting.

Were simultaneously satisfied and other requirements and criterias which determine the effectiveness of this strategy: lowering the annual inflation rate below 10 percent; building the central's bank credibility and consolidating it; strengthening the independence of jure (by the entry into force on July 30, 2004 of the new Statute of the BNR) and the *de facto* of the central bank; the restriction of fiscal dominance, the course of fiscal consolidation and improving coordination between fiscal and monetary policy; the relative flexibility of the exchange rate of MDL and reducing the vulnerability of the economy to fluctuations to this variable; healing and strengthening the banking system and the relative increase in banking brokerage; increasing the transparency and responsibility of the central bank as well as the intensity of central's bank communication with the public and financial markets, including issues new regarding monetary policy strategy and the preparation of its adoption; clearer outline of macroeconomic behavior and of economic function mechanisms necessary to identify and increase the efficiency of monetary transmission channels.

In the relationship between commercial banks and the real economy, central's bank monetary policy impulses are transmitted rather imperfectly and after a time that depends on the structural features of the national economy.

Although the central bank can control short-term interest rates, the real economy is influenced by *medium and long-term interest rates practiced by commercial banks for deposits and for loans offered to their customers*. The level of the later depends on the monetary policy interest rate, but also on a number of other determinants (expectations on inflation, the outlook for economic growth, etc..) and is crucial for investment decisions, consumption or saving. Generally, lower interest rates stimulate investments and consumption over saving, while higher interest rates

¹⁰⁷⁸ Anghel, Lucian , Sinteză macroeconomică trimestrială Aprilie 2009, BCR p. 34

stimulate saving, inhibiting short-term consumption and investments. Thus aggregate demand is influenced by the economy.

The aggregate supply has a capacity for adjustment to the level of aggregated demand limited to a short time horizon. On a long term, the supply mainly depends on the dynamic of some fundamental factors such as basic production capacity, employment and level of technological endowment, and therefore it adjusts more slowly and longer-term it cannot be influenced by monetary policy. Under these conditions, on the short / medium term monetary policy can affect only the gap between the actual level of economic activity and the one that is long-term sustainable (real GDP deviation from its potential level, or, excess demand).

The set of instruments and procedures by which the central bank implements monetary policy to achieve its primary objective forms the operational framework of the monetary policy.

The main instruments of monetary policy that the central bank (BNR) has at its disposal aims: open market operations; standing facilities granted to credit institutions; minimal reserves (RMO). On the medium term, the main problem that arises for BNR is to design a monetary policy that will enable the participation in "II European Monetary System (EMS II) and respectively, the entry into EMU (U.E.M).

2.The Strategy of the National Bank of Romania (NBR) regarding the adoption of Euro

Before the entry into the EMS II phase and then in the participatory phase, the inflation targeting strategy would continue to function, given that it is consistent with exchange rate flexibility and ensures the gradual fulfilment of all the Maastricht criteria.

Romanian financial sector is substantially integrated into the broader EU sector, mainly due to a high participation of foreign investors to the social capital of financial intermediation firms. Taking into account the Commission's evaluations on legal compatibility and convergence criteria plus additional factors, Romania does not meet the requirements for adopting the Euro.

The date mentioned for admission into EMS II was chosen considering that an early admission could prolong the waiting period before Euro adoption, and excessive delay could weaken the incentives for sustained reforms. Thus, the mentioned instalments can keep - for a limited period - some flexibility in terms of monetary policy and exchange rate. That flexibility is needed to make some additional structural reforms, which must be undertaken to give greater flexibility to the Romanian economy that might improve its ability to cope with "asymmetric" shocks.

Also, the reminded planning has the advantage to maintain the motivation for further reforms and reinforcement of the macroeconomic discipline. The transitional period creates the possibility of determining the "pivot rate" (the central parity) based on a fair estimate of the exchange rate's level of equilibrium after surpassing the top of capital inflows caused by favourable expectations of entering the EU.

Among the arguments that advocate possible reduction of the period of participation in EMS II, we remember the following: increased reliability - performance afforded by the latest phases of the process - is absolutely necessary for the passage to the next stage (adopting the Euro), but cannot be maintained indefinitely if the process is not completed; possibility of volatile capital movements around the time of Euro adoption, which requires greater exchange rate flexibility; this involves a transitional period even between the participation in EMS II and entering into the Euro zone, period that, by nature of its purpose, can only be very short; monetary policy applied in the meantime (inflation targeting) implies an obvious subordination of exchange rate movements to the inflation objective; or the requirements of exchange rate stability, specific to EMS II, may become incompatible with the inflation targeting.

As regards the NBR's strategy of adopting the Euro, by June 2009, NBR has not published such a strategy. Furthermore, the Board of National Bank of Romania decided to maintain the same

monetary policy for 2009, the same interest rate and the current level of mandatory minimum reserve ratios applicable to liabilities in Lei (18%) and currency (40%) of credit institutions¹⁰⁷⁹. In this context, the consolidation of the disinflation process and ensuring sustainable financing of the Romanian economy amid the international crisis requires keeping the current conduct of monetary policy in order to support the formulation and implementation of a balanced mix of macroeconomic policies. NBR continues to monitor developments in domestic and global economic environment, so by using adequate instruments it would achieve the objectives of price stability and financial stability through the applied monetary policy. Valentin Lazea, NBR chief economist, said that the national bank intervened in three ways in an attempt to control inflation and exchange rates: "It intervened verbally, and this is a weapon that all central banks use; it intervened using the interest, which grew cumulative until now with one percentage, and intervened in the money market, sterilizing Lei, meaning drawing on central bank deposits the Lei excess on the market"¹⁰⁸⁰. Also, Valentin Lazea considers that NBR should get involved in the currency market, meaning to sell foreign reserves in order to stem the exchange rate, to meddle with the minimum reserve required, and to continue increasing Lei's interest that, together with reducing interest to other international currencies, like the dollar, will grant new desirability.

To act on inflation, in 2009, the National Bank has imposed (as a crisis situation) to commercial banks especially high minimum required reserves: 40% for liabilities in foreign currency and 18% for the ones in Lei. Reserves are at these levels in order to prevent the entering in economy of a massive amount of money that could not be absorbed and thus generate inflation, as lower consumption converts in an abrupt disinflation. During the first part of 2010, NBR lowered the minimum reserve requirements to relaxation which is meant to bring money in the market and restart crediting.

The main implications for monetary policy in EMU accession are: alignment of monetary policy in the Euro area to avoid shocks caused by sudden changes in monetary policy position; maintaining the efforts to reduce inflation in a realistic tempo; it is necessary the preservation of "direct targeting of inflation", i.e. both in the period up to the entry into EMS II and during this phase; currency policy should allow the adjustment of the Leu's real exchange rate; in the period up to the entry into the EMS II, it is necessary to find the equilibrium level of exchange rate, which is then used as a *pivot point*; complete adoption of the *acquis communautaire* in the following two areas - banking and supervisory procedures and improving the institutional framework, strengthening the central bank's independence and ensuring its status compatibility with the "*European System of Central Banks*"; developing the banking system and the overall financial system, in order to increase the rationality of resource allocation and ensure monetary policy with adequate transmission channels; modernizing the payment system and connecting it to the European system TARGET; full harmonization of monetary statistics.

It is impossible to define precisely the policy after entering the EMU, but some general features can be stated as of now with pretty much certainty. First, there will not be an independent national monetary policy, but the participation of NBR representatives to the elaboration of the common monetary policy will be possible. In other words, the monetary policy will be subordinated to the common interest and therefore could not be used exclusively for solving specific problems of the Romanian economy. Secondly, we can make the assumption that until then, the national law which constitutes the

¹⁰⁷⁹ Anghel, Lucian , Sinteze macroeconomice trimestriale Aprilie 2009, BCR.

¹⁰⁸⁰ Medrega, Claudia, *Inflația coboara in aprilie la 6,45%, ajutata si de intarirea leului*. Ziarul Financiar, 13.05.2009.

framework for the adoption of monetary policy decisions would fully match the "European System of Central Banks" regulations.

3.NBR's Technical Preparation for the Euro Adoption in Romania

Preparation of Euro banknotes (denominations, graphics, technical features, safety features) will be conducted by Romania's Central Bank and European Central Bank. The manufacture of coins will be provided by the Ministry of Finance, as the legal issuer of currency will be the National Treasury, and NBR will adjust the amount of Euro coins that will enter the market. All coins of the same value will have the same size, colour, technical features, in all countries. At the moment, Romania provides harmonized statistical information, but some corrections are still necessary. For example, by the end of 2006, NBR used specific definitions of monetary aggregates (monetary base - M_0 , narrow money - M_1 , broad money - M_2 and quasi-money), but recently (March 2007) was decided to adopt the monetary aggregates definitions used by the ECB.

Furthermore, it would be indicated the realization of public information campaigns before the introduction of Euro. The NBR campaign will have to follow the mediatisation of the specific safety features graphics, and the fixed exchange rate¹⁰⁸¹.

The channels used by the NBR to transmit information can be the classical ones, used in any media campaign: the periodic publication of articles in high-circulation newspapers, conducting press conferences and symposiums, making posters and presentation folders, interviews with experts from the NBR and of course, publishing any information on the NBR website.

Especially for rural areas, banknote designs posters, identification elements and other essential information of this process may be displayed in postal offices, bank branches and subsidiaries. The presentation brochures could be made available inside the banks. For areas less connected to the mass media, local administration can be co-opted to publicise this process.

Problems that can increase the amplitude of the banknotes conversion process must be avoided, like the possibility of queues at bank counters, automatic vending machines or shops, and the problem of insufficient supply of cash in banks, the necessary of banknotes being difficult to estimate due to the psychological component - the novelty associated with this process.

4.Conclusions

The specialists' macroeconomic analysis found that Romania meets only one criterion for convergence, i.e. the public debt criterion, and that relatively, given the fast pace of Romania's indebtedness to overcome the economic and financial crisis. Consequently, in order to follow the established schedule, namely entering ERM II in 2012, and adopting the Euro in 2015, it is necessary to employ an appropriate monetary strategy, and developing economic policies that lead to fulfilment of all the convergence criteria.

As regards the monetary policy, it appears not to have changed so NBR will continue the same trend as in 2008 and 2009. However, alarming is that the NBR has not made public a strategy of monetary policy for adopting the Euro in 2015.

Central Bank's independence, reinforced by the latest status of NBR in June 2004, has not always as a support the collaboration with government authorities. A solution in linking monetary policy with the fiscal and financial plans would be the adoption of the strategy of multiannual budgetary programming that would ensure the premises for the Central Bank to meet the inflation targets. Thus, good collaboration between NBR and the Government should create favourable conditions for the performance of both nominal convergence criteria, as well as those of real convergence.

¹⁰⁸¹ Chiru Liviu, Popa, BNR: Adoptarea unilaterală a euro nu este o opțiune pentru România, Ziarul Financiar, 01.05.2009

Prospects for introducing Basel II involves an active collaboration with the banking community, an accurate assessment of internal rating models of credit institutions and strict surveillance conducted by the NBR.

Also, cooperation with monetary authorities, of supervision and regulation from other countries, especially those in the Economic and Monetary Union, is necessary.

In addition, it is recommended that, in 2014, NBR develops an information campaign for the Romanians to prepare them for the actual introduction of the Euro.

„BLACK-SCHOLES MODEL USED TO EVALUATE STOCKS OPTIONS”

Turcan Radu

University: University of Oradea

Faculty: The Faculty of Social and Human Sciences

Partial differential equation, parabolic Black-Scholes type:

$$\frac{\partial V}{\partial t} + \frac{1}{2} \sigma^2 S^2 \frac{\partial^2 V}{\partial S^2} + rS \frac{\partial V}{\partial S} - rV = 0$$

is used in evaluating equity options, that paying constant and continue dividends or in evaluate options in which interest rate, volatility and dividend are dependent on time.

Keywords : stocks, asset-support, options (call and put), contracts (futures and forward), portfolio, model

JEL Classification: G12, G13

1.1 Black-Scholes equation

Further we intend to Black-Scholes equations, capitalizing above the strategy used by Paul Wilmott:

$$\text{Be } \pi = V(S;t) - \Delta S \quad (1)$$

a portfolio consists of option, with value $V = V(S;t)$ and quantity: ΔS (ie: „short” position, for asset-support: S).

Also, consider the value of „ Δ ”:

$$\Delta = \frac{\partial V}{\partial S} \quad (\text{random component: } \Delta(\text{„delta”})) \quad (2)$$

Replaced, value of „ Δ ”: $\Delta = \frac{\partial V}{\partial S} \Leftrightarrow \Delta - \frac{\partial V}{\partial S} = 0$,

in his expression: $d\pi$, we obtain:

$$d\pi = \left(\frac{\partial V}{\partial t} dt + \frac{1}{2} \sigma^2 S^2 \frac{\partial^2 V}{\partial S^2} \right) dt + \underbrace{\left(\frac{\partial V}{\partial S} - \Delta \right)}_0 dS \quad (3)$$

or equivalent:

$$d\pi = \left(\frac{\partial V}{\partial t} dt + \frac{1}{2} \sigma^2 S^2 \frac{\partial^2 V}{\partial S^2} \right) dt \quad (4)$$

(ie: „increase” of π portofolio, free of risk)

But the variation of π , ie: $d\pi$ can write (using the nonarbitration principle) in the form:

$$d\pi = r\pi dt \quad (5)$$

Conclusion:

Replaced the relations: (1), (2) and (4) \rightarrow (5), we obtain:

$$\left(\frac{\partial V}{\partial t} dt + \frac{1}{2} \sigma^2 S^2 \frac{\partial^2 V}{\partial S^2} \right) dt = r \left(V - S \frac{\partial V}{\partial S} \right) dt \quad | \quad dt \neq 0 \quad (6)$$

$$\leftrightarrow \frac{\partial V}{\partial t} + \frac{1}{2} \sigma^2 S^2 \frac{\partial^2 V}{\partial S^2} = r \left(V - S \frac{\partial V}{\partial S} \right) \quad (7)$$

Ordering the terms in relation (29^o), we obtain finally equation seeking, respectively:

$$\frac{\partial V}{\partial t} + \frac{1}{2} \sigma^2 S^2 \frac{\partial^2 V}{\partial S^2} + rS \frac{\partial V}{\partial S} - rV = 0 \quad (\text{Black-Scholes equation}) \quad (8)$$

1.2 Interpretation of the notions:

O_1) Black-Scholes equation (deduced above), was written for the first time in this form, in 1969, but published 4 years later, in 1973, when Fischer Black and Myron Scholes proved the correctness of this equation.

O_2) Black-Scholes equation models a very important financial and economic phenomenon: the assessment of stock options.

O_3) The Black-Scholes equation, there are very important variables and parameters, respectively:

- $S=S(\mu;\sigma) \rightarrow$ stochastic variable (is the value of the asset-holder)

Where:

$$\left. \begin{array}{l} \mu = \text{drift (or unexpected return)} \\ \sigma = \text{asset volatility} \end{array} \right\} \text{parameters associated asset price „S”}$$

$$\begin{array}{l} t = \text{time (deterministic variable)} \\ r = \text{interest rate (without risk)} \\ V = V(S;t) \rightarrow \text{call option value (option to purchase).} \end{array}$$

O_4) Terms: $\frac{\partial V}{\partial t}$; $\frac{\partial V}{\partial S}$ and $\frac{\partial^2 V}{\partial S^2}$, which appeared in Black-Scholes equation, is: „indicators of sensitivity” to change the option value „V”, respectively:

$$\Delta = \frac{\partial V}{\partial S} \rightarrow \text{pointer „delta”, stands for:}$$

„percentage of modified (percentage of modified (∂V) option value V, depending on the value of asset-support (∂S)”

or even: $\Delta = \frac{\partial V}{\partial S} \rightarrow$ „hedge delta” useful (theoretical and practical) to eliminate the risk of a portfolio;

$$\theta = \frac{\partial V}{\partial t} \rightarrow \text{pointer „theta”, is:}$$

„modified of option price (∂V), depending on the variation of time (∂t)”

$$\Gamma = \frac{\partial^2 V}{\partial S^2} \stackrel{\text{def}}{=} \frac{\partial}{\partial S} \left(\frac{\partial V}{\partial S} \right) \rightarrow \text{pointer „gama”, is}$$

„sensitivity (excessive sensitivity) of $\Delta = \frac{\partial V}{\partial S}$, to price variations of asset-support S”

O_5) Finally, in the Black-Scholes equation, deduced previously, appear two terms: $rS \frac{\partial V}{\partial S}$ and rV , where:

- term: $rS \frac{\partial V}{\partial S}$, is the *convection* term of equation;

- term: rV , is the *reaction* term (which balances the first term of the equation $\frac{\partial V}{\partial t}$).

O_6) In conclusion, bringing together the 4 (four) terms:

$$\frac{\partial V}{\partial t}; \frac{1}{2} \sigma^2 S^2 \frac{\partial^2 V}{\partial S^2}; rS \frac{\partial V}{\partial S} \text{ și } -rV;$$

terms characterized briefly, above, we obtain Black-Scholes equation:

$$\frac{\partial V}{\partial t} + \frac{1}{2} \sigma^2 S^2 \frac{\partial^2 V}{\partial S^2} + rS \frac{\partial V}{\partial S} - rV = 0$$

equivalent to a special equations of fluid mechanics, type: „reaction-convection-diffusion”.

1.3 Black-Scholes equation solving

General overview:

Method for solving Black-Scholes equation:

$$\frac{\partial V}{\partial t} + \frac{1}{2} \sigma^2 S^2 \frac{\partial^2 V}{\partial S^2} + rS \frac{\partial V}{\partial S} - rV = 0 \quad (9)$$

aimed at obtaining the solution (exact) for the partial differential equation, parabolic type.

In literature, there are two broad categories of methods of solving this equation (ie: this type of partial differential equations).

- analytic methods
- numeric methods.

The analytical methods we can mention:

Method I: Transforming equation (8), in an equation with constant diffusion coefficient, using the change of variable:

$$V(S; t) = e^{\alpha x + \beta \tau} \cdot U(x; \tau)$$

In finally, „function”/solution $U(x; \tau)$ satisfy the basic equation of diffusion:

$$\frac{\partial U}{\partial \tau} = \frac{\partial^2 U}{\partial x^2} \quad (10)$$

(equation easier to solve than Black-Scholes equation (9)).

Method II, using Green function:

$$V'(S; t) = \frac{e^{-r(T-t)}}{\sigma S' \sqrt{2\pi(T-t)}} e^{\frac{[\log(\frac{S}{S'}) + (r - \frac{1}{2}\sigma^2)(T-t)^2]}{2\sigma^2(T-t)}} \quad (11)$$

Observations:

1) In the limit (when $t \rightarrow T$, and $T-t \rightarrow 0$ and $e^{-r(T-t)} \rightarrow e^0 = 1$) function (derivative I of V , given by (11) becomes *Dirac delta function*, ie:

„A function that is one (zero) everywhere except one point where it is infinite, so that”:

$$\int V'(S; t) dt = 1 \quad (12)$$

2) Function given by (11) is called *Green function*, which by integration, becomes:

$$V(S; t) = \frac{e^{-r(T-t)}}{\sigma \sqrt{2\pi(T-t)}} \int_0^\infty e^{-\frac{[\log(\frac{S}{S'}) + (r - \frac{1}{2}\sigma^2)(T-t)^2]}{2\sigma^2(T-t)}} \cdot \text{Payoff}(S') \frac{dS'}{S'} \quad (13)$$

where:

$\text{Payoff}(S) = V(S; T) \rightarrow$ ie: „profit/or loss for S is equal to the option V , at time $t=T$ ” (14)

There are other analytical methods to assess Black-Scholes equation, for example: Fourier and Laplace transformations.

The methods numericede solving partial differential equations, parabolic type (that is, and the equation: Black-Scholes), we can mention:

Finite difference method with the following:

- explicit finite difference method and

- implicit finite difference method

Very popular in the literature (to category: „numerical methods”) is the *Crank-Nicolson method*, which performs: „mean between the explicit and implicit method”.

Explicit method, applied Black-Scholes equation, to implement Black-Scholes model is applied to options: call and put European-style (or American type).

Default method, Crank-Nicolson equation applied to options: call and put European type, is more difficult to program, but has greater precision.

Final conclusion:

Black-Scholes Equation $\frac{\partial V}{\partial t} + \frac{1}{2} \sigma^2 S^2 \frac{\partial^2 V}{\partial S^2} + rS \frac{\partial V}{\partial S} - rV = 0$ represents a partial differential equation, parabolic type which corresponds to the Black-Scholes Model published by the American economists Fischer Black and Myron Scholes in 1973. This model may be used with success in evaluating equity options.

THE POLICY OF THE EXCHANGE RATE PROMOTED BY NATIONAL BANK OF ROMANIA AND ITS IMPLICATIONS UPON THE FINANCIAL STABILITY

Chifane Cristina

“Constantin Brâncoveanu” University Pitești, Faculty of Management-Marketing in Economic Affairs, Brăila

The more profound world economic crisis has strongly marked the evolution of the Romanian financial system.

The size of current account deficit, the relatively high external financing needs and the dependence of the banks on it, the high ratio between loans in foreign currency and deposits in foreign currency made of the Romanian economy, a risky destination for investors. In these conditions, since the end of 2008 and throughout 2009, the government's economic program was focused on reducing the external deficit in both public and private sector, on minimizing the effects of recession, on avoiding a crisis of the exchange rate and on cooling the inflationary pressures.

Keywords: monetary policy, exchange rate, external financing, budget deficit

JEL classification: E58

1. The interventions of NBR on the foreign exchange market

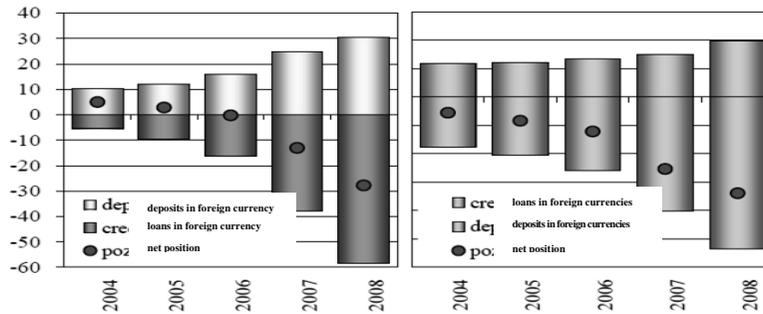

Supported by the global financial crisis, the evolution of the Leu rate has raised major problems. As in the period 2005-2007, the currency incomings have overestimated the Romanian national currency way above the level indicated by the fundamental factors of the exchange rate, the reduction of the foreign financing and the incertitude have afterwards determined an unjustified depreciation of the Romanian Leu. In spite of the high acquisition of currency in the anterior period, The National Bank of Romania has managed only to attenuate the unsustainable appreciation of the Leu, although the challenges in the bank system were very big. In the period 2004-2008, the continuous dynamics of the currency credits would have created negative effects at the level of the bank system under the circumstances of a rapid and excessive depreciation of the Leu (Chart 1).

Between October 2008 and April 2009, the Leu depreciated by 12% in comparison with the Euro (and by 21% in comparison with the Dollar), while the volatility exceeded 30% (Chart 2). These powerful contrasts between the two periods of 2008 could not have been anticipated, considerably affecting the reaction of the members of the economic environment and the business plans.

Chart no. 1. Deposits and loans in foreign currencies

non – financing organizations

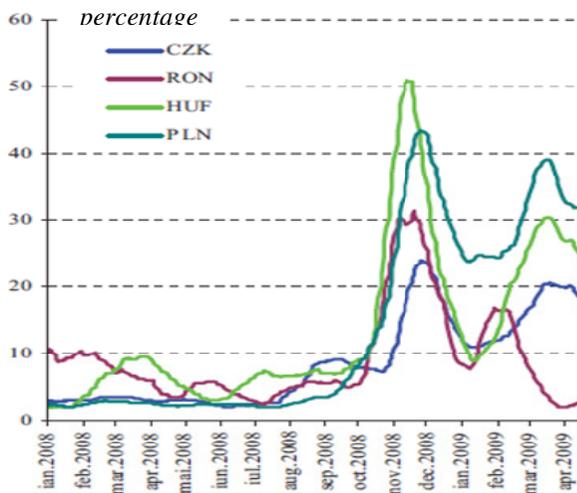

billion lei

Source: National Bank of Romania

The factors which contributed to this interruption in the dynamic evolution of the exchange rate were: **global** – a high incertitude regarding the situation of the global monetary system and the possible repercussions upon the emergent countries and **specific** – the worsening of Romania's qualification credit (of sub-investment) by two rating agencies (Fitch Ratings and Moody's). As one can notice from Chart 2, the volatility of the national currency, although in a significant progress, has remained under the level of other currencies in the region, and at present it registers some of the lowest values.

Chart no. 2. The Conditioned Volatility of the Main Currencies EEC compared to the Euro (percentage, average on a period of 20 days)

In this context, the National Bank of Romania, during the **interventions on the foreign exchange market** was oriented by the idea that a higher volatility of the exchange rate is detrimental to both the objective regarding inflation and the solidity of the real and financial sectors. Even more as the Romanian economy considered to be of small dimensions and with a high degree of openness is permanently exposed to the danger of some unfavourable capital movements at the level of the financial and especially the foreign exchange market.

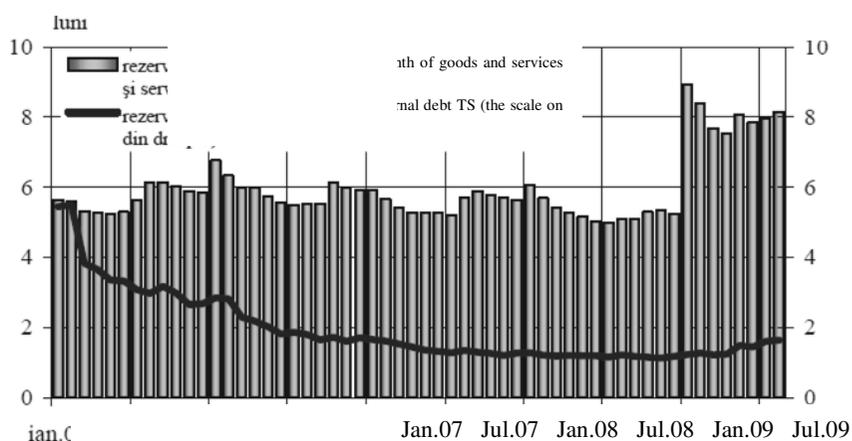

The option of the National Bank of Romania to intervene on the foreign exchange market was not singular in Central and Eastern Europe, the system of managed floating of the national currency being practiced by other Central Banks too, their foreign exchange interventions being amplified after the beginning of the global financial crisis. Under the circumstances, the National Banks

from the Czech Republic, Poland and Hungary, which have a flexible foreign exchange system have pronounced themselves against the excessive depreciation of the local currencies which could create destabilizing movements, promising, in their turn, to intervene in order to combat the phenomenon.

These interventions of the National Bank of Romania on the foreign exchange market have been aimed at the excessive depreciation of the national currency and the depreciation level was correlated to the progress registered by the adjustment of the current account.

These foreign exchange interventions were adjusted according to the **foreign exchange reserves** too. The foreign exchange reserves constituted due to the interventions from the period of overrating (2004-2008) and the sums received as a result of the financing agreement with the International Monetary Fund, the European Union and other international financial institutions have offered the central bank the possibility to support the national currency. Romania's National Bank aims at both the absolute value of the foreign exchange reserves and the derived indicators, respectively the foreign exchange reserve expressed in months of imports of goods and services and the report between the foreign exchange reserve and the short term foreign debt (Chart 3).

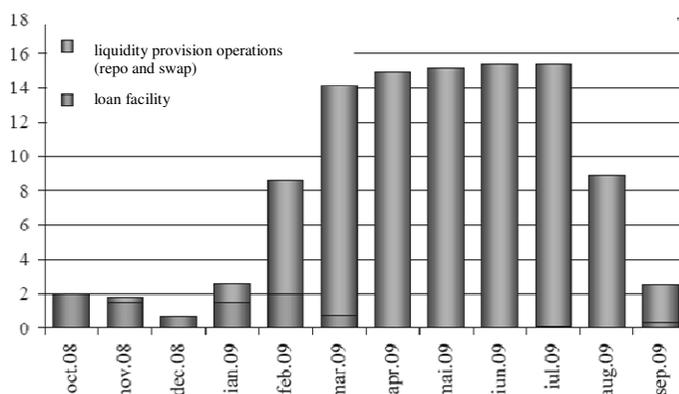

Chart no. 3. Foreign exchange reserves at NBR: derivative indicatives

Source: National Bank of Romania, National Institute of Statistics

The strategy of the National Bank of Romania to reduce the effects of the crisis has been aimed at both the correlated **amount and the moment of the foreign exchange interventions** and the **liquidities control on the monetary market**, under the circumstances in which the financing of the budgetary deficit was mainly done through the usage of the sums received from the International Monetary Fund and the European Union. In 2009, the National Bank of Romania supplied liquidities to the banks after it had been a net debtor towards the bank system due to the liquidity surplus generated by the massive capital inflow in the Romanian economy in the period 2004-2008. The foreign exchange intervention generated by the National Bank of Romania had as a purpose the attempt to avoid the reversal of its position as a creditor towards the bank system, a situation which could have caused problems for the implementation of the monetary policy (Chart 4).

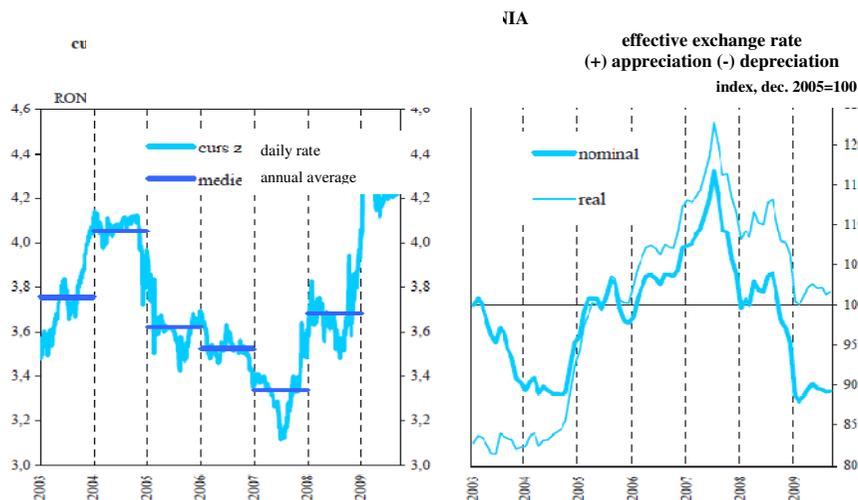

Chart no. 4. Liquidity provision operations

Source: National Bank of Romania

In this context, we can say that the foreign exchange interventions were necessary not only to maintain the exchange rate but also to properly manage the liquidities on the monetary market (Chart 5).

Chart no. 5

Source: BCE, BRI

Diminishing the depreciation of the Romanian Leu and implicitly the inflation pressures which appear by means of the exchange rate together with the fiscal consolidation efforts have allowed the National Bank to pass on to the **cautious relief of the monetary policy** ever since the beginning of 2010. The National Bank has taken the following **measures**: decreasing the monetary policy interest rate to 6.5%¹⁰⁸² per year, maintaining the present levels of the minimum reserves rates applied to both domestic and foreign currency liabilities of the crediting institutions

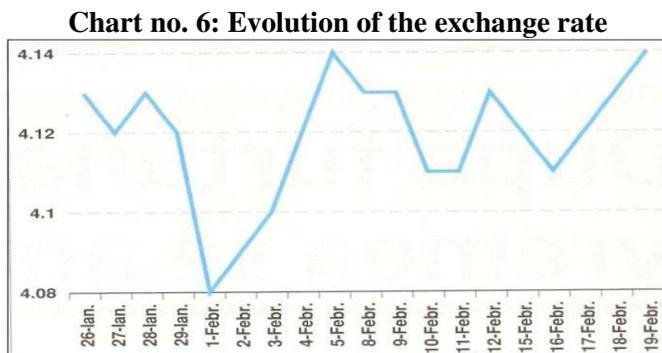

¹⁰⁸² During the meeting on 29 March 2010, the Administrative Board of Romania's National Bank decided to reduce the monetary policy interest rate to 6.5% per year.

(15%, respectively 25%), firm administrating of liquidities in the bank system in order to consolidate the signals sent by the monetary policy.

2. The measures adopted by NBR to support the exchange rate

The beginning of 2010 marked for the national currency the highest appreciation in Europe as regards Euro and one of the highest level in the world, it only being overpassed by the Japanese yen.

Among the factors that sustained the appreciation of our currency – “leu” – in January can be mentioned: the unfavourable international opinions to European currency which has registered significant depreciation as regards many other currencies such as dollar, yen or the currency met in East European area, as well as the events on the internal level such as the declaration of IMF representatives as to the funds granted to Romania (Chart 6).

Source: NBR

In the years to follow, the exchange rate had contradictory evolutions, the depreciation being influenced by the publication of data regarding the evolution of the Romanian economy in the latter half of the year and by the information regarding inflation in January.

Therefore, the 4th term of the 2009 year did not mark the end of recession, but a deeper contradiction in comparison to the former term, and the inflation proved to be quite alert (+0,5pp. as to December 2009).

The analysts foresee for the end of this year a rate of 3.95 lei / Euro on the background of improving the economic basis. The positive signals will not cease to appear, the appreciation of “leu” being influenced by the positive perception of the investments for Romania drawn by high rentability as well as by low risks as a result of the positive answer connected with the receipt of financial instalments from national investments.

3. The Agreements with the International Monetary Fund and the European Union - a Support for the Consolidation of the Macroeconomic Balance and the Financial System

Under the circumstances of a slow recovery from the crisis, **the loan agreements** negotiated with **the International Monetary Fund and the European Union** and with the Global Bank and other international financial institutions purport to financially support the Government’s economic program of macroeconomic and financial consolidation. The agreement with the International Monetary Fund and the European Union indirectly aims at an ordered adjustment of the foreign deficit with direct positive effects upon the exchange rate and implicitly upon the financial position of the companies, the population and the bank sector. These agreements have a clear preventive character ensuring **a higher degree of credibility to the Government’s economic program** as well as the financial resources for **the correction of the macroeconomic lack of balance**.

Taking into consideration the general positive evaluation regarding the bank sector, the agreements with the International Monetary Fund and the European Union aim at ensuring the

solvency of the Romanian banks in order to have a safety margin in front of some possible new pressures generated by the global financial crisis. For this reason, the solvency of the banks will be of at least 10% during the agreement (2009-2010) compared to 8% as it is stipulated.

The agreements with the International Monetary Fund and the European Union stipulate other temporary (2009-2010) or permanent measures too. The banks which commit themselves to maintain the exposure on Romania during the program and raise their own funds to ensure a solvency above 10% will no longer be expected to have minimum reserves for the subordinate loans coming from the action holders or the international financial institutions.

The credibility acquired due to the influence of the European Commission and the International Monetary Fund ensured the financing of the Romanian economy, a financing which has reflected positively in a few directions: relatively hire investments comparatively to the situation in which the agreements would not have been closed; the attenuation of the Leu exchange rate depreciation in comparison with Euro and other currencies. Signing the Vienna Treaty by means of which the banks have committed themselves to renew the financing lines and preserve the capital rates at satisfactory levels.

Conclusion

Resuming the capital inflow in 2010 could mean increasing the amount of money in economy which has to be sterilized by the National Bank of Romania. Otherwise, if the capital inflow could not be sufficiently reduced, then the National Bank of Romania could be forced to increase the international reserves by means of purchases on the interbank market. At the same time, this process of resuming the capital inflow determines new requests of coordination between the monetary policy and the fiscal policy. In order to attenuate the inflation pressures, in 2010 the budgetary deficit should be diminished. Otherwise, the monetary policy would have to compensate the differences and adopt the necessary measures, among which the one referring to the dimension of the monetary interest rates.

Due to the process of foreign financing and capital inflow resuming, the adoption of political decisions in conformity with the European measures of pump priming represents a positive sign since the IIIrd trimester of 2010.

In this paper we are analyzing the current state of the Romanian banking system which is facing different challenges due to the economic crisis. Identifying the main channels of crisis transmission, we can notice that the banking system has played a major role due to its structure, and the change of the banking behavior on the Romanian market. Analyzing the main indicators reflecting the health of the banking system, hence of the economy, generally speaking, the paper is trying to identify the measures which should have been taken and we still believe should be taken in order to obtain the economic recovery, the premise of a healthy economic growth.

Keywords: financial crisis, channel of transmission, Romanian banking system

JEL classification: G01, G21

1. The general frame

Considering the latest evolutions, the Romanian banking system can be considered as being stable, with a level of capitalization, solvability and liquidity according to prudential demands, despite accelerated crediting in the latest period of time and the deep effects of the international economic crisis. In general, the level of prudential indicators does not produce major concerns, but the tendency has to be monitored carefully taking into consideration the uncertain perspectives of the world economy. According to Professor Victor Jinga, the banking system¹⁰⁸³ is „an assemble of different banks, organized around a Central Bank, in order to coordinate the discount and re-discount of credits, placements and management of bank deposits”. The Romanian banking system is organized on two levels¹⁰⁸⁴:

- At the *top* – the National Bank of Romania, as a central bank for the Romania, exclusive emission body;
- At the *base* – commercial banks.

The central bank should ensure sustainability of the banking system, influence its behavior in order to fulfill objectives of the economy¹⁰⁸⁵. With the adhesion of Romania to the European Union, in 2007, The Romanian National Bank has become a member of the European Central Banks System (SEBC), and the Governor of BNR, a member of the European Central Bank General Council (BCE).

Taking into consideration the fact that the banking system was organized on the form of ownership, until December 31st 2009¹⁰⁸⁶, the Romanian National Bank has authorized 42 credit

institutions, Romanian legal persons, to service financial services in national currency and in foreign currency, of which there are 2 state owned capital banks, 4 private national owned capital banks, and 25 foreign owned capital banks, 10 subsidiaries of foreign banks and Creditcoop.

Table nr.1- Credit institutions

	number	
	dec. 2008	dec. 2009
State owned capital banks	2	2
Private national owned capital banks	3	4
Foreign owned capital banks	27	25
Subsidiaries of foreign banks	10	10
Total banking system	42	41
Creditcoop	1	1
Total credit insitution	43	42

Fig.1. Share of assets according to the source and structure of capital¹⁰⁸⁷

About the share of assets according to the source and structure of capital, in the 2000's **almost 50%** of the assets in the banking system were owned by state owned capital banks as opposed to 2009 when under 7% of bank assets were owned by state banks. Even though they own more than half the banking system assets, the first 5 banks according to the level of assets have continued to narrow down their heft in the banking system, from 56,3% in December 2007, to 54,3% in December 2008.

This reduction of the market share in favor of smaller banks has occurred because of the higher and higher level of offer attraction and diversity of bank product and also because of the aggressive policy of client portfolio widening.

Table nr.2: Net assets¹⁰⁸⁸

	Ponderosity(%)	
	dec. 2008	dec. 2009
State owned capital banks	5,2	7,3
Private national owned capital banks (including the subsidiaries of foreign banks and Creditcoop)	94,8	92,7
Of which:		
Foreign owned capital banks	88,2	85,3
Of which:		
Subsidiaries of foreign banks	5,6	7,4
Total credit institutions	100,0	100,0

The net assets of the banking system was 330,6 billion lei at the end of 2009, similar to the level of December 2008. In its structure, the private segment continues to hold the dominant position (92,7%) and the public segment holds 2,1%. The stagnation of net assets is attributed mainly to the divergent evolution of the main components. On one hand , the

non-bank clients credit activity has tightened with 4,4% in real terms compared to last year, their

1087

Source for the data: Report on financial stability 2009, www.bnro.ro.

1088

Banks (legal romanian persons), subsidiaries of foreign banks and Creditcoop.

heft lowering to 60,2% with 3% less. On the other hand, the credit institutions prefer placements in state notes, their heft in the structure of the assets had a significant rise (from 3,3% to 7,9%). When it comes to foreign owned capital banks, the first 3 countries regarding the capital level are: Greece (22,4%), Austria (8,4%) and Holland (9,2%). The most important change was attributed to Greece, which starting 2008, has transferred to the first position of the top foreign capital participation in Romanian banks.

2. Ways of transmitting the crisis in the Romanian Banking System

The rush for widening the clients' portfolio in order to obtain higher profitability seems it hadn't the anticipated effect, on the contraire, has led to the alteration of the bank's financial situation, which did not think about the fact that more is not necessary better. From this to the financial crisis of 2008 was not a long road. This recession period is, according to Daniel Daianu, the result of the fact that not enough was learned from previous crisis episodes during the latter two decades, and we did not pay attention to the severe warnings from prestigious financial experts. History has also shown that excessive greed is the recipe for failure.

We can affirm that the banking system has played a decisive role in triggering the crisis, which as expected created the spillover effect, flooding all sectors, mutating from a banking crisis into a financial one and further into an economic one.

Most economic analysts have identified a moment and a place for the crisis emergence, the dramatic fall of the home prices in the US, manifested starting 2006, followed by the collapse of the mortgage market, but its causes are pre-sciented from the beginning of the century. The blame falls on the monetary policy adopted by banks from great world powers – US, Japan, UK – characterized by a low interest rate that facilitated the populations' access to cheap crediting.

As a result, this led to excessive liquidity, which increased consumption of goods and services. The immediate consequence was an ungrounded rise in home prices generating a real-estate boom.

Another cause of the actual crisis is moral hazard¹⁰⁸⁹, a concept based on the principle too big to fail, according to which the state rescue coil for corporations, that cannot be left to bankruptcy, being too important for the economy. The banks now act more irrationally and riskier. Relaxing the crediting conditions for the population did not stop at low interest rates but also the eligible credit receivers range was widened. The debtors were not sufficiently analyzed and credits were given to people that had a bad credit history: late bill payments, low income, residual rates for other credits, inadequate guaranties. So subprime credits had a major contribution in triggering the crisis, because it determined the accumulation of underperformance credits in the banks portfolios.

Financial innovations also had a negative effect because they were followed by a lack of market transparency. Asset Backed Security bonds were created, which means a bank sells low liquidity assets to an intermediate firm that finances the transaction by emitting certificates guaranteed by the previous mentioned assets. The bank is benefits by taking these credits out of the balance¹⁰⁹⁰ and by gathering liquidity that can be invested in profitable activities, or using it to pay dividends or to give credits.

None the less, rating agencies activities can be questioned. There is a conflict of interest because the rating agencies are paid by those whose instruments they evaluate. As a result it is highly likely that the rating does not reflect the reality and it creates the impression that the instruments or the financial institutions are safe when in fact they have a high risk incident¹⁰⁹¹. So the

¹⁰⁹⁰ Silviu Cerna, *Turmoil in International Financial Markets: Causes, Consequences, Remedies*, West University, Timisoara.

¹⁰⁹¹ Luminita Todoran, *Financial crisis' effects on the Romanian economy*, West University, Timisoara.

objectivity of these agencies can be altered and this would lead investors to erroneous decisions. Analyzing the succession of events that paint the crisis picture we notice that the first moments of decay for the American economy appear in 2006, when the volume of sales decreases and the non-imbursed mortgages increase. The follow-up is the great number of bankruptcies in 2007 beginning with New Century Financial, specialized in subprime credits. 2008 is the year of bankruptcies and surprising nationalizations: Bear Stearns, Fannie Mae, Freddie Mac, Merrill Lynch, Lehman Brothers. Financial turbulences are felt all around Europe, starting with UK, Holland and short after by the official recession of the US (December 1st 2008), and of the Euro area.

How was the crisis exported into Romania? The answer that puts together all the channels of crisis transmission is: Globalization! The development of commercial relations between countries determines a propagation of unbalances much more rapid towards partners of the affected countries. If in July 2008, Lucian Croitoru was transmitting an optimistically message, as an advisor for the BNR governor, saying that “the Romanian banking system is feeling good”, because “international turbulences have not affected it¹⁰⁹²”, presently we are searching for measures to limit the crisis effects on our economy.

The crisis was transmitted into Romania through different channels, indirectly (commercial channel, financial channel, trust channel, balance) and directly (bank sector, capital market and foreign currency channel). Through the commercial channel Romania is affected by its commercial relations with the US and other EU states noticing fewer export or even no exports at all in certain sectors. Through the financial channel, the crisis limits access to external financing and diminishes the crediting volume generating difficulties that “helps” external private debt. Regarding the trust channel, a lot of foreign investors have left Romania, which had as an effect the remission of the foreign investments flux. On the effects channel a deterioration of the population and companies net asset took place, following the fact that foreign currency credits had a high heft and because the fall of mobile and immobile assets prices.

Directly, the most exposure to the crisis’ effects had the Romanian Banking System, because of the fact that it is mostly made out of foreign owned capital banks. As so, problems could rise regarding refinancing resident banks, and its consequences would be the limitation of credit lines for Romanian banks, meaning a more difficult access to external financing for the Romanian private.¹⁰⁹³ A positive aspect of the fact that Romania’s Banking System has not been exposed to toxic assets, not emitting mortgage guaranteed bonds, and also the fact that the heft of the mortgage client in the amount of non-governmental credit is relatively small. When talking about the capital market, we can observe that the evolution of Bucharest Stock Exchange’s indicators has been affected, especially on the financial institutions bonds segment, and the liquidity of the market has reduced. The effects of the crisis were felt on the foreign currency channel also, the volatility of the exchange rate has affected economic agents and also people. The RON depreciation created difficulties for importers and debtors that have taken loans in foreign currencies, while the appreciation over a certain limit has under-privileged exporters.

3. The condition of the Romanian Banking System in the economical crisis context

At macroeconomic level, in Romania, the economic growth took place on unsustainable basis, based on credit consumption of imported goods. As a consequence a current account deficit took place, which indicates the dependence of external financing¹⁰⁹⁴ so that governmental credits

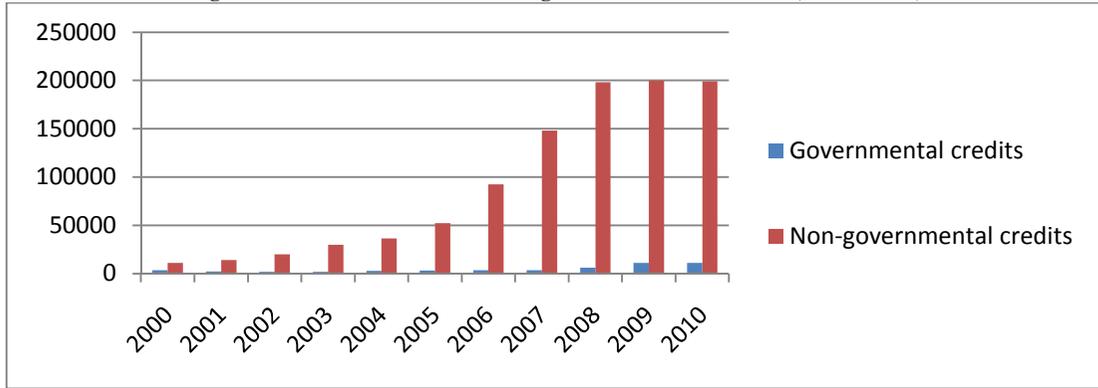

¹⁰⁹² Lucian Croitoru, interview given to the ‘Bursa’ magazine.

¹⁰⁹³ Silviu Cerna, *Turmoil in International Financial Markets: Causes, Consequences, Remedies*, West University, Timisoara.

¹⁰⁹⁴ Mugur Isarescu, *The International Financial Crisis and Challenges for Monetary Policy in Romania*.

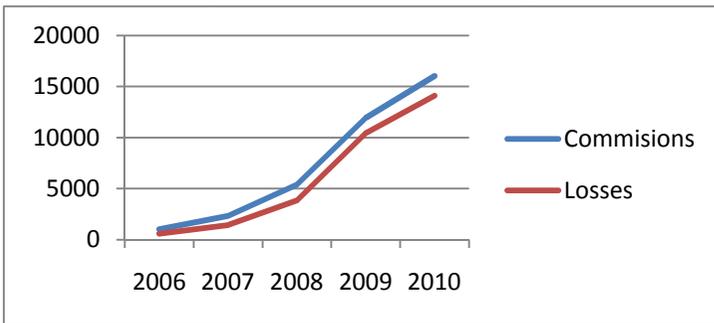

become double in 2009 compared to 2007. As non-governmental credits are concerned there is a roof level beginning 2008, when in previous years there was an alert growth due to the unsustainable economic growth.

Fig. 2 Governmental and non-governmental credits (mil. RON)

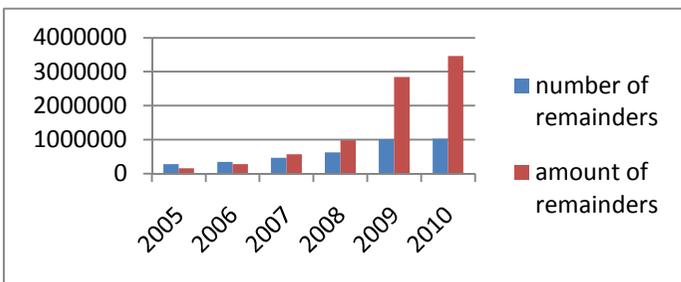

The roofing took place after the crisis begun because of the reticence towards credit of nonbanking economic agents but also because of the alterations in the banks consumers behaviour. Banks have become more prudent regarding credits for crisis affected sectors (constructions, petrol industry, automobiles, textile industry).

Fig.3 Evolution of commissions and losses of banks

The reticence of banks to give credits is put upon the growth of losses, which led to more commissions, limiting the crediting possibility.

Fig.4 The evolution of number and amount of bank remainders

Economic growth based on credit consumption of imported goods facilitated the conditions of crediting during 2006 and 2007. We could notice that after that period, beginning 2008, and an increase in the number of arrears. The remainder sums grow at a higher rate because of remainder credits.

Conclusions

Taking into consideration these characteristics of Romania's economy, the answer to the adverse effects of the crisis cannot be similar to the one formulated by some European countries or the US. The measures used in other countries cannot be simply duplicated. At a macroeconomic level, the main stimulation measures for the economy are as followed:

-adopting a complete and coherent mix of policies, by strengthening the fiscal policy and the income policy¹⁰⁹⁵;

¹⁰⁹⁵ Mugur Isarescu, *Romania in the Context of the Global Financial Crisis: An overview*, presented at the "How is the World Different After The Financial Turmoil?" conference.

-improving the absorption capacity for structural funds and replacing the private external financing with public external financing;

-creating new jobs in less occupied domains (infrastructure, tourism, food industry)that can slowly take on the role of an economic growth motor.

As the banking system is regarded, we believe that a series of actions are necessary in order to relaunch the activity of financial institutions like:

-holding the credit lines from mother banks towards their subsidiaries;

-relaunching the crediting process;-sustaining the national currency credits;

-a careful analysis of credit applicant, that take into consideration their capacity to reimburse the credit;

-soliciting guaranties accordingly to the given credit by orienting towards complementary services: Internet Banking, Mobile Banking, Home Banking;

-stimulating economy on one hand, and the justified consumption on the other hand.

After the year 2008 has been characterized by significant growth in all areas, 2009 has brought the most severe crises ever experienced in the latest decades. It seems that 2010 won't be problems free, because Romania's banking system profitability will remain at a low level, the level of un-efficient credits is expected to rise, the volume of the populations' and companies' deposits will also rise, 2010 being considered a year of economy. Probably, the banking system will know a visible come-back only in 2011.

NEW INTERNATIONAL FINANCIAL REGULATION: NECESSITY OR REQUIRED BY CRISIS

Zapodeanu Daniela

University of Oradea, Faculty of Economics

Cojocari Anatol

University of Oradea, Faculty of Economics

Marian Dan Sebastian

University of Oradea, Faculty of Economics

The global economic and financial crisis showed the limits faced by the international financial system. International financial regulations in general, and especially the banking sector regulations, should be refined and adapted to build a stronger and stable international financial system. We analyze the main trends in international regulations: the proposed amendments on capital requirements, the introduction of a global standard for liquidity and indebtedness, the winding-up directive, as well as their impact on the Romanian financial system.

Keywords: international regulations, global standard, winding-up directive

JEL classification: G01, G21

Introduction

The actual economic crisis made it clear that the way markets, financial institutions and international financial agents function needs reanalyzing, which led to a different level of understanding the way these institutions function but also to realizing the need to establish new rules, regulations and procedures. Due to the fact that the crisis is constructed as following: banking crisis financial crisis economic crisis, it becomes stringent the need to establish the rules on financial and bank markets; so the concept of financial stability exceeds reporting on country level, a certain financial stability on international markets level is needed. What began as a banking crisis on the American market has all the chances to become countries' crises (the example of Greece). Romania was affected by the international crisis, first through the banking and financial channel, and then through the commercial channel; none the less the problems our country is facing are not due exclusively to the international situation but more to great existing unbalances: rapid growth of income as opposed to the level of productivity, the current account deficit of over 10% before the crisis, a oversized state apparatus etc. It is necessary to understand the concept of financial stability, so according to The National Bank of Romania, stability is : "...a financial system, indifferent to the its size or complexity, is stable when it has the capacity to facilitate economic performances and to correct eventual unbalances that could happen as a result of adverse shocks¹⁰⁹⁶," or in Cerna(2008) "financial stability is a characteristic of the financial system, which is the ability to absorb financial unbalances that can emerge as a result of endogenous or exogenous factors of relevant size and unanticipated, by this reaching specific performance¹⁰⁹⁷". On an international level there are different organisms, governmental and non-governmental, that trace, recommend or implement different actions regarding the stability of financial systems like: The Bank of International Regulations through Basel I and Basel programs, Financial Stability Board, International Association of Insurance Supervisors,

¹⁰⁹⁶ Raport privind stabilitatea financiara, 2006 , <http://www.bnro.ro> .

¹⁰⁹⁷ Cerna Silviu &altii in Stabilitatea financiara, pg.12, Editura Universitatii de Vest, 2008.

International Association of Deposit Insurers, together with different commercial banks. In Romania, the Romanian National Bank writes, beginning 2006, “Reports on financial stability”, a document that is interested in : the international economic and financial context, the financial market and its risks, the infrastructure of financial markets, the institutions of the financial markets. The main indicators used in analyzing the financial stability are¹⁰⁹⁸:

- the system of indicators proposed by the International Monetary Fund (financial soundness indicator);
- stress-testing, that means a series of response tests of the financial system, to the factors of speculative pressure;
- early warning systems;
- other methods of analyzing and evaluating financial stability.

Even though there is large number of indicators at the disposal of the national and supra-national surveillance authorities, the world economic crisis has showed that new regulations are necessary. Implementing the Basel II recommendations in the EU has been realized by¹⁰⁹⁹ : Banking Consolidation Directive 2006/48/EC (BCD), Capital Adequacy Directive 2006/49/EC (CAD), which together have constituted the Capital Requirements Directive (CRD). CRD aims to ensure the financial soundness of credit institutions (banks, investment forms, etc) the Directive stipulates how much of their own financial resources such institutions must have in order to cover their risks and protect their depositors¹¹⁰⁰. Basel II implemented through CRD, beginning January 1st 2007, is based on 3 pillars¹¹⁰¹:

10. Minimum Capital Requirements. That aims minimum capital levels, credit risk, operational risk and market risk.
11. Supervisory Review. Regarding management risk and transparence of surveillance.
12. Market discipline. Completes the first two pillars by developing means of disseminating information to market participants giving them the necessary information regarding the level of capital, risk exposure and risk management.

Evolution of the world economy, the rise of interconnectivity at a global level, development of security and especially the economic crisis has made CRD out of date, new instruments and regulations being necessary in order to face the current challenges. So, beginning 2011, two new amendments, CRD 2 and CRD 3 will become effective, completing and bringing up to date CRD/Basel II, and also another amendment, CRD 4 is taken into consideration for the future.

Table 1. Capital Requirements Directive¹¹⁰²:

CRD 2	CRD 3	CRD 4
quality of firms capital	higher capital requirements for re-securitisations	<i>further counter-cyclical measures;</i>
management of large exposures	upgrading disclosure standards for securitisation exposures	<i>dynamic ‘buffering’ of loans;</i>
supervision of cross-border banking groups	strengthening capital requirements for the trading book	<i>liquidity standards</i>

¹⁰⁹⁸ Dupa Cerna Silviu & altii in Stabilitatea financiara, pg.79, Editura Universitatii de Vest, 2008.

¹⁰⁹⁹ Strengthening Capital Standards 3, Financial Services Authority, December 2009, pg.3,

<http://www.fsa.gov.uk/>

¹¹⁰⁰ Ibidem.

¹¹⁰² Strengthening Capital Standards 3, Financial Services Authority, December 2009, pg.7,

<http://www.fsa.gov.uk/>

CRD 2	CRD 3	CRD 4
risk management of securitisations		<i>foreign currency mortgages;</i>
different operation on the CRD hybrid capital instruments		<i>supplementary measures (possible leverage ratio)</i>

CRD 2 & 3

Improving the quality of firms capital will be made by establishing criteria for assessing the eligibility of hybrid capital to be counted as part of a firm's overall capital. The proposals specify the features that hybrid capital must have regarding permanence, flexibility of payments and loss absorbency to be eligible as Tier 1 capital. Hybrid capital is define as being " ... a form of debt that has been substituted for equity. This type of capital has both debt and equity features. This covers a variety of instruments, such as preference shares, that are not pure equity but have traditionally been deemed close enough to it to count towards a bank's tier one capital ratio - the key measure of financial strength"¹¹⁰³

Table 2¹¹⁰⁴: Characteristics of hybrid capital

Type of instrument	Permitted features
Undated	Cannot have an option to redeem in the first five years
	No incentives to redeem allowed within first ten years
	Can be included within any bucket depending on features
	Calls allowed in 35% and 15% buckets
Dated	Must have an original maturity of at least 30 years
	No incentive to redeem allowed
	Must have a 'lock-in' feature (eg. may not be repaid if in breach of capital requirements at maturity) and supervisors may stop repayment
	Calls allowed after five years
	Included within the 15% bucket

Effects of this measure: rise in the capital cost for affected companies, but also they will lead to a rise in companies' capitalization, lower bankruptcy risk, reduces contagion risk, lowers the impact of future financial crises (reduces moral hazard).

Large exposures management regime will applies to exposures to counterparty or a group of connected clients. The basic limit is set to 25% of the company capital resources, but isn't considered that this limit could equal up to 50% of the TIER 1 (and up to 100% of the CORE TIER 1) CRD 3 will enhance CRD by adding higher capital requirements for re-securitisations

¹¹⁰³ According with <http://lexicon.ft.com/term.asp?t=hybrid-capital>

¹¹⁰⁴ Strengthening Capital Standards 3, Financial Services Authority, December 2009, pg.27, <http://www.fsa.gov.uk/>

(the 5% skin proposal), upgrading disclosure standards for securitisation exposures and strengthening capital requirements for the trading book.

CRD 4

If CRD 2 and 3 continue to base themselves on the Basel II paradigm, CRD 4 aims the strong reformation of the financial system, but especially the banking system, by introducing new requirements and measures like: counter-cyclical measures, dynamic buffering of loans, quantitative liquidity standards and systemically important financial institutions. foreign currency mortgages and possible an leverage ratio. One of the most important one is the liquidity standard which is set to be implemented with CRD 4. It will two components: liquidity coverage ratio and net stable funding ratio. The liquidity coverage ratio “identifies the amount of unencumbered, high quality liquid assets an institutions holds that can be used to offset the net cash outflows it would encounter under an acute short-term stress scenario”¹¹⁰⁵, so it will deal with the liquid assets on the short-term. The net stable funding ratio measures “the amount of longer-term, stable sources of funding employed by an institution relative to the liquidity profiles of the assets”¹¹⁰⁶.

Dynamic buffering loans (dynamic provisioning) will help to deal with the pro-cyclical in the banking sector, allowing early detection of credit losses in loan portfolios, enabling bank to build up a buffer in good times that can be used in bad times. They have an anti-cyclical nature that enhances the stability of the banking system as a whole.

Table 3¹¹⁰⁷

Historic cost accounting						Dynamic provisioning					
Balance sheet	1	2	3	4	5	Balance sheet	1	2	3	4	5
Loans balance sheet value	100	100	100	100	100	Loans balance sheet value	100	100	100	100	100

¹¹⁰⁶ ibidem

¹¹⁰⁷ Exemple After Financial Stability Review- Dynamic provisioning: issues and application, pg 131, www.bankofengland.co.uk

Dynamic provisions are being already applied in Spain since 2000. The mechanics is as follows¹¹⁰⁸: -the total provisions are the sum of specific (*dot.espe*) and general (*dot.gen*) provisions.

$$dot.gen_t = \alpha \Delta C_t + (B - \frac{dot.espe_t}{C_t}) * C_t$$

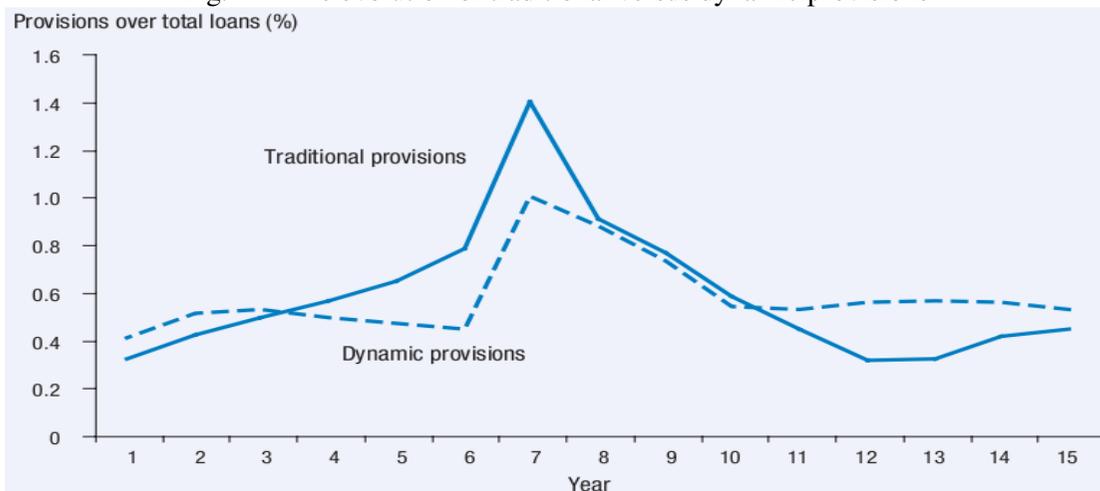

Where C_t is the stock of loans and its variation (positive in a lending expansion, negative in a credit crunch), covers the latent loss, and beta is the average specific provision for a full lending or

business cycle. There are 6 risk buckets, each with a different alpha and beta, they are:

	Alpha %	Beta %
Negligible risk, represented by cash and public sector exposures.	0	0
Low risk – mortgages with a loan-to-value ratio below 80% and exposures to corporations with A rating or above.	0.6	0.11
Medium-low risk, mortgages with a ratio above 70% and other collateral loans.	1.5	0.44
Medium risk, other loans (corporate exposures below A rating, SME)	1.8	0.65
Medium-high risk, consumer durables financing.	2	1.1
High risk, credit card and overdrafts.	2.5	1.64

While there levels may not be able to cover the all losses in case of an economic crisis they have proved useful in Spain. In 2007 the level of accumulated provisions was¹¹⁰⁹ 1.3 % of the total consolidated assets, while the capital and reserve represented 5.8 %.

Fig. 1¹¹¹⁰ The evolution of traditional versus dynamic provisions

It can be observed that using the dynamic provisions the banks exposures is not so pro-cyclical, and it offers them a buffer to use in moments of stress. The experience of Spain is very important for implementing such a method throw CRD 4, even if know Spain has a level of unemployment close to 20% it's banking system is stable.

Conclusions

¹¹⁰⁸ Dynamic Provisioning, The experience of Spain, pg. 2, www.rru.worldbank.org

¹¹⁰⁹ Ibidem, pg. 6

¹¹¹⁰ Ibidem, pg 4.

The global economic crisis has shown that current systems, especially Basel II, are no longer sufficient to cope with new type of challenges of global and financial type, even though Basel II was not the best safety net for the financial sector (or to the banking sector in particular) it was still better than the lack of any legislation. Thus the new rules and regulations issued by international supervisors are develop on the skeleton of Basel 2; CRD 2 & 3 & 4 will improve the current system, specifically by an increase in the stability of the financial sector. The CRD 2 directives which included proposals to be implemented by the end of 2010, but especially in discussions CRD 3 & 4, shows that we are heading towards a new approach both at micro as macro stability,

Babeş Bolyai University, Faculty of Economics and Business Administration

Muller Victor Octavian

Babeş Bolyai University, Faculty of Economics and Business Administration

The main objective of the paper is to bring to the forefront the environmental audit and the environmental risk when auditing financial statements, in order to obtain an image on what environmental aspects represent in the field of audit. The study is based on a fundamental, theoretical research and on a questionnaire applied to financial auditors regarding their involvement in providing environmental audit. Objectivity of environmental information can be achieved only by means of the audit process. The paper supplements previous studies regarding environmental audit and brings a model for environmental accounting and audit of information.

Keywords: environmental disclosure, environmental audit, financial audit, financial auditors

JEL Code: M420

1. Introduction

The industrial development, sustained by the economic and technological progress, has been criticized for its devastating impact on the environment companies having been urged to become responsible as far as their impact on the environment is concerned. In response, many companies have begun to report ecologic activities and environmental performance and these aspects fall under the attention of the company's management, accounting professionals, researchers, regulation bodies and media. Large scale use of environmental reporting for a variety of purposes poses the problem of whether this information is objective or not. Checking the objectivity of such information can be performed by means of audit process. The same as for environmental information included in the financial statements the information presented in the environmental reports and sustainable reports are also the subject of audit process. In a study conducted by KPMG regarding the publishing of environmental information, it has been proven that most companies audit the environmental reports independently from the financial reports and that the number of companies auditing their environmental reports is increasing (Benţianu and Georgescu, 2008).

2. Research methodology

The objective of the research paper is represented by the presentation of environmental audit and environmental risk when auditing financial statements, in order to have an image of what environmental aspects mean in the audit sphere. During this research we have raised questions which we tried to answer to: Which are the environmental aspects that an auditor must have in view when auditing financial statements? What is the role of environmental audit in evaluating the way environmental aspects are being controlled and managed? Which are the similarities and differences between environmental and financial audit? What is the involvement of accounting profession in the performance of an environmental audit?

The presentation of the role of financial and environmental audit in reflecting the objectivity of environmental information supplied is based on a fundamental, theoretical research. Also, by

means of a questionnaire applied to financial auditors in Romania we have analyzed the involvement of accounting professions in the performance of environmental audit.

3. Financial Audit and Environmental Aspects

The parties that are interested in a company's financial statements need to be certain that these reports reflect a clear and complete image of the company's performance and position. Auditing financial statements or financial audit provides such assurance, thus playing an important part in providing credible and objective information to interested parties.

The specific role of financial audit process is to evaluate and report the conformity of information included in the financial statements to a series of preset criteria. The objective of financial audit is to give the auditor the possibility to express an opinion regarding the degree in which financial statements are being elaborated in conformity, under all significant aspects, to an identified accounting reference system. When environmental aspects are significant to a company, there is a risk for occurrence of significant misrepresentations or inadequate or incomplete presentation of information within the financial statements. In such cases, the auditor must pay proper attention to environmental aspects during audit of financial statements.

After having brought environmental aspects to the forefront of financial audit and the importance of financial audit related to environmental performance management, we have analyzed the aspects an auditor must have in view in order to discover the risk of significant misrepresentations in the financial statements due to environmental aspects: getting to know the client, evaluating the risks and the internal control, the role of valid legislation and regulations, the basic procedures.

As shown in studies conducted by Gray and Bebbington (Gray, 2006; Bebbington and Gray, 2001) the financial statements are incomplete or insufficient in order to reflect an accurate image of the company's environmental impact. Environmental management accounting and the environmental reporting represent the two pillars supplementing the shortcomings of the traditional financial accounting system as far as company's environmental impact is concerned. If the environmental aspects included in the accounting standards and regulations are certified by means of financial audit, as presented above, we have questioned ourselves: who handles the certification of information provided by environmental management accounting and information included in the sustainable reports, more precisely the environmental reports, in order to offer environmental information users an assurance regarding the accuracy of such information? The response to this question is the environmental audit.

4. Environmental Audit

The increasing number of voluntary environmental reporting by the developed countries companies, as well as the legal requirements related to reporting certain environmental aspects in many European countries (Denmark, Holland, Norway, Sweden etc.) and more (USA, Canada, Australia etc.) raised issues regarding the certification of information included in these reports. The *environmental audit* is the response to such issues, becoming more and more accepted in various sectors of activity, because its greatest benefit is the gradual reduction of the company's environmental risk (Unhee, 1997; Stanwick and Stanwick 2001, Mishra *et al.*, 1997).

Environmental audit represent a basic pillar for ensuring an accurate image on the environmental impact of a company. From our point of view, environmental audit represents an evaluation of how environmental aspects are managed within a company, with the purpose of improving environmental management and securing a certain level of credibility for the environmental information provided. Therefore, environmental audit can be performed either for internal reasons, representing an instrument for evaluation, control and improvement of environmental management, or for external reasons, in order to ensure a reasonable level of assurance that environmental information evidence a clear and complete image regarding the company's environmental impact. No generally accepted principles have been issued to a similar purpose as

the accounting-financial regulations to the financial audit because of the character of environmental audit which is regulated to a very small extent (Dittenhofer, 1995; De Moor and De Beelde, 2005).

Even if environmental audit is not profitable from a financial point of view, the non-financial benefits it brings (increase of company's public image, competitive advantages, assurance of credibility before clients and investors, sense of security given to the management with regard to the environmental aspects management) turn it into a profitable process or activity especially for the companies operating in industries or sectors regarded as heavy polluting or within companies that due to the activities performed or products supplied are subject to highly significant environmental laws and regulations.

There are a large number of purposes environmental audit can be conducted for. The types of audit mentioned before are not performed in full by internal or external auditors. They can be conducted individually or in combinations, as they are useful to the operating units, management and individuals using environmental reporting, in order to ensure credibility of environmental information. In the context where sustainable reports and especially environmental reporting have experienced a particular development lately, there's the question of objectivity for the data included in such reports. Thus, a distinct importance in ensuring the objectivity of environmental information is given to auditing environmental reporting, mostly conducted by external auditors, to increase interested parties confidence.

We have also conducted a comparative approach of environmental and financial audit. The regulatory status of environmental audit is quite different momentarily to the financial audit, for which most countries have elaborated sets of standards. Although focused on financial audit, some of these standards are directly relevant for environmental aspects as well. As a result of lacking a set of general set criteria and the complex nature of environmental information users creating a multitude of purposes and objectives for the report, auditing an environmental report, respectively a sustainable report, is a much more difficult of a process compared to auditing financial statements, which makes the accounting profession to avoid involvement in the performance of environmental audit. From what we mentioned above, it appears that, in case of environmental report auditing, it is almost impossible, or at least inefficient from a financial point of view, to supply a high degree of assurance regarding the quality of the environmental report taken as a whole. The auditor's opinion can include several degrees of assurance for different sections of the environmental report (Wallage, 2000; Karapetrovic and Willborn, 2001).

5. Accounting profession and environmental audit

After defining the environmental audit and its role in assuring objectivity regarding environmental information presented in annual and environmental reports we analyse the involvement of accounting profession in the performance of an environmental audit. There were many study that demonstate the important role of an Internal or external auditor in conducting environmental audits (Taylor et. all., 2001; Cahill, 2002; Tucker și Kasper, 1998; Picard, 1998; Kite et.all., 1996). The involvement of financial auditors in performing environmental audit in New Zealand have been explored by Chiang and Lightbody (Chiang and Lightbody, 2004) who conclude that although the audit proffesion could have an important role in performing environmental only a few of them explored this possibility.

For analysing the involvement of accounting professions in the performance of environmental audit we have used as a research tool the questionnaire applied to financial auditors in Romania. The auditors were selected from www.cafr.ro which is the official site of The Chamber of Financial Auditors from Romania. From a total number of 2234 financial auditors to whom we sent the questionnaire in the period 27 July-15 August 2009, we received answers from 276, representing over 12 percent, which can be statistically validated. The questions and the responses are presented in Table 1.

Table1. The involvement of financial auditors in performing environmental audit

No.	Question	Multiple choice response	Number of auditors who respond	Percent
1	What is from your opinion the importance given by the Romanian companies to environmental aspect?	Consider important	23	8%
		Not consider important	106	38%
		Limited importance	147	53%
2	Should environmental risk be considered when assessing the inherent risk?	Yes	238	86%
		No	38	14%
3	Have you been involved, along your professional experience in performing environmental audit?	Yes	23	8%
		No	253	92%
4	Do you consider that accounting profession and financial auditors should play an active role in performing environmental audit?	Yes	203	74%
		No	73	26%
5	In the next 12 months, are you going to get involved in performing environmental audit?	Yes	113	41%
		No	163	59%
6	What are the factors that hinder the involvement of a financial auditor in performing environmental audit?	The lack of a guide or standard for environmental audit	167	61%
		The lack of technical knowledge in the field	160	58%
		The lack of professional skills necessary for carrying out environmental audit	77	28%
		Other factors	64	23%

Source: representation of the responses obtained

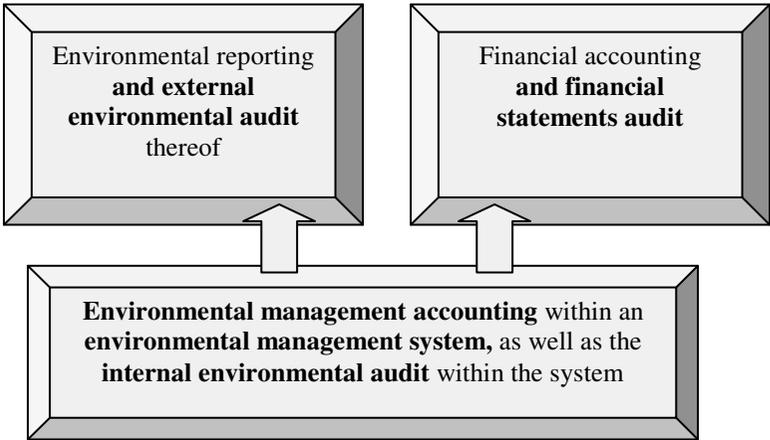

Following the conducted study we can conclude that in the financial auditors' opinion, Romanian companies give an insignificant importance to environmental aspects, the information they provide being general, insufficient and unclear to be able to reflect the company's environmental impact. The Romanian financial auditors, although they would wish to get involved in such missions (74%), very few of them take part in certification of sustainable reports, environmental balance sheets or other environmental audits (8%). Perhaps this is due to the very small demand for certification of sustainable or environmental reports (such reports in Romania are not mandatory), as for the other types of environmental audit, the accounting profession and financial auditors feel that non-existence of a guide on how to perform an environmental audit, as well as the lack of certain necessary technical knowledge are the biggest impediments to their involvement in performing environmental audits. We consider that the involvement of financial auditors alongside with engineers, physicists, biologists, ecologists and other professions in the performance of environmental audit would represent a significant gain especially when it comes to auditing environmental information of financial nature, like environmental costs, environmental debts, provisions and environmental contingent debts.

6. Results and conclusions

Objectivity of information can be achieved only by means of the audit process. Thus, we have tried to supplement the accounting model for environmental information presentation with the mechanism meant to ensure the objectivity of information provided, in order to reflect an accurate image on the environmental impact within a company. As a result, we have created *the responsible model for environmental impact presentation* represented as follows (Figure1):

- The model is based on environmental management accounting, functioning within an environmental management system, on which an internal environmental audit should be adequately performed;
- The second pillar, within the model, should be represented by traditional financial accounting, financial statements being subject to financial audit;
- The third pillar should be represented by environmental reporting and auditing thereof within the external environmental audit.

Figure1. The responsible model regarding the company's environmental impact

Source: representation created by the author

Following a comparative analysis between financial and environmental audit, we were able to point out that, due to non-existence of generally set criteria as well as the complexity of

environmental information users, creating a multitude of objectives and purposes for the report, the process of auditing an environmental report and a sustainable report respectively is a much more difficult process by comparison to the auditing of financial statements, which determines the accounting profession to avoid involvement in conducting environmental audit.

At the national and international level, only a small portion of accountants and financial auditors are effectively involved in environmental audit as a result of the accountants reserve with regard to the uncertainty coming from lack of a mandatory general framework. Lacking regulations and general reporting frameworks for environmental information determine auditors to avoid the fields where their expertise might prove useful. This can also explain why professional bodies focus this much on developing general frameworks and standards in their publications. An environmental audit requires different types of abilities and as a result, the most reasonable way to organize this type of audit appears to be teamwork, by involving auditors, accountants, engineers or other experts in environmental aspects.

DOES FAIR VALUE REPRESENT A CONCERN FOR ROMANIAN RESEARCHERS?

Andreicovici Ionela Irina
Babeş-Bolyai University Cluj-Napoca
Faculty of Economics and Business Administration

Jurcau Anca Sabina
Babeş-Bolyai University Cluj-Napoca
Faculty of Economics and Business Administration

In the actual economic context, the fair value concept is of high interest. We tried to see if the concept is only talk about, or if research in Romania has been actually done on this theme. We have analyzed the Romanian Journals recognized by CNCSIS in order to see if this concept represents a concern for Romanian researchers. This article is a literature review of the economic Romanian journals recognize by CNCSIS in the field of "fair value".

Keywords: fair value, CNCSIS, concern

Cod JEL: M41

1. Introduction

Fair value has been treated, from the conceptual and methodological point of view, and its effects in accounting standards or regulations. At international level, the concept of "fair value" has aroused debates especially regarding how to obtain it. Although the FASB issued two standards dedicated to fair value- FAS 157 "Fair value Measurement" (2006), and FAS 159 "The Fair Value Option for Financial Assets and Financial Liabilities (2007), is now trying a collaboration with FASB to issue a more complete and complex accounting standard and "Fair Value Measurement " to clarify issues like: the definition of fair value, it determination at level 3.

If international concern for "fair value" is very high, in our country, the concept is still new. Yet, it is still difficult to clarify it at the conceptual level and even more difficult to implement it. Related to this, there are questions about appropriateness of introducing an accounting system which includes fair value. We ask ourselves: Are Romanian researchers interested in the concept of „fair value”?

2. Research methodology

To review the literature in a particular area of research it is necessary first, a list of journals surveyed. Thus, from the Romanian journals, recognized by CNCSIS(National Council of Scientific Research in Higher Education) were selected 3 economics journals indexed A (ISI Journals) and 25 economics journals indexed B + (BDI Journals). All research conducted is considering a period of 4 years, from 2005 until 2009. This period was chosen because in 2005, CNCSIS introduced the classification of Romanian Journals in indexed journals A and journals indexed B. The 24 works that deals strictly with the aspects concerning the „fair value” were analyzed in terms of three factors: year of publication, article topic and research methodology.

3. Defining fair value

Considering that the article tries to evaluate the knowledge of Romanian researchers regarding the concept of fair value, it is necessary to define the concept.

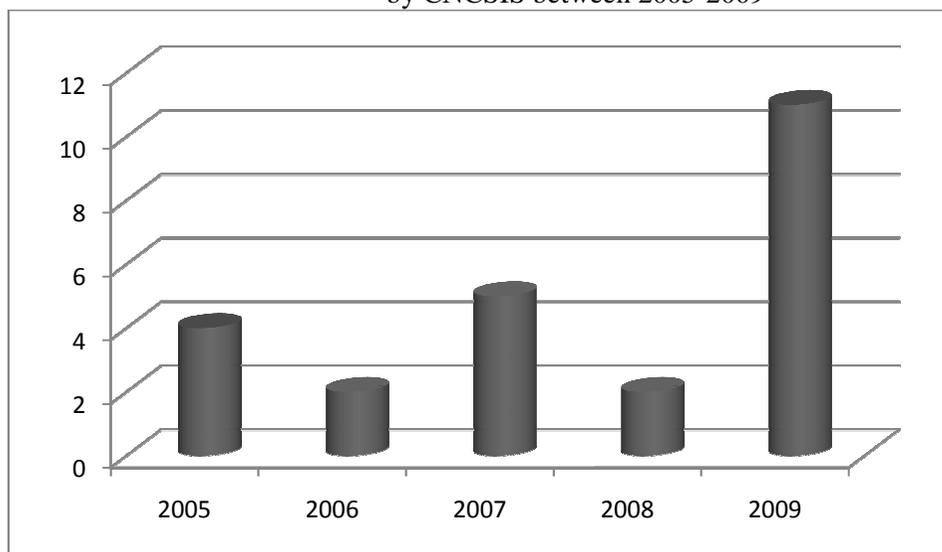

The term , known in Romanian as "valoare justa" is the translation of the phrase "fair value" which, literally speaking, corresponds to "genuine value" rather than "fair value" (R. Obert,

2004). When speaking of the contents of the concept, there are some opinions that attribute its quality of assessment base, others who claim that it represents a particular application of market value, others who consider some convention or accounting principle, finally it is also shown that fair value is an estimate and not a finding, as in the case of the market value. Another variant of the previous definition is the sum for which an asset could be exchanged in a balanced transaction, between parties informed and determined, different than in a forced liquidation sale (G. Holmes, A. Sugden & Gee A., 2002). IASB gives the following definition for fair value: *Fair value* is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date. (IASB, 2006).

4. Literature review study of the Romanian journals recognized by CNCSIS

After analyzing all studies included between the period 2005-2009 from the 28 selected national journals, it was chosen 26 studies that directly address the concept of fair value. The table below shows the number of studies that treat the subject assigned to the exact time they were published:

Figure 1: Study on the concept of „fair value”, published in the Romanian journals recognized by CNCSIS between 2005-2009

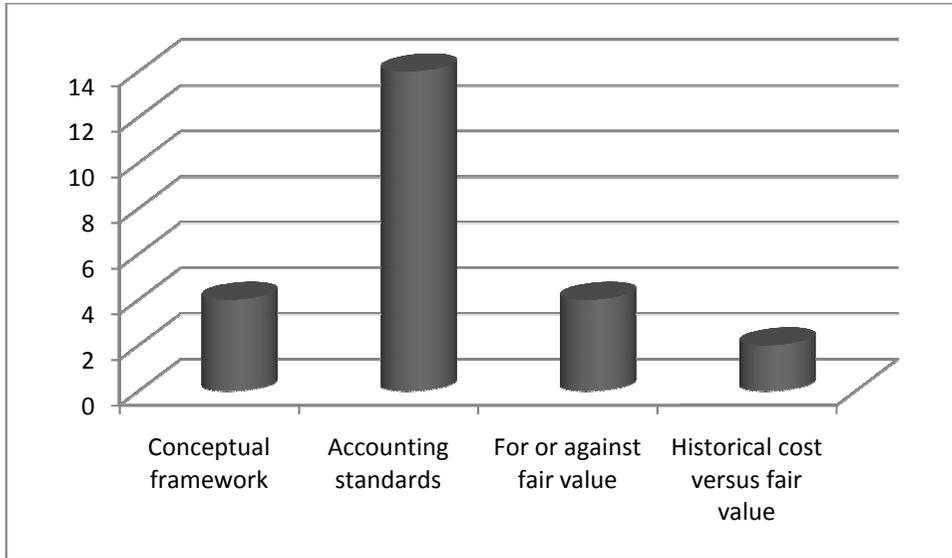

Source: autor's

compilation

After reviewing all studies during 2005-2009, we can observe that in 2009 were published a larger number of articles compared to the other years, this shows the intense concern in 2009 for fair value. This situation can be explained through an increase desire to adopt, both, internationally and nationally a modern accounting system, characterized by increasing concept of "fair value. Also the large number of articles published in 2009 can be explained by the economic crisis, which has increased the "popularity" of "fair value". Going forward, to the second analyzing factor, the theme of the article, it can be considered that the selected studies can be split in this way: conceptual framework, research on international accounting standards, studies that reveal the "marriage" between: historical cost and fair value, studies that support or reject fair value, in this being included the studies that show the advantages and disadvantages of fair value. The results can be summarized as follows:

Figure 2: Studies on the concept of fair value classified by topic published in the Romanian journals recognized by CNCSIS

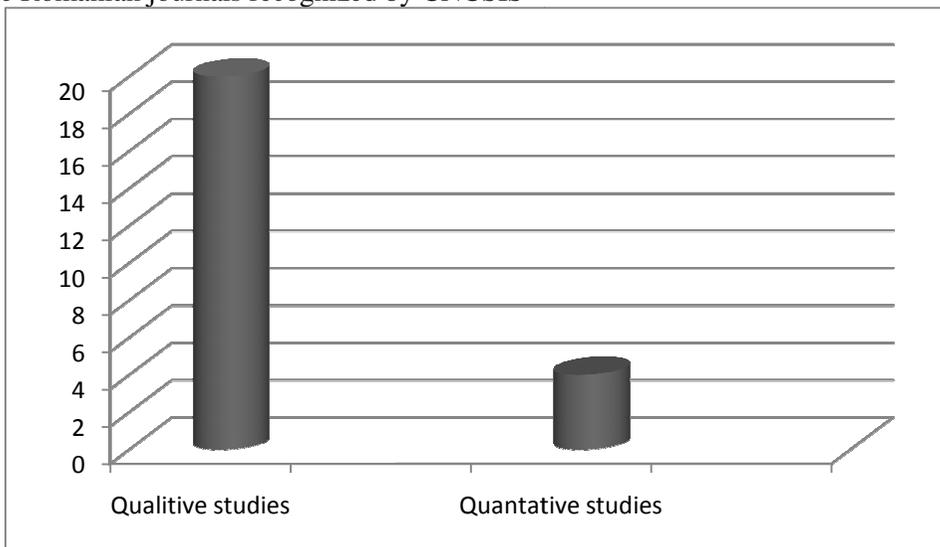

Source: Autor's compilation

As expected, the topic that caused the highest degree of interest among the Romanian researchers is the one concerning the fair value in accounting standards. This high concern can be explained by the activities undertaken by regulatory bodies accounting, FASB emitting FAS 157 in late 2006, followed by FAS 159 in early 2007, while the IASB issued Exposure Draft-measuring fair value in September 2009.

Analyzing, in terms of research methodology, selected studies, we can divide the articles in: qualitative articles and quantitative articles. We consider to be qualitative studies, the theoretical one, and quantitative studies, the empirical ones and those that describe case studies. The results can be summarized as follows:

Figure 3: Studies on the concept of fair value, classified by research methodology, published in the in the Romanian journals recognized by CNCSIS

Source: Author's compilation

We can see that the qualitative studies exceed the quantitative studies, this being expected, because in Romania the area of interest, regarding fair value is only at the beginning.

4. Conclusions

Considering all aspects of analysis we can answer the question from the beginning of the study and we can assert that the concern for the concept of fair value is very high right now, but at the same time, the literature in respect to this aspect is only at the beginning of knowing it. Therefore, it prevails theoretical studies, published in 2009 with the predominant research theme: concept of fair value in accounting standards.

CREATIVE ACCOUNTING – PLAYERS AND THEIR GAINS AND LOSES

Balaciu Diana

University of Oradea

Faculty of Economics

Vladu Alina Beatrice *

Babes Bolyai University, Cluj Napoca

Faculty of Economics and Business Administration

The aim of this paper is to bring into attention an interesting game of accounts manipulation and its plays. Their expectations represent the genesis point of manipulative behaviour and by understanding their actions and gains and losses we may create a link to understanding the process of creative accounting thinking. The divergent interests of these users (e.g.managers, fiscal authorities and banks) derive from their position and power, and give rise to doubt regarding the objectivity of accountancy information provided by annual financial reports.

Keywords:creative accounting, manipulation accounts, information users

Cod JEL lucrare:M 41

Introduction

When and why exactly this concept first appeared and what influenced its development – these are questions that come up when opening this true Pandora’s Box: creative accounting.

With hindsight a few favourable circumstances to this concept can be identified, circumstances first related to the economical advent of world states but at the same time to the need of economic entities to create for themselves a good reputation in an increasingly competitive and tough economic environment. About this particular moment, that is - the first mention, regarding creative accounting practices, we can’t ignore the fact that the first mention belongs to the founder of accounting - Luca Paciolo. This ambition of making figures more appealing or the opposite, if the case, is as old as 500 years. Thus, Luca Paciolo was shaping in his already renowned *De Arithmetica*, the first accounting manual, practices of creative accounting.

In the context of brisk Venetian foreign trade, relationships between traders were recorded by double-entry bookkeeping with ink and quill-pen in main and subsidiary books. Where discrepancies arose, the inkwell was occasionally knocked over on these books – not always unintentionally – in order to make the entries illegible. That’s the origin of the term “cover-up”.

In the context of the world economic crisis nowadays, creative accounting will be referred to more often as a field from where it is expected either to offer live-saving solutions or be blamed for all the negative evolutions. On this aspect, Salustro and Leburn (quoted by Delesalle, 2000) would say: „Crisis periods are actually trials for enterprises; affecting their cash flow and generating risks, that accounting doesn’t deal with in a flawless manner. Therefore, managers are tempted to resort to ingenious, more often questionable procedures, for refining accounts presentation.”

The reality of an enterprise can be mirrored in several aspects, starting from the atmosphere and the environment where the employees perform their daily activity, through the company’s brand and to the yearly financial statements. This reality, though, seen from the perspective of the external environment, capitalized in clients, suppliers, public institutions, banks, investors etc, is strongly influenced by the subjectivity of the one watching.

This approach of the accounting informing system may seem absurd due to the fact that the information of the financial statements are some figures, some values which apparently cannot be

misunderstood. Yet, reading between the lines and making certain connections, several ways to manipulate the information can be discovered.

Actors and their gains and loses in the accounts manipulation game

In the chess parties there are many times when we consider that one of the parts has an important advantage, even though the number of the pieces on the board is the same. To what does this statement owe, otherwise a correct one? Obviously, it is explained through the pieces activity difference. Seldom, during the moments of maximum confrontation of the pieces on the board, one of the parts has more pieces “out of the game”. How can we avoid such situations? Simple, taking into account the piece improving principle (according to the Russians, first worded out by Makogonov) who shows that: “in balanced position, when none of the parts has immediate threats, it is necessary to rearrange the pieces, in the worst situation, on a suitable field, or if this thing is not possible, let’s try to change them.” Of course, there are multiple the situations when we have more pieces out of the game. It is necessary the successive application of this principle, starting with the strongest pieces. What we have presented above seems something absolutely ordinary, we all learn, from first steps on the land of this magical game, that we have “to arrange the pieces on the centre of the board, to be stronger”. This does not prevent us, that in the moments of relative “calm” on the board, from forgetting about the application of this principle. Otherwise, subsequently, this thing becomes already hard or impossible to achieve.

As within the framework of this “brain” game we can see the ability of the parts to use the pieces available to them (by complying more or less with the principle worded) in order to achieve the result proposed, thus, by extrapolating our analysis to the case of the enterprises, we can identify certain participants who, according to the levers available to them can shape, more or less, the image of the enterprise.

Specialist literature in creative accounting field refers to agency theory, which relates to the conflicts of interests between users of accountancy information.

An agency relationship comes into being when one party, known as the *principal*, entrusts management of their private assets to another party, known as the *agent*, who has competence and knowledge inaccessible to the principal. The most common form of agency is that in which a manager operates on behalf of a shareholder. From this point of view in the life of an enterprise, we can identify two categories of actors having a special position (Feleagă N., 2006):

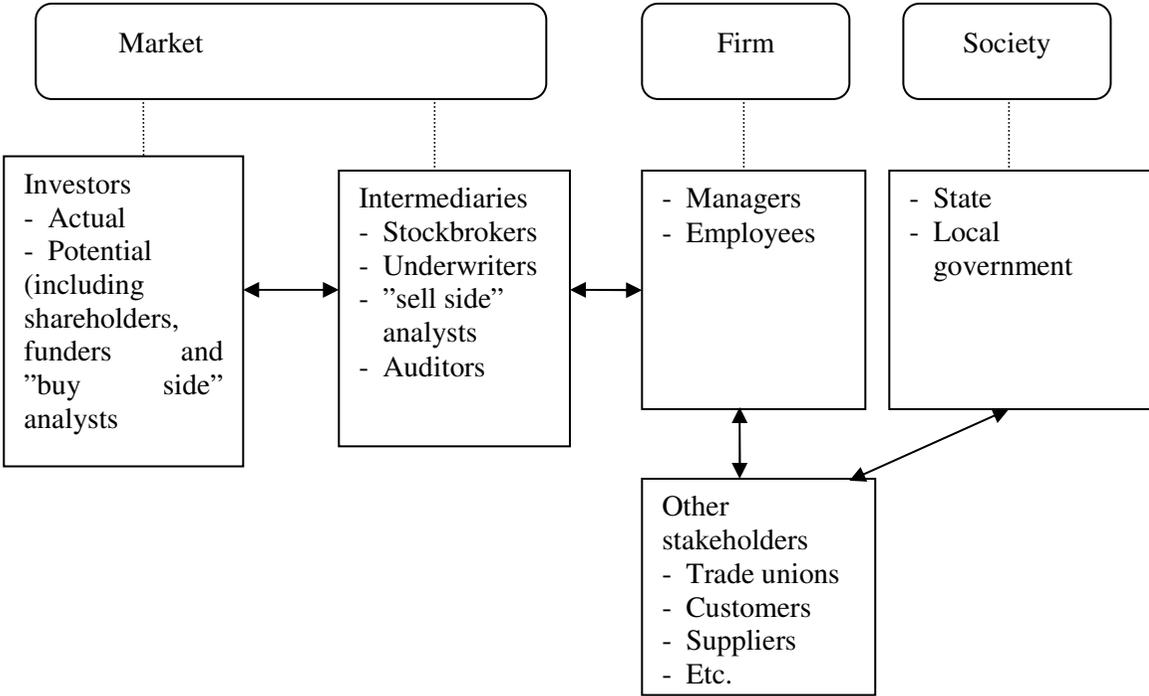

- on one side, the shareholders, because their patrimonial rights are not exercised but in the end, after the others, who have rights (creditors, suppliers, employees etc.) have emphasized their debts, the shareholders take the financial risk justifying the appropriation of a part of the year’s profit and from the residual net asset, in the case of the entity closing down;
- on the other side, the leaders, because they have privileged information, taking into account the position held in the enterprise and, therefore, are tempted to take advantage by allowing themselves considerable advantages or, generally, by directing the entity towards a direction useful for them. In the case of enterprises quoted on financial markets there is a natural distribution of responsibilities. Such a distribution and the problems arising from it have been presented in the founding papers of Berle and Means (1932).

The shareholders invest their capitals and give the leaders/managers a mandate through which they manage the best the organization, trying to maximize the performance of the enterprise. This separation of the responsibility can lead to conflicts generating costs. Manipulating accounting data is an activity reserved to company managers, even though the other players in the field influence the leaders/ managers in their decision to perform such a manipulation. If it were possible to build a theory of the accounting data management, it would not have started from the techniques used for manipulation, but based on the needs, the occasions arising and of the relations between players and investors.

The conflicts of interest among different interest groups is the real cause of creative accounting. Managing shareholders' interest is to pay less tax and dividends. Investor-shareholders are interested to get more dividends and capital gains. Country's tax authorities would like to collect more and more taxes. Employees are interested to get better salary and higher profit share. But creative accounting puts one group or two to advantageous position at the expense of others. One day the present authors had an opportunity to have a discussion with the Chief Accountant of an enterprise in this regard. The Chief Accountant told, in the course of conversation, that he was determined to retain profit for the expansion of his existing unit and establishment of new ones. Quite naturally, his interest was to pay less tax and less dividend and, accordingly, to 'create' financial statements. This type of creative accounting has led David Schiff (1993: 94) to warn investors; in general that taking a company's financial statements at face value can be ``a recipe for disaster``.

The IASC's framework for the Preparation and presentation of Financial Statements, envisaged by the IASB, presents the following categories of users: current and potential investors, employees, creditors, suppliers, and other commercial creditors, clients, government and governmental institutions and the general public. According to the position of these users relative to the business in question, they may be divided in internal and external users. *Internal users* are principally management personnel within the company. They have responsibility for information release systems, and therefore have access to supplementary information. External users fall into the other categories mentioned in the Framework; according to their authority, they may be able to dictate the nature of the information to which they are privy, as is very much the case with governmental institutions and banks, while other may be unable to have any say regarding the type of information to which they may obtain access, since they lack the necessary authority. According to Stolowy and Breton (2004) there are a lot of players in accounts manipulation game as we can see in the next scheme:

Figure 1. Players in the field of accounts manipulation

Source: Stolowy and Breton (2004)

The investors can be divided in four subgroups: real and potential shareholders and the real and potential stockholders. Their interests are very varied and the transfers of riches can be operated between these subgroups. Consequently, they react differently to manipulating accounting data.

Analysts can be grouped into two categories: “buy- side” and “sell-side”. The studies of Robb (1998) and Kasznik (1999) indicate the role of financial analysts whose issue recommendation and forecasts. According to Breton and Tafler (1995) they normally try to forecast the reported numbers including the effects of manipulation. They make profit if a manipulation raises prices, and furthermore the issues may be easier to sell.

Managers may or may not believe in market efficiency. In case they do not, they can act in order to manipulate the numbers. Their purpose would be to reduce the cost of capital, to satisfy the external demand of existing shareholders, to increase their own remuneration, to decrease the overall risk of the firm, or to avoid violating the debt covenant or incurring political capital costs. Concerning the *auditors*, two contradictory goals can be seen: on the one hand they want to satisfy the client and, on the other hand they want to avoid excessive risk from third parties. The quality of auditors may also have an effect on the degree of earnings management.

Current investors (shareholders) principally follow the progress of their investments, future profitability and the management’s administration and direction of company resources towards their individual interests.

Potential investors follow the likely estimated risk of their future investments, profitability and stability of profits over time, and the long term capacity of the business to generate liquidity.

The public, through the administration of diverse communities, is concerned with the impact of the company’s activities upon local economic development, the creation of new jobs, professional training, contributions to the local budget, and environmental impact.

There are many forces that influence the accounts and, more particularly, the profit figure. From the interests of each group arises the motivation to manage accounting figure. These motivations are studied directly and indirectly by many authors. Several have been identified ranging from the managers’ incentives to manipulate earnings to the reasons of the other stakeholders (Merchant și Rockness, 1994). The most important work in this area is the paper written by Watts și Zimmerman (1986) which proposes a theory for accounting procedure choice containing some essential underlying motivations: the remuneration package, debt covenants and political costs. Finally, Dye (1988) and Schipper (1989), propose some explanations of the manipulating behavior of shareholders based on the positive accounting theory.

Some of these stakeholders groups also have something to lose through accounts manipulation. Although, Revsine (1991) sais that everybody wins, that is not always the case.

Stolowy (2003) identified, on the one side, the potential gains of each group in manipulating accounts and the potential loss for different stakeholder groups because of accounts manipulation, on the other side. We can summarize them as follow:

Table 1. Potential gains and losses in/from manipulating accounts

Players	Gains	Losses
Managers	Reducing the cost of capital Keeping their job Managing their remuneration Respect the debts covenants Official examination Minimization of income tax Gain tax advantages Improve relations with creditors, employees and investors	The job and reputation

	Avoid political costs	
Existing shareholders	Increasing the market value of their shares Controlling employees claims Reducing the cost of capital Reducing the volume of transaction	Confidence in the market
Existing bondholders	Increase the market value of their bonds Controlling employees claims	Wealth transfer to the actual shareholders
Employees	Keeping their jobs Increase the remuneration	Their job from an unexpected bankruptcy
Suppliers	Keeping their client	Some money following an unexpected bankruptcy
Clients	Continuous services Warranty respected	Services interrupted Warranties not honored
State	Tax to collect Jobs for people	No more tax to collect Unemployed people to provide for
Bankers	Repayment of the loan	Some money following an unexpected bankruptcy
Society	Keeping the job Production of wealth	Jobs lost and resources wasted

Source: adapted from Stolowy and Breton (2004)

Conclusion

Even if creative accounting is not against the law, operating within the letter both of the law and of accounting standards, it is quite clearly against the spirit of both. Creative accounting is a process of using the rules, the flexibility provided by them and the omissions within them, in order to make financial statements look somewhat different from what was intended by the rule. The positive image built with the financial statements help will influence decision making both internal and external (users of accounting information being including here).

We can identify a lot of expected rewards earned by those who play this manipulative game. Understanding the players in the accounting field demands and expectations is the key to understand the process of creative accounting. If we were to articulate the process of rational reconstruction within the methodological framework that can be used in order to describe the process of characterize the manner in which their expectations can represent the genesis point of manipulative behaviour, the framework will include the following assumptions:

Source: Elaborated by the authors

Sometimes the desire reward is an upward move in a firm's share price. For others, the incentive may be a desire to improve debt ratings and reduce interest costs on borrowed amounts, or create

additional slack and reduce restrictions from debt covenants. Regarding high-profile firms, the motivation may be lower political costs, including avoiding more regulation or higher taxes. The question that arise as long as we seek in this field is: Can creative accounting be controlled? Until we'll be able to respond on this question based on our researches we come with the answer of Sir David Tweedie (quated by McBarnet D, Whelan C, 1999) when was asked whether the new regim will win the battle against creative accounting. His respond was memorable: " We're like a cross-eyed javelin thrower competing at the Olympic Games: we may not win but we'll keep the crowd on the edge of its seats!"

ASPECTS CONCERNING THE ECONOMIC AND FINANCIAL INDICATORS USED IN THE AUDIT OF FINANCIAL STATEMENTS

Bănuță Mariana
The University of Pitesti
Faculty of Economics

Bondoc Maria-Daniela
The University of Pitesti
Faculty of Economics

This article analyses aspects concerning economic and financial indicators used in the audit of financial statements, starting from the type of the audit in which they are included, the timing of their usage during the audit process, their application and interpretation, as well as their usage in the auditor's report. Recommendations concerning the usage of economic and financial indicators in the audit of financial statements are also made following this study.

Key words: economic and financial indicators, financial statements, audit evidence, audit procedure

JEL Classification: M41, M42, L25

Starting from the fact that not all the audit evidence that may be available can be examined and evaluated due to high costs and time that should be allocated for this purpose, **auditors are confronted with the necessity of making a decision concerning the adequate types and quantities of audit evidence** they must collect in order to substantiate their opinion concerning the accuracy of the information presented in financial statements.

The set of decisions that must be made by an auditor concerning the collection of audit evidence can be divided into the following categories:

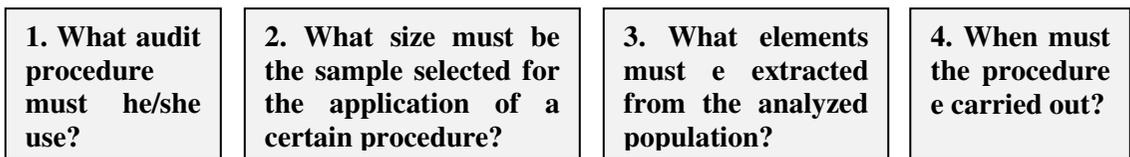

Figure no. 1 Auditor's decisions concerning the collection of evidence

Audit procedures

The audit procedure represents a set of detailed instructions related to the collection of a certain type of audit evidence that is to be obtained at a certain moment during the audit (**for example for the stock audit** – an objective related to balances – we can use as an audit procedure “The observation of the client's employees during stocktaking in order to assess whether they observe the instructions they have received”).

Consequently, in order to draw reasonable conclusions based on which the auditor can substantiate the auditor's report, he/she obtains **audit evidence**, by carrying out **audit procedures** through which:

- The auditor can acquire an understanding of the entity and its environment, including the internal control, in order to avoid the risks of material misstatements at the level of the financial statements and at the level of assertions (the audit procedures applied for this purpose are referred to in ISA as “**risk assessment procedures**”).
- The auditor can test, whenever it is necessary, or when he decides to do so, **the operating effectiveness of controls** in preventing or detecting and remedying material misstatements at the

level of assertions (the audit procedures applied for this purpose are referred to in ISA as “**tests of controls**”).

c) The auditor can detect **material misstatements at the level of assertions** (the analytical procedures applied for this purpose are referred to in ISA as “substantive procedures” and include **tests of details** for the categories of transactions, account balances and presentations of information, as well as **substantive analytic procedures**).

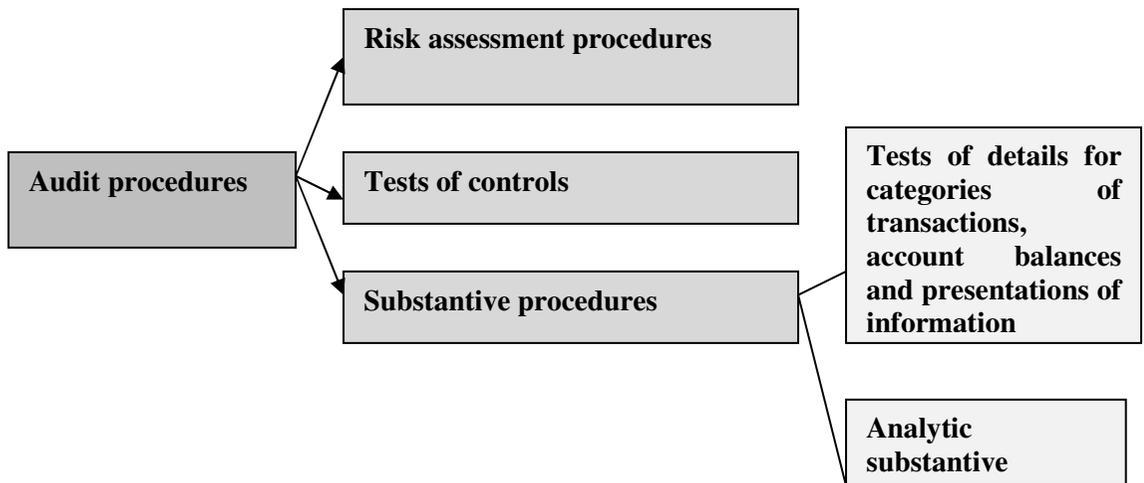

Figure no. 2 Types of audit procedures

In the decision-making process related to the audit procedure that should be used, the auditor can choose from seven main categories of evidence. These categories, referred to as **types of audit evidence** can be: physical examination, confirmation, documentation, observing and inquiring the client, reconstitution and analytical procedures.

The analytical procedures consist in the assessment of financial information made by studying the plausible relationships among both financial and non-financial data. These procedures also include the identified investigation of fluctuations and relationships that are inconsistent with other relevant information or deviate significantly from predicted amounts. ISA 520 “Analytical procedures” offers additional recommendations related to the analytical procedures. The analytical procedures use comparisons of data and indicators with the purpose of assessing whether the account balances or other data seem reasonable.

The economic and financial indicators, in our opinion, can be included in the analytical procedures and can be calculated and interpreted by the auditor in various moments of the audit process for purposes such as:

- understanding the economic industry and activity of the client (the planning stage).

One of the economic indicators that can be calculated by the auditor is, for example, the gross margin percentages. Its decrease might indicate an increase in the competition in the market segment of the company and respectively, the need to analyse more carefully, during the audit, the area of the inventory evaluation. An increase in the financial fixed assets rate as compared to the one entered in the previous accounting period might indicate an expansionary policy by the acquisition of new certificates and might determine the auditor to analyse the connections created among companies through the acquisition of the certificates, types and values of the transactions performed with the affiliated entities.

The evaluation of the client’s capacity to continue its activity (planning stage, finalization stage).

The analysis of the calculated economic and financial indicators may reveal the presence of important financial difficulties and could call into question the continuation of the activity (or whether the financial situations were drawn up taking into account the continuation of the activity). For example, if an auditor finds that there is a long-term liabilities/net assets ratio above

the average, along with a profit/total assets ratio below the average value of the industry, than the conclusion can be drawn that there is a relative high risk of financial blockage

-the indicators of possible misstatements in the financial statements (during the whole audit process)

If unusual fluctuations appear, one of the possible reasons is the presence of an accounting error. Assuming that by comparing the current value of the ratio of the provisions for guarantees granted to clients to the value of the total expenses in the sold product warranty period an downward trend was found, along with an increase in the expenses (for the afferent remediation) entered during the warranty period, as compared to the previous period, then the combination of these two pieces of information may indicate a possible undervaluation of the respective provisions.

-the decrease in the quantity of the tests of details (the planning stage and the test stage).

When following the calculation and interpretation of certain economic and financial indicators (as part of the analytical procedures) no unusual fluctuations are found, than the probability of the presence of a material misstatement in the financial statements is minimal. In this case, the analytical procedure constitutes conclusive evidence in favour of an accurate statement of the respective account balances, allowing for the possibility to carry out fewer tests of details concerning the respective accounts.

In the audit performance, the balances and the economic and financial indicators calculated by the auditor for the client entity are compared, according to the type of the applied analytical procedure, with:

- the data of the respective industry;
- similar data for the previous accounting period;
- anticipated results calculated by the client;
- anticipated results, by using non-financial data.

In what the above-mentioned types of comparisons are concerned, we are mentioning the following:

The comparison of the data of the client with the data of the respective industry is made only if there are economic, financial and non-financial data related to the respective entities in the audited client's industry. There are specialized entities that accumulate financial information related to hundreds of companies and compile the data obtained on various fields of activity. Some professional evaluation/audit companies buy this information in order to use it as a basis for comparison in the industry, during their audits. In our opinion, the most important contributions of these industry data comparisons consist in the fact that they support the understanding of the client's business activity and constitute accurate indicators of the probability of the occurrence of a financial blockage. The main disadvantage of using the industry indicators consists in the difference between the nature of the client's financial information and that of the data of the business entities that take part into the compilation of the industry total values. Sometimes comparisons can be irrelevant, as the industry information is nothing but industry-wide averages. The auditor must e very strict in interpreting the results, due to the fact that companies apply different accounting methods, thus affecting the comparability of the data (different accounting methods used for stocks: FIFO, LIFO, CMP, different methods for the depreciation of fixed assets: straight-line, declining, stating fixed assets at their fair value function of the option for their re-evaluation, etc).

Comparing the client's data with similar data from previous accounting periods

The auditor can performs less complicated analyses by comparing the balances of the current accounting period with those of the previous accounting period or by comparing the details of a synthetic balance with similar details in the previous accounting period. Among the disadvantages of this type of analysis there are:

- the fact that it does not allow for taking into account the increase/decrease in the business activity;

- the correlations among data are ignored.

These disadvantages are offset by the usage of the economic and financial indicators and of relative values, the comparisons being made against the results obtained in the previous years for the same client.

Comparing the client’s data with anticipated results obtained by the client

The entities required to submit financial statements accompanied by an auditor’s report have, within their organizational structure, staff employed in a specialized compartment in charge with budgeting various aspects of their activities and for various financial results. Taking into account the fact that budgets represent the client’s estimations for the current accounting period, the analysis of the most important areas within which differences may occur between the budgeted results and the actual ones may indicate possible errors (the absence of misstatements may indicate the fact that errors are less likely to be present). In this type of comparison, the auditor should:

- evaluate whether the budgets are planned in a realistic manner (discussing the budgeting procedures with the client’s employees may support this type of evaluation);
- to evaluate whether the current financial information has been altered by the client’s employees, in order to adjust them to the budget forecasts.

Comparing the client’s data with the anticipated results calculated by the auditor is made when the auditor calculates the estimated balance with the purpose of comparing it with the actual balance. For example, the auditor can apply the results of the quality analysis specific economic indicators in order to estimate the value of wastes recorded during the accounting period (function of their turning to account, the estimated value of the final balance for wastes).

In comparing the client’s data with the anticipated results by means of non-financial data, the auditor must take into account the accuracy of the data. For example, the auditor can calculate the direct labour costs (as part of the production costs) by multiplying the total number of hours worked by the time rate. For the auditor, it is more difficult to estimate whether the total number of worked hours is correct.

A brief analysis of the types of economic and financial indicators used for auditing is made below, part of them being presented to the users of the financial audits, in the auditor’s report:

Fundamental financial indicators

During the audit, the general financial analysis could be used for the identification of possible areas with problems that will be subsequently analyzed and tested in more detail, but also for the identification of certain economic problems of the entities for which the auditor can provide another type of consultancy. The auditor calculates:

The liquidity indicators – for the interpretation of which one should take into account the fact that the circulating assets of the entities can vary both in what their value as well as their liquidity is concerned (these aspects will influence the capacity of the company to pay its short-term obligations)

$$\text{Current liquidity} = \frac{\text{Current assets}}{\text{Current liabilities}}$$

$$\text{Immediate liquidity} = \frac{\text{Current assets} - \text{stocks}}{\text{Current liabilities}}$$

In order to eliminate the effects of the variation of circulating assets and their degree of liquidity, the limitation of the analysis to the most readily available and most objective circulating assets is recommended. By this method, the immediate liquidity eliminates inventories from calculation, and the limited liquidity further eliminates short-term liabilities. When a comparison is made among companies that apply different methods of evaluation, the value of the inventories can be

adjusted function of the technique of one of the methods so that a better basis for comparison may be obtained.

Solvability indicators and other financial equilibrium indicators – the auditor can calculate several indicators with the help of which the capacity of the company to pay its long-term obligations can be assessed.

$$\text{General solvability rate} = \frac{\text{Total actives}}{\text{Current debts}}$$

$$\text{Debt/Equity ratio} = \frac{\text{Debts}}{\text{Equity}}$$

$$\text{Net tangible fixed assets/equity ratio} = \frac{\text{Equity} - \text{intangible fixed assets}}{\text{Equity}}$$

The debt/equity indicator is deemed to be a key indicator: if the value of this indicator is too high, this may indicate that the entity has used its entire borrowing capacity and will not have an operating margin in case of future unfavourable events. A downward trend would indicate a good situation, the entity being in an expansionary period.

The net tangible fixed assets/equity ratio can indicate the current quality of the equity, as the intangible assets are eliminated, their substantiation largely depending of the future activities.

Risk indicators:

$$\text{Degree of indebtedness} = \frac{\text{Borrowed capital}}{\text{Owned capital}} \times 100$$

$$\text{Interest coverage ratio} = \frac{\text{Profit before interest and tax}}{\text{Interest charges}} = \text{number of times}$$

The interest coverage ratio estimates how many times the company can pay the interests of its outstanding debts. The lower the value of this indicator, the higher the risk relate to the position of the company.

Activity indicators management and performance indicators

$$\text{Inventory turnover rate} = \frac{\text{Costs of goods sold}}{\text{Average inventory}}$$

$$\text{Number of days of inventory} = \frac{\text{Average inventory}}{\text{Costs of goods sold}} \times 365$$

$$\text{Fixed assets turnover} = \frac{\text{Sales}}{\text{Fixed assets}}$$

$$\text{Total assets turnover} = \frac{\text{Sales}}{\text{Total assets}}$$

$$\text{Return on capital employed} = \frac{\text{Profit before interest and tax}}{\text{Employed capital}}$$

$$\text{Gross profit margin} = \frac{\text{Gross profit}}{\text{Turnover}} \times 100$$

Net profit

$$\text{Result per share} = \frac{\text{Net profit}}{\text{Weighted average number of shares}}$$

The improvement in the operating activities is deemed to be the key solution of most of the financial problems. Many users of the information (especially creditors and investors) are interested in the results of the operations of a business entity; consequently, a large number of indicators related to the operating activities and the performance (results) of the company are used. The most frequent indicator related to the operations and performance is represented by the earnings per share, which are part of the financial statements of most of the companies. As mentioned before, other additional indicators that complete the picture of the operating activities and performance are also calculated.

Following studies performed concerning the economic and financial indicators used in financial audits, we recommend:

- The usage of statistical techniques for a higher relevance of the analytical procedures. These techniques are useful for the interpretation of results and allow for more complex calculations and a higher level of objectivity.
- The usage of information programmes allowing for entering data from the client's subsidiary ledger and other data in the auditor's information system. In this manner, the recorded rectifications and financial statements are transposed in electronic format and a lot of time and costs are saved. Moreover, these programmes eliminate mathematical errors related to the calculation of some economic and financial indicators and to the dynamic representation of their results in various forms such as charts and tables for the simplification of the interpretation of unprocessed data.
- The usage of economic and financial indicators as analytical procedures, during the whole audit process, in all types of above-mentioned data comparisons.
- The economic and financial indicators presented in the auditor's report should be accompanied by comments, as their mere statement is not relevant as quality information for many users of the information.

THE ROMANIAN ACCOUNTING SYSTEM AND THE ACCOUNTING-TAXATION RATIO

Berinde R. Sorin

Babeş-Bolyai University, Faculty of Business, Cluj-Napoca, Romania

Răchişan P. Ramona

Babeş-Bolyai University, Faculty of Business, Cluj-Napoca, Romania

Groşanu Adrian

Babeş-Bolyai University, Faculty of Economics and Business Administration, Cluj-Napoca, Romania

In the context of a developed capital market, the dimensioning of the accounting profit is very important for investors, considering the financing of the economical entities to a higher degree than that offered by the banking system. The disconnection between accountancy and taxation stands as an essential premise. Considering this, we find three categories of major risks to be significant, together with the expanding tendencies regarding the distortions of the accounting result, which refer especially to the Romanian accounting and taxing system: creative accountancy (a form of disconnection between accountancy and taxation), taxation (a form of connection between accountancy and taxation) and the inflationary phenomenon. Even though the latter is rather low, the particularities of the Romanian economy creates certain conditions for a significant enhancement of the effect of general frugal having important taxing implications on the decapitalization of the economic entities.

Keywords: Accountancy and taxation; The accounting-taxation ratio; Connection/disconnection.

JEL Code: M - Business Administration and Business Economics; Marketing; Accounting; M41 - Accounting

1.Introduction - the materialization of Double Entry implementation in Romania

The materialization of double entry in the Romanian Principalities was not exactly estimated, there are some opinions that sustain that “it is impossible that the venetians that came to our countries [...] should not have spread out the secrets of this art that is vital to any merchant willing to observe by systematical calculations, how his trade goes”¹¹¹¹. On the other hand, real proofs of double entry accountancy can be found “in the accounting notes registers of the great merchants from Sibiu, Braşov and Bucharest from the XVIII century”¹¹¹².

The organic regulation from 1831 played a significant role in the evolution of the Romanian accountancy. “For the first time in the Romanian Principalities a regulate accountancy was organized based on the Organic Regulation, that would make possible the controlling of the assets that were used by the state servants; [...] The public houses service, the public education service, the mining service were organised, all f them being under state control”¹¹¹³. At state level the double entry accountancy was introduced after 1929.

2.The methodology of accounting research regarding the accounting and taxation of income and the results of the economical entities

¹¹¹¹ Rusu D., *Fra Luca di Borgo și doctrinele contabilității în cultura economică românească*, Edition Junimea, Iași, 1991, pg.92.

¹¹¹² Ionaşcu I., *Epistemologia contabilității*, Edition Economică, Bucureşti, 1997, pg.176.

¹¹¹³ Demetrescu C. G., *Istoria contabilității*, Edition Ştiinţifică, Bucureşti, 1972, pg.289.

From an utility point of view, the accounting result is at the boundary of two disciplines: accountancy and taxation and it serves the interests of a large diversity of users, among the most important are the investors and the state institutions. There is a great level of difficulty in setting up the right balance between the two categories mainly because the accounting and fiscal regulations are continuously changing.

In order that a capital market should evolve in a close connection with the economy, a dimension of the factors is to be determined, in this case we refer to the profit level that will reflect objectively the result of the activity of the enterprise from the point of view of the potential investors' interest, without neglecting its utility for the taxing necessities of the state.

These details imply the necessity of a disconnection tendency between accountancy and taxation, which will be a change for the Romanian accounting system that will be achieved in time, at least from a practical point of view.

From this point of view we intended to emphasise some risks that appear at this level, from the perspective of:

-creative accountancy (an expression of the disconnection between accountancy and taxation). The risks consist in some less ethical tendencies of artificially oversizing and undersizing the accounting and the tax profit according to certain objectives. It was considered that these risks can be controlled through a better activity of accounting regulation;

-taxation (an expression of connecting accountancy to taxation). The risks consist of some tendencies of artificial diminishing of the accounting and tax profit in order to achieve a tax economy towards the state institutions. This phenomenon is against potential investors' interest that do not have the possibility of seeing the efficiency of the activity of an enterprise to its real dimension. The risks can be diminished through extraccounting determining of the size of the profit tax on the basis of the taxable profit determined on the taxing principles and regulations, with minimal influences on accountancy. We consider that regardless of the size of the profit tax due at the end of the financial period (superior or inferior), the accounting profit has to reflect the economical reality so that the investors can get some correct information.

-inflationary phenomenon which shows, even in the case of a reduced rate of inflation, the risk of calculating and paying the tax on some artificial fiscal profit with serious consequences for the enterprise decapitalization when the tax and dividends are paid.

3. Results and discussions

3.1. The historical fracture concept applied to the Romanian accountancy evolution

After the Second World War Romania did not continue its existence starting from what it used to be, but it entered the sovietical influence area. In this context, "the new political ideology that marked Romania's development, requires the utilization of the historical rupture concept in the evolution of Romanian accountancy"¹¹¹⁴.

Under these circumstances the accounting norming in Romania becomes the state's exclusive mark starting with 1947, when it was created, within the Minister of Industry and Commerce, a Permanent Council of norming the accountancy. This Council had as a priority the elaboration of a general frame of accounts, applicable to all the industrial enterprises.

It may be observed that this event coincide with the elaboration of the French Accounting Plan in 1947.

The period 1950-1990 can be characterized by the evolution of accountancy towards monism, from an informational point of view (the only receiver of the accounting information being the state).

During this period a circuit of ideas expressed globally took place in the accountancy field. But the Romanian accountancy stayed off this circuit.

¹¹¹⁴ Neag R., *Reforma contabilității românești între modelele francez și anglo-saxon*, Edition Economică, București, 2000, pg.202.

After the fallen of the communist regime, the new governmental authorities imposed a number of legislative reforms, meant to contribute to the development of an economy oriented towards a market economy. The new Accountancy Law 82/1991 supports this. This reform implied the transformation of the financial statements, from statements meant to create some statistics used in order to observe the execution of plans at macro economical level, to a complex of financial statements meant to accurately inform some different categories of users.

3.2. The primary orientation of the accounting-taxation ratio in Romania

During this post revolutionary period Romania had to choose an accounting system, adapted to the new political, economical and social changes, one of the models presented above. The option for a continental model or an Anglo-Saxon one was revealed through the Accountancy Law 82/1991, which implied a very detailed copy of the French accounting system.

The objective or subjective motifs of this option can be varied:

- the most powerful argument can be noted as being the fact that “it has never been considered that the French accounting system have not been adequate to Romania”¹¹¹⁵;

- the similarity between Romania and France as regarding the existence of a code of laws (statute law);

- due to the fact that Romania was a developing country that was orienting towards the market economy, the predominant way of financing was through creditors, banks, and less through the financial markets. The Romanian exchange market came into being much later;

- because of the informational monism in the communist period, the accounting profession in Romania was only at the beginning, and the influence that this provide in order to protect certain accounting rights was insignificant;

 - the Romanian intellectual and political elite was sent to school in France several times;

- the communist regime also had some connections with France, perhaps more than with any other country from Western Europe;

- the influence that was exerted by Belgium and French specialists, who advised the Romanian government when choosing its alternatives regarding the new accounting system (in a similar way as with the present-day influence for adopting the Accounting International Standards);

- the Anglo-Saxon accounting model was not very wide spread in Europe (being characteristic only to the United Kingdom, The Netherlands and Ireland).

Consequently, one of the elements that were adopted together with the entire French accounting system was also the strong connection between accountancy and taxation. As a conclusion, taking into account the characteristics of the Romanian accounting system, influenced by taxation, it is nowadays defined by:

- the predominance of the banking sector for financing as a disadvantage for the financial markets;

- the prevalence of the statute law as a disadvantage for unwritten law;

- the law provides detailed accounting rules, and they are not being elaborated by independent and legitimate organisms;

- the accounting profession in Romania is insufficiently developed (The Corp of Auditors and Authorized Accountants came into being only in 1994);

- the main users would be the following, taken in order: fiscal authorities, creditors, and last, the investors;

- users' role in the process of elaborating the accounting regulations is insignificant;

- the predominance of the caution principle;

- the tendency of some limited publications of accounting reports;

- a large number of evaluation and accounting options;

¹¹¹⁵ Roberts A., The recent romanian accounting reforms: another case of cultural intrusion?, Edition Economică, București, 2000, pg.36.

- the estimation of a benefit more cautious than useful;
- tendencies in creating some funds from the dispensable profit.

3.3.Perspectives regarding the accounting-taxation ratio

Regarding the perspectives for the accounting-taxation ratio in Romania, it was mentioned that they are according to the international tendencies regarding the disconnection. Taking into account some of the recent evolutions (adopting the IV Directive of the European Economic Communities) we can say that the seeds that lead (at least theoretically in the beginning) to the possibility of gradually opening the road towards an efficient accounting system, where accountancy and taxation work independently from one another, exist. This tendency becomes more certain if we take into consideration Romanian's perspectives to join the European Union. This event implies also joining the official position of the Union, regarding the acknowledgement and utilization of the international accounting norms, and at the same time the disconnection between accountancy and taxation.

The perspectives of the disconnection related to joining the European Union are promoted by the importance of a favorable regular report that depends on the taxation level, such as¹¹¹⁶:

The conclusion is that a disconnection ratio between accountancy and taxation would be associated with a low level of taxation. The consequence is the decreasing of the country risk and at the same time a favourable Regular Report on Romania.

As regarding the actual typology of the accounting-taxation ratio in Romania (connection) we consider that accounting information influenced by taxation is not very credible as regarding the possibility to ensure the faithful image and also the essential objective of accountancy.

Contextually the questions that can arise are: Wouldn't an independency ratio between the two sciences be more appropriate? Is the idea of the accounting principles being influenced by the fiscal principle or the other way around justified, taking into account the fact that their essential objectives: the faithful image and the maximization of budgetary income can be affected? To what extent would accountancy and taxation carry out their objectives, independently from one another?

And, finally, what is our opinion? Do we choose connection or disconnection?

We believe that the objectives of both sciences can be achieved, their principles being respected, but we cannot forget the fact that the information source for both of them is accountancy. Therefore the idea of total disconnection between accountancy and taxation is not completely achievable. But we can refer to an interaction relation between accountancy and taxation.

The beneficiaries of the disconnection between accountancy and taxation would be first of all the investors and, second, the state itself. This hypothesis is provided by the following causality relation described in the next diagram:

¹¹¹⁶ Berinde, Sorin R., "Perspectives regarding the taxation system in Romania", StudiaUniversitatis Babes Bolyai – Negotia, no. 3, 2009.

THE
DISCONNECTION
BETWEEN
ACCOUNTANCY
AND TAXATION

INVESTORS' OPTIMUM
ACCOUNTING
INFORMATION

THE INCREASING
OF THEIR TRUST IN
THE INFORMATION
THAT THE
FINANCIAL
INSTITUTIONS
PROVIDE THEM

STATE'S
ENRICHMENT

THE
INCREASING
OF
BUDGETARY
RECEIVINGS

THE
INCREASING
OF PROFITS

THE
EMPHASING
OF THE
TENDENCY OF
ASSOCIATION
AND
INVESTMENT
AS A
DISADVANTAGE
FOR HOARDING

Therefore the disconnection between accountancy and taxation creates the premises for a better apprising of the investors. The consequence of them disposing of real accounting information would be the increasing of their trust in the information provided by the financial statements and the investment, as a disadvantage for saving. The increasing of the profits is assimilated to the increasing of investments and at the same time to the increasing of the budgetary receivings that refer generally to taxes and especially to profit tax, this thing leading to the state's enrichment.

4. Conclusions - The limits of disconnection between accountancy and taxation

The perspectives of disconnection between accountancy and taxation reveal some disadvantages. Contextually the risks that the creative accountancy represents for an accountancy disconnected from taxation, were mentioned, they being materialized in some technics that have as a result:

- the real financial administration of the accounting result (increasing it);
- the increasing of its own capitals;
- the reducing of the debt rate.

The premises of using the accounting creativity technics in the disconnected accounting systems are ensured by:

- the determination of managers' salaries taking into account the dimension of the accounting result. The consequences would be the adopting of the creative tricks that would lead to the increasing of the accounting result in order to increase their own benefits. On the other hand there is a tendency of increasing the losses for crisis periods in order to better emphasize the next possible profits;
- the high level of interpretability and inconsistency of laws;
- the pressure of certain users categories (especially investors);
- the evaluation of the imaterial investments is sometimes difficult.

The creative account technics with direct impact on the dimension of the accounting result are:

- the lease-back operations;
- selling-rebuying the investments titles;
- circular tranzactions with high price stocks;
- production assets without real utilization.

To conclude the matters discussed we can say that the accounting result can be influenced in the case of a taxation connected ratio (decreasing it). On the other hand, the accounting result is subject to an increasing risk due to the creative accountancy. Under these circumstances, a question arises: Which risk is better to be assumed taking into account the dimension of the accounting result? We believe that the accounting result should keep an equal distance towards the risk of taxation decreasing and the risk of accounting creativity increasing. True information would be provided this way both for the investors and the state's institutions.

“PATRIMONY” - A CONTROVERSIAL MATTER OF ROMANIA’S PROGRAM OF ACCOUNTANCY MATCHING

Boca Ileana – Sorina (Rakos)

“ Valahia” University of Targoviste

The dilemma has its origins in accountancy’s international matching, namely between the accountancy system implemented in our country beginning with 1994 and the one implemented by Anglo-Saxon accountancy where patrimony is substituted by its two components: PROPERTY for ASSETS and CAPITAL for LIABILITIES, patrimony being defined owing to financial condition. Property represents the measurable reality of the goods and available values. When compared with the proprietor, property makes up patrimony in case, from a juridical point of view, there is a real guarantee upon the manner of financial covering (obtaining sources, procuring manner), namely a legal manner of justifying the origin of available values.

Key words: patrimony, assets, liabilities, accountancy.

The JEL Classification: M41

1.Introduction

Labor division and the need to manage society’s resources have determined the appearance of patrimony as an economic and juridical entity. The necessity of measuring the material and human elements as well as the rights and obligations they determine while carrying out an economic activity in order to reach the envisaged objective has always existed; during the time it has been variously implemented. Strictly connected with the “technical” means of registering the data provided by the various stages of society’s development, the need of evidence has permanently witnessed a complex growth and manifested according to different results: beginning with the clay boards or papyrus, thousands of years ago, changing to the Middle Ages England’s “stick receipt”, the manner of registering “information” have known a permanent development, reaching the nowadays electronic storage. The registering theories, systems, and methods, strictly connected with the stages of social development as well as with the technical opportunities of collecting the data provided, have also witnessed a continual evolution. Money appearance has probably been the most important element of this evolution. The existence of patrimony is the cause of the existence of accountancy and, implicitly, the object of its representation and registering. Accountancy has appeared out of the need to answer the knowledge and management problems of patrimonial mass under rational and efficient circumstances.

Accountancy is a complex and integrated complex of standards, principles, rules, and measurement techniques that display the condition, at a certain moment, as well as the quantitative and value evolution of the changes that influence patrimony during a determined period of time. Accountancy is “grafted” on the State’s patrimony and activities. As any other science, accountancy has its own object and method. Between its object and method there is a mutual connection. The object points the economic phenomena and processes that belong to a certain science; the method allows the comprehensive knowledge of the object. Specialized works have outlined several conceptions regarding the domain and definition of accountancy’s

object, namely: the administrative conception, the juridical conception, and the economical conception.

According to the administrative conception, accountancy's object represents the value expression and control of administrative facts with a view to support the management in order to get maximum effects with a minimum effort.

According to the juridical conception, accountancy's object is the patrimony of a legal subject considered from the point of view of juridical relations, namely, through the money (material) rights and obligations of a natural or juridical person in correlation with their proper objects (goods, values).

According to the economic conception, accountancy's object is given by the circuit of the capital considered in relation with its destination (fixed capital and working capital) and with the manner of acquiring it (entity's own capital and foreign capital).

Accountancy considers that patrimony is structured according to patrimony elements; each element has a unique and compulsory appellation, a distinct economic content, a compulsory money expression, and even a specific figure symbol in order to avoid any confusion. This structure is evidently relevant when compared with the existence and individual movement of elements; accountancy is thus interested in determining the manner patrimony has increased or decreased as a whole and according to its affected patrimony elements. Another essential characteristic of accountancy is that the economic operations registered by economic entities are perceived through a double patrimony change, at least, as patrimony elements are established on the basis of the principle of double representation. Depending on the content of the economic operation, the specialist who works in the domain of accountancy should settle the patrimony elements that change as well as the manner they are affected, namely whether they increase or decrease.

Accordingly, patrimony, fund, domain are notions that clearly regard a group of goods. Nevertheless, we are interested in the notion of patrimony. Accountancy's object distinctly outlines the internal economic processes of each economic entity that determine quantitative and qualitative changes of the amount and structure of the funds administrated by each economic entity. Accountancy outlines such economic processes owing to the correlation between expenditures and incomes; their comparison determines the financial result (profit or loss). Considering the various opinions regarding accountancy's object, one may state that accountancy's object represents the value expression of evidence, calculus, and control of the condition and movement of the funds grafted upon a patrimony while pointing out the origin of their destination, economic processes, and financial results. The principles and procedures that belong to general accountancy are mainly the same in the various national accountancies. There might be implementation differences as they can be influenced by the accountancy standards specific to each country, by the characteristics of the various economic sectors, and by the accounting methods adopted by each economic entity. The defining feature of accountancy is patrimony representation according to its two aspects: economic means and economic sources.

2. Content

The outlining of the concept of patrimony as a support of economic activities has gradually determined the elaboration of an accounting system that should be able to face the more and more complex registering needs of the events that take place within such an activity as well as the need to register its existence at a certain moment; accordingly, the evolution determined the foundation of the present concept based upon double representation and double registering.

As a system previous to the present double registering accounting system, the simple accounting system, still used in certain domains, provides an isolated survey of patrimony elements; it does not target their double registering (according to origin and content). Yet, its application domain is quite similar: patrimony elements.

The connection between the accounting system and the notion of patrimony as a part of economic activity is clear. Whether one deals with simple accountancy or accountancy by double entry, the two accounting systems are determined by the concept of patrimony and target the providing of evidence in this domain. At its turn, the notion of patrimony derives from the manner economic activities are carried out.

There are, among others, two main characteristics of economic activities: their dynamic character and their rational character. The dynamics of economic activities determines certain dynamism to the notion of patrimony too; accordingly, patrimony undergoes certain changes determined by the constitutive complex processes of economic activities. At its turn, the rational character of economic activities gives a rational character to patrimony too; it will thus play a certain part according to its destination. The outlining of a patrimony, of no target propriety, is nonsense.

The patrimony of an economic entity represents all material and money values at its disposal as well as the rights and obligations that derive from the relations between the other economic entities that can either be natural persons or juridical ones with the State's budget, etc. as a whole. In order that patrimony exists two interdependent elements are necessary: first, natural or juridical person as *subjects* of rights and obligations and then, economic goods as *objects* of rights and obligations.

The structure of patrimony accordingly defined by accountancy can be schematically outlined as follows:

Patrimony: Money estimated economic goods
Money estimated rights and obligations
Natural or juridical person

Economic goods represent patrimony's material content. They are identified with the means or resources employed by an economic entity in order to carry out its activities. Money estimated rights and obligations show the propriety relations within which economic goods are produced and administered. They become rights in case economic goods are ensured by their legal subject in its capacity as a proprietor; they become obligations in case economic goods are ensured by third persons in comparison with the legal subject.

All rights represent the assets while all obligations represent patrimony's liabilities. Liabilities and assets are strongly connected from an economic point of view.

PATRIMONY'S ASSETS = PATRIMONY'S LIABILITIES

The patrimony assets of a company, for example, include the following elements:

- Parts' contribution to the company's foundation which, at its turn, can include financial means, investment goods, industrial propriety rights (patents, licenses, etc.);
- Goods subsequently gained by the company as a result of its economic activity;
- The right to use the ground;
- The right of propriety upon the products manufactured by its own firms;
- The profit given by the activity carried out by the company (to the extent to which it is not distributed as dividends among associates);
- The company's debt securities.

The company's patrimony liabilities also includes several elements such as: the obligations assumed by the company towards its associates, the obligations contracted while carrying out economic and financial activities for other juridical or natural persons, the company's obligations towards its employees.

From a juridical point of view, patrimony should be distinct both from the patrimony of other juridical persons and from the patrimony of each of the natural persons that form the analyzed collective entity. A juridical person's patrimony should not only be distinct but also autonomous, independent from any other patrimony; it is neither possible or permitted that a member of the group of people that form the juridical person to be responsible with his own patrimony for the obligations assumed by that juridical person nor that the juridical person to be responsible, with its patrimony, for the obligations assumed by one of the natural persons that form it. In order to

participate on one's own account and responsibility to the civil circuit, to the juridical life, in general, the collective entity that wants to be a juridical person should have its own patrimony which includes all its money estimated economic goods, rights, and obligations.

Accordingly, article 36 of the Companies Law no. 31/1990 stipulates the following: *“during the existence of a company, the creditors” of one of the associates “may exercise their rights only upon that part of the benefits that are due to the associate after the social balance sheet and after the company’s dissolving, upon the part due after liquidation”*; they cannot pretend, in order to put an end to the debt security, goods or rights belonging to the company, but only goods or rights belonging to their own debtor, either as a result of dividing yearly net benefits or as a result of dividing the net assets that result after the company’s liquidation.

A patrimony can either be theoretically or practically outlined as accountancy’s object provided the patrimony unit is legally founded and the economic values that belong to patrimony are invested, namely they are really used by a lucrative economic activity that determines profit (work=benefit) or by other activities having a non-lucrative character (which does not determine incomes) – administrative activities, social and cultural activities, etc. The knowledge of patrimony’s structure is theoretically and practically important for accountancy; accordingly:

- Each element of patrimony divides owing to its content and certain characteristics, a fact that determines the use, under specific circumstances, of the procedures belonging to accountancy method;
- The division of patrimony mass into the two categories of structures (Assets and Liabilities) determines a certain internal structure of the balance sheet so that it can allow the modeling of patrimony’s condition according to its double representation.

Within the balance sheet, patrimony elements are grouped and synthesized from the point of view of their value both according to Assets and Liabilities on the basis of specific criteria, as follows:

- Within the Assets of the balance sheet, assets patrimony elements are synthesized in a group depending on two criteria: destination of economic goods and their degree of liquidity.

Accordingly, the assets include: **fixed assets** (intangible assets, tangible assets, financial assets); **working assets** (stocks and under manufacturing products, debts, placements, cash assets); **regulation and assimilated assets; premiums regarding obligations repayment.**

- Within the Liabilities of the balance sheet liabilities elements are grouped according to two criteria: the nature of rights and obligations and the degree of debts’ chargeability (term of payment).

Consequently, liabilities include: the entity’s **own capitals** (individual capital, capital reserves, profit, and other sorts of capital); **risks and expenditures provisions; debts** (long term bank credits, short term bank credits, suppliers, various creditors, other debts); **regulation and assimilated liabilities.**

The value expression of each patrimony element registered in the assets and liabilities of the balance sheet is equal with the final balance of the corresponding account of the checking balance. Such final balances are usually registered in the balance sheet grouped according to elements and economic content. Such a grouping within the balance sheet of the elements of patrimony assets and liabilities is called balance sheet position.

Within assets, costs are registered according to the reverse order of assets liquidity; it means that the Assets of the balance sheet contain the least liquid elements such as: intangible assets and tangible assets; the last being the cash assets also called liquidities.

Within liabilities the succession of the positions is done according to the reverse order of their chargeability; it means that the Liabilities of the balance sheet first include the entity’s own capitals as they have the longest chargeability term; then follow long and short term debts, current obligations, etc.

Subsequently, one may state that assets express the nature, destination, and the degree of liquidity of economic goods an economic unit detains, and liabilities outline the nature of the rights and obligations, the manner they form and their chargeability.

Starting from the two elements of liabilities, rights and obligations, accountancy calculates and outlines the net condition of net patrimony according to the following relation:

Patrimony's net condition = Patrimony's assets – Patrimony's liabilities

Whatever increase or decrease of net patrimony is the effect of the profit or loss determined by the transactions that have been carried out and which change the owned propriety.

In order to describe and register such operations of increase or decrease of patrimony's net condition, accountancy employs the terms of incomes and expenditures.

Expenditures + (-) Result = Incomes

Incomes as a money expression represent the operations that determine wealth; expenditures represent the operations that regard the use of wealth.

The comparison of incomes and expenditures determines the profit or the loss, namely, profit in case incomes are higher than expenditures and loss when the reverse happens.

The use of money standard is strictly connected with the carrying out of accountancy's object, namely: money evaluation of patrimony elements supports their *value homogenization* which is the essential condition of their accounting registering.

The notion of patrimony evaluation does not overlap that of company evaluation; the last one is a complex work carried out by a team of evaluators according to certain specific techniques and procedures owing to which global patrimony as well as each of its elements are up-dated from the point of view of their value in accordance with the market.

The accounting data resulting after registering the existence and movement of patrimony elements periodically undergo checking, control, and analysis operations; the following main objectives are in view:

- Getting the certitude of the exactness of accounting data – one of the essential demands able to render the proper condition of patrimony owing to the balance sheet;
- Knowing, owing to control, the degree of material integrity and of efficient use of material and money means;
- Drawing out the economic and financial analysis of all patrimony components that determines conclusions and decisions according to which future activity is going to be based upon.

One can state that, owing to its object, accountancy defines itself as a scientific field specialized in the knowledge and display of patrimony's net condition and its results (profit or loss).

3. Conclusions

The category of patrimony regarded from an economic perspective, on the one hand, and from a juridical perspective, on the other one, cannot be abandoned owing to its characteristic of being a general structure able to match all the elements of financial reports. It allows a definite outlining of the concepts of Propriety and Capital, Means and Resources, economic patrimony, and juridical patrimony. Nevertheless, patrimony should be defined from an economic point of view through a unit's resources, on the one hand, and through the use of controlled resources, on the other hand.

The two conceptions, patrimony conception and financial condition conception, can co-exist and can complete each other. Patrimony may preserve its feature of being the dominant criterion of structuring financial condition (balance sheet) due to reasons connected with tradition while the functioning of the principle of double entry, according to the concept of patrimony, has a pedagogical connotation.

The Anglo-Saxon conception where the elements that form the balance sheet are the assets, the debts, and the entity's own capitals, can co-exist and complete the concept of patrimony due to the fact that the assets, the entity's own capitals, and debts (the last ones as source of assets) are the components of patrimony regarded from an economic and juridical perspective, and the applicability field of accountancy is patrimony.

With these in view, the process of accountancy normalizing is continual, laborious, and iterative: recently elaborated norms are expected to be changed soon, etc. As a result, the assimilation of the accounting referential (IASB) within the theory and especially within Romanian legislation and practice should be accurately, prudently, and critically done, resorting to creativity and innovative boldness and adapting it to the Romanian economic and social environment, to the national cultural and historical context and traditions.

ACCOUNTANTS ABOUT ACCOUNTING POLICIES. AN EMPIRICAL INVESTIGATION OF SMES FROM BIHOR COUNTY

Bogdan Victoria

University of Oradea, Faculty of Economics

Meșter Ioana Teodora

University of Oradea, Faculty of Economics

Beleneși Mărioara

University of Oradea, Faculty of Economics

This paper examines the setting up of accounting procedures and policies in sampled SMEs from Bihor, county selected after criteria of size at the end of 2008. In order to conduct our research we have set up a questionnaire of 25 questions which has been applied to 100 SMEs. The obtained results showed that out of the 83 respondents, only 92,68% agree with the provisions of Article 10 of Order 3055/2009, according to which entities must develop their own accounting policies approved by the managers, only 75,60% of the respondents agree that the existence of written accounting policies at the enterprise level improves the quality of financial reporting and managers' decision making process and a significant number of respondents (21,95%) do not know the fact that during a financial year, a firm's accounting policies cannot be changed. The most relevant result of our investigative research consist in identifying the need to train the human resources involved in the process of writing and applying accounting policies and procedures in SMEs and the necessity to set up a manual of accounting department.

Key words: accounting policies, financial reporting, disclosure, SMEs

JEL codes: M41, M10, C81

1. Introduction

The latest decades in accounting research have been marked by empirical studies on accounting policies as well as by the reinstatement of the research methodology. Several papers which have been written on the theme of accounting options on the financial markets borrow their analysis frame from the financial theory: they use the efficiency hypotheses of the capital markets and the market model. The provisional character of the accounting information has often been associated to the truths resulting from what is considered to be obvious. Products of an *a priori* research, the accounting practices and standards lack any empirical validation. According to Casta (1997), at the end of the 60's, a part of the accounting research move away from the normative papers and approach a positive epistemology. Finding their sources in the financial theory, the positive approach has introduced, in the accounting research, a methodological sequence, not known so far, containing the stages regarding the observation of practices, the configuration, the wording of the testing hypotheses, of the empirical tests and their validation.

Our research hold forth to initiate a questionnaire based research in order to see the main perceptions of the accountant working in a small or medium sized enterprise, of their utility in providing the faithful image given by the accounting. The central objective of our research is to determine the degree of sensitivity regarding the formulation of written accounting policies by the Bihor county SMEs and the setting up of a manual of accounting policies and procedures at a certain entity level. We used directly applied questionnaires, on selected SMEs. Within each firm, we wanted to ask a person from the accounting department or from the management team to fill the questionnaire. Almost in all the cases the respondents belong to the accounting department, in most of the cases being the chief accountant or the firm's economic director. The structuring of

the questionnaire was made on 3 essential levels: 1. general information about the respondent; 2. questions testing the managers or the accountants' perception on the enterprise accounting policies; 3. personal data about the respondent. In total, the questionnaire had 25 questions out of which 19 open questions and 6 mixed questions. Of the 25 questions, 18 require answers from a scale from one to five, varying between strongly agree (5) to strongly disagree (1).

2. Explanatory grounds and literature review

Virtually, the accounting policy represents options regarding the specific principles, the evaluation stages, the rules and the procedures adopted for the setting up and presentation of the financial statements. As it results from the *IAS 1 "Presentation of Financial Statements"*, the **accounting policy** represents the *assembly of principles, conventions, rules and methods adopted at a national level or at the level of the accounting entities for the accounting recording and for the setting up of the financial statements*. To the extent to which these elements become imperatively applied norms by the legal texts, the accounting policy is reported and subordinated to the normative regulation system. Nationally, actually, the accounting policy is set up by the regulator and at enterprise level, the policy is set up and assumed by the enterprise managers. When there are no specific requirements, the management of the entity must adopt policies able to provide information through the financial statements, and the information should be: relevant for the users' needs in making decisions and credible. Lacking an explicit standard or regulation and an interpretation, the management of the enterprise will use the **professional judgment** in order to develop an accounting policy leading to the most useful information for the recipients of financial information.

Several researchers (Hagerman and Zmijewski, 1979; Zmijewski and Hagerman, 1981; Francis, 1987; Leftwich, 1981; Gopalakrishnan, 1994) have been trying to explain the motivation of the managers in choosing the accounting methods and why the capital market reacts to the accounting changes imposed. In the literature regarding accounting policies, the researchers have used the following perspectives in order to identify the determinants of the accounting policies: the opportunistic behaviour, the efficient contracting and the perspective of the information. It is known that "*long-term debts*" and "*political vision*" are important determinants of the accounting policies. Two hypotheses have been extensively tested in the choice literature in relation to the accounting policy. They are: debt/equity hypothesis: the larger a firm's debt/equity ratio, the more likely the firm's manager is to select accounting procedures that shift reported earnings from future periods to the current period; size hypothesis (or the political cost hypothesis): the larger the firm, the more likely the manager is to choose accounting procedures that defer reported earnings from current to future periods.

On the other hand, in other studies (Tarca, 2002; Gernon and Meek, 2001; Saudagaran, 2001; Schipper, 1999; Nobes, 2000) the impact of international harmonisation pressures on companies' choices of accounting policies is investigated. Demands for greater comparability in reporting have arisen from increased international business activities and greater participation in global financial markets. Companies may seek more harmony in their reporting if they expect greater comparability to have more benefits than costs. If a company selected policies that were consistent with IFRS, then it would increase comparability of reporting with other companies using IFRS. An interesting research is presented in Gietzman and Trombetta (2003) study regarding disclosure interactions: accounting policy choice and voluntary disclosure effects on the cost of capital. In their research the authors considered how disclosure of accounting policy interacts with subsequent choice over voluntary disclosure of a non-financial performance metric. In their model the case that accounting policy choice influences voluntary disclosure is dependent upon a complex mix of firm and environmental factors. The central contribution of this research, like the authors underline, is to make precise a formal setting in which accounting policy choice has significant signalling value and moreover where the signalling value dominates the value of increased voluntary disclosure when accounting policies are chosen or mandated to be uniform.

Other previous research works (Myers and Majluf, 1985; Healy and Palepu, 2001; Lang and Lundholm, 2000; Paprocki and Stone, 2004; Levine and Smith, 2006) build their study on investigating or examining choices of critical accounting policies, testing whether the quality of critical accounting policy disclosures is significantly associated with a proxy for information asymmetry. Critical accounting policies are the three, four or five policies that are very important to the portrayal of the company's financial condition and results and that require management's most difficult, subjective or complex judgments often because they require estimates about the effect of matters that are inherently uncertain. Such disclosures are intended to reduce information asymmetry.

Domestic accounting literature is mainly preoccupied with the conceptual aspects of the accounting policies and the analysis of the motivations leading to the selection of a certain policy by the management of enterprise. Authors like Duțescu (2003), Feleagă and Malciu (2002), Cernușca (2004), Diaconu (2004), Bunea (2006) are preoccupied in their research with the meanings of defining the concept of accounting policies as well as with the essential estimation criteria of accounting choices. Thus, according to Bunea (2006), if we make a review of the opinions regarding the content of the concept of accounting policies, in order to identify its nucleus, we will notice that it does exist and it is made up of an objective – restriction, represented by getting in the financial statements a superior quality piece of information, useful to different categories of users, but also from the estimation policies binomial – drafting and presentation policies of financial statements. Feleagă and Malciu (2002) are more incisive when referring to the delineation between the accounting policies and the estimation techniques: *„actually different accounting policies represent the same set of events in different ways or different aspects of the same set of events; on the contrary, the estimation techniques are used to get to the events that must be presented.”* And Cernușca (2004) considers that the accounting policy requires licit and concerted actions supported by the research of the objectives suggested by the managers of the enterprise, but it can also be the expression of some implicit accounting options. The enterprise management, through the accounting policy it draws up, sets up certain objectives regarding the size of the result. The accounting policy chosen by the enterprise management has consequences on the determination of the size of the result, represent a true decision of strategic management.

3. Methodology and research design

The methodology used in the current paper is the human behaviour research methodology, whose methods are the interview, the questionnaire, the survey, the laboratory studies, the experiments etc. Regarding the investigation of the perception of the Bihor county SMEs Romanian accountants on the necessity to set up written accounting policies at the enterprise level, we used a questionnaire based survey. Thus, the empirical research was based on a pilot study constituted on a questionnaire applied in the territory. We wanted in this way to take the pulse of the population studied which is constituted of Bihor county SMEs, sampled according to size criteria: the net turnover reported at the end of 2008 financial year and the average number of employees reported at the end of the same period.

In order to understand the economic environment in which these firms operate, we will proceed by doing a short description of the position of Bihor county within the North-West region from the point of view of the activity and the main economic indicators of the SMEs in this region. The North-West region contains 6 counties: Bihor, Bistrița - Năsăud, Cluj, Maramureș, Satu Mare and Sălaj. The number of active SMEs in this region is of 88,168 approximately 14,30% of the entire SMEs sector. If the weight has remained constant compared to 2001, the absolute number has increased with + 39%. In the North-West region, the highest weight in the firm volume is held by Cluj county with a percentage of 34,70%, followed by Bihor county with a percentage of 25,30%. According to the value volume of the turnover, the region produces almost 11% of the national volume produced by the SMEs, and from the point of view of the SME's profits, the North-West

region has 9,50% of the total national mass. In the North-West region, Cluj has 43,50%, followed by Bihor which covers 21% of the total profit of the region (Nicolescu, 2009: 168).

From the point of view of (gross) profit's average value on the enterprise the average value is of 45,40 thousand lei on enterprise, the most profitable proving to be the enterprises in Satu Mare and Cluj, Bihor county being the fourth in this classification, with a value of 38,11 thousand lei/enterprise. Both at the average county level as well as at the regional level, the SMEs in this region prove to be less profitable compared to the national average. The equity ownership proves to be relatively well capitalized, because the rate of the equity ownership quotation the equity ownership established as a ratio between the turnover and the equity ownership is superior to some regions such as the Central and the Western parts or to the national average (348,60%). At one year level, the number of rotations was higher in Bihor and Sălaj, but more reduced in Bistrița - Năsăud (3,7 times). Compared to the previous year, the rotation speed was reduced from 448,10% to 398,80%. Regarding the rate of the commercial profitability, the North-West region, with 6,91%, is situated below the national average level (7,25%), just like in the case of labour productivity, the rate of employment charges indicates a higher intensity of the payroll expenses in the North-West compared to the national average (99,60% compared to 113,70%).

The central objective of our research is to determine the degree of sensitivity regarding the formulation of written accounting policies by the Bihor county SMEs and the setting up of a manual of accounting policies and procedures at the level of an entity. Within each firm, we wanted to ask a person from the accounting department or from the management team to fill the questionnaire. Almost in all the cases the respondents belong to the accounting department, in most of the cases being the chief accountant or the firm's economic director. It is important to emphasize the fact that in our research we have used the aleatory sampling procedure. The structuring of the questionnaire was made on 3 essential levels: 1) general information about the respondent; 2) questions testing the managers or the accountants' perception on the enterprise accounting policies; 3) personal data about the respondent.

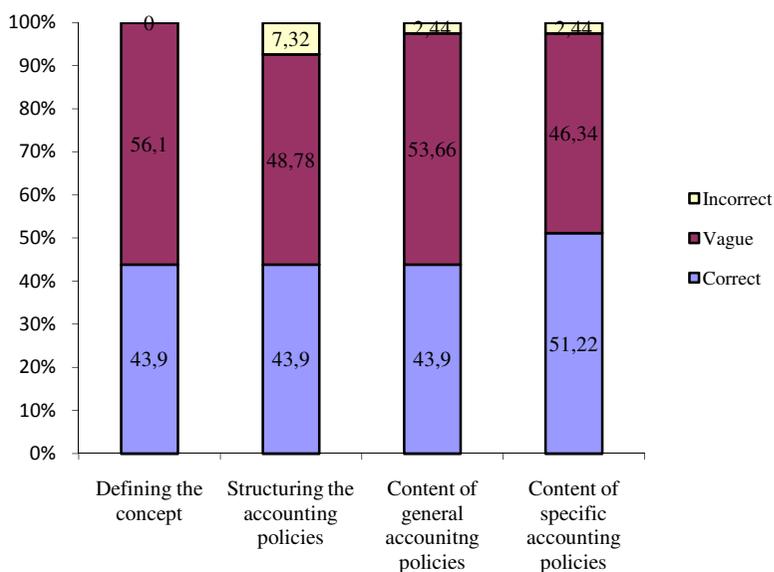

4. Descriptive statistics and results

Out of the 17 enterprises which have not filled in our questionnaire, 7 have been found in a difficult financial situation, meaning insolvency and 10 enterprises expressed their clear intention not to fill in the questionnaire. Out of the total of 83 questionnaires processed, in a number of 80, the general information section was filled in, but only 77 mentioned the name of the entity where the subjects work as well. We consider that is worth mentioning that out of the total of the answers received, a number of 65 subjects have declared that they have more than 5 year experience in making financial statements, these having a weight of more than 85% of the total of the sample, the rest having 1 to 5 year experience. Out of the 83 people interviewed, 66% were females and the distribution on age groups was the following: 41% were between 25 and 34 years old, 39% between 35 and 44 years old and the rest – over 45 years old. Regarding the subjects' professional qualification, the distribution of the sample showed that 44% of respondents are chartered accountants that have also economic college education, 7% of respondents are certified accountants with college education and 5% have economic average education.

The most interesting results have been obtained after processing the answers received at the second section of the questionnaire. Out of the 22 questions, 16 followed the acknowledgement of the provisions in the field of accounting policies of Order 3055/2009, 3 questions had in view the existence of accounting policies written at the entity level as well as their importance and 3 questions investigated the subjects regarding the training of human resources involved in drawing up personalised accounting policies at the enterprise level. By processing the answers of this section, we have followed on one hand to get an as faithful as possible image of the situation at the SMEs' level in Oradea and Bihor county, and also to analyze to what extent our hypotheses were confirmed by the empirical data.

To appreciate the degree of familiarity with the concept of accounting policy, in the questionnaire we have included questions referring to the defining of the accounting policy, the structuring of the accounting policies, the defining of the general and specific accounting policies, respectively, afferent to financial reporting. Regarding the definition of accounting policy, the respondents, by choosing the answers, have proved that they master this notion (43,90% - strongly agree and 56,10% - agree), unfortunately, in what the structuring of the accounting policies concerns, a quite important part of the respondents is not familiar with the two categories of accounting policies (7,32%) or does not know the content of the two types of accounting policies – general and specific (2,44%). Figure 1 presents, synthetically, the percentages of the correct, vague or totally incorrect answers, afferent to the aspects mentioned above. We noticed that the highest deficiencies are associated with the structuring of accounting policies into general respectively specific accounting policies.

Figure 1. Defining and understanding the notion of accounting policy in the sample

(Source: authors' calculus)

The following questions followed the assuming of own accounting policies. Out of the 83 respondents, only 92,68% agree with the provisions of Order 3055/2009, according to which the entities must develop their own accounting policies, approved by the managers or the people in charge with that particular entity's management. On the other hand, the highest percentage of them believe that the entity's management should adopt policies ensuring the providing of information in financial statements, relevant for the needs of users in making decisions which are credible at the same time.

According to Order 3055/2009, information presented in the financial statement of an entity, in order to be credible, must be faithfully represent the financial results and position of entity, reflect the economic substance of events and transactions and not only the juridical form, be neutral, prudent and complete considering all the significant aspects. A significant percentage of 92,69% of the sample considered that they agree with this statement. Only 75,60% of the respondents consider that the existence of written company accounting policies is improving the quality of financial reporting and managers and other information users' making decision process.

According to Order 3055/2009, the general accounting policy, must be notified in the explanatory notes of the financial statements, section: Accounting Policies and Methods. In spite of all these, in the sample, almost half (48,78%) of the respondents do not totally agree with the legislative provisions. The dispersion of the answers is higher than in the case of the question referring to the change of accounting policies. For example, even though the majority of respondents (82,92%) think that the implementation of a new accounting policy can be done only starting with the financial year following the one when the change took place, a significant percentage of them think differently.

During a financial year, a firm's accounting policies cannot be changed, yet, just like in the case of the previous question, a significant percentage of the respondents (21,95%) are not aware of this provision of Order 3055/2009. The changes in accounting policies can be done at the entity's initiative, in this case this has to be justified in the explanatory notes of the annual financial statements but they can be determined also by a change in the regulation, case in which the justification is not compulsory, being only mentioned in the explanatory notes. 19,51% of the respondents in our sample do not know this provision. Regarding the reasons for the change in the accounting policies, Order 3055/2009 has explicit provisions. In spite of all these, as presented in Table 1, a significant part of the respondents, between 12,19% and 53,66% gave wrong or vague answers to questions.

Table 1. The distribution of the answers regarding the change in the accounting policies in the sample

The change in the accounting policies is justified in the following situations:	Correct	Vague	Incorrect	Total
Exceptional changes occurred in the entity's statement or in the economic-financial context in which it develops its activity and/or by the getting of some credible and more relevant information	87.81%	9.76%	2.43%	100%
The change of the shareholders due to joining a group of firms when providing more secret information	82.93%	12.2%	4.87%	100%
The mergers and other similar operations made at accounting values	70.73%	17.07%	12.2%	100%
The changes in the applied estimate basis	46.34%	34.15%	19.51%	100%

(Source: authors' calculus)

According to the provisions of the same normative act, the change of the entity's managers does not justify the change in the accounting policies. In spite of all these, a significant percentage (17,07%) of those interviewed does not know it or disagree with it.

Attempting a synthesis of the degree of perception of the provisions of Order 3055/2009, we have grouped the first 16 questions of the questionnaire on essential aspects, as it can be seen in the table below. Each essential aspect has been associated with an average percentage, determined as a simple arithmetic mean of the answers in each category. The highest percentage of the correct answers, 96,95% is associated to the defining of the concept of accounting policy, at the opposite pole being, as we have mentioned previously, the familiarity with the legal regulations regarding the change in accounting policies.

Table 2. The degree of perception of the provisions of Order 3055/2009 regarding the enterprise accounting policies in the sample

The nature of the problem investigated	Answers (simple average percentages)			
	correct	vague	incorrect	total
Defining the concept of accounting policy	96.95%	3.05%	0%	100%
Assuming own accounting policies	96.35%	3.65%	0%	100%
The utility of accounting information	84.14%	12.19%	3.67%	100%
Communication of accounting policies used in order to draw up the financial statements	85.36%	12.19%	2.45%	100%
Change in accounting policies	76.52%	15.24%	8.24%	100%

(Source: authors' calculus)

We have considered as correct the answers “Strongly agree” and “Agree”, those vague are those answered with “Neither agree nor disagree” and the wrong answers had the answers “Disagree” and “Strongly disagree”. The subjects from our sample had relatively divergent opinions regarding the people in charge with making the accounting policies at the firm level. The distribution of the answers revealed that 36% of respondents consider that a group of professional specialists appointed by the firm’s management should be in charge with the writing and improving the accounting policies and procedures, 27% of respondents consider that the manager and a group of professional specialists would be much appropriate and 22% are of opinion that the economic executive or the chief accountant, 10% are for the accounting department and finally 5% are for an independent accountant to be responsible for elaborating and improving these policies.

5. Conclusions, limits and further research

As we presented in the previous sections, our study is a questionnaire based research, applied on a sample formed by 100 SMEs from Bihor county, selected using size, annual turnover at the end of 2008 as well as the average number of employees criteria. Only 83 of the applied questionnaires were validated. It is important to note that 65 of the respondents have over 5 years experience in financial reporting, that is over 85% of the sample, the others have an experience of 1 to 5 years, in the meantime, 44% of the respondents have economic higher education and other 44% are chartered accountants.

The most interesting results were obtained from the answers to the questions from the second section of the questionnaire. Out of the 22 questions in this section, 16 were designed to find out whether the respondents are familiar with the accounting regulations from the Order of Ministry of Public Finance no. 3055/2009, 3 questions were related to the existence of written accounting policies for each entity, and another 3 questions investigated the subjects’ opinion with regard to the formation and training of human resources of the personnel involved in the elaboration of specific accounting policies in a firm. In order to obtain a synthesis of the degree of perception of the Order no. 3055/2009, we have grouped the first 16 questions using some essential features – the defining of the accounting policy concept, their assuming at a firm’s level, the utility of accounting information, the accounting policy disclosure and their modification. We have computed an average weight of the correct and wrong answers for each of these essential features. The highest weight of the correct answers, 96,95% is associated to the defining of the accounting policy concept, on the opposite pole we find, as we mentioned earlier, the knowledge of the legal stipulations regarding the modification of the accounting policies.

Perhaps the most important result of our investigative research on the SMEs from Bihor county sample is the identification of the need of specialists' formation and training in the development of specific accounting policies, according to the entity's features, as well as the necessity of specialized assistance in the elaboration of a policy and procedure manual(guide) for the accounting department, which should comprise the specific theoretical framework for the development of strong accounting policies, premise of a believable and comparable financial reports, reflecting the economic substance of events and transactions. The limits of our study are related especially to the elaboration of the questionnaire, the formulation of the questions as well as the choice of the sample. We intend to remove these weaknesses in future researches, that will be focused on the investigation of specific accounting policies used in Bihor county or even North West Romanian SMEs, their presentation in the financial reports and the motivations behind the choose of an accounting policy or method in the detriment of another one.

ACTUARIAL ACCOUNTING - THE NEW DIMENSION OF ACCOUNTING

Botea Mihaela

The Bucharest Academy of Economic Studies, Accounting and Management Informatics Systems

Sahlian Daniela Nicoleta

The Bucharest Academy of Economic Studies, Accounting and Management Informatics Systems

Starting from the international convergence and resear of accounting as a general rule and actuarial accounting particularly context, this thesis wants to be part of the harmonization world movement, of the research and application of new settles, bringing forward for the insurance and private pension experts an entire set of good aspects and specific applications.

The goal is to offer practical alternatives in accomplishing financial reports, in estimation, recognition and evaluation of premiums and technical reserves belonging to the insurance and private pension field.

The study is based on the experience and casuistry of the national and multinational companies that perform in the wide area of insurance and private pensions.

The thesis brings originality through the new concepts used that form the content of actuarial financial accounting, and the high value of the research is produced by the new approach of the accounting based on actuarial calculations, which is a beginning in Romania, lining up to the international accounting research.

Keywords: Actuarial calculation, gross/net premium, fructification factor, current value, commutation-number, mortality table.

JEL code: M41: Accounting

The XXI century, century described by convergence and harmonization, defines itself by starting the bases of actuarial accounting, based on: actualized values and actuarial calculating.

The actualized and stocked value represents a present estimation of the value, depending of the future benefices fluxes that will appear during the activities that means bringing to date a value that will became **available** later. As the IASB general frame says, the actualized value is defined trough the future cash flows at the present time, the basic principal being “ money earned today have more value that the money earned in the future” .

Actuarial accounting finds it self at its best in the insurance system. In the market economy, insurances represent, on one hand, a business and citizens money protection device, and on the other hand a commercial activity that generates profits. In this context the enterprise as an independent element of the economical system interacts with the business partners, with the different level budgets, with the stock owners and other subjects, process that conditions the economical relations. In this case, the role of accounting is to assure with true and impartial information all the user, especially the enterprise owners and the stock investors.

With the help of actuarial accounting:

- We can measure and register possible variables of the **interest** rate and the inflation rate
- We quantify in monetary terms the risk of the economical activity
- We use the actuarial calculation for estimating, evaluating and recognizing the wealth and profitability

This type of accounting uses the actuarial calculations for maximizing the enterprise value.

The concepts of actualized value, current value and future value, insurance rate, voyager fructification factor, mortality tables, commutation numbers, technical backup, mathematical

backup, solvability, margin of solvability, insure risk, risks management, actuarial calculations, covering accounting against risks, time periods, immediate/delayed payments/incomes,

1. Actuarial accounting types regarding the estimation, recognition and evaluation of the life insurance rate.

In life insurances the preoccupation of the insuring is to obtain the stability of the activity financial results. He must work so that he will cover entirely; based **on the collected insurance rate**, the obligations he has for the insured ones. The insurance rates must also cover the expenses regarding the signing of the contracts, the purchasing of the insurance, etc. because of this the technique used to calculate the insurance rate and the mathematical backup is very important.

At the base of calculating life insurance rates stands the principle of a person's loss, who suffered in the result of the insurance case, among more insured persons, that have not suffered any loss. The payment for the case that came up are made from the the fund formed by all the insured as the result of paying the insurance rate. The quantum of the insurance rate represents the expected value of the insurance payments which belong to an insured person on the entire duration of the insurance. The insurance fees, in form of insured sum, belong to the insurance company and are made, in the case of life insurances, as the result of the decease of the insured during the insurance period or his/her survival until the end of the contract period.

So, to calculate the insurance rate we need to know: the number of deceased, the number of the survivors and the current value of the sum that will be paid (the sum that must be obtained by the insuring part from the insured persons, so that it could cover the future payments in case of death or survival at a certain age, with the condition that the incoming sums will be invested, that means fructification)

It results that to calculate the insurance rate, we start from the data that we obtained fructifying the insurance funds, and also from the mortification table of the analyzed country.

2. The fructification of the insurance funds

So that he can honor the obligations regarding the payment of the insured sum in case of death or at the end of the period (survival), the insurance company creates for it self, based on the incomes from the insured persons, a fond that, fructified as a bank deposit or other placements in the economical circuit, revenues. These profits are taken in consideration when we calculate the size of the insurance rate and depend on the insurance rate value existing in the fond, on the period of time in the economical circuit and on the fructification factor.

The fructification of this funds has as basic principal the composed interests. In the end of every year, at the initial sum deposited by the company it's added afferent interest, which is also fructified in the next period in the same conditions. That means it remains at the disposition of the credit institution, and it also produces interest.

2.1 Determination of the final value by using the fructification technique

A sum of money deposited in order to be fructified on a period of n years, at the end of the cretin period, it becomes:

$$S_n = S_0 (1 + i)^n$$

where: S_n - the sum obtained after fructification;

S_0 - the sum deposited in order to be fructified;

$1 + i$ - fructification factor ;

n - number of years on which the sum was deposited to be fructified.

Example:

An insurance company wishes to dispose of a sum of 1.000 lei over 5 years, by depositing a sum X in a credit institution where the interest rate offered is 5%.

To do this, the determination of the actualized sum of 1.000 lei, is necessary:

$$S_0 = S_n \frac{1}{1+n \cdot i} = 1.000 \frac{1}{1+0,05 \cdot 5} = 784 \text{ lei}$$

Consequently the company has to monthly deposit the sum of 784 lei for fructification, with an interest rate of 5%, so that over 5 years it will dispose of a sum of 1.000 lei.

3. Tables of mortality and commutation numbers

Tables of mortality and commutation numbers contain a series of demographical indexes determined based on the data on the number of survivors and deceases, birth years and ages for men and women and both genders, they can also be laid down on demographical regions or social-professional categories. Because of certain necessities, starting from general (complete) tables of mortality, or using estimation functions, abbreviated tables are made, meaning tables for different age intervals (for example from 5 to 5 years). In order to facilitate the study and use of the table of mortality in calculating the insurance rate, the actuarial science uses an International Actuarial Symbolization System.

The calculating of the insurance rate in life insurances necessitates the use of the demographic indexes of the table of mortality, as well as the data regarding the value of the actualization factor obtained in the financial actuarial tables. In the actuarial practice it is desirable to estimate the insurance rate tariff for each age and the duration of the insurance accepted by the insurer, which contributes to the performing of some huge arithmetic operations based on big volume data series.

In order to simplify calculating the insurance rate tariff, the life insurance technique use a series of auxiliary measures, known as commutation values, which are enlisted in the table of commutation numbers. These values are obtained by combining indexes enlisted in the tables of mortality and financial actualization. Thus the replacing of the digits with different values from this two tables is done and their aggregation in a single table.

The predetermined calculus from the table of commutation numbers take in consideration a basic insured sum equal with one.

Table 1. Commutation values obtained with the number of the survivors l_x

Formula	Formula explanation

insurance rate

- Tax payment to the state budget

186,6 lei 4441 Payroll tax fee for life insurance incomes = 54411 Lei bank accounts 186,6 lei
concerning life insurance

- Paying the net commission for the insurance income (1.866 – 186,6 = 1.679,4)

1.679,4lei 4221 Accounts payable due to intermediate concerning life insurance rate = 54411 Lei bank accounts 1.679,4lei
concerning life insurance

Conclusions:

The main problem that appears in the Romanian specialized literature in that at the moment we can not talk about actualized accounting, personalized as evaluation, recognition and calculus system.

This is why the applicative value of the paper consists in elaborating a new concept – the one of the actuarial accounting – which will contribute to perfecting the methodological base of the accounting of the insurance companies in Romania, which will allow:

- Only including in the insurance organizations income the quota of the insurance rate obtained form direct insurance and reinsuring gained, this way the cases of information distorting in the financial reports settled by this economic agents will be excluded;

- A better risk estimation in insurance, which will make the information presented in the financial situation come closer to the truthful image principle;

- Bigger stability of the financial results of the developed activity, as a consequence of the full covering of the obligations towards the insured as well as the expenses related to contracting and insurance rate collecting, from the insurance rate income;

- The use of the fructification and actualization techniques in detriment of the final value and the actual value;

- Taking in consideration ,in order to establish the insurance rate, the number of deceased, the number of survivors, the current value of the sum which will be paid in the future (the sum needed to be collected by the insurer from the insured persons in order to cover for future payments in case of decease or survival at a certain age, with the condition that the collected sums are to be invested, meaning fructified);

- The use of tables of mortality and commutation numbers for a better estimation of the insurance rate;

- The use of the “pro rata temporis” method by the Romanian insurance organizations for calculating the not gained insurance rate reserve at the end of the fiscal period. The use of this method improves the exactness levels of the actual won income calculus from the insurance activity in the managing period, except the case when the insurer doesn’t dispose of means in the not gained insurance income reserve, in the contract action period, and guaranties to fulfill the obligations undertaken according to the conditions stipulated in the insurance contract.

ACCOUNTING FOR FAIR VALUE HEDGING

Botea Elena Mihaela

The Bucharest Academy of Economic Studies, Accounting and Management Informatics Systems

Stanila Oana

The Bucharest Academy of Economic Studies, Accounting and Management Informatics Systems

Sahlian Daniela Nicoleta

The Bucharest Academy of Economic Studies, Accounting and Management Informatics Systems

The derivatives appearance was generated by the discovery of new ways to limit and manage current activity risks. Derivatives couldn't hedge any type of risk. Derivative operations can be used to hedge: interest rate risks, foreign currency exchange rate risks, credit risks. Derivatives used to hedge these risks can be handled to cover fair value exposure, cash flow exposure and exposure to changes in the value of a net investment in a foreign operation. The hedging accounting roll is to protect the profit against losses generated by fluctuations of: prices, currency exchange rates and interest rates. Hedge accounting applies to recognized assets and liabilities, but also for unrecognized firm commitments. The fair value hedge is defined as a hedge of the exposure to changes in fair value of a recognized asset or liability. The accounting for change in fair value of a derivative depends on whether the derivative has been designated as part of an effective hedging relationship.

Keywords: hedge accounting, hedge effectiveness, fair value exposure, cash flow exposure, fair value hedge

JEL code: M41: Accounting

As the use of derivatives increased on a global scale, the appearance of new accounting standards was necessary. This is why IAS 32 and 39 were issued: to provide a comprehensive list of all disclosures and presentation issues that are relate to financial instruments. Although they were issued as separate standards, they are applied in practice as a unit because they deal with the same accounting phenomenon.

The introduction of fair value as an evaluation method for financial assets has increased since the introduction of IAS 39 and thus, has generated a series of problems. The ones directly facing these problems are the companies that chose to use derivatives, weather for hedging or speculative purposes. When it comes to recording derivatives in financial reports, the most important issue is the treatment of the gains or losses resulting from the adjustment of the derivative's carrying value to fair value. The main reason for hedging accounting is to protect the profit against losses generated by fluctuations of: prices, currency exchange rates and interest rates. Gains and losses on the derivative used for hedging should be in the opposite direction from and of similar magnitude to the gain or loss¹ on the hedged item.

Requirements for Hedge Accounting

When using hedge accounting, three conditions must be met simultaneously:

- the nature of the hedge risk
- the hedge effectiveness
- the documentation

The derivatives appearance was generated by the discovery of new ways to limit and manage current activity risks. Of course, derivatives couldn't hedge any type of risk. Derivative operations can be used to hedge the following risks: interest rate risks, foreign currency exchange rate risks, credit risks.

Derivatives used to hedge these risks can be handled to cover three types of risk exposures:

Fair value exposure: A fair value risk exists if fair value can change either for a recognized asset or liability, or for an unrecognized firm commitment. To qualify for hedge accounting, the fair value risk must have the potential to affect reported earnings if it is not hedged.

Cash flow exposure: A cash flow risk exists if amounts of future cash flows that could affect earnings can change. The future cash flow at risk can be a contractual cash flow related to an existing asset or liability, or it can be a forecasted cash flow from a transaction that is expected to occur but is not yet subject to a contract.

Exposure to changes in the value of a net investment in a foreign operation: This type of risk relates to changes in the value of an investment in a foreign subsidiary or in a foreign company accounted for by the equity method. Such changes in value can occur when exchange rates increase or decrease.

In any case it is very important to calculate the value of the exposure and the potential to affect reported earnings. If the changes of the assets and liabilities value are recognized immediately in earnings do not qualify for hedge accounting. Matching the recognition of gains and losses occurs without any need for special accounting. For hedge accounting to be used, a company must expect that the hedge will be highly effective in offsetting changes in the value of the hedged item or changes in cash flows related to the hedged item.

In order to apply hedge accounting, you have to take into consideration the following:

Step 1 – choosing the derivative instrument has to generate gains and losses that offset losses and gains on the hedged item.

Step 2 – selecting a method to measure the portion of the change in value of the derivatives and evaluate hedge effectiveness (at the beginning, and while the hedge is active).

Measuring Offsetting Changes in the Derivative's Value Effectiveness tests can be based on changes in the value of the entire hedged instrument or can exclude changes in the value related to passage of time. For example, futures and forward prices can be viewed as the total of the current spot price plus a forward discount or premium. The change in forward discount or premium is unrelated to any changes in an item where futures are used to hedge, so a valid approach is to exclude the changes in discount or premium from the measurement of hedge effectiveness. In this case, hedge effectiveness would be evaluated by comparing changes in the spot rate component of futures prices to changes in the value of the hedged item. Similarly, the entire premium on an out-of-the-money call option represents the time value related to the possible gains should the option end up in the money. As the time to expiration draws closer, this time value gradually decreases. The changes in the time value component of the option is unrelated to any changes in an item that the option is used to hedge, so a valid approach is to exclude the changes in time value from the measurement of hedge effectiveness.

Hedge effectiveness would be evaluated by comparing changes in the intrinsic value of the option to changes in the value of the hedged item.

Hedge Accounting for Fair Value Hedges

IAS 39 defines the fair value hedge as a hedge of “the exposure to changes in fair value of a recognized asset or liability”. If a fair value hedge is effective, it creates a risk exposure in the opposite direction from the risk exposure of the hedged item.

Hedge accounting applies to recognized assets and liabilities, but also for unrecognized firm commitments. An unrecognized firm commitment is a contractual obligation that is not yet

reflected on the balance sheet, but in the future it will become an asset or a liability once it will appear in the balance sheet. The firm commitment must be for a fixed quantity, price, and date and has to be binding both parties (customer and supplier). In order to use hedge accounting to cover fair value risk, the hedge item must be a single asset, liability, or commitment or a group of assets, liabilities, or commitments whose values change together.

All changes that occur in the process of hedging will be reported in current earnings, the carrying value of the derivative is adjusted to fair value on the balance sheet, and the change in that carrying value from period to period is included on the income statement. At the same time, the balance sheet carrying value of the hedged item is also adjusted so that unrealized gains and losses due to the hedged risk offset the gains and losses on the derivative.

Example for Fair Value Hedge of Exposed Asset

In October N a refinery who's processing crude oil from import has an inventory of 80.000 barrels (12. 720.000 l) at 72 \$/barrel, 1\$=3lei. The company anticipates that the crude oil will be used in producing products that will ultimately be sold in June N+1.

Because on the market cruel oil's price registered an increase the company decides buying futures contracts (short position) on the American market (CME - Chicago Mercantile Exchange) in order to hedge the value of its crude oil. The company buys 10 June futures contracts at a price of 85,09 \$ per barrel . CME requires a margin deposit for 800\$ per contract (each contract refers 1000 barrels)

Hedging Designation

The refinery designates the futures contracts as a fair value hedge of the change in the value of the crude oil inventory due to changes in spot prices. It is a fair value hedge because the company is hedging the value of an existing asset. It might seem strange that the company is hedging the value of the inventory it already owns since the company has already spent the money to purchase that inventory, and the amount cannot increase. The company has a continuing need for oil in its production, however, and future purchases of oil would be at higher prices if the price of crude oil rises. Although the company designates the existing inventory as the hedged item, it is really hedging the cost of replacing that inventory once it has been used up.

Expected Hedge Effectiveness

If the value of crude oil drops, the company's inventory of it decreases in value, but it expects to make an offsetting profit on the short position in crude oil futures. It might seem that this hedge would be highly effective based on the critical terms of the derivative.

Subsequent Price Behavior the spot prices and futures prices subsequently change as follows:

Months	CME Spot cruel oil per barrel	Futures cruel oil per barrel
November 15	80,00	79,65
December 31	84,15	83,75
June 15	85.49	85,09

Accounting treatment

Since all of the conditions for hedge accounting were met, the refinery accounts for the futures contracts as a hedge of the fair value of its copper inventory. The carrying value of the inventory is adjusted by the amount of effective hedging, and changes in the futures position not attributable to effective hedging are recognized in earnings. Because CME (like all futures exchanges) requires daily settlement of futures positions, the changes in value are realized through cash payments to or from the exchange, and the open futures position always has a fair value of zero. Required journal entries at each date are as follows:

* November 15 – to record the margin deposit 800\$/contract (800 \$ x 10 contracts x 3lei/\$)

Commodities Accounts	=	Bank Account	24.000 lei
----------------------	---	--------------	------------

* December 31 – payment to CME in order to cover losses:

1000 barrels x (79,65 - 83,75) x 3lei/\$ per contract			
Commodities Accounts	=	Bank Account	123.000 lei
– to record losses on futures positions			
Profit & Loss Account	=	Commodities Accounts	123.000 lei
– to adjust the carrying amount of cruel oil for changes on spot price:			
80.000 barrels x (84,15 – 80,00) x 3lei/\$ per contract			
Cruel oil inventory	=	Profit & Loss Account	996.000 lei

* June 15 – payment to CME in order to cover losses:

1000 barrels x (85,09 – 83,75) x 3lei/\$ per contract			
Commodities Accounts	=	Bank Account	40,200 lei
– to record losses on futures positions			
Profit & Loss Account	=	Commodities Accounts	40,200 lei
– to adjust the carrying amount of cruel oil for changes on spot price:			
80.000 barrels x (85,49 – 84,15) x 3lei/\$ per contract			
Cruel oil inventory	=	Profit & Loss Account	321.600 lei
to record the return of the margin deposit			
Bank Account	=	Commodities Accounts	24.000 lei

Example for Fair Value Hedge of a Firm Commitment

On October 1, N, the refinery enters into a fixed-price contract to sell 10.000 barrels of gasoline at \$125 per barrel in December N. This is a firm commitment that exposes the company to risk because the cost of the cruel oil used to make the wire could increase, reducing the company's profit on the contract. The company decides to hedge this risk by taking a long position in cruel oil futures. The company buys 10 December CME futures contracts at a price of \$90,42 per barrel. The refinery has to pay a margin deposit of \$400 per contract.

Hedging Designation

The refinery will use the futures contracts as a fair value hedge of the firm commitment to sell its finish product: gasoline.

If the company intends to purchase additional copper to make the wire, the futures could instead be designated as a cash flow hedge.

Based on an analysis of gasoline and cruel oil futures prices, the company concludes that cruel oil futures should provide a highly effective hedge of cruel oil sales prices.

Subsequent Price Behavior The spot prices and futures prices subsequently change as the following table indicates:

Months	CME Spot cruel oil per barrel	June N+1 cruel oil Futures per barrel	Gasoline spot per barrel
October 1	86,27	86,61	125
November 30	88,71	89,07	127
December 31	90,42	90,42	129

Accounting treatment

Since all of the conditions for hedge accounting were met, the refinery records in its accounting the futures contracts as a hedge of the fair value for this firm commitment to sell gasoline. The commitment is recorded on the balance sheet at the amount of the effective hedging, and changes in the futures position not attributable to effective hedging are recognized in earnings.

The daily settlement of futures positions is realized through cash payments to or from the CME, and the open futures position always has a fair value of zero. When the hedged transaction finally occurs, the balance in the commitment account adjusts the recorded amount of the hedged transaction. See the following:

* October 1– to record the margin deposit 400\$/contract (400 \$ x 10 contracts x 3lei/\$)

Commodities Accounts = Bank Account 12.000 lei

* November 30 - to record gains on futures positions

1000 barrels x (89,07 – 89,61) x 3lei/\$ per contract

Commodities Accounts = Profit & Loss Account 73.800 lei

- to record firm commitment to sell

10000 barrels x (129 - 125) x 3lei/\$:

Profit & Loss Account = Firm commitment 60.000 lei

* December 31 - to record gains on futures positions

1000 barrels x (90,42 – 89,07) x 3lei/\$ per contract

Commodities Accounts = Profit & Loss Account 40,500 lei

- to record firm commitment to sell

10.000 barrels x (129 - 127) x 3lei/\$:

Profit & Loss Account = Firm commitment 60.000 lei

to record withdrawal of gains and the margin deposit

73.800 + 40.500 + 12.000 = 136.300 lei

Bank Account = Commodities Accounts 136.300 lei

- to record sale of 10.000 barrels of gasoline at \$125 per barrel

Accounts receivable = Sales revenues 1.250.000 lei

- to reverse firm commitment balance and adjust recorded revenues

Firm commitment = Sales revenues 120.000 lei

Conclusions

Hedge accounting applies to recognized assets and liabilities, but also for unrecognized firm commitments

In absence of hedging the firm sales commitment would not be recorded on the balance sheet.

All derivatives are to be shown at fair value on the balance sheet as either assets or liabilities, depending on the specifics of the contract

The accounting for change in fair value of a derivative depends on whether the derivative has been designated as part of an effective hedging relationship.

Under No.11 position paper "Economic and Monetary Union" Romania took responsibility of reporting according to European System of Accounts ESA 95. Public Institution classification is necessary to delineate the perimeter of general government (S.13), subdividing it into sub-sectors and to define how to consolidate their financial statements. To fulfill this research we used methods of documentary research, observation, analysis and empirical observation. Through the specific procedure of documents observation performed we accomplish delineating the problem in the general context. The empirical experiments produced practical data. The purpose of this study considered the practical applicability of a solution in offering a model of reporting that lead to increased correctness, forwardness, quality, of accounting information provided to their users

Keywords: ESA 95, sub sector, liabilities, financial statements

Cod jel: M41

Framework

Through entity's relation with its environment the need for objectives, relevant information arises whose satisfaction is required adequate supply. Accounting information in an organized manner provided by practitioners of economic entities should be useful to all users of information products of accounting. Market information is the meeting place of demand and supply of such information. Informational demand represents on one side informational needs of different users, and on the other side the pressures they are putting on general information system. The informational offer represents the aggregate information obtained in the accounting information system, available to various users groups and forms and their transmission routes.

Compared to other information sources, accounting information has high credibility. This credibility is being helped by auditors intervention, which aim to certify the summary documents submitted to users by managers.

Romanian Framework

Accounting Law provides that all companies should record the transactions based on double-entry bookkeeping system, the categories of entities which record their transactions single-entry bookkeeping system being specified by law. The responsibility to organize and record all the transactions for public institutions belongs to credit release authority.

Public institutions organize the accounting system, in different compartments led by the chief financial, accounting officer, or other person empowered to perform this function.

These people should have BA in economics and jointly share responsibility with his staff in the organization and management accounting law. Public institutions to which accounting is not

organized into separate compartments or does not have staff employed by individual employment contract, can establish separately work contracts, to organize accounting system, and to present the financial statements, with professional external to this institutions, authorized by law. Conclusion of contracts is subject to the regulations in force on public goods and services.

It is specific characteristic Romanian national accounts try positioning between two accounting cultures the traditional continental one and the Anglo-Saxon one.

Indebted customs, the communist doctrine, multiple legislative changes Romanian accountant from public system shows an aversion to new, need to be talked what/how/when to do.

International Accounting Standards (IAS/IFRS/IPSAS) come with a cultural inheritance difficult to be assimilated; it is based on professional reason (not a parameter in the communist era). The professional reason based on a set of general accounting accepted principles, can lead to a multitude of valid solutions to the same type of problem (controversy giving rise to supervisory bodies that may have another option).

The continuous change of International Accounting Standards, irrespective of their form, become in a paradox way more complex, and also more clarifying, lead to a new perspective for the Romanian Accountant whom is becoming a more international one. mastering the principles, and the terms of international accounting.

To converge means to moved toward the "to the same point, the same goal"; in the accounting domain *convergence* is a relatively new concept, appearing together with the internationalization of IASB objectives, in 2001. One of these objectives states: "To cooperate in an active manner with national regulatory standards board to identify quality solutions for the convergence of national accounting standards with standards developed by the IASB"

Compliance under explanatory dictionary of Romanian language is defined as: The ratio between two similar things or identical match, consistent identity. Accounting Compliance is the process by which compliance is assessed, and action consistency in content presentation rules and drawing up financial statements represent a harmonization of national regulations with the rules set by regional and international standardization bodies."

I agree with the conclusion reached „Convergence is following up on a national spirit of IAS / IFRS / IPSAS and conceptual framework, namely the adoption of the accounting treatment under international standards while normalizing the accounting means alignment, compatibility, for example at the European level, the accounting rules of different countries"

When it comes to economic account, many of member states of European Union, by lack of economic data, it so often referred to accrual with respect to financial, characterized by recording, the finding of income and expenditure obligations is adjusted to economic values on financial dimensions management based on economic accrual.

Public Romanian Institutions, using double entry bookkeeping system, records directly incomes and expenditure based on economic accrual to the reference period.

We number through the objectives of accounting normalization:

"...ensure regulatory accounting practices and thus lead to improved accounting

"...enable users of accounting information to make rational decisions based on accounting information

.. o serve as arbitrator between the various parties involved in economic life and, in particular between producers accounting information and accounting auditors who certify the quality of information thus ensuring the credibility of social accounting information;

To allow and enhance consolidation accounting in order to obtain an accurate accounting information for group companies;

..To assure the development of national statistics ,,

Reporting on sub sectors in Romania

Under No.11 position paper "Economic and Monetary Union" Romania took responsibility of reporting according to European System of Accounts ESA 95.

Given the internal and external reporting demands in 2009 by adopting the Minister of Public Finance Order nr.629/2009 Methodological Norms for the preparation and submission of quarterly financial statements of public institutions and of monthly financial reports in 2009 with amendments and supplemented (Omf.p.nr 2290/2009, 2941/2009 Omfp.nr) was introduced the necessity of sub sectors reporting.

The user of accounting information faces two sub sectors organization so when public institutions are grouped as sub sectors compiling annex for each sub sector they belong to:

- Annex 40a "Statement of assets and liabilities of central government institutions,"
- Annex 40b "Statement of assets and liabilities of public institutions of local government"
- Annex 40c "Statement of assets and liabilities of public institutions of social insurance (State, unemployment, health).

And the reporting of their contents is performed as defined by sub sectors:

Sectors and sub sectors according to	Name	User	Code ESA'95
European System of Accounts (ESA' 95)	IN	Annex 40	
Non financial companies	Economic operators		S.11
Financial Companies			S.12
Central Bank	B.N.R.		S.121
Other monetary financial institutions	Institutions	Credit Resident	S.122
Other financial intermediaries, except insurance companies and pension funds	Other residents		S.123
Financial auxiliaries	Other residents		S.124
insurance companies and pension funds	Other residents		S.125
Public administration			S.13
public institutions of central government			S.1311
public institutions of local government			S.1313
public institutions of social insurance			S.1314
Other states	Non-residents		S.2
European Union	Non-residents		S.21
Member States of European Union	Non-residents		S.211
Institutions of European Union	Non-residents		S.212
Third countries and international organizations	Non-residents		S.22

Classifying the public institutions is necessary to delineate the perimeter of public administration, to share it in sub sectors, as well as to define how their aggregated financial statements.

ESA 95 Manual shares the sector of public administration in four sub sectors:

- Public institutions of central government (S.1311),
- Intermediate public institutions of government (S.1312), does not appear as such in Romanian division
- public institutions of local government (S.1313),
- public institutions of social insurance (S.1314).

S.13 sector structure component analysis is required to analyze sub-classification of the institutions mentioned above, to reflect the route transactions to / from government.

Demarcation of the universe of public government is essential to prepare consolidated reports of the respective sector and the public government sector under the standards identified in this respect in Europe and internationally.

It should be noted the difference between public and government that depends on the classification of institutions. According to ESA 95, an institution is included in sub S.13 on its financing arrangements and the so-called compliance with the 50% criterion. This criteria are purely statistical and therefore not include an institution on the public institution list is based not only on its economic and legal profile.

For Romania, the institutions included in the perimeter of government based on two elements:

- financing arrangements
- Legal personality.

Example of standardized reporting practice Liability to Suppliers

Next we illustrate the analytical models, disclosure of the Liability to Suppliers

Presentation in a synthetic balance sheet at this moment

40			Suppliers and similar accounts
	401		Suppliers
	404		Fixed asset suppliers
		4041	Suppliers of fixed assets under a year
		4042	Suppliers of fixed assets over a year
	408		Suppliers - invoices not arrived
	409		Suppliers - debtors
		4091	Suppliers – debtors purchases of goods inventories nature
		4092	Suppliers – debtors for service and execution of works

First version analytical on sub sectors it has been tried to complement the automatic export of data to balance the 'Annex 40 (a, b, c) Statement of assets and liabilities of public institutions, information related to "Annex 30 Delays" in which complement or encountered numerous errors.

Non-current trade payables related supplies and services (ct.401+403+4042+405+4622). Total (rd.458+459+463+464), which:	Delays of public institutions of central government - (representing unpaid debt up to term) of commercial operations (ct.401+403+404+405+462). Total (rd.492+493+497+498)from which to:
-Economic operators (S11)	- Economic operators (S11)
-Public institutions from which (rd.460+461+462):	- Public institutions from which (rd.494+495+496):
- Central government (S1311)	- Central government (S1311)
- Local government (S1313)	- Local government (S1313)
- Insurance institutions (S1314)	- - Insurance institutions (S1314)
-other residents (S123,S124,S125)	--other residents (S123,S124,S125)
--Non residents (S21,S22)	--Non residents (S21,S22)

Current trade payables related to supplies and services (ct.401+403+4041 + 405+408+419 +4621). Total (rd.466+467+468.1+468.2), din care cater:	Delays of payments to suppliers, creditors of commercial operations (ct.401, ct.403, ct.404, ct.405, ct.462) din care: (rd.07.1+08+09+10+11)	07
- Economic Operators (S11)	-under 30 days	7.1
-Public Institutions from which: (rd.467.1+467.2+467.3)	-over 30 days	08
- Central government (S1311)	-over 90 days from:	09
- Local government (S1313)	-(ct.462)	9.1
- Insurance institutions (S1314)	-over 120 days	10
-Other residents (S123,S124,S125)		
- Non-residents (S21,S22)		
Debt from clearing operations, barter and economic cooperation (ct.462/5128)		

So being for the first case we have the following structure:

Synthetic account of first degree – suppliers was divided into the current and on current period, these accounts were in turn divided into accounts on sub- sectors, which were made taking account sub-division employment or settlement within the current period.

Inconvenient of this model are defined as follows.

A) Inability to develop synthetic unit balance and accounts of others to such a level of analytical representation

B) High degree of error which may occur in filling in the current settlement, the division generating difficulties, limits applying to future periods compared to the delayed pays report which was based on previous period

C) Many operations necessary to end of the month to their correct reporting and to fulfill its role to support the preparation of cash flow (ig Receive an invoice in 7 days settlement period, if received in the first days of the month, to its end where nonpayment was delayed, whether it was delivered in late fall into these categories)

To the second model we have the following grouping: current and non-current period

As found in dividing term solution to pay current period was chosen to make settlement within months of / analytical per month.

Thus a reduced employment opportunity for error in terms of the settlement payment is due in the same month and payment of invoices within 7 days, 30 even 180 days.

Problems arise when the health sector which are required by law for payment deadlines and troubleshoot the 180 days since July as the invoice will show the debt payment deadline non-current although less than a year and even pay up to end

As computing solution for avoiding the error of Completion from the calendar month following the expiry settlement accounts within months expired may not balance being blocked from completing fields (sub-account balance by the payment due date in January from the month February should be zero or as a result of payment or the transfer of category outstanding under 30 days)

Conclusions

SWOT analisys of this standardisation of liabilities to suppliers

Strengths

Provides a clearer picture, help in preparing cash-flow,

- Information on such debt indifferent is important.
- It facilitates a better assessment of management, procurement, suppliers of credit limits.

Weaknesses

- Original complex operations, human resources, insufficient training. Lack of specialized human resource endowment.

Opportunities

Reliability of the information provided internally and especially the risk of attracting internațional. Reduce plan sanctions for exceeding the time limits for submission of the situation, or supplementing them with errors.

Threats

Insufficient allocation of human resources results in less relevant and reliable information delays in reporting information on bodies (inter) national, drawing penalties.

University of Oradea

Faculty of Economics

Management accounting and cost calculation in the hospitality industry is a pathless land. The present article is a starting point of a long scientific approach on the domain of the hospitality industry and on the managerial accounting in this area.

Our intention is to put the spot light back on the thorny problem of applying Financial Accounting and specifically its implementation in the hospitality industry.

One aim of this article is to provide a picture of CVP analysis in decision making with customizing the hospitality industry. To cope with the crisis period, the competition and to achieve the expected profits of the hospitality industry ,managers have the possibility to apply CVP analysis, one of the most simple and useful analytical tools.

This paper will address the basic version of the CVP model, exemplifying the main indicators of the particular model for the hospitality industry that can help guide decision-making.

Keywords: CVP model, Break-even point, hospitality industry

JEL classification M41

Introduction

Hospitality industry is one of the most dynamic sectors of contemporary society with an increased role in the globalization process.

Tourism is an economic and social phenomenon characteristic of modern civilization, very rooted in society and therefore strongly influenced by its development. Addressing the large social segments and responding to their needs, tourism is by far a economical sector characterized by an increasing dynamism, manifested both nationally and internationally. Tourism rises to a vast human and material potential due to its content and complex character table, which has important implications for the development of national economies and society.

Tourism is a factor in individual and social equilibrium, a source of fulfillment for leisure time, developed in harmony with the human environment, natural and cultural resources to be placed in a context of sustainable development.¹¹¹⁷

Taking count of from the importance of tourism, the development prospects of the sector but given the current conjuncture and national economies affected by global economic crisis, maintenance and development of hospitality industry business entity requires harmonization of resources and market opportunities with their skills, foundation strategies cost information based on tourism products and services additional information on accounts, but taking count of the company's capabilities and balance with the environmental conditions.

Lack of coherent management strategy involves a weakness inherent in the management system benefits of providing costs. Awareness of benefits of providing quality services related to the right level of prices is not a common practice today.¹¹¹⁸

¹¹¹⁷Summary of processing of congress BITS, Naples, 14-18 june 2000, over of Theoretical and Applied Economics. Supliment. 29-31 mai 2009 ,Bucharest, pg 136

The tourism sector, regardless of market structure of interest covered by an economic entity (recreation and leisure tourism, spa tourism, business travel, tourism circumstance), key factors of success are:

- Differentiating their products from those of competitive interest in a more attractive environment afforded so, but not least your own offer competitive price / quality ratio. In Romania, because it applied the wrong policy in the hospitality industry on price quality ratio, the effects of policies currently exist through a customer orientation to market massive external interest;
- Diversification and complementary tourist services and submission of integrated products in the same package to ensure all facilities during the stay;
- Flexibility and adaptability of supply to demand trends
- Steady and sustained promotion of their products on the market, highlighting the defining characteristics that distinguish them from the competition.

Theoretical framework for the direct method and CVP model

Direct Costing method is based on the principle of separating variable costs from fixed costs according to behaviour change in production volume, and is charging only variable costs on products whether they are direct or indirect.

Originally, Direct - Costing `s cost is composed only of the total costs that change directly with output (activity level) and not from direct costs as we could wrongly understand deducing from it's name.

Thus, the name that best matches the Anglo-Saxon expression is the "variable cost method"¹¹¹⁹ or "variable costing". French Accountant General Plan 1982 also used the name "proportional cost method and some authors identify this marginal cost calculation method."¹¹²⁰

Costing provides relevant information for the management team, and is useful in formulating economic entity's business decisions for the next period. This method will provide a basis for cost estimates to study the effects of planned changes in production volume, resulting from changes in economic conditions or open some management actions such as price changes, increase or decrease in stocks or special promotional activity.¹¹²¹

So the method focuses on boosting sales in that size does not allocate fixed costs on inventory (unfinished products, finished products), but must be covered by the sales of the period.. Also the emphasis is on analysis and attribution of the fixed costs and attributing the variable costs on the margin (gross).The manager has the obligation to return and maximize margin on variable costs over which fixed costs will be charged.The margin on variable costs (M / CV), also called gross profit or contribution limit is determined as the difference between gross turnover and variable costs associated with the entire production sold. The margin of variable costs is also called the global margin and it is the sum total margins on variable costs per product unit set (m / cv) multiplied by the associated production sold. The unit margin can be determined as the difference between the selling price and the unit variable cost of product j.

$$M/CV = CA - CV; \quad CA = Qv \times pv \quad \text{and} \quad CV = Qp \times cv \Rightarrow R = Qv \times (pv - cv) - CF$$

Informational value of the margins in decision-making is subject to the following factors:

- Dividing the fixed costs and variable components must be fair and consistent;

¹¹¹⁸Larisa Dragolea, Radu Matei Todoran, Ensuring the quality of services by making costs effective in the management of rural tourist boarding houseswork presented at the International Scientific Conference "Challenges of a knowledge-based economy contmporane" II-nd Edition, ICMEA, Alba Iulia, 2009.

¹¹²¹ Sorin Briciu, citation pag 223.

- Rational use of uniform margins (gross contribution per unit) established as a basis for decisions in the sales policy , this requires constant variable costs per unit of product;
- For decisions regarding the selection of the production processes , the possibility of establish variable cost (marginal) reference constant unit cost of places is required
- Turnover, variable costs and the margin on variable costs, are three major indicators used by the Direct - Costing method , they behave proportional with the quantities sold. Assuming that the sale price is remains constant throughout the period in wich tje analis is made, we could consider that the business margin and variable costs behave in proportion to the turnover .¹¹²²

On the basis of the margins calculation we can establish wich of the products manufactured and sold is able to cover the resume and ensures participation in CF, and which product is unsuitable and produces loss to the company. Each product is judged by its ability to cover non-distributed costs (fixed costs).

The management team of the entity can decide to stop production of goods which have produced loss to the company. The decision must be taken into account if the product can help to ensure the dissolution of other products, or if there is a new product whose manufacture and disposal has good prospects to increase profit¹¹²³. We believe that in the hospitality industry we often find situations where a product conditions or contributes to the dissolution condition for others (demand for accommodation is conditional upon the existence catering unit, or the existence of bases for treatment and entertainment bring a significant contribution to the increase of outlets for lodging) . This way of approach allows considering whether to remove or develop one or other product sales. But the rationale for decision making must analyze several factors, not just gross contribution in absolute size.

A powerful tool of analysis based on Direct Costing is the Cost-volume-profit analysis , one of the most effective tools that managers of an economic entity dispose of. Cost-Volume-Profit examines the behavior of total revenue, total costs and results of operations under the influence of changes in production volume, selling price, fixed costs or variables costs. Managers routinely use CVP analysis to answer questions such as: How will the total costs and revenues be affected if we sell 1000 units more than usually? How will the production level be affected if you raise or lower the sales prices? All these questions have a common topic: What would happen if ...?¹¹²⁴

The CVP model proposed calculation and analysis of several indicators that will provide decision facets for the management team of specialized entities in the hospitality industry, information regarding the decisions of 'production' of products or packages and short term promotion. Cost calculation in direct-costing system should be organized to provide data to enable decisions based on marginal cost and coverage contributions¹¹²⁵ but also on other indicators (break-even factor coverage, range safety, etc.)

The CVP model and decision making

As we mentioned before , the CVP model analyzes the evolution of total revenue, total costs and operating profit as are changes in production levels (in the general economic activity), the selling price, the unit variable cost and / or fixed costs of a product. From practical work we could find that the even the easiest CVP analysis is useful in making decisions regarding strategic planning and offers, regarding the features of the tourism package products, prices and tariffs offered.

Competent economists say that in order to improve the performance of an economical entity in general, and to particularise, we will take the exemple of those from the hospitality industry, one of the first actions should be taken to improve organizational culture. If you have a culture that is not in concordance with the cost management and cost structure , or if you do not pay attention ¹¹²⁶ to the cost structure , you never get the results you want .

For the test result to be relevant we should take count of a series of constraints and limitation that have determined numerous critics from supporters of other ideologies . These restrictions include: knowing the exact cost behavior, relevant activity within the beach, all costs can be separated into fixed and variable costs, the analysis does not exceed the range of activity; variable costs that make the cost to grow proportionally with the output production fabricated and sold; input prices due not change during the period, so that appropriate costs record the progressive development of foreign business volume variation; production processes should be defined, known and not subjected to changes during the period of analyst, in the situation of obtaining more products it is required to observed and identificate: interdependencies between products, difficulties in product sales and their quantification as a linear dependency.

This type of analysis comes from the economic theory of costs, presented in Figure 1, Graph on which cost accounting analysis (Fig. 2) is a special case of the graph shown in Figure 1.

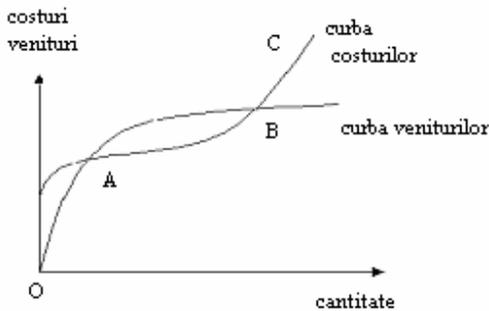

Fig.1: Economic reasoning of the cost-volume-profit analysis

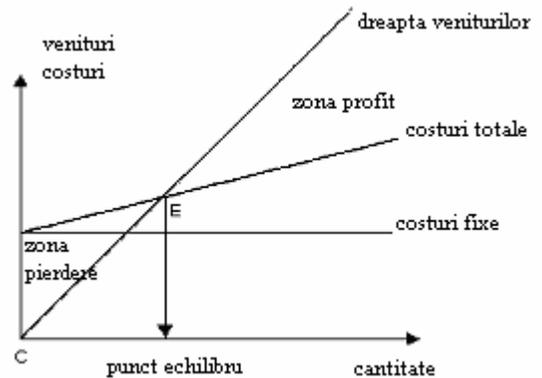

Fig. 2: Accounting rationament of the cost-volume-profit analysis

- OA: total costs exceed the revenues, the company is working in loss, since production capacity is fully used (to produce fewer products than is possible);

- AB: revenues exceed the costs (the profit), production capacity is used at a normal level

- BC: revenues exceed the costs (the loss). Production capacity is overloaded, producing more equipment than they were designed to do, there are breakdowns.

Basically, the economic model shows that there are two equilibrium points, B and C. Instead, the accounting model presents only one (point E). Accounting model is only a short-term picture of economic model is based on the concept of "relevant period" ("relevant range"), translated literature as a period of validity of the assumption of linearity.

Managers in the hospitality industry consider that the price competition in this area has the largest share a fixed cost. The issue will be at what level of "production" in the hospitality industry will the fixed costs be fully covered. The quantity of production sold for wich the total revenues equal total costs is called break-even, in other words, it reflects the amount of production sold so that the operating profit is zero. The management team of any entity is interested in the break-even as it reflects the minimum quantity of production that must be sold in order to not record losses.

¹¹²⁶ Anderson T, Elloumi F. Theory and Practice of Online Learning, Athabasca University, 2004, p.69-70

To determine the break-even (point of equilibrium critical point) the equation method is based on the formula is the result of which operate under:

$$RBE = CA - CV - CF \quad \text{and if} \quad CA = q \times p; \quad CV = q \times cv \Rightarrow \quad RBE = q \times (p - cv) - CF$$

If the equilibrium gross operating result is zero previous equation becomes:

$$q(p - cv) = CF \quad \text{and production volume to achieve equilibrium point is } q = CF / (p - cv).$$

But in the hospitality industry as we said, most of the costs are fixed, and "production" for housing units corresponds to the maximum accommodation. Therefore we think it would be appropriate to calculate the point of balance for each responsibility center or to calculate the point of equilibrium theory reporting the fixed costs to the average gross contribution.

$$P_{et} = CF / c_{bu} \quad \overline{c_{bu}} = \sum_{i=1}^n (Qv_i \times c_{bu_i}) / \sum_{i=1}^n Qv_i = Cb_{totala} / \sum_{i=1}^n Qv_i$$

In the given conditions in which an economic entity obtains and sells more products (such as travel and establishments) the breakeven structure is relevant. To get this structure it is necessary to calculate the volume of each bearer share in the total production cost, an index called specific gravity.

$$P_{ei} = gs_i \times P_{et} \quad \text{and} \quad gs_i = Q_{v_i} / \sum_{i=1}^n Q_{v_i}$$

The marginal contribution method is a variant of the previous method and we believe that the balance point is the turnover value for which the fixed costs are equal to the total contribution margin on variable costs (mv).

The unit margin on variable costs expresses increased profit earned by selling each additional unit of product. Thus, it will help cover the loss incurred by the entity until it breaks even, in time, each additional unit sold will increase profits. This affirmation holds a truth as long as the entity does not exceed the floor for which the fixed costs were determined¹¹²⁷.

Given that the equilibrium outcome is 0 value we can determined that the turnover achieving breakeven turnover called critical or break-even in monetary units according to the formula:

$$CA^* = CF / R_c \quad \text{and} \quad R_c = MV / CA \times 100 \quad \text{or} \quad R_c = Cb_{totala} / CA \times 100$$

But the fixed costs are relatively constant, so the gross operating margin result will change according to the variable costs per unit of product (mv) and by changing the quantity sold.

The margin on variable costs (gross contribution per unit) is calculated as the difference between selling price and unit variable cost and will contribute mainly to cover fixed costs which remain relatively constant in the range established and then cover up the profit or loss.

The break-even can be used to determine the physical volume of activity so as to achieve a profit (P))¹¹²⁸. Calculation formulas:

$$\text{In physical units } Pr_P = (CF + P) / CA *; \quad \text{In monetary units } CAP = (CF + P) / R_c$$

With the point of balance or breakeven we can calculate the turnover required to achieve a certain rate of profit (profit / sales). If the management team of an economic entity aims to achieve and maintain the enterprise to a certain rate of profit, he may find that using the break-even volume of activity that ensures it. The calculation formula is: $CA_{RP} = CF / (R_c - R_P)$

In the CVP analysis other indicators such as: coverage factor, dynamic factor of safety, range safety, index sampling rate volatility and operating leverage should be taken in consideration as being of an significant importance.

The coverage factor (Fa) shows how many percentes of the sales volume are needed to cover the fixed costs and obtain profit. Entities in the hospitality industry need to focus they're

¹¹²⁷ Nadia Albu, Cătălin Albu, *Performance Management Tools*, vol 1, Publisher: Editura Economică, Bucharest, 2003, pg 206

¹¹²⁸ Chirața Caraiani, Mihaela Dumitrana, *Accounting and Management Control*, Publisher: InfoMega, Bucharest, 2004, pg 161

manufacturing and selling policy with the highest coverage factor. Based on the coverage factor they can also calculate the selling price and the manager can take quick decisions and pricing policy.

Dynamic safety coefficient (Ks) shows how the revenue may decrease relative so that the entity can reach the equilibrium point. Any decrease in this ratio means that the entity is about to enter into losses.

The range of safety (IS), also known as distance or safety road shows how much can the entity afford to decrease its sales so that the unit does not enter in the area of financial losses.

Sampling index (PI) defines the percentage of turnover used to cover fixed costs, the company reaches break-even easier the lower its value is.

The purposes of any activity is to maximize the results by submitting a minimum of effort. Extent of such activity is the operational lever (Lo), which expresses how the assumption of fixed costs contribute to results. This indicator's value grows as the relationship between fixed and variable costs is higher.

Conclusions

Given the changing landscape, the hospitality industry is characterized by a dominant competitive logic, assuming a clear competitive advantage. There are several ways to create value, so there are many forms of competitive environment that have their own rules.

After identifying the competitive logic, the economical entity can adapt its strategy in an effective mode, Management accounting helps managers in the hospitality industry to organize existing and future businesses so as to assess, monitor and manage the future of the business and everything related to its economical stability.

As it has been already mentioned, CVP model allows the calculation of indicators for facets of decision-making, being useful to the entities of the hospitality industry, these indicators provide information on production decisions, selling, short-term promotion. Each of these indicators is particularly important, helping short-term management decision making, therefore we propose to analyze their influence and utility in future scientific research.

THE THRESHOLD OF SIGNIFICATION IN AUDIT

Brînză Diana Elena
University of Pitești
Faculty of Sciences Economics

Gâdoiu Mihaela
University of Pitești
Faculty of Sciences Economics

Within the framework of an audit of accounting data, the most important thing is to determine whether the information registered in financial reports reflects in an accurate way the economic events happened during the accounting period. The definition of the threshold of signification allows to the auditor even from the beginning of his mission to appreciate better the systems and the account liable to contain errors or significant inaccuracies, and at the end of the mission to appreciate if the anomalies discovered have to be correlated during the taxable year, for the purpose of expressing an opinion without reservation. Within the pages of this article, I tried to present a little inroad through the specialty literature in view of studying thoroughly the notion of threshold of signification and its relation with the audit risk, committing to paper their most significant aspects.

Key words: audit, threshold of signification, audit risk

Code JEL: M, M4, M42

1.Considerations regarding the threshold of signification

In a more and more active business world, the performances of economic entities are expected by its partners- shareholders, financial analysts, suppliers, creditors etc. The assembly of enterprise's activities, transposed in accounting language, is, in the first stage, the object of some internal verifications, accomplished by internal auditors or administration supervisors, which intervene in the domain of entity's business administration, contributing to the improvement of enterprise's organization and by this, to the capacity to attain the objectives established by the unit direction.

We generally define the audit as the professional examination of an information in view of expressing a responsible and independent opinion making reference to a criterion (standard, norm) of quality. The improvement of information use represents the objective of any type of audit.

The general plan of audit must comprise the following essential aspects:

- knowledge of client's activity;
- accounting and control system;
- risk and signification threshold;
- nature, duration and extent of procedures;
- coordination, advice, supervision and revision;
- other aspects;

By threshold of signification, we define „the level, size of a sum, over which the auditor considers that an error, an inaccuracy or an omission can affect not only the regularity and the correctness of annual accounts, but also the true image of the result, of the financial situation and of enterprise's patrimony.”¹¹²⁹

¹¹²⁹ Toma M., Chivulescu M., “Ghid practic pentru auditul financiar și certificarea bilanțurilor contabile”, Editura CECCAR, 1995.

The Financial Accounting Standards Committee (FASB) defined the threshold of signification thus: „The importance (gravity) of an omission or of an incorrect presentation of accounting information which from the point of view of general circumstances, gives rise to the probability that the reasoning of a reasonable person relying on the respective information had been changed or influenced by the omission or the respective error presentation”. The auditor’s duty is to determine whether the financial situations contain significant errors. In the case one notices the existence of a significant error in the presentation of information, the auditor will announce it to the client, in order to make a correction. If the client refuses to correct the situation, an opinion with reservations or an unfavourable opinion should be expressed, depending on the relative importance of the error (its signification). Consequently, the auditor must know very well the way of application of the threshold of signification concept.

The definition given by FASB emphasizes the reasonable users relying on the financial reports when taking decisions. Therefore, the auditors must know who are the possible users of the client’s situations and what decisions will be taken on the basis of these situations. For instance, if an auditor knows that financial situations will constitute the information basis for a sale and purchase agreement of the entire economic entity, the sum considered significant by the auditor could be smaller than in an audit with similar conditions, but with another objective. In practice, auditors might not know all the users or the type of decisions that they will take.¹¹³⁰

In „The General Frame for Drawing Up and Presentation of Financial Situations” of the Committee for International Standards of Accountancy, the threshold of signification was defined in the following way: „The informations are significant if their omission or incorrect declaration could influence the economic decisions of users, taken on the basis of financial situations. The threshold of signification depends on the element’s size or of the error judged in the specific circumstances of omission or incorrect declaration. Thus, the threshold of signification rather offers a limit than a primary qualitative characteristic that the information should have in order to be useful”.

The threshold of signification is a professional concept that could vary depending on the use of financial situations, of the degree of public interest, as well as of any other need of reference foreseen by the legislation. However, this variation is registered within some limits, according to the international practice (example: 0,5%-2% for expenses).

Example: Let’s suppose that the total sum of payments for the economic entity “Z” due to the accounting period N is of 200.000 lei. If the level of the threshold of signification is established to 1 % this means that the value is of 2000 lei ($200.000 \cdot 1\%$) and it is the maximum tolerable level of allowed errors. If the level of errors established by the auditor is greater than 2000 lei then, the accounts are not presented with accuracy.

1.1. Steps of application of the threshold of signification principle

The process of application of the threshold of signification principle follows five steps tightly correlated, presented above¹¹³¹:

Step I: Determination of preliminary value of the threshold of signification.

Step II: Assignment of preliminary value of the threshold of signification on audit segments.

Step III: Determination of preliminary value of the threshold of signification.

Step IV: Estimation of combined value of incorrect presentations.

Step V: Estimation comparison of combined values with preliminary or revised value of the threshold of signification.

¹¹³⁰ Arens, Loebbecke, „Audit- o abordare integrată”, Ediția a 8-a, Editura ARC, 2003.

¹¹³¹ Arens, Loebbecke, „Audit- o abordare integrată”, Ediția a 8-a, Editura ARC, 2003, pg. 289-296.

We have to underline the fact that the decisions regarding the threshold of signification refer to more than the determination of a sum for the financial situations. The reasons depend of certain factors, as for example:

An error to a certain level as part of the financial situations, referring to:

- total incomes from the profit and loss account;
- totality of assets from the balance sheet;
- totality of assets from the balance sheet.

Qualitative factors, as:

- probability that illegal payments were made;
- probability that irregularities may appear;
- clauses from the clients contracts with the bank to foresee that certain indicators from the financial situations be maintained at a minimum level;
- an interruption of the cashing flux;
- the direction attitude regarding the integrity of financial situations;

The auditor has in view the threshold of signification, respectively the dimension and the limit of error in the specific circumstances of the omission or incorrect declaration.

1.2. Specific elements of the threshold of signification

The specific elements of the threshold of signification are the following¹¹³²:

- needs of users of annual accounts;
- characteristics of the enterprise;
- characteristics of elements considered significant;

Needs of users of annual accounts

The information supplied by the annual accounts serves a large range of users: shareholders, associates, staff, creditors, clients, financial analysts etc. Depending on the users' demands and needs, the auditor will establish the threshold of signification as the users determine as significant elements different elements.

Characteristics of the enterprise

Among the characteristics of the enterprise that can be significant for the threshold of signification, we can mention:

- the activity area; in certain activity areas, the net result of the accounting period is replaced by other more representative indicators (for example, the trade domain where the net result is replaced by the gross margin);
- the enterprise's dimension determines the maximum and minimum limits of the threshold of signification;
- evolution in time of the enterprise (certain elements that modify the evolution of some important indicators);
- the social-economic environment in which the enterprise is functioning (legislation, political situation, competition, social climate etc);

Characteristics of elements considered significant

- sensibility; An element is considered "sensible" if its little variation determines a great modification in the appreciation of annual accounts.
- the approximation degree; An error is considered important if it refers to a post where precision and exactness are imposed, rather than when it refers to a post determined by appreciation (a mistake to a commission account is not as important as a mistake to the bank account in lei or to the account of cash book in lei).
- the element's evolution; The analysis in time of an element can reflect a tendency of its increase/diminution with unfair purposes.

¹¹³² Toma M., „Inițiere în auditul situațiilor financiare ale unei entități”, Editura CECCAR, 2005.

- the plurality of elements; The plurality of elements without much signification can lead to a significant resultant.

When establishing the threshold of signification, the auditor takes into account:

- the demands of information users, authorities and even those of the public opinion;
- the errors' influence at the total level of financial situations, but also in relation with the accounts' balance, with the transactions' classes and the presentations of information;
- the legal and regulation demands concerning the transactions' classes, the accounts' balance, the presentations of information and the existent relations between them;

2. Relation between the threshold of signification and the audit risk

According to the Audit Standard 320 „The objective of an audit of financial situations is to allow to an auditor the expression of an opinion, according to which the financial situations have been drawn up under all significant aspects, in accordance with an identified general frame of financial reference”. The threshold of signification expresses the maximum tolerable level of error accepted in order to decide if the accounts are correct or not.

There is a tight correlation between the threshold of signification and the audit risk. When he realizes an audit, the auditor must take into consideration the threshold of signification and its bond with the audit risk. As it is specified in the Standard of Audit 320 ”The Threshold of Signification”, the relation between this one and the audit risk is inversely proportional. The higher the threshold of signification level, the lower the audit risk and inversely. This relation is inversely proportional when the auditor determines the nature, the duration and the extent of audit procedures. For instance, if after the planning of specific audit procedures, the auditor determines that the acceptable level of the threshold of signification is low, then the audit risk is high. The auditor will compensate this either by reducing the evaluated level of the control risk, if reduction is possible or by supporting the reduced level and making some extended or additional control tests, or by reducing the fund non detection risk in the phase of audit planning.(Standard of Audit nr.320 “The Threshold of Signification in audit”)

According to the Standard of Audit 320 „The evaluation by the auditor of the threshold of signification and of the audit risk at the initial moment of the commitment planning can differ from the one in the moment of the evaluation of audit procedures results”, as a result of the new appeared circumstances or because of some changes in the knowledge stored by the auditor during the audit. When the total of unadjusted incorrect information approaches the threshold of significations level, the auditor considers the risk reduction through the application of some additional procedures or solicits to the direction to make the corrections in the financial situations due to the discovered incorrect information.

3. Examples regarding the way of interpretation of the threshold of signification

Example 1

At the company “X”, during the mission planning, the auditor determined a threshold of signification of 10% from the net profit; and for the stocks, which are badly controlled by the enterprise, the value of the threshold of signification determined by the auditor is of 650 lei, taking into account the total threshold, the effect of possible errors plurality and the fiscal incidence.

The errors found by the auditor during his checkings are of 400 lei and of 1400 lei in stocks evaluation. All the data are presented in the following table:

Data		The thresholds of signification	Found errors
	-lei-	-lei-	-lei-
Total balance	420.000		
Stocks	45.000	650	400+1400
Turnover	150.000		
Personal capitals	53.000		
Net result	9.000	10%*9000=900	
Cumulated		1550	1800

Between the two found errors, none is superior to the total threshold of signification ($400\text{lei} < 1550\text{lei}$; $1400\text{lei} < 1550\text{lei}$). Regarding the threshold of signification level determined by the auditor for stocks, the found error of 1400 lei exceeds the threshold of signification value (650 lei). Owing to the fact that the plurality of the two errors is superior to the total threshold ($1800\text{ lei} > 1640\text{ lei}$), the other error cannot be removed.

The influence of found errors over the above data will be determined through the correction of these errors with the percentage of profit tax (16%), due to the fact that the threshold of signification was established taking the net profit as base of reference.

The incidence of found errors over the characteristic figures is:

$$\text{-over the net result} = \frac{(400 + 1.400) - (1.800 * 16\%)}{9.000} = 0,168 = 16,8\% \text{ from the net result;}$$

$$\text{-over the personal capitals} = \frac{(400 + 1.400) - (1.800 * 16\%)}{53.000} = 0,0285 = 2,85\% \text{ from the personal capitals;}$$

$$\text{-over the turnover} = \frac{(400 + 1.400) - (1.800 * 16\%)}{150.000} = 0,01008 = 1,008\% \text{ from the turnover;}$$

$$\text{-over the stocks} = \frac{(400 + 1.400) - (1.800 * 16\%)}{45.000} = 0,0336 = 3,36\% \text{ from the stocks;}$$

Taking into consideration the incidence over the net profit and the fact that the cumulated error is superior to the total threshold of signification, the auditor must suggest the correction of stocks post to certificate without reservations the annual accounts.

Example 2

Let's suppose that within the financial situations of a company, we are presented the income from the exploitation activity in amount of 600.000 lei, the assets in amount of 1.270.000 lei and the total current debts of 380.000 lei. For instance, the auditors can decide that some information which distort the image much than 9% from the incomes total will be significant and will be the subject of a qualitative consideration. If the misrepresentation is smaller than 4% from the total of exploitation incomes, the auditors can consider them as non significant. The image distortions between 4% si 9% will be judged by the auditor. Thus, in this example, **the bounds of the threshold of signification** for the declarations regarding the exploitation income are between 24.000lei ($600.000 * 4\%$) and 54.000 lei ($600.00 * 9\%$). We proceed in the same way for the other posts taken from the balance, establishing the following bounds of the threshold of signification:

-for assets: between 50.800 lei and 114.300 lei;

-for current debts: between 15.200 lei and 34.200 lei;

If the cumulated value of presentation errors within the exploitation incomes is inferior to the limit of 24.000 lei, we shall consider that the financial situations present a real image; if the combined value of errors will exceed the value of 54.000 lei, then we consider that the financial

situations don't present a real image; and for the values situated between 24.000 lei and 54.000 lei, a rigorous analysis will be imposed to all the information put at disposal.

4. Consequences of threshold of signification

At the end of its mandate, the auditor draws up the recapitulative list of his findings and checkings. When the enterprise accepts the rectifications made by the auditor, this one can give a certification without reservations. Otherwise, the significant or non significant character of his findings will determine the auditor's attitude and the content of his certification. In this sense (Marin Toma, 2005):

- if his findings don't have a significant character, the auditor will give a certification of the regularity and exactness of annual accounts without reservations;
- in the situation when his findings have a significant character, the auditor, if it's case, will be determined to adopt a certification without reservations or to refuse the certification;
- the impossibility of certification, which appears in the situation when the auditor considers that the economic entity hasn't put at his disposal or couldn't supply enough elements to settle his conclusions; In this case, he will write down in his report that he is not in the position to express an opinion.

The determination of significant elements and of the threshold of signification is left to the auditor's judgement, because in audit, the professional judgement is totally irreplaceable, due to the great number of factors to take into consideration and to the subjectivity of their relative importance.

Conclusions:

The most frequent modality through which the users can obtain true information consists in the effectuation of an audit. Afterwards, the audited information is used in the final process, starting from the assumption that this information is reasonably complete, exact and impartial. The determination of the significant elements and of the threshold of signification is left to the auditor's judgement, because in audit, the professional judgement is totally irreplaceable, due to the great number of factors to take into consideration and to the subjectivity of their relative importance.

PROBLEMATISATIONS ET RESTRUCTURATIONS CONCERNANT L'ORGANISATION DU CONTROLE DE GESTION EN ROUMANIE DANS LE CONTEXTE DE LA GLOBALISATION DE LA CRISE FINANCIERE

Budacia Lucian Constantin Gabriel

Universitatea Hyperion București,

La deuxième décennie du troisième millénaire va représenter un nouveau début pour la théorie et la pratique du contrôle de gestion. Les structures et les conceptions classiques qui ne peuvent plus être utilisées comme instruments adéquats pour les nouvelles demandes devront être réanalysées. Le marché, la consommation, l'environnement, la valeur, la performance et la société informationnelle ont besoin de connaissance, d'un système de relations financières, de production et de communication basées sur la confiance. Les règles du jeu de business doivent être réécrites et la production de rapports financiers doit être validée et certifiée par des professionnels agréés et indépendants. L'internet va devenir un instrument efficace du contrôle de gestion. Dans ces conditions survient la demande légitime: Nous pouvons rester indifférents à ces provocations ? Il paraît que non. La connaissance, l'adaptabilité et la flexibilité deviendront les mots clés pour la nouvelle société qui sera créée. La société de l'avenir sera une société super-paramétrisée dans ce qui concerne les règles et les normes qui doivent être connues et comprises par ses membres.

Mots Clés: evolution du contrôle de gestion, valeur, économie basée sur connaissance, performance.

Cod jel: M11, M41

Optique stratégique et optique comptable dans l'évolution du contrôle de gestion

L'objectif de cette recherche était de montrer comment, en se référant exclusivement à la valeur-travail, **contrôle de gestion** perdait de sa pertinence aujourd'hui. Alors que la main d'oeuvre directe représentait au début du siècle, pour les ingénieurs tayloriens, le poste de dépenses le plus important, l'essentiel des coûts est aujourd'hui engagé avant la phase de fabrication (conception) ou après (commercialisation), en raison des modifications de la demande, de la concurrence et de la technologie.

En se fondant plutôt sur la valeur-rareté, il est au contraire possible de prendre en compte certains éléments tels que la qualité, la flexibilité ou encore les délais, qui ne sont traditionnellement pas gérés par le contrôle de gestion, et qui sont donc devenus des enjeux stratégiques.

Le **contrôle de gestion** est une fonction qui, par l'exploitation du système d'information, vise à contrôler, mesurer et analyser l'activité d'une organisation (entreprise à but lucratif ou association). Cette fonction doit apporter des éléments d'information décisifs au management quant à l'atteinte des objectifs (opérationnels et/ou stratégiques).

Le contrôle de gestion a pour mission de s'assurer de la cohérence entre la stratégie adoptée (*où veut-on aller ?*) et les moyens mis en œuvre sur le terrain (*que fait-on et avec quoi ?*). Cela implique plusieurs choses :

- en terme de positionnement, le contrôle de gestion est un des organes de la direction, même s'il a des liens forts avec le système comptable ou financier (par exemple). Et même, les managers opérationnels roumains font du contrôle de gestion ce qui est une des difficultés de définition des missions spécifiques au contrôleur de gestion.

-le contrôle de gestion n'est pas un organe opérationnel, mais un organe d'échange d'information. Une liaison étroite avec les unités opérationnelles est indispensable pour être certain du bien fondé des indicateurs et des outils de mesure. Bien que lié à la direction générale, le contrôle de gestion doit tout autant partir "du bas" que "du haut" et veiller à être utile aux unités de travail autant qu'à la direction de l'entreprise.

- le contrôle de gestion ne peut se contenter de "cueillir" l'information qui passe, il lui faut la maîtriser complètement et s'assurer de sa qualité (fiabilité, ponctualité, etc.) ; il aura besoin d'information spécifique, sans autre usage que celui qu'il en fera, et il peut avoir besoin de la construire lui-même.

- le contrôle de gestion ne se limite pas à donner des chiffres et allumer des voyants dans un tableau de bord, il construit le tableau de bord et l'adapte en permanence aux objectifs. Il aide à déterminer les indicateurs pertinents en collaboration avec le management.

Coût et valeur dans le contrôle de gestion

Les concepts fondateurs du contrôle de gestion ont vu le jour dans un contexte économique particulier, celui d'une croissance extensive. Dans la mesure où les modèles de contrôle sont fondés sur un mode de croissance hérité du siècle passé, qui n'a que peu à voir avec le présent, il peut paraître surprenant que les premières protestations portant sur l'inadéquation des outils comptables en général, et une possible redéfinition du contrôle de gestion, aient surgi aussi tard. Ce n'est que depuis peu d'années que la prise de conscience de la disparition des conditions qui avaient présidé à l'avènement des fondements du contrôle de gestion commence à se traduire par l'arrivée d'une assise nouvelle.

Le coût est le coeur pour un système de contrôle de gestion efficace. De fait, il a modelé le contrôle de gestion de façon telle que l'aspect rentabilité à court terme prime sur le long terme, entraînant une suprématie de l'objectif efficacité-économie du contrôle de gestion au détriment de celui d'efficience. Aussi le coût a-t-il été utilisé comme substitut interne à la valeur, réalisée en externe, pour évaluer la performance.

Patrick Besson répond à cette interrogation de façon positive... à condition toutefois que le marché soit "pur et parfait", situation bien peu réaliste s'il en est ! Il considère que l'information coût est insuffisante, mais qu'il ne faut pas tant chercher à améliorer celle-ci que repenser la valeur. Besson opère une différenciation entre effet utile et valeur, cette dernière n'apparaissant qu'en amont de la transformation (elle est consommée par cette opération) et en aval, dans la matérialisation de la transaction. L'effet utile est, quant à lui, un produit de la transformation qui donne lieu à la transaction.

Le passage par cette notion d'effet utile pourrait s'expliquer par le recours à une autre définition de la valeur, qui n'est plus fondée sur le travail, mais sur l'utilité. L'effet utile devient dès lors le substitut interne de cette nouvelle valeur. **Philippe Lorino** opère une analyse comparable. Il met en évidence le renversement entre une gestion fondée sur le coût et une gestion axée autour de la valeur . Il écrit que " *la représentation économique de l'entreprise doit se structurer autour du couple coût-valeur: la valeur, c'est la richesse produite par l'entreprise; le coût, c'est la richesse qu'elle consomme.*"

Le système de calcul des coûts qui s'est dès lors élaboré au début du siècle n'a pas cherché à remettre en cause cette définition de la valeur, mais s'est concentré sur l'élaboration de mesures rapportées à des quantités de travail, d'où les difficultés actuelles pour intégrer l'évolution de l'environnement (passage à une économie d'offre) et les modifications des constituants de la valeur induite.

L'école britannique intègre très clairement la notion de travail pour expliquer l'évolution de le **contrôle de gestion**. En particulier, Hopper et Armstrong reconstruisent la comptabilité selon une conception de domination du processus de travail. En replaçant la comptabilité dans une perspective conflictuelle, ils concluent que les modes de contrôle qui caractérisent les différentes formes du capitalisme provoquent des conflits économiques et sociaux. Catalyseurs de nouvelles formes de contrôle, ceux-ci doivent permettre d'éliminer ou de concilier les résistances au contrôle du travail.

Le système du contrôle de gestion sur le travail et la mécanisation du Taylor

D'après l'oeuvre de Taylor et de ses descendants spirituels, il est possible de déterminer plusieurs facteurs contribuant à prouver le fondement de la comptabilité industrielle sur la valeur-travail. Il s'agit principalement du chronométrage, du salaire aux pièces, de la séparation du travail manuel et intellectuel et de la constitution du "Planning Department". En fondant son système sur le travail et la mécanisation, Taylor l'a en fait appuyé sur des éléments parfaitement intégrés dans la société et compris de tous, ce qui explique sa diffusion et son succès.

Taylor semble préconiser la méthode du coût complet "*Les dépenses totales de l'établissement, directes ou indirectes, y compris celles de l'Administration et des services commerciaux, doivent figurer au prix de revient de l'objet vendu*". Ce système du coût complet est logique et surtout cohérent avec la situation économique qui prévalait lorsqu'il a été conçu (fin de la deuxième révolution industrielle); il l'est encore en Europe lorsque le taylorisme s'y développe, après la première guerre mondiale. De fait, les besoins des dirigeants européens se résumaient alors à la connaissance du coût de leur produit, afin de connaître le prix minimal qu'ils pouvaient accepter afin d'attirer une clientèle appauvrie.

La démarche de Taylor pour une usine de fabrication de starters automobiles est la suivante. La première étape consiste à classer le travail (ou plutôt les charges qu'il entraîne) selon un critère d'augmentation de la valeur par le travail. Si le travail effectué ajoute de la valeur au produit à vendre ou même à l'équipement permanent, les frais sont imputés aux fonctions de fabrication; si, par contre, le travail effectué n'ajoute aucune valeur, ni au travail, ni à l'équipement, alors il s'agit de dépenses qui sont rattachées à un troisième groupe de fonctions, les services auxiliaires, d'administration et de commercialisation.

Ces services se subdivisent en départements puis en catégories de dépenses. Même cette dernière classification est faite selon ce principe du travail qui doit entraîner une modification visible et directe du produit. Ainsi, l'entretien des outils, qui fait partie du département de maintenance (service auxiliaire) se partage encore en deux : entretien de ceux qui permettent de changer la forme ou la nature de la production en cours, et de ceux d'utilisation courante (tournevis, clefs...). La classification effectuée, il reste le plus délicat, l'imputation des dépenses. Taylor cherche à répartir les frais indirects de production tout au long du processus de fabrication. Les dépenses d'administration sont imputées au prorata des salaires des sections immobilisations, produits et matériaux vendus. Les dépenses auxiliaires sont quant à elles imputées aux différents services de production en fonction du total des *cost numbers charges* (somme des coûts relatifs à une machine ou un centre de production multiplié par les heures de travail sur les machines). Une formule semblable est encore utilisée pour répartir les dépenses du service des outils et de la réparation, puis pour celles de fabrication.

Enfin, pour ce qui est des dépenses commerciales, Taylor estimait qu'elles ne devaient pas apparaître dans le coût de production, et devaient donc être allouées seulement aux produits vendus (en fait, il les passait directement en charges). Alors que Taylor prêtait relativement peu d'attention à la comptabilité industrielle, qui n'était qu'un aspect de son système parmi d'autres, ses disciples et successeurs ont au contraire établi un lien étroit entre l'organisation du travail et la comptabilité analytique.

Taylor a beaucoup insisté sur l'importance de la main d'oeuvre comme critère de répartition. Cependant, le fait d'avoir employé un critère tel que celui des *cost numbers charges* montre une ouverture que ses successeurs n'ont pas toujours eue. Que ce soit *l'heure de main d'oeuvre* qui ait été retenue plutôt que *l'heure machine* ou encore le poids s'explique par le fait que, pour les ingénieurs, l'homme est toujours derrière la machine. L'utilisation d'un coût de revient qui exprime avant tout les coûts directs de la production a par conséquent entraîné une focalisation excessive des dirigeants sur ces coûts directs. Les conséquences en sont aujourd'hui bien connues, à savoir une mauvaise estimation de la valeur entraînée par le recours à la main d'oeuvre intellectuelle (problème des activités discrétionnaires entres autres), et la multiplication des subventionnements croisés entre produits.

En développant le travail intellectuel (le plus souvent fixe et indirect) et en le répartissant en fonction de la main d'oeuvre directe, il n'est possible de voir qu'une augmentation du coût de revient. Les avantages qui en résultent sont donc ignorés, d'autant que le rendement est considéré ici comme la productivité du travail direct. Seul le volume est synonyme de performance.

Vers un changement du concept contrôle de gestion

En changeant de modèle de croissance dès les années trente, il aurait fallu en même temps modifier la comptabilité industrielle, adaptée à l'évolution technologique de l'entreprise, mais certes pas à l'évolution globale du contexte économique, et en particulier de la concurrence. La technologie et la structure organisationnelle ne sont pas suffisantes pour définir le **contrôle de gestion**. L'appréhension de l'évolution de la concurrence doit permettre de redéfinir aussi la comptabilité de gestion.

Or, depuis les années trente, les pays occidentaux sont entrés dans un modèle de croissance intensive. Alors que le taylorisme négligeait de s'intéresser aux conditions d'écoulement de la production de masse, il devient indispensable de prendre en compte les nouvelles pratiques de consommation. En ce qui concerne le système productif, la croissance intensive s'accompagne de gains de productivité élevés combinés à une forte concurrence, ce qui entraîne une large diffusion du progrès technique en particulier dans le secteur des biens capitaux.

Le nouveau contexte concurrentiel qui découle de cette situation implique de s'attacher à la demande et non plus seulement à l'offre. En effet, il est indispensable de prendre en compte, au sein de l'entreprise, la baisse de la valeur relative des biens capitaux ainsi que leur obsolescence rapide. La production de masse, associée à la faible différenciation des produits, nécessite de se tourner vers une autre notion de la valeur. Dans ce cadre où l'offre doit s'adapter à la demande, la théorie néo-classique, qui part de la demande pour déterminer la valeur des biens, donc l'offre, paraît plus appropriée. La valeur de référence de ce modèle est la valeur-rareté (ou utilité), ce qui implique de connaître la satisfaction maximale du consommateur.

En fait, les économistes ne sont pas parvenus à opérer un choix entre les deux notions de valeur (les théories de valeur-travail et valeur-rareté restent toutes deux d'actualité). Ce qui signifie qu'il est possible de garder le coût comme inducteur de la valeur, et si besoin est (selon les caractéristiques de la consommation du produit et la nature de la concurrence), de juger un coût insuffisant pour évaluer la performance, et le compléter par un outil tel qu'il prenne en compte la demande.

Il est intéressant de constater qu'en réalité, l'interrogation sur la concurrence, et plus généralement sur le marché, est plus ancienne qu'il n'y paraît. En effet, c'est à partir des années cinquante que sont apparus les premiers outils intégrant cette orientation. Certains outils développés alors peuvent être considérés comme les véritables initiateurs d'un changement du concept de valeur.

Pour le **contrôle de gestion**, l'analyse de la valeur est une manifestation importante de la prise de conscience du marché. Tout comme le coût complet dans l'optique taylorienne, l'objectif est de réduire le coût de revient, mais en respectant les besoins et les exigences du marché en matière de qualité et de performance. Cependant, contrairement aux tayloriens pour lesquels les réductions ne pouvaient s'obtenir que dans la phase de fabrication, l'analyse de la valeur s'intéresse à la

conception du produit, s'interrogeant sur la façon dont le produit répond aux exigences de la demande. Son champ d'action couvre aussi bien les produits existants que ceux en cours d'élaboration, ou encore les procédés technologiques de fabrication.

L'analyse de la valeur est " *un procédé de travail dont l'objectif est de trouver le compromis optimal entre le coût et les fonctions d'un produit, tout en assurant un niveau de qualité nécessaire et suffisant* ". Par cette définition, on met en évidence deux éléments : le premier est le concept de valeur qui sous-tend celle de la méthode. En s'intéressant aux fonctions, elle impose de regarder l'utilité pour le consommateur, l'estime qu'il en tire ou l'échange qu'il pourrait en faire. Autrement dit, l'analyse de la valeur est définie par la valeur-rareté. Le deuxième élément est le fait que cette méthode vient en complément des outils de calcul du coût existant. Elle se contente d'apporter des renseignements complémentaires aux coûts calculés.

L'analyse de la valeur a donné naissance, toujours aux Etats-Unis, au *Design to Cost* (Conception pour un Coût Objectif). Le but est de ne pas dépasser un certain coût de revient afin de rester en deçà d'un prix de vente (notamment dans le cas de prix de vente plafonnés). Cette méthode ne semble s'intéresser qu'au coût, ce qui explique pourquoi elle a été repensée. En effet, dans un marché concurrentiel, où les produits sont peu diversifiés et les prix de vente très proche, la différence ne se fera pas sur le coût, mais plutôt sur les fonctions.

Les Japonais ont repris cet outil, le transformant en *Target-Costing* (coût-cible). Cette méthode est celle qui, à nos yeux, paraît le plus tenir compte de la demande, sans pour autant oublier la notion de coût de production. Pour Jean-Noël Deglaire et Laurent Dumarest (1994), le coût-cible est une technique qui intègre le souci du consommateur, car elle s'appuie sur l'équation marché + stratégie coût: d'une part, la marge de l'entreprise est déterminée "lors de la définition de la stratégie produit"; d'autre part, le prix de vente est déterminé par le marché sur lequel le nouveau produit doit permettre, selon les auteurs, "de satisfaire un ensemble de besoins exprimés ou latents". La référence à la valeur-rareté est ici exprimée de façon implicite.

Contrairement à l'analyse de la valeur sur laquelle les ingénieurs ont la mainmise, la technique du coût-cible relève bien du domaine des comptables de gestion. Une littérature fort abondante sur l'ABC tend à faire considérer cette méthode comme Celle qui permet d'appréhender à la fois le coût de revient et le phénomène qualité, donc les deux aspects de la valeur. En effet, en identifiant des inducteurs de coûts qui expliquent le rôle et donc le montant des frais généraux (qui ne sont pas nécessairement corrélés à une variable de court terme) l'ABC leur trouve une finalité : les activités. Cependant, la réponse que l'ABC apporte à ce problème ne diffère pas fondamentalement de la méthode classique des sections homogènes. A la section -verticale- lui est substituée l'activité -transversale- ce qui implique une réorganisation complète de l'entreprise (ABM).

Données stratégiques

Le développement de technologies de gestion en Roumnaie de la production grâce à l'informatique offre l'avantage de pouvoir dominer certains aspects particuliers de la demande.

Ainsi le Juste-A-Temps, avec ses corollaires (Kanban, OPT...), doit permettre de réduire les stocks et d'éliminer le gaspillage en s'attaquant à ses sources (matière et temps). Cette technique vise l'utilisation des moyens de façon intégrée, et non la charge maximale sur les postes de travail pour augmenter leur productivité. Il est alors possible de faire passer en charges directes certaines charges considérées comme indirectes dans l'organisation traditionnelle (qualité, entretien...).

Les méthodes telles que le *Cost of Quality* ou plus largement le *Total Quality Management* s'intéressent plus particulièrement à la qualité du produit. Alors que la première consiste à mesurer le coût d'obtention d'un certain niveau de qualité, la seconde vise à réduire les coûts de traitement supposés supérieurs aux coûts de prévention. Cependant, ces techniques ne relèvent pas systématiquement du contrôle de gestion. En effet, elles sont souvent contrôlées par les fonctions qualité dont sont à présent dotées toutes les grandes entreprises.

En fait, intégrer ces données dans le champ de le contrôle de gestion signifie élargir son champ d'action. Les informations de court terme fournies par les services opérationnelles sont nécessaires, mais à condition de les intégrer dans une optique stratégique. Bouquin explique comment le contrôle de gestion doit s'occuper de l'information monétaire, même non-transactionnelle, mais tout en prenant garde à délaisser une partie de l'information non-monétaire transactionnelle. C'est du monétaire dont doit s'occuper le contrôle de gestion. Johnson - Kaplan prônent eux aussi la valorisation du non-transactionnel. Keegan, Eiler et Jones exposent pour leur part une opinion similaire, définissant des *cost-based performance measures* et des *non cost-based performance measures* (mesures de performance exprimées en termes de coût / mesures de performance non- exprimées en termes de coût), qui peuvent être internes ou externes.

En fait, la valeur-rareté ne remplace pas la valeur- travail, mais elle la complète. La nature de la demande et de la concurrence est telle que, pour la majorité des industriels, il est nécessaire de combiner les deux notions. Cette réflexion sur la valeur nous amène à nous intéresser au coût. Jusqu'à présent, il a été admis qu'il devait traduire la valeur- travail, mais peut-il et doit-il également traduire la valeur- rareté ? Le développement des indicateurs non valorisés signifie-t-il une remise en question du coût ? Ces questions découlent en fait d'une interrogation sur les mécanismes de choix du prix. En effet, si l'on se réfère à la conception du " *mark-up* " (taux de marge), l'entreprise forme ses prix en ajoutant une marge au coût de revient. C'est cette règle qui est utilisée dans la technique du coût-cible par exemple. Ses avantages sont à la fois de tenir compte du marché (par la marge) et du coût.

Conclusion

Si dans le futur une entreprise roumaine souhaite améliorer ses performances financières, elle devra en effet s'assurer régulièrement qu'elle se rapproche petit à petit de son objectif en vérifiant ses états financiers; toutefois, elle devra toujours pouvoir relier ses performances financières avec ses actions opérationnelles. Le contrôle de gestion, en tant que production humaine, est le reflet d'une époque et d'un lieu. Cette notion de la valeur est la cause première de la non-pertinence de le contrôle de gestion aujourd'hui. Certains changements nous laissent cependant espérer un renouveau de la comptabilité de gestion et implicite du contrôle de gestion .

On peut identifier **les limites actuelle du contrôle de gestion dans la pratique roumaines comme:** tout n'est pas mesurable à un coût raisonnable, et pourtant il faut bien quand même piloter le système. Le contrôle de gestion n'est pas la panacée; une fois qu'un indicateur a été choisi, il devient très vite un but en soi, susceptible de toutes les manipulations. Cela induit un stress et limite la confiance qu'on peut accorder au système de contrôle de gestion, même si l'on peut mettre en place toutes sortes de parades (renouveler les indicateurs utilisés, les garder confidentiels, etc.), les managers ne doivent pas se contenter des indicateurs du contrôle de gestion, mais doivent aussi régulièrement constater sur place ce qui se passe dans les unités de l'entreprise et avec les clients, vu que les indicateurs ne détectent pas tout.

The importance of treating this theme is proved by the current situation that economy and the entities activating on the market are confronted with.

Risk is present in all the actions and event of humanity. Risk is in a permanent change, it evolves in complexity, among the traditional exposures to hazard other risks are added: operational, financial, strategic, market, country, legal, human, fraud risks and its complex character can be attributed to a range of factors that are grouped by the specialized literature in macroeconomic factors, also called extern, and microeconomic factors, also called intern.

In the last few years, the importance of the corporate governance involvement in risk management is more and more recognized. The organizations are under the pressure of identifying all risks that it is confronted with starting with social risks, ethical and environment risks to those financial and operational, and also to the way it manages them at an acceptable level. In the same time, using integrated risk management procedures and politics at enterprise level (ERM-Enterprise Risk Management) has extended, in this way organizations are admitting the risk management approach advantages.

The internal audit, in both his roles of providing assurance and consultancy, contributes to risk management in various ways, its importance being increasing due to the current financial crisis.

For the financial auditor the term of risk has other senses, meaning that risks are regarded through the mission type and objectives. But still, identifying and measuring audit risks during the mission's planning are strong connected to the existing risk management of the entity. In this way, if the audited entity has an implemented risk management that is proved to be efficient, this will represent a starting point for the auditor in evaluating the risks connected to his engagement, meaning that the general audit risk will be lower and the assurance level will be higher. More than that, an efficient enterprise risk management determines a higher level of trust in the internal audit department's activity.

Key words: Risk, risk management, internal audit, audit risk, efficiency

JEL Code: M 42

Introduction

While liberalization, globalization and fast development of informatics technology generate new business opportunities, financial and economic entities are exposed to more diverse and complex risks than before. Risk identification, measurement and control have never been more important for organizational and strategic management than they are today.

The paper treats issues such as the existing risks for an entity, the efficiency and advantages of implementing a risk management, the internal auditor's play in risk management functioning and its connection with the audit risk determined by the financial auditor during his engagement.

The importance of treating this theme is proved by the current situation that economy and other entities on the market are confronted with. Since the financial crisis started and up until now we could assist to the effects apparently produced by this situation, but even more by an inefficient management and by unreliable strategic plans.

Under these conditions, the entities that had developed an efficient risk management in the past had been capable to survive this period, and some of them even more, they managed to maintain profitable. It is also true that past can't be changed, but learning from it, some cautions can be taken, some decisions and plans that haven't been implemented can be reviewed.

Treating risk management and its impact in all aspects it becomes relevant for the entities which can still learn from mistakes and from other positive examples and also for those who analyze and study the market, being a subject of real interest and present.

1. About the risks

Risk has various definitions in the specialized literature. It can be defined as: "the possibility to get into danger, to face a mess or to support a damage".(I.Mihut & co.,2003:6), "the risk is practically the threat of an event to affect the ability of a company to function and to accomplish its strategic goals. The risk generally appears not from the probability that nothing is going to happen, but from the probability that something bad is going to happen" (I. Mihut & co., 2003:8). Also, "the economic life is governed by incertitude and any other view of further events is, by definition, susceptible not to fit in the predicted parameters" (I. Mihut & co., 2003:8).

The risk exists permanently and he produces or not depending of the created conditions. Risk is present in all humanity's actions and events. Risk is in a permanent change, it develops in complexity, beside traditional exposure to hazard, adding operational, financial, strategic, market, country, legislative, human, fraud risk, and the complex character of the risk can be referable to more factors that in the specialized literature are grouped in macroeconomic factors, named external factors and microeconomic, named internal factors.

Internal factors are:

- Economic, determined by: changes in interest rate, inflation, insurances, taxes, economic changes.
- Political, determined by: the ambiguous and changing legislation, some protective politics, regulations and respecting them, area political priorities.
- Competitive, determined by: the changes of the market, the pressure of big companies , the types and services offered, fashion trends, using the mass-media, the demanding and the expectations of the clients, contract requests.

Internal factors may be considered:

- Social determined by: employees' ethic and faith, individual culture of the involved people concerning risk, the pressure claimed by the employees for their compensation rights or performing inadequate activities, frequent employees' changes, to close relationships between employees.
- Economics, determined by: the changes in data processing , the material substitution, a better security for the new products and technology, a better system regarding the procedures and the new operating methods, the need to reduce the loses, the investors' and shareholders' expectations, the adopted strategy.
- Physical determined by: buildings' damages, the fraud made through the acts or intentions of the employees or clients employees.

2. Risk management's importance for internal audit

In the last few years, the importance of the corporate governance involvement in risk management is more and more recognized. The organizations are under the pressure of identifying all risks that it is confronted with starting with social risks, ethical and environment risks to those financial and operational, and also to the way it manages them at an acceptable level. In the same time, using integrated risk management procedures and politics at enterprise level (ERM-Enterprise Risk Management) has extended, in this way organizations are admitting the risk management approach advantages.

The internal audit, in both his roles of providing assurance and consultancy, contributes to risk management in various ways, its importance being increasing due to the current financial crisis. People carry on activities of managing risk in order to identify, evaluate, manage and control all types of events or situations that might affect the organization. These may vary from individual projects to defining the types of risk, for example, the market risk, in order to measure the threats and opportunities that organization as a whole is confronting with. The principles presented in this statement can be used to guide the internal audit's involvement in all risk management processes, but we are especially interested in risk management at enterprise level, because this is the one able to improve the governing processes in an organization. Enterprise Risk Management is a continuous process, structured within the organization as a whole, which allows identification, evaluation, decision upon the answers and reporting regarding the opportunities and threats that affect accomplishing the its objectives.

The Board of Directors has the general responsibility to make sure that risks are properly managed. But, in practice, the Board delegates the risk management functioning frame to the management team. Within the team, a separate function may exist, that coordinates and manages these activities and contributes through competences and knowledge.

The benefits of implementing an Enterprise Risk Management include:

- a higher probability of accomplishing the organization's objectives;
- improving the key risk understanding and their implications;
- a management that pays attention to the real important meters;
- less unpleasant surprises or crisis situations;
- the capacity of taking a higher risk for a higher reward/benefit;
- extended informing about risks and making decisions regarding risks.

Any decision regarding the accomplishment of a new objective, developments and restructures, involves a risk in obtaining the estimated results due to the influence of changes that take place all the time in the technical, economical, social, internal and external environment. The incertitude conditions influence the events that concur to obtain some indicators that can be used to evaluate the versions of realizing a project and the decisions' fundamentals.

Risk evaluation is necessary starting with the highest levels of making strategic decisions - for example, in al cases regarding of: what type of activities to be carried on, what assets to be bought or what markets to take in count- and continuing with the operational decisions- from accepting foreign currency payments to assuring a proper level of safety for the working place. Evaluation of risk plays a role even if an organization is or is not conscious of risk management (Likierman A., 2008).

Despite its complexity, risk management is actually a managerial instrument which helps the organization to hold the most proper control politics of the unfavorable results (Internal Audit Standard 1130). Even though, the general opinion saying that a good corporate governance determines management tot make the best decisions in risk conditions – meaning, well informed decisions are opposed to avoiding risk. Some specialists consider that in the current climate an attitude of adversity against risk once with the increasing importance of conformity, determined by the reactions of the regulators around the world regarding the corporate crushes (cases of Enron, Parmalat, Worldcom).

A good risk management has as a purpose the improvement of organizational decisions. This does not only refer to avoid or to minimize loses, but also to treat the opportunities in a favorable manner.

One of the key requests of the Board is to obtain the assurance that the risk management process is efficient, and key risks are managed at an acceptable level. It is possible that assurance may come from different sources, but from all of them the assurance provided by management is the most fundamental. This aspect should be complemented by providing objective assurance for which internal audit is a key source. Other sources include external audit and specialized independent reviews.

Internal audit will normally provide assurance on three areas:

- risk management process, both for process projecting and process's good functioning;
- classified risks' management as "key-risks", including controls efficiency and other response to that;
- adequate and reliable risk evaluation and reporting upon risks' status and control.

Internal audit is an independent and objective activity of assurance and advisory. Its main role regarding ERM is to provide objective assurance to the Board regarding risk management efficiency. Research has shown that Board directors and internal auditors agree upon the fact that two of the most important ways through which internal audit adds value to organization consist in providing objective assurance that major business risks are managed in a proper way and providing assurance that risk management and internal control work efficiently. One of the consultant role in which internal audit engages involves:

- Making available for management some instruments and techniques used by the internal audit to analyze risks and control performing;
- directing the process for introducing ERM in an organization due to accumulated experience;
- providing advisory, facilitating work-shops, preparing the organization for risk area and promoting the development of a common language for understanding this area;
- supporting managers that have as an objective the identification of the best ways to minimize risks.

Any time the internal audit supports the managerial team in creating or improving the risk management process, its working plan should include a well defined strategy regarding the responsibility migration for these activities to the members of the managerial team.

If within the organization exists a management risk function, that works properly, then the work volume of the internal auditors will be substantially reduced. If this function is missing, the internal auditors may support and advice the superior managers upon risk identification, their evaluation and establishment of risk appetite.

3. The connection between risk management and financial audit

In analyzing the audit process, risk evaluation takes a very important place. In some authors' opinion (I. Graz & S. Manson, 2000), risk evaluation should be the main concern of the auditor. Shortly, risk audit could be defined as the risk that an auditor assumes to give an inadequate audit opinion regarding the audited financial situations. Audit Standards mention the following definition for audit risk: "the risk that the auditor attributes to an inadequate audit opinion, when financial situations contain information significantly misstated".

For this reason, the auditors especially follow, starting with the moment they accept the engagement, but also during the whole mission, the risks that might occur that might lead them to opinions that do not reflect reality as it is. After identifying the risks, the auditors establish their procedures depending on the risk areas.

Taking into account the audit risk establishment's importance, the audit standards contain very few indications regarding the technical manner for establishing this risk. In this way, the professional judgment of the auditor is almost exclusively used.

The main objective that the auditor considers consists in projecting and implementing some audit procedures to allow risk reduction at an acceptable level. Audit risk has to be very well evaluated, because not only a superficial audit, but also too detailed applied audit procedures can have negative effects on the audit process. The issue for the auditor is that, if he is not aware of the risks he assumes, if he simply doesn't consider these risks, he might get some severe professional sanctions or payment for some significant material damages, as a consequence of being accused of bad-faith and negligence in accomplishing his attributes. All these explain the auditor's tend to

allocate a substantial part of his time during the engagement to identify the risks involved in exercising his mission.

When the general audit risk is evaluated within the engagement, it divides in three components, measured separately: inherent risk, control risk and detection risk. The relationship between the three components is the following:

Audit risk = Inherent risk x Control risk x Substantive risk or $AR=IR \times CR \times SR$

Audit risk and its components can be established both in quantity (percents) and quality (low, moderate, high) terms. In practice the most used are the quality methods of measurement for risk levels.

a) Inherent risk represents the susceptibility that the closing balance of an account or of a category of transactions to contain misstated information that might be individually significant or when misstated information are cumulated from other closing balances or transactions, supposing that there weren't effectuated side internal controls (RCFA, 2000:123).

b) Control risk represents the risk of misstated statement, that might occur in the clogging balance or in a category of transactions and might be individually significant or cumulated with other information, and can not be detected, prevented or corrected in due time by the internal control and accounting systems (RCFA, 2000:124)

External auditors base their work on the internal auditors' work by using the audit risk model. When the activity of the internal auditors is efficient, external auditors significantly reduce the control risk, reducing at the same time the quantity of substantive tests and implicitly the improving the quality of the given opinion.

c) Substantive risk represents the risk that a substantive procedure performed by the auditor might not detect misstated information in the closing balance of an account or of a category of transactions, that might be individually significant, or cumulated with other misstated information from other closing balances or other categories of accounts (RCFA, 2000: 124). Substantive risk's level is strongly connected to the substantive audit procedures performed.

As we could observe, for the financial auditor the concept of risk has another sense, meaning that risks are regarded through the engagement type and objectives. But still, identifying and measuring audit risks within the engagement planning coexists in strong connection with the existent risk management within an entity. In this way, if the audited entity has implemented a risk management that has proved its efficiency, this aspect represent a starting point for the auditor in evaluating the risks connected to his engagement, meaning that the general audit risk will be lower and the assurance level provided by the auditor will be a higher one. More than that, an efficient ERM determines o bigger trust in the activity of the internal audit department that leads the financial auditor to:

- reducing the number of tests and procedures;
- less audit evidence to be collected;
- shorter period of time for the engagement;
- concentration upon really important elements to be tested;
- higher cost/benefit report both for the audited entity and for the auditor.

4. Efficient risk management – a solution for crisis situations

The entities that knew to apply at the right time an efficient risk management are those which now look with lucidity to the market an which can take advantage of the existing crisis. Those who let themselves carried out by the increasing economy wave, and who had lost from sight the elementary risk management measures, must redirect.

The financial crisis that we are passing through is like a coin with its two faces. So managers can let themselves influenced by negative news and by the general state of pessimism, and they can concept their future plans depending on these or they can act in a way to take advantage of the situation.

Within the market, everything works on the domino principle: the increasing of the credit cost will bring the disappearance of some companies, but will consolidate the position of others, negative examples will create tensions, and, potential investors will reorient to other geographical areas.

If a company will win or not upon this situation depends of how well did it know to evaluate its business and the impact of an unwanted event, of how well did it know to develop a plan that assures upon the business continuity. And this means exactly risk management.

After this period that we are crossing might have to win the enterprisers who knew to correctly quantify the money value, the ones who will manage to balance the expenses and revenues. Up until now the consequences of the inexistence of such a balance had been seen through extreme measures as: disposals, activity interruptions, relocation.

The entities which accumulate reserve funds or the entities which increase these funds and are leading for bay markets, professionalism in serving the clients, added value, will be the winners in the current situation. Risk management represents the art of making decisions in a world governed by incertitude. More exactly, risk management represents a process of identification, analysis and answer to the risks that an organization is exposed to. The costs of implementing a risk management within a company depend on the methods of unpredictable events' managing.

Conclusions

It can be conclude that changing means insecurity, and insecurity means risk. The future belongs to the businesses based on an efficient risk management. The obtained results deserve the effort, because efficient risk administration brings important benefits for the company through: increasing the shareholders' trust, improving the company's image and the moral of the employees, increasing productivity.

The basic play that the internal audit has in connection with risk management should be providing assurance for the executive management and for the Board of Directors upon the efficiency of risk management. In the context of an extended role assumed by the internal auditor, additional protection measures should be applied.

There also is a strong relationship between the risk management's efficiency and the risk level and assurance level measured by the financial auditor. So, a risk management proved to be efficient leads the external auditor to establish a lower level for the general audit risk.

HOW FINANCIAL AUDITORS USE CAATS AND PERCEIVE ERP SYSTEMS?

Cardoş Vasile-Daniel

Babeş-Bolyai University Cluj-Napoca, Romania

Faculty of Economics and Business Administration

The adoption, implementation and expansion of complex information systems [IS] have an important impact on organizations. To cope with this situation, financial auditors need to use more and more computer-assisted audit techniques [CAATs] especially when auditing organizations with complex information systems such as Enterprise Resource Planning [ERP] in place. In this article we investigate the way Romanian financial auditors use CAATs during their mission and their perception regarding the effects of ERP systems on financial accounting and reporting system evaluation. Results show that even though financial auditors consider that the existence of an ERP system is influencing at least “to a great extent” their ability to evaluate the client’s information system, they are not using CAATs to the same extent.

Keywords: financial auditors, CAATs, ERP

JEL Classification: M42

Introduction

The adoption, implementation and expansion of information technology [IT] enhanced information system [IS] have an important financial and non-financial impact on business functions and their structure within a firm (Chatzoglou and Diamantidis, 2009). It is thought that the use of IT generates competitive advantage but meanwhile exposes organizations to new risks triggered by IT complexity.

Financial auditors need to develop and/or enhance their IT knowledge and skills in order to fulfill their mission as required by their professional standards. During audit planning they have to consider how the client’s characteristics affect systems risk (Bedard *et al.*, 2005) and the possible misstatements (Bell *et al.* 1998). Also, IT complexity affects the nature of audit testing (Javrin *et al.* 2009). To cope with this financial auditors are forced, by their professional standards and the current environment in which they work, to use more and more computer-assisted audit techniques [CAATs] especially when auditing organizations with complex information systems such as Enterprise Resource Planning [ERP] in place.

Enterprise Resource Planning [ERP] systems are generating unique risks due to business-process reengineering and customizations. This triggers control weaknesses which leads to financial statements errors and inaccurate internal information. These issues need to be addressed in the implementation process overcoming the problems arising from improperly trained personnel and inadequate process reengineering efforts (Wright and Wright, 2002).

The main objectives of this article are to investigate the way Romanian financial auditors use CAATs during their mission and perceive the effects of ERP systems on the evaluation of the financial accounting and reporting system. To achieve these objectives we used a questionnaire addressed to financial auditors in which they had to answer the following questions (on a scale ranging from 1 = to small extent to 5 = to a very great extent):

- To what extent are you using computer-assisted audit techniques (CAATs) for the evaluation of the financial accounting and reporting system? and
- To what extent the existence of an ERP system affects the evaluation of the financial accounting and reporting system?

Review of prior literature

The member bodies of the International Federation of Accountants [IFAC] are required to adhere to International Education Standards [IES] and Practice Statements [IEPS] in order to implement generally accepted “good practice in the education and the development of professional accountants” (IFAC, 2009:2). According to IEPS 2 *Information Technology for Professional Accountants* candidates to the profession have to be knowledgeable in CAATs consisting of: accounting packages; professional research tools; analytical tools and pattern matching/recognition (IFAC, 2009:34). Further, International Education Guideline 11 *Information Technology for Professional Accountants*, a precursor for IEPS 2 requires for the professional development of evaluators/auditors of information systems to use CAATs in the planning phase: in order to design effective and efficient verification procedures to meet evaluation objectives; and during system evaluation when performing planned procedures (IFAC, 2003).

Information Systems Audit and Control Association considers that CAATs may be used in performing the following audit procedures:

- „Tests of details of transactions and balances;
- Analytical review procedures;
- Compliance tests of IS general controls;
- Compliance tests of IS application controls;
- Penetration testing” (ISACA, 2008:2).

During the audit plan the auditor should use an appropriate combination of manual techniques and CAATs. The factors that may influence the use of CAATs might be: computer knowledge expertise and experience of the auditor, efficiency and effectiveness of using CAATs over manual techniques; time constraints and level of audit risk (ISACA, 2008).

In the scientific literature there are only a few research papers describing the extent of CAATs use in the audit practice and the factors supporting their use (Curtis *et al.* 2009). Javrin *et al.* (2008a) reported that financial auditors use extensively CAATs for analytical procedures, audit report writing, work paper management and sampling. Also, auditors perceived other audit applications as being important for audit planning, internal control evaluation and risk assessment, but used them less. In another paper Javrin *et al.* (2008b) identified performance expectancy and organizational and technical as factors that influence the auditor’s acceptance of CAATs. They argued that CAATs usage can be increased by developing training programs within audit firms. Curtis and Payne (2008), found that audit firms influence the implementation of new technology by using long-term budgets and by communicating their support and encouragement to auditors. Hermanson *et al.* (2000) investigated the extent to which internal audit departments are using CAATs for: system analysis and documentation; program testing or data integrity testing.

Regarding the ERP influence on the audit mission, Hunton *et al.* (2004) examined the extent to which financial auditor are able to recognize higher risks associated with ERP system in comparison to non-ERP systems and assessed financial auditors’ tendency to consult with specialists when assessing ERP and non-ERP system risks during the planning stage of the audit. They observed that financial auditors “do not indicate a greater need to consult with IT audit specialists when auditing an ERP versus non-ERP system and they are equally confident in the ability of financial audit teams to assess risks in both computing environments” (Hunton *et al.* 2004: 7). They suggest that financial auditors are overconfident in their ability to assess risks in complex systems. In a previous research Hunton *et al.* (2001) found that financial auditors are unlikely to consult with specialists with IS risk management practice in their firm which suggests that potential financial statements errors and audit risks may not be identified.

Method used

This study was supported by the Chamber of Financial Auditors of Romania. A questionnaire was indicated to financial auditors addressing matters related to the perceived importance and

their opinion or approach to several IT related activities they should be performing during their engagement. The questionnaire was emailed to 1.520 financial auditors, but due to invalid or wrong email addresses 232 emails were undeliverable. Of the 1.288 valid questionnaires mailed we received 96 answers (answer rate: 7.45%). To improve the answer rate we intend to have a second round of questionnaires sent out.

The questionnaire consisted of three main parts. In the first part, the respondents were asked to answer several questions related to their educational background, both academic and professional. The second part contained questions addressing the auditor's profile: the type of their main activity; years of experience; number of audit missions completed; the nature of the client organization's activity. In the third part, respondents were asked to answer seven questions related to: the perceived importance of several IT related activities; the way the identified IT related activities are carried out (by the auditor or by an IT specialists); the extent to which auditors apply analytical procedures or use CAATS during their mission; the extent to which ERP systems affect their ability to evaluate the client's AIS and the influence of AIS evaluation on the audit opinion (using an interval scale rated from 1 = not important/to a small extent to 5 = very important/ to a very great extent).

Results

The collected data showed that 44 respondents (45,8 percent) stated that the most frequently type of business audited by them is manufacturing, followed by services (19,8 percent) public institutions (11,5 percent) and banking (10,4 percent). The majority of the respondents (52,1 percent) have less than five years of experience, while 40 of them (41,7 percent) have between five and ten years of experience. Because the financial audit profession is still "young" in Romania none of the respondents have more than 15 years of experience.

The first question analyzed in this article was: To what extent are you using computer-assisted audit techniques (CAATs) for the evaluation of the financial accounting and reporting system? For this question the auditors had to choose between: to a small extent = 1; to some extent = 2; to a moderate extent = 3; to a great extent = 4; or to a very great extent = 5. The mean rating (see Table 1) for this question (2.8646) is close to the median value (3) suggesting that, on average, financial auditors use CAATs for the evaluation of financial accounting and reporting system ranging mainly from "to some extent" to "a great extent". But the mode value (2) suggests that most frequently the respondents chose the "to some extent" option (see Table 2).

The second question analyzed in this article was: To what extent the existence of an ERP system affects the evaluation of the financial accounting and reporting system? (available options: to a small extent = 1; to some extent = 2; to a moderate extent = 3; to a great extent = 4; or to a very great extent = 5. The mean rating (see Table 1) for this question (3.6979) is also close to the median value (4) suggesting that, on average, financial auditors consider that the existence of an ERP system is influencing their ability to evaluate the financial accounting and reporting system "to a great extent" (see Table 2). This is confirmed by the mode value (4).

Table 1. Descriptive statistics

	N	Mean	Median	Mode	Std. Dev.
Use of CAATS	96	2.8646	3.0000	2.00	1.25337
Influence of ERP	96	3.6979	4.0000	4.00	1.01691

Table 2. Frequencies of answers for the two questions analyzed

	Use of CAATs		Influence of ERP	
	Frequency	Valid Percent	Frequency	Valid Percent

Valid	To a small extent	15	15.6	4	4.2
	To some extent	27	28.1	7	7.3
	To a moderate extent	20	20.8	23	24.0
	To a great extent	24	25.0	42	43.8
	To a very great extent	10	10.4	20	20.8
	Total	96	100.0	96	100.0

From Table 3, presented below, we can see that of the 15 respondents who stated they use CAATs “to a small extent”; a third of them consider that the existence of an ERP system is influencing “to a very great extent” their evaluation of the entity’s information system. From an opposite perspective, of the 42 respondents who considered that the existence of an ERP system is influencing “to a great extent” their ability to evaluate the entity’s information system, 14 stated they use CAATs “to a great extent”, while the same number stated they use CAATs “to some extent”.

Table 3. Cross-tabulation CAATs x ERP

		The influence of ERP					Total
		To a small extent	To some extent	To a moderate extent	To a great extent	To a very great extent	
Use of CAATs	To a small extent	2	3	2	3	5	15
	To some extent	1	0	10	14	2	27
	To a moderate extent	0	2	8	6	4	20
	To a great extent	0	0	3	14	7	24
	To a very great extent	1	2	0	5	2	10
	Total	4	7	23	42	20	96

Conclusions

The above analysis suggests that even though financial auditors consider that the existence of an ERP system is influencing at least “to a great extent” their ability to evaluate the client’s information system they are not using CAATs to the same extent. This means that a significant number of auditors still rely on a traditional approach “around the computer”, by using tests of details and analytic procedures rather than “with the computer” by using CAATs, when they evaluate the financial accounting and reporting system or during their overall mission. As technology is constantly evolving auditors will be forced to be knowledgeable and use IT tools and techniques that will allow them to detect misstatements and by this properly changing their audit plan in order to avoid the possibility of issuing an erroneous opinion.

COSTS CONTROL IN THE SPHERE OF PUBLIC UTILITIES SERVICES THROUGH BUDGETARY ON RESPONSABILITY CENTERS

Catana Pulina

Universitatea Valahia din Targoviste, Scoala Doctorala

Alexandru Lacramioara

Universitatea Valahia din Targoviste, Scoala Doctorala

Setting prices and tariffs to ensure the economic viability of public service operators, user interests, included in terms of their supportability, environmental and natural resources conservation, require a rigorous cost management, each element representing expense leverage in establishing, adjusting or modification of rates or flexible rates.

A leading method of production which subscribes to these desiderata may be budgeting costs; the method entails setting budgets that allow the creation inside the establishment of autonomous subsystems called centers (places) of responsibility, which creates the frame favorable to optimize resource consumption and profit earning. Responsibility center can be approached from two angles: part of the company but also the basis for responsible performance.

Under these auspices, the article tries to capture some aspects of the unique features of behavioral services for water and sewer, were included in the Sectoral Operational Programme (SOP) Environment Programme financed by EU.

Keywords: cost, management accounting, public utilities, responsibility centers.

JEL: M4, M41

1. Introduction

The adhesion of Romania to European Union imposes clear criteria regarding the assurance of performance services and of quality, and, in special, the development of the network industries and the connections between them through the setting of regional transport services. Regional operator is formed through the association of Local Councils of administrative-territorial units which holds in their subordination water and sewerage services into a inter-community association and the setting of an unique economical agent (regional operator) on the County territory, which has the gold to assure public services through projects for the infrastructure development of achieved public services with reimbursable financial assistance from the European Union.

2. Budgeting and calculation of cost on responsibility centers to regional operator Teleorman

2.1. Generalities on the activities of regional operator

Regional operator has established five branches with secondary offices, situated in each urban entity from the county, led by five directors, and it is organized by a pyramidal system, as it follows:

- the basic organizational structure;
- branches (five urban localities).

Within branches, departments can be set up, bands and work teams depending on management activity. The other departments develop activities which compete to achieve production activity. Project financing will provide, prioritizing, from alternative sources of EU grant funds (81 %), grant funds from the state budget (12, 4%), from the budgets of local councils (2%) and their own sources of regional operator.

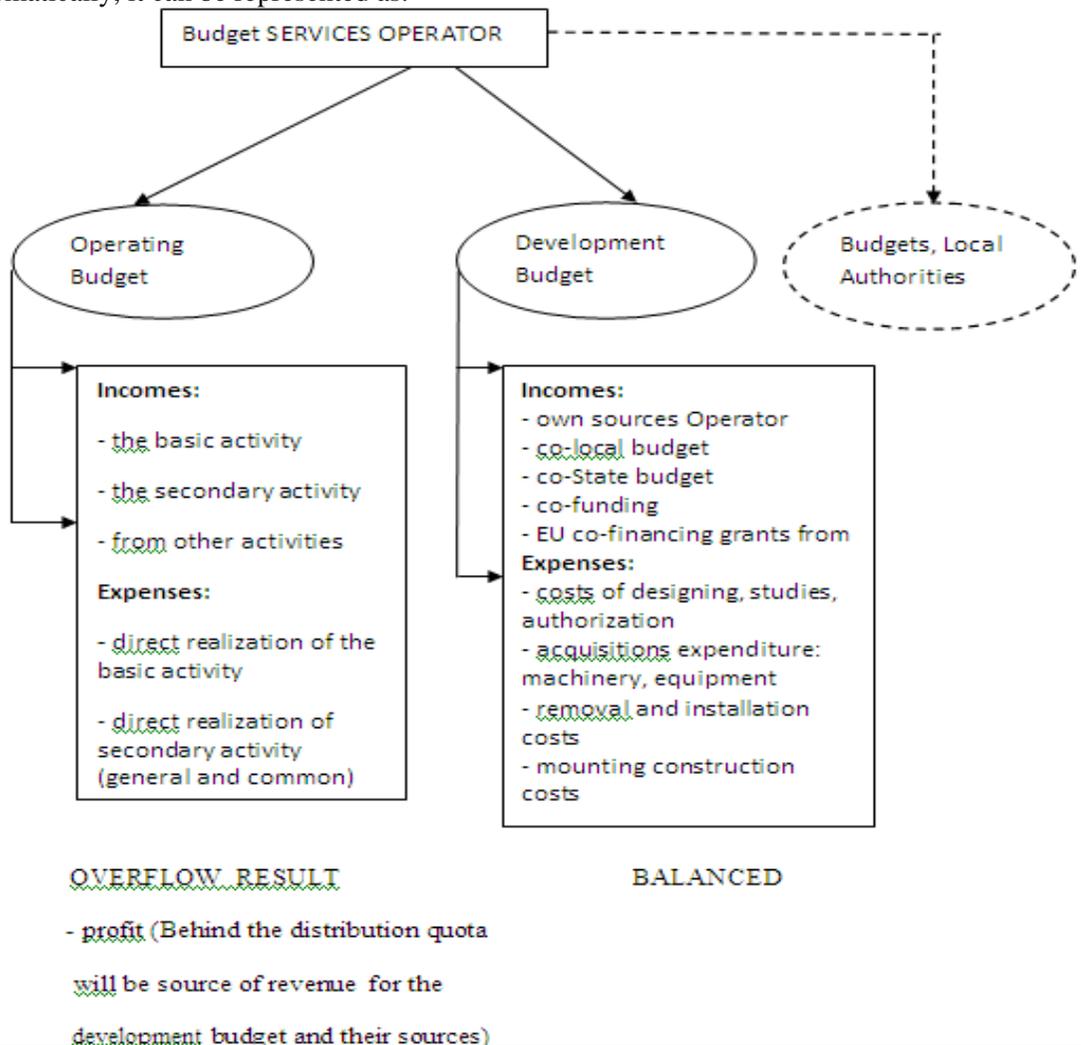

2.2. Budgeting costs

By presenting, in general, the specificity of the activity, the modality of financing, and the organizational structure of production activity and drinking water distribution and sewerage services to a regional operator, we proceed to examine the background and budgeting costs of services in this area.

In terms of temporary areal, budgeting will be on short term (a year), medium term (2- 5 years), but also on long term (5- 10 years) considering that the production activity takes place in parallel with investment activity spanning the period 2009 – 2015.

Taking into account as subject, the budgeted activity, we see that we are dealing with two types of budgets: operating budget and development budget but five budgets adjacent to development budget- budgets of territorial administrative authorities which co-finance the development budget of the regional operator and guarantee through upstream bank guarantee letters, from year to year, the branch bank loans.

Schematically, it can be represented as:

Operating budget of the regional operator services is established by adding the operating budgets of the five branches, budgets which, as structure, both revenue and expenditure are identical, considering that both the base production and the secondary is homogeneous to which are added departments' budgets.

Budget expenditure (direct and indirect) can be structured in the following budgets: budget costs for raw materials and materials; direct wage bill budget contributions to social insurance budget

and special funds budgets directly related to direct salaries; budget expenditures for electricity in a coaching gold; fuel technology spending budget; indirect costs budget to tangible and intangible amortization; indirect costs of production budget (municipalities) of the sections; administrative overheads budget; production cost budget section; general budget of the production costs; budget unit cost per product.

We present here some specific features of budgets as:

- budget costs for raw materials and materials - raw material in this situation is the raw water and what is particular element is that water is a State monopoly and is classified as priceless natural resources. Consumption of natural resources is not free in the cost of production.

- production cost budget section - coincides with the budget process production phase; department budget capture / capture phase of raw water; department budget treatment / phase raw water treatment; distribution department budget / water distribution phase; department budget sewage / wastewater channel phase; department budget treatment / phase wastewater treatment and discharge envoy. This situation is possible because production is consistent and an important feature in determining the cost centers.

- budget unit cost per product - costs included in budgets already developed, are taken in budget unit cost, and the articles regrouped according computer classes articles classification. The peculiarity is that each branch, based on the principle of decentralization, cuts out its budgetary expenditure costs, collects and distributes costs to determine the unit cost per m³ of drinking water, such as, at a regional operator where it works with five prices per m³ of drinking water.

One of the research tracks might be possible making a unique price per m³ of drinking water to operator level, after implementation of the modernization of production and distribution of technical infrastructure, when all branches will share the same management working and standards.

- development budget - regional operator services is drawn from the general department and unlikely the income and expenditure realized until now by the service operators in which it was also included the investment activities, I proposed to cut this part of BVC and to treat it separately form the development budget.

2.3. Computational costs on responsibility centers

The method of calculation on expenditure places or cost centers consist in, essentially, collecting all costs of finite product, the calculation and their distribution on the final carrier (finite product), not on the places of particular units of costs calculation. A large volume in the efficiency of this method is the proper organization of the costs' places and optimization of the number, their levels and their respondents.

Thus, the need to consider some essential elements, namely: the specific of the activity (the object of the activity); the production technology features; the production structure; the organizational and functional structure.

If the first three elements which are specific to achieve the objects are much harder to change, the fourth element may be adapted to the cutting process centers on charges by a redesign of the organizational structure and function of the operator services.

Considering the four elements and the possibility of changing some of them, we may think the responsibility centers to the structure regional operator services level, previously, presented in the paper as:

- General department - supervisor of the whole activity - can be established as a center for lifetime analysis but also by cost center budgeting overhead of operator, may be detailed in several cost centers depending on the number of its subordinate departments.

- Investment department - cost center for investment activity where development costs are budgeted will collect and distribute to other cost centers that will be affected by work on modernizing infrastructure.

- branches (of the 5 urban localities) - can be cost centers; the result, but with concomitant obligation analysis centers on the branch budgeting costs, but also the obligation to establish revenue and cost centers in the production and sale activity. In these conditions, at this level, the next steps would be:

Step 1: delineation of expenditure – it will determine the cost centers at each phase of the production process taking account that, previously, I presented as feature of this service - homogeneity of production structure and production departments with overlapping production phases;

- it will specify that the cost centers are the real centers (operational expenses), that is directly related to the structure of enterprise technology and they are functional centers (structures of expenses) that is not directly related to the structure of production technology but to the performance of activities of organization, administration and management of production that are obtained in the actual places or service operator overall.

Differences between actual and functional spaces lie in the production and identification of consumer spending. In actual job, the activity can be measured quantitatively and can be identified on product costs, work or service; on the job as long as the functional activity can not always be measured quantitatively, but it is appreciated more in terms of quality and expenses incurred in these places may be direct for its own work and indirect to the work developed for more real centers. So, the functional spaces will reflect the expenses which may not be distributed, after, no criterion to real places, but which still contain the final product cost. Place of expense or cost center must be viewed in terms of: a collection techniques of production costs on expenses places which they rose; where they appeared; a distribution possibility on cost carriers; a production obtained in that place, if it meets a distinct function or is a commodity production; the responsibility increase of the leader's of the expenses places in question.

Step 2: the optimizing of the number of places and expenditure analysis centre, considering that the budget structure will be modeled after the hierarchical structure, and it will have to determine to what level, the responsibility center will be established .

Step 3: the determination of the ventilation way of auxiliary centers in the main centers, through the determination of keys distribution arising from their specific and temporary options. After attending these organizational steps, next steps for the organization of budgeting, accounting and cost calculation on actual expenditure centers.

In the case of the method of calculation on places of expenditure, both planning and tracking of production costs, it will be made by real, functional expenses places and within these computer articles.

A peculiarity in budgeting auxiliary and annexes expenses represents the impossibility of a hair quantitative measurement, leading to their overall determination – values, using various statistical methods such as the previous year achievements corrected with the foreseeable changes of planned budget and cost reduction coefficient.

After programming expenditure places (centers) of costs by centralizing their organizational structures, it is obtained the service operator's expenditure budget operator, in which are included supply costs.

Budgeting expenditure places (centers) production requires proper organization of accounting costs on places realized as units of calculation. In this sense, collection of direct costs from the base section, will be made by account 921, "Expenditure on basic activities" that take place in analytical number of centers (the 5 branches), and within their computer articles. Collection of indirect costs related to production base is made with the help of 923 accounts "Indirect costs of production" which is developed by analytical number of centers, real expenditure (the 5 branches) maintenance and operating expenses and number of functional centers on costs of production for the main sections of the department overheads. Auxiliary expenditure activities will be collected for the 922 account "expenditure auxiliary activities" applied on analytical patterns. If it is necessary, the appropriate analytics can take place on expenditure items.

Similarly, it is organized the accounting sections and functional structures, administrative overheads that are collected for the 924 account "general administration expenses".

The recording of the actual cost of the finite production is accomplished by debiting the 902 account "internal deduction related to the obtained production". Calculation and recording differences between budgeted and actual cost is performed in the debited of the 903 account "internal deduction related to price differences". The deduction of the actual cost of the finite production is accomplished by debiting 901 account "internal deduction related to expenses" and crediting the 931 account "obtained production cost". In the debit of the 931 account, it is registered the credit of the 903 account, meaning the price differences

We can conclude that in the 901 debit account, we can find the obtained production cost (the 931 credit account) and the price differences between budgeted and actual cost, in a word, all expenses regarding the achieved finite production. Homogeneity of production (delivered water) does not require the expenses treatment with the progressed production costs. The unit cost calculation is made by the ratio of total expenditure related to the finite production of the achieved quantity.

3. Conclusions:

Redesigning the regional operator activity on water supply and sewer facilities on responsibility centers, can ensure:

- the separation of productive expenditure from the unproductive expenditure and the monitoring with the purpose to reduce the latter expenditure;
- efforts quantification, but also each employee contribution;
- locating costs on training places, which enable tracking of their evolution;
- through the elaboration of the expenses budgets and their individualization on products, it can introduce a computerized internal system for allocating the resources and tracking expenditures.

We believe that it should be followed the example of the managers of developed countries that have made from the redesign of the activity of the companies on responsibility centers a current practice, and two of the indicators of results (actual expenses related to global production and production cost of goods) are suppliers of statistical calculations and information which must be elaborated, interpreted, accounted and strictly controlled, activities for which is responsible the management accounting.

In a period when convergence is the main driving force of IASB and FASB programmes, who needs a comparison of the two sets of standards-IFRS issued by IASB and US GAAP issued by FASB? Aren't they mainly the same after 5 years of hard work of those who establish the two sets of standards? The answer lies in the fact that mostly all people who work in a multinational company has to understand the present differences between these two sets of standards. A combination of the convergence of the national standards with the IFRS and the follow-up use of IFRS standards would mean that the two accounting languages from all over the world should be reduced rapidly only to IFRS and US GAAP. Although these two sets of standards are more and more similar to each other, they are not totally identical-yet. And until they become identical it will be necessary to state clearly and explain the differences that exist between them.

Keywords: IFRS, US GAAP, convergence, Romanian regulations

JEL Classification: M41

1. Introduction

Convergence is in fact a term that defines either elimination or assimilation of the differences and it represents the main priority that exists both on the agendas of the U.S. Financial Accounting Standards Board (FASB) and the International Accounting Standards Board (IASB).

Nevertheless the major differences existing between US GAAP – issued by FASB - and the International Financial Reporting Standards (IFRS) issued by the IASB are the topic of many discussions. These differences suggest that the two GAAPs keep on using different languages. This apparent contradiction made many people ask themselves how different are these sets of standards and where they do exist, why do they exist and when will they disappear?

Even if the US standards and the international ones do contain differences, the general principles, the conceptual structures and the accounting results between them are most of the times the same or similar, although the differences seem to have overshadowed the similarities. We believe that an analysis of this problem should not forget the fact that the two sets of standards are more similar than different for most of the transactions, IFRS being mainly but not totally based on the same principles as US GAAP.

2. Literature review

There were issued various statistics which refer to the importance of both these accounting regulations: IFRS AND US GAAP. These statistics were realised by the most known and important firms of audit from all over the world and demonstrate the real significance of these

two accounting regulations, IFRS and US GAAP, as accounting languages of the world. The analysed indicators for realizing the statistics are: the international exchange capitalization and the presence in the list of the biggest 500 companies in the world.¹¹³³

So, out of an international exchange capitalization of 36 trillions USD¹¹³⁴:

- 11 trillions USD correspond to the companies that adopted IFRS as a financial reporting system;
- 17 trillions USD correspond to the companies that adopted US GAAP;
- 4 trillions USD correspond to the companies that apply Japanese GAAP;
- the rest refers to other financial accounting systems (Canadians; Indians).

And among the companies included in Fortune 500, in 2005, 200 applied IFRS, 176 applied US GAAP and 81 applied Japanese GAAP.

3. Methodology

The character of this paper is a theoretical one. The data were collected through analyzing of regulations and accounting standards such as: American, International and Romanian standards and through studying the existing literature regarding the differences between these standards.

The paper has two parts. The first one is about the importance of convergence for the entire world and the second one presents a comparison between the regulations or accounting systems which are internationally relevant. Of course, we also attached importance to the Romanian accounting system.

4. The process of convergence

Convergence refers to the activity of accounting regulations of heading for the same goal, leading to similar economical conclusions; but at the same time we could say that it refers to the emergence of functional or structural similarities between systems that differ from the point of view of their accounting doctrine and culture, as a result of similar conditions imposed by the economical globalization.

“To converge” means getting to the same result or to the same point. For a better understanding of this concept which is frequently used in accounting, we have to start from that point of view that a perfect harmonization of accounting regulations cannot be possible, because each accounting system is influenced by economic, financial, fiscal, social, juridical and cultural variables of the environment¹¹³⁵.

The convergence means the alignment to the International Accounting Regulations, without taking them word by word. The convergence refers to a sole set of standards, with the possibility of their conformation to the national realities, issued by the representatives of multiple countries.

As a conclusion we can say that the national accounting systems should adapt their regulations to the international ones (IFRS/IAS) or just to enact some changes.

There have been different opinions related to convergence. There have been many who didn't consider possible to achieve this convergence process but there have also been others who saw it possible.

Those who didn't see possible the achievement of convergence and only saw the obstacles are the pessimists who doubted the opportunity of adopting the international accounting regulations that might have assured the convergence.

The arguments that they bring are some realities that different accounting systems are facing with: difficulties and time in correcting some governmental errors, ethical shortages, accounting scandals

¹¹³³ Fortune 500.

¹¹³⁴ Cristea S., Armonizarea contabilă internațională și practicile contabile naționale. Studiu de caz pentru România și Italia; Editura Accent, 2007, 42.

¹¹³⁵ Palich L.E., Gomez-Mejia L.R., A theory of global strategy and firm efficiencies: considering the effects of cultural diversity, *Journal of Management*, Vol. 25, no. 4: 587-606.

Another category would be formed of those who believe in the utility and possibility of achieving this process and these will be the optimists. The main arguments brought by these are^{1136, 1137}:

- the investors and the financial analysts can understand the financial situations of foreign companies;
- the resource flow for investors streamline internationally;
- the multinational companies can easily establish the stabilized accounts;
- tax authority can measure in an easier way the profit tax owed by foreign companies;
- the enterprises can define worldwide their strategic position in their activity sector.

We consider that big efforts are made to achieve this convergence process and we think that this process is realised on 3 dimensions:

- the convergence between FASB and IASB;
- the convergence between IAS and regional regulations;
- the convergence between regional and national standards.

We have still to wait and see how long this process of convergence will last and if it will be finally achieved.

5. Differences between accounting regulations: IAS/IFRS, US GAAP and Romanian Regulations

FASB started in 1995 a project with a special importance for the international accounting, namely a comparative study between IAS and US GAAP. The goal of this project was that of offering the necessary information for appreciating the acceptance of IAS for the stock exchange quotation of the non-American companies on the capital market from USA. These differences were and are still discussed by IASB during its meetings.

The differences established by the FASB's project refer to 5 categories, namely:

- accounting method and similar application modalities, with the mention that „similar does not mean identical”, in this category were included 56 from 255 reviewed differences;
- similar accounting method but different application modalities: there aren't guides for the application of the standards, in this category are included 79 from the cases;
- different accounting method, in this category are included 56 from the cases;
- there are allowed more alternative methods or there are problems which are treated by one of the standards but not by the other one, in this category are included 64 from the cases.

Although at the beginning, not even the big accounting companies agreed that foreign companies should present financial situations issued according to IAS/IFRS, without a reconciliation with American regulation US GAAP, slowly they began to change their opinion and they joined the process of convergence between the two types of regulations.

Therefore, some of the biggest accounting companies (PriceWaterhouseCoopers and Delloite&Touche) made some studies in which they analysed the differences existing between IAS and the national standards of some countries they considered as being strategic from the point of view of the investments. Among these countries we could mention: the Netherlands, Czech Republic, Switzerland, Great Britain, Hong Kong, China and others.

Moreover, these advisory companies showed their interest and involvement in identifying the differences between US GAAP and IAS, respectively IFRS. Throughout the last years, the interest in analysing the differences between IAS/IFRS and US GAAP was constant.

Usually, the methodology of study of these differences is a simple one and it consists in comparing the requirements of the standards issued by IASB with the American ones. These

¹¹³⁶ Obert R., *Pratique des normes IAS/IFRS*, Ed. Dunod, Paris, 2004.

¹¹³⁷ Gernon H., Meek G., *Accounting – an international perspective*, McGraw-Hill International Editions, 2001.

conclusions might be punctual and accompanied by some explanations or they can be concerned with thematic, where the differences between the accounting practices are more obvious.

Of course, these differences between IFRS and US GAAP do not represent the totality of the differences that exist between these regulations because many times these differences depend on the industry where the entity is part of, on the economical nature of the entity's activity as well as on the accounting policies adopted by the entity.

These comparative studies between the two accounting regulations do not contain all the differences that exist between them, but are mostly concerned with the differences that were most often found in practice.

Therefore, in the following table we will try to present the most important similarities and differences between these three regulations¹¹³⁸.

Table 1. Comparative analysis between IFRS, US GAAP and Romanian Regulations

Subject	IFRS	US GAAP	ROMANIAN REGULATIONS
Financial Statements			
Components of financial statements	Balance sheets, income statements, cash flow statements, statement of changes in equity and accounting policies and explanatory notes present comparative information for two consecutive years.	Similar to IFRS, except that SEC requires to public companies to present in the income statement, cash flow statement, statement of changes in equity, comparative information for 3 years.	The Financial Statements comprise the: - Balance sheet; - Profit and loss account; - Statement of changes in equity; - Cash flow statement ; and - Explanatory notes. The information should be presented for 2 years.
Balance sheet	Does not prescribe a particular format. A liquidity presentation of assets and liabilities is used, instead of a current/non-current presentation, only when a liquidity presentation provides more relevant and reliable information. Some minimum items are presented in balance sheet.	Entities must present either a classified or non-classified balance sheet. The items of the balance sheet are presented in decreasing order of liquidity. The public companies should follow SEC regulations.	The format requested is the list (the vertical one). The assets are classified by nature and liquidity and the liabilities by nature and eligibility.
Income statement	Does not prescribe a standard format, although expenditure is presented in one of two formats (function or nature). Certain minimum items are presented in the income statement.	Present as either a single-step or multiple step format. Expenditures are presented by function. SEC registrants should follow SEC regulations.	The format requested is the list The operating expenditures are classified by nature.
Statement of changes in equity	This statement shows capital transactions with owners, the movement in accumulated profit/loss and a reconciliation of all other components of equity. The statement is presented as a primary statement except when a SoRIE is presented. In this case, only disclosure in the notes applies.	Similar to IFRS except that US GAAP does not have a SoRIE, and SEC rules permit the statement to be presented either as a primary statement or in the notes.	The format requested is the one presented on columns. This statement presents all the elements of equity and their evolution during the period.
Cash flow statement	Standard headings but limited guidance on contents. It is used direct or indirect method.	Similar headings to IFRS, but more specific guidance for items included in each category. Direct or indirect method is used.	Prescribe a similar model with that prescribed by IAS 7. Direct or indirect method is used.

¹¹³⁸ PWC, 2006; Deloitte, 2007; KPMG, 2007; E&Y, 2007.

6. Conclusions

No piece of work that draws a comparison between two large sets of accounting standards can include all the differences that might appear in accounting due to the large number of transactions that might take place. The existence of any differences – and their materialisation in financial situations of an entity – depends on various specific factors including the nature of the entity, the interpretation of general IFRS principles, its industrial practices and the choice of its accounting politics where US GAAP and IFRS offer a solution. Throughout this work I've tried to approach the differences that appeared mainly in the present practices.

WHY ARE THERE ANY DIFFERENCES?

While the national standards were developed, IASB and its predecessor the International Accounting Standards Committee (IASC) had the opportunity to use the thinking of standard setters from all over the world. As a result the international standards contain elements of accounting standards from different countries. Even where an international standard had as its starting point a standard that existed in the US, IASB could improve that standard. Through this action IASB could avoid some of the problems that appeared in FASB standard. Besides, as part of the annual "Improvements Project," IASB revises its existing standards in order to improve their clarity and consistency and taking advantage again of the present practice and opinions. Due to these reasons, some of the differences between US GAAP and IFRS refer to the standards – meaning, they are intentional deviations from U.S. requirements.

As a general rule, the IFRS standards are broader and are based on principles as compared to those from the US. IASB avoided issuing interpretations of its own standards and preferred to leave the implementing of the principles that are included in its standards to the preparers and auditors and its official interpretive body, the International Financial Reporting Interpretations Committee (IFRIC). While the US standards contain important principles as well, the strong regulatory and legal environment from the U.S. markets led to a more normative approach - with far more "clear lines," more suggestive implementation advice and more complex interpretations. As a general rule, IFRS standards are more broad and "principles-based" than their U.S. counterparts, with limited interpretive guidance.

The IASB has generally avoided issuing interpretations of its own standards, preferring to instead leave implementation of the principles embodied in its standards to preparers and auditors, and its official interpretive body, the International Financial Reporting Interpretations Committee (IFRIC). While U.S. standards contain underlying principles as well, the strong regulatory and legal environment in U.S. markets has resulted in a more prescriptive approach — with far more "bright lines," comprehensive implementation guidance, and industry interpretations.

THE RELATIONSHIP BETWEEN ACCOUNTING AND TAXATION: A BRIEF INTERNATIONAL LITERATURE REVIEW

Cuzdriorean Dan Dacian

Babes-Bolyai University, Cluj-Napoca

Faculty of Economics and Business Administration

This paper analyses the international literature regarding the relationship between accounting and taxation in the last 20 years. To this purpose we reviewed the 3 international economic databases (EMERALD, EBSCO and SCIENCE DIRECT).

We have found various studies approaching this relationship, the main research being performed due to the differences between them in the accounting systems that govern the world countries.

Keywords: accounting, taxation, accounting systems

JEL Classification: H25, H29, M40, M41

Introduction

The relationship between accounting and taxation is a relationship that existed, exists and will always exist; the question is related to the intensity, interrelation and mutual consequences.

When accounting intersects with taxation, many topics can be discussed. Literature gives us a rich source of documentation at the crossroads of accounting with taxation and the relationship that exists between them, the last aspect representing the object of study undertaken.

The study is intended to be an analysis of key studies that have addressed this relationship in the international literature, waiting to identify the key areas that are approached, namely accounting paradigm within the studies undertaken may be included.

Research methodology

Methodology approached followed to identify the articles from economical databases (EBSCO, EMERALD and SCIENCE DIRECT) that treated the phrase "the relationship between accounting and taxation". It was selected only the items that meet the following requirements: (1) articles are written in English (2) articles are full text, (3) selected articles were cited at least twice in the other papers.

The achieved is a qualitative research using inductive method, longitudinal analysis, identified as the positivist current.

Key areas identified

A lot of studies have examined the relationship between accounting and taxation in last two decades. These studies cover both national and various European and international countries, in this respect, the analogue method was used. In this regard, studied like the following can be mentioned: Haller (1992); Radcliffe (1993); Hoogendoorm (1996), Blake *et al.* (1997); Lamb, Nobes and Roberts (1998); Porcano and Tran (1998); Aisbit (2002); Doupnik and Salter (1993).

Doupnik and Salter (1993) have developed a classification of countries based on accounting schemes, obtaining their classification based on similarities of accounting standards, similar features of capital markets, namely the similarities corporate governance mechanisms. Eight accounting regimes have been developed, thus: (1) North American; (2) Anglo-Saxon; (3) Nordic; (4) Latin developed; (5) Latin developing; (6) Germanic; (7) Japanese and (8) Asian developing. Francis *et al.* (2002) realized a classification of financial accounting and tax compliance in relationship between accounting and taxation, based on each of the 8 aforementioned accounting regimes. The authors identified 3 level of compliance which defines the accounting systems, as follow:

- *Low level of compliance*: North American and Anglo-Saxon accounting systems;
- *Moderate level of compliance*: Nordic, Latin developed and Asian developed accounting systems;
- *High level of compliance*: Germanic, Latin developed and Japanese accounting systems.

The debate that surrounds the connection between accounting and taxation has been and still exists and as a consequence we can characterize it as being extremely intensive. Haller (1992) studied the development of the relationship between accounting and taxation in Germany treating it from an historical point of view. Moreover, Radcliff (1993) addressed the same relationship in terms of UK and France, using the analogue method. The author noticed some similarities between the two countries' accounting practices. The author focused on the example of adjustments deductibility for inventory distortion value, ordered but not delivered, even more, being the fact that both countries have denied the deduction for such adjustments. If the previous study was focused on determining the elements of similarity, the study conducted by Porcano and Tran (1998) focused on determining the factors founded in divergences surrounding the relationship between accounting and taxation. These divergences concerned the implications arising for the alignment of taxation rules with accounting rules. The study is one that can be qualified as being fundamental research and explores the relationship between accounting and taxation in countries where Anglo-Saxon accounting system is implemented: USA, UK, Australia, Canada and New Zealand.

The study conducted by Boross, Clarkson, Fraser and Weetman (1995), addresses issues regarding the new accounting system from Hungary since 1992. As a major difficulty discovered in the steps taken towards to implement the new system, the link between taxation and accounting was mentioned. The authors mentioned that tax rules have priority in preparing financial statements or cost calculation judging under detrimental bases regarding the new accounting rules.

We also recall the fundamental type of research carried out by Alley and James (2006), which addresses the relationship between accounting and taxation in terms of different objectives pursued by each of the two areas, the difficulties encountered in applying economic concepts and evolutionary process involving by both areas.

The degree of independence varied temporal and territorial belonging among the classifications of Nobes and Parker (1981) (*macro-economic orientation*), and Choi and Mueller (1992) (*micro-economic orientation*).

Micro-economic orientation refers in fact to that financial statements that are prepared primarily for shareholders and their development is not influenced by tax rules. The financial statements portraint a true picture of companies, and also, such an approach generates two types of results: accounting and tax result.

Macro-economic orientation, on the other hand, acknowledges the influence of tax rules; the companies prepare financial statements, mainly to the interests of creditors or state in order to determine the results focused on tax purposes.

A first approach used in order to asses these debates was the distinction that is made when it comes to two groups of countries, thus: countries influenced by Anglo-Saxon accounting system (e.g. USA, UK and Canada) and those under Continental accounting system influence (e.g. Italy, France, Portugal, Spain).

Using the classification of accounting systems under the aegis of the two approaches mentioned above, it is what the literature refers as the disconnection between accounting and taxation. The disconnection is primarily explained by the method of calculating of accounting and tax profit.

Accounting profit is calculated applying the principles and accounting rules, while the tax profit is calculated taking into account the tax rules. The profit calculated using two different methodologies, connote major differences.

It can mentioned that the introduction of the Fourth European Directive has produced major changes in the legislation of many European Union (EU) countries, from macro-economic

orientation to micro-economic orientation towards greater independence of accounting to taxation. The implementation of the Fourth Directive was seen as a genesis point of breaking the link between accounting and taxation (Christiansen, 1996).

Blake *et al.* (1997) focused on some dilemmas associated with the relationship between accounting and taxation, dilemmas and controversies such as:

- Tax considerations that support this link, and secondly, issues related to obtaining economic picture through the faithful representation of financial statements for some international users, and even fellow countrymen, which indicates that this goal can not be achieved as long as the link is a strong one;

- Addressing the issue of harmonization of national accounting practices at European level the fundamental link between tax and accounting rules, and accounting system is identified as a major obstacle;

- Main benefits from residing in “breaking” the link, experiencing large listed companies, while maintaining relations benefits are felt by small companies (since it not involves additional costs in the consolidated accounts as the large listed companies);

- In regard to this link, the practitioners supports the efforts of “breaking” this link, but this is not yet possible, maintaining the relationship having a major impact not only on accounting policies and practices but also spilling on the accounting conceptual framework.

The authors also highlights the fact that Sweden offers an unusual example of country that deals with two different pathways, as, legal system is based on a close relationship between accounting and taxation, while the private sector tries to "break" this link. The authors focused on ways regarding the directions in which Swedish accounting practitioners are willing to broke the link between accounting and taxation in order to develop relevant and comparable financial statements for accounting information users.

Two EU countries (Germany and United Kindom) were identified as distinctive and contrasting leaders in European accounting tradition of Anglo-Saxon and Continental origin, and an assesment was conducted regarding the major differences between those two countries. The differences are presented in **Table 1**.

Table 1 *The differences between Anglo-Saxon and Continental Accounting System*

Anglo-Saxon Accounting System (including United Kindom)	Continental Accounting System (including Germany)
Fair view	Legal view
Shareholder orientation	Creditor orientation
Disclosure of accounting information	Secrecy of accounting information
Tax rules separate	Tax dominated
Substance over form	Form over substance
Professional standards	Government rules

Source: Nobes (1992) and Blake *et al.* (1997); Author projection

The distinction between Anglo-Saxon and Continental accounting system, based on the relationship between accounting and taxation, is treated by Lamb, Nobes and Roberts (1998). The authors explained in more detail the two directions involved, as following:

- Historical link between accounting and taxation (the existence of taxation determin, to some extend, the existence of accounting);

- Degree of separation or rather contemporary connection between financial and tax reporting in respect of calculating the profit, an indicator considered to be very important in any economic activity.

Profit is the objective of empirical research conducted by Tzovas (2006). The author tried to identify the underlying factors designed to support decisions for a court accounting policies of Greece, where tax and financial accounting coincide. Study results revealed that the design decisions on accounting policies do not exclude the influence of tax minimization. Moreover, it

highlights the fact that the project objectives on the profit value may conflict the objectives to minimize the tax burden supported by companies.

Hoogendoorn (1996) has developed a taxonomy regarding the relationship between accounting and taxation in major EU countries. 13 countries were selected according to the stringency of the relationship and the possibility of maintain this connection was taken into consideration. The taxonomy considered is presented as follows:

- Accounting and taxation are characterized as being dependent and this relationship is not expected to change. In these cases we do not find deferred tax regulations, and as a result, several alternatives are allowed. Both individual and consolidated accounts are therefore influenced by tax regulations, and representing countries such as Belgium and Italy are mentioned;
- Accounting and taxation are dependent and this relationship is not expected to change. There are few deferred tax regulations and fiscal influences. France and Germany are included in this category (Germany also may be included in the first category);
- Accounting and taxation are still dependent, but the aim of breaking the relationship between them is desired. We do not find strict regulations regarding deferred taxation, and representing countries such as Sweden and Finland are mentioned;
- Accounting and taxation are formally independent; in practice the connection between them being characterized as very strong. We can find there strict deferred taxation regulations, and representing countries such as Poland and Czech Republic are mentioned;
- Accounting and taxation are independent. Alternative regulation allows deferred taxation, and as representative country is recalled Denmark;
- Accounting and taxation are independent and there are also specific deferred taxation regulations, representing countries such as Ireland, UK, Netherlands and Norway are mentioned.

Aisbit (2002) conducted a further study, based on the Hoogendoorn (1996) study. The author concludes that a close relationship between accounting and taxation lead to difficult interpretation of financial statements results. Referring strictly to the study conducted by Hoogendoorn (1996), the author highlights that this is a dynamic study and that changes have occurred in recent years regarding the classification of countries into one category or another, and the financial statements may not be fully independent from taxation. The road to independence is "paved" with good intentions by induced upon acceptance and application of IAS.

Remaining within this boundaries, Radcliffe (1993) discuss about the distinction between *tax compliance* (which necessitates of general assumption that taxable income is calculated under Generally Accepted Accounting Principles) and *financial compliance* (as a financial reporting practice involving substantial dependence on the choice of a specific accounting practice in preparing financial statements, to be conclusive for tax purposes, and also, the inclusion of specific items is a necessary condition for the granting of tax exemptions). The author explains that the existence of compliance indicate the fact that there is a close relationship between accounting and taxation, and that both of them have the power to influence each other.

On the scope of financial reporting systems correlated with taxation, we can mention a reference book for the international literature, *Comparative International Accounting (Fourth Edition)*, written by Nobes and Parker (1995). The authors identified seven factors contributing to the permanent existence of differences between financial reporting systems, as follow: legal systems, capital providers, taxation, accounting profession, inflation, accounting theory and accidents of history (1995, p. 11).

The authors highlight as a crucial extent that tax rules may affect the accounting estimates in various accounting regimes. Deferred tax is an example, mentioning that it was an endless source of controversy in Anglo-Saxon accounting system (UK, USA), while in the Continental accounting system (France, Germany), where the controversy is minor (marked by the strong influence of tax accounting rules), (1995, p. 15).

Stoianoff and Kaidonis (2005) studied the accounting and tax system in Australia, in an attempt to identify the extent to which community may benefit from them (as social function) and the

extent to which the both are emerging. The author's conclusion is bleak: both systems are disadvantages the society, supporting each other in an attempt to favor a certain class of society. Gallego (2004) realized taxonomy of relationship between accounting and taxation standards, thus bringing into focus the concerns of Spain. The taxonomy realized by the author, aimed the regulations from USA, UK, International (IAS/IFRS) and Spanish regulations.

Oliveras and Puig (2005) proposed the following verifiable *statement*: "there was a great reduction in the influence of tax in Spain in the early 1990s" (not intentionally they used the term "hypothesis" instead of usual "statement" as the authors explain that they wanted to avoid the implications that are subject of statistical tests). Although we find the fact *stated* in the literature, as a result of reducing the tax accounting rule, the authors refuting this claim.

Making use by the classification introduced by Lamb *et al.* (1998), the authors tested the previous claim, concluding that the relationship between accounting and taxation has undergone major changes over the period before 1990, moving from a definite rule, to its dramatic reduction. Taking the sample as 16 items (including assessment of fixed assets, depreciation, leasing classification, research and development costs, long-term contracts, foreign currency transactions, pensions, financial assets, etc.), the authors followed their introduction in the five cases developed by Lamb *et al.* (1998) according to the specificities of each item, underlining the analysis for three years: 1989, 1994 and 2003. Half of items were placed in Case 3 "Accounting leads" in 2003, representing a decrease of fiscal rules compared to 1989, where only 2 of 16 items were classified in this case. For 2003 we have no item included in case 5 "Taxation dominates" unlike 1989.

For clarification we brought in carefully the classification of Lamb *et al.* (1998), which provides five criterias of classification for relationship between accounting and taxation, relationship characterized in terms of accounting rules, and taxation, as follows:

- *Case 1: Disconnection* (the accounting and taxation rules are pursued for different purposes to be fulfilled. Disconnection is possible when we have tax and accounting rules separate, independent and detailed);

- *Case 2: Identity* (this identity can be a *de facto* identity or when accounting is "leader". Regardless of which way we look accounting *prima facie* will affect taxation);

- *Case 3: Accounting leads* (it is possible when accounting rules or accounting options are adopted for financial reporting purposes and for tax purposes. This scenario is possible because of lack of specific tax rules to be sufficient);

- *Case 4: Tax leads* (it is possible when a fiscal rule or option is adopted for tax purposes and financial reporting purpose. This scenario is possible because of lack of specific accounting rules to be sufficient);

- *Case 5: Tax dominates* (a tax rule or option is imposed both for the financial and tax reporting, being in conflict with financial reporting rules).

Shaviro (2009) highlights the differences that arose between tax and accounting profit reported by companies, through the reporting of accounting profit semnficativ higher than fiscal profit. The author highlights that the problem of accounting manipulation is very present despite by implementation of the Sarbanes – Oxley Act. A recent study is conducted by James (2009), the relationship between accounting and taxation being discussed both in UK and, from a wider perspective of it, in Europe. The author asserts the different goals pursued by accounting and taxation. According to author, the relationship between accounting and taxation is much more complex than it appears, and according to the jurisdiction where the relationship is dispute, there may be differences of perception or approach. The relationship between accounting and taxation is seen as the author characterized by progressive accents, since both, accounting and taxation, are dominated by permanent changes.

Conclusion

The relationship between accounting and taxation is conducted in the literature under various spectra or directions as: accounting standards, capital markets, corporate governance mechanisms, accounting procedures, in terms of transversal and longitudinal analysis, using analogue analysis, tax and accounting rules, the objectives of each of both scientific fields, micro-economic orientation versus macro-economic orientation, degree of independence that has a temporal and territorial accurate picture, tax compliance.

Accounting paradigms, identified as a result of browsing literature that treats the relationship between accounting and taxation, are: *The Antropological/Inductive Paradigm*; *Decision-Usefulness/Decision-Model Paradigm*; *Decision-Usefulness / Decision-Model Paradigm/ Aggregate-Market-Behavior Paradigm*; *Decizion-Usefulness/Decision-Maker/Individual-User Paradigm*.

AUDITOR'S ETHICS IN THE CONTEXT OF GLOBAL CRISIS

Dana Simona Dragos

University of Oradea, Faculty of Economic Sciences

In the context of current global crisis, a series of questions regarding the professional accountant's position need to be clarified in order to may understand the way in which the auditors, considered objective and independent due to their ethical and professional conduct, contribute to the confidence increase of those who found their decisions on an accounted financial situations basis. We also ask ourselves to what extent our society can sustain the development of a regulation based ethical behaviour and specific institutions, taking into account the existing pressures in crisis conditions. The increased number of financial scandals lead to a regression of confidence of the accounting information users, regarding the respect of ethical standards by the auditors, and there are real reasons of concern because of the increase of the non-ethical behaviour's number of cases.

Keywords: audit, ethical dilemmas, independence, objectivity.

JEL Classification: M 42

Introduction

Of a larger approach, ethics can be defined as a set of principles or moral values that the organizations, the groups and each individual described in a separate way. There are many codes of conduct, codes of professional ethics defined by different insitutions and group of crafts, necessary and respected in order society function in a proper way. The International Federation of Accounts (IFAC) established the International Ethics Standards Board for Accountants (IESBA) having the role of the elaboration and the issue of high quality ethics and other provisions for accountant professionists all over the world.

The object of this article represents the analysis of the code regarding the ethical and professional conduct in the field of audit, in the context of current crisis, using a research methodology based on the review of the literature and legal regulations in this field.

The solution of ethical dilemmas

The ethical dilemma can be defined as a situation in which a professionist has to take a decision concerning a certain attitude. The auditor is the professionist confronting along its career with a series of ethical dilemmas, having to provide an objective and independent opinion regarding the financial situations of an individual. The solution possibilities of ethical problems are quite ample, but the auditor has to pay attention when chosing from these possibilities, because the provided services have an impact on different users, client representants, lenders, governments, financial and affairs communities and even on the economic welfare of the community that he joins. The threshold between a moral behaviour and an immoral justification conduct can be easily crossed. An example of frequently used justification mechanism is one in accordance with the principle "If it is legal, it is moral", using the argument according to which every conduct that doesn't violate the law is as well moral and bases mostly on the hypothesis on the law's perfect character. According to this reasoning an individual cannot be obliged to return a found object, but only in case the person who lost the object can prove that it belongs to him. Ethical dilemmas solution represents the permanent concern of the regulatory bodies in any field of activity and one of the easiest way of defining is the formal reference frame.

Generally, but applicable in any field, the 6 steps method represents a simple form of ethical dilemmas' solution, as it is described below:

- Getting relevant information;
- Identification of ethical problems on the basis of the given information;
- Determination of the persons or groups affected by the dilemma's final resolution and the way they will be affected;
- Identification of the alternatives that the person who has to solve the dilemma disposes of;
- Identification of the prospective consequences of each alternative;
- Decision regarding the proper actions to be undertaken.

The Code of Ethics for Professional Accountants in the field of audit represents the formal reference frame, containing a set of principles and regulations which have to rule the auditors' activity. The International Accounting Standards (IASs) no. 100 and the International Standards Certifications (ISC) 3000 forecasts the necessity that the accountant professionalist conform himself to the ethics rules issued in the Code by the IFAC.

Conduct and professional ethics national provisions

The mission of the International Federation of Accounts (IFAC), as it is prescribed by the constitution, is "to strengthen the accountant profession at a global level, applying harmonized standards which are able to provide high quality services for public interest". Taking into account the IFAC's mission, there has been established the Ethics Standards Board for Accountants having as objective the elaboration and the emission of high quality ethics standards. The code has a significant impact on the practitioners, offering fundamental principles regarding the auditing practice and specific and correctly applicable conduct rules. The auditor's activity must come up to the highest professionalism standards in order to guarantee confidence to the users regarding its services quality. To maintain this confidence, the auditor has the obligation first of all to have defined and to respect the ethical and professional conduct code.

Romania has adopted the Code through The Body of Expert Accountants and Licensed Accountants, entitled The National Code of Ethics for professional accountants, and it is compulsory to be known and to be respected by all professional accountant, no matter how they carry on their activity. The purpose of the Code supposes accomplishing the aim concerning professionalism, credibility, quality of services and the confidence conveyed by its users to reach the highest level of performance and to come up to the public interest needs. The accountant professionalist has the responsibility not only to satisfy the needs of a client, but also to act for public interest. The auditor helps to maintain the integrity and the efficiency of financial situations, a role that imposes to him to respect and to adapt himself to the ethical provisions of the Code.

The code regarding the ethical and professional conduct in the field of financial audit is structured as follows:

- *Fundamental principles* for the profession and practice of financial audit, that is the integrity, independence and objectivity, privacy, professional competence and political neutrality.
- *Conduct rules* that imposes the standard behaviour for auditors, which helps them to understand and put into practice the fundamental principles.

Integrity supposes the professionalist obligation to carry on its services in a modest, correct and incorruptible manner, acting in accordance with the profession's requirements. The auditor has to avoid the conflict of interests and to present deliberately incorrect information.

From *objectivity* point of view, it is stipulated the auditor's obligation not to discredit the professional reputation and the profession because of an unwanted influence. The accounting reports have to be precise and objective and the datas used for analysis to be employed from the provided documents according to audit standards.

Professional competence oblige the auditors to maintain the knowledge and professional aptitude at an international standards level, carrying on their activity with careful attention, competence and conscientiousness, offering to the users of the information an assurance regarding the benefit of a service based on the most current practical and legislative aspects.

From *privacy* point of view, it is necessary that auditors keep privacy regarding the facts, the information and the documents they are acquainted with both for personal interest and the benefit of a third person.

Political neutrality concerns the auditor's attitude regarding the political convictions, he must keep his independence to all political influences in order to accomplish his tasks in the most impartial way.

Conduct rules represent minimal standards of ethical behaviour, set forth as specific rules that must be respected by any professional in practice in the domain of accountancy and audit. Besides the previously detailed principles regarding independence (rule 101), integrity and objectivity (rule 102), privacy (rule 301), auditors have also to know:

Technical standards supposing the observance by the auditor of some techniques regarding: general standards (rule 201), observance of standards (rule 202) and accountant principles (rule 203). The auditors have to conform to technical and professional standards drawn up by:

- international audit standards;
- committee for international accountancy standards;
- professional member organizations or other organization with regulation competences;
- the current legislation.

The interpretation of conduct rules meets the practitioners questions regarding a specific rule. The interpretations are not officially applied, but their violation put the practitioner in the impossible situation to justify his various conduct in comparison with the conduct rules. The role of the ethical verdicts is also to give explanations regarding some specific real circumstances which are published in the complete version of the Code.

Besides the Code of Ethics for Professional Accountants issued by the IFAC, there are also other ways by means of which profession and even society can encourage the auditors and the experts in the field to behave properly to carry out high quality audit and other professional services. Other similar ways are the exams for the licence of expert accountant, licenced accountant, quality control, collegial evaluation, legal responsibility, standards defined by stock exchange values and operations committee, classification of accounting expertize companies and others.

Ethics development in crisis conditions

According to specialists estimations, the problems the individuals confront with, especially on the Romanian market, are linked first of all to the internal factors regarding the employees' discrimination, social responsibility, information disclosure, resources use for personal reasons and other problems having as starting point the ethical and moral responsibility. The financial scandals in the last years, reaching the highest point with the contemporary financial crisis, have brought forth the problems regarding ethical behaviour and social responsibility. The individuals and regulation organizations in the given field take more and more evident measures to help increase the lost confidence in accountancy.

The Sarbanes – Oxley Act (SOX) represents one of legislative measures taken by the USA, regarding corporate governance, by means of which The Public Company Accounting Oversight Board has been established in order to set up standards for rate entities and for the leading of controls concerning the audit companies activities. The SOX Act extended over the American borders, influencing thus all companies having their headquarters in another country than USA. One of the regulation measures undertaken by IFAC represents the establishment of the Public Interest Oversight Board (PIOB), in February 2005, having as object the oversight of IFAC's standardization activity regarding the audit missions. A series of conferences also debated the ethics problem in auditor's profession.

A new structure appears within "the Ethics and Compliance Officer" association having as object the establishment of internal systems and procedures by means of which employees' way of interaction is controlled and especially crisis situations are prevented.

At the base of financial scandals lay a series of specific causes regarding economical and political policies, but the lack of transparency of financial reports represents a major problem.

The reasons may vary, but they are especially due to the insufficient training of the managers who are obliged to find new resources and carry out their activities in a competitive environment. The economic environment goes through a stage of major transformations, under the influence of new technologies and the dynamics of production factors; thus, the transparency of accounting information becomes a guarantee of financial stability and performances.

Conclusions

The current economic environment in which we carry out our activity is very different from the past economic environment, accountant professionists find themselves every day in a competitive climate imposing them to obey the new rules and to adapt their activity to the requests of the market. The actual financial crisis put into evidence the necessity of solid, unitary regulations, having a real basis concerning ethics and morality in financial reference. The demand for audit and certification services depends especially on the confidence of the users in the respective profession. Thus, the management of professional activities in accordance with a Professional conduct code, known, respected and understood by the practitioners in the given field is imperatively necessary.

The aspects regarding the ethics code are and have to be permanently an effort to improve competition and quality of services. The behaviour rules recommend the auditors to remain independent and carry on faithfully their activities. Professional conduct code requires to the members "to respect the ethical and technical standards of the profession, to make a continuous effort to improve the competence and quality of services and to practice their professional responsibilities for each individual at as highest levels as possible", these requirements representing the necessary to improve the accountant information users' confidence.

The Romanian economy confronts with the lack of some performant management practices, existing at the present insufficient studies and researches to help the elaboration of a solid basis regarding management possibilities. The managers don't know how to protect themselves against some ethics and conduct problems which may appear during their activities. One of the reasons represents the reticence concerning the organization structures changes, the appearance of "the Ethics and Compliance Officer" representing an essential part in defining the activity, but the Romanian companies aren't yet used to transfer a part of their management responsibilities to a third person. As a reply to the current crisis, at the request of the professionists to focus on the civic duties, IFAC improved the support of developing countries and established an Anticorruption Working Group and enlarged the independence and other ethics advices in the Ethics Code [3]. Similar additional measures have to be undertaken and the professionists who don't respect the Code's dispositions must be penalized so that they be obstructed in the future to justify their immoral conduct. The concerns for ethics and social responsibility have to be permanently in the attention of accountant professionists, of auditors and all professionists from any other field of activity. Only a proper behaviour may offer confidence and lead to the increase of the practiced profession's prestige. The faster understand of the fact that ethics doesn't mean only legality supposing a way of communication and development will lead to the proper and quicker pass over the current economic-financial deadlock.

A TAXONOMY OF ACCOUNTING INFORMATION SYSTEMS USED BY ROMANIAN ORGANIZATIONS

Deac Marius

*“Dimitrie Cantemir” University Bucharest,
Faculty of Economics Cluj-Napoca*

Inspired by a series of international studies, the present article tries to determine a typology of accounting information systems used by Romanian organizations based on 3 key characteristics: the use of financial accounting, management accounting and operational reports by the management of these organizations. The three types of information systems that were identified using cluster analysis are then described based on the cluster score for these components of the accounting information system.

Keywords: accounting information systems, financial accounting, managerial accounting, operational reports.

JEL codes: M10 M40 M41

1. Introduction

Although in the past 20 years numerous studies have been published, studying various factors of internal and external influence on the organization's information system and internal control system, most of these were conducted in countries with a developed economic system, and on organizations which operate in a strong competitive environment.

There are a small number of studies that use contingency theory to study the accounting information systems in organizations operating in countries with emerging economies.

Also, there has been little research on how internal and external factors influence the accounting information systems of organization in Eastern Europe.

A few studies on the development of accounting system made in countries of Central and Eastern Europe published mainly in journals such as "Management Accounting Research" or "The European Accounting Review" tend to suggest that accounting organization in this geographical area is still in an early stage of development.

2. Research methodology

The present study has been conducted using a questionnaire containing a total of 21 sets of questions. The main objective of the survey was to determine how various factors (such as size, complexity, degree of formalization, the perceived risk of the external environment) influence the organization of accounting departments, information systems, internal control of an enterprise.

The questionnaire has been completed primarily on-line using Google Docs application, during August-September 2009. The study comprised a total of 93 organizations, most of them in Cluj county region, representing 28.70% of the organizations contacted, and 38.58% of the questionnaires sent to completion.

Accounting Information System was evaluated in terms of its level of detail using three sets of questions (no. 17, 18 and 19). Also, the Accounting Information System is conceptualized in terms of its three main components:

- financial accounting,
- management accounting,
- operational reports.

In the present paper, we present the content of the three sets of questions mentioned (Tables 1, 3 and 4), together with some descriptive statistics of their responses (Tables 2, 5 and 6) and some conclusions.

Question. 17 of the questionnaire is designed to measure the level of detail of the reports based on data extracted from financial accounts.

Table 1. Question no. 17 of the questionnaire (translated version)

17. The use of financial accounting data within your organization					
(Please indicate which of the following data from the financial accounts is reported within your organization and the hierarchical level witch is the recipient of these reports)					

		General Manager	Department Manager	Team Leader	Individual Level
(FIN01)	Expenditure on raw materials or goods	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(FIN02)	Expenditure on wages and other similar charges (CAS, CASS, etc.).	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(FIN03)	Depreciation of fixed assets	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(FIN04)	Expenditure on services	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(FIN05)	Income	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

On this set of questions, respondents were able to tick one or more hierarchical levels for which reports are prepared. The maximum theoretical value for each indicator is 10, calculated as the sum of the values 1, 2, 3 and 4, representing the encoding for each hierarchical level.

Descriptive statistics elements that characterize the answers to this question (no. 17) are presented in Table 2.

Table 2. Descriptive statistics indicators for Financial Accounting as part of the Accounting Information System

Indicator	Number of responses	Minimal value	Maximum value	Average	Standard deviation
FIN01	93	0	10	4,59	2,845
FIN02	93	0	10	4,52	2,741
FIN03	93	0	10	4,67	2,495
FIN04	93	0	10	4,67	2,597
FIN05	93	0	10	4,77	2,646

Question 18 of the questionnaire is designed to measure the degree of detail for the reports based on data extracted from management accounts and question 19 the level of detail for the reports based on data extracted from operational records.

Descriptive statistics that characterize the responses to question 18 are presented in Table 5, and responses to question 19, in Table 6.

Table 3. Question no. 18 of the questionnaire (translated version)

18. The use of management accounting data within your organization					
(Please indicate which of the following data from the management accounting is reported within your organization and the hierarchical level witch is the recipient of these reports)					

		General Manager	Department Manager	Team Leader	Individual Level
(GES01)	Direct material costs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(GES02)	Direct labor costs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

(GES03)	Indirect costs of maintenance and operation equipment	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(GES04)	Other indirect costs	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(GES05)	Administrative overheads and selling expenses	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Table 4. Question no. 19 of the questionnaire (translated version)

19. The use of operational reports within your organization

(Please indicate which of the following operational reports are prepared reports within your organization and the hierarchical level which is the recipient of these reports)

		General Manager	Department Manager	Team Leader	Individual Level
(OPE01)	Consumption of resources (eg manpower expressed in person-hours)				
(OPE02)	Time (eg delivery time of orders)				
(OPE03)	Quality of products				
(OPE04)	Flexibility (eg ability to adapt to individual customer orders, the possibility of introducing new products or services)				
(OPE05)	Personnel state (eg, attitudes toward work)				

Table 5. Descriptive statistics indicators for Managerial Accounting as part of the Accounting Information System

Indicator	Number of responses	Minimal value	Maximum value	Average	Standard deviation
GES01	93	0	8	4,18	2,236
GES02	93	0	8	3,83	2,452
GES03	93	0	8	3,97	2,438
GES04	93	0	8	4,18	2,136
GES05	93	0	8	4,11	2,129

Table 6. Descriptive statistics indicators for Operational Reports as part of the Accounting Information System

Indicator	Number of responses	Minimal value	Maximum value	Average	Standard deviation
OPE01	93	0	7	3,75	1,875
OPE02	93	0	7	3,73	1,714
OPE03	93	0	7	3,84	1,721
OPE04	93	0	7	3,72	1,890
OPE05	93	0	7	3,65	1,579

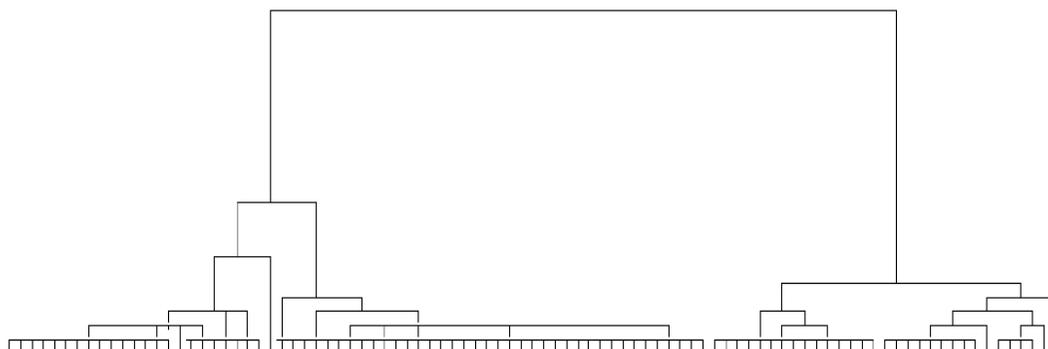

Based on these questions, a score was calculated for each of the three main components of the accounting information systems (management accounting, financial accounting and operational reports). Elements of descriptive statistics for these scores are presented in Table 7.

Table 7. Descriptive statistics of the scores for the main components of Accounting Information System

Indicators	No of cases	Average	Standard deviation
FIN	93	4.64	2.03
GES	93	4.05	1.82
OPE	93	3.74	1.31

The scores were then standardized (so that the average of each individual score is 0 and the standard deviation is equal to 1). Standardized indicators were then used for analyzing the grouping of organizations covered by this case study, using hierarchical clustering based on Euclidean distance radical. The result of this procedure is shown graphically in Figure 1.

Figure 1. Hierarchical cluster graphical representation

The analysis of the dendrogram shown in Figure 1 reveals that the organizations presented in the present research use a fairly large variety of accounting information systems. We have decided to use a grouping into three clusters. The final grouping of the organizations into clusters was performed using the K-means criteria. The result of the clustering procedure is presented in Table 8.

Table 8 The summary of accounting information systems K-means cluster grouping

Indicator	Type of Accounting Information Systems		
	Simple	Complex	Medium
Financial Accounting standardized score	<u>1,27795</u>	1,21652	0,12638
Management Accounting standardized score	<u>1,38706</u>	1,07107	0,27964
Operational Reports standardized score	<u>1,01713</u>	1,35392	- 0,11980
Number of cases	27	24	42

In Table 8, the maximum values for each criterion are in bold and the minimum values were underlined.

3. Conclusions

By analyzing data in this table, we distinguish three categories of accounting information systems:

Simple accounting information systems – the ones who achieved the lowest score in each of the three criteria used. In this type of information system various data is aggregated but it is rarely used. Perhaps the management of the organizations that use such accounting information systems is an intuitive one, and the environment in which these enterprises

operate is simple and less competitive. Communication is probably achieved in a interpersonal and less formalized manner. We expect this type of accounting information systems to be used in simple and small enterprises having a sequential dependencies between departments;

§ **medium accounting information systems** – these have an average score on each indicator that characterizes accounting information systems. We expect this type of information system to be well represented in all types of organizations with sequential dependencies between departments.

§ **complex accounting information system** – this is the most advanced type of accounting information system, characterized mainly by using lots of reports from financial and management accounting. This type of system accounting information achieved maximum scores in all three indicators used. We expect it to be used mainly in the large and complex organizations with reciprocal dependencies between departments, which require good planning and coordination.

In 2008 we have conducted a small exploratory case study regarding some factors that could lead to a better use of accounting information in the companies in Cluj area. The study was based on a small questionnaire. The test group was comprised by a group of students in the final year of study, students who already worked in financial or management positions in companies from Cluj-Napoca and the surrounding areas. The study has addressed a few technical, organizational and educational factors that – in our view – can improve the use of accounting information in managing a company.

Keywords: exploratory case study, accounting information, company management

JEL codes: M10 M40 M41

1. Research methodology

During 2008 we have conducted a small exploratory case study regarding different factors that can improve the use of accounting information in Romanian companies. A few technical, educational and organizational factors were chosen, based on the authors' personal experience. The study has been conducted using a questionnaire on a small number of companies based in Cluj, represented by students in the final year of study who occupy management or accounting positions in these companies. The study was supposed to give an insight on the factors that could or could not impact the usefulness of the accounting information system for the purpose of managing a company.

The structure of the analyzed companies grouped by size is presented in table 1. Micro and small enterprises are under-represented as nation-wide they account for about 80% of the number of companies.

Table 1. The structure of the analyzed companies by size

	Absolute frequencies	Relative frequencies (%)	Cumulated frequencies (%)
Microenterprises	7	17.9	17.9
Small enterprises	9	23.1	41.0
Medium enterprises	11	28.2	69.2
Large Enterprises	12	30.8	100.0
Total	39	100.0	

2. Technical factors

The **technical factors** that could impact the usefulness of accounting information throughout an enterprise that were taken into consideration were: the use of a better accounting software, the use of more powerful computers and the usefulness of better accounting software manuals and procedures.

Responses to the question whether the use of better accounting software could lead to a better use of accounting information within the company are presented in table 2.

Table 2. The perceived usefulness of a better accounting software

<i>Company size</i>	<i>Agree (%)</i>	<i>Disagree (%)</i>	<i>Total (%)</i>
Microenterprises	57.1%	42.9%	100.0%
Small enterprises	55.6%	44.4%	100.0%
Medium enterprises	72.7%	27.3%	100.0%
Large Enterprises	66.7%	33.3%	100.0%
Total	64.1%	35.9%	100.0%

We observe that - in general – the respondents agree that better accounting software would positively impact the usefulness of accounting information throughout their companies. As the size of the company increases, the percentage of positive responses has increased from 57.1% to 72.7%. An explanation for this could be that with an increase in the volume of accounting information and in the degree of complexity of operations due to the size of the company, the accounting software must meet increasing requirements.

Table 3 represents the responses of the perceived benefits of the use of more powerful computers.

Table 3. The perceived usefulness of more powerful computers

<i>Company size</i>	<i>Agree (%)</i>	<i>Disagree (%)</i>	<i>Total (%)</i>
Microenterprises	71.4%	28.6%	100.0%
Small enterprises	22.2%	77.8%	100.0%
Medium enterprises	54.5%	45.5%	100.0%
Large Enterprises	41.7%	58.3%	100.0%
Total	46.2%	53.8%	100.0%

We observe a high percentage of people who consider this factor would impact the use of accounting information mostly in micro-enterprises (71.4%). On the whole we conclude that this factor is not perceived as useful (53.8% of the respondents disagree on the utility of this factor). The higher perceived usefulness in micro-enterprises can be explained by their small budgets for IT procurements and probably the use of old computers.

Table 4. The perceived usefulness of better accounting software manual and procedures

<i>Company size</i>	<i>Agree (%)</i>	<i>Disagree (%)</i>	<i>Total (%)</i>
Microenterprises	14.3%	85.7%	100.0%
Small enterprises	22.2%	77.8%	100.0%
Medium enterprises	36.4%	63.6%	100.0%
Large Enterprises	25.0%	75.0%	100.0%
Total	25.6%	74.4%	100.0%

Table 4 presents the perceived usefulness of better accounting software manual and procedures. While - in general – we can conclude that these manuals and procedures are sound (74.4% of respondents do not believe that better manuals or procedures could impact the degree of utilization of accounting information throughout the enterprise), we observe however, an increase in the percentage of positive responses from 14.3% in micro-enterprises case to 36.4% in the case of medium sized enterprises. A possible explanation of this variation can be the increase the complexity of professional accountants work, in sync with the increase of company size. The

decrease observed in the large enterprises case could be explained by better training of their employees.

3. Educational factors

The study has also taken into account a few educational factors that could influence the usefulness of accounting information for the management of these organizations. These factors were: accounting personnel training in accounting, accounting staff training in computer-use, accounting staff training in accounting software, management staff training in accounting, management workforce training in computer-use and management personnel training in accounting software.

Table 5 presents the perceived usefulness of trainings in accounting for accounting department staff.

Table 5. The perceived usefulness of accounting staff training in accounting

<i>Company size</i>	<i>Agree (%)</i>	<i>Disagree (%)</i>	<i>Total (%)</i>
Microenterprises	57.1%	42.9%	100.0%
Small enterprises	44.4%	55.6%	100.0%
Medium enterprises	63.6%	36.4%	100.0%
Large Enterprises	58.3%	41.7%	100.0%
Total	56.4%	43.6%	100.0%

By analyzing the data in table 5 we conclude that 56.4% of the respondents consider that accounting department staff training courses in accounting might lead to an improved use of information provided by the accounting information system in the management of enterprises. We also note that this factor's perceived usefulness remains relatively constant (around 57-60%) with the increase in the size of the enterprise.

Table 6 presents the responses to the question whether the attendance of training courses in computer use by accounting department personnel would be beneficial for a better use of accounting information.

Table 6. The perceived usefulness of accounting personnel training in computer-use

<i>Company size</i>	<i>Agree (%)</i>	<i>Disagree (%)</i>	<i>Total (%)</i>
Microenterprises	28.6%	71.4%	100.0%
Small enterprises	33.3%	66.7%	100.0%
Medium enterprises	45.5%	54.5%	100.0%
Large Enterprises	41.7%	58.3%	100.0%
Total	38.5%	61.5%	100.0%

Analyzing the data in the above table shows that the majority of professional accountants consider that their preparation in the use of computers is satisfactory. The highest percentage of negative responses (71.4%) was recorded in microenterprises and the lowest in the case of medium-sized enterprises (54.5%).

On the question regarding the perceived usefulness of training in the use of accounting software, the answers vary depending on company size (see table 7). Small organizations recorded the lowest percentage of affirmative answers (22.2%). The total percentage of those who answered affirmatively is lower than those who responded negatively (43.6% vs. 54.6%), which shows that

in general, the employees of accounting departments are well trained in the use of accounting software.

Table 7. The perceived usefulness of accounting staff training in the use of accounting software

<i>Company size</i>	<i>Agree (%)</i>	<i>Disagree (%)</i>	<i>Total (%)</i>
Microenterprises	57.1%	42.9%	100.0%
Small enterprises	22.2%	77.8%	100.0%
Medium enterprises	54.5%	45.5%	100.0%
Large Enterprises	41.7%	58.3%	100.0%
Total	43.6%	56.4%	100.0%

Table 8 shows the perceived usefulness of management training in accounting.

Table 8. The perceived usefulness of management training in accounting

<i>Company size</i>	<i>Agree (%)</i>	<i>Disagree (%)</i>	<i>Total (%)</i>
Microenterprises	42.9%	57.1%	100.0%
Small enterprises	55.6%	44.4%	100.0%
Medium enterprises	63.6%	36.4%	100.0%
Large Enterprises	58.3%	41.7%	100.0%
Total	56.4%	43.6%	100.0%

We see an increase in the percentage of positive responses from 42.9% in microenterprises to 63.6% in the case of medium size organizations and a slight decrease in the case of large enterprises. In general, accounting professionals consider this factor as being beneficial for improving the use of information provided by the accounting information system.

Table 9. The perceived usefulness of computer-use training for managers

<i>Company size</i>	<i>Agree (%)</i>	<i>Disagree (%)</i>	<i>Total (%)</i>
Microenterprises	28.6%	71.4%	100.0%
Small enterprises	33.3%	66.7%	100.0%
Medium enterprises	18.2%	81.8%	100.0%
Large Enterprises	8.3%	91.7%	100.0%
Total	20.5%	79.5%	100.0%

By analyzing data from table 9, we see a decrease in the number of people who believe that the organization of training courses for management in the use of computers will improve the way financial accounting information is used. A possible explanation for this result could be a better training of managers of medium-sized and large enterprises in this area of expertise compared with the management of micro and small enterprises.

Table 10 presents the responses on their perceived usefulness of organizing training courses in the use of the accounting software for management to improve the use of accounting information system in their companies.

We observe a decrease in the percentage of persons who considers this factor to be beneficial from 33.3% in the case of small companies to 8.3% for large enterprises. This could be due to the same factors as in the previous question, namely better training of managers of medium-sized and large enterprises in this area compared with the management of micro and small enterprises.

Table 10. The perceived usefulness of management training in the use of accounting software

<i>Company size</i>	<i>Agree (%)</i>	<i>Disagree (%)</i>	<i>Total (%)</i>
Microenterprises	14.3%	85.7%	100.0%
Small enterprises	33.3%	66.7%	100.0%
Medium enterprises	27.3%	72.7%	100.0%
Large Enterprises	8.3%	91.7%	100.0%
Total	20.5%	79.5%	100.0%

4. Organizational factors

The organizational factors that were taken into account by this study were: a better collaboration between the accounting department and management and a better collaboration between accounting department and other company departments.

The influence of a better collaboration between the department of accounting and the management of the enterprises is presented in table 11.

Table 11. The perceives usefulness of a better collaboration between the accounting department and management

<i>Company size</i>	<i>Agree (%)</i>	<i>Disagree (%)</i>	<i>Total (%)</i>
Microenterprises	57.1%	42.9%	100.0%
Small enterprises	44.4%	55.6%	100.0%
Medium enterprises	45.5%	54.5%	100.0%
Large Enterprises	41.7%	58.3%	100.0%
Total	46.2%	53.8%	100.0%

The highest percentage of positive responses is recorded in the case of microenterprises (57.1%). This is somewhat surprising because of the interpersonal relations that should exist in small organizations. In other categories of enterprises the percentage of positive responses is relatively constant and slightly below the percentage of negative responses.

Table 12. The perceived usefulness of a better collaboration between the accounting department and other departments of the enterprise

<i>Company size</i>	<i>Agree (%)</i>	<i>Disagree (%)</i>	<i>Total (%)</i>
Microenterprises	14.3%	85.7%	100.0%
Small enterprises	22.2%	77.8%	100.0%
Medium enterprises	54.5%	45.5%	100.0%
Large Enterprises	50.0%	50.0%	100.0%
Total	38.5%	61.5%	100.0%

By analyzing the responses to the question whether a better collaboration between the department of accounting and other departments of the enterprise would lead to an improvement in the use of accounting information by management staff we observe a steady increase from 14.3% in positive responses for microenterprises to 50% in the case of large companies. A possible explanation of this result is that as a company increases in size, the communication between departments is formalized and becomes increasingly cumbersome.

5. Conclusions

This study should be repeated using a larger and more statistically representative sample. It should also be interesting to observe whether the financial and economical crisis has increased the management interest in accounting information.

The factors that proved to be the most promising in improving the use of accounting information in the management of Romanian companies are mainly educational (management and accounting staff training in accounting) and technical (better accounting software). Small sized organizations (micro and small enterprises) could also benefit from using a better IT infrastructure. Large organizations (medium and large sized companies) should improve the collaboration between the accounting department and the other departments.

ACTUARIAL ACCOUNTING OF THE IMPLICIT OBLIGATIONS. CONCEPTUAL APPROACH

Dragne Luminita

Christian University "Dimitrie Cantemir", Bucharest

Lepadatu Gheorghe

Christian University "Dimitrie Cantemir", Bucharest

Actuarial accounting requests that any enterprise should use the projected unit credit method to determine the actualized value of its obligations regarding the benefit and the cost of the current service related to the specific obligations, and, if it is the case, the cost of the precedent services. The projected unit credit method (sometimes known as the method of the benefit proportional to service or the benefit method/ seniority) accepts any period of working as a supplementary benefit unit and measures separately each unit to build a final obligation.

Key words: employee benefit, plan of pension, actuary

JEL: M41

1. Informal practices - involving obligations

An enterprise should account not only its legal obligation, under the formal terms of a defined benefit plan, but also any obligation that arises from the enterprise's informal practices. Informal practices give rise to an obligation, if the enterprise has no realistic alternative than paying employee benefits. An example of a constructive obligation is where a change in the informal practices of the enterprise would cause unacceptable damage to its relationship with employees. Formal terms of a defined benefit plan may permit a company to conclude what is required under that plan. However, usually it is difficult for a company to cancel a plan if employees are kept. Therefore, in the absence of evidence to the contrary, post-employment benefit accounting requires that a company which is currently promising such benefits continue to do so for its employees during the work remaining until retirement. The amount recognized as defined benefit obligation should be the net total of the following amounts:

- (a) the present value of defined benefit obligation at the balance sheet,
- (b) plus any actuarial gains (less any actuarial losses) not recognized,
- (c) minus the cost of any service rendered not yet recognized,
- (d) minus the fair value of plan assets (if any) the balance sheet date, except that obligations are established directly.

Present value of defined benefit obligation is the gross obligation, before deducting the fair value of any plan assets. This Standard encourages, but does not require a company to engage a qualified actuary in measuring any post-employment benefit obligations significant. For practical reasons, a company may require an actuary to conduct a detailed assessment of the obligation before the balance sheet date. However, that assessment results are updated for any significant transactions and other significant changes in circumstances (including changes in market prices and interest rates) from the balance sheet date. An enterprise should recognize the net total of the following amounts as expense or income under the limit, except to the extent that other International Accounting Standard requires or permits their inclusion in the cost of an asset:

- (a) current service cost
- (b) interest cost
- (c) the expected profitability of any plan assets and any reimbursement rights
- (d) actuarial gains and losses, to the extent that they are recognized,
- (e) past service cost, it requires a firm recognize, and

(f) the effect of any curtailments and settlements. Other International Accounting Standards require the inclusion of certain employee benefit costs in the cost of assets, such as, for example, stocks or tangible.

Any post-employment benefit costs included the cost of such assets include the appropriate proportion of the components listed.

2. Recognition and Measurement

The latest cost of a defined benefit plan may be influenced by many variables such as final salaries, employee turnover and mortality, guidelines and medical costs for a funded plan, the investment earnings on plan assets. Ultimate cost of the plan is uncertain and this uncertainty is likely to persist for a long time. To assess the present value of post-employment benefit obligations and current service cost that is necessary:

- (a) apply an actuarial valuation method
- (b) attribute benefit to periods of service, and
- (c) actuarial assumptions to make.

3. Actuarial valuation method

An actuarial valuation method for companies to use the projected unit credit method to determine the present value of defined benefit obligations and their related current service cost and, where applicable, past service cost. Projected Unit Credit Method (sometimes known as proportional method for employee benefit or service as the benefit per year of service) recognize each period of service as giving rise to an additional unit of benefit and measures each unit separately to build the final obligation. Undertaking a fully updated post-employment benefit obligation, even though part of that obligation is due within twelve months of balance.

4. Periods of service award benefits

In order to determine the present value of defined benefit obligations and related current service cost and, where applicable, past service cost, an enterprise should attribute benefit to periods of service, using the formula for calculating benefits plan feature. However, if an employee's service in recent years will lead to a significant level of benefit than in earlier years, an enterprise should attribute benefit on a straight-line basis, from: (a) the date when service employee first leads to benefits calculated as planned (whether or not benefits are contingent additional services) to (b) the date when the additional services rendered by the employee will not lead to significant value and additional benefits based on the plan, other than additional growth salary. Projected Unit Credit Method requires an undertaking to award benefits for the current period (to determine the present value of benefit obligations determined). A company that is awarded benefits periods required to provide post-employment benefits. This obligation arises from conduct by employees in exchange for services post-employment benefits which an enterprise expects to pay in future reporting periods. Actuarial techniques allow an enterprise to measure that obligation with sufficient firmness to justify recognition of a liability. Employee service gives rise to an obligation under a defined benefit plan, even if benefits are conditional on future employment (in other words, they are not legitimate). Employee service before the investment gives rise to an obligation that, at each successive balance sheet value of future service, which an employee has done it before entitlement to benefit is reduced. Likelihood that particular event takes place affects the measurement requirement, but does not determine whether or not it. The obligation increases until the date the employee's service increment will not lead to significant value added benefits. Therefore, all benefits are attributable to periods ending on or after that date. Benefits attributed to individual accounting periods, benefit plan formula. However, if the service rendered by an employee in recent years will lead to a significantly higher level of benefit than in earlier years, a company awarded benefits on a straight-line basis until the date the employee's service increment will not lead to significant values Additional benefits of.

5. Assumptions

Assumptions must be unbiased and mutually compatible. Assumptions are best estimates of the variables that will determine the ultimate cost of providing post-employment benefits for a company. Assumptions include: (a) demographic assumptions about future characteristics of current and former employees (and those that depend on them) that are eligible for benefits. Demographic assumptions take into account the following: mortality both during and after employment, employee rotation rates, disability and early retirement, the proportion of dependent members participating in the plan, to be eligible for benefits, and compensation rates under medical plans; and (b) financial assumptions, which take into account the following aspects: update rate, future salary and benefit levels, in case of medical benefits, future medical costs, including, where relevant, the cost of administering claims and benefit payments, and the forecast rate of reimbursement plan assets. Actuarial assumptions are unbiased if they are not providing free or only conservative. Actuarial assumptions are mutually compatible if they reflect the economic relationship between factors like inflation, increasing wage rates, return on plan assets and discount rates.

Actuarial assumptions: discount rate

Discount rate used to discount post-employment benefit obligations (both funded and unfunded) should be determined by reference to profit on the market at the balance sheet, high quality corporate bonds. In countries where there is no market interest in such bonds, the market should be profit (balance sheet date) for government bonds. Currency and term corporate bonds or government bonds should be consistent with the currency and estimated term post-employment benefit obligations. One actuarial assumption which has a significant effect is the rate update. Update rate reflects the time value of money, but not on the actuarial risk and investment. Moreover, the discount rate does not reflect the company's specific credit risk, risk that occurs due to its creditors, or the risk that future experience differs from actuarial assumptions. The discount rate reflects the estimated time of benefit payments. In practice, a firm that often made using a convenient single average discount rate reflects the estimated time, the benefit payments and the currency in which benefits are paid.

Assumptions: salaries, benefits and medical costs of post-employment

Benefit obligations should be valued on a basis that reflects:

- (a) estimated future salary increases,
- (b) the benefits set out in terms of the plan (or resulting from any obligation in excess those terms) at the balance sheet and
- (c) estimated future changes in the level of any state benefits that affect the benefits payable under a defined benefit plan, if and only if: either those changes were enacted before the balance sheet or experience or other credible evidence indicates that those state benefits will change in a predictable manner, for example, aligns with future changes in general price levels or general salary levels.

Estimates of future salary increases take account of inflation, seniority, promotion and other relevant factors such as labor supply and demand. Assumptions do not reflect future benefit changes that are laid down in formal terms of the plan (or the implied obligation) at the balance sheet. Such changes will be to:

- (a) past service cost, to the extent that they change benefits for service before the amendment, and
- (b) current service cost for periods after amendment, to the extent that they change benefits for service made by amending.

Some post-employment benefits depend on variables such as level of state pensions or free healthcare. Measurement of such benefits reflects expected changes in such variables, based on

past experience and other credible evidence. Assumptions about medical costs should take account of changes in estimated future healthcare costs, resulting in both inflation and specific changes in medical cost level and frequency of claims, in particular, depends on age, health and sex workers (and those dependent on them), and can depend on to other factors such as geographic location. Therefore, historical data is adjusted to the extent that all demographic population differs from that used as the basis of historical data. Historical data are also adjusted where there is credible evidence that historical trends will continue.

Actuarial gains and losses

In benefit obligation assessment, an enterprise should recognize a percentage of gains and losses as income or expense if the cumulative unrecognized actuarial gains and losses at the end of the previous reporting period exceed the maximum of:

- (a) 10% of present value of defined benefit obligation at that date (before deducting plan assets),
- (b) 10% of the fair value of plan assets at any time.

These limits must be calculated and applied separately for each defined benefit plan. Gains and losses resulting from increases or decreases may be the present value of defined benefit obligation or the fair value of any related plan assets. Long term gains and losses may offset one another. Therefore, estimates of post-employment benefit obligations are best viewed as a range (or corridor) around the best estimate. An enterprise is allowed, but it is not required to recognize actuarial gains and losses that fall outside that line. Standard “employee benefits” requires a company to recognize a specified minimum percentage of gains and losses that fall outside the “corridor”;; plus or minus 10%. The standard allows also systematic methods of faster recognition, provided that those methods satisfy the requirements. Such permissive methods include, for example, immediate recognition of all actuarial gains and losses that are both inside and outside the corridor, explaining the need to consider any unrecognized part of an interim obligations in accounting for subsequent actuarial gains.

6. Conclusions. Recognition and measurement: plan assets. Fair value of plan assets

Fair value of any plan assets is deducted in determining the amount recognized in balance. When a price is not available commercially, the fair value of plan assets is estimated, for example, by updating the projected future cash flows using a discount rate that reflects both the risk associated with plan assets and the maturity or date of exit for those forecasting assets (or, if they have not matured to extinguish the obligation period associated). Plan assets exclude enterprise fund contributions payable associated report and any transferable financial instruments held by fund. Plan assets are reduced by any liabilities of the fund that do not relate to employee benefits, for example, trade and other debts, and liabilities resulting from derivative financial instruments. Where plan assets include qualifying insurance policies that satisfy the full amount, and when some or all benefits payable under a plan, fair value of those insurance policies should be the present value of obligations associated.

DIVERSITY OF NATIONAL AND INTERNATIONAL ACCOUNTING PRACTICES: THE CASE OF INTANGIBLE ASSETS

Dragu Ioana- Maria

Babeş- Bolyai University, Faculty of Economical Sciences and Business Administration

Although seven years have passed since the Norwalk Agreement has been signed, the global accounting standards continue to represent a goal for IASB and FASB, being far from the stage of practical implementation. More than that, the financial crisis made things worse, as it contributes to the unfavourable conditions for the development of convergence process. But despite all these negative elements, FASB and IASB continue to collaborate in obtaining a single set from the two distinct accounting regulations, which can serve for practical accounting purposes. The globalization phenomena imply the existence of a unique set of financial reporting standards. Thus, accounting diversity is to be reduced at international level, so that it would be in accordance with companies' interests. Therefore, one can state the importance of harmonizing both national and international accounting regulations.

Keywords: comparability, harmonization, similarity, diversity

M41

1. Introduction

The term of intangible assets may have different meanings, depending on the nature of accounting reference. If we consider the international standards (IAS 38), there are three conditions or criteria for intangibility: identification, non-monetary and non-physical substance forms. The Romanian accounting regulation (OMFP 3055/2009) extends this definition, by mentioning that intangible assets are to be used in the production process or goods and services supply, as well as for rent to third parties or for administrative purposes. Beside this difference, there are many others, including elements of recognition, valuation and depreciation. The aim of this paper is to identify and thus present the concept of intangibles through both national and international perspectives. In what concerns the practical approach, we study the similarity and differentiation with respect to IAS/IFRS and OMFP 3055/2009. In addition, we have chosen a sample of 50 companies listed at London Stock Exchange for which we measured the harmonization degree using Pearson Coefficient, as H Index and Taplin's Index or E(H).

2. Methodology of Research

When determining the harmonization degree, we use measurement systems for both formal and material levels. In what concerns formal harmonization, it can be established by computing Jaccard Coefficients that stand for the correlation and association between national and international accounting regulations. The other main part of the research consists of material harmonization. This results in using the option concentration analysis, and this means including H Index and E(H), in order to obtain a synthesis of the harmonization degree at practical accounting level. According to national and international accounting standards, intangible assets contain some peculiarities with respect to similarity as well as diversity degree, recognition methods, valuation and depreciation. Therefore, Jaccard Coefficients represent the most suited elements for illustrating the comparability of IFRS and RO GAAP regulations. Regarding the firm practices comparability, it evolves from statistics analysis. Thus, we determined H Index as well as Taplin's Index. In addition, our research is based on a sample of 50 companies with FTSE 100 stock index that stands for the relevance of analysed data.

3. Literature Overview

Many scientists have signalled an evolution in accounting standards, by underlying their relevance as well as professional judgment and future orientation. There is a need for a simplified accounting system, based on historical information and transactions (Rieger, 2006). Further on, we should adopt reconciliation at reporting level, by reducing diversity and thus increasing harmonization. Chand and White (2007) describe harmonization as being the process through which contradicting accounting rules are decreasing and finally it results a better comparability of financial reports. This paper underlines certain aspects regarding formal and material harmonization. When measuring the diversity between two elements we use Jaccard similarity coefficient, so as to obtain the compatibility degree of two accounting systems (Georgescu & Co, 2009).

The analysis of optional concentration implies the usage of H Index and E(H) or Taplin Index. Van der Tas (1992) has conducted some research in the field of material harmonization degree, demonstrating the importance of these indicators, that can be successfully used in determining firm practices comparability. For instance, H Index and E(H) can be determined for a group of companies, randomly selected, by computing the frequency of accounting methods usage, as well as the relative frequency. In addition, the indicators should have a value between 0 and 1, indicating the harmonization level. According to some researchers, it seems that H Index comes from an idea launched by Hirsch, who sustained the existence of H publications as a set of articles written at high performance standards. These “high performance publications”, are known in literature as “Hirsch Core” (Thompson, 2009:2). Nowadays, H Index continues to be a subject of interest for many scientists. Egghe L. (2010) mentions in his paper on information technology the influence of adding or eliminating sources belonging to H Index. Another recent study, this time conducted by Fiorenzo Franceschini (2010), explains some peculiarities and limits of this indicator, as well as the situations when it is not used in a proper manner.

Thus, we can estimate that H Index will become an objective measure of comparability of national and international accounting practices in the near future.

4. Study on Accounting Regulations Comparability: IAS 38 Intangible Assets and OMFP 3055/2009

4.1. Comparability for Regulations- Jaccard Coefficients

Figure no. 1: Accounting regulations analysis and coefficients computation

	IFRS	RO GAAP	S_{ij}	S_{ij}	D_{ij}	D_{ij}
A) Recognition						
-Setup costs	0	1				
-Development costs	1	1				
-Goodwill	1	1	0.67	0.67	0.33	0.33
-Brands	1	1				
-Licenses	1	1				
-Clients' lists	1	0				
B) Valuation						
<i>B1) Initial valuation</i>						
-Acquisition cost	1	1	1		0	
-Production cost	1	1		0.75		0.25
<i>B2) Revaluation</i>						
-Book value	1	1	0.5		0.5	
-Value after revaluation	1	0				
C) Impairment						
<i>C1) Determination models</i>						
-Impairment testing	1	0	0.5		0.5	
-Amortization	1	1		0.625		0.375
<i>C2) Amortization methods</i>						
-Linear	1	1	0.75		0.25	
-Digressive	1	1				
-Accelerated	0	1				
-Production units	1	1				
TOTAL				0.68		0.32

The above figure presents the accounting treatments according to international regulations or IFRS and Romanian regulation or RO GAAP. The notation system involves using the score “1” and “0”. Thus, we give “1” point if the accounting standard allows the usage of a certain treatment, while denoting with “0” the case when the treatment does not occur. The formulas for the coefficients are: $S_{ij} = a / (a + b + c)$, $D_{ij} = (b + c) / (a + b + c)$, $S_{ij} + D_{ij} = 1$.

4.2. Interpretation of results

The results from the computations show a similarity degree (S_{ij}) of 50% for both *revaluation of intangibles* and *models of impairment determination*. On the other hand, in what concerns the *recognition stage methods* and *amortization methods*, the level of diversity (D_{ij}) is very low and common methods are predominant in 75% of the cases, respectively 67%. These phenomena could be explained by the frequency for recognition options or the one for amortization methods. If in the first situation there were four common elements (*development costs, goodwill and licenses*), the issue of *amortization* implies a single set of methods (*linear, digressive and production unit*), which is representative for IFRS as well as RO GAAP. In what concerns the *initial evaluation*, national and international accounting regulations contain the same methods. Thus, in this situation, the diversity degree is zero, while recording a maximum similarity. Therefore, through the previous analysis, we have delimited three main cases. The first refers to the one in which Jaccard Coefficients are different and includes intangible assets *recognition* issues as well as *amortization* methods, as part of impairment. In the second case we can observe a minimum diversity point for *initial evaluation*, while the last one corresponds to a medium similarity degree.

For each of the three main issues discussed in this paper (recognition, valuation and impairment), we find the average of diversity and similarity degrees. The values of 32%, respectively 68%, or total averages, corresponding to the last row of the table, were computed as sum of the previous mentioned averages, divided by three. When calculating the average for Jaccard Coefficients, by considering the importance and thus weight of the three issues as being equal, we obtain a value of 68% for similarity, which means that there is a harmonization tendency in what concerns intangibles.

5. Study on Accounting Practices Comparability for FTSE 100 companies

5.1. Analysis of financial reports for the chosen companies

Figure no. 2 was developed using the same notations as in the previous analysis of Jaccard Coefficients.

5.2. Interpretation of results¹¹³⁹

The first element of our analysis consists of intangibles' *recognition*. In what regards *set up costs*, 49 companies do not use them. *Development costs* and *brands* are used by most of the firms (94%, respectively 98% usage degree). Further on, we can observe that all the 50 companies use goodwill and licenses as accounting treatments, generating a maximum level of harmonization of 100%. By calculating E(H), we obtain similar results, which leads us to the idea of harmonization tendency. Regarding *valuation at acquisition cost*, both indicators show 100% harmonization degree. In contrast, only 38% of the companies value their intangible assets at production cost, although when computing E(H) the level of harmonization overcomes the medium threshold. In case of *revaluation*, 90% of firms use *book value* and the accounting treatment of *value after revaluation* has an H Index of 0.5, which implies that there is a large group of companies not using it. Concerning *impairment of intangible assets*, most companies use the same treatment, the majority of them choosing *linear amortization*. For all the issues regarding impairment, the indicators values exceed 0.8, demonstrating the harmonization of accounting practices.

Finally, if we compute the average for H Index and E(H) for every accounting treatment, we obtain 0.82, respectively 0.91. In addition, we consider them having equal weights. The values are very close to 1, so that we can state the image of harmonized accounting practices for the listed companies.

The results of our analysis show a high level of harmonization degree for intangible assets, and in some cases we can even find perfect similarity between international standards.

The formulas for indexes are: $H\ Index = n p_i^2$, $E(H) = n p_i^2 + n p_i * (1 - p_i) / n$, for $i = 1, n$.

¹¹³⁹ This section applies to results obtained in Figure no. 2: Indexes Computation.

6. Conclusions

On the basis of theoretical background and quantitative research, we can underline the tendencies of both convergence and harmonization processes in what concerns national and international regulations, as well as accounting practice of the analysed companies.

Through this study, we aimed to present the concept of intangibles from national and international perspectives. The practical approach involved a research in the similarity and differentiation with respect to IAS/IFRS and OMFP 3055/2009 as well as in accounting practices. The latest assumed a study on 50 listed companies for which we measured the harmonization degree.

In the first part of the research, we investigated the harmonization level corresponding to the national and international accounting standards. Thus, the findings imply three main aspects: different Jaccard Coefficients for *recognition* and *amortization methods*, minimum diversification level in case of *initial valuation* and the medium similarity degree of *revaluation* and *impairment determination models*.

The average for Jaccard Coefficients, calculated for the whole accounting treatments, show a harmonization tendency in what regards the intangible assets.

The second part of this paper relies on measuring the comparability degree of accounting practices corresponding to the companies from the analysed sample. Therefore, we determined H Index and Taplin Index or E (H) for the accounting treatments and options, and finally we computed an average of these indicators.

Further on, the obtain results suggest the following: a high level of harmonization for *recognition* of intangibles, a tendency to reconciliation for valuation of these assets, as well as common practices concerning impairment.

THE MODERN PRACTICE OF INTERNAL AUDITING IN THE CONTEXT OF THE GLOBALIZATION

Enache Tasica-Daniela

"1 Decembrie 1918" University, Alba Iulia

Ștefan Petre

"1 Decembrie 1918" University, Alba Iulia

Ducu Corina

"1 Decembrie 1918" University, Alba Iulia

Perhaps no one has ever before discussed in such a concerned and intense manner in Romania about an activity which, in the West, internal auditors have had in view for a longer period of time and it has been are very useful to them in the specific internal audit activities.

If 20 years ago the Romanian companies' financial activities were part only from the accountants' duties, now the internal and external linkages of the economic units are too complex to be managed only by the accounting departments.

Various activities have appeared around accounting, such as Controlling and Auditing that connect it with strategic management.

Keywords: globalization, internal auditing, business environment, global economy, auditors.

Cod JEL: H83

Management responses to global competition have included the improvement of quality and the initiatives of risk management, the reorganization of the structures and processes, as well as a greater accountability. But all these need more time, trust and relevant information for the decision making process.

Organizations also struggle to enforce the most efficient governance structures and processes. In such a climate, there is no surprise that the internal auditing function is viewed as the most qualified profession which helps the good government process and supports the key governance processes: monitoring the controls, assessing the operational efficiency of these management strategies and initiatives.

Since the internal auditing profession has become much stronger, it has rapidly responded to the new requirements imposed by the regulations of the legislation as well as by the content of the international reports: the issuing of the Report of the National Commission of Fraudulent Financial Reporting (Treadway Commission Report, 1987); the Report of the Sponsoring Organizations Committee (COSO), of the Treadway Commission (COSO, 1992), as well as, subsequently, the internal control frameworks outlined in the Cadbury Committee Report (Cadbury Report, UK); Control Criteria Committee (COCO Report, Canada, 1995); and the recent changes in the rules of the New York Stock Exchange regarding the structure and constitution of the Board of Administration of the listed companies, plus the requirement that all publicly listed companies have an internal auditing function.

The Sarbanes-Oxley Law of 2002 and the appeals for better corporate governance.

However, to take advantage of this huge wave in the demand for their services, the internal auditors need a repertoire of skills, attributes, but also competencies considerably improved, they must properly increase the position and profile of the organization and to align adequately, within them with the respective organizations.

Ratliff & Reding offer expanded responsibilities and the qualifications set of the 21st century auditor, as follows¹¹⁴⁰: 21st century auditors must be prepared to “audit” almost everything: operations (including control systems), performance, information and information systems, compliance with the legislation, the financial positions, fraud and quality.

First, internal auditing is a new vision on the control of using the public funds and the administration of public property in the sense of extending the control’s sphere of interest beyond the strictly financial-accounting area.

Secondly, internal auditing, although it is an ex post control, provides a continuous monitoring of the system operation, especially in the field of underlying the decisions of performing the operations which employ the money or the public property.

Thirdly, it leads to performing a maximum convergence between the objectives pursued by different forms of internal control at the level of public institutions, the very fact that these forms and internal control structures are the object of internal auditing.

Fourthly, it is a real negative feedback mechanism for the Ministry of Finance as well as for the other public institutions for which such a control structure operates.

Fifthly, it helps changing the control mentality from the field in the sense of directing its analysis and evaluation effort towards the control aspects and variables of the analyzed system: the operation manner of the managerial decision, the interpersonal collaboration of the workers within the system, the way of assuming the future, the risk management manner. This will lead in the future to the detachment of control from conformity, which will remain control through exception (including the preventive financial control) from the performance control that will become a broader and broader area.

In addition, auditors must understand the concepts of independence and objectivity as concepts that refer to different types of audits practiced by different types of auditors. They must fully understand the material implications and costs of the risk and audit evidence.

In the late 1990s, partly as a result of the research studies sponsored by the I.I.A., as well as the numerous articles published in the I.I.A. magazine, “*The Internal Auditor*”, I.I.A. has recognized a fundamental need to assess the principles that govern the profession, of the guidance and of the basic knowledge relevant to skills and abilities.

Behind the strategy document issued for this purpose by I.I.A. “A vision for the future”¹¹⁴¹ there were several goals: the increase of the economic value of internal auditing; the constant assurance of high quality internal auditing and gaining a higher consciousness of the market towards the internal auditing.

The report issued by I.I.A. conducted a review of the existing professional standards, of the code of ethics, and even of defining the notion of internal auditing. The I.I.A. Committee concluded that the old terminology has failed “to properly reflect the evolution of the practice and to efficiently promote the internal auditing profession on a competitive market”.

The new definition of internal auditing is designed to fit the expansion of the role and responsibilities of the profession: “Internal auditing is an independent and objective activity that gives an organization an assurance regarding the degree of control held on operations, it guides it to improve its operations and contributes to adding value. Internal auditing helps this organization to achieve its objectives by evaluating, through a systematic and methodical approach, its risk management, control and company management processes, making proposals to improve the effectiveness”¹¹⁴².

¹¹⁴⁰ Ratlif. R.L.. AND K.F. Reding, *Introduction to Auditing: Logic, Principles, and Techniques*, Altamonte Springs, FL: The Institute of Internal Auditors, 2002, p.11

¹¹⁴¹ Report of the Guidance Task Force to The I.I.A.’s Board of Directors – *A Vision for the Future: Professional Practices Framework for Internal Auditing* (Altamonte Springs, FL: The Institute of Internal Auditors, 1999).

¹¹⁴² International Standards for the Professional Practice of Internal Auditing, I.I.A., 2004, p.1

Through the deep analysis of the definition we identify that it encapsulates the purpose, but also the challenges for modern internal auditing, marking a substantial progress as compared to other definitions previously stated, being rather a perfectible definition than a perfect one because it contains besides the essential positive aspects some negative ones as well.

Among these positive aspects there are the following:

- Reference is made to the independence of the auditing structure and of the auditor;
- The role of the internal auditing is expanded by emphasizing its “counselling” function, going even further and suggesting to the auditor to bring a substantial contribution to the management of the organization;

Among the weaknesses of the definition the following issues can be found:

- The word “activity” is used to describe the role of internal auditing, instead of “function”, given that an activity is less complex than a function, a fact which places its person in charge on a subordinate position.

- The reality that “internal auditing is exercised within an organization” is not specified. The definition emphasizes that *auditing creates plus-value*. They are specialists in the field who support the idea that the plu-value of the internal auditor is not his auditing report, this being merely a means of communication. The value consists, in the specialists’ opinion, in the auditor’s ability to make the organization prosper. The auditor is therefore creator of value through the savings it generates, the opportunities it creates and the losses avoided as a result of its activity.

Analyzing the impact of “fattening the globe”, experts say that externalization, globalized trade, chain supply chain and the political forces have permanently changed the world into a better one but also into a worse one, and the accelerated growth pace of globalization has and will continue to have a growing impact on activities¹¹⁴³. In this context, the best example is related to the current financial crisis which has as its starting point the U.S., but its repercussions, especially because of this phenomenon of globalization, can be seen in the world as well.

The globalisation of the financial markets and the financial innovations in the context of some poor regulation (or lack of them) and of the interest conflicts, can create the prerequisites for a financial crisis on an international scale, the crisis that economy is now facing. The measures to fight it are numerous, generating much debate among the top decision makers in the U.S. or the EU. Emphasis is placed on cooperation between the supervisory authorities, at the same time analyzing the causes that have generated this crisis. The origin of the financial crisis must be sought in the effects of the huge cross-border capital flows and of the more extensive use of financial instruments/derivatives (such as bonds securitization), which are neither transparent nor actually transacted on the markets. Consequently, the financial markets have become, in many areas, more and more opaque, and the identification of those who have taken risks and the evaluation of these risks have become almost unattainable goals.

The international economic growth through the new or expanded markets and the “hunt” of the foreign suppliers offering the lowest costs create a unique set of problems for the multinational companies, according to a study conducted by specialists¹¹⁴⁴. Among the most common:

- The savings from Brazil, Russia, India and China (known under the acronym of BRIC¹¹⁴⁵) have created a new order on the world markets. China and India in particular, will be the most powerful economic centres, even by 2012.

⁴ T.L. Friedman, *The Dell Theory of Conflict Prevention*, Editura Barclaz Barrios, Boston, 2008, p.49.

⁵ Price WaterHouseCoopers, *Audit Intern 2012 (Internal Auditing 2012)*, A study which examines the future of internal auditing and the potential decline of the control-based approach.

⁶ The BRIC or BRICs acronym refers to the developing economies with rapid growth in Brazil, Russia, India and China. The acronym was proposed in 2001 by Jim O’Neill, head of the global economic research department at Goldman Sachs, and developed in his book “Dreaming with BRICs” in 2003. He claimed that since they are rapidly developing countries, by 2050, the combined BRIC economies could eclipse the combined current economies of the richest countries in the world. These 4 countries comprise over 25% of

- The increase of outsourcing and a development of the offshoring and manufacturing services have made the global distribution chains to be more interconnected and more vulnerable, thus creating the financial market volatility.

Research shows that a significant and growing trend will have an impact the internal auditing, present and future. In the context in which organizations are expanding to take advantage of the global markets and of the supply chains, internal auditing faces a new demand of needs for these services and increasing responsibilities. Experts say that “it is only about speed and fluidity when taking advantage of globalization. Offshoring (moving your business from one place to another) is easier than ever, the joint-venture¹¹⁴⁶ type activities frequently take place and change is a constant in the present environment. To meet these challenges, companies must develop governance processes that are able to respond to changes”.

The opinion of internal auditors of large multinational companies is that the risks associated with the expansion towards the global markets could be quite difficult to identify and assess. Inexperienced internal auditors are likely not to understand the need to allow the adequate support to the global aspirations of the organization they work for.

The cultural aspects have been designated as an important topic, internal auditors becoming aware of the need to be attentive to how people think and act in China, India, and other areas with key partners in the marketing activities.

According to the apostles of the globalization theory, we have entered a new era of interdependence, in which stateless corporations go beyond their national boundaries driven by a new technological revolution and facilitated by the new information systems. From this perspective, the national state is an anachronism, the capital flow is unstoppable, and the world market is the one which determines macroeconomics.

The opinions expressed by advisers to the countries with less developed systems and civil servants with no experience in internal financial control practiced in public institutions refer to the fact that internal auditing should be introduced and developed in a differentiated manner in these countries.

The approach of implementing the same model both in the organizations from the developed countries and in the developing ones may be inadequate and even dangerous, leading to losses.

The pressure to change the role of internal auditing partly comes from exerting the profession of internal auditor and from the management, both looking for new ways to add value to the internal auditing function and to reduce the costs simultaneously. The philosophy of internal auditing born based on these views has strongly influenced the overall approach to internal auditing, which was adopted worldwide.

At present, for many developing countries, there is a significant difference in terms of stimulating the reform.

EU is a direct example in this context, of what can be done to improve the understanding of public sector management including the public financial control in those countries wishing to join the EU.

the inhabited area of the globe, 40% of the world population and hold a combined GDP of 15,435 trillion dollars. Almost at every scale, there would be the largest entity from the global arena.

These four countries are among the largest emerging markets with the fastest growth. Source: Wikipedia

⁷ Joint venture represents a contractual agreement through which more people agree to undertake an economic activity subject to a conjugate (concomitant) control. The control of an economic activity is conjugated when it is exercised, collegially, by virtue of a contractual agreement. None of the entrepreneurs is able to control, unilaterally, the company's joint venture-type activity. Such a control may not appear in companies with one shareholder. The conjugated control does not mean that all the decisions of the joint venture company be taken unanimously. The contractual agreement can distinguish decisions that require the approval of all contractors and those that can be taken by a determined majority. Source: Online Legal Dictionary Rubinian: <http://www.rubinian.com>.

The improvement of internal auditing should be seen as complementary to the improvement of management. Management must understand that internal auditing is a tool of it and to respond accordingly.

The effective internal auditing may exist if there are appropriate circumstances, and if they do not exist then one can have a little faith in the internal auditing. In particular, there must be a real willingness at the highest political level in order to achieve the progress in ensuring that the resources are directed towards those areas where the political decisions show that they should be. This should be a capacity of management.

For the developing countries receiving international aid, a financial condition required is that there is a strong budgetary system with clear political objectives, the political objectives should be aligned with the poverty reduction strategy. A second condition targets the accounting system. This is equivalent to the traditional role of ensuring that the existing proper financial records are done correctly. An effective accounting system should place each record chronologically.

With these two conditions met, the internal auditor may have ensured the raw material that he can process.

The internal auditor should ensure, as much as possible, that fraud and corruption, but also other abuses of funds, are minimized. This involves the internal auditor in looking for the insurance, with the support of management (the support being essential) to:

- the budget is comprehensive both concerning the expenditure and the revenue and that it meets all the legal requirements;
- the accounting system is effective and provides on time the information that management requires to manage the budget;
- the variations between the budget and the actual expenditures are properly reported and approved;
- the payrolls are accurate, the “ghost” employees are eliminated and, as employees, they are given the fair wages;
- the purchases are made in a manner that serves to minimize corruption;
- the revenues are properly assessed, the payments and returns are completed correctly.

This does not mean that the internal auditor should verify each document. This remains the responsibility of the management. What the auditor is responsible for and must do is his involvement in these systems enough to ensure that the requirements for these systems are met. This should be the minimum expected by the management of the auditing plan, and then to react to the findings from the internal auditing report. Through this process, the internal auditing work program is actually established.

Even if these limited objectives are nevertheless met, we believe that the training of both management and internal auditors is necessary for:

- Internal control practices management;
- Internal auditing management and the linkages with it;
- The internal auditors, in the basic auditing techniques;
- The internal auditors to enable them to gradually work in systems based on more sophisticated approaches.

It is assumed that this process takes time. It must be also noted that internal auditing is not a mechanical activity issued with light rules under regulations and procedures.

Successful internal auditing requires imagination and the ability to think “outside the system”.

In simple terms, the key role of the internal auditor in countries with a weak public sector should focus on the role of financial probity and on the financial regularity.

Based on an understanding of how the contemporary organizations function and on the relevant influences, the internal auditing function and its activities will be discussed from various perspectives in the following chapters of the internal auditing field.

In our opinion, we believe that these perspectives will provide a richer understanding of the context of the internal auditing function and its activities in the modern organizations and, thus, it

helps generate basic and applied research questions that are of interest for both the academia and for practitioners.

CRITICAL DEVELOPMENT OF COSTING METHODS USED IN THE FURNITURE INDUSTRY, IN THE CONTEXT OF ECONOMIC REALITY SPECIAL XXI CENTURY.

Ene Dumitru

Valahia University of Targoviste, Economics Faculty, Doctoral School,

In the current economic downturn in the furniture industry companies, to face competition, requires new costing methods to succeed, in a flexible manner, fructifying market information, inside to find levers to identify places, resource intensive activities and then cost reduction opportunities. New methods of management cost excess the accounting and economics scope Current economic situation requires this work and converts the cost information into the main tool of insurance competitiveness and profitability of the company. Applying the standard cost in single cost model is a viable business solutions of enterprises in the furniture industry to face strong competition from European Union, specifically in the context of complex economic XXI century.

Keywords: cost, value, performance, costing system, efficiency;

JEL Cod: M 41

1. Introduction

The enterprises of the furniture industry is placed in a competitive environment, in the value chain between suppliers, on the one hand and distributors or customers on the other. External tensions who acting on it must be taken within its. To face competition companies allocate more and more research resources for research, to achieve quality products that require obtaining additional authorization. Harmonization with European standards of quality, environmental protection involves additional costs will be reflected in the indirect costs of the enterprise. Further, their share will increase in relation to total expenditures and their allocation will be made on products that are found most. This development of costs resulting from the need to launch the marketing of new products, new technologies of need to communicate with the external environment, highly complex and dynamic, which requires great efforts to adapt.

In these circumstances companies in the furniture industry to face competition requires new methods of costing. They rely on the use of techniques who involving in their quest a large number of specialists and changes in many of enterprise functions. In countries like USA, Japan, France this problem was solved by applying methods that meet current requirements as the method ABC (Activity Based Costing)-the process cost approach, the method target costing, value engineering analysis, UVA method. By implementing advanced management accounting methods to provide increased management control over the rational use of resources, proper allocation of their consumption on objects of calculation, optimizing the production process and use information as necessary to end users.

2. The impact of cost calculation methods on Operating results

Comparative studies of the results obtained by applying different methods of costing shows that the Operating results is influenced by policies and methods applied by enterprises, namely: costing method, method of inventory valuation, depreciation system practiced. Calculation method chosen has a direct impact, measurable, and one indirectly. Directly affects, the method of calculation affects income, the value of stored and fixed production (in charge of production), as and size of finished goods stock. Indirectly the influence manifests itself through the sale price, when it was based on cost. The Cost calculation errors affects enterprises performance in both variants possible: when is higher, respectively lower than the actual consumption of

resources. When the full cost is set at a level higher than normal, the price will be higher than its competitors, which will affect the competitive advantage and competitiveness of enterprise. When the full cost is set at a level lower than normal, exists the risk that the sale price does not lead the necessary margin to normal undertaking and the enterprises to operate at a loss. Also, how to "guidance" of consumption to the balance or profit and loss account significantly change the results of the company.

3. Advantages and disadvantages of using the method on orders in the furniture industry

As advantages of method on orders, identify [1]:

- the method is suitable economic context that has emerged: that of labor productivity growth mechanized companies;
- the method is adapted to work in the stable universe, because the average unit cost is calculated based on information obtained in previous years, on the "stock";
- is a tool for establishing long-term policy, because the full cost (return) is the first information used in setting the retail price (before linking with the market price and the price of competitors);
- *Can be used in evaluating tangible and intangible assets, works property built by enterprises themselves;*
- *can be used together with assessment methods based on variable costs and eliminate the incidence of changes in activity by attributing rational practice of fixed costs.*

However, in the deep economic crisis by passing both furniture enterprises, as well the environment they operate, the cost information provided by traditional method lose their relevance. *The lapse of that cost calculation model is given by changes in business environment but also the practices of firms.*

As critics of the method generated by change the economic context can remember:

- products are not homogeneous, there are a wide variety in how they consume resources;
- need to provide products and special orders, not manufactured in homogeneous series homogeneous;
- various activities and tech make impossible the existence of some homogeneous;
- decreases share of production costs for distribution, R & D and other support activities;
- reduced share of indirect costs to direct, using a single arbitrary allocation bases leading to erroneous results;
- multiplying the cost variability criteria (or, in other words, increasing fixed costs relative to production volume);
- order cost calculation system there is no explanation to obtain the production cost, but the cost-value optimizing various cost items.

4. Modern costing and the impact on measurements performance in the furniture industry

Enterprise management involves measuring costs and performance and their management. For performance measurement is calculated projected costs (standard or exanthema) and compared with realized costs (real or expost). The conditions that characterize the current global economic environment, the most important objective of an accounting system costing seems to be able to estimate involved total product offering.

The stakes of the full cost calculating are high: performance assessment at the centers of responsibility, highlighting the effect of "chain" in case of cuts in processes and activities, assess the financial accounting, decision making on products, customers and activities.

A modern management characterized by the fact that *performance and accountability that are global, collective, and costs must be integrated within the concept of value, involves the use of computer systems and performance measurement.*

4.1. Pros and cons arguments of using standard-cost calculation method

Standard-cost method has its genesis in SUA where appeared in 1901 under the name "Estimated cost system"(The pre-calculated cost), promoting first cost is determined before construction start. Standard cost has an pre-calculated cost to assess the performance over a certain period of time ."Trough Estimated cost system" was transformed in 1918 in "Standard cost accounting" (Standard cost calculation).[2]

The idea that the cost is a function of many factors has transformed the cost calculation in main objective of planning enterprise profitability. In this context, the standard cost is considered as a normal cost of production, and calculation of actual cost of products is no longer necessary. Favorable or unfavorable differences between actual and standard costs are deviations from normal manufacturing conditions, affecting company results for that period. In our country, Implementing Regulation Accounting Law states that, the standard or normal cost method is to determine in advance to the manufacturing of products both direct costs and those indirect grouped into fixed and variable, contained in the cost of production form antecalculation. By adding or subtracting deviations at the standard cost resulting the effective costs obtained production. It is noted that the Romanian version the deviations do not affect financial results.

Thus the positive points of the method can enumerate:

- *simplicity* - the standards are not influenced by short-term changes and are not reversed only when no longer reflects reality;
- *speed* - no need to wait to collect relating information to unit cost;
- *decisions* - *facilitate the application of coercive measures following calculating deviations.* Standards can be the basis for determining sales prices and allow performance evaluation of an entire component units;
- turning to production standards starting and calculating a regular manner deviations allows awareness at financial implications of of failure rules. *They facilitate the development of budgets, forecasts and incentives and simplifies the process of costing*[3];
- *can use management by exception*: managers will be contacted only when needed, to record significant deviations (exceptions);

In our view, the main conceptual advantage is increasing the accountability of staff, *orientation towards a "managerial attitude" (in the sense of Druker).*

Obviously that approach *method has drawbacks*, among which we mention:

- *implementing the method requires a long time* and the process is slow because it radically change existing habits and organization structures; standards must be substantiated and supported by staff;
- *standards must be accessible, but also ambitious.* However, the standard should not be very flexible because change milestone not allow accurately assess performance;
- *the method triggers conflicts regarding responsibility for deviations*, especially when the limits of responsibility centers are not very clearly defined and there are interactions between products and services;
- *standards are difficult to establish and watched in the field of intangible activities* (research-development, marketing, training);
- *causes high costs of implementing and adapting to changes.*

4.2. Adjustments to the standard-cost method

Following critics to the standard cost, he suffered a restriction of its application in several companies. Still others have preferred to adapt to the new system [4] :

- reduce the importance of standards and deviations relating to labor;
- manifests itself more strongly the importance of analysis based on machine hours, support services costs, product quality, production cycle;

- increasing importance inducers cost: the cost management system focuses on inductors and the number of hours-car number changes;
- advanced management accounting systems implementation requires moving attention at the unit-level costs for non unit-level costs and the growing importance of controlling overhead costs;
- need to obtain high quality and zero defect target, under JIT implementation.;
- eliminating costs that do not add value;
- shortening product life cycle;
- adoption of non-financial measures in operational control;
- Benchmarking's development as a way to control costs and increase efficiency-continuous search of the best ways to accomplish tasks through constant comparison methods and their performance with other firms or other parts of the same company;
- adoption of information systems in real time: a production system based on computer use allows the analyst to collect information even during the production process and draw up in real-time reports on the size of performance indicators. Allow thus rapid elimination of deviations.

4.3. Standard-cost method in the base model - single cost: direction of improvement of Management Accounting and Calculation Cost in furniture enterprises

Standard cost method is classified as forecast calculation methods and operational tracking of the production process allowing the establishment of production costs in advance before the start of production and making budget control actual costs against the default, on the kinds of irregularities and cases, while deployment of the production process. In this way, it offers undeniable advantages of studying and analyzing intelligence on the line of production efficiency, can meet such an important function for modern enterprise management, that the investigation and prediction tool and is therefore a valuable tool for the decision.

According to the concept of this method, unit production costs must be calculated in advance, using for this purpose preset sizes. While carrying out the production process is organized operative tracking of expenditure that gives rise to that, by comparison with standard costs, to establish the irregularities on places of spending and on the causes, so as to make the budgetary control of costs. In the original conception of standard cost method no longer have to calculate the actual cost, because the standard cost is considered scientific cost and at the same time, real, reason for any deviation the actual Costs from Standard-Costs is regarded as a deviation to normal and as such should pass directly into financial results. Still not exclude the possibility of calculating the actual costs of production achieved. This is done adding, or, subtracting of the standard-cost a deviations taken from management accounting which will track not only on places the costs and causes, but also on products. Calculation model is as it follows:

$$Cu_e = \frac{Cts \pm A}{Q} \quad \text{that,}$$

Cu_e = is the effective unit cost;

Ct_s = total Standard-cost;

Q = quantities produced.

The main work that involves the application of the standard cost method is:

- developing the standard calculation by product;
- Calculating, tracking, analysis and reporting standard deviations for control budget;
- Management Accounting organizes in terms of application of Standard-cost method.

Standard-cost method has the advantage of calculate labor rationalization, as the standard unit cost determined in advance is considered real cost and therefore not calculated the actual cost of finished products and production in progress at the end of each management period, and deviations are regarded as deviations from normal and pass directly into the company's financial results. The finished product and that in progress may settle at the cost standard. This feature but not removes the possibility calculating the actual cost of time to time, by distributing deviations to the finished product and production deviations in progress by conventional criteria, such as, for example, report that standard costs of production.

Another advantage of the standard-cost method and that cost is that although the concept is based on total costs using the classification of costs production into direct and indirect, it uses and classification of costs into variable and fixed production, allowing cost analysis compared with output and calculation of specific indicators direct-costing method, namely the equilibrium point optimal activity, the coverage factor, coefficient and interval safety, required for making based scientific decision.

A main feature of the standard-cost method consists *in the existence of an adequate operational comparison between actual expenditure and that pre-established taken as the baseline.* The application of Standard-cost method, the standard version single cost leads to increasing the practical value of accounting information and, implicitly, to improve the organization of economic activities. All this results in a better foundation costs budgets and, consequently, establish benchmarks as well to express the normal conditions of industrial activity.

Management based on predetermined size as the standard-cost method *corresponds to the principle of objective-based management and accounting gives in its quality of providing useful information decisions and corrective action , a major importance.*

In these conditions, accounting becomes the industrial enterprises, a useful tool for management, enterprise management, as its main mission is not to determine the cost of production, but to check if it determined in advance, was respected leaders sectors. In this way, management accounting can make tracking and control of classification in provisions of the budget and can provide expenditure information on the level of expenditure production.

Standard-cost method aims, mainly, to increase the role of production costs in ensuring achievement of the objectives in directing and good function of the company. *The main purpose of such calculations is to provide operational information needed to budget, evaluate, coordinate and control the activity or enterprise.*

Starting from the role and place of management accounting information in the modern, application of standard cost method gives it a matter of expediency, given the leverage in the process of preparation and decision making to trigger corrective action.

The standard-cost method replaces the simply operations of collecting and recording the actual data, to compare them to the end of the management period to achieve the commands method used in furniture industry enterprises, by providing an analytical character, operational and information predicting that their exploitation *to increase the efficiency of future activity.*

A prerequisite for the practical standard-cost method, besides the existence of a scheme sufficiently comprehensive scientifically based standards, is the existence of a well-developed techniques and operations production programming. This implies requires the existence a corresponding level of the organization of production, and a high degree of knowledge and explanation of economic and technological factors of production for all products and, especially products and new technologies.

Organization in good conditions of primary documentation on the expenditure and production cost calculation, and proper organization of records deviations from standards are also necessary prerequisites for adopting this management accounting and cost calculation method.

Considering the advantages and disadvantages of each of the three variants of standard-cost accounting organization, **I think the alternative that best meet the management needs of furniture enterprises is the standard version single cost.** This option enables for establishing

effective costs deviations from the standard costs during the unfolding process of production, costs of calculation articles and on causes, which facilitates cost effective budgetary control and decision making at all high levels of command. This also eliminates workload caused by the operation of in progress production inventory, whereas the recording system of consumption and production obtained in accounts only standard cost calculation, it is to determine the accounting method.

5. Conclusion

As a synthesis of research results I appreciate the following:

- **cost is a synthetic indicator reflecting efficiency of planning systems, record and control.**

It is measured by total consumption related to production of product, conditioned of technology and production organization, so it is designed to evaluate the product produced at a concrete stage of the production process;

- each enterprise must acquire modern management techniques to insure formation one adequate information system of a specific activity carried. Market economy requires this action, and transform *cost information into the main tool to ensure competitiveness and profitability of the furniture enterprise;*

- choosing the most appropriate costing methods in an enterprise leads to the fulfillment of two major goals: *to ensure the issue of improving quality information and user operations, control them and adding a value.*

- the costing method on orders, which are used in the furniture industry enterprises, has a number of drawbacks and *is not oriented to meet the management accounting function:* getting accurate information on the cost of manufactured products, ensuring the efficiency of the structural subdivisions of manufacturing production;

- *Using Standard-Single Cost Method, applied in conjunction with direct costing method in enterprises in the furniture industry in Romania is a direction of improving managerial accounting.*

In conclusion, it can be said that this paper has addressed a complex topic research and interest, **as improving methods of costing and managerial accounting is probably a viable solution to companies in Romania to cope with strong competition from EU Europe, in complex economic context, particular XXI century.**

COMPARATIVE INTERNATIONAL PERSPECTIVES ON MARKET-ORIENTED MODELS OF CORPORATE GOVERNANCE

Niculae Feleagă

Voicu D. Dragomir

Liliana Feleagă

The Faculty of Accounting and Management Information Systems

The Academy of Economic Studies of Bucharest, Romania

Balaciu Diana

University of Oradea

Faculty of Economic Sciences

The study of corporate governance requires not only the knowledge of economic, financial, managerial and sociological mechanisms and norms, but it must also incorporate an ethical dimension, while remaining aware of the demands of various stakeholders. The interest towards good governance practice is very present in the company laws of many countries. National differences may lead to specific attributes derived from the meaning that is given to the role of competition and market dispersion of capital. Based on a research consisting of a critical and comparative perspective, the present contribution is dominated by qualitative and mixed methods. In conclusion, it can be said that a market-oriented corporate governance model, though not part of the European Union's convergence process, may very well respond to the increasing importance of investors' rights and to the gradual evolution of corporate responsibilities, beyond the national context, with the aim of ensuring market liberalization.

Keywords: corporate governance, comparative approach, international evidence, United Kingdom, European Union convergence, financial markets, agency theory

Cod JEL lucrare: G3

1. Introduction

Corporate governance is a subject that is notoriously difficult to define in one sentence. Some view corporate governance in the narrow sense, dealing with the structure and functioning of the boards of directors, and their relationship to management. This narrow definition is the one often found in corporate governance codes and the *OECD Principles of Corporate Governance*, issued in 2004. A broader definition includes a company's relationships with shareholders, especially in organisations with concentrated ownership. Finally, academic studies dealing with governance broaden the definition to all internal relationships within a business, including the issues raised by the conduct of shareholders, especially institutional investors, the functioning of the general meeting and the company's relationship with the financial markets (Wymeersch, 2006).

No matter how complex the concept of corporate governance is, it can be eventually reduced to a simple formula by which to optimize its primary objective, the creation and distribution of wealth. Company law and the authorities regulating the financial markets are trying to formulate this optimization equation, thereby helping to design the rules by which to achieve a balance between various interests of corporate stakeholders. The different legal systems of the European Union are engaged in a convergence process: in each Member State, companies are properly functioning due to the harmonization of capital, personnel structures, sales and production opportunities. Conceptual differences relate to several aspects: the shareholders' involvement is connected to the postulate that managers are primarily appreciated for pursuing the investors' interests rather than those of other stakeholders, i.e. the degree of protection for employees and

creditors.

The local characteristics of economic entities are strongly rooted in national culture, which induces crucial features that are resistant to change. Whereas some EU Member States grant a certain privilege to the property rights of investors, a majority of countries in continental Europe are placing a particular emphasis on factors of a social nature. The issues outlined above are deemed to motivate a comparative approach to corporate governance systems. Such comparative analysis leads to the identification of two major models: one derived from a liberal approach, under which the company is considered the property of shareholders, and a second model, articulated on the financial and economic peculiarities of the Rhineland area. The latter acknowledges the fact that the enterprise is a social community dominated by solidarity expressed by all its members, (i.e. the actors of the agency theory: the principal – the shareholders – and the agents: the managers, employees and, generally, all other stakeholders). Supplementing the example of the social model and analyzing the cases of Germany, France and Japan, we find that large commercial banks, insurance companies and the governmental institutions play a dominant role in this system of governance, beyond the fact that these three major instances of economic power are backed up by the presence of financial markets. The gradual evolution of business beyond its national context is a commitment to provide market liberalization. The framework of globalization imposes the existence of an international benchmark for multinational companies. Many entities are striving to reach an optimal size, allowing them to achieve economies of scale which are necessary for better performance and increased foreign market presence. Therefore, the European economic environment is getting more and more accustomed to takeover bids which grant the transfer of economic control from smaller entities to larger conglomerates.

2. The analysis of market-oriented corporate governance

In order to analyze the events that have taken place since the second quarter of 2000, and taking into account their influence on corporate governance systems, it is possible to see further steps in the improvement of these systems, namely the institutional components and the way the agents concerned are involved. The two steps must be combined, since reducing institutional integration is a fundamental component of the profile and actions of the corporate agents. However, both the behavioral and institutional failures could be examined for each of the drivers of corporate governance system. In this respect, one could examine not only the corporate components involved but also the supporting elements, whose purpose is important in corporate governance. Some of these components bear the attribute of adjusting devices (Pérez, 2009).

If an entity's manager is also its creator and sometimes its major shareholder, the mechanisms of governance are either quasi-inexistent, either strictly peripheral. The opposite situation, when the investors' engagement leads to the formation of large companies managing a considerable fortune, is placed in the area of considerable success. In other words, to the extent that individual success can be easily explained, large enterprises have as sole concern not to be a barrier for independent development that would lead to the flourishing of new successful investment. This continuous monitoring of independent action in the context of financial markets clarifies the purpose of the securities commissions, i.e. the prevention of misleading interpretations, as it has been observed, for example, in the Microsoft case. However, the results are diametrically opposite when there is a separation between the managers and the legal rights expressed by business owners.

Two fundamental elements, both well established as American values, can be highlighted in this context. Firstly, the culture of entrepreneurship enables the managers to achieve their investments goals when confronted with new challenges related to shareholders' requests. Secondly, the primacy of property rights leads to the setup of several governance mechanisms designed to ensure that the owners are not harmed and that the entity's activities are conducted to their advantage. These two developments are more or less compatible, but they definitely lie within the

larger picture of political, ideological and cultural values of the American economic environment. They justify the implementation of specific corporate governance systems in the United States, considering the multiple facets of different historical periods under consideration.

The media implications of stock evolutions in the last decade and the increasingly significant involvement of financial analysts have led to the expansion of managerial opportunism which, in some cases, was a major driver towards the entities' bankruptcy. Some cases of accounting and auditing fraud became heavily publicized, i.e. Enron and Worldcom. The long-term vision of the company implies a strategic direction of a rational nature, leading to an enhanced performance of the entity. Profitable choices will thus contribute to improving the competitive situation for a larger market share or group of companies, primarily aimed at reducing the risks of all activities of that group. Legal representation in the short-term derives from the fact that shareholders have fixed contractual links with the entity and, as such, they can easily give up the capital they have committed. In the event of resale, the costs shall include any losses of value (when the sale price is less than the purchase price) and transaction costs (costs incurred during the buying and selling of shares). Shareholders will aim at improving financial indicators (cash flow, earnings per share), and will not take into account other indicators which point to increasing the long-term performance of the entity (Finet, 2005).

3. International perspectives on corporate governance models

The manager has a significant role in the debate concerning corporate governance because she/he is a major player in the economic process that aims at creating and distributing value. Agency theory in a formal sense originated in the early 1970s in the United States, but the concepts behind it have a long and varied history. Among the influences are property-rights theories, organization economics, contract law, and political philosophy, including the works of Locke and Hobbes. Some noteworthy scholars involved in agency theory's formative period in the 1970s included Armen Alchian, Harold Demsetz, Michael Jensen or William Meckling.

Agency theory raises a fundamental problem in organizations: a corporation's managers may have personal goals that compete with the owner's goal of maximizing shareholder wealth. Since the shareholders authorize managers to administer the firm's assets, a potential conflict of interest exists between the two groups. Countries with more concentrated ownership structures often have majority shareholders who significantly influence the board. Consequently, an 'agency' conflict arises between controlling 'majority' shareholders who may extract private benefits at the expense of minority owners. In the UK and US there is an emphasis on creating wealth for shareholders. That said, while approaches may differ, there is global appreciation of the OECD's generic corporate governance principles of responsibility, accountability, transparency and fairness.

Studying the models of corporate governance in various countries allows the determination of differences between Anglo-Saxon countries, where financial markets have a strong position, and countries belonging to Continental Europe where financial structures are a mix of three elements: bank financing, market-oriented capital and governmental intervention.

Corporate governance practices in the **United States** are not regulated by any one particular statute but instead are affected by the governing instruments, the corporate law and the court decisions of each issuer's state of incorporation, and, in the case of many publicly-owned issuers, by the U.S. federal securities laws and requirements of the national securities markets. Matters governed by state law include the voting rights accorded to shareholders, the functions of the board, and the ability of board members and executives to enter into transactions with the company. U.S. federal securities laws also affect corporate governance practices, primarily in the areas of disclosure and financial reporting, proxy voting, and the submission of shareholder proposals for consideration at shareholders' meetings. In addition, the national securities markets impact corporate governance practices through their requirements applicable to issuers of securities traded on their markets. Subject to all of these different laws and regulations as

applicable, corporations may establish their own governance practices in their corporate charters and bylaws. Stakeholders in a U.S. company may participate as shareholders (e.g., through employee stock ownership plans) and through service as directors. In the United States, the rights of stakeholders are established by a variety of laws, such as labor law, contract law and insolvency law. If their rights as established by these laws are violated, stakeholders can obtain effective redress through the courts and, in some cases, administrative agencies.

British incorporated companies listed on the UK Stock Exchange are subject to the Combined Code on Corporate Governance. The most recent (2008) version of the Code combines the Cadbury and Greenbury reports on corporate governance, the Turnbull Report on Internal Control (revised and republished as the Turnbull Guidance in 2005), the Smith Guidance on Audit Committees and elements of the Higgs Report. The changes which have taken place in British corporate governance over the past decade, both in the composition of boards and in the behavior of institutional investors, have been incremental rather than radical, and fall well short of the systemic reform which some observers believe is necessary. The Cadbury Code is a global landmark achievement in terms of financial governance, by encouraging listed company with generally recognized “best practices” in accordance with the comply-or-explain principle (Feleagă et al., 2009). British corporate governance is often described as a system of control by outsiders, rather than the insider control system which – at least until recently - has prevailed in Germany. This reflects, among other things, the larger role which the stock market plays in Britain and a different ownership structure. Germany has fewer publicly quoted companies than Britain, and most of them have at least one large shareholder who is represented on the supervisory board and takes a close interest in management decisions.

The **German** corporate governance system is different from that of the Anglo-Saxon countries insofar as it is based on the notion that it is possible, or indeed necessary, to integrate lenders and employees into the governance of large corporations. German corporate governance is shaped by a legal tradition that dates back to the 1920s and regards corporations as entities which act not only in the interests of their shareholders, but also have to serve a multitude of other interests. A narrow orientation toward shareholder value in the sense of an exclusive commitment of management to shareholders' interests is still not part of German business culture, nor is it in line with actual practice or with the law (Charkham, 1994). The German corporate governance system is generally regarded as the standard example of what Franks and Mayer (2001) have called an insider-controlled and stakeholder-oriented system. The past decade has seen a wave of developments in the German corporate governance system. Two of the factors which drive the evolution of financial systems in general, and specifically of national corporate governance systems, are European integration and globalization. It is often argued that these factors expose countries to the pressure of adopting a ‘good’ corporate governance system, and very often a good system is assumed to be one that comes as close as possible to the capital market-based Anglo-Saxon model of a financial system and the outsider-controlled model of a corporate governance system.

Following the publication of the two Vienot reports in July 1995 and July 1999, **France** now has a very extensive set of rules of corporate governance, promoting both efficiency and transparency. The aim of a corporate governance revolution in France was improving the workings of company bodies for management or the supervision of management, in particular the audit committee; the adequacy of accounting standards and practices; the quality of financial information and communication; the effectiveness of internal and external controls (by auditors and regulators); relations between companies and the various categories of shareholders; and the role and independence of various other market players, such as banks, financial analysts, ratings agencies. In the case of France, a broadening of corporate ownership has led to the opening of the Paris stock exchange to foreign investors and major. For some, it became necessary to reform the legal framework in order to impose greater transparency in the field of corporate governance. The internationalization of corporate ownership in French companies lead to the convergence of

reporting practices on matters such as proxy voting and shareholders' rights. In France, the debate on corporate governance sprung out of the financial market's opening to foreign and domestic investors. Broadening the ownership of the companies resulted in a request for greater transparency and the need to accommodate investors' expectations.

The working hypothesis is that the disclosure of accurate and timely information by the issuers of securities builds sustained investor confidence and constitutes an important tool for promoting sound corporate governance throughout the **European Community**. To that end, it is important that listed companies display appropriate transparency in dealings with investors, so as to enable them to express their views. The Council and the diverse Committees opted, in company law regulation, to provide for a framework for competitive business. This calls for flexible rules and forms of rulemaking, for light regulatory regimes where possible, scope for party autonomy and for less cumbersome and burdensome procedures. The system of harmonising company law through Directives - that have to be implemented by Member States - may have led to a certain 'petrification'. Simultaneously however, the "shelf life" of law tends to become more limited as society is changing more rapidly, and company law is no exception. Fixed rules in primary legislation may offer the benefits of certainty, democratic legitimacy and usually strong possibilities of enforcement. But this comes at the cost of little or no flexibility, and disability to keep pace with changing circumstances. EU Directives are in practice even more inflexible than primary legislation. That is the reason behind the diversity of legal instruments concerning corporate governance, when it comes to the binding power of each type of instrument.

In this respect, takeover bids are a threat to uncompetitive managers and an efficient mechanism to create shareholder value. However, in the **European Union**, Member States are reluctant to give a greater say to shareholders in the context of takeover bids. To prevent this from happening, the Takeovers Directive was adopted on 21 April 2004 and lays down, for the first time, minimum EU rules concerning the regulation of takeovers of companies whose shares are traded on a regulated market. The Takeovers Directive is one of the measures adopted under the EU Financial Services Action Plan. It aims to strengthen the Single Market in financial services by facilitating cross-border restructuring and enhancing minority shareholder protection.

4. Conclusions

The corporation has been the object of scientific research since the first decades of the 20th century. Professional management and dispersed ownership have driven the corporation into becoming the major form of business organization, mostly because it is believed that it favours a better allocation of resources. However, the classical theory that shareholder value maximization is the ultimate corporate goal has been challenged by the proponents of stakeholder theory, who argue that the satisfaction of corporate constituencies is of primary concern for managers and directors (Dragomir & Ungureanu 2009).

The institutionalization of mass shareholding through the involvement of investment funds has led to the development of a new perspective on corporate governance. The rise in the proportion of people's savings through acquisition of financial instruments has turned the attention of larger social groups to the principles of corporate governance and to the issues of shareholder value protection. On the other hand, a transnational and liquid capital market is an easy target for speculators and short-sighted investors. The last two decades of the 20th century have witnessed a series of bubbles and market contractions easily attributable to an 'irrational exuberance' (Greenspan, 1996).

In conclusion, corporate governance is intimately connected to the effect of strategic decisions on value creation (Pérez, 2009). Considering that managers are the authors of any corporate policy, the process of value maximization is almost entirely their responsibility. Within a market-oriented model, the role of corporate governance is to use various incentives and control mechanisms tailored to align managerial behaviour to the interests of shareholders. Shareholder primacy cannot be separated from the economic paradigm of the stock market; hence, the stock

market has a primordial role in the disciplining of managers and in reducing agency costs, thus creating value for the stakeholder society at large.

DATA CAPTURE : THE KEY TO DETERMINING HOW MUCH TO HEDGE

Iancu George

Academy Of Economic Studies Bucharest

The key to using forex hedging to effectively manage your foreign currency risk is to capture accurate forex exposure information. The collection and evaluation of data on foreign currency transactions can be broken down into three areas: Recorded assets and liabilities on the balance sheet Firm commitments (binding third-party contracts) . Highly probable future (forecasted) transactions Once you have captured this data, you can determine the hedging ratio on your future foreign exposures.

Keywords : cash flow , fair value, hedging , forex , OCI .

Cod JEL lucrare: M 41

Other comprehensive income is the difference between [net income](#) and [comprehensive income](#) and represents the [certain gains](#) and losses of the [enterprise](#). It is commonly referred to as "OCI." In practice, it comprises [five] general items:

1 Unrealized Gains and losses on [available for sale securities](#) as required by Statement of Financial Accounting Standards No. 115 ("FAS115") - "Accounting for Certain Investments in Debt and Equity Securities"

2 Gains and losses on [derivatives](#) held as [cash flow hedges](#) as required by Statement of Financial Accounting Standards No. 133 ("FAS133") - "Accounting for Derivative Instruments and Hedging Activities".

3 Gains and losses resulting from converting foreign currency subsidiaries to the parent currency as required by Statement of Financial Accounting Standards No. 52 ("FAS52") - "Foreign Currency Translation", and

4 Minimum [pension](#) liability adjustments, as required by Statement of Financial Accounting Standards No. 158 ("FAS158")- "Employers' Accounting For Defined Benefit Pension And Other Postretirement Plans".

5 Unrealized gains and losses from a foreign currency hedge of a net investment in a foreign operation as required by FAS133.

Data Capture: The Key to Determining How Much to Hedge

The key to using forex hedging to effectively manage your foreign currency risk is to capture accurate forex exposure information. The collection and evaluation of data on foreign currency transactions can be broken down into three areas:

1. Recorded assets and liabilities on the balance sheet
2. Firm commitments (binding third-party contracts)
3. Highly probable future (forecasted) transactions

Once you have captured this data, you can determine the hedging ratio on your future foreign exposures.

Capturing Data on Recorded Assets and Liabilities

Companies need to collect and review data on foreign currency exposures (foreign currency assets and liabilities) generated from their accounting systems (accounts receivable, accounts payable, and so on), a task that becomes more challenging if there are multiple systems deployed. Ideally, this data capture should be automated through financial system inquiry programs that produce appropriate summary reports for determining hedging amounts. A review of the foreign exposure data is a prudent business practice because erroneous journal entries may have been

posted to the general ledgers. Once this data is collected and reviewed, the organization can implement its hedging program, reducing the percentage hedged based on an assessment of the risk that the data capture was susceptible to error.

Capturing Data on Firm Commitments

Firm commitments are binding agreements with third parties. Information on firm commitments is included in the methods and procedures for capturing your financial commitments as disclosed in the financial statement notes and your purchase order system. Typically, the data capture exercise entails a process of identifying signed third-party agreements and managing this information. One of the challenges in this area of data capture is the need to properly segregate how the firm commitments are included in the foreign currency forecasted transactions. Firm commitments typically offer the ability for the company to choose between using a cash flow forex hedge or a fair value forex hedge, while forecasted transactions may only use cash flow hedges. Under both the cash flow and fair value hedges, the change in the effective portion of the forex hedge is recognized on the income statement at the same time at which the gains and losses from the hedged foreign currency item impacts earnings. However, the administration of tracking the impact of the hedged items on earnings is sometimes easier when using a fair value hedge. For example, if you are hedging a foreign currency purchase of raw materials, which are used in the production of finished products, it will be more challenging to administer the accounting entries related to when the cost of raw materials (bought and sold to third parties) impacts the earnings.

Under a cash flow hedge, the impact to earnings is recorded in the OCI account and transferred to earnings when the inventory is sold to third parties (not when it is sold to a subsidiary). However, under a fair value hedge, the accounting will be easier to administer since the fair value of the raw materials will be adjusted for the effective portion of the fair value hedge. Since the impact is included directly in the raw material cost, the impact to earnings will occur whenever the third-party sale of the finished products takes place as part of the normal accounting entries.

Forex Hedge Accounting Treatment

Capturing Data on Forecasted Transactions

Accurate forecasting is critical to the company's ability to properly hedge an appropriate amount of forex risk. To improve forecasting techniques, consult with the purchasing and sales departments, and ask members of the budgeting department how accurate their prior forecasts were. To help manage the forecasting risk, consider reducing the hedging ratio (percentage to hedge) and designate and execute forex hedges in layers.

Forex Hedging Ratios

Each company will need to develop and review its own forex hedging policy and procedures. Note that forex hedging percentages or ratios can be refined as the data capture process improves. A company may choose not to hedge all of its exposure to certain currencies. For example, it may be prudent to use confidence factors to determine either a hedging ratio or a forecast of foreign cash flow. It may be a wise decision to reduce the forex hedging ratio if there is questionable data capture, at least until the data capture process improves. Predicting future cash flows requires significant judgment skills and considerable estimates of future activity. The forex hedging ratios related to longer-term future cash flows will often be lower to avoid over-hedging a position. If management reduces the forex hedging ratio because it has a certain view about future currency movements, then the company is engaging in speculative behavior (not hedging). Ideally, this activity should be tracked and reported separately to senior management and the Board of Directors.

Scenario 1 (Hedging Ratio Based on Uncertainty)

A Japanese company expects to complete a 10 million euro purchase contract. However, the purchasing department does not have sufficient confidence in this purchase amount, so it recommends a hedging ratio of 80%, and further recommends that any hedging above 5 million euros be in lots. The company hedges one lot of 5 million euros (for the first 5 million euros) and three additional lots of 1 million euros each. It does not hedge the remaining 2 million euros (which is outside of the hedging ratio). If, for some reason, the purchase contract ends up with just over 7 million euros, the majority of the hedging relationships would remain intact and only one lot of 1 million euros would need to be closed out and taken to the income statement. Conversely, if the contract is later forecasted to increase beyond the original 10 million euros, the company could make additional hedges at that later date.

Scenario 2 (Hedging Ratio Based on Speculation)

A U.S. dollar company has exposure to a 100,000 euro receivable that it hopes to collect in 60 days. The current EUR/USD rate is 1.4677/1.4678, but management feels very strongly that the U.S. dollar will drop in value over the next couple of months. In this example, the company could reduce its forex hedging on the known exposure to 75%, in the hopes of profiting from a lower U.S. dollar on the remaining 25%. Alternatively, the company could hedge out the entire 100,000 euro exposure with a spot trade, selling 100,000 units of EUR/USD, in which case any changes in future EUR/USD currency rates would be effectively hedged

To act on their judgement around the USD drop in value, the company could buy 25,000 euros through a EUR/USD spot trade as a separate transaction in their speculation account, thereby profiting from a USD decline over the next couple of months but maintaining a safe hedge on their receivable. To minimize downside risk, the company could place a stop loss order on speculative trades to limit potential loss.

Natural Hedges

The most economical forex hedge is a natural hedge. A natural hedge is where the foreign currency outflow is offset by a foreign currency inflow. However, the natural hedge may be tricky when the timing and amounts of the two cash flows do not match.

Scenario (Natural Hedge)

A British company does a great deal of business in the United States, with many American suppliers and customers. In three months, it has a large shipment worth \$10 million USD due to arrive at a US customer's factory. By coincidence, a shipment of raw materials is scheduled to arrive in Britain from the US at the same time, worth \$15 million USD. Based on past experience, the company has a high degree of confidence that it will receive payment from its US customer within 30 days of delivery, so has timed its payment to its supplier to coincide with this date.

In this scenario, there's a high probability of a natural hedge of \$10 million USD. The company only needs to hedge a \$5 million exposure.

Forex Hedge	Hedge Designation (special accounting treatment)	Documentation and Testing	Forex Hedge FMV (mark-to-market)	Hedged Items	Impact – Effective Portion of the Forex Hedge	Comments
Not designated	None	No special documentation	Hedge FMV on balance sheet- Offsetting entry direct to P&L	Recorded foreign currency assets and liabilities on the balance sheet	The gain/loss on forex hedge and the hedge item's forex revaluation impact to earnings offset each other.	Creates desired effect
				Future transactions (both firm commitments and forecasted transactions)	Protects overall economic value; however, earnings volatility occurs due to mismatch when forex hedge impacts earnings and when the future transaction impacts earnings.	Potential earnings volatility may occur.
Designated	Fair Value Hedge	Upfront documentation, periodic testing of hedge effectiveness.	Hedge FMV on balance sheet- Offsetting entry direct to P&L	Firm purchase/sale commitments (binding contracts)	Change in FMV of underlying firm commitment is recorded on the balance sheet until purchase/sale is made. When purchase/sale is completed, this recorded commitment is reclassified to the purchase/sale amount.	Purchase/sale commitment's change in value recorded on the balance sheet (not usual treatment). Easier to track hedge item's impact to earnings by adjusting purchase amount at time of purchase.
				Recorded foreign currency assets and liabilities in special circumstances. Typically, foreign denominated debt.	Change in FMV of recorded asset or liability is recorded directly to earnings as is the gain or loss on the forex hedge.	Generally designated for situations when the company is hedging foreign denominated debt against changes in foreign currency rates and interest rates.

Forex Hedge	Hedge Designation (special accounting treatment)	Documentation and Testing	Forex Hedge FMV (mark-to-market)	Hedged Items	Impact – Effective Portion of the Forex Hedge	Comments
	Cash Flow Hedge	Upfront documentation, periodic testing of hedge effectiveness. Forecasted transactions must meet definition of high probability.	Hedge FMV on balance sheet-Offsetting entry direct to P&L	Firm purchase/sale commitments (binding contracts)	After the purchase/sale is completed, its impact to earnings must be tracked to determine when to reclassify the amounts in the equity OCI account to earnings. Change in FMV of underlying firm commitment is not recorded.	Cash flow forex hedges must lock in all the variable amounts of the hedged items (i.e., both forex and interest rates). Potentially more challenging to track hedged item's impact to earnings for purchase transactions.
				Highly probable forecasted transactions	After the purchase/sale is completed, its impact to earnings must be tracked to determine when to reclassify the amounts in the equity OCI account to earnings. Change in FMV of underlying firm commitment is not recorded.	Cash flow forex hedges must lock in all the variable amounts of the hedged items (i.e., both forex and interest rates). Potentially more challenging to track hedged item's impact to earnings for forecasted purchase transactions.
				Recorded foreign currency assets and liabilities in special circumstances. Typically, foreign denominated debt.	Change in FMV of recorded asset or liability is recorded directly to earnings as is the gain or loss on the forex hedge.	Generally designated for situations when the company is hedging foreign denominated debt against changes in foreign currency rates
	Net Investment Hedge	Upfront documentation, periodic testing of hedge effectiveness.	Hedge FMV on balance sheet-Offsetting entry direct to P&L	Net investment in a subsidiary	The gain/loss on forex hedge and revaluation of the net investment in the foreign subsidiary would both be recorded in the equity OCI account for foreign currency translation accounts, hopefully, offsetting each other.	Need to assess whether intercompany foreign currency debt is considered to be long term in nature. Depending upon the frequency with which the net investment hedge is updated to reflect current notional exposure, some ineffectiveness may occur.

CLASSIFICATION OF HIDDEN INTANGIBLE ASSETS

Gîju George Ciprian

Valahia University of Târgoviște, Faculty of Economics

In a society in which the market value of a company is given in proportion of 75-85% of the intangible assets, it can be said that the current accounting does not give sufficient relevant information for a company in order to take decisions on long-term. For Skandia, the market value of an organization is given by two components: financial capital and intellectual capital. Accounting for intellectual capital is not exactly easy to achieve, both because of the assessment and viability in the accounting process in view of current legislation. This article aims to show what are hidden intangible assets (intellectual capital), what is their place in the classification of intangible assets, what are the components of hidden intangible assets according to different existing reference models and also the possible solutions such as submission of additional financial situations.

Keywords: intellectual capital; alternative accounting; hidden intangible assets; evaluation; knowledge economy.

Jel code: M41 Accounting

1. Introduction

The global influence of information and the technological changes and communication changes have transformed our society favoring globalization of economy and innovation as key factor to global competition. Lately, economic, political and social environment suffered profound changes which have determined a higher level of globalization and higher competition, passing from the traditional accounting to modern accounting that on which day requires more information.

The evolution from the agricultural age to the industrial age is now very easy to understand. Instead, what is now happening in the new economy has an incredible impact in the process of evolution. New Economy changes everything. Thus, according to a study published recently it can be seen the growing importance of intangible assets:

- In 1978, intangible assets constituted 5% of assets.
- In 1998, intangible assets constituted 72% of assets.
- Today, 75-85% of assets are intangible.

In Europe, the interest in this phenomenon is increased realizing numerous studies financed by the European Commission which include “Mobilizing the intellectual capital in Europe” (2005) and Meritum Project (The Meritum Project - 2002): Guidelines for managing and reporting on Intangibles - Intellectual Capital Report, European Commission.

2. Intellectual capital

In the new economy, intellectual capital is the key factor of competitiveness of an organization and the long term value. Today, as well known, the value is given more by intangible assets than the physical ones. The explanation for the difference between the market value of a company and its accounting value is in its intellectual capital. After Stewart¹¹⁴⁷, intellectual capital is the source of richness for both individuals and organizations for ... and both have it in common.

“What is intellectual capital? It is, defined by a company, <<what exits the gate at the end of the day>> Are people? Company’s know-how? ... It is the sum of ideas, inventions, technologies,

¹¹⁴⁷ Stewart, Thomas A.: La Nueva Riqueza de las Organizaciones: EL Capital Intelectual, 1998, 312.

general knowledge, computer software, projection, techniques for data processing, processes, creativity and publications of the company. Intellectual capital can be simply understood as knowledge that can be turned into benefits¹¹⁴⁸.”

Edvinsson and Malone¹¹⁴⁹ define intellectual capital as the possession of knowledge, applied experience, organizational technology, customer relationships and professional skills that give a competitive advantage in the market.

Nevado and López¹¹⁵⁰ talk about intellectual capital as total assets of a firm, even if not reflected in traditional financial statements, generate or will generate value for the company in the future, and consequence of the issues related to human capital and the structural: the capacity of innovation, customer relations, quality of processes, products and services, cultural and communicational capital, which allows a company or organization to take better advantage of opportunities, giving birth to generation of future benefits.

We also find many definitions of intellectual capital that is related to intellectual capital defined as the sum of its components, and definitions that make reference only to the human aspect.

3. Intellectual capital classification

In order to measure and evaluate the intellectual capital is necessary to know and to understand which its main components are. The distinction between different components of intellectual capital will help us to understand what intellectual capital is and will allow us to apply the concept to strategic and operational level.

In the past years there have been many attempts to make a classification of intellectual capital, but let's take first a view of the classification of intangible assets in general. Nomen¹¹⁵¹ makes a classification of intangible assets according to their utility:

- With unique, superior, nesubstitubile utilities;
- With substitutable utilities (using another asset);

A second classification divides intangible assets in:

- Identifiable intangible assets (separable) and controllable;
- Unidentifiable intangible assets (inseparable) and uncontrolled.

Both may come from acquisition or can be generated internally. The third classification refers to:

- visible intangible assets;
- hidden intangible assets.

Visible intangible assets are those that are legislated in different accounting standards. They may also be identifiable and controllable or not, or whether generated internally or through acquisition.

Hidden intangible assets or intellectual capital are those for which are no accounting standards and they are not listed in the financial statements. These are unidentifiable and uncontrollable, obtained through acquisition of other company or generated internally.

Hidden intangible assets or intellectual capital consists of:

- Human capital;
- Structural capital.

In the following scheme it is presented the classification of intangible assets¹¹⁵²:

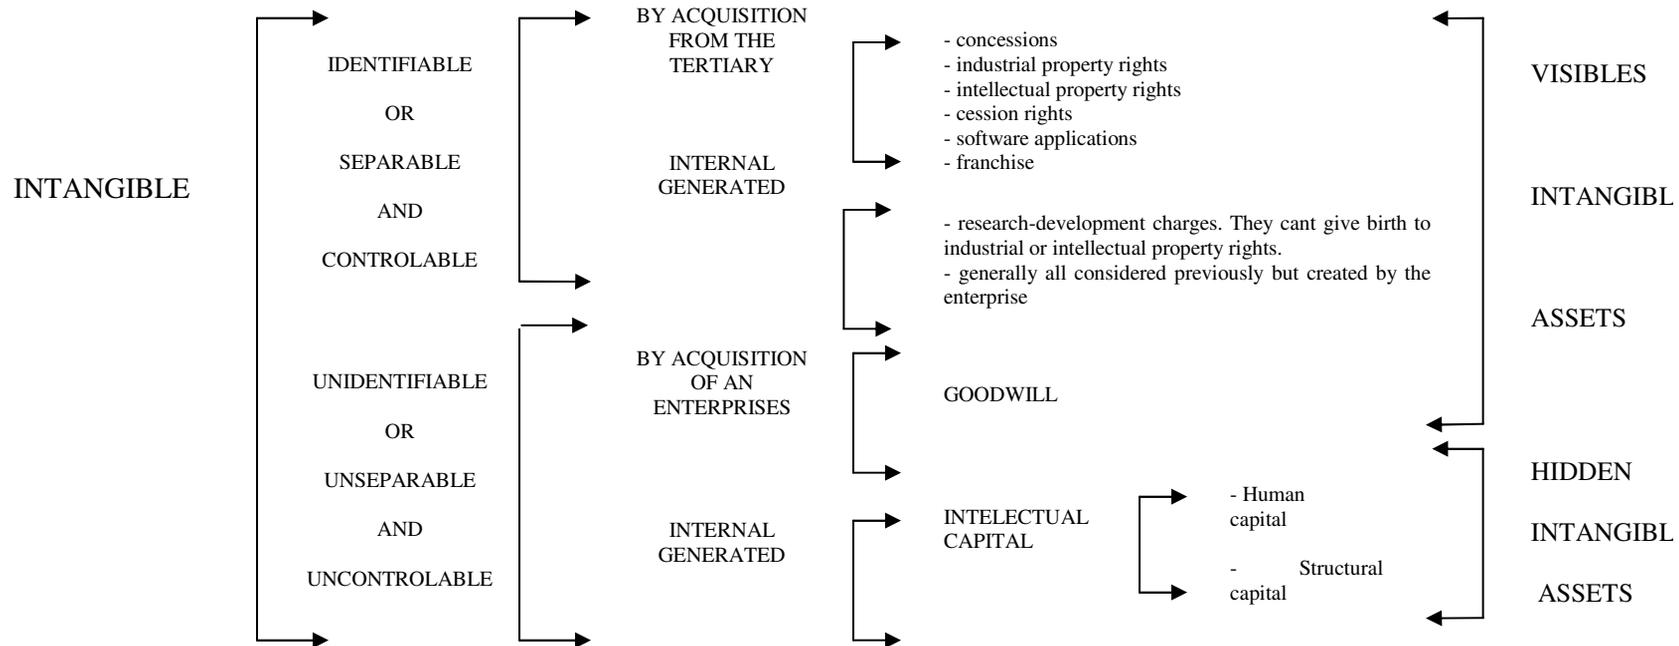

¹¹⁴⁸ Sullivan, Patrick H.: Rentabilizar el Capital Intelectual, 2001, 27.

¹¹⁴⁹ Edvinsson, Leif; Malone, M.S.: El capital intelectual. Como identificar y calcular el valor de los recursos intangibles de su empresa, 1999, 64.

¹¹⁵⁰ Nevado, Domingo y López, Víctor R.: El capital intelectual. Valoracion y evaluacion, 2002, 25.

¹¹⁵¹ Nomen, Eusebi: Valor razonable de los activos intangibles, 2005, 38-40.

¹¹⁵² Nevado, Domingo y López, Víctor R.: El capital intelectual. Valoracion y evaluacion, 2002, 18.

Intangible assets classification¹¹⁵³

¹¹⁵³ Nevado, Domingo y López, Víctor R.: El capital intelectual. Valoración y evaluación, 2002, 18.

Human capital refers to the body of knowledge, skills and training, skills and ingenuity, skill and attitude, learning ability and motivation of individuals who compose the organization. Company values, culture and philosophy are also included in the human capital.

Capital structure may be described as the infrastructure that incorporate, support and qualify human capital and made possible the labor development in the company (programs, databases, organizational structure, patents, trademarks). It also makes reference to customers, the company-customer relationships, organizational processes, management, production and marketing.

Further we follow some of the rankings made by the "parents" of intellectual capital:

1. After Kaplan and Norton¹¹⁵⁴ (Balanced ScoreCard model):

- Human capital;
- Informational capital;
- Organizational capital.

2. For Skandia¹¹⁵⁵ (Skandia Navigator model):

- Human Capital
- Structural capital:
 - Customers capital;
 - Organizational capital;
 - Innovation capital;
 - Process capital.

3. For Brooking¹¹⁵⁶ (Technology Broker model) the intellectual capital of a company shall be divided in:

- Market assets (partly derived from intangible assets related to the market);
- Intellectual property assets (know-how, manufacturing secrets, copyrights, patents, trademarks and service);
- Assets focused on individual (qualifications of persons);
- Infrastructure assets (technologies, methodologies and processes that make possible the company operation)

4. For Stewart¹¹⁵⁷:

- Human capital;
- Structural capital;
- Clients capital.

5. For Euroforum¹¹⁵⁸ (Intellect model):

- Human capital;
- Structural capital;
- Relational capital.

Most authors share the intellectual capital in almost the same groups: human, structural and relational, but with different names and not composing the same items. Most models have developed in recent years of the end of XX century because during this period began to see the importance of intangible assets. It is not fundamentally different regarding the concept of intellectual capital, even if they introduce some new concepts. The models do not assign a financial value to intellectual capital using financial indicators to measure and manage it. The financial perspective is included only in the Balanced Scorecard and not all models explicitly recognize the present / future perspective.

¹¹⁵⁴ Kaplan, Robert S.; Norton David P.: El cuadro de mando integral - The Balanced Scorecard, 2004, 239.

¹¹⁵⁵ Edvinsson, Leif; Malone, M.S.: El capital intelectual. Como identificar y calcular el valor de los recursos intangibles de su empresa, 1999, 73.

¹¹⁵⁶ Brooking, A.: El Capital Intelectual - el principal activo de las empresas del tercer milenio, 1997, 25.

¹¹⁵⁷ Stewart, Thomas A.: La Nueva Riqueza de las Organizaciones: EL Capital Intelectual, 1998, 122.

¹¹⁵⁸ Euroforum: Medición del Capital Intelectual. Modelo Intellect, 1998, 34.

Regarding the classifications, most models divide intangible assets in almost the same components: human capital, structural (organizational) and relational, but with different names and does not integrate the same elements.

In all studied models we find that the human capital is the base of the richness, less in Balanced ScoreCard where it is considered from the education-training perspective and increased staff.

Structural capital (organizational), as is called in most models, we find it in the Balanced ScoreCard as internal process perspective and in Technology Broker as infrastructure asset.

The capital is called relational in Meritum and Intellect models. In Skandia Navigator it is integrated as customer's capital in structural capital and in the Balanced ScoreCard it is considered as perspective customers. It is the most developed part in the intellectual capital. Thus we find it also by the following names: external structure, market asset.

The first report of intellectual capital that has been published as a supplement to the annual accounts of Skandia in 1994 was the "Intellectual Capital View", followed in 1995 by the "Creative Process Value", and in 1996 by "The Power of Innovation".

For Skandia, financial capital and intellectual capital are the 2 elements that define the organization, value which is actually fair value. According to IAS 16 the fair value represents the sum for an asset that might be willing changed between the 2 interested parts within a transaction developed in objectives conditions with objective determinate price¹¹⁵⁹. The intellectual capital is composed of human capital and structural capital:

According to the Skandia "Scheme of Market Value", intellectual capital consists of:

1. Human capital: personal skills, knowledge, skills and experience of employees and staff, organizational culture.
2. Structural capital: "what remains in the office when employees go home" (such as hardware, software, databases, patents), infrastructure that incorporates, forms and sustain human capital:
 - a. Capital customers: customer relations, their satisfaction and loyalty, longevity, sensitivity to price, long-term welfare clients;
 - b. Organizational Capital: Organizational competence and investment in systems:
 - Innovative capital: the capacity for renewal and innovation of new products and services and other intangible assets and used talent for creating and launching new products and services.
 - Processes capital: techniques and programs for employees in order to add value for the enterprise and to increase the efficiency, work processes.

As we can see, Skandia uses both financial elements and non-financial elements in order to establish the market value of a company. The tool measuring, managing and information of Skandia is "SKANDIA NAVIGATOR" that is presented as a home.

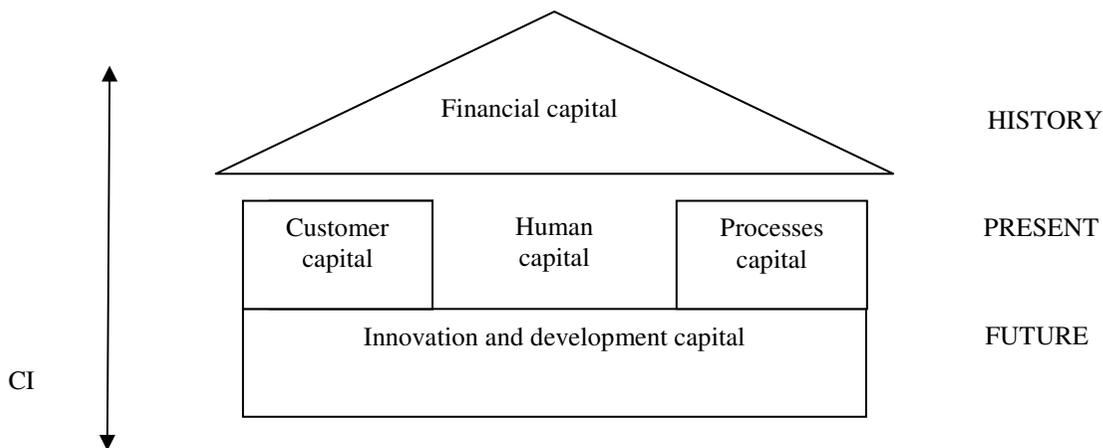

Thus, the triangle above represents the financial point of view (the past of the company - financial statements). The walls of the house represent the present and they include customer and market processes and the foundation is the innovation and development capacity. In the center we find the human capital - "the heart of the organization".

The model has 111 main indicators and 51 auxiliary indicators that are being used. They may be quantitative or percentages indicators.

The model proportionates a balance between the past (financial perspective), present (customer perspective, human perspective and perspective of processes) and future (innovation and development perspective):

1. Financial perspective surprises information stemming from the financial statements;
2. Customers perspective offer a vision of the degree in which the enterprises satisfies the needs of customers with products and services, being present indicators related to share sales customers, or how loyal are its customers.

¹¹⁵⁹ IAS 16, 2007, 6.

Skandia Navigator¹¹⁶⁰

3. Human perspective is “the heart of the organization”, “that part of the intellectual capital that goes home every night” and “the combination of experience and innovation that are in these employees and the strategies of the enterprises for change and preserve this combination” (Edvinsson and Malone, 1999, 92) it presents indicators such as employee satisfaction, their improvement.
4. Process perspective refers to the processes of efficient production of goods and efficient service-oriented to customers.
5. Innovation and development perspective aims to capture the opportunities that define the future of the enterprises - look into the future to prepare for it and to establish lines of action to ensure long term growth and profitability.

Starting from the structure of intellectual capital and respecting the requirements to be met under Meritum¹¹⁶¹ such as utility, comparability, reliability, objectivity, veracity, sustainability, relevance, understandability, timeliness, significance, we can establish the indicators needed to measure intellectual capital depending on the line of business of the enterprise.

Conclusions

Intellectual capital is, as we saw, a term with many definitions but almost all it is defined as an intangible asset that is not reflected in current financial statements. It is knowledge, experience and intellectual force of employees, as resources and knowledge stored in the databases of the organization, in systems, in processes, in culture and philosophy, all managed and used to obtain services and products with the ultimate aim of obtaining benefits. Intellectual capital includes intangible assets and resources that can be used by the organization to create value transforming them in new processes, products and services.

In the past years it has been questioned the quantification of value and explanation of the components of the organization intellectual capital. There are many companies that rely on intangible assets to achieve benefits and to gain competitive advantages but the current financial statements does not capture - and can not capture - key determinants of value that dominates the new economy. Critics suggest that companies should compensate this by extending reporting on intangible assets, especially non-financial reporting. Their reason is that this enlarged reporting

¹¹⁶⁰ Edvinsson, Leif; Malone, M.S.: El capital intelectual. Como identificar y calcular el valor de los recursos intangibles de su empresa, 1999, 90.

¹¹⁶¹ Meritum Project: Guidelines For Managing And Reporting On Intangibles - Intellectual Capital Report, 2002, 19.

will better communicate the economic situation of the company through the submission of additional information relevant to reflect the real value of the company.

Recommendations:

- Introduction of a generally accepted model for measuring intellectual capital worldwide and creating the necessary accounting frames in order to make comparisons.
- It's necessary to develop some harmonized specific rules at the global level concerning accounting and auditing intellectual capital.
- Promote the development of new complementary information systems - alternative accounting.

THE IMPACT OF DISCONNECTION OF ACCOUNTANCY FROM TAXATION ON THE SHARE RESULT

Groșanu Adrian

Babeș-Bolyai University, Faculty of Economics and Business Administration, Cluj-Napoca, Romania

Răchișan P. Ramona

Babeș-Bolyai University, Faculty of Business, Cluj-Napoca, Romania

Berinde R. Sorin

Babeș-Bolyai University, Faculty of Business, Cluj-Napoca, Romania

The opinions regarding the optimum of accounting-taxation ratio are divided between the supporters of the disconnection between accountancy and taxation, on the one hand, and those of the connection between accountancy and taxation, on the other hand. A great number of scientists' points of view converge to the idea that the emergence of the accounting science was determined by fiscal reasons. During those days the single reason of accountancy was indeed that of determining the taxable base and starting from these premises the hypothesis that relates accountancy to taxation does not seem so old-fashioned. But along with the general development of economy we observe the coming forth of new and important participants to the economical activity, these being directly interested in the growth of the activity of the enterprise in question and providing them with information could no longer be overlooked.

Keywords: Disconnection, Deferred taxation, Inflationary phenomenon, Accounting gross profit.

JEL Code: M - Business Administration and Business Economics; Marketing; Accounting; M41 - Accounting

1.Introduction - Briefing on the history of accountancy, taxation and the accounting-taxation ratio

In order to illustrate the present-day stage of evolution and social prestige of a science, one should start with its history. Starting from this point we consider that an incursion in the accountancy and taxation history helps us to better understand the present-day stage, both as a form of scientific knowledge and as a social practice. Accountancy as we can see it today is a science representing the result of a long historical process and not the result of an intended will of economical agents or the product of some scientists' thinking.

Historians have been arguing for a long time and they still are about the origins and the events related to arising of accountancy as double entry (some consider the concept evolving from the accountancy as single entry, as the economical activities began developing, others, on the contrary, consider accountancy as single entry to be a sinthetization of the double entry¹¹⁶²). Regarding these opinions we consider that the double entry is the result of the accountants' work, of their consequent preoccupation to dispose of the single entry gaps and to improve it step by step. In this field literature the opinions concerning the relation between double entry accountancy – capitalism, are also different. The question is whether the double entry accountancy generated capitalism or if the latter could be conceived without the double entry accountancy.

The German economist Sombart determined in 1982 that capitalism cannot be imagined without the double entry accountancy. He mentions that “the possibility and the impulse for achieving the

¹¹⁶² Ionașcu I., *Dinamica doctrinelor contabilității contemporane*, Edition Economică, 2003, pg. 13.

request of plenary development of the ideas belonging to the capitalist system: the idea of profit and the idea of economical rationalism were created through the calculations of double entry accountancy.”

This point of view has been severely criticised in time by historians, but especially by Fernand Braudel, who observes the fact that in some capitalist societies there are some important institutions that will resort relatively late to the double entry (insurance companies from London, The Dutch Company of Eastern Indies).

Anyway we have to admit that the double entry is an integrant element for capitalism. There is no doubt that all over the world the fiscal problem represents a preoccupation both for researchers and for the accountant practician. This thing is emphasised by the dynamic of the fiscal evolutions, the regulations stipulated by the fiscal texts being in a continuous change: “the fiscal text [...] acts exactly like a living body: it is conceived, it is born, it lives, sometimes well put up with, some other time hardly accepted, it disappears and it can be reborn, fed by different stimuli [...] Taxation is the result of the constant compromise between the care for justice and the necessity of obtaining an income”¹¹⁶³.

The results of the published researches lead us to the hypothesis according to which the study of the fiscal relations approach very rarely the period before the XVIth century, in a concret way.

The “barter” fiscal forms are gradually abandoned, just as capitalism begins to install, when the merchandise production becomes dominant, and the public actions start to vary and amplify. At this moment “the money” taxation begins. Thus until the second half of the XIX century, the capitalist system will put its mark on taxation. The real modernization of taxation begins after 1870, when a second phase of the industrial revolution takes place and the process of centralization of the micro economical structures begins. At least until the XIX century, the French treasure up in order to buy land, to pay taxes, to buy a public function. In XVII century one can find the same feudal rights all over Europe, but starting with the XVIII, in France the bondage is abolished, the peasants wanting to become landed owners and to break free from their landlords. During this time England remains governed and administrated by landlords, who are the land owners.

In this period the tax system proves to be quite unjust all over Europe, but it seems it manifested strongest in France. While here the royal power gives tax immunity to the king, as a consolation for effective ruling, in England the aristocracy is the one that endures the most severe public expenses, as an exchange for governing. Therefore the privilege of tax immunity is owned by the poor in England, the aristocracy enduring most of the taxes, while in France most of the taxes are endured by the poor. These will be the origins of the emergence of two situations and attitudes that are diametrically opposed towards taxation, between the two great European rivals, and they are emphasised also by the priorities of the business men in those two countries at that time: the French bourgeois using his savings to buy a public function, while his English homologous invests in trade. After the World War II the financial systems reflect and are conditioned by the political doctrine of each regime that comes to power. During this period the society, and at the same time the trade economy, began to evolve mostly towards a capitalist market economy (decentralised), on the one hand, and a planned collective economy (centralised) on the other. “The place and the form of taxation in these two types of economical systems will be very different, because the tax is basically related to the decentralised economy. It disappears in the pure centralised state economy”¹¹⁶⁴.

2.The importance of using the case study in order to emphasise the research results

The case studies presented during the research activity do not have to be chosen starting from the fact that they are representative from a certain point of view. That is because the research does

¹¹⁶³ Delesalle F. E., Delesalle E., Contabilitatea și cele zece porunci, Edition Economică, București, 2003, pg.35.

¹¹⁶⁴ Beltrame P., Les systèmes fiscaux, Presse Universitaire de France, Paris, 1979, pg.10.

not have to lead to establishing some statistical generalizations. The priority should focus on the theoretical generalizations¹¹⁶⁵. **Referring in particular to the case studies that we analyze for the theme of this paper work, we estimate that they have an illustrative - descriptive character** because on the one hand it is intended to be presented the classical accounting practice (emphasising the determination of the taxable profit in historical costs), and on the other hand it is tested the implementation and the consequences associated with the implementing of the innovative accounting practice (the possibilities of using the alternatives from the current cost perspective). **The exploring character of the case studies** (consisting in a preliminary investigation regarding the way in which the accounting practices are implemented) arises from the presentation of the way in which the accounting practices were implemented, which referred to the deferred taxation starting when the regulations harmonised with the international legislation in the accounting field were adopted.

The practical details are presented through the case studies of descriptive – illustrative – exploring nature, according to the case studies typology described above. Taking into account the utilization of the case studies we indicate the existence of some inductive influences in the content of this paper work.

The case studies show the practical reality at national level, with continuous references to the theoretical aspects.

The case studies focus on the activity of large enterprises and less on the activity of middle size and small enterprises, (in the large enterprises it can be taken into consideration the disconnection between accountancy and taxation, some scepticism related to the accounting creativity or the determination of the dimension of the artificial profit, that comes more from inflation and less from the growing of the activity efficiency) because they represent a greater interest for a great number of investors since they are quoted on the capital market.

As regarding the emphasizing of the impact of the deferred taxation, some case studies were chosen to illustrate the situations generating the temporary differences (some applied in the Romanian accountancy, others being just proposals in the course of implementing, arguments being brought to support this purpose).

3. Results and discussions

3.1. Models to determine the contingent interest tax

In order to emphasize the effects of accountancy connection to taxation combined with the effects of the inflationary phenomenon, some models of dimensioning the economical entities' result in historical costs, current buying capacity, current costs and real terms were presented. In order to implement them the numbers of consumer prices were used, which were provided by the National Statistics Institute. The dimensions of the accounting result can vary significantly from one model to another. The main critique that was made regarding the accounting profit and also the fiscal one, determined by historical costs, is that it leads to subevaluation of expenses (related to stocks and assets' underevaluation). The consequence is an overevaluated profit. This is shortly the explanation for the actual profitableness of that enterprise and to a less extent the explanation of a inflationary phenomenon.

We can conclude that the proportion between the real profit and the one caused by inflation depends on:

- the activity area of the enterprise;
- the dimension of the inflationary system in each economy.

We estimated that the inflationary impact with consequences regarding the artificial amplification of net or fiscal profit, is as stronger as:

- the number of immobilizations and stocks within the assets is larger;

¹¹⁶⁵ Malcolm S., Research methods in accounting, SAGE Publications Ltd, London, 2005, pg.25.
1656

- the number of expenses regarding the stocks is more significant as far as the total expenses are concerned during a financial exercise;
- the stock circulation flow is very low;
- the period for recovering the debts is longer than the period for paying the debts, strictly considering the number of days and not the activity field.

Therefore an enterprise that does not possess assets (they are lent) and that does not show significant stock consumes (a service provider enterprise) will not be much affected by the inflationary phenomenon even if the latter is intense enough. The outcome of such an enterprise, taking into consideration a medium level of inflation determined by historical costs, will not be too different from the outcome established by methods that rely on the impact of the inflationary phenomenon.

On the other hand, the more intense the activity production is, the greater the inflationary impact. Such an activity may require a larger production facility. Their amortization at the historical cost level, inflationary depreciated will only increase the artificial fiscal profit, since these expenses will not be levelled with the afterward registered incomes that were increased by inflation. This phenomenon has been partially reduced by the Romanian accounting system by the authorization of some revaluations, their surplus being deductible as a supplementary amortization. Following the decrement of the inflationary phenomenon, the deductibility of the amortization surplus has been abandoned, that is why few enterprises still resort to annual revaluations in order to correct the inflationary phenomenon. Even though its effect is not that strong however it could have a major impact on decapitalization. Intense activity production involves the existence of a large stock of raw materials. A later consume can lead to a subevaluation of the production cost and implicitly to the achievement of a artificial profit that would get to a real more diminished level by deflation or even to losses. We believe that this could be considerably amplified if the circulation flow of those stocks is very low:

- either because the material stock is oversized;
- or because the production system has a long cycle of production.

We can conclude that the enterprises in the production field are more exposed to the inflationary phenomenon than the enterprises acting in the field of service providing (where the number of stock consume involved in the production cost is less significant than the total amount of man-hour).

The stronger the inflation, the larger the artificial profit. Therefore there will be an inflationary tax that will trigger the decapitalization of the enterprise when it is paid out, because it has no real efficiency basis of the economical activity.

We believe that the implementation of the historical cost method in dimensioning the fiscal result is advisable, due to reasons deriving from uniformity necessities. On the other hand, it would be appropriate the implementation of one of the other three methods for internal informing necessities regarding the appraisal of the inflationary impact and its partial counter-balance.

We consider appropriate the implementation of the model of the result determination in the current buying capacity within those economies that confronted with ample inflationary phenomenon, because in this case, the prices level evolves uniformly for all elements, on a strong rising trend.

On the other hand, the result model in the current costs involves the up-dating according to some factors specific to each element that is about to be re-dealt with, therefore the difficulty level related to uniformly choosing these factors and to the implementation of this model is very high. Its advantages are that if there is an economy where the prices levels do not evolve uniformly for all elements that are re-dealt with, the inflationary impact can be more efficiently cleared out.

This is Romania's case, which over the last years has not been confronted with very ample inflationary phenomena at national level, but, on the other hand, the prices for certain categories of goods have significant rising evolutions much over the general level of prices. This thing can influence significantly the result determined by current costs, in an enterprise that owns productive assets.

3.2. Models to determine the deferred profit tax

The fixed report model or the deferred model involves the calculation of the deferred tax based on the legal tax basis in the exercise of setting the temporary difference. More than that, no adjustments are necessary in order to reflect the changes that appeared in the tax quota, the future quotas of profit tax being irrelevant. This model emphasizes the principle of connecting the income and the expenses in that year when the temporary differences appeared¹¹⁶⁶.

The arguments for the implementation of this model are the following:

- the profit and loss account is the most important financial statement, and the connection of expenses to income represents an essential feature of the accounting process. Therefore, it is less important whether the deferred taxes from the balance sheet are not assets or real debts, as a concept;
- deferred taxes are the result of past events and transactions that generated temporary differences. Since accountancy uses historical cost as an evaluation basis for most of the economic events, the deferred taxes should be evaluated similarly;
- the historical quotas of profit tax are verifiable. From this point on, the deferred taxes calculated based on the historical quotas increase the reliability of accounting information.

The variable report model or the debts model involves the calculation of the deferred tax based on the quotas estimated to be in force in the exercise of the temporary differences re-assimilation.

The arguments that sustain this model are:

- the accounting balance sheet is an important financial statement. The calculation of the deferred tax based on the quotas in force in the year when the temporary differences are reabsorbed increases the predictability of information regarding the future flows in treasury, the financial flexibility and liquidity of the enterprise;
- the calculation of the deferred taxes based on the future tax quotas, is more appropriate conceptually speaking, because their value represents future probable economic sacrifices (future tax payments) or future economic benefits (future tax decreases);
- the deferred taxes derive from past transactions, but they are taxes to be paid (or diminished) in the future, considering the quotas in force at that time;
- accountancy mostly relies on assessments. The calculation of the deferred taxes based on some future quotas creates information that is not less reliable than that regarding the assets depreciation during estimated utilization period.

The net of tax model considers the profit tax expense to be equal with the sum that is to be paid to the state in the name of the current exercise and considers the fiscal effect of the temporary differences as an adjustment of debts (assets) and expenses (income). However the implementation of this model is difficult, because some temporary differences cannot be associated with individual debts or assets. On the other hand, the information presented in the balance sheet is questionable when implementing this method. Such an example is the irrelevance of the value for an asset stated in the balance sheet, if its cost recover and the specific tax were taken from its entrance value.

¹¹⁶⁶ Feleagă N., Malciu L., Fair accounting versus bad accounting, Edition Economică, București, 2002, pg.69-72.

Taking into account the things mentioned above for the determination of the profit tax, we pronounce in favour of the implementation of the deferred tax method, and within this, of the variable report model.

Therefore, the Romanian accounting system maintains in this case the primordality of the caution principle in accountancy, that is characteristic to the continental accounting systems. Taking into account this point of view, it is considered that the probability of accomplishing each of these alternatives is quite low and the option is the disclaimer of the debts regarding the deferred tax. This situation is in accordance with the IV Directive, because it does not mention the obligation of claims and debts regarding the deferred taxes to be reflected in the individuals accounts. Only the VII Directive mentions that deferred taxes in the consolidations situation can be registered.

4. Conclusions - The impact of disconnection between accountancy and taxation

The significant level where the disconnection between accountancy and taxation (by the reflection of the deferred tax book debts and debts) influences the share result, can be observed in the reporting for an period, and can be expressed as below (for an romanian case of study) :

-romanian currency lei-

		<i>The connection between accountancy and taxation</i>	<i>The disconnection between accountancy and taxation</i>	<i>The difference</i>	
				<i>Absolute form</i>	<i>Relative form</i>
1	<i>Net result</i>	10.041.331	10.399.078	357.747	3,56%
2	<i>Number of shares in circulation</i>	207.981.560	207.981.560	-	-
3	<i>Share result (rd.1/rd.2)</i>	0,04828	0,05	0,002	4,14%

In this situation we calculated an accounting result connected to taxation (without the reflection of the deferred taxes impact) an accounting result disconnected from taxation (taking into consideration the deferred taxation). The share result determined by starting from these two situations shows a 4,14% plus for the disconnection between accountancy and taxation. We believe that this difference is significant for an economy where the capital market is very developed, where a variation of 4,14% of the marketable share course is very high, the variation being only from reasons regarding the connection or the disconnection between the accounting result and taxation, in relation with the importance of this information for investors.

ACCOUNTING CONVERGENCE ON ECONOMIC CRISIS

Holban (Oncioiu) Ionica

Academy of Economics Studies from Bucharest

If normalization accounting is the process of harmonizing the presentation of financial statements, accounting methods and terminology, accounting convergence is the process by which accounting standards are developed in a way that is able to lead to the same fact or purpose, by highlighting the similarity of national - regional - international.

This paper put in light the importance of the normalization and harmonization process, what it's done in and what we have to do for that in Romania.

Keywords: accounting, globalization, convergence

JEL: M41

Introduction

The contemporary accounting phenomenon has features based on the need or harmonization, convergence, compatibility and unity in book-keeping, seen also as general objectives of this field, which could be realized only by its normalization. The main phenomena governing the process of current accounting reform worldwide are: normalization, harmonization, convergence, conformity and accounting internationalization. These phenomena act both individually, and through a mutual inter-conditional relationship. The accounting convergence is the process of elaboration of accounting norms in a manner able to lead to a similar fact or goal, by stressing the similarity between national - regional - international levels.

A second reason leading to the harmonization/convergence of accounting systems are the desire for unity among conditions of competition in various countries. A synthesis of phenomena and aspects which could be considered as causes leading to the need for international accounting harmonization/convergence includes:

- the economies encountering an accelerated process of globalization;
- the requests from financial accounts users (a factor determined from the first one). Thus, we shall aim towards a unity of economic language and accounting as an instrument of communicating information;
- the extension process of the European Union;
- the phenomenon of capital markets globalization. The growth and globalization trend of large companies' activities lead to a great number of foreign companies purchases. This in turn led to an increase of their financial needs, leading in the end to the development of international capital markets.

The fundamental issue of accounting harmonization/convergence is also related to the reliability mark for the accounting activity as a whole. The statement is based on the users' level of trust regarding the occurrence that the same public company, for the same period, in different countries, has different figures about the size of their own capitals and results, as a result of complying with the regulations in force in these respective countries.

Implications of convergence on accounting system

Analysing what has been stated before, the harmonization/convergence of international accounting is a positive phenomenon, and its realization is determined by the current evolution of the economic life in general, and accounting in particular.

The events characterizing the beginning of the third millennium show that the process of market globalization is not enough to create the desired economical and socio-cultural development. The economic balances request this process to be a unitary one.

Within this dialogue, using, generally, the economic language, and specifically, the accounting language to communicate needs unity not only in thought, in the conceptualization of methods for organizing and managing companies, for administering and controlling their operation, but also in the accounting principles and methods for elaboration and presentation of financial accounting balances.

The globalization is a forced adventure, while the harmonization, convergence of accounting norms can be considered as its corollary. The production of accounting norms did not commence and, naturally, will not end with the one realized by IASB, it is centuries old and has been defined as a form of expressing political power (we remind you that even since 1673, the great political figure Jacques-Baptiste Colbert, theoretician of mercantilism and protectionism, introduced in France financial book-keeping rules, subsequently included in France Commercial Code from 1807).

“To converge” means “to direct towards the same point, to the same goal”. In the field of accounting, convergence is a relatively new concept, being employed once the objectives of the International Accounting Standards Board (IASB) were defined, one of them being “to aim towards convergence in national and international accounting norms, with the goal of offering high quality solutions”.

The idea of convergence implies a approach, certain members of the Board being responsible for following the connections with the national, public or private, normative organizations in big countries which can have their own opinion at any given time (United States of America, Great Britain, France, Germany, Japan, Canada, Australia and New Zealand), in order to analyze the exigency of norms as compared to those issued by the national normalizing partners.

In this context, the national and international intercessions have as a target realizing a convergence between national and international norms.

Convergence does not mean however the failure of accounting harmonization, but an obvious intercession aimed towards using an appropriate communication in a globalizing context, with the goal of having a common reference, International Financial Reporting Statements, while the short term goal of convergence is to eliminate the individual differences between US GAAP and the current IAS IFRS. Within this short term project, FASB analyzes various issues and either suggests alterations in the American norms, in order to eliminate the differences found, or it communicates to IASB the reason for which it decided not to alter the provisions of US GAAP, while at the same time IASB is carrying on a process of revising IFRS, taking, as the case may be, the same measures as FASB.

The IFRS reference, that the convergence is aimed to, employs a certain accounting philosophy, novel for many companies, related to fundamental principles within a conceptual framework, with no connection to the legal or fiscal influences. In order to keep the accountants' perceptions, a decision was taken stating that, starting with January 1st, 2005, only the marked companies should apply the IFRS reference in its current form. While five years ago we had a serious reticence when discussing the creation of a common accounting language, today things are, in our opinion entirely different.

A study with the goal of identifying the stage of convergence between national accounting references and IFRS showed the significant progress seen in 2003, that is, before the decision of the 91 countries which authorized or imposed the application of IFRS starting with January, 1st, 2005. But future studies should not exclude the hindrances encountered by the accounting convergence:

- The complexity of certain norms, mainly those regarding the financial instruments and, generally, any norm stating the recognition of the actual value, a very sensible issue in our opinion;
- Any national accounting reference bears, in one form or another, the mark of fiscal grounds;
- Accountants training, translation of norms and interpretations.

Convergence of accounting for Romania will assume a single set of standards and Romanian professional accountant will therefore be required to become a man who has the right to think, to reflect the accounting treatment of each transaction, to deepen the processes and phenomena that have to find in financial reporting have the right to choose between several types of accounting treatment, i.e., will be entitled to use professional reasoning. European integration may have consequences for the two types of accounts in Romania. The first of them are positive. An advantage of convergence is the communication in a single language that provides a high level of trust and increase opportunities of access to capital markets and allows multinational groups to apply accounting principles common to all branches. He discussed more content convergence with International Financial Reporting Standards, and concluded that broke away was that it is essential and more accounting information users want to see done. The basic desire is to remove the accounting guidance in Romania to provide more information to one user, namely the state. This aims to introduce a new open system professional judgments transparent financial statements and accounting rules compatibility with IAS / IFRS.

Convergence of accounting for Romania to be accepted as a phenomenon "physical" that it is pointless to try to challenge or passing: but must necessarily understand it, in terms of advantages and disadvantages, also. Especially for small nations, as is the case of Romania, understanding and implementation of accounting convergence phenomenon will make the difference between winners and losers.

Conclusions

Convergence is not an easy thing! Even the president of FASB declared that the greatest challenge of the convergence process was to persuade the national business communities about the necessity for an international process accounting language. Even if Securities Exchange Commission (SEC) and the multinational companies in the USA are privileged by this convergence, the small companies and the family level businesses are less happy. Perhaps people don't like change in general, preferring rather to keep their status quo.

It is thought that the convergence process will be a long and expensive one, mainly due to the large number of differences between the US GAAP and IAS, but, if realized correctly, this process will mean an important international success. The path will not be easy and will have to deal with "revolts", and we hope that the disputes between IASB and the European banking and insurance industries, regarding the financial instruments accounting, as well as the decision of the European Commission to delay the application of IAS 32 and IAS 39 would not have a negative influence over the international accounting convergence process.

Romania is the irreversible processes of standardization and convergence aimed at production and communication of financial information relevant, reliable, comparable language to use a joint account all categories of users. If Romania fails to move quickly, will be the certainly left the bar. Integration into the EU could mean a switch to an acceptable level to IAS / IFRS. The future will show whether, in the context of European integration, convergence will be obstacle or incentive for change in accounting in our country.

Almost nothing can be done nowadays without the thought of obtaining performance, of reaching high performance result. The many uses of this word almost lead to the loss of its substance and to the appearance of at least one doubt about still knowing how to obtain the performance. This is exactly what this study intends to do, bringing into question and analyzing the script of the movie called „performance”. And what could be more interesting and more exciting than the presence on the scene of accounting of the actors – Efficiency, Economy and Effectiveness, standing in the spotlights of Profitability and directed by the Man of the accounting books

Keywords: economic profitability, financial profitability, performance, effectiveness

JEL classification: M41

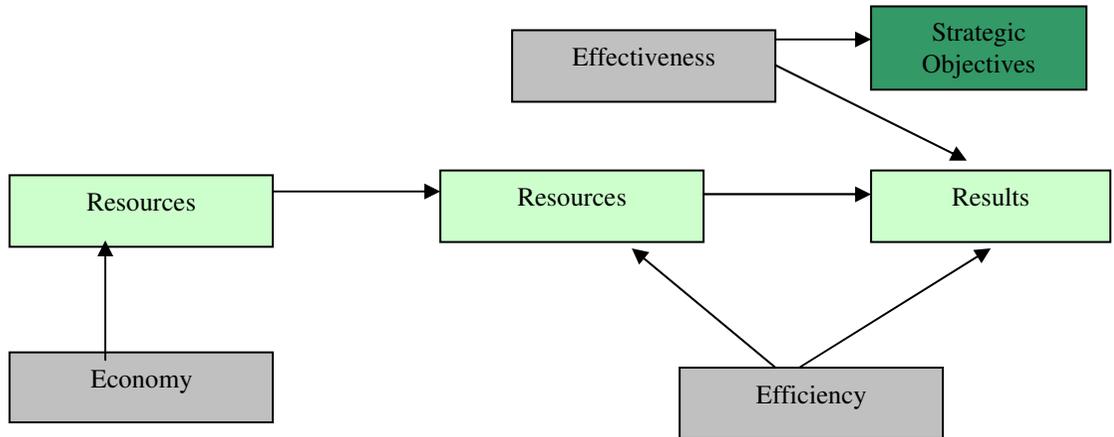

Introduction

The accounting result was, for a long time, and still continues to be considered in accounting the main indicator used for measuring the performance of an economic entity (Dhaliwal et al, 2001). There is an opinion according to which when the entity obtains profit that leads to a high performance result. Analyzed from the computation way point of view, the accounting result is past-oriented, serving as a measure of the progress an entity achieved during a past time period. In the current context of normalization, where there are several options to reflect the same transaction, there is no objective outcome. The selection of a norm or an option, which implies the abandon of other norm or option, has consequences on the financial statements and on the accounting result. The result can vary between certain boundaries, without considering, inside this space, a level of result more representative than the other. The reason the accounting result has lost and still loses “ground” in the financial performance measurement is the appearance of the comprehensive income (Jianu & Jianu, 2008).

In the field of financial management and business finances, the performance is analyzed also making appeal to concepts, other than the accounting result. Professor Ristea (1997) considers that we can associate three concepts to the performance: efficiency, economy and effectiveness. *The efficiency* implies either the maximization of the results achieved starting from a given input of resources or the minimization of the quantity of resources for a standard result. *The economy* implies to obtain the needed input at the lowest price. *The effectiveness* assumes that the obtained results reach the budgeted ones. Therefore:

$$\text{Performance} = \text{Efficiency} + \text{Economy} + \text{Effectiveness}.$$

The definition of the performance is named, by Professor Ristea M., *the equation of the three "E"s* and can be represented schematically as follows:

The true performance is achieved by bending the three “E”s only if this performance is maintained on a long time. This is the reason why, in the above mentioned scheme, we linked the effectiveness concept to the one regarding the accomplishment of the strategic objectives.

In the literature, there are also other approaches regarding the efficiency concept. *Bouquin (1998)* considers that the purpose of the entity is that of creating value. A question rises though: *Who is the beneficiary of this value?* The author gives the answer. *The efficiency aims to create value for the shareholders, while the economy is interested in creating value for the clients.* Although they reflect the same thing - the value creation, the efficiency and the economy are not congruent, because they are analyzed differently, depending on the person involved. We consider that, depending on the nature of the set objective, there are different forms of efficiency: the productivity, if the objective is production; the economy, if the set objective is saving; the profitableness/earning performance, if the objective is the profit. Due to the fact that the purpose of any business is to obtain profit, we stopped at the study of the profitability concept.

The current study is structured in three parts: in the first one, we accomplished a comparative study regarding the profitability concept from the continental, Anglo-Saxon and Romanian points of view. In the second part, we analyzed the most used rates of return in the field of financial management: the return on assets (economic profitability) and the return on equity (financial profitability). In the third part, we presented the rates of return used in the business finances, which allow the performance analysis from the accomplishment of the objectives set by the auditors the point of view.

1. A comparative analysis of the profitability concept

Most often is spoken about profitability (term known as “rentabilité” in French or “profitability” in English) comparing the invested equity to their results. In order to accomplish this comparison, the rates of return are computed. *The rate of return* represents the ratio between *the result* and *the capital invested* for obtaining it. *Colasse (2000)* associates the profitability concept with that of profit, reflecting the entity’s ability to provide a result expressed in monetary units. The profitability analysis is accomplished through the rates system that expresses the relation between a result and the capital invested to obtain it. The author suggests the following types of results that can be used in the profitability analysis: the operating result, the financial result, the current result, the exceptional result (in the French approach) and the net result. As it regards the invested capital, the following indicators can be retained: the equity, the ongoing capital, the fixed assets,

the total assets. It is assumed that there are X types of result and Y types of invested equity, this leading to a number of X*Y rates of return.

In the **continental system**, three rates of return, specific to the analysis of the economic entities, can be underlined: the operating profitability, the return on equity (financial profitability) and the earnings per share.

In order to express *the operating profitability*, two ways of computation are proposed:

$$\frac{\text{Operating result}}{\text{Total assets}} \text{ or } \frac{\text{Gross operating surplus}}{\text{Total assets}}$$

The return on equity (financial profitability) shows the payment of the investment of the owners in the entity, through their contributions in resources or in benefits belonging to them. It is also known as the return on invested equity (profitability of the invested equity). There are four rates of return on equity.

The first two rates are determined as a ratio between a result indicator and the equity.

$$\frac{\text{Net result}}{\text{Equity}} \text{ or } \frac{\text{Financing capacity}}{\text{Equity}}$$

The financing capacity is preferred to the net result, because it is not affected by the entity policy regarding the depreciation methods. This argument finds justification in an accounting connected to taxation, specific to the French practice, but it is not justified in an accounting according to the IFRSs, where the net result is one of the pertinent indicators in the financial performance measurement.

The next two rates considered to express the financial profitability of an economic entity are: the rate of benefits capitalization and the rate of dividends yield. *The rate of benefits capitalization*, which expresses the ratio between the earnings per share, has a limited interest from the financial diagnosis point of view, because two entities from the same sector and with the same net result can have different rates of capitalization. Colasse himself agrees that this rate shows the stock image of the entity rather than its profitability. *The rate of dividends yield*, computed as a ratio between the dividend per share and the share price, presents interest for the minor shareholders rather than the analysis of the financial profitability.

The third rate represents *the earnings per share*, considered by IASB one of the main indicators in the analysis of the entity performance. The earnings per share represent the unitary result, which is distributed to shareholders of the group represented by the parent entity. IAS 33 *Earnings per Share* is applied by the entities, whose ordinary shares or potential ordinary shares are listed and by the entities in process of issuing ordinary or potentially ordinary shares on the financial market. If an entity presents both consolidated and separate financial statements, according to IAS 27 *Consolidated Financial Statements and Accounting for Investments in Subsidiaries*, the assembly of information requested by IAS 33 applies only to the consolidated statements. If an entity chooses to disclose the earnings per share in separate financial statements, it won't include this rate in the consolidated statements.

The entities have to disclose two types of earnings per share:

- § the basic earnings per share, established based on the number of outstanding shares;
- § the diluted earnings per share, computed taking into consideration the dilutive instruments. The dilutive instruments are those which provide future access to the parent entity capital (convertible securities, contractual rights to purchase shares) and whose conversion would lead to the decrease of the earnings per share.

The basic earnings per share is obtained by dividing the net profit or loss attributable to ordinary equity holders of the parent entity by the weighted average number of the ordinary shares outstanding during the period. The preference dividends are deducted from the net earnings. The use of the weighted average number of ordinary shares outstanding during the current financial year reflects the possibility that the value of the shareholders' equity has varied, as a result of a higher or lower number of shares outstanding at a certain moment. The own shares redeemed by the entity are not taken into account in the computation of the weighted average number of shares. The time weighting factor, used in the computation of the weighted average number of shares, is equal to the number of days when the shares were outstanding, but in many circumstances, a reasonable estimation, such as the one computed based on the number of months when the shares were outstanding, is accepted. IAS 33 states that "the weighted average number of shares outstanding during the financial period, as well as the weighted averages computed for all the disclosed periods are adjusted in case of events, other than the conversion of the potential ordinary shares, which changed the number of the shares outstanding, without generating a corresponding change in resources" (IASB, 2009). An example in this regard is the case of the capital increase through internal operations, which implies the issue of bonus shares, leading to the increase of the number of shares without a corresponding increase of the entity's resources. In case an entity issues dilutive instruments, the computation of *the diluted earnings per share* is imposed. An entity will compute the values of the diluted earnings per share corresponding to the profit or the loss attributable to the ordinary equity holders of the parent entity. In case the result is obtained from continuous, as well as from discontinued activities, the diluted earnings per share must be separately computed for each of these results. We must take into consideration the general dilution generated by some of the instruments issued by the entity in the computation of the diluted earnings per share. The dilution varies depending on the type of instrument. Therefore, we distinguish:

- § dilutive instruments for which the funds are received from the moment they are issued, as well as convertible securities, preferential shares convertible in ordinary shares;
- § dilutive instruments for which the funds are received only in the moment they are exercised, as well as the options or contractual rights to purchase shares.

In the **Anglo-Saxon practice**, the rates on return are known as profitability rates. Four rates are significant in the analysis of entity's profitability: the profit rate, the economic profitability (return on total assets), the financial profitability (return on equity) and the earnings per share. We will shortly analyze the first three rates, the fourth one presenting the same computation way as in the French version.

The profit rate is computed as a ratio between the net result and the turnover and shows the profit obtained to a monetary unit of the entity's registered turnover.

The Return on Total Assets (ROA) is determined based on the following ratio:

$$\frac{\text{Net result} + \text{Interest expenses}}{\text{Average balance of total assets}}$$

The interest expenses are added to the net result due to the fact that the assets are financed by the shareholders, as well as by the creditors, and the ratio must provide information regarding the measure of earnings for both categories of investors. The denominator takes into consideration the total assets average, because the net result is obtained during an entire financial year.

The Return on Equity (ROE) expresses the ratio between the net result and the equity average. The explanation for using the equity average is the same as in the case of the total assets average: as the net result is obtained during a financial year, it is normal to use the same measurement unit in the ratio.

In the **Romanian literature**, the profitability is assimilated either to the concepts of result, or to the profitability of the listed entities, or to the rates of return. *The types of result* which can be assimilated to profitability are: the gross operating surplus, the operating result, the current result, the extraordinary result and the net result. *The profitability of the listed companies* is measured through the following set of indicators: the stock value (number of shares * share price), the turnover for a share, the market capitalization ratio (the ratio between the share price and the earnings per share), the share yield (the opposite of the market capitalization ratio). The most often met *profitability rates* in our literature include the commercial rate of return, the economic rate of return and the financial rate of return.

The commercial rate of return is expressed as a ratio between the gross operating surplus, the operating result or the net result on one side, and the turnover on the other side.

The economic rate of return is a ratio between the gross operating surplus or the operating result on one side, and total assets or total operating assets, on the other side.

As it regards **the financial rate of return**, there is a common opinion regarding the computation way, as a ratio between the net result and the equity.

Order 3055/2009 for the approval of the accounting regulations according to the European directives presents, in the explanatory notes to the financial statements, four rates that must be computed and disclosed by the Romanian entities. Our opinion is that, depending on the computation way, the four rates can be included in the category of profitability rates, even if the name of two of them is improper. We refer to *the rotation speed of fixed assets* that evaluates the effectiveness of the fix assets management by examining the turnover generated by a certain quantity of tangibles and *the rotation speed of total assets*. The computation formulas for the two rates are the following:

$$\text{The rotation speed of fixed assets} = \frac{\text{Turnover}}{\text{Fixed assets}}$$

$$\text{The rotation speed of total assets} = \frac{\text{Turnover}}{\text{Total assets}}$$

We consider the computation way of these rates inadequate, as long as the denominator and the nominator are not expressed in the same measurement unit. Therefore, for the indicator regarding the rotation speed of the tangibles, the turnover is evaluated in sale prices, while the tangibles are presented at the entry value. As it regards the indicator rotation speed of the total assets, the turnover is expressed in sale prices, while the total assets include a wide range of evaluation bases.

The other two indicators up for the profitability measurement, named **profitability indicators**, express, according to Order 3055/2009, *the efficiency of the entity in achieving profit from the available resources*. The computation way and the indicators' significance, as they are presented in order 3055/2009, are the following:

The return on equity represents the profit the entity obtains from the money invested in the business:

$$\frac{\text{Profit before interest and income tax payment}}{\text{Equity}}$$

Where the equity refers to money invested by the shareholders and the long term creditors in the entity, and includes the equity and the long term debts or total assets minus current debts.

Gross margin on sales

$$\frac{\text{Gross profit from sales}}{\text{Turnover}} * 100$$

A decrease of the percentage can point out the fact that the entity is not able to control the production costs or to obtain the optimum sale price.

As we can notice from the above presented approach, there is no mutual opinion regarding the profitability concept at the international level. *It is often said that when an entity obtains profit, it is “rentable” in the continental vision, profitable in the Anglo-Saxon vision, or both “rentable” and profitable in the Romanian version, if there is such a version!* And, because we brought into discussion the profitability concept, we also express our point of view regarding the profitability indicators, which must be taken into consideration in the analysis of the entity’s performance. A wide number of indicators make the understanding of the disclosed information difficult; therefore we stop at two profitability rates, considered by us the most pertinent: *the economic rate of return* (return on assets or operating profitability) and *the financial rate of return* (the return on equity or financial profitability).

2. THE ECONOMIC RATE OF RETURN AND THE FINANCIAL RATE OF RETURN – PERTINENT INDICATORS IN THE ENTITY’S PERFORMANCE ANALYSIS

The economic rate of return measures the payment of the assets assembly used by the company, being also known as the return on assets. The economic rate of return is computed as follows:

$$\text{Economic rate of return} = \frac{\text{Operating result}}{\text{Economic asset}}$$

The gross result is usually used in the computation of the economic rate of return. The economic asset is determined as a sum between the gross value of the fixed assets and the need of working capital.

The ratio presented above can be divided as follows:

$$\text{Economic rate of return} = \frac{\text{Operating result}}{\text{Turnover}} * \frac{\text{Turnover}}{\text{Economic asset}}$$

The economic rate of return represents thereby the product between the gross margin and the asset rotation. A normal economic rate of return can result either from low margins and a pronounced rotation of assets, or from high margins and a week rotation of assets (Amelon J-L., 2004). In order to reflect the way the economic rate of return is influenced by the net margin and the asset rotation, the following two situations are given:

<i>Elements</i>	<i>Ist Situation</i>	<i>2nd Situation</i>
Net margin	10%	2%
Rotation of assets	2	10
<i>Economic rate of return</i>	<i>20 %</i>	<i>20 %</i>

Such a comparison reflects two important types of behavior an entity can adopt, in order to increase its economic profitability: the increase of the net margin and, therefore the increase of the operating result faster than the increase of the turnover, on one side, and the increase of the assets rotation through a pronounced increase of the turnover, on the other hand. The first

situation is specific to the entities activating in the telecommunications or constructions field, while the second one characterizes the distribution entities.

The financial rate of return shows the payment of the investment made by the owners through the contributions of resources or the benefits belonging to them. It is also known as the return on equity. It is computed based on the following ratio:

$$\text{Financial rate of return} = \frac{\text{Net result}}{\text{Equity}}$$

The financial rate of return can be analyzed as a product of other rates, as follows:

$$\text{Financial rate of return} = \frac{\text{Net result}}{\text{Turnover}} * \frac{\text{Turnover}}{\text{Economic asset}} * \frac{\text{Economic asset}}{\text{Equity}}$$

The financial rate of return represents thereby the product between *the commercial rate of return*, *the assets rotation* and *the overall borrowing rate*. It results that the entity can act from three points of view in order to maximize the financial rate of return (Niculescu., 2003):

the result maximization by increasing the activity level and by improving the margins. The accomplishment of these two objectives is based on the activity optimization in all the domains: internal organization, management of stocks, quality of products and services, commercial management;

the increase of the equity yield by intensively using the fixed assets and decreasing the need of working capital, specially by reducing the stocks and claims;

the minimization of the committed equity for a given volume of the invested equity.

The financial rate of return is one of the main indicators in the analysis of the entity's performance, which depends of the fairness of the commercial policy (the commercial rate of return), the efficiency of the capital employed (the economic rate of return) and the policy and the financial structure of the entity (the overall borrowing rate). The financial rate of return of the entity is strongly influenced by *the leverage*. In order to reflect this influence, we are going to use the following abbreviations:

- § RN – net result;
- § RE – operating result;
- § D – borrowed capital;
- § CP – equity;
- § AE – economic asset;
- § Rd – interest rate;
- § Ri – income tax rate;
- § Re – economic rate of return;
- § Rf – financial rate of return.

As a general rule, the net result is obtained by deducting the financial interest expenses and the income tax expenses from the operating result. The formula for the net result computation is the following:

$$RN = RE - Rd * D - Ri * (RE - Rd * D) = (RE - Rd * D) * (1 - Ri)$$

Knowing that the economic rate of return represents the ratio between the operating result and the economic asset, where the economic asset is the sum between the equity and the borrowed capital, the above mentioned formula becomes:

$$RN = (Re * AE - Rd * D) * (1 - Ri) = [Re * (CP + D) - Rd * D] * (1 - Ri) = [Re * CP + (Re - Rd) * D] * (1 - Ri)$$

Replacing the net result in the financial rate of return formula, we reach to the following conclusion:

$$R_f = \frac{RN}{CP} = \frac{[Re * CP + (Re - Rd) * D] * (1 - Ri)}{CP} = [Re + (Re - Rd) \frac{D}{CP}] * (1 - Ri)$$

It results that the financial rate of return depends of:

- § The economic rate of return;
- § The interest rate sustained by the entity;
- § *The leverage*, which represents the difference between the economic rate of return and the interest rate;
- § *The leverage rate*, which represents the ratio between the borrowed capital and the equity;
- § Income tax rate.

The leverage explains how it is possible to accomplish an equity profitability superior to the assembly of invested assets, which is the economic profitability. The leverage is based on the following principle: when an entity is indebted and invests the borrowed funds in industrial equipment, for example, it obtains a certain result for this sum, superior to the financial expenses generated by its debt, otherwise it wouldn't invest anymore. The entity achieves a surplus from the difference between the economic profitability and the interest rate applied to the borrowed sum. This surplus returns to the shareholders and increases the financial profitability, where from its name comes. Nevertheless, if the difference between the economic profitability and the interest rate is negative, the increase of the entity's indebtedness has an opposite effect on the financial profitability. Therefore, with every percentage of debt increase, the financial profitability will decrease with the difference between the economic profitability and the interest rate. In this case, the indebtedness has a *leverage effect* (Vintilă, 1999), leading to the decrease of the return on equity, this being a reason why the entity will have to "work for his bankers".

We take the example of two entities A and B, which have different economic rates of return. The economic return on assets for entity A is 12%, while for entity B is 9%. We intend to compute the financial rate of return for the two entities in the following three hypotheses:

- 1st hypotheses: Both entities are financed exclusively from the equity (the leverage rate is 0);
- 2nd hypotheses: Both entities are financed 50 % from the equity and 50 % from debts (the leverage rate is 1);
- 3rd hypotheses: Both entities are financed 20 % from the equity and 80 % from debts (rata the leverage rate is 4).

The economic asset of the entity is of 1.000 mu, the income tax is 16 % and the interest rate 10 %.

The financial rate of return for the two enterprises, in the three hypotheses is the following:

	Entity A			Entity B		
	1 st hypotheses	2 nd hypotheses	3 rd hypotheses	1 st hypotheses	2 nd hypotheses	3 rd hypotheses
Economic rate of return	12 %	12 %	12 %	9 %	9 %	9 %
Operating result	120	120	120	90	90	90
Financial expenses	0	(50)	(80)	0	(50)	(80)

Current result	120	70	40	90	40	10
Income tax	(19,2)	(11,2)	(6,4)	(14,4)	(6,4)	(1,6)
Net result	100,8	58,8	33,6	75,6	33,6	8,4
Financial rate of return	10,08 %	11,76 %	16,8 %	7,56 %	6,72 %	4,2 %
Economic rate of return after tax	10,08 %	10,08 %	10,08 %	7,56 %	7,56 %	7,56 %

It can be noticed that in case of entity A, which has an economic rate of return superior to the interest rate, the financial rate of return increases with the indebtedness, and, therefore the leverage plays a favorable part. In the case of entity B, which has an economic rate of return inferior to the interest rate, the higher the financial rate of return is, the lower the indebtedness becomes, and, therefore the leverage plays an unfavorable part. It results that the higher the leverage rate, the higher the risk assumed by the owners of the entity is. A higher leverage rate allows the shareholders to receive a higher payment than the return on assets, but, in the same time, they can bear significant losses if the return on assets proves to be inferior to the interest rate. The leverage is *a double-edged weapon (Colasse, 1993)*, which can be mastered by the owners of the entity only if they use correct foresight regarding the economic rate of return. In the absence of such provisions, the indebtedness rate must be carefully manipulated.

3. PROSPECTIVE RATES OF RETURN

The interest of the economic and financial rates of return is limited from the financial point of view. As we have previously seen, when the economic rate of return is higher than the interest rate, the entity gains as a result of the leverage, but the risk of the entity also increases. This risk is not taken into consideration for the computation of the rates of return. Both the economic and the financial rates of return are ex-post determined, after the events have taken place. They are not corresponding to the shareholders or financers ex-ante requirements, but analyzed in time, they could provide valuable information for the foresight making. Nevertheless, although the *economic and financial rates of return* can't be used as criteria for choosing the investments or financing, they are *financial control instruments (Vernimmen, 2000)*.

In order to overcome the above-presented limits, we propose the following rates of return that correspond to the definition according to which *the performance represents the achievement of the fixed objectives* (the names of the rates belong to us).

The rate of return obtained by the shareholder is determined for a single period, based on the following relation:

The rate of return obtained by the shareholder = the yield + the plus or the minus of value =

$$\frac{d}{V_0} + \frac{V_1 - V_0}{V_0}$$

Where:

§ d – the dividend received by the shareholder for the analyzed period;

§ V_0 – the initial value of a share;

§ V_1 – the ending value of a share.

Placed in an uncertain universe, the investor can only compute this rate at the end of the period, when the share value is certain. Although the rate of return obtained by the shareholder is not computed based on the accounting data anymore, but based on the stock data, it isn't an instrument useful for the foresight making, because it is also ex post determined.

The rate of return required by the investor is equal to the rate without risk, increased by a risk premium, related only to the risk of not being diversified, which is the market risk.

The trend of a share to vary along with the market is reflected by the beta coefficient, β , which is a measure of the title volatility, reported to a medium volatility title. A low risk share is the one which tends to vary up and down, along with the market variance, measured by an index computed by the Stock Exchange. Such a share will have, by definition, a beta equal to 1, which indicates the fact that, generally, if the market increases with 10%, that share will also increase with 10%, and, if the market decreases with 10%, the share will also decrease with 10%. A question rises: which is the rate of return requested by the investor in order to compensate the risk he takes, to a certain level of beta? This profitability is obtained by adding the free of risk rate to a risk adjustment factor, required by the investors as a compensation for the risk assumption. This risk adjustment factor for a certain share is obtained by multiplying the market risk premium with the individual investment risk measured by beta. The equation for the rate of return computation required by the shareholder for a share is the following:

$$\text{Rate of return obtained by the shareholder} = r_{fr} + \beta_i * (r_p - r_{fr})$$

where:

r_{fr} - the rate of return (interest) of a share without risk;

β_i - beta coefficient of share i;

r_p - market rate of return;

$(r_p - r_{fr})$ – market risk premium.

The rate of return assessed by the investor (c_{pa}) is obtained by leveling the current price of a share (C_p) with the actualized sum of the dividends infinitely paid by the entity (d_p), as it results from the following relation:

$$C_p = \frac{d_{p1}}{(1+c_{pa})^1} + \frac{d_{p2}}{(1+c_{pa})^2} + \dots = \sum_{t=1}^{\infty} \frac{d_{pt}}{(1+c_{pa})^t}$$

There is a distinction between the rate of return *assessed* by the investor and the *required* one. The assessed rate reflects the value the investor expects to earn for a share, while the second rate represents the value required by the investor starting from the risk level of the share. Comparing the two rates, the investor can take the decision to keep or not the share. Therefore, if the rate of return estimated by the investor is higher than the rate of return required by him, the decision is to keep the action. But if the rate of return estimated by the investor is lower than he required by, the decision is to sell the share. Comparing the rate of return required by the investor with the rate of return obtained by him, the connection between the objective set by the investor - the required profitability and the current result – the obtained profitability is made. If the achieved profitability is higher than the required one, we can say that the investment is profitable; therefore it leads to high performance result.

CONCLUSIONS

We certainly believe that we succeeded in what we planned, that is to draw attention to the fact that to make performance is more than a simple goal. And, because the subject is so comprehensive and interesting, we will try to draw an informative conclusion.

Performance represents a complex concept, long debated by worldwide accounting professionals. The causes of the interest for performance, along with those already discussed, are in our opinion:

- The indissoluble relationship between performance, sustainable development, standard of life, productivity, economic growth and poverty eradication;
- The performance shaping as a self standing field of accounting, which starts to crystallize and individualize through the conceptual assembly and the particular instruments.

The performance always implies elements of productivity, efficiency and profitability; this is not an objective or a target, but a very important way of accomplishing the social welfare. The performance can also be seen as that ability of the entities to ensure a relatively high income from the exploitation of the production factors, as well as a superior income form the exploitation of the workforce.

The transition to the knowledge-based economy has as major impact the increase of the knowledge role and importance inside the production activities, developed by the entities, most frequently becoming the main source of making performance. The knowledge is a source for performance, because the main element the entities focus on is the added value and this is obtained also from knowledge.

Without pretending that we have drained the subject, but with peace of conscience that we approached a new dimension of performance – knowledge, we make an invitation to more exciting, challenging and full of substance approaches and deepening.

A SURVEY ON BUSINESS EVALUATION METHODS USED IN MERGERS

Jurcău Anca Sabina

Andreicovici Ionela Irina

Babeş-Bolyai University Cluj-Napoca

Faculty of Economics and Business Administration

In mergers, a subject that arouses controversies between the leaders of the companies involved in the transaction is the determination of the exchange ratio. The basis of its determination is represented by the application of business evaluation methods that are completed by a negotiation process. In order to better understand the major aspects regarding this issue, this article presents a literature review of the main business evaluation methods used to determine the exchange ratio in merger transactions. We concluded by showing the context of use and the application conditions of the most used methods.

Keywords: business evaluation methods, mergers, exchange ratio

Cod JEL: M41

1. Introduction

For the investors in companies that seek to merge is very important to determine whether the merger will be efficient for them or not. So, they must ask themselves if the acquired company is really worth. Naturally, both sides of a merger will have different ideas about the value of a target company: the seller will tend to establish a value as high as possible while the buyer will try to pay the lowest price possible.

In mergers, the essential point, which is the subject of the negotiation between the leaders of companies involved in the transaction, is the determination of the exchange ratio between the shares of the acquiring firm and the acquired firm. This ratio results from a comparison as complete as possible between the companies to merge, a comparison that is preceded by a gathering of information on the market, competition, legislation, and especially the company. Here is the role of evaluation.

Business evaluation does not suffer from the lack of methods, but rather from the coexistence of a large number of methods, among which practitioners may feel lost. The different business evaluation methods that exist can overlap to better estimate the price of a company and minimize the risk of error. But we must be aware that "there is no unique value of a company".

2. Research methodology

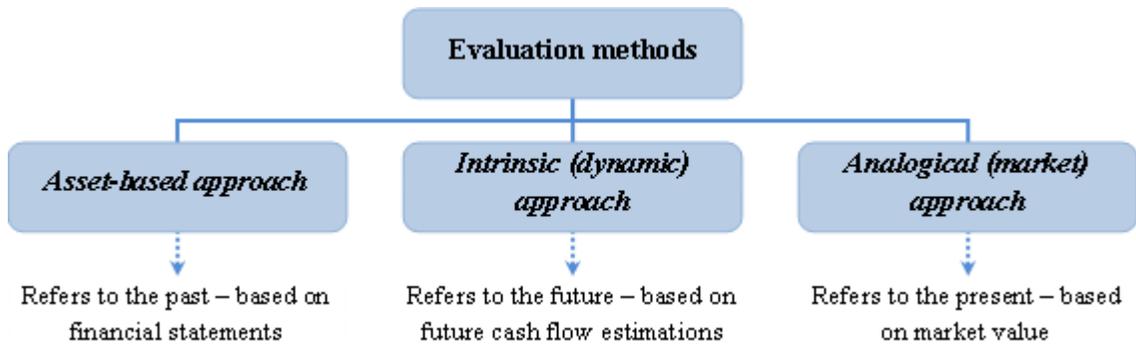

This paper is a theoretical study and its purpose is to present the different methods of evaluation used to determine the exchange ratio in merger transactions. We based our study on the information gathered from the existing literature at international level, using as a research method the qualitative approach.

This study is a fundamental research, the utility of such research, although it does not identify a problem with the purpose of solving it, being reflected in its contribution to the future developments of this research, by ensuring premises for forthcoming studies.

3. Evaluation methods – the base for exchange ratio determination

There are over a dozen methods of evaluation, these methods being structured differently from one author to another. As we can see in figure 1 Ceddaha (2005) groups the evaluation methods into three approaches.

Figure 1. Structure of evaluation methods

Source: adapted from Ceddaha (2005)

Asset-based approach

The theory underlying the asset-based approach to business valuation considers the value of a business as being equal to the sum of its parts. The asset-based approach estimates the selling value of the assets based on the financial statements. Using this method the objective is to estimate the accumulated wealth and not to determine the potential future value (Meier, 2009). In this context, the two methods used, approximates the net asset value or the adjusted net asset value.

The **net asset value method** consists in calculating the net worth of the company, namely the difference between the value of the assets adjusted for non-values and the amount of debt of a company (Meier, 2009). Even in a context of liquidation, the net assets are often penalized by the historical cost principle which involves recognition of an asset at its acquisition value and not at its resale value (Meier, 2009). Purely accounting, this approach is only a first approximation, very concise and promptly, of the value of a company (La Chapelle, 2002), which does not reflect its true value (Iselin, 2007).

The **adjusted net asset value method** aims to overcome the inherent limitations of historical cost and prudence accounting principles. The method consists in the reevaluation of the various types of assets and liabilities according to their replacement value, their use value or resale value, showing pluses or minuses of value. It is justified especially when the target company owns non-operating assets that can generate considerable gains (Meier, 2009).

This asset-based approach can be used in evaluating the exchange ratio for a merger by exchange of shares, if both of the companies are evaluated on the same principle. However, this approach has serious limitations. It is a static method that does not include the future perspectives of the company, the intangible assets (brand, corporate culture, customers), that form the competitive advantage of a company and are not included in the financial statements (Schatt & Roy, 2002).

The calculated value is a photograph at a time T, used by entrepreneurs to evaluate their assets but less relevant to a purchaser who justifies his investment by the expected profit, which is a bet on the future.

However, this approach finds its application in some cases, in real estate companies, investments companies or industrial holdings. In contrast, it is not at all adapted to rapidly changing companies: startups, business that grow quickly, where the latest balance sheet gives only a truncated picture of the business and its potential (La Chapelle, 2002). In all cases, the asset-

based approach provides only a first reference value that should always be complemented by other methods that take into account the expected trends, criteria more relevant to the investor (Iselin, 2007).

Intrinsic (dynamic) approach

The intrinsic or dynamic approach is the queen of the financial evaluation. Over the years, researchers have observed an increasing use of models based on discounted cash flows generated by the company in taking various decisions. A more recent evidence of this trend is provided by Trahan and Gitman (1995), Bruner et al. (1998) and Graham and Harvey (2001). Also, Mukherjee Kiyamaz and Baker (2004) found that almost 83% of buyers use the method based on discounted cash flows to determine the value of the target company.

Evaluation using a dynamic approach aims to determine the capacity of the company to create future value (Meier, 2009), value related to future cash flows generated by the company. Iselin (2007) considers that the philosophy behind this approach is based on the idea that the purchaser does not buy the historical flows of the company (the accumulated wealth), but the future cash flows (or the future wealth).

If the principle of the dynamic approach is simple, its application is rather complex. This method very used is based on the discounted future cash flows of the company at a rate representing the average remuneration required by the investors of the company given its risk (Ceddaha, 2005).

The enterprise value is the sum of discounted cash flow over an explicit horizon and the terminal value at the end of that horizon, when the cash flows are difficult to estimate (Salustro, 2009).

$$V = \sum_{i=1}^n \frac{CF_i}{(1+k)^i} + TV$$

CF_i - cash flow of year i ;

k - discount rate;

TV - terminal value;

n - number of years of the forecast period.

The method of discounted cash flows is divided into three steps, each of these steps posing different problems. According to Ceddaha (2005) the steps refer to: **1. establishing free cash flows over an explicit horizon; 2. choosing a terminal value at the end of the explicit horizon; 3. discounting the cash flow and the final value at a rate given the risk.**

The implementation of each of these steps is problematic: the duration of the explicit horizon, the determination of the terminal value and the discount rate are the main challenges facing the evaluator.

Regarding the **explicit horizon**, the evaluator should avoid it being too short not to give undue importance to the final value, or too long, so that the forecasts of cash flows remains only theoretical (Ceddaha, 2005). The problem of the duration of the forecast period has been often discussed by researchers: some argue that the forecast must be made for at least 10-15 years (Koller, Goedhart, Wessels, 2005) while others claim that an average of seven years is desirable (Ceddaha, 2005). There are also opinions that argued that the horizon must be long enough in order for the company to reach a stable state at the end of this period (Copeland, Koller, Murrin, 2000).

The choice of the explicit forecast period depends essentially on the number of years it is considered necessary before obtaining a stable business with constant rates of return and growth (Meier, 2009) and, in consequence, it coincides with the end of a period of extra profitability for the company (Cassia, Plati, Vismara, 2007). The explicit horizon, which coincides with the period when the company beneficiate of the competitive advantage (Cassia, Plati, Vismara, 2007)

is also determined by the business sector and the stage of business development (Ceddaha, 2005, Sherman & Hart, 2006).

In DCF method the analysis of the **terminal value** has often a considerable weight in the calculation, but its determination is often ad hoc or requires assumptions regarding free cash flows beyond the horizon (Penman & Sougiannis, 1998). The estimation of the terminal value is frequently at the heart of debate because it is often an important part of the value obtained by the DCF method (Cassia, Plati, Vismara, 2007), especially when the explicit horizon is short (Ceddaha, 2005).

Perhaps the most crucial concept of the DCF method is the **discount rate**. As the future cash flows occur in the future and the target company is valued today, it is necessary to adjust future capital inflows in today's money. The discount rate reflects the idea that the same amount of money is worth more today than in the future (Sherman & Hart, 2006). Economic and finance theory proposes the use of the corporate cost of capital as a discount rate. This value is the weighted average cost of the funds available to a company, including equity (common stock), debt (after tax rate), and preferred shares.

Even the value approach by the DCF method suppose a delicate matter, requiring a real know-how, it is the most capable of reflecting the global nature of the business and its ability to deliver performance in the future.

Analogical (market) approach

The market valuation approach, known also as the multiple valuation method or the method of comparables, is among the approaches the most used by practitioners for the evaluation of unlisted companies. For example, Asquith, Mikhail and Au (2005) reported that 99% of analysts use multiple method for evaluating companies and Roosenboom (2007) finds that underwriters typically use this method when evaluating initial public offerings (IPOs).

This method consist on transposing (by using ratios called multiples) the market capitalization of a company listed on a stock exchange to the company that we want to evaluate. It is based on the application on historical or anticipated balances of the company to evaluate, of the calculated multiples based on a sample of comparable listed companies (Ceddaha, 2005) or the "peer group".

The method proceeds in three stages: **1. defining a sample of comparable companies; 2. calculating the multiples; 3. applying the multiples to the target firm.**

Even the method is apparently simple and fast, it still involves some problems, especially in defining the sample and the choice of the multiples.

Concerning the "peer group", the companies selected to be part of it must belong to the same industry, be of similar size and have a similar stage of development and an economic model as close as possible (Pansard, 2007). But this is not enough; in order for the companies to be similar, they must have a comparable dynamic of value creation in terms of growth and economic profitability perspectives (Ceddaha, 2005). The value of a business is an increasing function of future payoffs and a decreasing function of risk (Liu, Nissim, Thomas 2000); therefore, the companies in the sample should be comparable with the evaluated company not only in terms of growth ratios but also in terms of risk.

As for the number of companies in the sample, Ceddaha (2005) considers that it is better to have a small but reliable sample rather than having fifteen companies with disparate characteristics whose value creation differs too much from the company to evaluate. Based on an empirical study, Cooper&Cordeiro (2008) demonstrated that using about five comparables is optimal when the comparable firms used are those from the same industry with expected growth rates closest to the target firm, and if their average growth rate is within 1% of the target firm's growth rate.

The problem of the "peer group" was also studied by Henschke & Homburg (2009) which considers that is not sufficient to reduce the sample to the most similar firms, because differences

remain, and correcting for them leads to the most accurate value estimates. So, to have a value of the company closer to reality, it is necessary that the sample is homogeneous.

The multiples utilized in the market approach represent the ratios between the observed market values and the measured values of the indicators for firms in the sample. When defining the multiples various indicators are utilized such as operating income (EBIT), profitability (EBITDA), price earnings ratio (PER), cash flow per share or even book value of equity per share.

The average of the ratios calculated for firms in the sample is the multiple used for determining the value of the company to evaluate. For the average be meaningful, it is important that the value of the ratios we calculate for each company in the sample be relatively close. If they are greatly different, which implies that the dispersion around the average is substantial, the average (a measure of central tendency) will not be very meaningful (Weston & Weaver, 2001).

The most utilized multiple is PER that establishes the value of the equity of a company from its historical or estimated net income. Taking into account that the market price reflects the real value of all future benefits of a company (Barker, 2002), PER represents the value of future benefits related to the current ones that is the rate at which profits are discounted.

Even if it has its limits, the market approach, which is based on the assumption of market efficiency (Ceddaha, 2005), is preferred by the evaluators because allows them to predict what the publicly traded price of a company is likely to be (Weston&Weaver, 2001).

4. Conclusions

The different evaluation methods that we have presented have each its advantages and limitations. Finally, the evaluation methods are only a measurement tool that should be adapted according to circumstances. As we can see in table 1 each method of evaluation is relevant in a certain context and taking into account specific conditions.

Table 1. Context of use and application conditions of evaluation methods

Evaluation methods	Context of use and application conditions
Net asset value	Rarely relevant in mergers
Adjusted net asset value	Relevant for holding companies (investment companies)
Discounted Cash Flow	Relevant in any context, less for holding companies, if the values used (cash flow projections, terminal value and discount rate) are correctly estimated
Multiples	Relevant for non listed firms if there are enough similar listed companies able to form the peer group

Source: adapted from Meier (2009)

Using these or other methods we obtain a value, but not a price. The value is derived from a calculation and can be adjusted while the price is the result of a negotiation between the parties and involves factors like the supply and demand, market share, synergies for the buyer, liquidity needs of the seller etc. (Salustro, 2009).

The evaluation methods are useful because they provide a starting point and a range of reasonable values based on reasonable assumptions and actual events (Sherman & Hart, 2006). However, the price of a company depends also on the real determinants objectives of stakeholders. The variety of evaluation methods led to a variety of values of a company, so we

can say that there is no single value or “fair” value. The value taken into account in a merger to determine exchange ratio of the shares is also the result of calculations, estimations, but mainly the result of negotiations.

The evolution of Accounting during the transition to a market economy has demonstrated the existence of a special methodology of gathering, processing and providing information related to modern Accounting, based on specific informational system. Accounting may offer a model, as a means of expressing financial records and its economic activities.

Key words: accounting, standards, audit, financial records;

JEL: M41; M42

1. Utility of the information from the annual financial statements

Accounting remains the main provider of economic information necessary for managers to short-term decisions. It is designed currently as an internal tool in making decisions and in achieving management control. Role in addition to providing real and reliable information on whether the property, it is the financial audit. This information is useful not only managers but also other categories of users.

If the information produced by accounting, particularly those based decisions can not be disclosed because it is the company's strategy, the audit report provided by may be published.

Information provided to be useful, must first be accurate, and timely, do not require high costs for collection and, in particular, to be current. In terms of accuracy, determine the quality of decision information. Incorrect information may lead to loss-making decisions for the enterprise. **Thus, accuracy of accounting information is feasible but with higher costs.**

Accuracy of information is understood both in terms of calculation itself and in terms of actual coverage of all cost items, the causes that generated them and the responsibility for these.

Timeliness of information, characterized by promptness is transmitted, the quality of decision is crucial since a belatedly received information loses value and is equivalent to manager a total lack of information.

News information, depends on the promptness with which it is collected, processed and transmitted.

The three characteristics of information, where information can be found and released by a financial audit. Thus, the information is essential for financial audit because, based on the audit report are forecasts or future acquisitions and may lead to an incorrect date and the bankruptcy of a company. If information is appropriate to say that a financial audit report based on statements made earlier, there is no relevance to meet the objective "true picture".

Current market economy system, is characterized by a high level of technicality, modernization and upgrading in accordance with market demands immediate, is due to rapid obsolescence. The amazing speed of processing requires all sectors and industries to Western standards align to succeed and be profitable in step with social progress.

A rigorous accounting system, will reveal changes that may be made to the accounting database in order to reflect the transition from a centralized economy to a market economy, a process currently under way in Romania. The accounting system is designed to provide third parties the information that he produces are able to meet the needs of their end users.

Current and potential investors need information to help decide on the one hand, whether to buy, keep or sell their shares in an entity asset and, secondly, in relation to that company the ability to pay them dividends. They are useful information for establishing the rate of return possible in the

next period, so as to make comparisons in terms of existing opportunities at a time on the market and investment risks.

Managers need information units, which enable them to conduct business in a profitable manner. They require access to additional information that would help in better asset management entity. Tax authorities requires that financial statements are prepared so that the taxable profits of the company can be properly determined.

Tax financial statements are prepared using a system of precise rules provided by laws in force accounting and pilot companies based reasoning system based on professional, by the provisions of the Framework and International Accounting Standards.

Employees have brought attention to accounting, where they are interested in items relating to the size of profits, the distribution thereof, and growth prospects in terms of salaries and establishment of various benefits and personal opportunities available to them.

Providers are concerned about the degree to which the debtor unit will meet its obligations and at the same time, their interest on its future business volume, which can significantly influence the volume and value of orders unobtainable.

Customers are interested in the company's ability to continue their work, they require a range of information, enabling them to estimate the prospects of business partners so that in the event of major changes that might occur, appropriate reactions able, leading to their protection activities.

Lenders are a category of donors, including a significant share of banking units have.

Banks are anxious especially when pre-credit analyst, the capacity for repayment of loans to be granted, the degree of liquidity of the customer and its ability to profit in the period ahead.

Other external users are represented by groups or individuals who were not included in the categories listed, such as, for example, competitors, consumers, etc..

Depending on user requirements, the manager decides in what context will attempt to provide the information required, given that information to be provided are those prescribed by law or regulation, but on the other hand, there may be information sought by users are not included in financial statements and the company can provide. Can there another category of information called "sensitive", which the company does not want to make them public because they can significantly influence the market.

Another factor in choosing the information that is provided, the cost of collecting information, which in some cases, benefits may be more important than communication.

The database has a flexibility that allows all users needs, without double accounting records. To increase business competitiveness, it must rise in "top of the best companies", in which are highlighted national elements of profitability, turnover, which is a prerequisite for future partnerships.

In a market economy based on continually increasing the quality and level of information, "information is power."

The large number and variety of transactions undertaken in a market economy, the vast majority of large companies, shows that these benefits need speed data processing by computer.

2. Qualitative types of data derived from financial statements

Whatever the system chosen, or the computer at hand, he easily makes a reference to primary documents, any underlying transaction (eg invoice number).

Processing system mainly to record economic information, have the capacity to generate evidence of financial audit work necessary part of the financial auditor.

We can say that the financial auditor prefers a computerized data collection system, because it is easier to test the accuracy of the database. For example, in accounting for leases, according to International Accounting Standards, it must be net reveals they were registered or leased the assets held under leases, which would be very difficult if use of manual records, especially from a company whose main line of business leases.

Thus, auditors, the position of independence and impartiality that lies have a significant role in ensuring the quality of financial statements information released, bringing it greater credibility. From this perspective, the financial audit is designed to equally protect all users of accounting information.

Although financial audit does not provide an absolute guarantee, remains the most likely risk management information and thus to obtain high quality information, useful for different users decisions.

Financial Auditor role is to increase user confidence that the accounting information was obtained, processed and analyzed in accordance with international accounting standards and auditing and financial statements present all (or reserves) reflects the economic reality on financial audit.

3. Specificities, in terms of quality of financial statements conducted in accordance with the International Accounting Standards

Under the general framework of the International Accounting Standards Committee, information is significant because their omission or erroneous declaration may influence the economic decisions of users, decisions on financial statements.

Qualitative characteristics are characteristics that determine the usefulness of data derived from financial statements and are classified into four categories: understandability, relevance, reliability and comparability.

Intelligibility of information provided, is an essential quality for users, because it involves the ease with which can be understood and applied these data, but assuming that beneficiaries have sufficient knowledge of financial, accounting or even economically.

Relevance of information, is that influence economic decisions of users, helping them to assess events, confirming or correcting their past evaluations. Under the new rules, an auditor formulates an opinion on whether financial statements prepared by the company really reflects a true and fair view, carefully choosing the level of materiality.

Within each of its mission, financial auditor shall ensure that all issues may be important and may affect the audit opinion were fully taken into account. Thus, the audit procedures used are designed to provide reasonable assurance of detecting all important aspects of the problem.

Relevant information is influenced by nature and materiality. Materiality is largely subjective, but his determination, the financial auditor's reasoning makes use of his professional

Auditor is concerned to properly quantify the materiality level for two reasons:

6. To decide on the level of materiality used during the procedure for collecting audit evidence. Audit scope and purpose of the tests are mainly related to materiality;
7. To decide on the "materiality level of opinion";
8. Materiality is an expression of meaning or relative importance of an issue in the context of financial statements. An issue or value is considered significant if its omission would affect obviously, decisions of users of financial statements.

Credibility is the quality of information we ensure that it does not contain significant errors, is neutral and trustworthy. Credibility of information based on the following defining characteristics: fair representation - information to be reliable, economic transactions and events reflect exactly;

- § Prevalence of economics on the judiciary - the vast majority of transactions counting process reflects the economic substance of transactions, not just their legal form. To take into account the prevalence of a transaction, look at all aspects and implications, with emphasis on those which may have a commercial effect in practice,
- § Neutrality - the information contained in financial statements to be credible and timely in making correct decisions, it is necessary that it should not be influenced by anything
- § Prudence - professionals who prepare financial statements have various uncertainties in the presentation of economic issues, but are always careful in using professional

judgments so that their estimates are not contrary to the principle of prudence. Allows accounting records to assets of real value, or as close to reality through prudent valuation of assets and liabilities

- § Completeness - not to be invalid, the information required to be complete, without omitting significant issues, within reasonable limits of materiality chosen correctly.

Comparability - The financial statements presented are compared in time and space, so users could make a relevant opinion on the financial position of the enterprise market and its expected performance. Therefore, disclosure of the accounting records, indicators and accounting policies, and consistency is achieved in case of changing some of the techniques used, they will be presented in such a way that it can pair with the techniques used in previous periods .

4. Accounting framework in accordance with International Accounting Standards which define the limits of accounting information is relevant and reliable by:

- Opportunity - refers to the timely submission of economic data, because a delay in reporting can lead to loss of information relevant effects;
- Cost-benefit - is a limit as coercive rather than qualitative, this ratio is optimal when we refer to relevant information. If information is to obtain a price higher than the benefit of its use when it has no capacity to be relevant;
- Balance between qualitative characteristics - the specialty practice can not be rigorously quantify this balance is a problem because professional reasoning, resulting in financial statements, which belongs to both producers and users of information.

Reflects the information in the financial statements, is a concept of British origin, took over and defined by EU Directives. In the Romanian accounting, this new concept was introduced by the Accounting Act, under which, the official document of the management of economic units is the "balance sheet, which gives an accurate picture, clear and complete assets, financial position and performance".

5. Conclusion

In conclusion we can say that Romania's current accounting rules require financial statements to be made so that they reflect a true and fair view of heritage. This is possible if professional accountants and management unit uses professional reasoning. An important part of professional reasoning is related to the accurate determination of materiality for the purposes detailed presentation of financial statements (either primary or statements in the explanatory notes annexed to the balance sheet) of significant items. This is very important and is given special attention since, including detailed accounts of insignificant items could create confusion in their interpretation or analysis would hinder them. It is widely agreed that the use of judgment, not carried out with a universally valid model whose application to provide a financial audit with guaranteed positive results.

Such a goal is achieved through the rigorous pursuit through a deep understanding of the economic environment, social and institutional entities audited by resorting to specific professional standards and adherence to a code of professional ethics.

Financial auditor is a difficult approach even with meeting all these elements.

In conclusion, we believe that the opinion made by an auditor improves the quality of the information contained in financial statements and is the most efficient manner in which it appears that financial statements do not present significant deviations, thus meeting the interests of both parties.

Sustainable development is an economic growth strategy aimed to conciliate economic and social progress without endangering the natural equilibrium of the planet. The true stake of the future is the avoidance of environment degradation through developing of a responsibility sense both of citizens as well as of companies, for the purpose of reaching a stable sustainable development. Environmental accounting expresses the appearance of a new ethics that answer to the human worries for planetary development and progress. Starting from the damage caused to the environment, we ask ourselves about the destructive activity conducted by companies and making them responsible of the problem to the future generations.

Keywords: environmental accounting, social responsibility, environmental cost

JEL code: M41, M14

Sustainable development and corporate social responsibility

Sustainable development means that the needs of the present generation should be met without compromising the ability of future generations to meet their own needs. Sustainable development is the constant re-evaluation of the dialogue between man and nature and the connection between generations in the process of multi-dimensional evolution of human society, proving to be an essential process of this world, also being an approach superior to the environmental management traditional belief.

Protecting the environment is one of the concerns of modern societies. For example, the European Union adopted in 2002 the Sustainable Development Strategy, updated in 2006 and 2009. Within this document, one of the principles of sustainable development politics is the implication of partners from the social and business environments, principle that aims to enhance the social dialogue, corporate social responsibility and private-public partnerships to foster cooperation and common responsibilities to achieve sustainable consumption and production¹¹⁶⁷. This is a result of the idea that a concern for the state of the environment cannot be adequately examined without considering corporations¹¹⁶⁸.

As a result of this vision over development, the corporation slowly evolves towards logic of responsibility. The company is considered a part of the society, not just a production and profit instrument for the shareholders; therefore, entities have also a social responsibility. This responsibility takes into consideration the interests of all stakeholders, starting from the shareholders, employees, business partners, to the consumers and the community, and needs a social implication strategy that must integrate in the long and medium term communication and development strategy. Today, ethic preoccupation in companies is being underlined and it is brought into discussion the analysis of applying the moral rules of individuals to the concrete decisions made within the company. Companies should consider social responsibility a competition strategy component. Those that have minimized environmental risks are the ones more advanced in developing own policies regarding to employees, shareholders, clients,

¹¹⁶⁷ European Union, Renewed EU Sustainable Development Strategy, 2006, p. 5.

¹¹⁶⁸ Bullis, C., Ie F., Corporate Environmentalism, In S. K. May, G. Cheney, & J. Roper (Eds.), The debate over corporate social responsibility, Oxford University Press, New York, 2007, p. 321.

suppliers, and they managed to improve long and medium term economic performances. Research related to environment protection has shown that company social responsibility significantly increases client satisfaction and fidelity. Implementing an ecological and responsible business model considers criteria like: implementing an environmental politics that respects the entities' vision and mission; capital allocation for environmental management, implication of human resources in the process; usage of various instruments. The involvement of major corporations in matters of environment shows the concern and the interest of modern industries for environment¹¹⁶⁹.

This concern is underlined by the fact that many of the modern companies included environmental problems in the Corporate Social Responsibility Charter. Whilst there is no unitary definition of social responsibility, we consider that this represents the discernment of specific issues, problems, expectations and claims upon business organizations and their leaders regarding the consequences of organizational policies and behavior on both internal and external stakeholders. The focus is upon the products or corporate actions¹¹⁷⁰. Social responsibility is just a component of the corporation social politics process which includes corporate social responsiveness, that means development of individual and organizational processes for determining, implementing and evaluating the firm's capacity to anticipate, respond and manage the issues and problems arising from the diverse claims and expectations of internal and external stakeholder¹¹⁷¹.

Developing of such capacity for company need to set up a managerial system of environmental problems, and accounting plays a key role in this system.

Environment accounting – tool of environmental management systems

Environmental accounting represents a methodology for quantifying the costs and effects of environmental conservation activities. Initially integrated in social accounting, environment accounting has its origin in a multitude of legal, economic and social factors. To summarize, three factors are at the base of environment accounting: the legislative basis, costs evolution and pressure from the stakeholders. They challenged companies to review some of the practices regarding their decision-making process and the communication of environmental information. Through the introduction of environmental accounting, companies aim to improve the effectiveness of conservation efforts and implement sustainable environmental policies with quantifiable results over a long term.

Using environment accounting has a number of advantages like¹¹⁷²:

- the possibility of managing more efficiently the flows of energy and materials, including the quantity of wastes, their type and their destination;
- the possibility of better estimating, identifying and managing of general costs and environmental costs;
- obtaining more precise information for starting and sustaining programs for improving environment performance;
- obtaining the necessary information for measuring and reporting the environment performance¹¹⁷³, for the purpose of upgrading the image of the organization in relationship with all those interested in its activity (clients, employees, government, investors, stakeholders).

¹¹⁷¹ Idem.

¹¹⁷² Toms, J.S., Environmental Management, Environmental Accounting and Financial Performance, Publication: London CIMA Publishing, 2000, p. 157-168

¹¹⁷³ Idem.

Environmental information publication is a key company accountability process, and environment accounting helps entities substantially improve their trustworthiness among the people and enjoy a fair evaluation¹¹⁷⁴.

Environment accounting is the attempt to use control and tracking analogue instruments (information identification, measurement, accumulation, analysis, interpretation and communication)¹¹⁷⁵ in favor of those used in the economic management of a company or a public authority.

Environment accounting is now entirely new but it coexists with previous visions. It evolved in the last two decades and had as motivation the development of an accounting system that would supply a basis for efficient activity planning regarding environment and financial protection. The setting up of economic and environment accounts offers synthetic information to key decision makers regarding environmental resources and it is necessary for determining environmental costs and their consequences over production, income and economy.¹¹⁷⁶

The main objective of environment accounting is the reform of managerial accounting in order to allow entities to improve their profits by reducing costs. Practically, environment accounting is an instrument with which entities can modify their existing accounting systems so they can offer managers information about environmental costs.

From this point of view, in elaborating entity development politics and strategies, managers must take into consideration environmental costs. These are the expenses linked to the prevention of environment pollution and degradation, evaluating pollution and environment protection and fixing these problems¹¹⁷⁷. Taking into account the variety of the effects of an entity over environment, it's difficult to quantify the costs of environment degradation. The difficulties are generated by the lack of knowledge regarding nature and the scale of the destructions, but also by the lack of a market price. The main problems identified in quantifying environment costs are: the singularity of environmental investments and polluters, the economic horizon, the absence of a market, the absence of relations between cost and efficiency.

The analysis of environment accounting practices concludes that this branch of accounting has succeeded, in theory, to accomplish its initial objectives. It was about management help tools like accounting environmental aspects and communication of environmental information for what financial accounting stands for.¹¹⁷⁸

The requirement to establish the financial impact of environment performances was recently introduced in environment performance evaluation and reporting. As a result of such problems, not only environmental information presented in financial statements is subjected to audits, but also information presented in environmental or sustainable development reports¹¹⁷⁹.

A short analysis of the Romanian companies involvement in environmental matters

Starting from the general objective of the European Union Sustainable Development Strategy, the Sustainable Development National Strategy of Romania establishes that eco-efficient management of resources consumption and their maximum exploitation to be realized by

promoting a production and consumption model which would allow a long term sustainable economical growth and a successive rapprochement to the medium level of performance of European Union's countries.

European integration led to a greater attention given to environment by the economic agents. Romania begun to show some interest in the field of eco-efficiency, as a way to ensure sustainable development, but it lags far behind other European countries. Undoubtedly, the localization of important multinational companies (e.g. Renault, Siemens, Alcatel, and Continental) in Romania contributed to raising corporate awareness in terms of environmental impact and will foster a positive evolution in the field¹¹⁸⁰.

Sustainable Development National Strategy of Romania is a national document which complies with the sustainable development strategy of the European Union. Its main objective is the continuous upgrade of quality of life, creating durable communities able to capitalize the economy's ecological and social potential, to manage and to use resources efficiently mainly to ensure prosperity, environment protection and social cohesion.

As for the Romanian companies involvement into environmental problems, we will realize an analysis on the base of the expenditure made by these for environment protection.

In Romania, the economic agents' expenses related to environment protection are distinctly underlined for the unspecialized economic agents, the ones that carry out an environmental activity as a secondary or auxiliary activity, and for the specialized economic agents, the ones that posses a department which has environment protection as a main activity.

Table no. 1
Types of environmental expenses by types of producers
- thousand LEI current prices -

	2006		2007		2008	
	Nominal values	%	Nominal values	%	Nominal values	%
Specialized producers (total) from which:	5297304	68	7039354	72	8328234	65
- investments	793154	10	1048084	11	1716516	13
- internal current expenses	4101018	53	5487074	56	5637738	44
- external current expenses	403132	5	504196	5	973980	8
Unspecialized producers (total) from which:	2460918	32	2743422	28	4516525	35
- investments	1125384	15	1329980	14	1550499	12
- internal current expenses	961416	12	913847	9	2153762	17
- external current expenses	374118	5	499595	5	812264	6
Total environment protection expenses	7758222	100	9782776	100	12844759	100

¹¹⁸⁰ Bărglăzan D., Drăghici A., Vartolomei M., Eco-Efficiency – The New Dimension Of Economic Efficiency, în journal Recent, Vol. 10, no. 3(27), November, 2009, p. 180.

Considering this data it can be ascertained that in the producers environment protection expenses total, a big part are the expenses done by the specialized producers (65% in 2008), and the unspecialized producers expenses are only 35% in 2008. In the analyzed periods, the expenses evolved contradictory, but in time they have a constant growth. In 2007 in regard with 2006, the environment protection expenses done by the specialized producers grew by 1.742.050 lei, absolute value and 33% relative value, and in 2008 in regard with 2007 they grew with 1.288.880 Lei absolute value, and 18% relative value.

By analyzing the other component taken into consideration, unspecialized producers environment protection expenses, it is observed that these registered a significant growth in the period 2007-2008. So, in 2007 in regard to 2006 the expenses grew with 282.504 Lei, absolute value, and in 2008 in regard to 2007, with 1.773.103, absolute value, or 65% in relative figures.

The explanation of this evolution is given by Romanian adhesion to the European Union and the necessity of economic agents to abide by the environment requirements imposed by the communitarian aquis.

Table no. 2

Environment protection expenses, domains and types of producers

- thousand LEI current prices -

Environment domain	2006	2007	2008
Unspecialized producers – total, of which	2460918	2743422	4516525
Air Protection	962660	803990	1242606
Water Protection	514629	642085	788120
Waste and used water elimination	411186	479853	1072457
Soil and groundwater protection	237729	179375	619360
Noise and vibration reduction	32338	19093	8900
Natural resources protection and bio-diversity conservation	119123	117202	141974
Other environment domains	183253	501824	643107
Specialized producers – total, of which	5297304	7039354	8328234
Air Protection	21762	44614	55984
Water Protection	1146586	1002417	1352751
Waste and used water elimination	4024884	5843427	6778036
Soil and groundwater protection	30304	27468	65817
Noise and vibration reduction	5912	19728	3165
Natural resources protection and bio-diversity conservation	33189	39384	21900
Other environment domains	34667	62316	50582

Source: www.insse.ro

Analyzing the environment protection expenses of domains and types of producers, we observe that in the three years taken into consideration, the specialized producers invested the largest amount in waste and used water elimination, and the smallest amount, in noise reduction.

The most sensitive environmental domains, air protection and water protection, registered an ascendant trend. Thereby, in 2008 in regard to 2007, expenses for air protection done by the unspecialized producers have risen by 438.616 lei, absolute value. Meanwhile, air protection expenses done by specialized producers have risen by just 11.370 lei, absolute value.

The expenses for water protection rose progressively, reaching 514.629 lei in 2006 for the unspecialized producers and 788.120 lei in 2008. The specialized producers spent 1.146.586 lei in 2006, and 1.352.751 lei in 2008.

Conclusions

In the face of environment problems, companies must become morally responsible, but the way in which each company understands this responsibility is different. The true problem rises in the convergence of social responsibility with economic interest followed by any company with an economic life. In this point environmental accounting intervenes, not as a supplementary cost source, but as a mean of better administration of companies' resources in the perspective of an economic sustainable development.

Environment accounting is an indispensable tool for the application of the "sustainable development" concept and the insurance of environment protection. It is constituted under the form of a system that permits environmental information organization, through physical or monetary indicators.

Companies relate more often to the concept of sustainable development, gently evolving towards responsibility logic. They must take into account more and more the economic and social restrictions of the markets in which they operate. Practically, for obtaining decision assistance tools, each company needs information regarding the state of the environment, quantifying environment costs that affect its activity. Environment accounting must supply this kind of information and to propose a way of evaluation of environment deterioration.

A successful assimilation of the notion sustainable development will take shape in options that modify the companies' business model, in the spirit of a long term vision and a sustainable mission.

Accounting Today Summum is based on the theories, concepts and sentence combining increasingly international standards and European Directives in the field. In our country, to date there is no obligation application of IFRS, but the accounting regulations with European Directives and International Accounting Standards (IAS). Of caution, most of EU countries applying national accounting regulations with European directives, the separate financial statements, and International Financial Reporting Standards are used to prepare consolidated financial statements. Many EU countries have identified the risks arising from the application of IFRS as the primary basis of accounting and have shown restraint in their application avant. According to the above we are led to think about proposing a strategy to implement IFRS / IAS forestry entities within the National Forest “Romsilva”.

KEYWORDS

Forestry entity, biologically active, biological transformation, harvest

*Cod JEL: M – Business Administration and Business Economics; Marketing; Accounting
M4 / Accounting, M41-Accounting*

International Accounting Standard for Agriculture was approved by the IASC Board in December 2000, being last in the great family of the IAS to work with major changes in previously approved standards on specific elements of farming but because of many similarities with the work forestry. The objective of this standard “Agriculture” is to prescribe “the accounting treatment and disclosures that pertain to agricultural activities”¹¹⁸¹ by these activities understanding the transformation of biological assets for sale of agricultural products or additional biological assets.

The “spirit” of IAS 41 by active biological means “a live animal or a plant”¹¹⁸² and a group of biological assets is “a group of similar living animals or plants”, and it is clear that forestry is biologically active handlers forest plants (trees and shrubs), game, fish, birds, etc. . Also to be understood very well the concept of “biological transformation” and “harvest”. Thus, the biological transformation processes means growth, genetic transformation, production and procreation, which affect the quantity of a biologically active, “harvest” implies separation of production from a biologically active or biologically active termination of life.

¹¹⁸¹ International Financial Reporting Standards (IFRS) CECCAR Publishing, Bucharest, 2006, p.2156.

¹¹⁸² IAS 41 „Agriculture” CECCAR Publishing, Bucharest, 2004, p. 37.

We believe that these definitions are sufficient to cover the full range of forestry activities, with recognition that there are a number of features such as:

1. **Ability to change** - live plants and animals are capable of biological transformation;
2. **Managing change** - involves the administration that facilitates biological transformation by increasing or at least establish the conditions necessary to conduct the process;
3. **Measuring the change** - which is to change the quality or quantity due to biological changes that are measured and monitored, there intervened and routine administration.

An entity should recognize a forest biological asset when and only when:

- entity controls the asset as a result of alternative events,
- it is probable that future economic benefits associated with the asset to run the entity;
- fair value or cost of the asset can be reliably measured.

A forestry entity within the scope of IAS 41 “Agriculture” shall not¹¹⁸³:

- a. The investment made in a forest in reducing atmospheric carbon, this gives rise to carbon credits that can be sold or used to offset pollution caused by entity,
- b. forest belts of the slopes and riverbanks,
- c. live animals and plants held for exhibitions and competitions (horse, etc. ornamental seedlings.),
- d. deforestation,
- e. hunted in natural,
- f. collection of spontaneous vegetation (berries, herbs, mushrooms, etc.).

A biological asset or a product of its assets must meet the conditions for recognition in the annual financial statements of an entity forest, according to the Framework for the Preparation and Presentation of Financial Statements issued by the IASC. In this regard in paragraph 89 of the framework states that an asset will be recognized in the balance “when it is likely to achieve a future economic benefit the company and the asset has a cost or value that can be measured reliably”¹¹⁸⁴. From the practical point of view, controlling forest establishment on a biological asset or agricultural produce is determined by property ownership, control or exercise a right like property, which arise from past events (eg, control of national forest property as forestry entity). But the question is the evaluation of these biologically active.

IAS 41 “Agriculture” and also make a very significant shift from the traditional model of assessment based on historical cost, widely applied by economic entities in general. This shift is based on evaluating fair value minus estimated costs of providing point of sale enabling more relevant information that reflects the effects of changes caused by biological transformation of assets. In a forest entities should be evaluated as a biological asset at initial recognition and at each balance sheet date at fair value less estimated costs of point of sale. Point of sale costs include commissions and fees imposed by regulatory bodies and exclude transport and other costs necessary to sell products on the market.

Determining the fair value of biological assets in forestry can be done more easily by grouping them based on significant attributes: species, age, quality, etc., But this value will be relevant if it was based in an active market. If there are more active market base will consider the most relevant market but also the biological assets used for recovery. If there is an active market can use a number of criteria including the sign:

- latest transaction price on the market,
- the market price for similar assets appropriately adjusted to reflect differences;
- benchmarking of activities such as a value in number of seedlings planted per hectare or value expressed in pounds of meat pheasants.

¹¹⁸³ IAS 41 „Agriculture” CECCAR Publishing, Bucharest, 2004, p. 37.

¹¹⁸⁴ Opera quoted, p.72.

A forest is biologically active entity generating future benefits but economic life beyond the financial year. This is the case, for example forestry plantations (forest) to obtain wood household supplies but considered biologically active and producing biological assets such as pheasants and trout farms, which produce eggs, chicken and meat. In this case the fair value measurement is compromised and has an major impact on the relevance of annual financial statements.

Forestry activities involving the gradual physical development (growth of forest plantations or increase an animal) which clearly brings a biological asset value growth is creating a new element (seedlings obtained from seed - or birth of an animal nursery: pheasants, fish, etc. .) have no place any transaction. These biological changes related to future economic benefits. For example, the rhythmic growth of forest plantations unequivocally and directly affects the expected future economic benefits, but differ in terms of pace bear all costs. If they would use the assessment based on historical cost accounting point of view, if the previous example would be the recognition of revenue to intervene at the first harvest and sales (probably more than 80-100 years after planting) wood products derived forestry entity. We believe that such a forestry entity, the processes of growth, propagation, harvesting indicators are "pawns" for assessing the performance of such entities. The assessment of biological assets at fair value result in an assessment and reporting period income growth throughout the plantation until harvest. All these arguments based on fair value assessment increases the relevance, credibility, comparability and understandability of information based on this model, than what would be obtained based on historical cost. Also believe that by determining the fair value is the relationship between the value of biological assets size of the expected future economic benefits of forestry entity from those assets. Where market prices due to the current condition of the biological assets are not available, you can use net present value of asset cash flows to pre-tax discount rate determined by market fluctuations. In this case, consider the current value of biological assets, excluding any increase in value from additional biological transformation and future activities of the entity. For example, an entity 31.12.2008 a plantation forest has 600 trees to be harnessed as silver Christmas trees over three years, namely the 2012 Act because their condition is not an active market. Current market price of silver fir Christmas tree is sold for 100 lei. The value of plantation forestry entity at year end would be 600 pcs. X 100 ROL = 60.000lei. For estimating the fair value is calculated the present value of expected cash flows from asset sales biological considering a discount rate of 8%. Discounted net cash flows of plantetei 31.12.2005 would be $60,000 / (1 + 8\%)^3 = 47,630$ lei. Fair value can be approximated by costs when:

- biological changes occurring in fewer initial costs incurred (for example, between the time of sowing in the nursery and the balance sheet),
- when the biological transformation of the price impact is not expected to be significant (for example growth of a pine plantation that has a cycle production 40-80 years),
- if the market price changes are insignificant. According to Romanian legislation in the field, fair value is equivalent to the free market price represented by the “open price competition under free form, in which no one agency can not influence the market or decide unilaterally setting the level and its dynamics, price formed on the basis of direct confrontation between buyers and sellers”¹¹⁸⁵.

At initial recognition of a biological asset at fair value less estimated costs of point of sale can be found a gain or loss will be included in net profit or net loss for the period. Such situation would meet the forest entities that own farm pheasants. Exemplified by a case study, the rearing of pheasants are produced in April this year, following incubation process 4,000 chickens live to be capitalize a foreign partner. The market price of chickens a day is 0.65 Euro/pieces. Expenses related to their supervision by veterinary treatment (vaccination) is a cost to maintain current

¹¹⁸⁵ According to Art. 1, para. (2) nr.73/2002 letter of the Law on organization and operation of agricultural and food products market in Romania, published in Gazet Oficial no.110/8.02.2002

biological assets and lute will not be counted in determining fair value. So pups will be registered as biologically active in the market price of 2,600 lei a gain resulting from the initial recognition will be reflected in the profit period. Furthermore the initial recognition of a biological asset, losses may be recorded to determine fair value as estimated costs are deducted at point of sale, but may be recorded in earnings when the quantitative and qualitative changes occur.

Suppose that fair value can be measured reliably for a biological asset. This hypothesis can be ignored for the initial recognition of a biological activity that are not available on the market determined prices or values for which estimates are credible alternatives. In this case that biological asset shall be valued at cost minus any depreciation and any losses from damage Battery.

Since value just such a biological asset can be estimated reliably, that asset should be valued at its fair value less estimated point of sale. In terms of IAS 41 "Agriculture" fair value of biological assets at the time of collection can always be measured reliably. Of particular importance it attaches to IAS 41 is subsidizing agriculture in general, but forestry and who receive conditional grants for forest road construction, to prepare conditions for the development and exploitation of forest stands located in inaccessible regions. IASs application noted above conflicting changes to the agricultural and forestry production subsidy to the initial presentation in IAS 20 "Accounting for governmental subsidies". So speaking to IAS 20 "an unconditional governmental subsidy in relation to a biological asset measured at fair value less estimated point of sale are recognized as revenue when and only when the government grant becomes receivable. If a government grant related to a biological asset measured at fair value less estimated point of sale is subject to be recognized as revenue when and only when conditions required for the grant are met"¹¹⁸⁶.

IAS 41 "Agriculture" requires a different treatment than that required by IAS 20, when a government grants linked to a biological asset measured at fair value less estimated point of sale or if the entity requires some subsidization specific conditions. IAS 20 requires that government grants should not be recognized until there is certainty that the entity meets the requirements for grant allocation.

Also, IAS 20 allows the use of two methods:

- setting up government grant as income in advance;
- government subsidy net book value of assets.

IAS 41 in optical second method is "consistent model based on fair value, an asset is assessed and presented to fair value. Deduction treatment using book value, a company should first be deducted from the subsidy for the assets carrying and secondly to measure the asset at fair value. Company recognizes that the government grant as income immediately, even if conditional grant. This contravenes the requirement of IAS 20, which government grants should not be recognized as income until there is certainty that the company meets the requirements of its grant"¹¹⁸⁷.

Particular attention should be paid by the entity forest way of disclosure in terms of IAS 41 "Agriculture". Providence in this, entities must submit forest cumulative gain or loss in current period on initial recognition of biological assets and the change in fair value less estimated point of sale costs of biological assets. Entity must provide a description of each group of biological assets and reproduction supplies mature and immature as appropriate. They provide information that may be useful in assessing the emergence of future cash flows. The entity also must provide forestry methods and significant assumptions applied in determining the fair value of each type of biological assets. Forestry entity is required by IAS 41 to present:

- existence and carrying amounts of biological assets whose title is restricted and the carrying amounts of biological assets to secure the obligation;
- the commitments for development or acquisition of biological assets;

¹¹⁸⁶ International Accounting Standards, Economic Publishing House, Bucharest, 2001, p.130.

¹¹⁸⁷ IAS 41 „Agriculture” CECCAR Publishing, Bucharest, 2004, p. 94.

- financial risk management strategies related to forestry.

Remember that, even if IAS 41 does not expressly mention forestry as a branch of a national economy encompassing agriculture many. But similarities between this branch of national economy and agriculture have led to this classification. In other countries (Finland) as new agriculture with forestry is deemed a separate economic sector. Therefore we are not indifferent approach to financial risk management strategy of both forestry activities in may shield production cycle (seeds, wickers, fishing, etc.). And own production forest itself, where life cycles are between 30 and 160 years.

Case study on the accounting record and reflect their operations in forest entity annual financial statements under IAS 41 „Agriculture”¹¹⁸⁸

An entity shall submit to the beginning of the year forestry 1.01.2009 following situation for the species „red oak” planted to increase the processing of timber and mining:

Age (years)	Surface (ha)	Fair value less estimated point of sale costs of biological assets (lei)
25	120	272
20	87	146
12	168	132
5	80	110

a. Planted consumable biological assets

In April 2009, the entity has planted 100 ha of forest seedlings „red oak”. Expenditure entity with seedlings and planting them had the value of 7200 lei. Registration seedlings and planting costs will be reflected in the accounts as follows:

Biologically active = Availability 7.200 lei

The highlight here is deducted from cost of biological assets acquired in accordance with IAS 41 „Agriculture” (paragraph 24) is approximated fair value through cost.

b. Maintaining supplies of biological assets

Maintenance areas planted with „red oak” 5 years old forest entity has incurred various expenses in 2009 amounting to 1.950 lei recorded in the accounts as follows:

Sundries = Debt / availability 1950 lei

c. Collection of biological assets consumables

In August 2009 the entity has harvested forest oaks (species „red oak”) aged 25 years. Fair value less estimated cost of point of sale of logs at harvest is 411 lei (272 lei + 139 lei). Perform record harvest oak effect on stocks and biological assets and income occurred at harvest:

Stocks = Income: Gain occurred in fair value less estimated costs of point of sale of logs

Harvested 139 lei

Stocks = Biological assets 272 lei

The effect of this accounting operations is the initial recognition of its stock in accordance with IAS 2 „Inventories” and record as income under IAS 41 (paragraph 28) the gain occurred in fair value less estimated cost of point of sale of logs made from aged oak culture for 25 years.

d. Processing of forest products

Forestry processing entity logs obtained in September 2009 conducted expenses (expenses for processing logs) worth 18,500 lei. Coverage of the accounting operations are performed as follows:

Stocks = Debt / Available 18500 lei

Accordinging accounting regulations in Romania is the next record:

Sundries = Debt / Available 18500lei

Stock = Stock change 18500 lei

¹¹⁸⁸ The study draws on Appendix 2, Exemplaie 1: Consumable Biological Exposure Assets of Daft No.90/2000 issued by the Financial Reporting Standards Board, Institute of Chartered Accountants of New Zealand

e. The sale of forestry products processing

In September 2009, 80% of processed logs (timber) were sold for the sum of 42000 lei. Record revenue from the sale of logs in the accounts is performed as follows:

Claims / availability = Revenue from timber sales 42000 lei

Unstorage forest products shall be as follows:

Cost sale = Stocks 15129 lei

Income = Stocks 329 lei

(Net gain occurred in fair value less estimated costs of point of sale of logs harvested)

Book value of the stock before the sale is 411 lei +18500 lei = 18911 lei

18500 lei x 80% = 14800 lei

411 lei x 80% = 329 lei

Appealing again to Romanian Accounting Regulations destocare this transaction is recorded as:

Changes in inventories = Stocks 15129 lei

f. Sale of consumable biological assets

In December entity sells a forest area of 40 ha oak aged 20 years for the sum of 90000 lei. Fair value less estimated costs of point of sale oak plantation 20 years old at the beginning of the period were: $(146 \times 40 / 87) = 67.12$ lei. Contabiltiate coverage of the business transaction will be done by registering:

Claims / availability = Biological assets 67 lei

Claims / availability = Income 833 lei

(Gain change occurred in the fair value less estimated point of sale costs)

This record profit reflected the sale occurred in the forest „red oak” and also noted that a reduction by selling the book value of biological assets estimated point of sale of forest sold.

In the annual balance sheet biological assets (oak forest) will be reflected in categoria „current assets” as follows: 01.01.2009 book value of biological assets is 660 lei, and the end of financial year 2009 it will be 7730 lei. Stocks will be presented in current assets (assets) on 31.12.2009, at 3782 lei valaorea accounting.

CONCLUSIONS

Romanian experts consider that the area should consider the implications of applying IAS 41 „Agriculture”, forestry for several reasons: nature of the forest creates uncertainty or conflict when applying accounting methods „rigid” because critical events associated with biological changes (growth, degeneration, production and multiplication) affecting substance biological assets are difficult to treat by means of a model based on cost accounting history and achievement; IAS changes the appearance of existing sites. Such amendments to IAS 2 „Inventories” amend the provisions on animal stocks, agricultural and forest products were valued at net realizable value based on well-established policies. Changes and provisions relating to biological assets in IAS 16 „Intangible assets”, IAS 17 „Leasing”, IAS 18 „Income from current activities”, IAS 20 „Accounting for Government Grants and Disclosure”; an international trend towards liberalization, where a continuously growing number of companies listed on international capital markets and a larger volume of investment and will have the effect of increasing the size of the scope and nature of commercial forestry activities. This will cause an even greater need for financial statements based on solid accounting principles and universally accepted. Thinking need a national IAS 41, specific Romanian agriculture and forestry and why not a national standard accounting only for forestry; education and research specialists near the specific problems of accounting in forestry management and training program for personnel directly involved in keeping and accounting organization from entities including the Central Forest National Forest „Romsilva”.

Stefan Veronica

Valahia University of Targoviste

Faculty of Economic Sciences

Abstract: *The International Public Sector Accounting Standards based on the accrual accounting get inspired from the International Financial Reporting Standards (IFRS) issued by the International Accounting Standards Board (IASB), the provisions of these Standards being applied in the public sector. The IPSAS 19 Standard requirements „Provisions, contingent liabilities and contingent assets” have been elaborated in accordance with this policy. Without neglecting the reality of the Romanian accounting practice from the public sector, we shall gradually present the **provisions evaluation and recognition stages**. The differentiated practices applicable to the public sector in relation with the private one have led us to the analysis of the solutions proposed by IPSAS 19 „Provisions, contingent liabilities and contingent assets” versus IAS 37 „Provisions, contingent liabilities and contingent assets” (it treats the provisions, the contingent assets and the contingent liabilities at the profit oriented entities).*

Key words

Provisions evaluation, Public sector, IPSAS 19, IAS 37, Depreciation

JEL classification: M

1. Provisions for depreciation versus depreciation of value

In the old Romanian accounting regulations' acceptance, the differences found in minus between the inventory value (established at stock-taking) and the asset elements' input book value distinguished themselves in the accounting by the constitution of some rectifying structures – *provisions for depreciation or loss of value*, when the depreciation was considered reversible.

Impairment of value, in the view of IPSAS, is also a reversible process of deterioration of asset value occurring during the useful life due to various factors – internal and external. Are the two processes equivalent, knowing that both have the effect of reducing the balance sheet value of those assets?

Differences arise in how to determine whether the two structures: if the provision for depreciation is determined as the difference between the input (gross) book value and the inventory asset value, depreciation value is spread between the net book value and recoverable amount. We notice a clear distinction between different terms such as gross book value - net book value, i.e. value of inventory - amount recoverable. Moreover, depreciation of value is deterioration in the value of an asset with little chance of disappearing in the future due to specific factors and requires direct debit account for impaired assets, just to show the direct influence of the decrease in value.

1.1 Provisions for depreciations versus other liabilities

The provisions can be distinguished from other liabilities such as *payable and accruals* because there is *uncertainty about the timing or amount of the future expenditure required in the settlement*. By contrast:

- payables, which are liabilities to pay for goods or services that have been received or supplied and have been invoiced or formally agreed with the supplier;

- accruals, including amounts due to employees, are liabilities to pay for goods or services that have been received or supplied but have not been paid, invoiced or formally agreed with the supplier, but the uncertainty of their amount or timing is generally much less than for provisions.

1.2 Provisions for depreciation versus contingent liabilities

In a general sense, all provisions are contingent because they are uncertain in timing or amount. However, the international standards distinguish them from the contingent liabilities by the recognition treatment – within the public sector standards, the term “contingent” is used for liabilities and assets that are not recognized because their existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity. If the provisions are recognized as liabilities – they are present obligations and it is probable an outflow of resources embodying economic benefits to settle the obligation; the contingent liabilities are not recognized as liabilities because they are either possible obligations as it has yet to be confirmed whether the entity has a present obligation, or they represent present obligations for the entity but they do not determine an outflow of resources embodying economic benefits. In exchange, the entity shall monitor and evaluate permanently the contingent liabilities as a result of their possible evolution towards the initial estimation, in order to recognize a provision, where necessary.

Example no.1:

The production department of the public entity X, during its activity in exercise N, has breached an environmental law but it remains unclear whether any damage was caused to the environment. In exercise N+2 it becomes clear that the damage was caused and remediation will be required by the competent environment authority.

In the period N – N+2, the evolution of the contingent liability shall be carefully monitored, because there is no legal obligation to make probable an outflow of future economic benefits for the entity.

In exercise N+2, the entity shall recognize a provision as a result of the existence of legal obligation that implies an outflow of economic benefits to extinguish it.

2. Provisions recognition

A provision should be recognized when:

- an entity has a present obligation (legal or constructive) as a result of a past event;
- it is probable that an outflow of resources embodying economic benefits or service potential will be required to settle the obligation;
- a reliable estimate can be made of the amount of the obligation

2.1 Present obligation – legal or constructive – generated by a past event

In this structure there are included those obligations generated by past events that are independent of the entity’s future actions or the ongoing activities in the future. Financial statements deal with the financial position of an entity at the end of its reporting period and not its possible position in the future. Therefore, no provision is recognized for costs that need to be incurred to continue an entity’s ongoing activities in the future. The only liabilities recognized in an entity’s statement of financial position are those that exist at the reporting date.

Examples of situations in which the provision is imposed by a legal obligation

Example no. 2:

A government-owned research institute uses a nuclear power station to create radio isotopes that are used in medical purposes. According to the contract through which it received the right to use the station, for the decommissioning of one unit, which is to be expected no sooner than 50 years, the entity estimates the site restoring costs of 400,000,000 lei.

At the end of the budgetary exercise, it is recognized a provision of 400,000,000 lei, following the existence of the site restoring obligation stipulated in the contract, obligation that implies from the behalf of the entity outflows of resources materialized in the diminishing of future economic benefits.

Examples of situations in which the provision is imposed by a constructive obligation

A constructive obligation is that obligation that results from the actions of an entity if:

- from the previous conduct, from the entity written policy or from a specific declaration, the entity indicated to its partners that it assumes certain responsibilities; and
- as a result, the entity induced to its partners the idea that it shall honor those responsibilities

Example no. 3:

The local authority from region X with a wide opening to the sea promotes an environmental policy in which it undertakes to clean up all the contamination that it causes. The local authority has a record of honoring this published policy. There is no environmental legislation in place in the jurisdiction.

In this situation, the obligating event is the contamination of the environment, which gives rise to a constructive obligation because the policy and previous conduct of the local authority has created a valid expectation that it will clean up the contamination. A provision is recognized for the best estimate of the costs of the clean-up of the contaminated land.

A constructive obligation for the entity also results from the restructure process. The following examples of events may fall under the definition of restructuring:

- termination or disposal of an activity or service;
- the closure of a branch office in a specific region or relocation of activities from one region to another;
- changes in management structure, for example, eliminating a layer of management
- fundamental reorganizations that have a material effect on the nature and focus of the entity's operations

2.2 Probable Outflow of Resources embodying Economic Benefits or Service Potential

For a liability to qualify for recognition there must be not only a present obligation but also the probability of an outflow of resources. An outflow of resources or other event is regarded as probable if the probability that the event will occur is greater than the probability that it will not.

Where it is not probable that a present obligation exists, an entity discloses a contingent liability, unless the possibility of an outflow of resources embodying economic benefits is remote.

Example no. 4:

During the budgetary exercise N, the Local Council X gives a guarantee of an entity from its subordination with the view of finalizing an investment. The entity is financed from its own incomes and in completion, from budget subventions. During the exercise N+1, the financial condition of the entity deteriorates and it fails to pay its due rates.

At the end of the exercise N, although there is a legal obligation from the guarantee of the credit, no outflow of economic benefits is probable and thus, no provision is recognized. The guarantee is disclosed as a contingent liability.

In the budgetary exercise N+1, it is probable that an outflow of resources embodying economic benefits will be required to settle the obligation. A provision is recognized for the best estimate of the obligation.

2.3 Reliable Estimate of the Obligations

Except in extremely rare cases, an entity will be able to make an estimate of the obligation that is sufficiently reliable to use in recognizing a provision.

Best estimate

The amount recognized as a provision should be the best estimate of the expenditure required to settle the present obligation at the reporting date.

The best estimate of the expenditure required to settle the present obligation is the amount that an entity would rationally pay to settle the obligation at the reporting date or to transfer it to a third party at that time. The estimates of financial effect are determined by the judgment of the management of the entity, supplemented by experience of similar transactions and, in some cases, report from independent experts. The evidence considered includes any additional evidence provided by events after the reporting date.

Where the provision being measured involves a large population of items, the obligation is estimated by weighting all possible outcomes by their associated probabilities.

The name for this statistical method of estimation is “expected value”. The provision will therefore be different depending on whether the probability of a loss of a given amount is, for example, 60% or 80%. Where there is a continuous range of possible outcomes and each point in that range is as likely as any other, the mid-point of the range is used.

Example no. 5:

A manufacturer of medical equipment offers warranty at the moment of sale to the purchasers. According to the terms of the sale contract, the manufacturer understands to eliminate by repairs or replacement, the defects that become apparent within 12 months after purchase.

If minor defects were detected, the repair and replacement costs of 1,000,000 lei would result. If major defects were detected, costs of 5,000,000 lei would result. The past experience indicate that, for the coming years 80% of the equipment will have no defects, 15% of the equipment will have minor defects and 5% of the equipment will have major defects.

The expected value of the cost of spare parts and repairs is:

Specification	Cost
80% of the equipment will have no defects	zero
15% of the equipment will have minor defects	150.000
5% of the equipment will have major defects	250.000

A provision for warranties given to the clients in the amount of 400,000 lei, evidenced in accounting as follows:

6812	=	1512	400.000
„Operational expenditures concerning provisions”		„Provisions for warranties given to the clients”	

Risks and Uncertainties

The risks that inevitably surround many events and circumstances should be taken into account in reaching the best estimate of a provision. A risk adjustment may increase the amount at which a liability is measured.

Caution is needed in making judgments under conditions of uncertainty, so that revenue or assets are not overstated and expenses or liabilities are not understated. However, uncertainty does not justify the creation of excessive provisions or a deliberate overstatement of liabilities.

Present value

Where the effect of the time value of money is material, the amount of a provision should be the present value of the expenditures expected to be required to settle the obligation.

The discount rate (rates) should reflect current market assessments of the time value of money and the risks specific to the liability. The discount rate should not reflect risks for which future cash flows estimates have been adjusted.

The discount rate of a provision is known as a pre-tax rate.

Future events

Future events that may affect the amount required to settle an obligation should be reflected in the amount of a provision there is sufficient objective evidence that they will occur.

Expected Disposal of Assets

Gains on the expected disposal of assets are not taken into account in measuring a provision, even if the expected disposal is closely linked to the event giving rise to the provision.

The entity recognizes gains on expected disposals of assets at the time specified by the Accounting Standard dealing with the assets concerned.

Reimbursements

Where some or all of the expenditure required settling a provision is expected to be reimbursed by another party, the reimbursement should be recognized when it is virtually certain that reimbursement will be received if the entity settles the obligation. The amount recognized for the reimbursement should not exceed the amount of the provision.

Example no. 6:

Local authority X, through a specialized agency, operates a gravel quarry on land used for the construction and maintenance of roads. The agreement with the landowners requires the local authority to restore the quarry site in order to remove the effects over the environment. At the end of the reporting date it is constituted a provision in the amount of 750,000 lei.

In the concluded contract it is stipulated that, if the environment works are entirely executed, the entity shall receive from the local budget a 20% financing from the cost of the works executed with the remedy operations.

Provision recognition

6812	=	1518	750,000
„Operational expenditures concerning provisions”		„Other provisions”	

Expenditures recording occasioned by the removal of the effects over the environment, after their nature

6xx	=	%	680,000
„Expenditures account”		3xx	
		„Stocks’ accounts”	
		4xx	
		„Third parties’ accounts”	
		5xx	
		„Treasury accounts”	

Annulment of the provision recognized in this purpose

1518	=	7812	750,000
„Other provisions”		„Incomes from provisions”	

Recording of the amount to be received as financing, at the date of fulfilling the recognition conditions

4xx	=	7722	150,000
„Third parties’ accounts”		„Subventions from other budgets”	

In the patrimonial result account, the provision related expenditures can be presented at the value reduced with the amount recognized for a reimbursement.

Sometimes, an entity is able to look to another party to pay part or all of the expenditure required to settle a provision (for example, through insurance contracts, indemnity clauses or suppliers’ warranties). The other party may either reimburse amounts paid by the entity or pay the amounts directly.

In most cases, the entity will remain liable for the whole of the amount in questions so that the entity would have to settle the full amount if the third party failed to pay for any reason. In this situation, a provision is recognized for the full amount of liability, and a separate asset for the expected reimbursement is recognized when it is virtually certain that reimbursement will be received if the entity settles the liability.

Changes in provisions

Provisions should be reviewed at each reporting date and adjusted to reflect the current best estimate. If it is no longer probable that an outflow of resources economic benefits or service potential will be required to settle the obligation, the provision should be reversed.

Use of Provisions

A provision should be used only for expenditures for which the provision was originally recognized.

Future Operating Net Deficits

Provisions should not be recognized for net deficits from future operating activities. Net deficits from future operating activities do not meet the definition of liabilities and the provisions general recognition criteria.

An expectation of net deficits from future operating activities is an indication that certain assets used in these activities may be impaired. The entity shall treat these assets in accordance with IPSAS 21 „Impairment of non-cash-generating assets”.

Onerous contracts

If an entity has a contract that is onerous, the present obligation under the contract should be recognized and measured as a provision. Many contracts (for example, some purchase orders) can be cancelled without paying compensation to the other party, and therefore there is no obligation. Other contracts establish both rights and obligations for each of the contracting parties. Where events make such a contract onerous, the contract falls within the scope of this Standard and a liability exists which is recognized.

Example no. 7:

An entity performs a production activity in a rented building under a contract of lease. During December the budgetary exercise N, the entity relocates to a new building.

According to the contract of lease, the lease on the building continues for the next two years. The contract cannot be cancelled and the building cannot be re-let to another user because no such clauses were stipulated in the contract.

A provision is recognized for the best estimate of the unavoidable lease payments.

Disclosure

For each class of provisions, an entity should disclose:

- The carrying amount at the beginning and the end of the period;
- Additional provisions made in the period, including increases to existing periods;
- Amounts used during the period;
- Unused amounts reversed during the period;
- The increase during the period in the discounted amount arising from the passage of time and the effect of any change in the discount rate;
- A brief description of the nature of the obligation and the expected timing of any resulting outflows of economic benefits;
- An indication of the uncertainties about the amount or timing of those outflows;

- The amount of any expected reimbursement, stating the amount of any asset that has been recognized for that expected reimbursement.

THE INFLUENCE OF GLOBAL FINANCIAL CRISIS ON THE ACCOUNTING POLICIES

Marcus Cristina-Maria

Babes Bolyai University

Faculty of Economics and Business Administration

Accounting practices are deeply implicated in the current financial crisis and in proposals for recapitalizing financial institutions and restoring stability to the global financial system. Noting that very little research has been done on the accounting policies implications of such crises, particular consideration is given to exploring the significance of and potential for research on this topic. This article discusses the changes that occur in the accounting policies starting with 2007 when the economic catastrophe begins. The empirical results suggest that companies introduced new components on their accounting policies with the emergence of financial crisis and there isn't a trend of changes in accounting policies depending on the activity of a company.

Keywords: Accounting policies, economic-financial crisis, financial statements, management decisions

JEL Classification: M41 – Accounting

1. INTRODUCTION

While it has become common place to blame bankers and their bonuses for the current global financial crisis, as the economic ruin deepens and spreads more fundamental questions will undoubtedly be asked about our economic system and the institutions upon which it is founded. The magnitude of this financial and economic crisis calls for a fundamental reassessment of all areas of business and economic scholarship, including accounting research.

The current economic and financial crisis has significant implications for accounting, both for practice and for the research community. In the areas of financial accounting, auditing, management accounting and the regulatory institutions that oversee accounting and auditing practices there are genuine worries that the crisis has revealed numerous problems and inadequacies.

There is a sample of companies that have already responded to the requirements of changing the components of the accounting policies caused by the current economic environment, this is the reason why we consider a study to quantify and analyze the changes in accounting policies.

2. RESEARCH METHODOLOGY

The importance of having accounting policies well presented and the relation between costs and benefits trigger the interest of all the professionals in this field. In the qualitative stage, in order to deepen the knowledge of this theme, we used the method of documentation, through rigorous analysis of the specialized literature, the international regulations (IAS 8 and IFRS with direct implication into the accounting policies). Based on our findings we try to establish a trend in terms of accounting policies for 23 entities listed on the New York Stock Exchange.

3. LITERATURE REVIEW

The world of accounting practice is implicated in the current financial crisis in a number of ways. The most obvious is through financial reporting requirements governing asset valuation and off-balance sheet entities (Ryan, 2008). The importance of these seemingly mundane accounting rules is underscored by the fact that the solvency and survival of our major financial institutions now turns on how accountants value bank assets and the extent to which auditors require firms to consolidate off-balance sheet entities.

The number reported on the various financial statements provide important information to decision makers, but most users require additional details to facilitate their analysis. All financial reports include additional information in notes that follow the statements.

The first note is typically a summary of significant accounting policies. The summary of significant accounting policies tells the user which accounting methods have been adopted by the company. It is impossible to analyze a company's financial results effectively without first understanding the various accounting methods that have been used. It would be similar to discussing a swimmer's time in the 100 freestyle without knowing if the race had been measured in yard or meters. (Short D., 2003)

PricewaterhouseCoopers and KPMG have been conducted a study, in 2009, regarding the significant accounting policy disclosures and the result of their research is summarized above:

- § PwC noted that information around the decision to consolidate (or not) was largely inadequate. For many of the banks surveyed they found that the significant accounting policy disclosures surrounding SPEs failed to provide a tailored discussion of the specific policies. Quite often, disclosures took the form of a repetition of the wording in the consolidation standards. Of the banks surveyed, 20 disclosed securitization activity as well as their accounting policies surrounding derecognition. However most of the banks provided only a brief repetition of the derecognition standard as opposed to providing a tailored discussion of the judgments made in applying accounting policies.
- § KPMG figures that 9 banks provided a detailed description of their accounting policy in relation to the consolidation of SPEs. Only 6 banks provided detailed descriptions of the reasons for not consolidating some vehicles, or the nature of changes that led them to consolidation.

Accountants inevitably make many accounting estimates and policy decisions when preparing financial statements. They must select depreciable lives for long-lived assets choose: inventory costing method, make assumptions about pensions, and make many more judgments. These accounting estimates are driven by an entity's accounting policy as it applies to the issues at hand. These decisions could significantly affect a company's financial statements and how users understand a company's results and financial position. (Holtzman M., 2007)

Financial statements must be clear and understandable. They are based on accounting policies which vary from enterprise to enterprise, both within a single country and among countries. Disclosure of the significant accounting policies on which the financial statements are based is therefore necessary so that they may be properly understood. (International Accounting Standards No. 1, paragraph 10)

Accounting standard setters argue that information about the accounting policies used by a reporting entity is essential for financial statement users in interpreting financial statements. (Hope O., 2007)

4. QUALITATIVE ANALYSIS OF REGULATIONS REGARDING THE ACCOUNTING POLICIES

IAS 8 Accounting policies, changes in accounting estimates and errors is the international regulation which prescribe the criteria for selecting and changing accounting policies, together with the accounting treatment and disclosure of changes in accounting policies, changes in accounting estimates and corrections of errors. The Standard is intended to enhance the relevance and reliability of an entity's financial statements, and the comparability of those financial statements over time and with the financial statements of other entities.

Accounting policies are the specific principles, bases, conventions, rules and practices applied by an entity in preparing and presenting financial statements. When an IFRS specifically applies to a transaction, other event or condition, the accounting policy or policies applied to that item shall

be determined by applying the IFRS and considering any relevant Implementation Guidance issued by the IASB for the IFRS.

IFRSs set out accounting policies that the IASB has concluded result in financial statements containing relevant and reliable information about the transactions, other events and conditions to which they apply. Those policies need not be applied when the effect of applying them is immaterial. However, it is inappropriate to make, or leave uncorrected, immaterial departures from IFRSs to achieve a particular presentation of an entity's financial position, financial performance or cash flows.

An entity shall select and apply its accounting policies consistently for similar transactions, other events and conditions, unless an IFRS specifically requires or permits categorization of items for which different policies may be appropriate. If an IFRS requires or permits such categorization, an appropriate accounting policy shall be selected and applied consistently to each category. An entity shall change an accounting policy only if the change:

(a) is required by an IFRS; or

(b) results in the financial statements providing reliable and more relevant information about the effects of transactions, other events or conditions on the entity's financial position, financial performance or cash flows. (Technical Summary of IAS 8 Accounting Policies, Changes in Accounting Estimates and Errors, IASB , 01.01.2009)

From a substantive viewpoint relating to IFRS, this is so in that addressing global business changes that are uncertain, uneven, ongoing and evolving requires the application of judgment in assessing financial performance and position beyond mere reliance on the application of pre-defined rules.

5. QUANTITATIVE ANALYSIS REGARDING THE ACCOUNTING POLICIES CHANGES

Based on theoretical considerations and previous empirical research we developed a series of hypotheses that link the company's accounting policies changes caused by the current crisis. Quantitative research methodology initiate with choosing the investigated population. In this respect we have consulted the website of the New York Stock Exchange to identify the entities that have a major role in the international economy, and we choose those companies which were most active on the financial market from NYSE. To form a representative sample we have chosen 25 companies listed, but only 23 of companies have remained in our analyze because 2 of them haven't published on their website the financial statements for year 2006. In addition, each company from our sample is relevant and representative for the sector in which it is operating, and financial data is available to the general public as proof that we were able to achieve their financial reports for years 2006 (before financial crisis), 2007 (the year when financial crises arise) and 2008 (the second year of financial crisis), by accessing their website.

After analyzing the information that entities provided on their website, regarding changes in accounting policies caused by the current crisis, we developed 2 hypotheses that we considered relevant to our investigation:

H1: Companies introduced new components on their accounting policies with the emergence of financial crisis.

In an accounting context, materiality refers to the relative importance or significance of an item to an informed decision maker. An item or event is material if it is probable that the judgment of a reasonable person, relying on that information, would have been changed or influenced by its omission or misstatement. Many decisions regarding materiality call for the careful application of the accountant's judgment. The application of materiality often depends on the size of the particular item in relation to the overall size of firm. Obviously, what is material to Smith's Shoe Store is not material to General Motors. (Flamholtz. E., Diamond M., Flamholtz D.). Taking this into consideration, our research do not intend to compare the number of components of

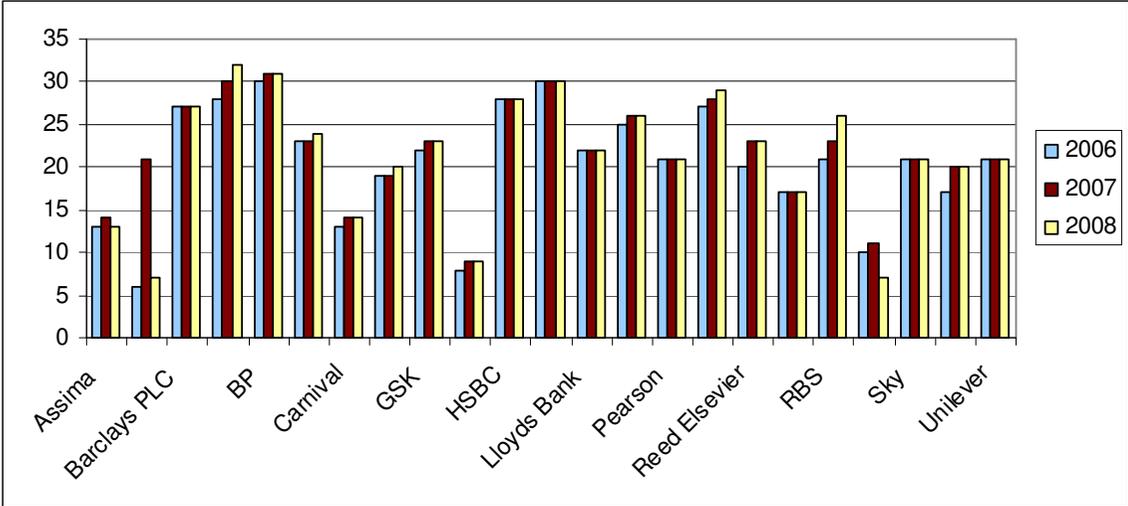

accounting policies from one company to another, it intends to compare the evolution of components of accounting policies for each company over 3 years.

H2: There is a trend of changes in accounting policies depending on the activity of a company.
 Astami E. concludes in her research that companies which belong to the same industry are directed towards the same direction when it comes to change their accounting policies.

6. RESULTS

We can state that all companies have been modified their accounting policies after the financial crash, 15 companies, out of 23, have been introduced new components on their accounting policies, which means that the managers considered the new economic environment a reason for introducing new elements in the financial statements.

FIGURE 1. COMPONENTS OF ACCOUNTING POLICIES CHANGES

Source: Compiled by author

Taking into consideration the above table we can not conclude that there is a trend of changes in accounting policies depending on the activity of a company and we believe that this occurs because our research have been done on a few number of companies.

TABLE 1. COMPONENTS OF ACCOUNTING POLICIES CHANGES TAKING INTO ACCOUNT THE ACTIVITY

Activity	2006	2007	2008
IT	13	14	13
Pharmaceutical	6	21	7

7. CONCLUSION

The crisis, thus, challenges us to re-evaluate our research agendas – and perhaps also the institutional incentives and unexamined assumptions that drive them – so that accounting research can contribute to a broader social and political analysis of the financial crisis.

Financial reporting standards that are seen to adapt to the role of mitigating the risks of interpreting the increasingly complex global business environment and which find legitimacy on the grounds of both market imperatives and political and institutional alignment, will potentially achieve a sustained global presence in the future. If companies use a range of different accounting methods, stock market participants may have to devote considerably more resources to analyzing and comparing the companies' financial statements.

As a summary of our research we can state that for 23 listed companies from New York Stock Exchange only one hypothesis was accepted and this leads us to affirm that:

1. companies introduced new components on their accounting policies with the emergence of financial crisis; and
2. there isn't a trend of changes in accounting policies depending on the activity of a company.

With today's business environment of complex transactions and the recent crop of complicated accounting standards on derivatives, business combinations, stock-option compensation, postretirement benefits and income taxes, it is more difficult than ever to understand how underlying uncertainties affect the financial statements. New disclosures about accounting policies are supposed to meet this need. Thus, the paper adds both to the literatures on accounting policies changes of analysts' forecasts and to the international accounting literature.

Finally, it is important to recognize that accounting rules and changes in them are shaped by political processes (like any other regulation). The role of the political forces further complicates the analysis. For instance, it is possible that changing the accounting rules in a crisis as a result of political pressures leads to worse outcomes than sticking to a particular regime (e.g., [Brunnermeier et al., 2009](#)[Brunnermeier et al., 2009](#)). In this regard, the intense lobbying and political interference with the standard setting process during the current crisis provide a fertile ground for further study.

A useful direction for further research would be to increase the number of companies upon which we would do the research and also to introduce new variables that would quantify the reasons which determines the management to changes the accounting policies and if those changes are reliable for the company.

THE ACCOUNTING REGULATION PROCESS IN THE FIELD OF FINANCIAL INSTRUMENTS

Matiş Dumitru

Our paper develops an analysis on the accounting regulation process by considering the field of financial instruments as one of the most controversial areas of financial reporting. After a brief introduction, comprising aspects related to the accounting regulation process, we first stop upon the historical evolution of the two main accounting referential that currently collaborate through the convergence process. Our analysis focuses both on standards first issuance and on their amendment process. A special emphasize is given to the international accounting referential. The obtained results enhance the complexity of the approached field and indicate significant steps still needed to be taken.

Keywords: standard setting bodies, accounting regulations, financial instruments, regulation process

JEL Classification: M40, M41

Introduction

Approaching the accounting regulation process in the field of accounting can be done by using a large range of attitudes, starting with the vision of a free market and ending at the other extreme of excessive regulation that in our opinion can also be correlated with the typology of rule-based accounting systems. The fundamental assumption that lays at the basis of the “free market” approach when it comes to accounting regulations says that accounting information should be treated like any other economic goods. This implies that forces of demand and offer should be allowed to act towards that point that generates the optimal offer of information related to a certain entity (Deegan and Unerman, 2008, p. 57). In other words, those opinions militating for the reduction or even elimination of the regulatory process bring as an argument the fact that when someone wants to obtain a certain information regarding a certain entity he/she will also be prepared to pay for it, while the demand and offer would be the ones leading to the creation of the informational optimum. We will further develop a detailed analysis in the field of accounting for financial instruments as being one of the most controversial areas of financial reporting.

Research methodology

Our paper is based on analyzing accounting standards being issued by significant accounting standard setting bodies in the accounting arena. This involves on one hand closely considering the results of the accounting regulation process and on the other the development of the process itself. Once the particularities of the accounting regulation process were established, it also helped us organize our paper. Since the IASB work plan includes amending already existent standards, after presenting their first issuance, we needed to insist on corresponding amendments. This was not an issue for the American accounting referential issuing a new standard once an

amendment is needed. The developed analysis allowed the identification of the most problematic areas in reporting for financial instruments.

Historical evolution of two great accounting referential

Developments taking place within financial markets that become more and more sophisticated from one day to another, allowing entities to trade innovative contracts that significantly transform their risk profile, represent maybe the only factor within the business cycle that brings significant problems when it comes to traditional financial reporting practices (Bonham *et al.*, 2008, p. 1131). All these aspects started to make their presence obvious from some time now, IASB (International Accounting Standards Board), former IASC (International Accounting Standards Committee) commenting since back in 1996 on such aspects and emphasizing that:

At the root of the necessity of changing the accounting for financial instruments, we must place fundamental changes that appeared within international financial markets. An entity can significantly and instantly change its profile from the financial risk's perspective, therefore imposing careful and continuous supervision. Meanwhile, an entity can use derivatives as speculative tools in order to multiply the effects of changes taking place in interests, exchange rates, commodities' prices of securities, therefore multiplying their earnings if prices move in an advantageous direction or, similarly, multiplying their losses at a contrary evolution. Accounting for financial instruments did not keep pace with these informational necessities of market participants. Existent practices are grounded based on some principles that were developed when accounting's main preoccupation were production entities that combined different forms of inputs (materials, labour, machinery, etc) and transformed them into outputs (goods or services) with the purpose of selling them. Accounting for these processes generating incomes was first preoccupied by achieving a certain connectivity of expenses with revenues. A key element of this process is represented by the moment of revenues obtaining, representing that point when a company may consider that it has transformed its inputs into cash or rights on cash. These traditional concepts of valuation being based on realization and costs are not suitable for recognizing and measuring financial instruments. By recognizing this aspect, many countries have made a significant step towards acceptance of fair value accounting in the case of certain financial instruments (IASB, 1996).

Recognizing these issues more than a decade ago was actually clearly delimiting the challenges that were going to fully solicit accounting standard setting bodies for some time. More precisely, it was necessary to accept new approaches to financial reporting if wanted to keep pace with particular features of financial instruments. Moreover, identifying to what extent would this new approach also generate implications in other areas of the activities being developed by entities, therefore being necessary to abandon traditional accounting methods. Direction for actions to be taken that were chosen by the IASC and afterwards IASB indicate the fact that these issues were closely considered, developments within the field of financial instruments also affecting other areas. A particular attention was also paid to creating some models that were to be used in measuring fair values for some balance sheet elements such as those in the field of insurance contracts, agriculture and even recognition of revenues (Bonham *et al.*, 2008, p. 1132).

If we are to make reference to that point in time when accounting regulations in the field of financial instruments were initiated, we must take into consideration the American accounting referential whose development in the considered area was actually imposed through the level and complexity of transactions taking place within the American capital market. At least after World War II, USA occupied a leading position when it comes to financial innovation and corresponding regulation in this field (Veron, 2007, p. 22). The domination of American capital markets and unprecedented powers being concentrated in the Securities and Exchange Commission's (SEC) hands represents a clear proof of the fact that the American financial environment exerts a significant influence on a global level, regardless if we make reference to SEC's representatives or American members of the accounting profession.

A turning point in the history of accounting regulation was created once with Enron's bankruptcy back in 2001 and other financial scandals manifesting in 2002, but also the unforgettable '90s bubble. Previous to these events, there was also a series occasional criticism towards certain standards within the American accounting referential, but in generally it was still considered to be, in America and other areas of the world, as being the best available set of accounting standards (Veron, 2007, p. 23). We also mustn't forget the fact that US was the first to issue accounting standards (in 1930) and also the first (once with the establishment of the Financial Accounting Standards Board – FASB in 1973) to be based on an accounting regulatory body that claimed independence towards the accounting profession and towards direct political pressures. Although FASB was the one to initiate a series of projects in different problematic areas from an accounting perspective, Enron's collapse shook to the grounds all perceptions on what quality of accounting standards meant, bringing to surface a series of shortcomings of the American accounting referential.

It was therefore reached a totally different context, recent endorsement of the international accounting referential by UE favoring its acceptance as an alternative to the American one, now being more doubted than ever. In February 2002, president of IASB David Tweedie was explicitly criticizing the rule-based approach that was predominant within US GAAPs. In contrast, he was presenting the principle-based vision that IASB had approached. Shortly afterwards, the possibility of introducing a principle based system (such as the International Financial Reporting Standards - IFRS) within USA was being analyzed, the Sarbanes-Oxley Act (SOX) asking SEC to consider this issue (SEC, 2003).

Since 2000, FASB and IASB started to work on eliminating existent differences between US GAAP and IFRS. They decided to entitle this process as convergence, bearing in our opinion a particular character if we are to consider just the involved parties. The principle being incorporated within the Norwalk agreement in September 2002 (also known as Memorandum of Understanding - MoU) and renewed in February 2006 sustains that both parties should make significant efforts towards reciprocal closeness of the two accounting referential.

Analysis focusing on accounting for financial instruments

Starting with the grounding of other studies approaching this issue of great accounting referential (Hail *et al.*, 2009, Veron, 2007) we will also approach a presentation that focuses on the international accounting referential, but while also making numerous references and parallels with other accounting referential where their content or the considered moment impose it. A parallel approach of all aspects in accounting for financial instruments through the perspective of great accounting referential would generate an unjustified dimension of the presentation. We therefore chosen to particularize the manner in which information will be presented based on authors' professional judgment.

Considering the fact that each accounting referential has its own rules regarding the way the regulation process takes place, it would be rather difficult to achieve a parallel, but yet unitary presentation, of all preoccupations in the field of financial instruments. Our objective is to follow the main moments in time that were marked through an accounting regulation being issued, while considering three accounting referential. Choosing the three accounting referential was done with the aim of enhancing global representativeness. We therefore obviously chose the international accounting referential being issued by IASB, the American accounting referential issued by FASB, and also the Australian accounting referential issued by AASB (***Australian Accounting Standards Board***), which often proved some significant particularities. We must mention the fact that within the international accounting referential we now¹¹⁸⁹ find three distinctive standards whose objective is directly represented by financial instruments. These are IAS 32 *Financial instruments: Presentation*, IAS 39 *Financial instruments: Recognition and Measurement* and

¹¹⁸⁹ We only considered the three standards currently being effective. Furthermore, within its project of replacing IAS 39, IASB has already issued in 2009 a new standard, IFRS 9 having January 1, 2013 as effective date.

IFRS 7 *Financial instruments: Disclosures*. According to IASB's work procedure, these standards have often been amended and for this reason, we will first stop at pointing those moments when standards have first been issued and afterwards come back for a detailed analysis. The American accounting referential on the other hand issues a new standard each time it wishes to amend an already existent standard, and for this reason, it is necessary that we enumerate a significant number of distinctive standards (SFAS¹¹⁹⁰). Still, we must keep in mind that there are some situations when more of the mentioned standards approach the same aspects. In accordance to our methodology of presenting those moments when financial instruments standards have been issued we must distinctively present all of them. As previously mentioned, the corresponding attention will also be granted to those moments that brought standards' amendment, also within the international accounting referential, even if it did not represent new standards, implications still being significant. The Australian accounting referential involves a similar working procedure to that of IASB, therefore having some moments that involve distinctive standards being issued, while since January 1, 2005 the so-called Australian equivalent standards for IAS/IFRS became effective. The following figure 1 presents the manner in which the three considered accounting standard setting bodies acted in time in order to regulate the field of accounting for financial instruments. Figure 1 reflects each regulatory body's manner of working, but also its preoccupations in the field of financial instruments. A closer analysis on the significant moments in our figure demonstrates the fact that the American accounting referential seems to be taking the initiative most of the times, while representing a valuable source of inspiration for the international one. Creating accounting standards in this field is challenging for all regulatory bodies for some time now. As figure 1 proves it, a series of developments were initiated in US that also paid special attention to the requirements related to the use of fair value measurements of financial instruments. The purpose would be to better reflect both risks and rewards connected to those instruments. The Australian approach is also interesting, developing its own specific accounting standards that are tailored to suit their need, while also benefiting from the evolutions within the international accounting referential that they keep pace with.

Despite the fact that based on their methodology of amending existent standards, our figure seems to reflect a clear and easy approach of IASB on accounting for financial instruments, a content analysis proves the contrary. Difficulties constantly raised from practice have often determined the international accounting referential to move away from the declared principle based approach towards rules that made the standards extremely complex, difficult to apply and also controversial. In order to catch the dynamic of the approached field and the complexity of the corresponding accounting regulations, we will further graphically represent those moments that imposed significant amendments of the international accounting referential in time. Figure 2 mirrors IASB's reaction in time during the difficult task of establishing financial reporting standards for financial instruments.

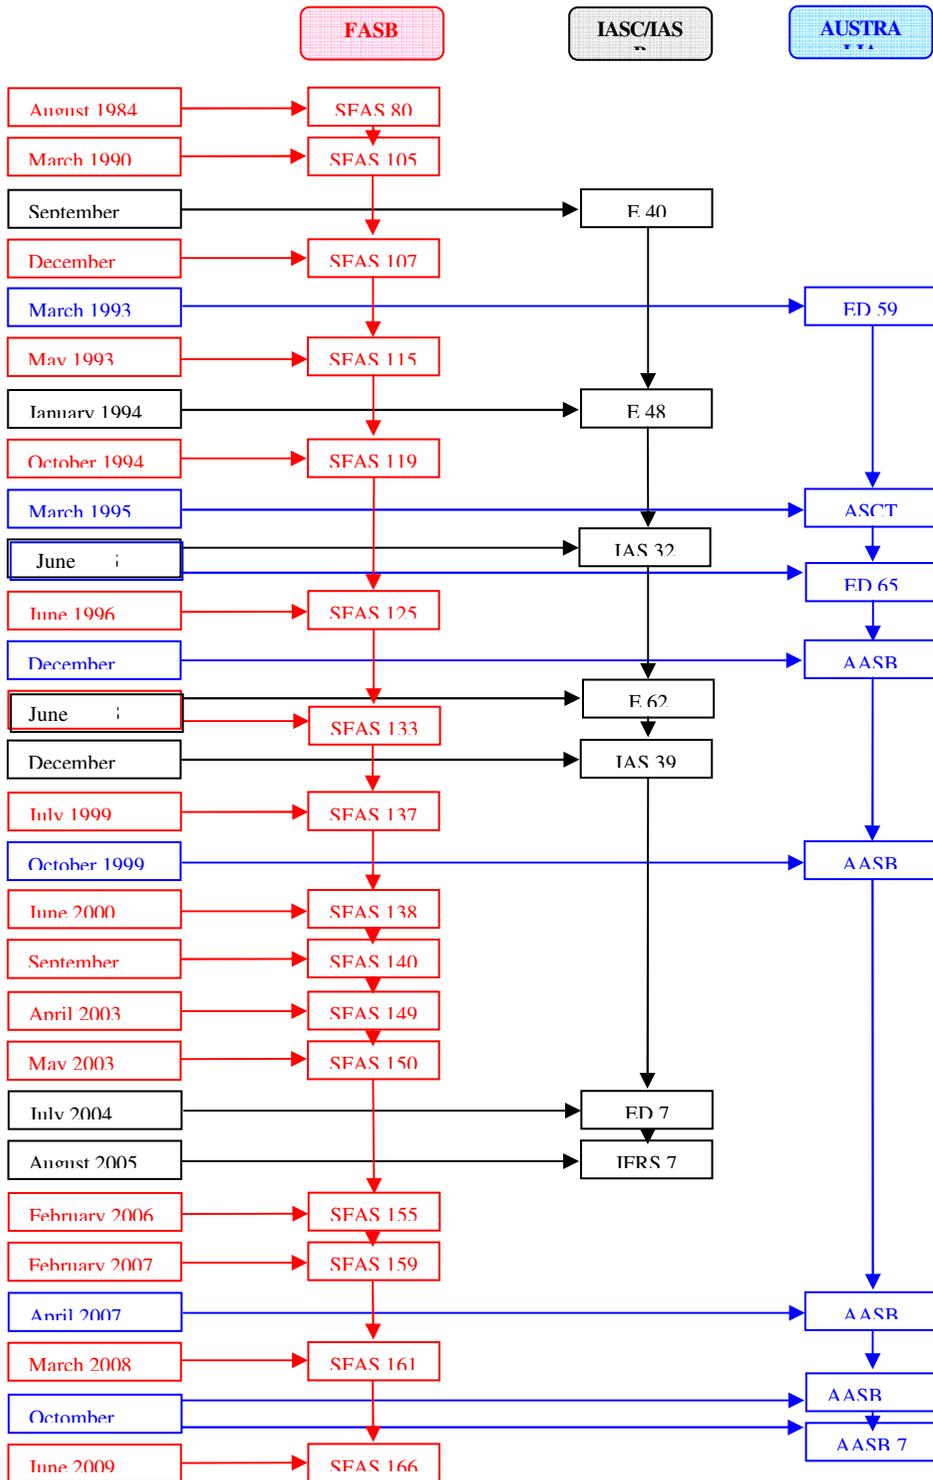

Conclusions and further developments

The below presented figures both reflect the complexity of the approached area and also the difficulty of developing the accounting regulation process in this field and reach the desired true and fair view. When closely analyzing the international accounting referential we notice that three standards were necessary and are still not sufficient. Figure 2 details their development in time, but also the correlations between them with regard to responsibilities each one should face. IASB's first efforts within the accounting regulation process in the field of financial instruments, or better said back then IASC, manifested starting September 1991 through Exposure Draft E 40 *Financial instruments*. This was afterwards modified in the shape of Exposure Draft E 48 *Financial instruments* that also generated the first version of IAS 32 *Financial instruments: Disclosure and Presentation*. Meanwhile,

¹¹⁹⁰ We have chosen to use the old FASB codification because we considered the new codification, having only been introduced since last year, is not yet very popular. The correspondence between the old classification and the new one is provided by the FASB on its official website.

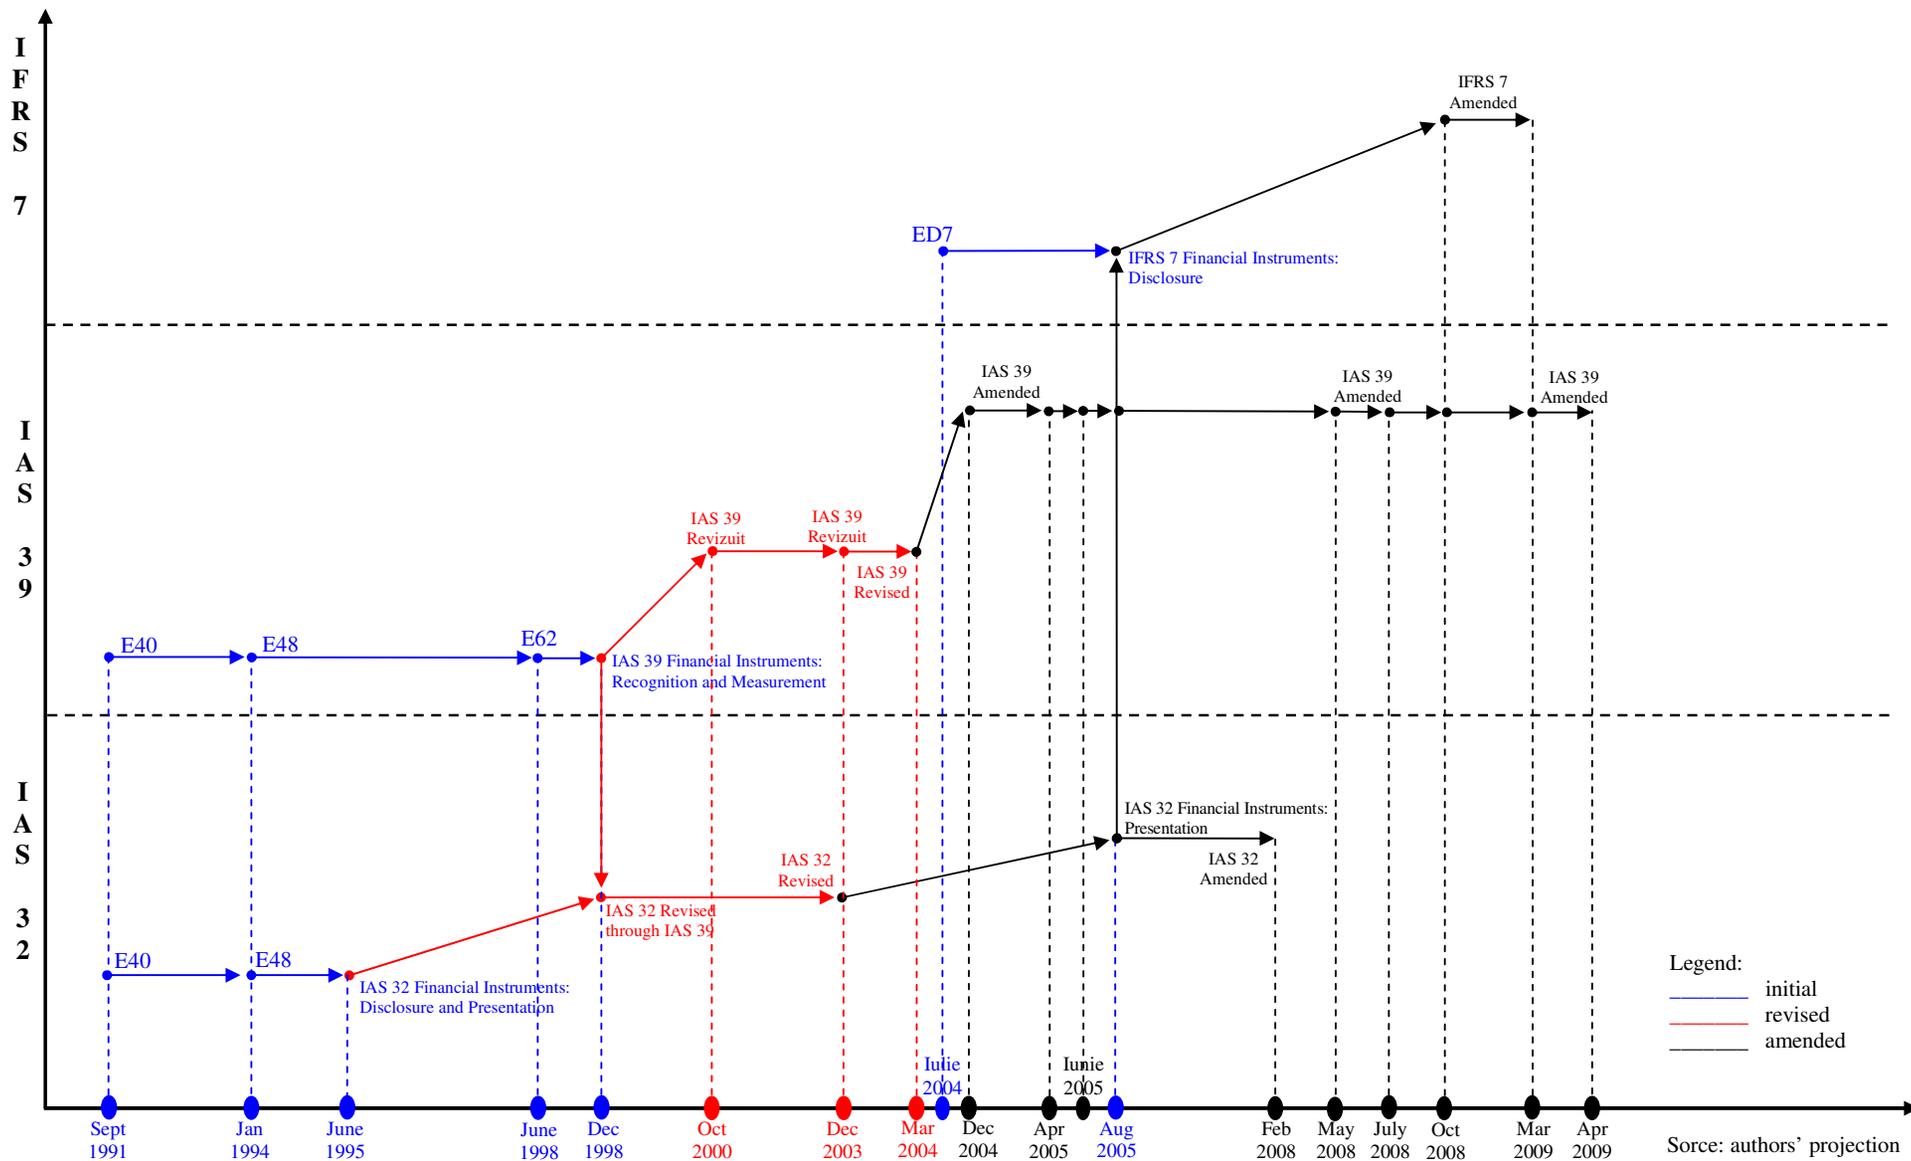

analysis within the field of accounting for financial instruments continued to be developed with regard to recognition and measurement issues. These researches also soon took the shape of an Exposure Draft, namely E 62 in 1998, shortly becoming IAS 39 *Financial instruments: Recognition and Measurement*. IAS 32 was also revised with this occasion.

Figure 1. Accounting regulations in the field of financial instruments

Source: authors' projection

Figure 2. Evolutions of the international accounting referential in the field of financial instruments

Source: authors' projection

It is now more than obvious that IAS 39 represents the most revised and amended standard being issued by IASB. This does not come as a surprise considering the controversial aspects this standard deals with. Recognition and measurement have always represented a difficult aspect of financial reporting, but the current financial crisis enhanced its importance. Therefore, IAS 39 was amended with regard to the reclassification of financial assets. Significant pressures were made due to the fact that classifying a financial asset within a certain category also dictated its valuation at fair value or amortized cost. Considering the resulting inactive financial markets due to crisis circumstances, entities required for the right to reclassify arguing that current circumstances have also determined them to change their intentions upon their financial assets. But on the other hand, allowing them to reclassify also offers the opportunity of avoiding fair value measurement with manipulation purposes. This decision of amending IAS 39 was very much criticized and brought damage to IASB's formal independence, especially since it was done very urgently and without respecting the complete due process. European banks were also among the first to put pressures on IASB. The problem of financial instrument's measurement remains open, the new IFRS 9 *Financial Instruments* seeking to replace IAS 39 and eliminate their classification determining the measurement attribute. The problem is even more difficult due to the context now surrounding fair value that took some of the finger pointing for the current financial crisis. While already being a sensitive topic, fair value measurement brought even more controversies due to the circumstances generated by the impact of the financial crisis on capital markets around the world.

We consider that the development in June 2004 of the exposure draft for a standard that was to be entirely dedicated to disclosure issues on financial instruments represented a clear proof of accepting a change in accounting paradigms. We refer here to the necessity of reorienting approaches when it comes to accounting for fictive capital. The emphasis now moves from recording data towards measurement, reporting and disclosing information, that is imperative for a good understanding of the implications of financial instruments being used by reporting entities. We conclude by saying that reporting for financial instruments represents a challenging area for all involved parties. Events surrounding European Union's endorsement of IFRS, with the well known carve out concerning IAS 39 and the fair value option, also represent a good example for the manner in which political forces can intervene within the standard setting process even when dealing with its international level. It is therefore an area imposing changes in accounting paradigms and continuous search for better solutions, while practice keeps facing us with a new riddle every day.

In the current context, organizations are evaluated not only in terms of product quality. The modern organization is valued beyond its economic performance, quality management and communication policy, and by its contribution to the social life of the community it takes part of. The new social responsibilities that appear for the companies involve the increasement of information requests from both outside and inside for better management of the entity. Social responsibility accounting is a branch of accounting in the context of scientific knowledge that provides answers to social problems, the causes, manifestations and projections in a dynamic environment. This article aims to show what social responsibility is and how it works according to SA 8000:2008, what would be its implications and its main objectives, emphasizes the importance of publishing additional information on corporate social responsibility other than traditional financial situations.

Keywords: social responsibility, social responsibility accounting, SA 8000: 2008, key areas, quality

1. Introduction. The concept of social responsibility

Social responsibility is the notion or concept which connotes the obligations of the companys to groups formed in the society, other than shareholders and also those prescribed by law and unions. The two sides of this definition are: firstly, the obligation must be voluntarily accepted (so the behavior influenced by enforcement forces of law or trade union is not voluntary), secondly, the obligation is something broader, meaning it extends beyond the traditional duty to the shareholders, to other groups in society such as consumers, employees, suppliers and neighboring communities. The essence of this conceptual issue is whether the organizations have obligations to other social groups than shareholders¹¹⁹¹.

Corporate social responsibility is a concept whereby companies integrate their social part and the environment in their own economic operations and interact with key players in their field of interest voluntarily¹¹⁹².

CSR is what the community expects from it in terms of environmental, economic, legal, ethical and philanthropic view point. The most developed and most widely accepted model of corporate social responsibility is the so-called „quadripartite model of corporate social responsibility", initially proposed by Archie Carroll in 1979 and then refined in a recent work, done in collaboration with AK Buchholtz¹¹⁹³.

Environmental responsibility. Environmental responsibility is a reflection of sustainable

¹¹⁹¹ **Ionescu Gh. Gh.** *Cultura Afacerilor- Modelul american*, Ed. Economică, București, 1997, 175

¹¹⁹² **Comisia Europeană**, *Cartea Verde: Promovarea unui cadru european pentru responsabilitatea socială a corporațiilor*, Bruxelles , 2001

¹¹⁹³ **Carroll, A. B., Buchholtz, A. K.:** *Business and Society: Ethics and Stakeholder Management*, 4th edition, Cincinnati, South- Western College, 2000

development issues including the ecological aspects considered by the literature¹¹⁹⁴ to be a core value of social responsibility.

Economic responsibility. Companies have shareholders who expect a reasonable profit for their investments. They have employees who want safe and well-paid jobs, they have customers who demand quality products at affordable prices, etc..

Legal Responsibility. Corporate legal responsibility calls for the business to comply with the normative documents in force.

Ethical responsibility. Ethical responsibilities require corporations to do what is just, fair and equitable, even if they are not forced to do so by the existing legal framework.

Philanthropic responsibility. The Greek word "philanthropy" literally means "love of people" and placing this within the context of business covers all those situations where the corporation is free to decide, without any external constraint, to engage in actions aimed at improving quality of life for employees, local communities and ultimately society as a whole.

2. Social Accountability 8000 standard

The Most relevant standards of social responsibility is the SA8000 developed by **CEPA (Council of Economic Priorities Accreditation Agency - USA)** now known as **Social Accountability International (SAI)**. The Social Accountability 8000 Standard (SA 8000), along with other types of certification standards and corporate codes of conduct, represents a new form of voluntary "self-governance" of working conditions in the private sector, initiated and implemented by companies, labor unions, and non-governmental activist groups cooperating together. There is an ongoing debate about whether this type of governance represents real and substantial progress or mere symbolism. Advocates promote SA 8000 and similar codes as a necessary tool to improve workplace conditions, especially in nations that lack robust enforcement of regulatory standards¹¹⁹⁵.

The **SA 8000** standard is an internationally auditable performance standard relying on International Labor Organization Conventions, on the Human Rights Declaration and the UNO Convention on child's rights. The management system of social accounting can be developed so as to integrate part of the other management systems: quality (ISO 9001:2000), environment (ISO 14001:2004), health and workforce security (OHSAS 18001:1999).

SA 8000: 2001 can apply in all and any organizations which wants to:

- Measure the companies' performance in eight key areas: child's work, forced work, occupational work and security, free association in collective associations, discrimination, disciplinary practices, working hours, remunerations;
- Investigate and solve the employees' or the parties' problems, as well as take some actions with a view to correct them;
- Elaborate a health and occupational security management system to eliminate or minimize the risks of employees or other parties who might be exposed to health and occupational security-related risks associated with their activities;
- Implement, maintain and improve, on a permanent basis, a social accountability management system;
- Make sure this system complies with the company's policy in terms of social accountability;
- Prove this compliance to others;
- Try to get certification/confirmation of its social accountability management system by an external organization.

¹¹⁹⁴ **Crane et al.:** Corporate Social Responsibility. Readings and causes in a global context. Routledge, 2008, 307

¹¹⁹⁵ **Hiscox et. al,** Evaluating the Impact of SA 8000 Certification, 2008, 2

Generally, CSR can positively influence competitiveness in the following ways¹¹⁹⁶:

- Improved products and/or production processes, resulting in a better customer satisfaction and loyalty;
- Higher motivation and loyalty of employees, resulting in a higher creativity and innovativeness;
- Better publicity due to the award of prizes and/or enhanced word-of-the-mouth;
- Better position at the labour market and better networking with business partners and authorities including better access to public funds due to a better company image;
- Cost savings and increased profitability due to a more efficient deployment of human and production resources;
- Increased turnover/sales due to a competitive advantage derived from the above.

The intent of SA8000 is to provide a standard based on international human rights norms and national labour laws that will protect and empower all personnel within a company's scope of control and influence, who produce products or provide services for that company, including personnel employed by the company itself, as well as by its suppliers/subcontractors, sub-suppliers, and home workers. SA8000 is verifiable through an evidenced-based process. Its requirements apply universally, regardless of a company's size, geographic location, or industry sector.

Complying with the requirements for social accountability of this standard will enable a company to:

- Develop, maintain, and enforce policies and procedures in order to manage those issues which it can control or influence;
- Credibly demonstrate to interested parties that existing company policies, procedures, and practices conform to the requirements of this standard.

SA 8000 is a consensual standard that specifies minimum requirements and include definitions in the following areas:

- Child Labor;
- Forced and compulsory labor;
- Health and Safety;
- Freedom of association and right to collective bargaining;
- Disciplinary Practices;
- Discrimination;
- Work Program;
- Remuneration;
- Management systems.

2.1. Child Labor

The company shall establish, document, maintain, and effectively communicate to personnel and other interested parties, policies and written procedures for remediation of children found to be working in situations which fit the definition of child labour above, and shall provide adequate financial and other support to enable such children to attend and remain in school until no longer a child as defined above.

The company shall not expose children or young workers to any situations – in or outside of the workplace – that are hazardous or unsafe to their physical and mental health and development.

2.2. Forced and compulsory labor

The company shall not engage in or support the use of forced or compulsory labour, nor shall personnel be required to pay 'deposits' or lodge identification papers with the company upon commencing employment. Neither the company nor any entity supplying labour to the company

¹¹⁹⁶ **European Commission**, Enterprise and Industry Directorate-General: Corporate Social Responsibility in SMEs, 2007, 3

shall withhold any part of any personnel's salary, benefits, property, or documents in order to force such personnel to continue working for the company.

Personnel shall have the right to leave the workplace premises after completing the standard workday, and be free to terminate their employment provided that they give reasonable notice to their employer.

Neither the company nor any entity supplying labour to the company shall engage in or support trafficking in human beings.

2.3. Health and Safety

The company shall provide a safe and healthy workplace environment and shall take effective steps to prevent potential accidents and injury to workers' health arising out of, associated with, or occurring in the course of work, by minimising, so far as is reasonably practicable, the causes of hazards inherent in the workplace environment, and bearing in mind the prevailing knowledge of the industry and of any specific hazards.

2.4. Freedom of association and right to collective bargaining

All personnel shall have the right to form, join, and organise trade unions of their choice and to bargain collectively on their behalf with the company. The company shall respect this right, and shall effectively inform personnel that they are free to join an organisation of their choosing and that their doing so will not result in any negative consequences to them, or retaliation, from the company. The company shall not in any way interfere with the establishment, functioning, or administration of such workers' organisations or collective bargaining.

2.5. Discrimination

The company shall not engage in or support discrimination in hiring, remuneration, access to training, promotion, termination, or retirement based on race, national or social origin, caste, birth, religion, disability, gender, sexual orientation, family responsibilities, marital status, union membership, political opinions, age, or any other condition that could give rise to discrimination.

2.6. Disciplinary Practices

The company shall treat all personnel with dignity and respect. The company shall not engage in or tolerate the use of corporal punishment, mental or physical coercion, or verbal abuse of personnel. No harsh or inhumane treatment is allowed.

2.7. Working hours

The company shall comply with applicable laws and industry standards on working hours and public holidays. The normal work week, not including overtime, shall be defined by law but shall not exceed 48 hours.

Personnel shall be provided with at least one day off following every six consecutive days of working. Exceptions to this rule apply only where both of the following conditions exist:

- National law allows work time exceeding this limit; and
- A freely negotiated collective bargaining agreement is in force that allows work time averaging, including adequate rest periods.

In cases where overtime work is needed in order to meet short-term business demand and the company is party to a collective bargaining agreement freely negotiated with worker organisations (as defined above) representing a significant portion of its workforce, the company may require such overtime work in accordance with such agreements. Any such agreement must comply with the requirements above.

2.8. Remuneration

The company shall respect the right of personnel to a living wage and ensure that wages paid for a normal work week shall always meet at least legal or industry minimum standards and shall be sufficient to meet the basic needs of personnel and to provide some discretionary income.

2.9. Management systems

Policy. Top management shall define in writing, in workers' own language, the company's policy for social accountability and labour conditions, and display this policy and the SA8000 standard in a prominent, easily viewable place on the company's premises, to inform personnel that it has

voluntarily chosen to comply with the requirements of the SA8000 standard. Such policy shall clearly include the following commitments:

- To conform to all requirements of this standard;
- To comply with national and other applicable laws and other requirements to which the company subscribes, and to respect the international instruments and their interpretation;
- To review its policy regularly in order to continually improve, taking into consideration changes in legislation, in its own code-of-conduct requirements, and any other company requirements;
- To see that its policy is effectively documented, implemented, maintained, communicated, and made accessible in a comprehensible form to all personnel, including directors, executives, management, supervisors, and staff, whether directly employed by, contracted with, or otherwise representing the company;
- To make its policy publicly available in an effective form and manner to interested parties, upon request.

Management Representative. The company shall appoint a senior management representative who, irrespective of other responsibilities, shall ensure that the requirements of this standard are met.

SA8000 Worker Representative. The company shall recognize that workplace dialogue is a key component of social accountability and ensure that all workers have the right to representation to facilitate communication with senior management in matters relating to SA8000. In unionised facilities, such representation shall be undertaken by recognized trade union(s). Elsewhere, workers may elect a SA8000 worker representative from among themselves for this purpose. In no circumstances, shall the SA8000 worker representative be seen as a substitute for trade union representation.

Management Review. Top management shall periodically review the adequacy, suitability, and continuing effectiveness of the company's policy, procedures, and performance results vis-à-vis the requirements of this standard and other requirements to which the company subscribes. Where appropriate, system amendments and improvements shall be implemented. The worker representative shall participate in this review.

Planning and Implementation. The company shall ensure that the requirements of this standard are understood and implemented at all levels of the organisation.

Control of Suppliers/Subcontractors and Sub-Suppliers. The company shall maintain appropriate records of suppliers/subcontractors' (and, where appropriate, sub-suppliers') commitments to social accountability.

Addressing Concerns and Taking Corrective Action. The company shall provide a confidential means for all personnel to report non-conformances with this standard to the company management, and the worker representative. The company shall investigate, address, and respond to the concerns of personnel and other interested parties with regard to conformance/non-conformance with the company's policies and/or the requirements of this standard. The company shall refrain from disciplining, dismissing, or otherwise discriminating against any personnel for providing information concerning observance of the standard.

Outside Communication and Stakeholder Engagement. The company shall establish and maintain procedures to communicate regularly to all interested parties data and other information regarding compliance with the requirements of this document, including, but not limited to, the results of management reviews and monitoring activities.

The company shall demonstrate its willingness to participate in dialogues with all interested stakeholders, including, but not limited to: workers, trade unions, suppliers, subcontractors, sub-suppliers, buyers, nongovernmental organizations, and local and national government officials, aimed at attaining sustainable compliance with this standard.

Access for Verification. In the case of announced and unannounced audits of the company for the purpose of certifying its compliance with the requirements of this standard, the company shall ensure access to its premises and to reasonable information required by the auditor.

Records. The company shall maintain appropriate records to demonstrate conformance to the requirements of this standard.

SA8000 is based on the principles of international human rights norms as described in International Labour Organisation conventions, the United Nations Convention on the Rights of the Child and the Universal Declaration of Human Rights. It measures the performance of companies in eight key areas: child labour, forced labour, health and safety, free association and collective bargaining, discrimination, disciplinary practices, working hours and compensation. SA8000 also provides for a social accountability management system to demonstrate ongoing conformance with the standard.

Conclusions

Economic globalization is a challenge for organizations worldwide. In this context, an important topic of Social Responsibility gets increasingly higher in present world, being not seldom a tie breaker criteria in auctions in which economic agents with similar activity profile are involved. Accounting, as informational means, must offer information to different users of accurate information. Amongst these users, we can think of the society, in general terms, which is directly interested in knowing the social repercussions of the organization's activities.

According to research carried out, the real problem lies in accounting interpretation of environmental and social concepts, and theoretical position is adopted to talk about them, since, for accounting purposes, it is important the externalization and internalization of social responsibility concept. The social responsibility accounting information are meant not only to meet the society's requirements but also to make their contribution to creation of value inside the organization showing the extent to which the company is socially responsible and contributing to creation of intangible assets. SA 8000 is a voluntary standard for organizations interested in auditing and certification of working practices applied to the premises, and in collaboration with suppliers or partners who demonstrate social responsibility.

Preparing consolidated financial statements has been a common practice for groups of companies around the world for a relatively long time, going back one century in the USA and tens of years in different European countries. A far-reaching issue regarding consolidation accounting policy is the concept of control, as it holds a crucial role in determining the basis of consolidation and the applicable method of consolidation and subsequently in influencing the content of the group financial statements. We focus in our article on the concept of exclusive control as it is approached by the relevant International, American and European standards, casting light also on possible future developments of this concept. The objective of our study is to acknowledge the differences and similarities between the approaches to the control concept, closing with the presentation of the influences of these approaches on the basis of consolidation.

Keywords: Group, Consolidation, Control, IFRS

JEL: M410

1. INTRODUCTION

Preparing consolidated financial statements has been a common practice for groups of companies around the world for a relatively long time, going back one century in the USA and tens of years in different European countries. Within the EU, groups of companies have to publish consolidated statements in accordance with the 7th European Directive. Moreover pursuant to EU Regulation 1606/2002, listed groups have to publish (in addition) a set of consolidated statements prepared in accordance with IFRS (Tiron-Tudor & Müller, 2007: p. 66). A far-reaching issue regarding consolidation accounting policy is the concept of control, as it holds a crucial role in determining the basis of consolidation and the applicable method of consolidation and subsequently in influencing the content of the group financial statements. In other words, the objective of identifying the situation in which a company has to include in its consolidated financial statements the assets, liabilities and income pertaining to another company gravitates to a major extent towards the concept of control. The accounting literature and practice encounters a large diversity of opinion regarding the issue of control of another company (Henry, 1999: p. 39). The objective of our study is to acknowledge the differences and similarities between the approaches to the control concept, closing with the presentation of the influences of these approaches on the basis of consolidation. We focus in our article on the concept of exclusive control as it is approached by the relevant International, American and European standards, casting light also on possible future developments of this concept. Thus we planed for our research to study the appropriate technical literature, the relevant legislation in the field of consolidations as well as the IASB's discussions chronology of its Project "Consolidations" and FASB's ED for the proposed Standard on Consolidated Financial Statements.

2. THEORETICAL SETTING OF THE CONCEPT OF CONTROL

Presently there is no standard definition of control. However there are common coordinates of the existing definitions, which focus basically on the ability to direct the financial and operating policy of a company and on the possibility to obtain benefits which originate from the respective company. A definition with a large international acceptance, which includes the two mentioned elements presents control as being the power to govern (direct) the financial and operational policy of an entity in such a manner as to receive benefits from its activities (Feleagă & Feleagă, 2007: p.24) This definition is based on the following two cumulative criteria for the existence of control: A) the power criterion and B) the benefits criterion.

A. The power to direct the financial and operating policies of an entity has the meaning of strategic power (IASB, 2006a: p. 5). The operating policies consist in the those policies which direct activities such as sales, acquisitions, marketing, production and human resources and the financial policies refer to those policies which direct the accounting policies: budget approval, credit policy, dividend policy, bond policy, cash management etc. (Ashwal, 2005: p. 7). The owner of this strategic power has the possibility to determine the way one entity's assets are used (either directly within its activities or indirectly by selling them), and has also the possibility to determine that entity to contract supplementary loans, to raise or pay its debts (IASB, 2006a: p. 5). An important issue in this context is whether this strategic power must necessarily have an exclusive character or not. We believe that this power cannot be shared or divided, in other words in our opinion only one entity can control another entity. Where directing the financial and operational policies of an entity can take place only together (in common) with other entities involved, control is not present.

B. Deriving benefits from the activities of a controlled entity are mainly (and in most cases) linked to the ownership of capital instruments issued by that entity. The holder of such instruments can benefit a) directly through any returns on the shares in the form of dividends and through changes in the value of the shares (especially if they are listed) that are a result of those shares absorbing the variability of the entity's assets and liabilities or b) indirectly from any proceeds from selling that capital instruments. The range of possible benefits can be extended, as these derive from being able to utilize or deal with the assets and liabilities of the controlled entity.

According to the definition of control presented above, the control concept has an exclusive character (Matiș, 2003: p. 313). This exclusive control can have two forms: legal control and effective control (Malciu & Feleagă, 2002: p.22).

3. ASSESSING THE EXISTENCE OF CONTROL AS THE BASIS OF CONSOLIDATION

3.1 The US GAAP Approach to Control as the Basis of Consolidation

The FASB consolidation policy project has for many years focused on developing new standards to determine which entities should be included in consolidated financial statements (Ashwal, 2005: p. 2). This project is aimed at reconsidering the consolidation principles included in Accounting Research Bulletin No. 51, Consolidated Financial Statements (ARB 51), which was issued in 1959. ARB 51 describes the purpose of group financial statements and the general rule of consolidation policy. According to ARB 51 consolidated financial statements are required when one of the companies in the group directly or indirectly has a controlling financial interest in the other entities. Within this context control is considered as having ownership of a majority voting interest (i.e., over 50% of the outstanding voting shares of another company). Accordingly, only the existence of legal control is considered as the basis of consolidation. SFAS 94 amended ARB 51 to eliminate all of the exceptions to consolidation, except when control is likely to be temporary or if it does not rest with the majority owner (e.g. if the subsidiary is in legal reorganization or in bankruptcy. However, SFAS 144 eliminated this exception.) Actually

neither ARB 51 nor SFAS 94 define control. The notion of control has always been in the American accounting literature but it was never defined (Henry, 1999: p. 39).

The declared purpose of group financial statements and the general rule of consolidation displayed in ARB 51 focus on companies that issue voting shares, which generally are business enterprises organized as for-profit corporations. Under these requirements consolidation is based on control, where control is generally measured as owning (directly or indirectly) more than 50% of an entity's outstanding voting shares of equity. However, during the years since ARB 51 has been issued, both business enterprises and not-for-profit organizations have continued to conduct a growing and diverse range of activities through increasingly complex organizational structures (Ashwal, 2005: p. 2). Therefore, FASB issued in 1995 an *Exposure Draft on Consolidated Financial Statements: Policy and Procedures*, where it arrived at a definition of control and outlined procedures for CPAs to use in preparing consolidated financial statements. Opposition to the ED was strong enough to cause FASB to vote it down (Henry, 1999: p. 41).

During 1999, the FASB issued a revised ED on consolidation policy, *Consolidated Financial Statements: Purpose and Policy*. The concept of control is defined as the ability to direct the policies and management that guide the ongoing activities of another entity so as to increase the benefits and limit the losses from those activities.

The FASB determined in 1999 that there was not sufficient Board member support to proceed with a final statement on the consolidation policy ED, although it believed that improved guidance in this area is desirable (Ashwal, 2005: p. 7). Six years later, the FASB issued an exposure draft, *Consolidated Financial Statements, Including Accounting and Reporting of Noncontrolling Interests in Subsidiaries*, which should replace ARB 51. The ED carries forward the 50% plus one – bright line rule of ARB 51. This indicates clearly that the US GAAP is continuing the rule based approach to the concept of control.

3.2 The IASB Approach to Control as the Basis of Consolidation

International accounting consolidation rules (including the application of the concept of control) are included in IAS 27 (issued in 1989 and last revised in 2007), *Consolidated and Separate Financial Statements* (IAS 27) and SIC 12, *Consolidation - Special Purpose Entities*, an interpretation relating to IAS 27, which provides further indicators of control over SPEs.

Among other things, IAS 27 prescribes the requirements for preparing and presenting consolidated financial statements for entities under the control of a parent. Under IAS 27 consolidated financial statements should include all subsidiaries, which are defined as entities controlled by another company (parent). IAS 27 defines control as the power to govern the financial and operating policies of an entity so as to obtain benefits from its activities. This definition involves the two cumulative criteria (power and benefits) presented in the beginning of this paper. It encompasses both the notion of governance (power) and the economic consequence of that governance (i.e., benefits and risks). Governance is related to the power to make decisions through the selection of financial and operating policies, which does not require active participation or ownership of equity instruments. Benefits may be related to present or future cash inflows either directed to the controlling entity or remaining in control of the controlling entity or may involve non-monetary increases in value to the controlling company. Risks may relate to present or future cash or non-monetary outflows either paid by the controlling entity or through assets controlled by the enterprise (Ashwal, 2005: p. 7).

Control is presumed to exist when an investor owns (directly or indirectly) more than 50% of voting interest in an entity. However, in particular cases it may be possible to demonstrate that such ownership does not mean control, especially when a significant minority interest exists or when another party has the ability to dominate the board of directors of the entity. The substance of the arrangement has to prevail, as it may provide evidence to rebut the presumption. In addition, control can exist even when an entity owns less than 50% of an entity's voting power when one or more of the conditions enumerated in IAS 27.13 exist.

It is obvious that the scope of control is broader than in the US GAAP world: IAS 27 covers both legal and effective control (including the statute control), whereas ARB 51 considered only legal control (based on the 50% threshold). In addition to the indicators in IAS 27.13 for the assessment of control, the potential voting rights identified in IAS 27.14 should also be considered in evaluating whether or not control exists.

3.3 The EU Approach to Control as the Basis of Consolidation

The EU accounting consolidation policy is laid down in the Seventh Council Directive, issued in 1983. This Regulation has been the main harmonization instrument in the field of consolidation policy on EU level. The Directive does not define the concept of control but displays (within Article 1) the following situations when a (subsidiary) undertaking (entity) has to be included in the consolidated financial statements of its parent:

- has a majority of the shareholders' or members' voting rights in another entity; or
- has the right to appoint or remove a majority of the members of the administrative, management or supervisory body of another entity and is at the same time a shareholder in or member of that entity; or
- has the right to exercise a dominant influence over an entity of which it is a shareholder or member, pursuant to a contract entered into with that entity or to a provision in its memorandum or articles of association; or
- is a shareholder in or member of an entity, and a majority of the members of the administrative, management or supervisory bodies of that entity have been appointed solely as a result of the exercise of its voting rights (this is not applicable if another entity has the rights referred to in the first three subparagraphs above with regard to that entity); or
- is a shareholder in or member of an entity and controls alone, pursuant to an agreement with other shareholders in or members of that entity, a majority of shareholders' or members' voting rights in that entity.

Furthermore, apart from these situations the Directive allows Member States to require an entity to be included in the consolidated financial statements if its parent: has the power to exercise, or actually exercises, dominant influence or control over that entity; or together with that entity are managed on a unified basis by the parent undertaking.

These situations are in fact indicators of the existence of control. The scope of control within the European Directive is very similar to that presented in IAS 27. It is clearly that the situations presented above encompass both legal and effective control. The contractual or statute control (as a form of the effective control) is also taken into consideration.

4. THE CONTROL BASED MODEL OF IASB'S AGENDA PROJECT "CONSOLIDATIONS"

In June 2003, the IASB added a project on Consolidation to its agenda, whose goal is to publish a single IFRS on consolidation to replace IAS 27 Consolidated and Separate Financial Statements and SIC-12 Consolidation – Special Purpose Entities such that the control criteria within a single IFRS should be developed for all entities (IASB, 2006a: p.1). This project forms part of the Memorandum of Understanding between the IASB and the FASB which sets out a Roadmap of Convergence between IFRSs and US GAAP 2006-2008. Most standard setters (including the IASB) have identified control as the appropriate basis for consolidation; however, there appear to be differences in the way control is interpreted in deciding whether consolidation is required. As a result, there may be differences in how a reporting entity is defined (Deloitte, 2007). Within this context, the IASB "Consolidations" project will provide more rigorous guidance around the concept of "control", which is the basis for consolidation under IAS 27.

4.1 Updating the Definition of Control

The Board has tentatively agreed to define control as the ability to direct the strategic financing and operating policies of an entity so as to access benefits flowing from the entity and increase, maintain or protect the amount of those benefits (IASB, 2006a: p.4). This definition contains three tests:

- 1) the ability to direct the strategic financing and operating policies of the entity (the ‘Power Criterion’);
- 2) the ability to access the benefits flowing from the entity (the ‘Benefits Criterion’); and
- 3) the ability to use its power so as to increase, maintain or protect the amount of those benefits (the ‘Link Criterion’).

The first two tests correspond to the cumulative conditions presented in the definition of control at the beginning of this paper. The third test is the new element. This condition should be usually met (if the first two conditions are complied with). However, situations might occur when a company (A) has the abilities to direct the strategic financing and operating policies of another entity (B) and to access the benefits flowing from that entity (thus fulfilling the Power and Benefits Criteria) but pursuant to a contract entered into with that entity or to a provision in its memorandum or articles of association is not able to increase, maintain or protect the amount of the benefits flowing from that entity. In our opinion such situations should be rather exceptional.

4.2 Shifting the Focus of Control to the Assets and Liability

The staff basically agreed with the definition the Board has tentatively approved upon, but wished to amend it in order to focus on the assets and liabilities of the entity rather than the entity per se. Thus the considered type of wording is An entity has a controlling interest in another entity when it has exclusive rights over that entity's assets and liabilities which give it access to the benefits of those assets and liabilities and the ability to increase, maintain or protect the amount of those benefits.

We consider this change as being suitable and agree with the IASB staff who argues that the use of the assets and liabilities of an entity are, ultimately, what power over the strategic financing and operating policies is intended to capture. According to the staff, this characterization of control also provides a stronger link with benefits. It also avoids implying that control over assets and liabilities can only be achieved by directing the strategic financing and operating policies of an entity—control might be achieved other than through strategic power (IASB, 2006a: p. 5).

4.3 Assessing the Existence of Control by Considering Indicators

In many situations establishing whether an entity controls another entity is easy, because the rights are clear. This is especially the case when an entity owns (directly or indirectly) more than 50% of voting interest in another entity. This fact is consistent with the property rights literature which notes that, apparently, as the power over assets increases the evidence of that power should also become more apparent, because the rights should become better defined (IASB, 2006b: p. 8). In these situations the identification of control is based on the existence of *presumptive indicators*.

Possibly the most obvious presumptive indicator is the right to cast a majority of the votes of an entity, giving the holder the right to appoint that other entity's board of directors. However even if a company holds less than a majority voting rights in another entity, other presumptive indicators of control may be applicable such as (IASB, 2006a: p.11):

- it has the dominant voting power at meetings of the entity's governing body, when the balance of voting interests is widely dispersed and disorganized;
- it has exclusive rights to exercise more than half of the entity's voting rights by virtue of an agreement with other investors;
- it has exclusive rights under a statute or an agreement to determine the entity's strategic operating and financing policies.

- it has exclusive rights to appoint or remove the majority of the members of the entity's board of directors or equivalent governing body and control of the entity is by that board or body.

In the absence of presumptive indicators assessing control might require more judgment. The IASB staff believes that in such circumstances control should be assessed by considering the indicators that evidence the nature of the relationship between the investor and the investee. They might indicate that the dominant investor (but holder of less than the majority of voting rights) is participating in the activities of that other entity. Such indicators (considered collectively) could be structured into the following three categories (IASB 2006b: p. 11):

- The ability to dominate the governing body, and therefore the strategic policy decision process;
- The ability to participate in the management of an entity;
- The ability to access the residual assets of an entity.

5. CONCLUSIONS

From an International (IFRS) and European perspective (7th Directive), the concept of control is much broader than under US GAAP. The US GAAP approach towards control is rule-based (50% bright line rule) and many analysts argue that this approach opens the door for creative accounting as it can be used to shape the basis of consolidation. For example, if companies need to get debt off their consolidated balance sheet, they get their equity ownership in a subsidiary under 50%. If the subsidiary prospers, they turn around and get that entity on the other side of the bright line (Henry, 1999: p. 40). The Enron debacle demonstrates best the need for a principle based approach of the concept of control: it did not consolidate hundreds of off-balance-sheet entities and failed for this reason to recognize the associated liabilities (Kivi, Smith & Wagner, 2004). However the convergence with IFRS will probably determine FASB to issue in the relatively near future a standard which will embrace the principle based approach to the concept of control, thus abandoning the 50% bright line rule and relying more on the accountant's judgment. The European perspective of the concept of control is somehow similar to the IFRS perspective. However the translation into Member States legislation of the options allowed by the 7th Directive regarding effective control (Article 1.2) can influence the basis of consolidation of groups pertaining to different EU Members, especially when the conditions explicitly stated in the Directive (Article 1b,c,d) are not present.

Companies are no longer making the balance according to the code of commercial law rules, but instead particularly according to the rules of the International Accounting Standards Board (IASB). For the fifth time the capital market orientated companies prepare their annual financial statement according to the international accounting regulations IFRS. There was never such a far-reaching standardization of the accounting over country limits. But for many practitioners is this system confusing. During crisis it has seemed even crisis emphasizing.

Stichwörter: International Financial Reporting Standards (IFRS), Internationalisierung, International Accounting Standards Board (IASB), Securities and Exchange Commission (SEC)

JEL Kode der Arbeit: M40

1. Internationalisierung der Rechnungslegung

Warum gibt es international unterschiedliche Rechnungslegungssysteme, die prinzipiell doch alle demselben Metazweck folgen? Die Rechnungslegungsregeln und -praktiken eines Landes lassen sich letztlich nur nachvollziehen, wenn Entstehungsgeschichte, Rahmenbedingungen sowie Einflussfaktoren der Rechnungslegung bekannt sind. So ist die Rechnungslegung insbesondere vom sozioökonomischen Umfeld abhängig, wozu z.B. die Geschichte, die Kultur, das Rechts- und Steuersystem und die Kapitalmarktverhältnisse eines Landes gehören.

Die Rechnungslegung ist in den kontinentaleuropäischen Ländern ein Risikokoordinationsinstrument für sämtliche Unternehmensbeteiligte und damit fester Bestandteil der gesetzlich kodifizierten Unternehmensverfassung. Folglich sind die Interessen möglichst vieler Vertragspartner des Unternehmens mit der Rechnungslegung abzudecken. Das Rechnungslegungssystem dient hier einerseits als Informations- und Kontrollinstrument für sämtliche Unternehmensbeteiligte. Andererseits werden aus ihm auch unmittelbare Rechtsfolgen abgeleitet. Entsprechend sind detaillierte Regulierungen zur Rechnungslegung zu finden. Um die Vermögensinteressen aller Unternehmensbeteiligten und hier insbesondere der Fremdkapitalgeber angemessen zu berücksichtigen, sind die Rechnungslegungsregeln tendenziell vom Vorsichtsprinzip geprägt.

Im angelsächsischen Rechtssystem des Common Law finden sich nur wenig detaillierte Rechnungslegungsvorschriften in den Gesetzen. Die Rechnungslegung ist hier ein möglicher Bestandteil der Vertragsgestaltung und insofern speziell auf die Bedürfnisse einzelner Vertragspartner zugeschnitten. Somit bleibt es den Vertragspartnern eines Unternehmens überlassen, wie der Abbau der asymmetrischen Informationsverteilung zwischen Rechnungslegern und Rechnungslegungsadressaten konkret zu erfolgen hat. Nur für bestimmte Unternehmen, insbesondere wenn sie einen organisierten Kapitalmarkt in Anspruch nehmen, existieren detaillierte Rechnungslegungsvorschriften, um die Funktionsfähigkeit dieser Märkte zu schützen. Meist werden diese Regeln von privaten Rechnungslegungsgremien, wie z.B. dem US-amerikanischen Financial Accounting Standards Board (FASB), entwickelt, Gesetze, z.B. im Bereich des Kapitalmarktrechts, geben hierfür nur einen weiten Rahmen vor.

Es ist deutlich, dass die Rechnungslegung in Funktion und Inhalt von rechtlichen Rahmenbedingungen abhängt. Wenn die Rechnungslegung, wie im kontinentaleuropäischen Rechtssystem üblich, in ein enges Geflecht von Standardverträgen auch im Sinne von Gesetzen eingebunden ist, werden die Funktionen der Rechnungslegung auf die mit diesen Verträgen verfolgten Zwecke hin ausgerichtet. Wenn hingegen wenige Verträge existieren, wird die Rechnungslegung lediglich zur Verringerung der Informationsasymmetrie betrieben, da eine weitere Spezifizierung ohne entsprechende Standardverträge nicht möglich und sinnvoll ist.

Die internationale Ausrichtung der Geschäftstätigkeit zieht meist auch einen erhöhten externen Finanzierungsbedarf nach sich. Um das erforderliche Finanzvolumen zu möglichst günstigen Konditionen beschaffen zu können, sind sämtliche potentiellen Finanzierungsquellen anzusprechen. Die Inanspruchnahme attraktiver ausländischer Kapitalmärkte. z.B. durch Kreditaufnahme bzw. Emission von Anleihen und Aktien, setzt voraus, dass die ausländischen Kapitalgeber über die Rendite-Risiko-Position ihres finanziellen Engagements im Unternehmen informiert werden. Als unternehmensbezogene Informationen bieten sich hierfür vor allem die Rechnungslegungsdaten an.

In vielen Ländern verlangen institutionelle Fremdkapitalanbieter von den kreditnehmenden Gesellschaften, dass sich diese im Rahmen der Kreditverträge z.B. zur Einhaltung bestimmter Jahresabschlussrelationen verpflichten. Damit muss ein ausländisches Tochterunternehmen, das in seinem Heimatland einen Kredit aufnehmen will, eine auf dem jeweiligen nationalen Rechnungslegungssystem aufbauende mittel- und langfristige Jahresabschlussplanung vornehmen. Um diese Plandaten mit der Konzernzentrale abstimmen zu können, müssen auch hier die Abbildungsregeln für die Rechnungslegung bekannt sein.

Neben der Vermittlung entscheidender Informationen sollen die Adressaten durch eine IFRS-Abschluss in die Lage versetzt werden, die in der Berichtsperiode vom Management des Unternehmens geleistete Arbeit beurteilen zu können. Die Informationsbedürfnisse der verschiedenen Jahresabschlussadressaten sind:

- *Investoren*: detaillierte Informationen über die künftige Entwicklung;
- *Kreditgeber*: Informationen über die Wahrscheinlichkeit von jetzigen und zukünftigen Liquiditätsproblemen;
- *Arbeitnehmer*: Informationen über die Stabilität und Ertragskraft;
- *Lieferanten und andere Gläubiger*: Informationen über die wirtschaftliche Lage;
- *Kunden*: Informationen über die wirtschaftliche Lage und die Fortführung;
- *Regierungen und sonstige Institutionen*: Informationen über ihre wirtschaftliche Lage;
- *Öffentlichkeit*: potentielle Adressaten von Abschlüssen.

Es ist festzuhalten, dass durch die zunehmende Internationalisierung der Unternehmenstätigkeit die kritische Auseinandersetzung mit ausländischen Rechnungslegungssystemen und den dahinter stehenden sozioökonomischen Rahmenbedingungen für absatz-, beschaffungs- und insbesondere für finanzierungspolitische Fragestellungen in den letzten Jahren stark an Bedeutung gewonnen hat. Für die Unternehmen und ihre Vertragspartner zeigt sich in dieser Entwicklung auch der Vorteil harmonisierter Rechnungslegungsregeln. Zumindest in der Tendenz dürfte gelten, dass diese Harmonisierung Transaktionskosten reduziert, die sich auf Seiten der Unternehmen auch in konkreten betriebswirtschaftlichen Kosten niederschlagen.

2. Institutioneller Rahmen der IFRS

Die Historie des International Accounting Standards Committee (IASC) und seiner Nachfolgeorganisation, des International Accounting Standards Board (IASB), lässt sich in vier Zeitabschnitte einteilen, in denen unterschiedliche Arbeitsschwerpunkte verfolgt wurden:

- *1973 bis 1988* - Entwicklung von Standards mit zahlreichen Wahlrechten
- *1989 bis 1993* - Ausarbeitung des Rahmenkonzepts und Reduzierung von Wahlrechten
- *1994 bis 2000* - Erfüllung der Anforderungen der International Organization of Securities Commissions (IOSCO) (sog. „Core Standards“)

- *seit 2001* - Gründung des IASB, Reduzierung der verbliebenen Wahlrechte, Konvergenz der internationalen Rechnungslegungssysteme

Das Erreichen einer Konvergenz der weltweit unterschiedlichen Rechnungslegungssysteme bildet einen Schwerpunkt in der Arbeit des IASB. Während die Vorgängerorganisation IASC eher den Kompromiss zwischen den unterschiedlichen nationalen Rechnungslegungskulturen suchte, was sich in den zahlreichen Wahlrechten der IAS niederschlug, verfolgt das IASB die Entwicklung einer wahlrechtsfreien und einheitlichen Rechnungslegung.

Da die Entwicklung neuer IFRS eine lange Vorlaufzeit benötigt, wurden im Rahmen dieses Projekts jene bereits existierenden Standards überarbeitet, bei denen eine Verbesserung kurzfristig international durchsetzbar erschien. Insbesondere die Zahl der noch bestehenden Wahlrechte sollte verringert werden, um eine Verbesserung der Vergleichbarkeit von Abschlüssen zu erreichen und am den Informationsgehalt von Abschlüssen zu erhöhen. Mit der Veröffentlichung von 13 überarbeiteten Standards und der Streichung von IAS 15 wurde das Improvements Project am 18.12.2003 durch das IASB abgeschlossen. Da diese Standards nicht grundlegend überarbeitet, sondern lediglich in zahlreichen Details geändert wurden, werden sie weiterhin als International Accounting Standards (IAS) bezeichnet.

Um eine weltweite Konvergenz der Rechnungslegungsnormen zu erreichen, arbeitet das IASB mit den nationalen Standardsettern eng zusammen, um eine international einheitliche Anwendung der IFRS zu erreichen. Dabei sollen auch bewährte Regelungen einzelner Ländern in die überarbeiteten Standards einfließen. Bevor die IFRS aber zum weltweit akzeptierten Rechnungslegungssystem werden können, benötigen sie insbesondere noch die offizielle Anerkennung der US-amerikanischen Börsenaufsichtsbehörde, der Securities and Exchange Commission (SEC).

IASB und FASB vereinbarten im September 2002 im Rahmen des sog. „Norwalk Agreement“ eine enge Zusammenarbeit mit der Zielsetzung, noch bestehende Unterschiede zwischen IFRS und US-GAAP bis zum Jahr 2005 weitgehend abzuschaffen. Unterschiede, die über diesen Zeitpunkt hinaus bestehen, sollen durch eine Koordination der zukünftigen Arbeitsprogramme der beiden Standardsetter beseitigt werden. Ziel ist dabei nicht die Eliminierung jeglicher Unterschiede zwischen den beiden Rechnungslegungssystemen, sondern die Anerkennung einer gleichrangigen Qualität der Bilanzierung. Die SEC hat im übrigen im November 2007 bestätigt, dass IFRS-Abschlüsse ausländischer Unternehmen, die an einer US-Börse gelistet sind, ab 2009 anerkannt werden.

Die vollständige Anerkennung der IFRS für US-amerikanische Unternehmen wird in den USA allerdings noch kontrovers diskutiert und hängt von vielen politischen Unwägbarkeiten ab. Auch bei einer erfolgreichen vollständigen Anerkennung der IFRS in den USA werden die US-GAAP weiterhin als Prototyp einer informations- und kapitalmarktorientierten Rechnungslegung eine Vorbildfunktion für die IFRS besitzen. In einer historischen Perspektive vermag diese Vorbildfunktion die Grundausrichtung, aber auch die Details der IFRS-Rechnungslegung zu erklären. Sie trägt darüber hinaus auch zum institutionellen Verständnis kapitalmarktorientierter Rechnungslegung bei.

Um die selbstgestellte Aufgabe des IASB, weltweit akzeptierte Rechnungslegungsstandards zu entwickeln, zu erfüllen, bedarf es eines mehrstufigen, mit Stellungnahmemöglichkeiten versehenen formellen Verfahrens. Zur Sicherstellung von Qualität und globaler Akzeptanz sollen die IFRS nicht nur das Ergebnis intensiver Entwicklungsbemühungen innerhalb des IASB darstellen, sondern auch die Standpunkte externer Rechnungslegungsexperten wie multinationaler Unternehmen und nationaler Rechnungslegungsgremien berücksichtigen. Der Ablauf des formellen Verfahrens verdeutlicht daher das Bestreben des IASB, möglichst alle an der Rechnungslegung interessierten Gruppen in den Entstehungsprozess der IFRS einzubinden.

Das IASB trägt die volle Verantwortung für die Entwicklung der IFRS. Es kann die jeweilige Vorgehensweise nach Effektivitäts- und Kostengesichtspunkten wählen und bestimmte Vorarbeiten an Advisory Committees oder auch an sonstige, externe Expertengruppen oder

nationale Rechnungslegungsgremien delegieren. Zudem sind öffentliche Anhörungen möglich oder auch die Durchführungen von Feldstudien, um die Zweckmäßigkeit eines Standards sicherzustellen.

Ein Kernproblem des IASC bzw. IASB war immer die fehlende rechtliche Verbindlichkeit der Standards. Einzelne Länder sahen (und einige tun dies nach wie vor) die IFRS lange Zeit nicht als gleichwertig mit ihren eigenen Bilanzierungsregeln an und verweigerten daher Abschlüssen nach IFRS die rechtliche Anerkennung.

Problematisch erscheint, dass das IASB keine staatliche Organisation in und die EU damit faktisch den Prozess der Entwicklung der Standards an eine private Organisation ausgelagert hat. Um weiterhin die legislative Kompetenz zu bewahren, behalten sich die EU-Instanzen daher das Recht vor, die IFRS vor der Umsetzung in europäisches Recht zu kontrollieren und erst bei Übereinstimmung mit den EG-Richtlinien und den europäischen Interessen zu verabschieden. Hierzu sieht die EU-Kommission ein Anerkennungsverfahren vor, das neu herausgegebene und überarbeitete IFRS zu durchlaufen haben, bevor sie auf EU-Ebene verbindlich werden.

3. Zusammenfassung und kritische Würdigung

Alle kapitalmarktorientierten Unternehmen in der Europäischen Union müssen den Konzernabschluss ab dem Jahr 2005 nach den International Financial Reporting Standards (IFRS) aufstellen. Nach nunmehr fünf Jahren IFRS-Anwendungspflicht haben sich die meisten Unternehmen - wenn auch nicht reibungslos - an das neue Bilanzierungssystem gewöhnt. Das International Accounting Standards Board (IASB) möchte mit den IFRS hochwertige globale Rechnungslegungsstandards erstellen, die den Bilanzadressaten transparente und vergleichbare Jahresabschlussdaten liefern. Insofern bilden die IFRS ein Rechnungslegungssystem, dessen vorrangiges Ziel die Bereitstellung entscheidungsnützlicher Informationen insbesondere für Eigen- und Fremdkapitalgeber ist. Die IFRS bilden damit eine wesentliche Säule der Corporate Governance und sollen zur Informationseffizienz der Kapitalmärkte beitragen.

Andere Staaten sind dem EU-Beispiel gefolgt, und so werden die IFRS inzwischen in mehr als 130 Ländern als Regelungsgrundlage für die Erstellung von Einzel- und Konzernabschlüssen verwendet. Hierunter fallen unter anderem Australien, China, Kanada und die Russische Föderation. Bedeutende Wirtschaftsnationen wie Indien und Japan wollen in den nächsten Jahren folgen. Damit hat sich das IASB mit den IFRS in den letzten fünf Jahren kontinuierlich zum global anerkannten Standardsetzer für die Rechnungslegung kapitalmarktorientierter Unternehmen entwickelt. Die internationale Durchsetzung wäre vollendet, wenn auch amerikanische Unternehmen die IFRS verwenden dürften, was von der Börsenaufsichtsbehörde SEC jüngst aus politischen Gründen jedoch auf frühestens 2015 verschoben wurde.

Trotz der vielfältigen Vorteile, die eine international einheitliche Bilanzierungssprache für die Kapitalmärkte mit sich bringt, mehren sich auf Seiten der Unternehmen, Rechnungslegungsadressaten und auf politischer Ebene kritische Stimmen. Erstere bemängeln insbesondere den erheblichen Erstellungsaufwand von Konzernabschlüssen als Folge der zunehmenden Komplexität der Abbildungsnormen und der häufigen Änderung von Bilanzierungsregeln. Für Rechnungslegungsadressaten, insbesondere für Privataktionäre, sind die IFRS-Konzernabschlüsse kaum noch verständlich. Vielen politischen Institutionen ist das IASB nicht geschmeidig genug, um schnell und möglichst widerstandslos ihrem Willen zu folgen. Hinzu kommt noch die „Glaubensfrage“ nach dem notwendigen Umfang der zum Fair Value zu bilanzierenden Vermögenswerte und Schulden.

Bei all dieser Kritik ist hervorzuheben, dass das IASB als privatrechtliche Organisation erst seit einigen Jahren arbeitet. Seine Verlautbarungen sind Ergebnis eines formellen Standardsetzungsverfahrens. Alle beteiligten Interessengruppen können sich über Kommentierungsschreiben zu den jeweiligen Diskussionspapieren und Standardentwürfen an der Erstellung der IFRS beteiligen. Hierdurch soll sichergestellt werden, dass die unterschiedlichsten Bilanzierungsinteressen im Entstehungsprozess eines IFRS berücksichtigt werden. Wie in jedem

politischen Prozess ist auch hier nicht gewährleistet, dass sich gute Argumente durchsetzen. Bilanzierungsregeln entstehen aus einem Geflecht von Argumenten und machtpolitischen Interessen. Dieser Prozess unterliegt keinem festen Ablaufplan. Allerdings kann sich ein derart interessenpluralistisches Standardsetzungsverfahren mit globalem Anwenderkreis schnell über einige Jahre hinziehen.

Andererseits reagierte das IASB im Rahmen der Finanzmarktkrise umgehend auf die Verwerfungen an den Kapitalmärkten. Es folgte dem Druck der EU-Staaten und änderte die Bilanzierung von Finanzinstrumenten, die auf eine Schonung des regulatorischen Eigenkapitals von Banken zielte, innerhalb von drei Tagen. Die Gradwanderung, einerseits eine hohe Qualität im Standardsetzungsprozess zu sichern und andererseits den kurzfristigen politischen Interessen der Regierungen, von deren Zustimmung das IASB als privatrechtliche Institution letztendlich abhängig ist, zu entsprechen, wurde jüngst mehr als deutlich. Auch die Abhängigkeit von großen, multinationalen Unternehmen und Wirtschaftsprüfern ist offenkundig, da das IASB 12,7 Millionen Pfund und damit etwa 65% seines Etats als Spenden von diesen Gruppen erhält.

Insgesamt hat das IASB in den vergangenen fünf Jahren mehr als 70 Verlautbarungen veröffentlicht. Damit hat die Regelungsdichte deutlich zugenommen, was auch ein stetiges Anwachsen der IFRS-Konzernabschlüsse zur Folge hatte. So ist die Seitenzahl der Konzernabschlüsse von den Dax-30-Gesellschaften in dieser Zeit um durchschnittlich mehr als ein Drittel gestiegen. Hinsichtlich der Beteiligung beim Standardsetzungsverfahren ist eine immer größer werdende Anzahl an kommentierenden Gruppen zu beobachten, so dass das IASB verstärkt auch unterschiedlichen politischen Zwängen unterliegt. Folglich dürfte es für das IASB schwerer werden, über alle unterschiedlichen Gruppen legitimierte Rechnungslegungsstandards zu verabschieden.

Derzeit bestehen - nicht nur bedingt durch die Finanzmarktkrise - noch viele Überarbeitungsprojekte am IFRS-Regelwerk. Neben der Neuformulierung wesentlicher Standards (Finanzinstrumente, Leasingbilanzierung, Umsatzrealisation) steht vor allem die Neukonzeption des sogenannten Rahmenkonzepts aus. Hier sind die grundsätzliche Zwecksetzung der IFRS-Rechnungslegung, die Formulierung der Adressatengruppen sowie die qualitativen Merkmale zu definieren. Solange dieses Rahmenkonzept fehlt, besteht die Gefahr, dass vielfältige Standards und Interpretationen nicht logisch aufeinander abgestimmt sind und damit Inkonsistenzen in der Bilanzierung auftreten.

Die steigende Regulierungsdichte der IFRS-Rechnungslegungsregeln erscheint naheliegend, da die Gesetzgeber durch den Bilanzeid des Vorstandes und mit nationalen Enforcementstellen viel unternommen haben, um das Vertrauen in eine regelkonforme Bilanzierung zu erhöhen. Daher haben sowohl die Abschlussersteller als auch die Wirtschaftsprüfer ein gestiegenes Interesse an detaillierten und eindeutigen Bilanzierungsregeln, bei deren Befolgung sie sicher vor Bilanzierungs- beziehungsweise Prüfungsfehlern und deren Haftungsfolgen sind. Das IASB wird daher der häufig in Kontinentaleuropa formulierten Forderung nach einer stärker prinzipienorientierten Bilanzierung kaum nachkommen. Im Gegenteil: Es ist davon auszugehen, dass die Regulierungsdichte noch weiter zunehmen wird.

Mit der zunehmenden internationalen Verbreitung besteht jedoch die Gefahr, dass sich das IASB bei der Suche nach einem politischen Kompromiss im Detail und in der Inkonsistenz verliert. Um dieser Gefahr zu begegnen, hat das IASB aus prozessualer Sicht verstärkt darauf zu achten, dass sich im Standardsetzungsprozess sämtliche Interessengruppen gleichberechtigt einbringen, Feld- und Machbarkeitsstudien vorab stattfinden, Entscheidungsprozesse transparenter werden und ein Feedbacksystem zur Verbesserung der Standards installiert ist. Dies gilt umso mehr, als das IASB auf eine eigentlich wenig wünschenswerte Monopolstellung in der Rechnungslegungsregulierung zusteuert.

Harmonisierte Bilanzansatz-, Bilanzbewertungs- und Konsolidierungsregeln entfalten erst dann den erwarteten Adressatennutzen, wenn die Regeln von den Unternehmen konsequent befolgt werden und dann aufgrund einheitlicher Präsentationsregeln zu vergleichbaren Abschlussdaten

führen. Wegen der weitgehend fehlenden IFRS-Gliederungs- und Ausweisstandardisierung wurde der Unternehmensvergleich in den letzten Jahren kaum verbessert. Auch der Zeitvergleich ist aufgrund der vielen Standardänderungen beeinträchtigt. Zwar gibt es externe Datenbankanbieter, die Bilanzdaten standardisiert aufbereiten, jedoch sind diese nicht immer aktuell und die Aufbereitungen nicht immer fehlerfrei. Eine Lösungsmöglichkeit für dieses wichtige Thema könnte die technische Plattform eXtensible Business Reporting Language (XBRL) bieten. Dabei handelt es sich um eine auf XML basierende Sprache, mit der elektronische Dokumente im Bereich der Finanzberichterstattung standardisiert erstellt werden können. Eine Standardisierung und damit eine Vereinheitlichung der Präsentation der IFRS-Rechenwerke könnte dann erreicht werden, wenn das IASB hierfür Mindestgliederungsregeln vorgäbe.

Das IASB hat mit den IFRS in den letzten fünf Jahren innerhalb der EU und inzwischen auch weit darüber hinaus die Rechnungslegung für kapitalmarktorientierte Unternehmen harmonisiert. Es hat einen wertvollen Beitrag geleistet, dass in einer einheitlichen und standardisierten Sprache über die wirtschaftliche Lage von Unternehmen berichtet wird. Aufgrund der Turbulenzen an den Kapitalmärkten, der zunehmenden internationalen Verbreitung der IFRS, aber auch wegen unglücklicher institutioneller Rahmenbedingungen und individueller Fehler hat das IASB noch einen steinigen Weg zu gehen. Es bleibt zu hoffen, dass die verantwortlichen politischen Institutionen dem IASB genügend Zeit geben, den eingeschlagenen Weg fortzusetzen. Die Alternative, ein Rückfall in wieder stärker national regulierte Rechnungslegungsstandards, wäre für das weitere Zusammenwachsen der Kapitalmärkte wenig förderlich.

Our paper develops an overview of trade literature within the particular area of material accounting harmonization. The usefulness of this paper consists in offering an up to date image on what was written on this particular topic with significant practical implications. We first divide existent studies on stages that we consider can be grounded based on trade literature's evolution. Furthermore, a qualitative analysis is done for studies belonging to each period. Limitations of previous studies are also synthesized. The final point of our analysis gives shape to research perspectives that further needs to be exploited.

Keywords: material accounting harmonization, de facto harmonization, measurement instruments, trade literature, accounting harmonization process

JEL Classification: M40, M41

Introductory thoughts

When it comes to researches in the area of international accounting harmonization measurement, there is a difference between those studies focused on the regulations harmonization problematic (*de jure* harmonization) and those which have as main study target the implementation method of the international standards in the accounting practice (*de facto* harmonization). In this context, we can argue that material harmonization is defined through the concentration level present around an option for a certain accounting policy (Herrmann and Thomas, 1995, p. 254). Based on this reasoning, the harmonization level increases along with the company's number that opts for the same accounting policy. This material harmonization type (*de facto*) is measured based on the concentration index developed by van der Tas (1988).

If we wish to define the material harmonization we can state that it represents that process where the diminution of the alternatives level and accounting option is intended, what means an increase of the harmonization level of the accounting practices and implicitly of the comparability level. On the other hand, starting from the statement that the harmonization is a process that leads towards a harmony state which afterwards becomes a real state (Canibano and Mora, 2000, p. 351), then we sustain the idea that the material harmonization is actually the process of the compatibility level increase between regulations and practice and the harmony state is reached when the differences variation between the two elements is contestant.

For a better understanding of the material harmonization process, it is very important to be able to identify the impact the modifications of afferent policies and accounting options have over the comparability level of the practices not only at an intra-state level but also at an inter-state level (Archer *et al.*, 1995, p.80). Further, on we can consider that a particular importance is given to the influence that the inter-states situation has it over each national accounting system involved in an accounting harmonization process when it comes to practice.

A mandatory condition for the development of a common market at the European Union standard is an accounting-financial information flow as a result of the accounting harmonization process (Canibano and Mora, 2000, p.349). In this context, the accounting practices harmonization aims to become an important factor in reaching the common market desideratum (Herrmann and Thomas, 1995, p. 253) which could have important consequences especially on regional scale. If such a statement is real then we can estimate that the political element tends to become of high importance in the accomplishment of the accounting harmonization process.

Research methodology

In order to develop our paper we put into practice the steps of the exploratory literature review process. After establishing the approached topic area, we searched for papers belonging to this category and read them. After carefully analyzing the content of the selected paper, we outlined the subtopics being approached and summarized each one of them. After analyzing the evolution of studies being written in this area we established significant periods in time that helped us organize our study. Based on the previously developed summaries we discussed main subtopics within the selected papers. Limitations of the studies were also grouped and presented. Based on what was already done and the identified limitations we finally identified some future research guidelines that might help fill the existent gap in trade literature.

Stages within trade literature and typology

Taking into consideration all these aspects exposed through a brief approach that shows the importance and the role of the material accounting harmonization process we can estimate that if we take as analysis criteria the previous researches influence over the mentioned studies, we can separate the scientific steps from this research sphere in at least two categories: (1) the studies influenced by van der Tas' researches (1988, 1992a, 1992b), named – measurement systems based on the option concentration study and (2) studies that can be considered as new approaches in the material harmonization measurement sphere, named – measurement systems based on the similarity philosophy between the accounting practices.

The existing researches in the measurement sphere of the material harmonization level as well as in the sizing sphere of the international accounting regulations impact over the national accounting systems generated a series of results correlated on one hand to the IASC/IASB status, and on the other hand to the development of the standards issued by the international authority.

Due to this aspect, we started the descriptive analysis of the results from the material harmonization measurement sphere applied to four different categories of studies based on the IASB evolution and the standards issued by this authority. If we take into consideration the division into periods of the IASB evolution established in the previous chapter we can establish the systematization periods of the researches results in this analysis sphere, as follows: (1) The material harmonization level in the context of some flexible accounting standards, (2) The material harmonization in the context of the international standards comparability desideratum, (3) The material harmonization effects as a result of IOSCO agreement, (4) The material harmonization sizing in the financial reporting standards context.

Taking into consideration this delimitation in time, we can state that the *period prior to 1989* is characterized mostly by a high level of diversity and less through a medium level of the harmonization degree, situation present in the following periods.

If we bear in mind the existing studies *during 1989-1995* we can state that the defined material harmonization level is high in certain problems (for example: postponed taxes) and on the other hand is even absent when it comes to other elements (like: assets depreciation, goodwill, development and research expenses, etc.), and the international accounting harmonization process, can be characterized at most through a medium level.

Analyzing also the similar researches in the material harmonization sphere **for the 1995-2003 period**, we can state that the international accounting harmonization process, as a whole, can be

characterized through important evolutions of the reached harmonization level, not only for certain accounting systems but for certain accounting problems as well. A remarkable fact is that the efforts made for the material harmonization as well as the afferent researches of this problem intensified reaching a high level of complexity.

If we consider the research instruments used in these researches and if we anticipate the research methods during the studies from the next period we are entitled to state that in this period (1995-2003) a maximum level of the debates regarding the van der Tas' indexes was reached. The derived aspects, their complexity but also the usage methods almost tend to be out of print giving way to other approaches regarding the material harmonization measurement.

The central element of the results obtained by the existent studies *during 2003-present*, we can state that the international accounting harmonization process manifests liberally especially when it comes to the accounting practice. A remarkable aspect is that two out of the three studies are focused on the sizing problem of the material harmonization level on a regional scale, and all three researches study the IFRS implementation effects in the national accounting systems.

The following table synthesizes the above established periods within the international accounting harmonization process, the evolution of material accounting harmonization studies and their results on the state of material harmonization:

Table 1. Stages within trade literature

Period	State of documented material harmonization and the international accounting harmonization process
Prior to 1989	- high level of diversity - a medium level of the harmonization degree
1989-1995	- high material harmonization in certain problems (such as: postponed taxes) - absence of harmonization when it comes to other elements (such as: assets depreciation, goodwill, development and research expenses, etc.) - at most a medium level registered by the international accounting harmonization process
1995-2003	- important evolutions of the reached harmonization level for the international accounting process
2003 - present	- liberal manifestation of the international accounting harmonization process

Source: author's projection

Limitations and research perspectives

Studies done in the material harmonization sphere generated for the scientific knowledge a series of relevant results. However, at the same time a series of limits of the research and its perspectives were identified for the next periods.

Thus, in the technical literature (Aisbitt, 2001) were mostly identified a series of limits afferent to the research methodology. These can be classified in two important categories, as follows:

- problems afferent to the causal deduction, or in other words, problems typical to the professional reasoning of research;
- problems afferent to the indexes characteristics of the material harmonization level measurement (Aisbitt, 2001, p.60).

A series of suggestions for further researches were given beyond the existing studies limits. Starting with the examples mentioned in the studies, we are entitled to generalize these suggestions as follows (Aisbitt, 2001):

- avoid data loss and the optimum sizing of the accounting elements necessary for the analysis;
- in these studies where the number of accounting elements differs from one category of analyzed elements to another, the interpretations must be carefully analyzed, taking into consideration also the effect of such an approach over the calculated measurement indexes;
- all the necessary efforts have to be made so that the allotment and the analytical reasoning of the measured elements to be accomplished in order to sustain the validity of the research;
- to increase the relevance and the reliability of the studies it is recommended to use those pieces of information that can be obtained from the producers of the accounting-financial information and to recur to the restriction of the analysis performed in those companies that present the information clearly and unambiguous.

Considering all these aspects we can conclude that the role of the existing researches in the material harmonization sphere is very complex and of high importance. We appreciate that the studies for the material harmonization measurement are aim at the international accounting harmonization process.

Taking into consideration all these approaches of the material harmonization as well as the existing studies in this domain, we can still state that this problem represents the research object of a great number of published studies. Furthermore, efforts orientation regarding the material harmonization must be pointed towards the diversity level diminution in the international accounting sphere, thing that can represent an index of the harmony level increase (Emenyonu and Gray, 1996, p. 270) or, in other words, an index of the harmonization level increase between regulations and accounting practices.

In this research paper we described the existing relation between the controllable components of the current learning context (CLC) which leads us to Biggs's aligned system of instruction. We tried to shape the CLC components in order to increase the CLC effectiveness. We succeed to do this through the curriculum we build, which was created based on Bloom's taxonomy and critical thinking approach of teaching. The importance of the research consists in offering our perspective on the alignment process between objectives, teaching and assessment through the course design we created.

Key words: curriculum, teaching, assessment, Bloom's taxonomy, critical thinking

JEL Classification: I21

1. Introduction

We started our research with 3Ps model: Presage, Process and Product developed by Briggs in 1995. This model presents the factors that affect the learning outcome of a learner: prior education experiences along with current learning context influence SAL which determines the learning outcome. The 3Ps model offers educators ways to stimulate higher level learning¹¹⁹⁷.

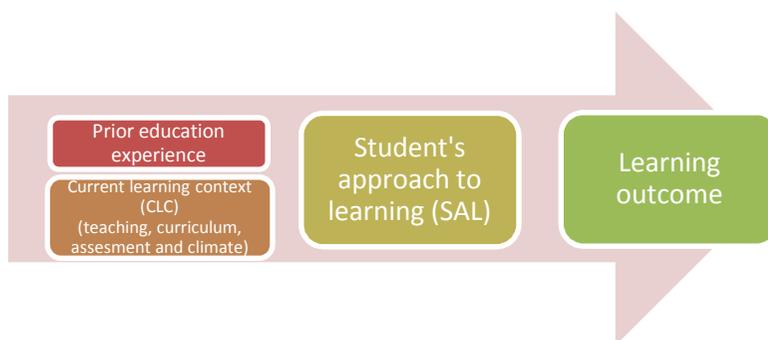

Fig. 1. 3Ps' Biggs's model

Observing the CLS components, we noticed that they can be divided in two major parts: controllable and uncontrollable by instructors. Teaching, curriculum and assessment are controllable elements by instructor but climate cannot be controllable in all cases, depending on which type of climate is: classroom or institutional. Besides the uncontrollable elements, the controllable ones influence student's approach to learning and the learning outcome.

¹¹⁹⁷ Duff A. and McKinstry S., *Student's Approaches to Learning*, Issues in Accounting Education, Vol. 22, No. 2, May 2007, p.186.

In this paper we focused our attention on controllable elements of the CLC and tried to shape them in order to increase the CLC effectiveness. This implies to align the controllable elements of CLC based on the course objectives. Our objective relies on the idea that instructors have to teach what really matter for students and evaluate the knowledge gained using the same matrix as they used in teaching. Scientific literature underlines that during teaching, a great majority of teachers focus their awareness on what they are doing, not on what they are teaching, or on what their students are learning¹¹⁹⁸.

The importance of the research consists in offering our perspective on the alignment process between objectives, teaching and assessment through the course design we created.

2. Defining the concepts and building the model

We defined the concepts used within this paper: teaching, curriculum, assessment and learning in order to have a clear understanding of their meaning. Many definitions were attributed to these terms, so we presented here only those we considered relevant. Then we grouped the terms in order to accent the interaction between them.

Teaching is defined as the interaction of a student and a teacher over a subject¹¹⁹⁹. As it is stated, this definition indicates the existence of a transmission process between two parties.

Since information is transmitted to the student, he/she will receive it through **learning**. So we reached the learning term, which is defined as the process of gaining competencies and knowledge, growth in attainment¹²⁰⁰. As we can see, teaching relies upon learning because without learning teaching is useless.

Another definition for teaching was given by Engel cited by Gardner and Jewler¹²⁰¹, according to which teaching consists of building a bridge from the subject taught to the student learning it. In our opinion, this definition is not proper for teaching since building a bridge (or a course) needs not only the construction process, which can be defined partially by teaching, but also “raw materials”, represented by knowledge, as defined further. Even so, we consider that Engel’s metaphoric idea of building a bridge is a brilliant one and we used it further.

Using Engel approach, the question is: what does instructor transfer? The core of the transmissions is **knowledge** transposed in textbooks, articles, case studies, videos, and many others. When the transfer process is finished, a question rise: was it efficient? The efficiency is measured by **assessment**, an evaluation process which helps instructors to identify how much knowledge were transferred and measures the completion stage of learning.

Another controllable element of the current learning context is **curriculum**. Curriculum is a term of considerable debated as to meaning. During time, several approaches of curriculum theory and practice were considered: curriculum as a body of knowledge to be transmitted, as a product, as process and as praxis¹²⁰². Within Biggs’ model, curriculum was perceived as a body of knowledge-content or by subjects.

We combined the CLC components and built the model below. The bridge construction (or course design) started with his left foot, where knowledge from all sources was gathered by

¹¹⁹⁸ Biggs J., *What the student does: teaching for enhanced learning*, Higher Education Research, & Development. Vol. 18, No. 1, 1999, p.63.

¹²⁰² Smith, M. K., *Curriculum theory and practice' the encyclopedia of informal education*, 2000, available at www.infed.org/biblio/b-curric.htm.

instructor. The amount of knowledge and the type of it is normally based on the course objectives, defined in the projection phase of the course, by instructor.

When course starts, teaching starts: the knowledge is transferred from instructors to student through sequential processes. In our model, the arches represent the process of teaching and classroom activities. The information transmitted is absorbed by learning process, graphically represented by the small parabola near the right foot bridge. The parabola captures the information and transforms it into knowledge at learner level. After all these processes are done and the bridge construction is ready, the bridge has to be tested for endurance, which is done through the assessments.

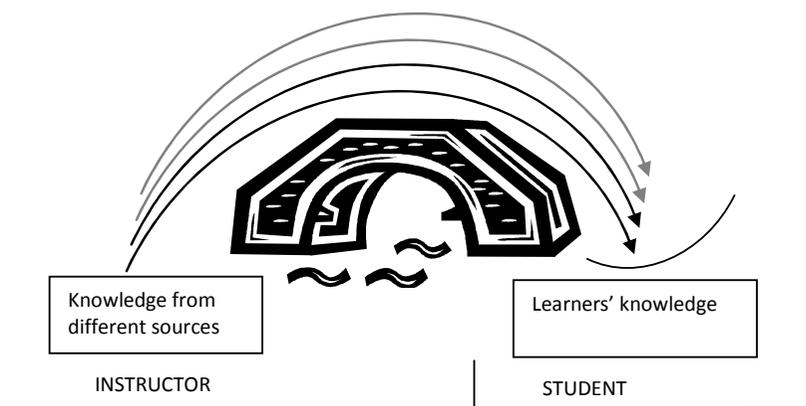

Fig. 2. CLC components combined

As we can see from the model, we defined the objectives of the course and based on them we teach and assess students.

We build this model based on a step-by-step approach and on CLC elements. It represents a system whose scope is to provide learning outcomes based on course objectives. In fact, this model represents the graphical approach of the **Biggs' aligned system of instruction**, defined as a fully-criterion referenced system, where the objectives define what we should teaching; how we should be teaching it; and how we could know how well students have learned it.¹²⁰³

3. Applying the model in practice

In order to apply the Biggs's model into practice, we gathered all the controllable elements of the CLC into the curriculum. Our approach regarding the curriculum is totally different from Biggs's approach, who considered, in his 3Ps' model, the curriculum as a syllabus. We followed the product approach of the curriculum, defined as a plan where objectives are met then applied and outcomes are measured. In order to emphasize the importance of the rationality and the need of simplification in elaborating a curriculum, Tyler developed four famous questions which are still relevant today¹²⁰⁴:

1. What educational purposes should the school seek to attain?
2. What educational experiences can be provided that are likely to attain these purposes?
3. How can these educational experiences be effectively organized?

¹²⁰³ Biggs J., *What the student does: teaching for enhanced learning*, Higher Education Research, & Development. Vol. 18, No. 1, 1999, p. 64.

¹²⁰⁴ Kizlik B., *Information about Curriculum, Curriculum Development, Issues and Planning*, 2009, available at <http://www.adprima.com/curricutility.htm>.

4. How can we determine whether these purposes are being attained?¹²⁰⁵

Relying on the model presented and using the above questions in order to structure our work, we tried to design the Managerial accounting curriculum. Managerial accounting is a mandatory discipline for accounting undergraduates in the Faculty of Economics and Business Administration, undertaken in the second year of study.

We structured the Managerial accounting Curriculum into six major parts: course description, course objectives, recommended readings, how to learn efficiently, how to communicate and evaluation system. The curriculum was written in a simple way and addressed directly to students.

The curriculum starts with a **general course description**, whose scope is to help students to become familiar with the main areas that are to be examined. The first part of the general course description is followed by a “proving” part where we did emphasize why discipline is important; to strengthen our message, we took real life examples.

The **course objectives** followed the course description, state the main goal of the course: to acquaint students with the fundamentals tools of Managerial accounting. **General course objectives** are presented further. At the end of this course students will:

- understand the core issues of Managerial accounting;
- be able to use properly the most important tools and to apply important management and accounting methods combined;
- be able to analyze methods in order to find the most suitable one for the given situation;
- be able to evaluate different situations based on facts or suppositions, and
- to build, formulate and write an opinion about the analyzed case.

General course objectives rely on two pillars: developing critical thinking and Bloom’s taxonomy. Critical thinking, social responsibility, reflective judgment, and evidence based reasoning...are the most enduring goals of a first-rate liberal education¹²⁰⁶. And Schneider continues by saying that in 2003 many college graduates are falling short in reaching these goals. According to Minnich¹²⁰⁷ if people think this mean that they are more likely to question than to assert, inclined to listen to many sides, capable of making sensitive distinctions that hold differences in play rather than dividing in order to exclude, and desirous of persuading others rather than reducing them to silence by refuting them. Critical thinking involves eight skills: 1). ask questions, 2). define the problem, 3). examine the evidence, 4). analyze assumption, 5). avoid emotional reasoning, 6). don’t oversimplify, 7). consider other interpretations and 8). tolerate uncertainty.¹²⁰⁸

Technical speaking, developing the critical thinking involves skills which are not possible to be achieved without understanding the context and further identifying the potential solutions and choosing the most appropriate solution. For solving these technical aspects, we designed the entire curriculum based on Bloom’s taxonomy. The new approach of Bloom’s taxonomy structures it on the following levels¹²⁰⁹:

Level 1 - Remembering: can the student recall or remember the information?

Level 2 - Understanding: can the student explain ideas or concepts?

Level 3 - Applying: can the student use the information in a new way?

¹²⁰⁵ Tyler, R. W., *Basic Principles of Curriculum and Instruction*, Chicago: University of Chicago Press, 1949.

¹²⁰⁶ Clayton, M., *Rethinking thinking*, The Christian Science Monitor, 2003, available at <http://www.csmonitor.com/2003/1014/p18s01-lehl.html>

¹²⁰⁷ Minnich E., *Teaching Thinking: moral and political considerations*, Change, sept/oct 2003, p.20, available at <http://www.elizabethminnich.com/change-think.pdf>

¹²⁰⁸ Lipps J.H., *Judging authority*, NeuroQuantology 2004, Issue 2, p. 116-121

¹²⁰⁹ Overbaugh R.C., Schultz, L., *Bloom’s taxonomy*, available at http://www.odu.edu/educ/roverbau/Bloom/blooms_taxonomy.htm

Level 4 - Analyzing: can the student distinguish between the different parts?

Level 5 - Evaluating: can the student justify a stand or decision?

Level 6 - Creating: can the student create new product or point of view?

Moreover, a significant importance should be pay to the order of these levels since each level have to be mastered before going to the next one and the difficulty of the levels are increasing from the first to the last level.

Based on the pillars mentioned before, we developed **specific course objectives** for each main topic of the discipline.

Recommended readings consist in a text book and Harvard Business School case studies. The curriculum offers detailed information regarding how to buy them and different forms of book available for sale: hardcopy, electronic version, or rights to access the book for a limited period of time. Besides these, students can access more resources like PowerPoint Presentations, Narrated Slides and Standard and Enhanced Quizzes from the book publisher's website for free.

The diversity of learning materials offered to students is motivated by the willingness to offer students appropriate types of materials which fit their learning style: visual, auditory or kinesthetic.

Course content part details the topics and chapters covered each week. Moreover, it specifies the chapters needed to be read, exercises, problems and HBS case study assigned for each week. Exercises, problems and case studies that are to be graded were specified separately in the curriculum, in order to eliminate any possible confusion.

Course set-up implies the way classes, tutorials, individual and group out-of-school activities of students are organized. Course is based on individual work and asks over for reading the chapter assigned, solving exercises and problems and case study analysis. Each week, a tutorial and a class are held. In tutorials, teaching assistant discuss with students exercises and problems assigned for the week and if needed, sensitive theoretical parts of the chapter assigned. Subsequent to tutorials are classes, where case studies are analyzed using Socratic method. Tutorials and classes are not compulsory for students to attend. Moreover, textbooks are not lectured.

How to learn efficiently is a part of the syllabus that we considered mandatory to present since our teaching approach is not very common in our faculty. Teaching case studies and effective lecturing are teaching methods our students are not familiar with. Moreover, since learning is a process that takes time, improving efficiency is needed in order to maximize student's learning outcome. That is why our suggestions regarding your learning process were referring to: how to read the textbook in order to understand the topic and how to analyze a case study.

The last part of the curriculum is dedicated to the **evaluation system**. The final grade comprises three parts:

- student's active participation in tutorials (30% of the final grade),
- student's active participation in classes (10% of the final grade),
- final exam (60% of the final grade).

Since our aim is to align the CLC controllable components, we had to connect the students' evaluation forms with the teaching method and the course objectives. At the end of this course our expectations are that students to be able to understand and apply specific management and accounting methods, analyze them, evaluate, create and be capable to convey these information in oral and writing communication. For doing this, we designed the final assessment based on Bloom taxonomy in order to evaluate the knowledge on each level of the taxonomy. For doing this, we identified the major parts of the discipline and for each of them we chose five questions in order to test students' knowledge starting with the first level and finishing with the fifth one.

Therefore, final evaluation comprises 15 questions / problems plus a case study analysis, whose main role was to test critical thinking.

4. Conclusions

Starting with Biggs's model, we built a model of CLC controllable components and we described the way these components interact. Our model represents in fact the curriculum, viewed from the product perspective. Based on this, we developed the Managerial Accounting Curriculum and we described the way we did it. We designed the curriculum in such way that allows us to maximize the CLC component. In alignment process of the CLC components we used two methods: problem-based learning and case studies analysis, which are considered successful methods in getting the alignment.

The curriculum we had designed represents a helpful tool for clarifying what we have to teach, how we teach and what we assess. It is a simple but organized plan of our activity with students and it helps both us and students to show, respectively, to know exactly our expected professional engagements.

AN EXPLANATION OF THE CHANGE IN ACCOUNTANTS' ATTITUDE TOWARDS FLEXIBILITY USING THE THEORY OF REASONED ACTION

Olimid Lavinia

Academia de Studii Economice Bucuresti

Calu Daniela Artemisa

Academia de Studii Economice Bucuresti

ABSTRACT: In this paper we look at accountants as “consumers of accounting regulations”. We explain the change in the accountants’ attitude towards flexibility in the accounting regulation process, using a theory derived from social psychology: the Theory of Reasoned Action (TRA).

In 1999 and 2005 we tested the attitude towards flexibility of a number of Romanian accountants who aimed at becoming private practitioners. We observed that before the existence of an accounting conceptual framework (1999), the accountants surveyed preferred flexibility with respect to accounting choices. A few years later (2005), after the implementation of IASB’s conceptual framework (but before the regulator removed it), the preference of accountants changed to flexibility. We believe that these changes could be explained using TRA.

KEY WORDS: Romanian accounting regulation, Theory of Reasoned Action, accountants’ attitude, uniformity, flexibility

1. INTRODUCTION

Our research paper aims at explaining the change in the attitude of two groups of Romanian accountants who aimed at becoming private practitioners with respect to flexibility in accounting regulation. We use the Theory of Reasoned Action to explain this change in two key moments: 1999 and 2005. These dates are important for Romanian accounting because:

- in 1999 the Romanian accounting regulator introduced the first conceptual framework via the Ministerial Order 403/1999, having translated the Framework for the Preparation of Financial Statements (IASB, 1988).
- in 2005 Romanian, the same regulator removed this conceptual framework from Romanian accounting regulations (Ministry of Finance, 2001).

We notice that before the existence of an accounting conceptual framework (1999), the accountants surveyed preferred uniformity with respect to accounting choices. A few years later (2005), after the implementation of the conceptual framework (but before the regulator removed it), the preference of accountants changed: (they wished less uniformity and more choice).

2. ROMANIAN ACCOUNTING BACKGROUND

After the fall of communism in 1989, reforms were undertaken to modernise the country’s financial system. In our opinion, accounting reform comprised three phases, from the presence of IASB accounting framework in Romanian accounting regulation point of view. The first began in 1990 and lasted until 1999, the second began in 1999 and lasted until 2005, with the third beginning right after that.

Phase one: The initial French-influenced accounting reform is usually justified by the traditional cultural and legal ties and also by the economic similarities between the two countries (Feleagă and Ionaşcu, 1993).

Similarly to France, the bulk of regulations were to be found in the 1993 detailed Regulation for the Application of the Accounting Law (the Green Book) that included a National Chart of Accounts very similar to that of the French Plan Comptable Général 1982. For every account in the chart, corresponding accounts and explanations were listed for both debit and credit.

The strong link between accounting and taxation is revealed by the use of the same stock valuation and depreciation methods that were used for both financial statements and tax returns. The useful lives of fixed assets were not estimated by management, but were chosen from a Catalogue that contained the authorised useful lives of depreciable assets. Three depreciation methods were permitted: straight-line, declining balance with tax coefficients, and accelerated (meaning a 50% depreciation expense in the first year of use, followed by the straight-line method). Tax authorities were not generous with companies: in a period of rampant inflation, protection against its effects was not granted, as changes to accelerated depreciation or LIFO were difficult in practical terms¹²¹⁰. It was often the case that a change to an accelerated method was allowed only for the fixed assets purchased after a certain date, but not for an entire class of assets. In exchange, several government ordinances regulated the revaluation of tangible fixed assets and provided official revaluation indices. To counteract the loss of tax income because of higher depreciation charges following revaluations, the Ministry of Finance limited the amount that was recognised as depreciation expense linking it to the actual degree of productive use of fixed assets.

Although the regulations provided for the recognition of impairment losses and provisions, companies recognised only those that were tax deductible. For non-financial companies these were: allowances for doubtful debtors declared bankrupt and provisions for warranties (according to a tax calculation) and unrealised exchange losses.

Phase two: Effective 1999, this second phase of the accounting reform was evaluated as having “avoided some of the pitfalls experienced earlier in other transition economies and also shortened some of the development process by making changes in parallel rather than in sequence” (King et al., 2001). Large companies referred to the 1999 and 2001 Regulations harmonized the Fourth Directive of the European Communities and with International Accounting Standards (hereafter the Harmonisation Regulations). Small companies were regulated through the Simplified Regulations issued in 2002.

The Harmonisation Regulations attempted to reconcile the structure of the Fourth Directive, with IASB’s conceptual framework, British Companies Act and French Plan Comptable Général. A British-style vertical balance sheet coexists with a French by-nature profit and loss account. Cash flows and changes in equity statements, accounting policies and explanatory notes are mandatory. The presence of the Alternative Accounting Treatments is, at least in its form, a British influence¹²¹¹. A remarkable feature is Note 4 which shows a by-destination operating profit, thus reconciling macroeconomic interests with those of foreign investors. Following the enactment of the Harmonisation Regulations, the accounting regulator along with the professional accounting body, universities and accounting firms undertook extensive IAS/IFRS training programmes (Ionascu et al, 2007; Calu et al, 2009).

Phase three: In preparation for the country’s joining of the European Union, the Ministry of Public Finance decided in June 2005, to separate European Directives from IFRS and in November 2005 issued new Regulations conforming to European Directives (Fourth and Seventh

¹²¹⁰ Before changing a particular valuation method, an enterprise had to obtain the (written) agreement of tax authorities, based on the presentation of the influences on the patrimonial and financial situation as well as on the amount of income tax.

¹²¹¹ The Alternative Accounting Treatments allow the revaluation of fixed assets and inflation accounting.

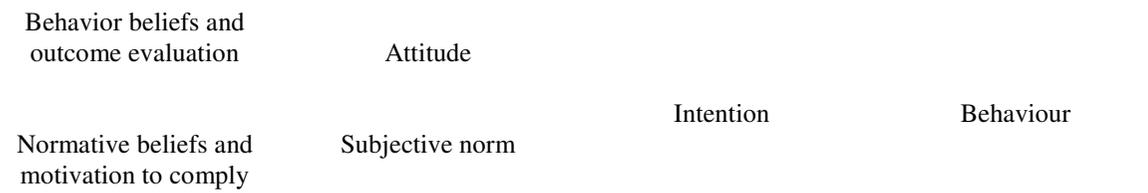

Directives as amended)¹²¹². All entities, formerly large and small should prepare financial statements in accordance to these new regulations. The implementation of the IAS Regulation restricted the use of IFRS to the consolidated accounts of listed companies.

3. RESEARCH FRAMEWORK

Our study evaluates the attitude toward flexibility of two samples of Bucharest accountants in order to predict their behaviour and the possibility to change it. Drawing on Hofstede (1981) and Gray (1988) we define flexibility as accountants’ preference to adapt accounting rules according to the different circumstances in which an enterprises functions as opposed to using the same accounting rules for all enterprises.

In order to explain the behaviour of accountants with respect to flexibility, we chose to use the Theory of Reasoned Action (Fishbein and Ajzen, 1975). TRA claims that a suggested behavior is more likely to be performed by an individual when a higher intention to perform it exists. This intention results of a positive evaluation of the behavior (attitude), and of the pressure exercised by relevant groups on the individual to perform the behavior (subjective norm).

Figure 1. The formation of behavior according to TRA

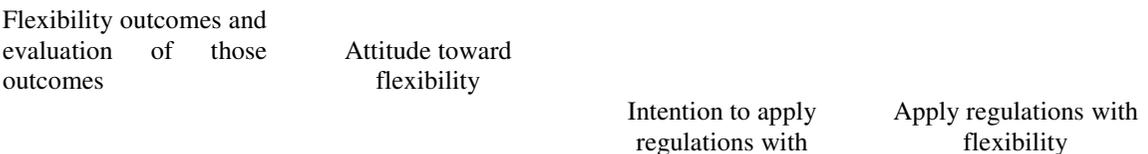

A person’s behavioral intention has therefore two ingredients: the attitude and the subjective norm. Following Fishbein, M., and Ajzen, I. (1975) we employ the term attitude to refer to an accountant’s general feeling of favorableness or unfavorableness toward flexibility. For example, as an accountant forms beliefs about revaluation, financial statement presentation or valuation of stocks, he “automatically and simultaneously” acquires an attitude toward them. Every belief relates an object to an attribute, e.g. *the reevaluation of fixed assets is a matter of choice*. The accountants’ attitude toward flexibility depends on his evaluation of this attribute (*a matter of choice*).

The subjective norm is formed by the perceived expectations of relevant groups relating to the behavior and by the person’s motivation to comply with these expectations. In our research we take the subjective norm to mean the demands perceived by the accountants from the regulating authorities and the professional body to comply with their policies.

An *intention* relates to the probability that a person will perform a certain behavior. With respect to the belief and the attitude regarding the reevaluation of fixed assets we can speak of the intention to undertake reevaluations of fixed assets on a voluntary basis.

Figure 2. TRA applied to accounting flexibility

1212 Order of the Minister of Public Finance no. 1752/17.11.2005 for the approval of accounting regulations conforming to European Directives, Official Journal 1080/30.11.2005.

Compliance with regulations and fiscal control

Perceived demands of regulating authorities

flexibility

4. RESEARCH METODOLOGY AND RESULTS

The attitude of accountants towards flexibility was tested in 1999 and 2005 using the questions in Appendix 1. The respondents were asked to range their choice on a five-point scale going from strong disagreement to strong agreement: to a very small extent, to a small extent, moderately, to a large extent, to a very large extent. We consider the middle answer as reflecting an undecided respondent. A number of 101 questionnaires were returned in 1999 and 56 questionnaires in 2005. The two samples are characterized in Tables 1. The testing was done at training courses organised by CECCAR to assist accountants in Bucharest wishing to qualify as public accountants and licensed accountants.

Table 1: Accounting experience and age of respondents

Descriptive statistics	1999		2005	
	Accounting experience	Age	Accounting experience	Age
Mean	10,79	38,63	9,88	37,27
Median	8	39	8	38
Mode	5	31	5	28
Standard deviation	7,92	8,88	6,86	8,56
Minimum	2	24	2	23
Maximum	34	63	30	53
Observations	98	96	52	49

The answers obtained for all three questions were added up under the following headings: High Uniformity, Uniformity, Middle, Flexibility and High Flexibility. We eliminated those questionnaires featuring incomplete answers to the four questions. We calculated a score by multiplying the sum of the answers in each category with coefficients ranging from -2 to 2 (i.e. -2 for High Unif, -1 for Unif, 0 for Middle, 1 for Flex and 2 for High Flex). The last column, labeled Scale, shows hypothetical scores that could be obtained if all the answers were of a single kind, i.e. if all answers were High Unif, the score would be $380*(-2)=-760$ or if all answers were High Flex, the score would be $380*2=760$. The score of each pair of values is interpreted by reference to such a scale.

The 1999 questionnaire results shows an attitude toward uniformity (score -64 in Table 2): the respondents favour the existence of only one method of presentation of the financial statements and of stock valuation (Q1 and Q3), possibly because of the additional amount of work involved in the opposite situation. The answers received to a questionnaire sent in 1997 to the finance directors of big taxpayers located in Bucharest, revealed that the additional workload was the main cause for the lack of popularity with the accountants of the inflation-adjusted tax balance sheet (Olimid, 1998). The same study showed that only in 4% of cases, companies used more than a method of stock valuation. The other question (Q2) upset the uniformity trend: whereas the preference for the companies' initiative regarding the revaluation of land and buildings may be again a reaction to the omnipresence of the Ministry of Finance in the Romanian accounting environment.

Table 2: Uniformity versus Flexibility. 1999 Score

Unif vs Flex	Q1	Q2	Q3	Total options	Coeff.	Score	Scale
High Unif	37	11	26	74	-2	-148	-564
Unif	19	9	22	50	-1	-50	-282
Middle	17	24	26	67	0	0	0
Flex	17	19	12	48	1	48	282
High Flex	4	31	8	43	2	86	564
Total questionnaires	94	94	94	282		-64	0

We present below the 2005 results for the attitude toward flexibility and then we compare the results of the 1999 and 2005 testing.

Table 3: Uniformity versus Flexibility. 2005 Score

Unif vs Flex	Q1	Q2	Q3	Total options	Coeff.	Score	Scale
High Unif	11	7	16	34	-2	-68	-312
Unif	8	2	12	22	-1	-22	-156
Middle	18	14	8	40	0	0	0
Flex	9	14	10	33	1	33	156
High Flex	6	15	6	27	2	54	312
Total questionnaires	52	52	52	156		-3	0
1999/2005 Scale ratio						1,81	
2005 Adjusted Score						- 5,42	

Table 4: Comparison of 2005 and 1999 scores

Question in set	1999 Score	2005 Score
First	-68	-16,27
Second	50	50,62
Third	-46	-39,77
Totals	-64	-5,42

The overall Uniformity score decreased significantly from the previous testing (from -64 to -5,42), most of the decrease being owed to the question that tested the attitude toward the choice of presentation of the financial statements. This could be explained by the introduction of two sets of accounting regulations for individual companies, plus another for groups of companies. Although still not crossing the boundary to full flexibility the overall attitude toward uniformity in this respect has decreased from the 1999 testing.

Conclusions

We evaluated the attitude toward flexibility at two points in time (1999 and 2005) and observed that, over time, accountants' attitude moved to less uniformity. The beliefs of accountants must have changed owing to extensive IAS/IFRS training programmes in IAS/IFRS that followed the enactment of the Harmonisation Regulations. The 1999 and 2001 Harmonisation Regulations were heavily influenced by IAS/IFRS and there is no better proof than the inclusion of IASC's conceptual framework in the text of these regulations. This inclusion signalled that the regulator was at least favourable to the exercise of professional judgment and flexibility in interpreting accounting regulations. It follows that the subjective norm changed from the strict uniformity imposed by the Ministry of Finance until 1999 to one which allowed choice, albeit small (e.g. the exclusion of certain line-items from the balance sheet when their amount is nil, the full introduction of the true and fair view requirement, substance over form etc). We therefore infer that the intention to apply regulations with flexibility.

Appendix 1. The 1999 and 2005 Questions

1999 Uniformity versus flexibility (Unif vs. Flex):

- Q2.** To what extent do you agree to the existence of several presentations of the financial statements?
- Q10.** To what extent do you wish that the revaluation of land and buildings be a matter of enterprises' choice?
- Q14.** To what extent do you wish that a single stock valuation method should be mandatory for all companies?

2005 Uniformity versus flexibility (Unif vs. Flex):

- Q5.** To what extent do you agree to the existence of several presentations *of the components* of the financial statements (*e.g. balance sheet, profit and loss account etc.*)?
- Q7.** To what extent do you wish that the revaluation of land and buildings *be done by independent valuers*?
- Q8.** To what extent do you wish that a single stock valuation method be mandatory for all companies?

A MANAGERIAL AND COST ACCOUNTING APPROACH OF CUSTOMER PROFITABILITY ANALYSIS

Pete Ștefan

Babes-Bolyai University, Faculty of Economics and Business Administration, Cluj-Napoca

Cardoș Ildikó Réka

Babes-Bolyai University, Faculty of Economics and Business Administration, Cluj-Napoca

In the last years many organizations realized that market orientation is essential to their success. Satisfying the needs of customers, offering them products and services which meet their desires and demands, customer loyalty can increase profitability for long term.

After analyzing the existing journal literature in this field we would like to emphasize that managerial accounting, cost calculation methods and techniques, the analysis of costs provides relevant information when analyzing the customer's profitability. We pay special attention on cost systems. An activity based costing approach takes customer profitability to new levels of accuracy and usefulness, provides the basis for creating, communicating and delivering value to the customers.

Keywords: managerial accounting, ABC, customer relationship management, customer profitability analysis, organizational performance

JEL classification: M41- Accounting and Auditing

1. Introduction

The rapid growth of the internet and its associated technologies has greatly increased the opportunities for marketing and has transformed the way relationships between companies and their customers are managed (Bauer et al., 2002). Companies are focusing on delivering the highest value to customers through better communication, faster delivery and personalized products and services.

Many companies are racing to re-establish their connections to new as well as existing customers to boost long-term customer loyalty (Chen&Popovich, 2003). It seems like they realized that they can win the race through the implementation of customer oriented cost systems, relationship marketing principles and technology-based customer relationship management applications.

In a business-to-business environment customer relationship management (CRM) becomes the business process that provides the structure for how relationships with customers are developed and maintained (Lambert, 2010). Management firstly identifies key customers and customer groups to be targeted than the decision regarding who represents key customers includes evaluation of the profitability of each customer. Often it is assumed that the marketing function is responsible for these activities. However, in complex business relationships there is a need for other organizational functions to interact and collaborate. Marketing and sales, human resources, research and development, finance, managerial and cost accounting, IT and IS must join forces in order to create value for both the organization and customers.

2. Research methodology

Customer relationship management, customer profitability analysis and their relationship with managerial accounting and cost systems is an attractive area for research especially because of their novelty and exploding growth.

In order to create a good research in the field of managerial accounting and in order to generate good and relevant knowledge researchers must follow a set of qualitative criteria. According to

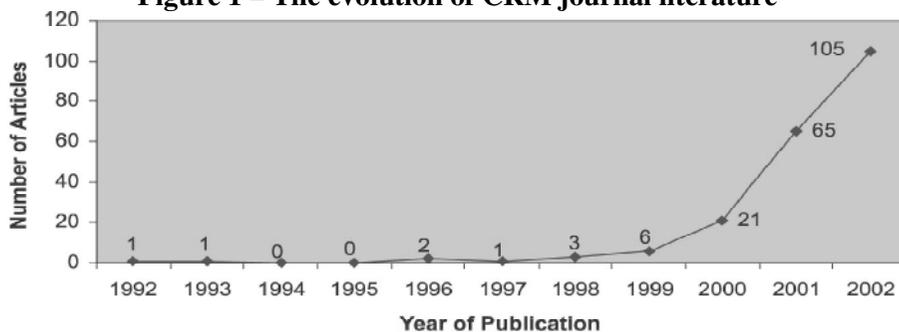

Lukka&Mouritsen (2002), when conducting a research, there is a need for theory, testing and rigour. In this article we are focusing more on theory and rigour and less on testing. Our intention is to lecture in the field of managerial accounting, management and marketing in order to understand the phenomenon of customer relationship management and to analyze the existing connections between managerial accounting, cost management and marketing.

The remainder of this paper is structured as follows. First the background is established by tracing the roots of the interest and researches made in the field of customer relationship management and customer profitability analysis. Second, our intention is to present the conceptual framework of customer relationship management, pointing out that a cross-functional and customer oriented system is needed to increase company profitability. Third, we would like to emphasize that managerial accounting and the cost management plays a vital role in the process of profitability analysis. New and complex cost systems, such as activity based costing (ABC), allow a stronger focus on the customer, investigate the relationship between costs and clients, analyses the way to attribute the relationship costs to customer segments. Finally, advantages and disadvantages of CRM and ABC implementation are discussed in order to establish further research objectives.

3. Literature review

Interest on customer relationship management (CRM) began to grow in 1990s (Ling&Yen, 2001; Ngai, 2005) when organizations and businesses realized that an enhanced relationship with their customers can lead to customer loyalty and retention and ultimately to profitability (Ngai, 2005). Over the last years CRM has attracted the attention and interest of both academics and practitioners. The significantly increasing number of articles, conference papers, doctoral dissertations or unpublished working papers emphasizes this interest.

Figure 1 – The evolution of CRM journal literature

Source: Ngai (2005)

We can observe that the output of CRM research increased significantly since 1999. If in the early and mid 1990s Ngai (2005) identified only 8 articles related to CRM, after 1999 he identified almost 200 articles. After 2002 the interest and debates of researchers and practitioners becomes more and more intense, especially because the recent changes in the business environment, globalization and the intense competition.

The majority of the published papers and articles are related to: (1) *general and managerial aspects and concepts, characteristics about CRM* (Leventhal, 2000; Abbott 2001; Chen&Popovich, 2003; Sin et al, 2005; Helgesen, 2007) especially because CRM is a relatively new phenomenon for many organizations; (2) *management, strategic cost management, planning, strategy and organizational performance* (Seybold, 2001; Crosby,2002; Baker, 2002; Van Raaij E.M., 2005; Cugini et al, 2007).

A significant part of the researchers considers that (1) *CRM works together with marketing and sales* and that (2) *CRM needs also service and support activities in order to maintain good relationships with customers* (LiBrizzi, 2001; Coner&Gungor, 2002; Anderson, 2002; Seddon, 2000; Bitner et al, 2002;

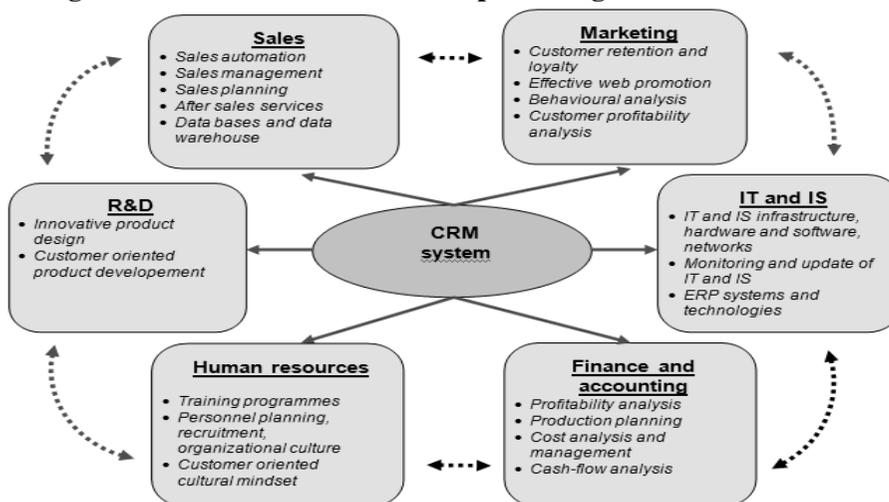

Chen&Popovich, 2003; Ang&Buttle, 2006; Helgesen, 2007). Over the years, the rapid growth of automation, information technology, internet and associated information systems has made that academics and practitioners focus on the analysis and development of these aspects. The *relationship between CRM, IT and IS; data, information and management; data mining; the development of software, tools and systems; internet, e-commerce and e-management* are just a few research topics intensely debated by researchers (Ferguson, 2000; Drew et al, 2001; Corner&Hinton, 2002; Shebab et al, 2004; Bih-Ru, 2007; Ngai et al, 2009).

We noticed that there seems to be a need for a market-oriented managerial accounting system whose objective would be to furnish updated and relevant information, reports, graphic representations about customer needs, customer accounts, and customer's profitability. Furthermore, many arguments and opinions consider that activity based costing (ABC) is the solution when establishing profitability figures of customers (van Raaij, 2003; Murphy, 2005; Helgesen, 2007).

4. Customer relationship management – the solution which leads to profitability

Customer relationship management (CRM) is a widely recognized business approach but there is no universally accepted definition of this concept. Academics consider that CRM is an enterprise approach to understanding and influencing customer behavior through meaningful communications in order to improve customer acquisition, customer retention, customer loyalty, and customer profitability (Swift, 2001; Ngai, 2005); others consider that CRM is a strategy and process of acquiring, retaining, and partnering with selective customers to create superior value for the company and the customer (Helgesen, 2007) or that when fully and successfully implemented CRM is not only a technology solution but a cross-functional, customer-driven, technology integrated business process management strategy that maximizes relationships and encompasses the entire organization (Chen&Popovich, 2003). A CRM system can help organizations to answer questions like: *What products or services are important to our customers?; How are we perceived by our customers?; How should we communicate with our customers?; How can we maintain good relationships with our customers?.* In order to answer to these questions a CRM system and technology must link front office and back office functions.

Figure 2 – CRM and its relationship with organizational functions

Being cross-functional, a CRM system involves fundamental changes in the ways companies are organized and business processes are conducted (figure 2). Of the six identified function information technology (IT) and information systems (IS) have the most difficult role. Their job is to establish a connection with the other functions, to create communication channels between them. To achieve this there is a need for IT equipment, hardware's and software's, "information-intensive strategies", computer technologies, computer aided design/manufacturing, flexible

manufacturing and cost systems, data warehouse, data mining (Sin et al, 2005). All and all, the effective communication and collaboration between these functions ensure the success and organizational performance.

5. Customer profitability analysis by using activity based costing (ABC)

We noticed earlier that CRM is a business approach and a strategy to improve customer satisfaction, customer loyalty and customer profitability. Furthermore, customer satisfaction and customer profitability are considered to be a milestone in the path towards company profitability (Cugini et al, 2007).

Customer cost information is essential for managerial decision making (Dalci et al, 2010). Understanding the true costs of serving specific customers is important for every organization. Those companies who understand which customers are more profitable and which are not are “armed with valuable information needed to make successful managerial decision to improve overall organizational profitability” (van Raaij, 2003; Dalci et al, 2010).

In the changing technological environment, when the internet and e-commerce gains the customers on their side, companies realized that traditional cost accounting systems do not provide accurate cost information, information used in the decision making process. As an answer to these changes, activity based costing (ABC) was designed and, in time, gained popularity, because it focuses on the activities associated with the costs and assigns activity costs to products, services or customers that consume resources. Because of these characteristics ABC (1) becomes a tool for determining true costs of bots sales, marketing activities and customers; (2) will help companies to make better decisions based on accurate costing information (Stapleton et al, 2004; van Raaij, 2005; Cugini et al, 2007; Dalci et al, 2010).

The mechanism of ABC requires going through several stages. First, ABC assumes that products, services or customers generate activities and activities consume resources. Second, product costing involves a two-step allocation process in which costs are first allocated to activities and then the activity costs are allocated to products or customers based on each product or customers demand for, or consumption of the activities (Stapleton et al, 2004).

While traditional cost systems rely on arbitrary allocation of overhead costs, ABC classifies cost pools according to the activities performed within the organization. Moreover, by understanding the hierarchical levels of the costs ABC enables managers to better understand cost causation and make better decision, it help managers to understand which customers are profitable and which ones are not and leads to increased profitability (Dalci et al, 2010).

Many specialists (Kaplan&Atkinson, 1998; Albu&Albu, 2005; Murphy et al, 2005) consider that ABC permits a customer profitability analysis by comparing the revenue streams with the service costs associated with specific customers or customer groups. This activity requires a combination of accounting and marketing skills but the result of this collaboration might be a diagram, useful to managerial decision.

Figure 3 – Customers profitability by using ABC

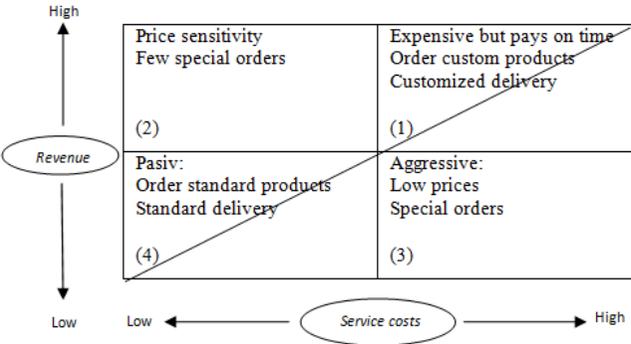

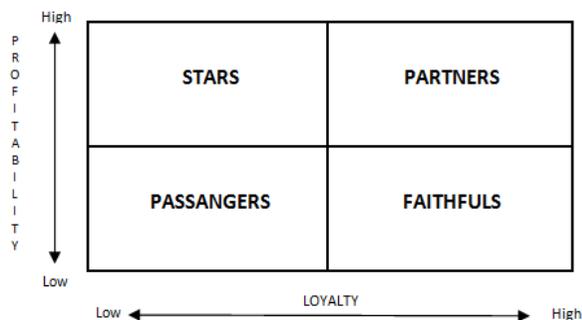

Figure 3 shows that there are several ways in which companies can have profitable customers. There are customers (category 4) who can easily be served but at low cost and low prices. Instead, expensive customers (category 1) can be profitable if the revenues obtained compensate the customer costs. The most vulnerable customers (category 2) are those who generate high revenues but have low servicing costs. Companies should pay special attention to those; they must give discounts and special services to keep them faithful and loyal. The fourth category (category 3) is represented by those customers who generates low revenues and involves high customer costs. In such cases companies must rethink their internal processes, improve manufacturing processes, and renegotiate with customers the process, the delivery terms and special orders.

As we said earlier, ABC allows managers to identify and separate the profitable customers from the unprofitable ones. Furthermore, it permits managers to identify customer profiles in terms of profitability and loyalty, presented in figure 4.

Figure 4 – Customers profiles in terms of profitability and loyalty

Source: Albu&Udroiu, 2009

Analyzing the figure above we can conclude that the PARTNERS are the best customers for every company because they generate high profitability and they are loyal also. Companies must pay special attention to STARS because they generate high profitability but their loyalty level is low. On the other hand, PASSANGERS and FAITHFULS are those customers who are loyal but the level of profitability is low. In such cases companies must reanalyze permanently the costs associated to serve this category.

All and all, customer profitability analysis can be a complicated process but can have a massive implication for the profitable growth of any organization. By examining customer needs and behavior, by implementing an ABC cost system, it becomes possible to: (1) establish customer revenues and customer costs; (2) identify customers' profile; and (3) develop a wider and more sustainable understanding of how to grow the business profitability.

6. Ending ideas

Usually, market oriented businesses must have to main objectives: (1) to satisfy the needs of customers by offering them products and services which meet their desires and requests, and (2) to satisfy the business unit's needs by implementing customer relationship management systems that will generate, on long term, profitability.

Customer satisfaction is hard to win and easy to lose. To be efficient, CRM must comprise the major functional areas in every organization. Every organization must focus on designing and developing profitable products with an acceptable cost structure. Then marketing and sales function interact directly with customers because of the strategies and techniques developed to

achieve goals. By using customer service and support activities organizations can improve and maintain good relationship with customers; they must fulfill the needs of everyone quickly and accurately. In supporting and maintaining these crucial functions information technology (IT) and information systems (IS) plays an important role. Adequate IT and IS can enable the collection of data to determine the economics of customer acquisitions, retention or to establish their profitability, on one hand. On the other hand IT and IS are necessary to an effective communication and collaboration between the functions mentioned above.

An important part of a CRM system is marketing and sales which leads inevitably to customer profitability analysis. CPA opens a door on a new way of thinking about business; it provides routes to a clear strategy for profitable growth. ABC is a necessary and efficient measurement tool for profitability analysis and this will result in better-informed managerial decision.

All and all, a CRM system, a CPA and an ABC cost system requires changes to organizational culture, more precisely, there is a need for customer oriented cultural mindset. The commitment of both top management and employees is an essential element for bringing value to the company and the customers; it requires full-time attention of the implementation project team with representatives from sales, marketing, and manufacturing and information technology.

Indeed, implementing a CRM system is a resource- and time-consuming activity; a labor-intensive operation; which has to be monitored and maintained permanently. But a system like CRM gives the possibility to increase managerial insights into how products, customers or supply channels works; how profitable they are; allows managers to make decisions with more accurate information and lower chances for error in those decisions.

Bogdan Victoria

University of Oradea, Faculty of Economics

In the last few decades, the problem of voluntary disclosure of financial or non-financial information has been, in the attention of specialists, given the fact that information asymmetry, as explained by the agency theory, has become an important factor for the actors of financial markets. High quality financial reports consistent with the IAS/IFRS, issued at regular intervals, have the role of offering data for in-depth financial analysis that can be the basis for decisions regarding stock market investments. The performance of company, estimated by using the EVA, MVA, VA indicators, are directly linked with the average cost of capital, which in turn is sensitive to the evolutions of the stock market, measured both by the level of the asset attached to the entity and of the level of financial market. The impact of voluntary disclosure on company's performance in our paper has been studied on TUFEL company listed on the Bucharest Stock Exchange, confirming a refined degree of predictability.

Key words: voluntary disclosure, performance, cost of capital, EVA, TURISM FELIX

JEL codes: M41, M10, G14

1. Introduction

Through this study we hope to emphasize the fact that in any insecure economic period, a society that is marketable (on stock market) is interested in reporting data as frequent as possible. The voluntary reports offer credibility and predictability to the marketable entity, for the existing investors or for the potential ones in an economical and financial environment characterized by increased uncertainty.

All over the world there are strict rules regarding the shape and the content of synthesis documents and the moment of placing them in the public domain. Studies have shown that the nature and the number of information voluntarily disclosed correspond to the size of the company; the number of shareholder and the structure of shareholding; the status of marketable company; the company's performances; debt-to-equity ratio; recommendations from the Audit Report; company's internationalization ratio; company's original branch; the costs associated with information communication. Costs are considered a key factor that deeply influences the company's decisions regarding the communication policy. These costs are: cost of production information; disputation costs; political costs; competitive disadvantage cost.

The theory that explains *informational asymmetry* is *agency theory*¹²¹³. According to this theory there is an *agency connection* between managers and shareholders and is based on the bonus remuneration system. Gathering resources and maintaining at a positive level a number of economic indicators such as the *stock price* are elements that strongly motivate the managers into voluntarily sharing information. The models developed in the last years have used, as a signaling instrument, the *accountant information management*. Managers can transmit, through their

¹²¹³ Liliana Malciu , *Cererea & oferta de informații contabile*, Editura Economica ,București 1998, pag. 74

content and the moment of the publication of these models, signals of company's return rate perspectives. The signaling through the content of the information is done by choosing the accountant method, through informing certain sectors and through informational budget. There is a direct relation between the origin of information and its publishing date.

2. The cost of capital and the value creation

The investor is the one that wants the best return rate of its capital, therefore he will orient his interest towards the companies that create value. The accountant indexes consider the company as performing well when it turns out profit. But the result must not only be positive, but it has to compensate the cost of resources brought in by the shareholders¹²¹⁴. For the "capital" factor there is a minimum remuneration called the capital cost. If a company earns its capital cost, its objective is achieved and has satisfied its shareholders expected earnings. *The shareholders will not accept a remuneration that is below the risk free interest rate because any investment has a superior risk in comparison with risk free asset.* Any investment must offer a remuneration that contains a *risk bonus*.

3. A brief review of the literature on the topic

The financial market works as any other market, on the basis of demand and offer, having as a base of transaction, the capital. Research in the modern theory of the portfolio, contains a series of models of analysis and estimations of the central relation of portfolio management, that is the correlation risk-return rate. Markowitz's theory created an economic-mathematical model that follows the behavior of the financial market's subjects and has introduced the *practice of diversification of the title portfolio*, depending on the correlation risk-return rate. Sharpe has divided the risk that characterizes financial titles into two subclasses: the systematic risk and the specific risk. In a general formula, Shape has introduced into the equation of a title's return rate, the notion of volatility, that shows the connection between the evolution of a title's return rate and a macroeconomic factor's return rate, usually considered the *market's medium return rate*. Subsequently, Lintner and Shape use for the first time the hypothesis of introducing *the risk free asset* into the portfolio and thus the risk bonus appears as a result of investment demand in risky assets. The risk free asset offers certain remuneration without an existing risk taken. The equation $=r_f + \beta_i (r_p - r_f)$ called also CAPM (Capital Asset Pricing Model) emphasizes the connection between the risk asset, the risk free asset and volatility. Based on Markowitz and Shape's researches, Ross established a multi-factorial model, called APT (Arbitrage Pricing Theory), through which he accomplishes a connection between title's individual return rate and a series of macroeconomics factors.

Disclosures in excess of those required by laws, accounting standards or stock exchange listing requirements regulations, namely voluntary disclosures, have been an area of interest to researchers for many years. Companies continue to disclose voluntary information despite ever increasing mandatory requirements and so the motivation for such behaviour has been the focus of much attention (Watson *et al.*, 2002). It is often argued that companies might find it advantageous to provide additional pieces of information to investors and analysts through the annual report. This statement is based on the fact that information asymmetry between companies and potential investors, due to a low level of disclosure, increases cost of capital by introducing adverse selection between buyers and sellers of the company's shares. By disclosing more information companies are likely to reduce information asymmetry and hence attract liquidity in the company's shares, which lead to lower cost of capital. So, we have to underline that voluntary disclosures can take several forms: press releases, conversations with financial analysts, letters to shareholders and the provision of additional information in annual reports.

¹²¹⁴ Iulia Jianu , *Evaluarea, prezentarea și analiza performanței întreprinderii* , Editura CECCAR ,București , 2007 pag. 363

The practice of voluntary disclosure is usually explained by *two economics-based theories*: agency theory and signalling theory or information problem theory (Healy and Palepu 2001; Xiao *et. al.* 2004). Voluntary disclosure is focused to solve the *ex-ante* (information problem) and *ex-post* (agency problem) at once. Agency theory basically assumes that everyone is selfish, pursuing her self-interests. In the context of modern companies, there exists separation of ownership (principals) and control (agents). Since principals cannot perfectly monitor agents' behaviour and agents are selfish, agents have strong incentives to act for their own interests at the expense of principals'. Agency theory is *ex-post* since it exists after the formation of companies. Dumontier and Raffournier (2002) classified the accounting choices into two broad categories: the way the company evaluates its transactions (choices concerning accounting valuation) and the way the company presents its accounting information (choices concerning financial statement format). The authors have shown that companies listed on foreign markets are more inclined to adopt international standards voluntarily.

Agency theory is commonly used in the literature to analyze the determinants of accounting choices. As Jensen and Meckling (1976) observed agency theory argues that there is an avoidable monitoring cost for shareholders, paid to prevent expected expropriations by management. Since companies are competing against each other in the capital market to raise funds at the lower possible cost, there is a high incentive for these companies to help investors reduce their monitoring cost, by offering them clearer and therefore more reliable information. Financial statements, in opinion of Prabowo and Angkoso (2006), are one main device to reduce the agency problem, although there are other mechanisms such as efficient market for corporate control, governmental regulation, efficient job market for managers and managerial stock ownership program. By forcing managers to prepare standardized financial statements, shareholders can monitor and control managers' action with the proxy of company's financial performance. As Healy and Palepu (2001) considered it is expected that by disclosing additional, not mandated information, managers and owners can actually reduce agency costs.

Signalling theory exists before investors put their money into certain companies. Therefore it is called *ex-ante* problem. Information problem exists because investors have no or limited information to assess the quality of companies, forcing them to value all the companies at average level. The main problem with information asymmetry is that it impairs the efficient allocation of capital and entails higher cost of capital. Akerlof (1970) sees information asymmetry as a „lemons” problem that arises when a person wants to buy a used car. The signalling theory may be relevant to analyze the determinants of accounting choices. More specifically, accounting policy choices has signalling properties. The most commonly investigated information asymmetry is between the company and the investors although such kind of asymmetry can appear between other parties too (e.g. the company and the underwriter). Previous studies have demonstrated that increased disclosure decreases information asymmetry. Botosan and Plumlee¹²¹⁵ (2001) have a research plan in which they analysed the cost of capital through the dividend discount rate. This research was based on S. Ross's classical formula, Arbitrage Pricing Theory (APT). Since in the original model, the number and nature of macroeconomic risk factors aren't defined, the researchers chose a set of six indicators: the volatility ratio defined by CAPM; financial leverage; the size of the company, the share's account value, the rate of long term profit rise; the actual market value of the stock. These set the expected nature of the correlation between them and the cost of capital. The research was carried out on a sample of 23,765 companies between 1979 – 1993.

¹²¹⁵ Botosan, Christine A. and Plumlee, Marlene A., Estimating Expected Cost Of Equity Capital: A Theory-Based Approach (July 2001). University of Utah Working Paper. Available at SSRN: http://papers.ssrn.com/sol3/papers.cfm?abstract_id=279309

Ionaşcu *et al.* (2009) conducts an ongoing research during the 2009 – 2011 period¹²¹⁶, with the title „*The benefits of adopting IFRS standards: a research exploring the impact of internantionalizing Romania’s accounting on capital cost reduction*”. The objective of their study is to identify the possible economic benefits of Romania adopting the IFRS. They start with the idea that applying IFRS, considered a high quality standards, must lead to *an increase in financial information transparency, a reduction of information assimetry and risk*, and, as a consequence, to *a decrease in the capital cost*.¹²¹⁷ On the sample of 37 marketable companies that adopted IFRS beginning with the year 2000, they evaluated capital cost in two different moments: **t** (in 1999, before the IFRS reporting) and **t+τ** (in 2003, after the adoption of IFRS). The research used a quantitative type methodology, by testing the model proposed by Botosan și Plumlee(2005). Results show that, indeed, after adopting IFRS, capital cost decreased from 0,8 (before the implementation) to 0,07 (after the implementation). IFRS offered the advantage of lower capital cost for Romanian companies listed at the Bucharest Stock Market (BVB).

4. Research Methodology

In the process of drafting this paper, we have followed the next steps:

Choosing the subject of the research and establishing the significance of the problem

The current paper wishes to argue that accounting information being credible, standardised and available in real-time is the basis of the decisions that an investor makes in an uncertain economical environment. These decisions are measured through an indicator of our choosing, cost of capital. The influence of this indicator on the company’s performance are measured through the concept of value creation.

Documentation, by resorting to the international and national literature in this domain

The international literature used is mainly about the theoretical contributions of researchers like, Sharp, Lintner, Botosan and Plumlee, but also about empirical testing done by numerous researchers such as Botosan (2006), Ionaşcu (2009).

Defining the research questions:

Our research was based on the following the research questions:

Q1: *AV – actual value, MVA –market value added and EVA –economic value added represent measures of performance and are directly correlated with average capital cost;*

Q2: *voluntary disclosure of financial information help to better estimate capital cost by investors;*

Q3: *a society that operates in a sector where stock have a volatility of less than 1, the average capital cost is relatively stable.*

Possible errors may arise from the data collecting methodology or from the stated research questions.

Chosing the data collecting methods and techniques

The chosen society satisfied the following criteria: to be marketable on BVB; to publish interim rapots in standard form, as set out by IAS 34. These public reports are disclosed through the own society’s web page.

Data analysis and the validation or rejection of research questions

The validation or rejection of our research questions shall be made by applied quantitative analysis on the gathered data. ACC – average capital cost, AV – actual value, MVA –market value added and EVA –economic value added are calculated in 5 different moments in the 2008 – 2009 period, using the aforementioned conceptual framework and the financial information from the anual and interim reports. By analysing the results, we shall determine the validity of the presumption that: *voluntarily disclosed financial information in a standardised format decreases*

¹²¹⁶ webpage of the research project <http://cig.ase.ro/didactice/default.aspx?idutilizator=31>

¹²¹⁷ Ion Ionaşcu , Stere Mihai , Mihaela Ionaşcu ,*Implementarea IFRS și reducerea costului capitalului pentru companiile românești cotate* , Revista Audit financiar , Nr 1/2010

capital cost and alters the created value in such a way that informed investors will have access to decision criteria during the year 2009.

Data interpretation

After obtaining the results, we analyse both the absolute values from a quantitative point of view, as well as their evolutions in time. By comparing amounts and evolutions we shall have a qualitative analysis of the results.

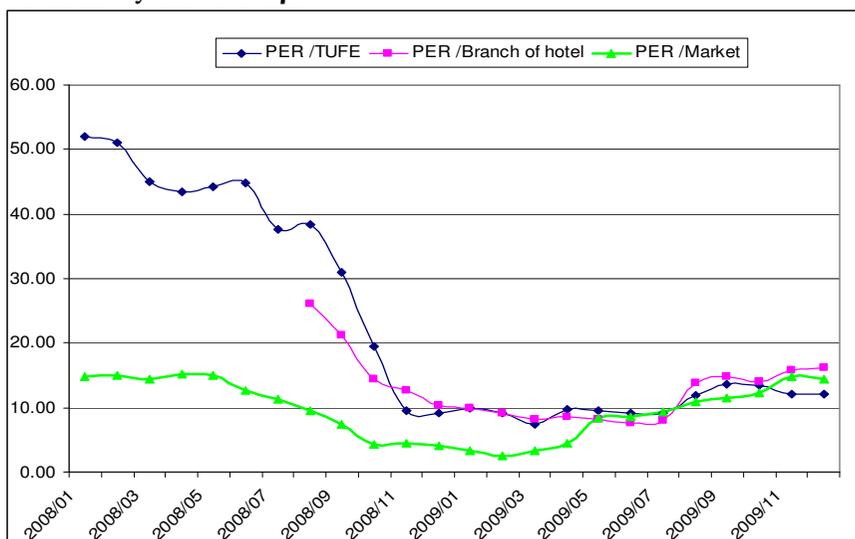

5. Results of the performed analysis on TURISM FELIX SA

The case study focuses on the *average capital cost*, in the conditions of voluntary disclosure of financial information, on a trimestrial basis, and the accuracy of the risk evaluation as compared with the annual mandatory reporting, as well as a performance estimation by calculating the **MVA**, the **EVA** and the **AV**. The analysed company is TURISM FELIX SA, a stock company from the Bihor county, with a social capital of 49.614.945,60 lei, marketed, in the Category II section, with the symbol TUFÉ, at the Bucharest Stock Market (BVB) since March 21, 2007. Currently 496.149.456 stocks of the company are being transacted.

In order to determine β (the sensitivity coefficient, which measures the stock's sensitivity to market fluctuations and which determines the specific risk) using the least square method, the monthly PER stock market indicator was used, both for the TUFÉ stocks and the market as a whole. The values of β for December 31, 2008, March 31, June 31, September 31 and December 31, 2009, were determined using the information from the Monthly Buletins issued by the BVB in the last 24 months. For the calculations, additional information was used from the financial reports of the 2008, 2009 fiscal years, as well as data from interim trimestrial reports from 2009. The following values are known from the macroeconomic environment:

- the flat income tax of 16%, according to Law 571 of 2003 – Fiscal Code;
- risk-free interest rate is 7,4%¹²¹⁸ ;
- we assume an expected return rate on these stocks by investors of 27,4% ;

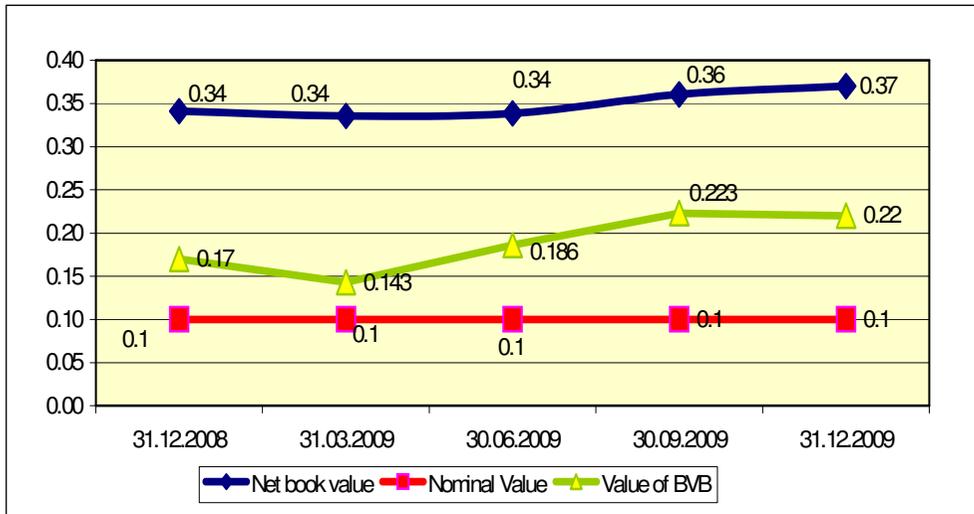

The TUFÉ stock's PER indicator, the market and the hotel industry figures are at the basis of calculating the volatility coefficient β .

Graph No.1. Evolution of the PER index

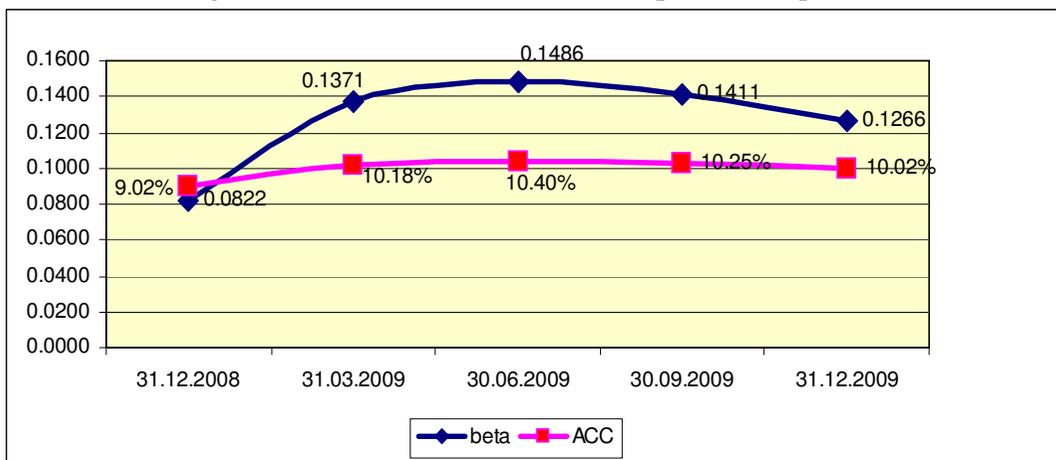

¹²¹⁸ medium interest on Treasury bonds issued by the Romanian National Bank (BNR) in 2005 for a period of 15 years, according to the Monthly Bulletin of the BNR

During the study, the company kept its nominal share value at 0.1lei/stock. The AGA decision during 2009 allocated the whole profit of 2008 on reserves.

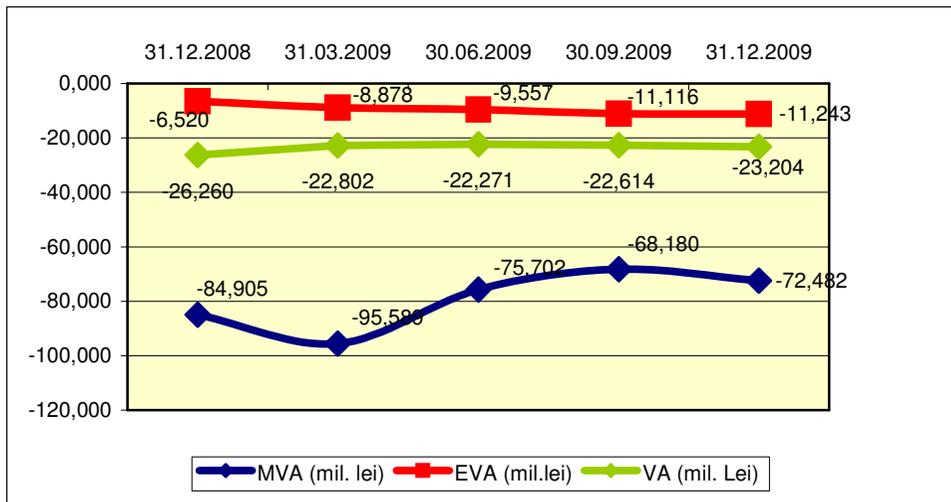

Graph No.2. Evolution in time of the market, accounting nominal values of TUFÉ stocks.

The evolution of β in paralel with the evolution of ACC shows to what degree the estimated ACC responds to the degree of volatility of TUFÉ stocks. The average capital cost shows a paralele evolution to β , but with a much more moderate amplitude (Graph No.3)

Graph No.3. Evolution of the sensitivity coefficient β and of the average capital cost ACC

Using average capital cost and market value of the stock, one can calculate the company's capacity to create value through its three approaches: MVA, EVA and AV. Calculating AV, by updating the total available treasury stream using as an update rate the ACC, was done with the following things in mind: keeping the total available flow at the level of December 31, 2008, estimating a time frame (of 4 years), operating with the average capital cost pertaining to every moment in time. Through this method, AV's obtained values show the way these evolved correlating with the average capital cost.

Graph No.4. The evolution of MVA, EVA and VA during the Dec. 31, 2008 - Dec. 31, 2009 period

Market Value Added (MVA) is calculated as the difference between the market value and the accounting value representing the *created external value*. EVA is an instrument used to measure the created value of the company through its shareholders, calculated as the difference between the net exploitation result and the invested capital cost, being also an indicator of internal performance.

6. Conclusions

The only available data, between two annual reports, on which estimates are made, are the ones from the last report, which are basically historical data and, as they get older, they become more unreliable and outdated. Through the interim report, the risk and uncertainty conditions are updated, and one can test whether the tradeable stock behaves according to the evolution of economy, or according to speculative fluctuations. The increase in the stock price during the period between January 1st and December 31, 2009, by 30% is supported by the rise of the AV by 11,5%, of the MVA by 15%. The evolution of β is presented in Graph. No. 4, in which one may notice that during a period of major turbulence on the capital market, β had significant fluctuations (+80%), and towards the end of the year reached a value of 0.126, an increase of 50% compared to the value from the beginning of the year (0.0822). The average capital cost (ACC) shows a similar fluctuation as β , but a maximum β amplitude of 80% corresponds to a maximum ACC amplitude of 15%. We can safely say that this verifies the hypothesis from the literature of this field: *if a company operates in a sector in which the stock presents a volatility that is less than 1, the average capital cost is relatively stable*. The average capital cost has risen by 13% during the year 2009, from a value of 9.02% to 10.02%.

We consider that evolution of PER stock indicator already includes the decision of investors to buy, therefore they probably acted either with full knowledge that their investments would be profitable on long run, or they acted in a speculative manner. By comparing the stock price with accounting value of stock, investors can make the natural decision of buying, given that the price of the stock is around 50% lower than its account value. This study upholds the idea that interim reports, done correctly, are welcome, and almost mandatory for companies listed on the stock exchange, especially given the socio-economic context, one of a less than stable period. It may be argued that the benefits for the reporting company vastly outweigh the effort put into the drafting of these interim reports. The benefits are measurable in time, through the stock market indicators attached to the stock, and through the trust given by existing and future investors.

ACCOUNTING AND TAX ON ASSETS DEPRECIATION

Samara Silvia

“Valahia” University Târgoviște

Although limited fiscally, provisions and adjustments for depreciation must be registered by the entity in order to transmit the real image and to provide to users, an useful and current information. The entity’s accounting policy relating to adjustments for depreciation has an impact on the outcome of the fiscal year and in consequence on the income tax by the impact of the depreciation of reversible value considered as an expense of the period as long as it is tax deductible. Although in an accrual accounting, the accounting principles and standards accept the registration of the depreciation of assets totally, thereby leading to an accurate picture of the financial situation, however taxation imposes restrictive rules for deductibility of provisions and adjustments for depreciation.

Keywords: value adjustments, loss of value, tax deductible adjustments, tax non deductible adjustments, profit.

JE code: M4, M 41.

1. Introduction

The usual terminology of our country in accordance with accounting regulations and approaches from literature refers to two types of depreciation:

- Irreversible depreciations are specific to tangible and intangible assets and they are due to physical or moral wear as well as to other causes. Depreciation is found by comparing the value of entrance of the fixed assets with the inventory value at the end of the financial year;
- Reversible depreciation consist of the possibility the in following period, the fix assets (intangible, tangible, ongoing and financial) as well as the mobile assets to register a decrease in market value (possible cost recovery may be lower). Such depreciation is estimated at the end of the fiscal year during inventory, so that through calculation a real assessment of the asset to be made, in the balance sheet.

As a result, the depreciation is not definitive and therefore provisional adjustments are made for them, and the assets, as described above, are maintained at the entrance value. According to O.M.F.P. 3055/2009, *“value adjustments comprise all adjustments intended to take account of reductions in value of individual assets, established at the balance sheet date, whether that reduction is final or not. Value adjustments include: permanent adjustments, hereinafter referred to as depreciation, and / or temporary adjustments, referred to as adjustments for depreciation or loss of value, depending on whether the adjustment of assets is permanent or temporary”*.

Both depreciations and adjustments play the part of reserves similar to sources, but which generate certain expenses related to assets and which ultimately affects negatively the financial outcome of the exercise or of the respective management period. The two distinct types of costs are: expenses for asset depreciation specific only to fixed assets falling under the scope of physical and / or moral wear and expenses of adjustments for value depreciation that can be seen in all asset categories.

According to International Accounting Standards amortization is not considered depreciation and depreciation of assets is treated as a value adjustment. The value depreciation is treated differently. It is a loss of value occurred during the useful life period of the asset, due to specific factors, which determine that the net selling price or the replacement cost is lower than the net accounting value. The size of the depreciation is given by the difference between the net accounting value and the inventory value. The inventory value gets different shades depending on the category of assets: recoverable value for tangible and intangible assets, net realizable value

for stock, probable value receivable for debts, stock market value for short-term financial investments. The reflection in accounting of value loss according to IAS36 is made throughout the expenses for the assets' depreciation and the crediting of the account of the impaired asset, in order to highlight the direct influence of the loss of value. Assets will appear to the new value both in the balance sheet and in the primary records. By what has been presented, we can conclude that there are differences between the depreciation of assets as it is perceived in the Romanian theory and practice and depreciation of value in terms of International Accounting Standards.

2. Tax treatment of adjustments for the value depreciation

From the point of view of taxation, in order to protect the taxable income adjustments for depreciation are not binding. For this reason, the fiscal rule requires formal and substantive conditions for the deductibility or not of depreciation expenses. Through the content, structure, method of formation and implications on the result of the year, the provisions and adjustments for depreciation are the most eloquent example of the imperative role of taxation on accounting.

In terms of tax, value adjustments fall into two categories:

- ***tax deductible adjustments***, which involve the right to deduct from the result of the year the expenses due to their creation. In this case, the entities receive a deferral of the income tax because it is calculated and paid only at the time of the transition to revenues. If the adjustments are tax deductible, entities decrease from their result the adjustment's value and, as such, the tax obligations to the budget are reduced. At the time of the reduction or cancellation of the value adjustment by registering it as revenue, the result of the activity increases, but the financial effect of deferred income tax is more beneficial for the body, because all this time it has been made a temporary self-financing, through the retention of amounts available to the entity, whose chargeability is being delayed;

- ***tax non deductible adjustments***, which require the transfer of costs for their creation in the category of non deductible expenses when calculating the income for that year. This situation is apparently not at all encouraging, because the entity must pay an additional tax for the value of adjustments. But considering that revenues from the reduction or cancellation of adjustments are free of tax, as there cannot be a double taxation, deductions for their creation are not justified. Tax demarcation, generally, is at the basis of the attractiveness of recording adjustments by the entity, but it should not constitute a decisive criterion, as the achievement of the fair image objective that the bookkeeping must offer requires the compliance with all accounting principles and hence registration of all value losses of assets, whether or not deductible. Thus, the annual financial statements will give priority to the accounting rules and the determining of the taxable income will take into account the tax rules. This deductibility may be different or identical in different countries, depending on their respective fiscal policy. Fiscal policy is essential in supporting economic growth and the tax system is a key element in attracting foreign investors and, thus, a country's economic development.

3. Adjustments for depreciation and financial and fiscal implications. Case Study

If amortization is allowed as deductible fiscally, adjustments for depreciation are not accepted in any way by deductibility, except for receivables – doubtful customers in the case of their bankruptcy on the basis of a court decision testifying it. Thus, there is a disparity between the financial statements presented by the establishment, between the financial statements and the profit and loss account, this leading to distortion of accounting information, which is no longer genuine and credible. In countries where accounting is linked to taxation the entities by the creation of adjustments for depreciation aim only at getting tax benefits and not at meeting the requirements for reflecting a true image. By analyzing the adjustments for depreciation only in terms of fiscal rule, they being non deductible, entities which are dropping the mechanism of adjustments will get a deformed fixed assets capital, different from the accounting truth. In order to

highlight the financial and tax implications concerning the establishing of adjustments for depreciation we assume a hypothetical situation, taking into account the formation of deductible provisions and also of non deductible provisions.

CC "A" SC and CC "B" SC have the same activity – public catering. At the end of year N-1, respectively at the beginning of financial year N, the two entities have the same financial structure and the same achievements. Therefore the balance sheet of the two entities at the beginning of year N has the following structure:

Balance sheet at the beginning of year N of the CC "A" SC and CC "B" SC

Asset	Amounts	Debts + capital and reserves	Amounts
0	1	2	3
Fix assets	40.000	Debts – total	44.000
Raw materials	14.000	Commercial debts	14.000
Finished products	18.000	Payment dividends	25.200
Clients	16.000	Tax income (16%)	4.800
Bank accounts in lei	32.000	Equity - total	80.000
Cash – in lei	4.000	Paid subscribed capital	60.000
		Reserves	20.000
		Result of the year	30.000
		Allocation of profit	30.000
Total	124.000		124.000

The loss and profit account at the beginning of the financial year N at CC "A" SC and at CC "B" SC

Elements	Amounts
Sales income	60.000
Stored production income	14.000
Operating expenses – total	50.000
Operating result	24.000
Financial result	6.000
Extraordinary result	-
Result of the year	30.000
Income tax (16%)	4.800
Net result	25.200

During year N the following economic transactions were made:

Finished goods are obtained – worth 60.000 m.u., cost of production, sales of 50.000 m.u. production cost in the year end inventory for sold finished goods, selling price for sold finished goods 80.000 m.u., of which only 40.000 m.u. is received, the difference of 20.000 m.u. representing receivables. The client CC “C” SC is declared bankrupt, his receivable is 8.000 m.u. Total operating expenses 60.000 m.u., of which 58.000 m.u. have been paid, the rest of 2.000 u.m. representing debts, incomes from cashed in debts 4.000 m.u., dividends are paid during the year in amount of 25.200 m.u. and the income tax 4.800 m.u., the amount of 25.200 m.u., representing payable dividends for the year N, the net profit obtained at the end of the year is totally allocated for dividends payment.

CC “A” SC will constitute provisions for client depreciation of contested debts, in amount of 8.000 m.u., the entity foreseeing very small chances of recovering the debts, through the letters of confirmation of balance sent at the end of the financial year at the occasion of debts inventory. CC “B” SC does not create provisions for debt depreciation.

In the accounting of company “A” the accounting records for the establishment of the provision is as follows:

$$\begin{array}{rcl}
 8.000 & 6814 & = & 491 & 8.000 \\
 \text{Operating expenses concerning the} & & & \text{Adjustments for debt} & \\
 \text{adjustments for the depreciation of} & & & \text{depreciation- clients} & \\
 \text{mobile assets} & & & &
 \end{array}$$

Therefore during the year N, the two entities had the same records, the only difference is the provision for depreciation of customers receivables, created only by the entity “A” at the end of the year. At the end of the financial and fiscal year N the profit and loss account, respectively the balance sheet of the two companies having the following structure:

The profit and loss account at the end of year N at CC “A” SC end CC “B” SC

Elements	AMOUNTS	
	CC „A” SC	CC „B” SC
Sales income	80.000	80.000
Stored production income	10.000	10.000
Total operating expenses from which - provision expenses	68.000 8.000	60.000
Operating result	22.000	30.000
Financial result	4.000	4.000
Extraordinary result	-	-
Result of the year	26.000	34.000
Income tax (16%)	4.160	5.440
Net result	21.840	28.560

The amount have been obtained by analyzing the initial situation and the transactions that took place during the financial and fiscal year N, with the help of the synthetic and the analytic accounting.

Balance sheet at the end of the year N for CC "A" SC and CC "B" SC

Assets	Amounts CC "A" SC	Amounts CC "B" SC	Debts + equity	Amounts CC "A" SC	Amounts CC "B" SC
0	1	2	3	4	5
Fix assets	40.000	40.000	Debts - Total	42.000	50.000
Raw materials	14.000	14.000	Commercial debts	16.000	16.000
Finished products	28.000	28.000	Tax income	4.160	5.440
Clients debts	28.000*	36.000	Payment dividends	21.840	28.560
Bank accounts in lei	8.000	8.000	Equity	80.000	80.000
			Capital	60.000	60.00
Cash in lei	4.000	4.000	reserves	20.000	20.000
			Result of the year	21.840	28.560
			From which contested debts	8.000	8.000
			Income allocation	21.840	28.560
Total	122.000	130.000	Total	122.000	130.000

* 28.000 represents the net value of customers debts, (36.000 nominal value - 8.000 adjustments for depreciation)

The financial and fiscal implications of the creation of provisions by CC "A" SC are as follows:
 - the profit of CC "A" SC, which created the adjustment for the depreciation of contested client debts, has recorded a decrease compared to CC "B" SC, respectively a decrease of 8.000 m.u. This can be explained by the increase of expenses for the adjustments which are tax deductible. As a consequence the profit is diminished which will have as an effect a reduction of the income tax. Thus a delay of payment of an income tax will occur concerning the period N, from creation to its annulment:

- for CC "A" SC this delay of tax payment, as well as the temporary keeping at the company's disposal of a certain volume of the net profit, respectively 8.000 u.m., it represents a direct advantage.

- after the liquidation of CC "C" SC and the valorization of its assets and the payment of debts the following situations can occur affecting both companies:

- if the debt are recovered, the company which registered a provision will cancel it, on the expense of the income accounts, this payments that were supposed to be paid in the past (tax and dividends) will be made in the present, which lead to the company obtaining of sources of free

financing, this compensating in some sort, the delay of cashing in. for the company that did not register provisions, the ulterior cashing in of debts had no influence what so ever.

- if debts are not recovered, both companies register losses for the uncollected receivables.
- for the company that registered the provision, by its annulment on the expense of revenues cancels the effect of the loss from the financial records.
- for the company that did not register a provision for depreciation the effect is felt solely in the year in which the non collection takes place, through the inclusion in the profit and loss account of the expense for losses from uncollected receivables.

After the litigation is solved, favorably or not, the provision created is annulled:

8.000	491	=	7814	8.000
Adjustments for depreciation of customer receivables			Revenues from adjustments for the depreciation of mobile assets	

In conclusion, the company will have 8.000 m.u. more to pay, either as taxes dues to the state budget, or as payment dividends to the shareholders. In this case, CC “B” SC practically will not register any supplementary expense but in comparison with CC “A” SC, it will not have at its disposal the amount of 8.000 m.u., amount that CC “A” SC was practically credited for a period of two years with zero interest.

For the state budget the creation of provisions by company “A” does not represent a direct advantage as it generates a delay in payment of a tax, thus a delay of cashing in revenues for the state budget. On a long term however, the state budget will profit also due to the fact that company “A” will use the amounts temporary at its disposal, will become more viable financially, will be able to increase its activity, the results will be better and thus it will feed the state budget with a greater volume of taxes. These advantages become real only if the provisions created are tax deductible. The other provisions created but not included in the fiscal laws are not deductible from the taxable income; therefore they will be added to the taxable income to which the income tax is applied. This is why companies refrain from creating provisions non deductible fiscally, even if they prove to be useful. Their creation appears however as a necessity, with the purpose of reflecting a true image of the companies’ financial situation.

The European Union is currently affected by the financial crisis that spread internationally. The member states face difficulties such as price volatility, uncertainties, liquidity issues, cases of bankruptcy, increased unemployment rate, and decreasing GDP. The present paper analyses the challenges faced under these new circumstances by the European companies and their stakeholders. By taking into consideration the threats and weaknesses faced by firms and other interested parties, we emphasize the importance that transparency and communication among companies and their stakeholder have in overcoming financial difficulties.

Keywords: economic turmoil, stakeholders, communication, challenges, corporate governance

JEL Classification: G30

Introduction

The present paper covers aspects related to the current situation of the European Union and the causes of the economic crisis that affected the member states. The authors analyzed not only the effects, but also the chain of events that lead to the current crisis. The break-out of the world economic crisis, initially started with a financial crisis, caused by unprecedented increases in credits that were stimulated by a long period of moderate financial and economic conditions. As a consequence, this crisis is opening the road to changes affecting European companies, stakeholders and the relationships between them, as well as to changes at the level of the whole society. What are these changes and what possible directions of actions should be adopted are the main questions this paper tries to answer. As a result of their analysis, the authors emphasize the role and importance of communication in times of financial crisis, as main survival factor and even exit from the crisis.

1. Current Economic Situation of the European Union and Causes of the Financial Crisis

The fifth anniversary of the largest recent enlargement of the European Union is marked by financial difficulties faced by the member states. Risk adversity, reduced liquidity, price volatility, uncertainty regarding the future of financial institutions, doubts related to the quality of the structured credit products and uncertainty about the macroeconomic prospective now characterize the EU economic environment.

The current turmoil was preceded by a period of benign financial and economic conditions, with low real interest rates and no liquidity problems. The consequence was an exceptional growth of credit, since investors and intermediaries were willing to take on higher risks. In conjunction with this, a sophisticated and apparently stable system was established, which consisted in originating extremely complex financial instruments that allowed banks to offload risks (especially in the

United States of America). These financial instruments were then distributed and bought – mostly in Europe, without paying proper attention to the underlying assets and the real economic fundament of these instruments¹²¹⁹. This excessive distribution of credit, the use of complex financial instruments, the underestimation of risks and even the lack of economic cooperation between major countries within the European Union and globally have led to the current financial crisis.

However, the report of the Economic and Financial Affairs Council (ECOFIN) called “Five years of an enlarged EU: Economic achievements and challenges” states in an optimistic tone that “the recent EU enlargement was not only a historic step in unifying a long-divided Europe but also a success from an economic point of view resulting in a win-win situation for the whole EU”¹²²⁰. The objective of the European Union structures currently refers to using the created synergies in order to diminish the negative effects of the financial crisis in the member states. The European Council in 2008 agreed on a European Economic Recovery Plan, based on a proposal of the Commission. Moreover, the Council of the European Union has recently drafted country-specific recommendations that have in view the particular economic situation in each member state¹²²¹.

2. Corporate Governance. The Impact of the Current Financial Crisis on the Main Stakeholders and Accounting Professionals

In theory it is considered that the concept of enterprise refers to a single entity which operates harmoniously and whose main goal is to maximize value and shareholder wealth. Due to the appearance of new elements and complex needs, other views on the enterprise have been developed. Thus, the definition of the enterprise could be based on the concept of social interest, with the purpose of generating wealth as a result of the participant’s collaboration in the company’s life (shareholders, managers, creditors, employees, customers, suppliers, public power). Thus, the objectives of a company are of social nature, but also relate to maximizing profits¹²²². The definition developed under the first theory leads to financial information directed towards investors, while the second definition is oriented to satisfy the financial needs of all users¹²²³.

One of the key factors that influence the efficient use of resources, the increase of the confidence shareholders have in the enterprise managers, the success in achieving the company’s objectives and the economic efficiency is the corporate governance system by which a company is controlled. This system promotes fairness and transparency at company level, and consists in a set of rules of conduct that aims the welfare of the society as a whole, but mostly the welfare of the shareholders and other stakeholders: managers, creditors, employees, customers, suppliers, public power, etc.¹²²⁴

Across the European Union, there are several corporate governance models which have distinct characteristics: the Anglo-Saxon corporate governance system (specific for Great Britain) and the German system (specific for Germany and for Continental Europe countries). The Anglo-Saxon model has a “shareholder orientation, with the expectation that other stakeholders will indirectly benefit from the active pursuit of shareholder interests”. The German system “is more orientated

towards a stakeholder approach, in the sense that employees are also included in the internal governance process”¹²²⁵. Although, the corporate governance systems may differ, the managers, investors and other stakeholders have different behaviors in relation to changes of the economic environment that recently stroked over Europe.

2.1. Managers, Investors and Auditors

There are several challenges that European managers, investors and auditors face under the current financial crisis, which highlighted certain weaknesses in the related management, investment and auditing processes. It is a known fact that managers and investors have contrasting interests and different views on the success of a company. Whereas for investors, who took financial risks, success means, in most of the cases, financial performance, namely profit, managers are often tempted to follow their own interest, at the expense of the investors. However, under the current economic situation, it may happen that the objectives of the managers and those of the investors are the same, since both are interested in survival and exit from the crisis. Therefore, a challenge for investors and managers would be to cooperate better towards improving their risk management systems and bringing their company financial success.

Since investors do not always have the benefit of direct contact to the responsible managers, the ones that act instead of them and protect their interests are the financial auditors. Their interest is to obtain a reasonable insurance that the financial statements provide a true and fair view. Under financial crisis, the role of the external auditors has an increased importance, and banks and supervisors rely more and more on the expertise and judgment of external auditors as independent and upright experts¹²²⁶. Auditors in the European Union also face new challenges, since political, social and economic pressures on them are now higher than ever. Currently, two widely used sets of auditing standards exist side by side, i.e. International Standards on Auditing (ISAs) and the US standards adopted by the Public Company Accounting Oversight Board (PCAOB). Europe should adopt ISA’s as soon as possible to reduce uncertainty and promote convergence, and should call for convergence between ISA’s and PCAOB standards¹²²⁷. Moreover, the quality of the audit work is more and more important, and independence rules are essential in this matter. However, countries currently apply different independence rules, particularly those on scope of services restrictions. Europe should seek to adopt or converge to the independence standards of the International Federation of Accountants (IFAC) as soon as possible¹²²⁸.

2.2. Creditors

The current financial crisis has underlined some major weakness of European and international financial institutions. In fact, the now intensively publicized world’s economic crisis started with a boom on the market of credits and financial instruments. The long period of moderate economic conditions in the European member states and the positive evolution of new member states stimulated this credit expansion and the failure in correctly assessing investment risks. Other factors for the credit boom at international level and for lowering the underwriting standards were: increased competitiveness among financial institutions, low interest rates, rising house prices, and weak government oversight.

¹²²⁸ *Report on the Financial Crisis 2008*, drafted by René Ricol, p.58.

As a natural reaction, in times of financial crisis, the attention of bank creditors grows significantly. While in normal conditions, prudence should be a fundamental principle, during financial crisis, lenders focus on excessive prudence, on business continuity of companies, on their ability to maintain profits, on the degree of liquidity, but also on the human factor, especially on managers, on their behavior, the measures taken to survive, and also to exit the crisis. The refusal of bank creditors to fund a company can lead to a liquidity crisis. The permanent communication between creditors and managers, the fair description of the company's situation, the flexibility, the transparency and the fairness are key factors for establishing a viable relationship between creditors and companies. In crisis conditions, survival is the main objective of the companies and funds are primary. However, if loans are not efficiently used, it can lead to bankruptcy.

2.3. Other stakeholders – employees, customers, suppliers

2.3.1. Employees

Survival remains the biggest challenge in times of financial crisis. However, survival is understood in different ways by the managers and the employees of a company. If managers believe that survival means reducing the number of staff, for sure, the employees will think exactly the opposite, because the disposal would affect their welfare, as the unemployment period may be longer than normal. On the other hand, accepting a number of employees too large in comparison with the necessities of survival or continuation of activity can lead to inefficiency and even bankruptcy. In crisis conditions, the employees are interested not to lose their job, and to maintain the same financial and other benefits. Therefore, the permanent communication with their managers, the active participation in the business of the company, or on the contrary, the more or less violent confrontations between managers and employees are some of the possible effects related to the reaction of employees during these difficult conditions.

2.3.2. Customers and suppliers

Trading partners demonstrate more prudence when there are going concern issues. Customers are mainly interested in the company's going concern assumption, but they also have in mind the possibility of negotiating prices easier. On the other hand, the suppliers are interested and analyze more strictly the profitability of the companies and their ability to pay the financial liabilities. However, the monitoring of debits and deadlines is the main objective of suppliers in times of financial crisis. The improvement of the relationships between the trading partners and the companies can be achieved through communication and informational transparency. The financial crisis leads to significant changes in the behavior of stakeholders. The reactions differ depending on the role of the participants in the company's life. To avoid bankruptcy and conflicts of interest, managers should adopt a flexible attitude, adapt to the demands of the stakeholders involved and not at last, insure permanent communication between company and interested parties.

3. Importance of communication under economic crisis

Most economic crisis lead to rumors, to distorted perceptions regarding the economic environment, to stress, to lack of control, to panic, to disorientation, to uncertainty, to lack of security and even to major lack of balance in the whole society. The first affected by the above mentioned facts are companies, their owners and managers, but also other stakeholders and parties directly involved in the life of a company. They may have reactions such as denial, avoidance of responsibility, disclaimer of culpability, justification. Finally, the reactions are transformed into positive ones: acceptance, remediation, corrective actions, optimism and confidence. One of the factors that make the transition from a negative attitude on the crisis to a survival-oriented behavior, if not to optimism, is the communication between the company and stakeholders and between the company and the economic environment as a whole.

Individuals react differently to a given situation. Their personality, temperament, and the environment in which they have developed and worked, the psychological, social, economic, political factors and the factors of other nature have led to different, complex, sometimes opposed reactions. Social context involves individual's interaction, which can be achieved mainly through communication. The role of communication is important because it can lead to sustainable and productive relationships between individuals or to the opposite reactions of rejection, conflict, and indifference. Human relationships influence the creation, the existence and the development of the enterprises, and of the economic environment. Companies cannot exist without individuals, whereas a powerful connection is created: individuals depend on the existence and the proper functioning of companies, while companies cannot exist in the absence of individuals.

In times of financial crisis, communication takes magnitude, since individuals need accurate information on the facts (in order to eliminate rumors and distorted perceptions of the economic environment). On the other hand, using communication and tools offered by psychology, individuals can recover their balance (by eliminating stress, lack of control, panic and disorientation). Last but not least, the uncertainty, and the lack of security and balance can be controlled and removed only when panic and disorientation in the society are reduced. Thus, individuals can make correct and rational decisions related to the crisis situation, can identify the causes, clear them off and restore the social and economic balance.

Conclusions

The current economic conditions in the European Union launch new challenges for companies and their stakeholders. The uncertainty, the increasing number of cases of bankruptcy, the risk adversity of investors, the reduced liquidity, the stricter credit conditions, the price volatility are some aspects that require changes that may be catalyzed through communication, as an essential instrument of survival and exit from the crisis. The responsibility of managers will be to develop survival strategies and powerful instruments of risk management, whereas investors will be more prudent and conservative. Creditors will tighten their underwriting procedures and auditors will face stricter internal controls in order to avoid audit failures. Confronted with the threat of losing their jobs, employees will become directly interested in the success or failure of the company where they work. In our opinion, the main catalyst of all these changes will be communication.

The new configuration of the international economic relations which are in a general globalization process determined by the international capital circulation requires the compatibility and comparison of the information provided by the financial statements. The investors and the entrepreneurs wish to understand and to be able to compare the entities' financial situation and performances, no matter the juridical and accounting system which are subdued to by their localization. The differences between the important variety of the accounting systems were identified long time ago and since then there have been efforts made in order to conceive a economic financial reporting structure, accessible to the entire accounting world. Therefore, there is the need of normalization, harmonization, and convergence in accounting. Our intention in the current paper is to bring again into discussion the problem of accounting harmonization, emphasizing a few aspects which in the Romanian context we consider to be controversial and which require some clarifications. This paper represents a brief review of the evolution of the accounting harmonization in Romania, analyzing the difficult moments and mainly it is focused on the conceptual understanding of the concepts of harmonization, convergence, and conformity in the Romanian accounting. Our approach is not an exhaustive one, but it has as objective to reflect on the importance of the stages of accounting modernization in Romania. In the last part of this paper, the conclusions that we reached after study, are presented synthetically, as well as the continuation of the approach initiated in other papers. Keywords: accounting harmonization, normalization and standardization, convergence JEL Classification M41

Conceptual approaches of the accounting normalization, harmonization, and convergence processes

The first preoccupations regarding the accounting normalization and standardization process were in Great Britain (the beginning of the 19th century) and the United States of America (after the 1929-1933 crisis), but in Germany in 1919 Professor E.Schmalenbach designed the first unitary chart of accounts starting from the Dewey decimal system. Yet the process of normalization is accelerated after the Second World War due to the state's need to get homogeneous and unitary financial accounting information which should allow it to exercise the economic and fiscal control. A second objective of the normalization indicated by Bernard Colasse¹²²⁹ is the need to use accounting information by the external users from time and space comparisons among enterprises. Romanian authors Niculae Feleagă and Ion Ionașcu¹²³⁰ added to

¹²²⁹ Colasse B, Contabilitate generală, Editura Moldova, 1995, apg 38-39;

¹²³⁰ Feleagă N, Ionascu I, Tratat de contabilitate financiară vol I, Editura Economica, București 1998, pag 263-364;

these objectives also the contribution of this process to a better re-allocation of financial resources at the country level. The highest part of those interested in defining the process of normalization has convened on the same type of this process approaches:

- A regulated approach which is actually one of political type within which there the state intervention. This can be considered as a forced normalization, but its absence could lead to the appearance of the market cartels and monopolies;
- The pragmatic professional approach within which the central part is played by the accounting profession. In this case, the normalization is voluntary;
- And another of a mix type which is actually a combination of the two mentioned above, for the accounting norms worded out by professional bodies are validated by public institutions or they require an active participation of the accounting profession, of the trades and employer associations when design accounting norms¹²³¹.

Regarding the object of accounting normalization, it has been agreed that in accordance with the public or private nature of the normalization, it refers to the determination of a unitary terminology and some generally accepted accounting principles, to the design of unitary financial statements in what their format is concerned, the structure, definition, familiarity and evaluation of the financial statements items and the design of the general account charts.

The need for accounting normalization is required by the differences between the accounting solutions adopted, a phenomenon generating a series of problems. The most frequent problems mentioned are:

- *problems for which the companies having to draw up the financial reports* according to different national norms or standards, a fact generating more work and sometimes difficulties in choosing the rules when it is not clear which set of norms is the most suitable;
- *problems for the users*, those who have to read and interpret the financial statements and who scarce or very vague accounting knowledge, and not to mention international accounting knowledge;
- *a general problem referring to the "unfair conditions"*, for accounting has economic consequences not only indirectly, through investment decisions, but also directly because accounting is the basis for making decision regarding the negotiation of wages, prices, setting up the dividends and in some countries it is the basis for the decisions made by taxation, and by the state in its efforts to redirect and stimulate the businesses.¹²³²

Normalization as a process drawing up rules, norms to present the synthesis documents and defining the methods and the accounting terminology, totally or partially applicable to a group of countries or enterprises, has as objectives¹²³³:

- to ensure the regulation of the accounting practices and therefore to determine the bettering of the accounting;
- to allow the accounting information users to make rational decisions, based on the accounting information;
- to create a trustful environment between the capital holders and the business managers;

¹²³¹ Cristea Șt. M. Armonizare contabilă internațională și practicile contabile naționale. Studiu de caz pentru România și Italia, Editura Accent, Cluj Napoca, 2007, p.45;

¹²³³ Feleagă N., Îmblânzirea junglei contabilității, Editura Economică, București, 1996

- to act as a referee between different parties participating to the economic life, and especially, between the accounting information producers and the accounting auditors certifying the quality of the information, thus ensuring the social credibility of the accounting information;
- to give a certain protection to the accounting auditor by confining his responsibilities;
- to allow the consolidation of the accounting information at the groups of firms level;
- to allow the drawing up of national statistics.

The normalization effort is capitalised in the enunciation and definition of accounting postulates, principles and standards (norms). If the accounting postulates and principles refer to very general elements, produced by the normalization act for a long period of time, the accounting norms can be applied to particular cases.

A postulate represents a sentence whose acceptance is required in order to make a demonstration. The accounting postulates are based on the observations made on: the economic environment by identifying the users of the financial information and the objectives of the financial information process. The observations considered useful to a formulation of accounting principles and norms are catalogued as accounting postulates.

The accounting principles are conceptual elements guiding the normalization makers in drawing up accounting norms, starting from the accounting postulates. Also, they are support elements for the financial information producers in order to correctly acknowledge in the financial statements the transactions and other events, as well as to faithfully represent the financial position, the performances and the evolution of the financial position through these synthesis documents. Finally, the accounting principles are guides for the auditors in their activity to certify the accounts. They have a lesser degree of generality than the postulates, but a higher degree than the accounting norms.

No matter they are called accounting postulates or accounting principles, they can be defined as accounting statements based on the direct acknowledgment and which are considered true, without necessarily being obvious.¹²³⁴

The accounting standards (norms) are precise rules to acknowledge, evaluate, classify, and present the accounting information. It results that, often, the accounting normalization consists in defining the norms and then in applying them.¹²³⁵

The normalization efforts made in the attempt to reduce the number of accounting alternatives, treatments internationally, was not on the profession's agenda until 1973, the year when by creating IASB the efforts made for the accounting harmonization were intensified. The pressure for the accounting harmonization to become the means to do the comparability is increasing.

The international normalization is meant to facilitate to a considerable extent the international economic and industrial exchanges. The international harmonization is more and more gaining ground and lately we have felt a progressive evolution of passing from the European harmonization to the international harmonization.

The normalization and the harmonization are two indispensable processes and sometimes complementary. The former has in view the setting up of norms and the latter the comparability between different norms.

To harmonize means to put in a perfect agreement the elements of a whole¹²³⁶, which sometimes means to prescribe changes, changes from which some win and some lose.

¹²³⁴ Todea N. Teorie contabilă și raportare financiară, Editura Aeternitas, Alba Iulia 2009, p. 32

¹²³⁵ Feleagă L. Feleagă N. Convergențe contabile internaționale prin prisma aderării la Uniunea Europeană, Revista Economie teoretică și aplicată, pp. 37-44

¹²³⁶ DEX

The international accounting harmonization is the process through which the national rules or norms, different from one country to another, are improved in order to become comparable and to give the same interpretations to transactions and events.

Taking place internationally as a result of more and more pronounced globalization and financialization and deriving from the accounting normalization which has as objectives: the determination of an accounting terminology and principles generally accepted, the acknowledgment and evaluation of the items making the financial statements, the manner to present the financial statements and the adoption of the most suitable accounting norm instrument, **the accounting harmonization means “the complete match of the elements of a whole”, but in the context of a “good understanding between groups of people”¹²³⁷ in order to satisfy the requirements of the financial and accounting information users.** In this view, the elements of the whole are considered to be represented by the national accounting rules and practices, different from one country to another, sometimes divergent, which in order to be “*completely matched*” are improved to be made comparable.

The harmonization process is trying a way to conciliate the different points of view, the homogeneous presentation of information not being necessary anymore, but the assurance of a unitary meaning even for those who use different standards. If the normalization means total homogeneity, the harmonization means flexibility in total diversity, that is the harmonization establishes the limits’ within which the accounting practices can vary, taking into account, to a higher extent, the national differences.

Mainly supported by the international accounting community, *the accounting harmonization movement*, globally, whose essence leads, on long term, to a certain homogeneity of the national norms and practices, deals with a variety of the objectives attributed to the financial statements, but especially, with the economic, social and cultural environment of different accounting systems, culminating with manifestations to state the national sovereignty and identity.

The Commission for Stock Exchange Operations emphasises **the necessity to assure the international harmonization** in the following terms: “The increasing internationalization of the financial markets means that a better compatibility should be more and more ensured of the firms’ accounts in different countries. Actually, the divergences between the financial statements set up according to the international norms by each country, the lacunas revealed in the accounting information put forth by some of them and, sometimes, the variations of a national norm from one year to another, make the comparisons impossible: for example, the comparison of the average productivity of the personnel between the groups of a country and the ones from another country when actually the firms in these countries are not even constrained to indicate in their annual reports the number of employees or the costs involved by them?”¹²³⁸

The international accounting harmonization is required also by the *privatization tendency* of some enterprises. The transfer of some more and more firms from the state property to the private sector is requests new needs in terms of private capitals, which, usually, are too big in order to be fulfilled by the capital markets of a single country. In these conditions, the wish of such enterprises to create and apply some homogeneous accounting norms is justified.

Regarding the harmonization process, it is subject to a staging process, therefore we can speak about different degrees of achievement of the international accounting harmonization. Thus, if the normalization has allowed the unitary drawing up of the financial accounting information in order to rigorously capitalize the decisions by the users, the harmonization should determine similar decisions of the users in similar conditions, no matter the geographical positioning of the entity.

¹²³⁷ Dictionarul explicativ al limbii române, 1975, p. 52

¹²³⁸ Farcane N., Cotleț D., Reforma în sistemul contabil românesc, Editura Orizonturi Universitare, Timișoara, 1999, p. 117

In this point the concept of convergence appears on the international accounting “stage”. The accounting convergence has in view the identification of some objectives that the enterprises and the accounting professionals all over the world follow as a final aim in the presentation of the annual financial statements, without imposing the application treatments, rules and procedures and being useful to the users.

No matter that we talk about normalization, harmonization, or convergence, the essence of these processes is information. The problem of information is vital for the organization, for a system, for a process. Information represents knowledge intelligibly presented to a person. The information is that entity totally or partially removing the state of non-determination called entropy, based on a message addressed to a receiver. To be useful, the information must have some fundamental characteristics: to be consistent, relevant, exact, desirable, accessible, complete, and concise.¹²³⁹

The triggering of the convergence process took place in October 2002 when the Financial Accounting Standard Board and the International Accounting Standard Board announced the signing of an agreement memorandum which was updated on 27th February 2006 with perspective until 2008.

The convergence process takes place on three levels:

- on the first level, there is the convergence between the IASB and FASB norms;
- on the second level, there is the convergence between the regional norms and IAS (the EU case);
- on the third level, there is the convergence between the national and regional standards, as in the case of the accounting systems of the EU member states.

The situation in evolution of the normalization, harmonization, convergence, and standardization process in Romania. whether Romania?

For the beginning, it is fair to mention that we cannot talk about a purely Romanian accounting system for almost always the accounting system practised in our country, no matter it was the result of a historical fracture or not, was and still is an imported product. As the indefatigable researcher of the accounting meanings, N. Feleagă, stated, the Romanian accounting system is of French inspiration, *“aligned to the requirements of the European and international norms, in which the Romanian norm makers hallmarked some Romanian characteristics, partially acceptable, partially arguable.”*¹²⁴⁰

The national accounting normalization is characterised by three specific aspects:

- it is of public authority for the accounting norms are issued by the state institutions, in compliance with the accounting policies of the Ministry of Public Finances and is based on laws and other normative acts consecrated to accounting and which are compulsorily to be complied with by all the enterprises;
- the main piece of normalization in Romania is represented by the general account chart, still in force, structured according to the French model, into patrimonial accounts, balance sheet accounts (classes 1-5), economic processes accounts (classes 6-7), off-balance sheet accounts (class 8) and accounts for the management accounting (class 9);
- it is based on a theoretical frame of accounting with both continental and Anglo-Saxon influences.

The Romanian theoretical frame contains regulations and norms issued by the institutions authorised and it is characterised by the fact that the current system of Romanian accounting norms is comparable with the accounting law of the European Union by integrating in the

¹²³⁹ Briciu S. et al, Managementul prin costuri, Editura Risoprint, Cluj Napoca, 2003, pp.27-31

¹²⁴⁰ Bogdan V. Armonizare contabila internațională, Editura Economică, Bucuresti 2004, p. 337

Romanian accounting law of the provisions of the 4th European Directive (1978) on the annual accounts of companies, of the provisions of the 7th Directive (1983) on the consolidated accounts and of the 8th Directive on the auditing norms of financial statements.

The process of Europeanization and internationalization of the Romanian accounting system is passing also through the process of assimilating the results of the convergence between the two global accounting referential promoted by IASB and FASB. More than 1,000 Romanian enterprises started once with the issuing of the Order no 94 of Ministry of Public Finances of February 2001, the adventure of knowing and implementing the international accounting standards (IAS).

The start of the international accounting harmonization and convergence has determined the Romanian law maker to review the strategy of action within the Romanian accounting reform by reconsidering the adaptability of IAS/IFRS to the Romanian business environment. In the same time, the adoption of Directive 51/2003 by the European Commission in order to modernize the 4th and 7th Directives has determined the Ministry of Finances to change the legislative frame which stipulated a partial harmonization both with IAS and with the modernized European standards. At the present, Romania has chosen to eliminate the concept of harmonized regulations, preferring the term of corresponding accounting.

The regulations of a new order (no. 1752), applicable in Romania starting with 1 January 2006 require being in accordance with the European Directives on accounting. When Order 1752/2005 came into force, both Order 94/2001 on the sanctioning of the Accounting Regulations harmonized with the 4th Directive of the European Economic Community and with the International Accounting Standards and Order 306/2002 on the sanctioning of simplified Accounting Regulations harmonized with the European Directives are abrogated. As it results from the title of these Regulations, they want to be not only *harmonized* with the European Directives but also *in accordance with* them, meaning similar with them. This change has led to the split of opinion among professionals: some consider this moment as being a step back, a waste of the efforts made by the companies to adopt and use the standards, and others say that this moment has been the natural consequence of the evolution of the international accounting. Certainly, when the decision was made, there was the problem of the cost-efficiency-benefit ratio afferent to the further application of the IFRS stipulations. Maybe this question was the result of an empirical study presented at the Accounting Association European Congress in 2006 by Ion Ionascu, a study which discloses the fact that at the level of the companies quoted on the Bucharest Stock Exchange, the cost of IAS/IFRS implementation was approximately 30,000 Euro per entity, an amount which represented for the authors only 0.035% costs average of these particular companies in 2004.

Conclusions

In conclusion, we can emphasise that in what the segment of small and middle sized enterprises and of the other entities which do not frame within the category of enterprises applying the IAS/IFRS norms is concerned, the accounting harmonization is being translated in the conformity with the provisions of the 4th and 7th European Accounting Directive, this thing being done through the accounting regulations sanctioned by the Ministry of Public Finances.

Regarding the segment of public interest entities, under the incidence of the IAS/IFRS provisions, the harmonization can be understood as the convergence existing between the OMFP 1126/2006 provisions and the requirements of the international referential.

The novelties in the field of accounting regulation are brought by OMFP 3055/2009 applicable from 01.01.2010, according to which the corporate bodies which at the date of the balance sheet exceed the limits of two of the following 3 criteria, further called size criteria:

- total assets: 3,650,000 euro;
- net turnover: 7,300,000 euro;

-average number of employees during the financial year: 50 draw up financial statements in compliance with the provisions of the 4th and 7th Directives of the European Economic Community.

A new challenge for the Romanian entities is represented by the design and development of own accounting policies. They contain the accounting treatments established based on Order 3055/2009 for each of the operations performed and must be approved by the managers.

In the process of accounting reform in Romania, a supplementary effort is necessary for the accounting professional to impose himself in the relation with other decision makers, this imposition being possible by instituting the public private partnership in the field of accounting, which would have as result the appearance of a robust and modern accounting system.

PREVENTION AND DETECTION OF FRAUDULENT FINANCIAL REPORTING IN THE CONTEXT OF THE FINANCIAL CRISIS

Prevention and earlier detection of fraudulent financial reporting must start with the entity that prepares financial reports. Thus the first focus of the Sarbanes-Oxley Act's recommendations is the public company. These recommendations, taken together, will improve a company's overall financial reporting process and increase the likelihood of preventing fraudulent financial reporting and detecting it earlier when it occurs. For some companies, implementing these recommendations will require little or even no change from current practices; for other companies, it will mean adding or improving a recommended practice. Whether it means adding or improving a practice, the benefits justify the costs. The Sarbanes-Oxley Act is a direct response to the recent scandals in the US corporate world. Governance, compliance, risks and internal controls are mounting concerns for almost all organizations. As the numbers of rules, regulations and contractual obligations steadily rise, management is growing more and more concerned about their exposure on day-to-day operational decisions!

Key words: fraud, internal control, COSO, risks

Cod jel : M11, M41

Haw can defined the internal control?

The Committee of Sponsoring Organizations of the Treadway Commission (COSO), is a [U.S.](#) private-sector initiative, formed in [1985](#). Its major objective is to identify the factors that cause fraudulent financial reporting and to make recommendations to reduce its incidence. COSO has established a common definition of internal controls, standards, and criteria against which companies and organizations can assess their control systems. COSO is sponsored and funded by 5 main professional accounting associations and institutes; [American Institute of Certified Public Accountants](#) (AICPA), [American Accounting Association](#) (AAA), [Financial Executives Institute](#) (FEI), [The Institute of Internal Auditors](#) (IIA) and [The Institute of Management Accountants](#) (IMA).

Internal controls are put in place to keep the company on course toward profitability goals and achievement of its mission, and to minimize surprises along the way. They enable management to deal with rapidly changing economic and competitive environments, shifting customer demands and priorities, and restructuring for future growth. Internal controls promote efficiency, reduce risk of asset loss, and help ensure the reliability of financial statements and compliance with laws and regulations.

Internal control means different things to different people. This causes confusion among businesspeople, legislators, regulators and others. Resulting miscommunication and different expectations cause problems within an enterprise. Problems are compounded when the term, if not clearly defined, is written into law, regulation or rule. This report deals with the needs and expectations of management and others. It defines and describes internal control to:

The COSO framework involves several key concepts. [Internal control](#) is a *process*. It is a means to an end, not an end in itself. Internal control is affected by *people*. It's not merely policy manuals and forms, but people at every level of an organization. Internal control can be expected to provide only *reasonable assurance*, not absolute assurance, to an entity's management and board. Internal control is geared to the achievement of *objectives* in one or more separate but overlapping categories.

Establish a common definition serving the needs of different parties. Provide a standard against which business and other entities large or small, in the public or private sector, for profit or not can assess their control systems and determine how to improve them. *Internal control is broadly defined as a process, effected by an entity's board of directors, management and other personnel, designed to provide reasonable assurance regarding the achievement of objectives in the following categories: effectiveness and efficiency of operations, reliability of financial reporting, compliance with applicable laws and regulations.*

The first category addresses an entity's basic business objectives, including performance and profitability goals and safeguarding of resources. The second relates to the preparation of reliable published financial statements, including interim and condensed financial statements and selected financial data derived from such statements, such as earnings releases, reported publicly. The third deals with complying with those laws and regulations to which the entity is subject. These distinct but overlapping categories address different needs and allow a directed focus to meet the separate needs.

Internal control systems operate at different levels of effectiveness. Internal control can be judged effective in each of the three categories, respectively, if the board of directors and management have reasonable assurance that they understand the extent to which the entity's operations objectives are being achieved, published financial statements are being prepared reliably, applicable laws and regulations are being complied with.

While internal control is a process, its effectiveness is a state or condition of the process at one or more points in time. Internal control consists of five interrelated components. These are derived from the way management runs a business, and are integrated with the management process. Although the components apply to all entities, small and mid-size companies may implement them differently than large ones. Its controls may be less formal and less structured, yet a small company can still have effective internal control.

The components of the internal control

The components are: *Control Environment, Risk Assessment, Control Activities, Information and Communication and Monitoring.*

The control environment sets the tone of an organization, influencing the control consciousness of its people. It is the foundation for all other components of internal control, providing discipline and structure. Control environment factors include the integrity, ethical values and competence of the entity's people; management's philosophy and operating style; the way management assigns authority and responsibility, and organizes and develops its people; and the attention and direction provided by the board of directors.

Every entity faces a variety of risks from external and internal sources that must be assessed. A precondition to *risk assessment* is establishment of objectives, linked at different levels and internally consistent. Risk assessment is the identification and analysis of relevant risks to achievement of the objectives, forming a basis for determining how the risks should be managed. Because economic, industry, regulatory and operating conditions will continue to change, mechanisms are needed to identify and deal with the special risks associated with change.

Control activities are the policies and procedures that help ensure management directives are carried out. They help ensure that necessary actions are taken to address risks to achievement of the entity's objectives. Control activities occur throughout the organization, at all levels and in all

functions. They include a range of activities as diverse as approvals, authorizations, verifications, reconciliations, reviews of operating performance, security of assets and segregation of duties.

Pertinent information must be identified, captured *and communicated* in a form and timeframe that enable people to carry out their responsibilities. Information systems produce reports, containing operational, financial and compliance-related information, that make it possible to run and control the business. They deal not only with internally generated data, but also information about external events, activities and conditions necessary to informed business decision-making and external reporting. Effective communication also must occur in a broader sense, flowing down, across and up the organization. All personnel must receive a clear message from top management that control responsibilities must be taken seriously. They must understand their own role in the internal control system, as well as how individual activities relate to the work of others. They must have a means of communicating significant information upstream. There also needs to be effective communication with external parties, such as customers, suppliers, regulators and shareholders.

Internal control systems need *to be monitored* a process that assesses the quality of the system's performance over time. This is accomplished through ongoing monitoring activities, separate evaluations or a combination of the two. Ongoing monitoring occurs in the course of operations. It includes regular management and supervisory activities, and other actions personnel take in performing their duties. The scope and frequency of separate evaluations will depend primarily on an assessment of risks and the effectiveness of ongoing monitoring procedures. Internal control deficiencies should be reported upstream, with serious matters reported to top management and the board.

The internal control system is intertwined with the entity's operating activities and exists for fundamental business reasons. Internal control is most effective when controls are built into the entity's infrastructure and are a part of the essence of the enterprise. "Built in" controls support quality and empowerment initiatives, avoid unnecessary costs and enable quick response to changing conditions.

There is a direct relationship between the three categories of objectives, which are what an entity strives to achieve, and components, which represent what is needed to achieve the objectives. All components are relevant to each objectives category. When looking at any one category the effectiveness and efficiency of operations, for instance all five components must be present and functioning effectively to conclude that internal control over operations is effective.

Internal control can help an entity achieve its performance and profitability targets, and prevent loss of resources. It can help ensure reliable financial reporting. And it can help ensure that the enterprise complies with laws and regulations, avoiding damage to its reputation and other consequences. In sum, it can help an entity get to where it wants to go, and avoid pitfalls and surprises along the way.

An internal control system, no matter how well conceived and operated, can provide only reasonable not absolute assurance to management and the board regarding achievement of an entity's objectives. The likelihood of achievement is affected by limitations inherent in all internal control systems. These include the realities that judgments in decision-making can be faulty, and that breakdowns can occur because of simple error or mistake. Additionally, controls can be circumvented by the collusion of two or more people, and management has the ability to override the system. Another limiting factor is that the design of an internal control system must reflect the fact that there are resource constraints, and the benefits of controls must be considered relative to their costs.

Who has responsibility for internal control ?

Everyone in an organization has responsibility for internal control. The chief executive officer is ultimately responsible and should assume "ownership" of the system. More than any other individual, the chief executive sets the "tone at the top" that affects integrity and ethics and other

factors of a positive control environment. In a large company, the chief executive fulfills this duty by providing leadership and direction to senior managers and reviewing the way they're controlling the business. Senior managers, in turn, assign responsibility for establishment of more specific internal control policies and procedures to personnel responsible for the unit's functions. In a smaller entity, the influence of the chief executive, often an owner-manager, is usually more direct. In any event, in a cascading responsibility, a manager is effectively a chief executive of his or her sphere of responsibility. Of particular significance are financial officers and their staffs, whose control activities cut across, as well as up and down, the operating and other units of an enterprise.

Management is accountable to the board of directors, which provides governance, guidance and oversight. Effective board members are objective, capable and inquisitive. They also have a knowledge of the entity's activities and environment, and commit the time necessary to fulfill their board responsibilities. Management may be in a position to override controls and ignore or stifle communications from subordinates, enabling a dishonest management which intentionally misrepresents results to cover its tracks. A strong, active board, particularly when coupled with effective upward communications channels and capable financial, legal and internal audit functions, is often best able to identify and correct such a problem.

Internal auditors play an important role in evaluating the effectiveness of control systems, and contribute to ongoing effectiveness. Because of organizational position and authority in an entity, an internal audit function often plays a significant monitoring role.

Internal control is, to some degree, the responsibility of everyone in an organization and therefore should be an explicit or implicit part of everyone's job description. Virtually all employees produce information used in the internal control system or take other actions needed to effect control. Also, all personnel should be responsible for communicating upward problems in operations, noncompliance with the code of conduct, or other policy violations or illegal actions.

A number of external parties often contribute to achievement of an entity's objectives. External auditors, bringing an independent and objective view, contribute directly through the financial statement audit and indirectly by providing information useful to management and the board in carrying out their responsibilities. Others providing information to the entity useful in effecting internal control are legislators and regulators, customers and others transacting business with the enterprise, financial analysts, bond raters and the news media. External parties, however, are not responsible for, nor are they a part of, the entity's internal control system.

Actions that might be taken as a result of this report depend on the position and role of the parties involved: Senior Management, Board Members, Other Personnel, Legislators and Regulators

Most senior executives who contributed to this study believe they are basically "in control" of their organizations. Many said, however, that there are areas of their company a division, a department or a control component that cuts across activities where controls are in early stages of development or otherwise need to be strengthened. They do not like surprises. This study suggests that the chief executive initiate a self-assessment of the control system. Using this framework, a CEO, together with key operating and financial executives, can focus attention where needed.

Under one approach, the chief executive could proceed by bringing together business unit heads and key functional staff to discuss an initial assessment of control. Directives would be provided for those individuals to discuss this report's concepts with their lead personnel, provide oversight of the initial assessment process in their areas of responsibility and report back findings. Another approach might involve an initial review of corporate and business unit policies and internal audit programs. Whatever its form, an initial self-assessment should determine whether there is a need for, and how to proceed with, a broader, more in-depth evaluation. It should also ensure that ongoing monitoring processes are in place. Time spent in evaluating internal control represents an investment, but one with a high return.

Members of the board of directors should discuss with senior management the state of the entity's internal control system and provide oversight as needed. They should seek input from the internal and external auditors.

Managers and other personnel should consider how their control responsibilities are being conducted in light of this framework, and discuss with more senior personnel ideas for strengthening control. Internal auditors should consider the breadth of their focus on the internal control system, and may wish to compare their evaluation materials to the evaluation tools.

Government officials who write or enforce laws recognize that there can be misconceptions and different expectations about virtually any issue. Expectations for internal control vary widely in two respects. First, they differ regarding what control systems can accomplish. As noted, some observers believe internal control systems will, or should, prevent economic loss, or at least prevent companies from going out of business. Second, even when there is agreement about what internal control systems can and can't do, and about the validity of the "reasonable assurance" concept, there can be disparate views of what that concept means and how it will be applied.

Corporate executives have expressed concern regarding how regulators might construe public reports asserting "reasonable assurance" in hindsight after an alleged control failure has occurred. Before legislation or regulation dealing with management reporting on internal control is acted upon, there should be agreement on a common internal control framework, including limitations of internal control. This framework should be helpful in reaching such agreement.

Rule-making and other professional organizations providing guidance on financial management, auditing and related topics should consider their standards and guidance in light of this framework. To the extent diversity in concept and terminology is eliminated, all parties will benefit.

Conclusions

This framework should be the subject of academic research and analysis, to see where future enhancements can be made. With the presumption that this report becomes accepted as a common ground for understanding, its concepts and terms should find their way into university curricula. We believe this report offers a number of benefits. With this foundation for mutual understanding, all parties will be able to speak a common language and communicate more effectively. Business executives will be positioned to assess control systems against a standard, and strengthen the systems and move their enterprises toward established goals. Future research can be leveraged off an established base. Legislators and regulators will be able to gain an increased understanding of internal control, its benefits and limitations.

Internal auditors play an important role in evaluating the effectiveness of control systems. As an independent function reporting to the top management, [internal audit](#) is able to assess the internal control systems implemented by the organization and contribute to ongoing effectiveness. As such internal audit often plays a significant *monitoring* role. In order to preserve its independence of judgment Internal Audit should not take any direct responsibility in designing, establishing, or maintaining the controls it is supposed to evaluate. It may only advise on potential improvement to be made COSO publications are available through the American Institute of Certified Public Accountants.

The assessment of a significant ascertainment made by the auditor is particularly sensitive which shapes the quality of a mission as a whole. Materiality plays a primary role in determining the relevance of information provided by the users of financial statements. This material highlights the role of qualitative factors in determining materiality, as far as many practitioners are accustomed to consider this item only in terms of quantitative factors. Although legislation does not set precise rules in determining materiality, the issue is necessary because decisions of the auditors and users of audited information hang on this item.

Keywords: materiality, qualitative factors, professional judgment, financial statements.

JEL: M42

Introduction

Materiality is used in the audit process in all the three phases of the mission, which gives it great importance. Materiality is used in the planning phase, in the deployment phase and in the review phase.

ISA (*International Standards of Audit*) 320 defines materiality as that size over which the economic decisions or judgment on the accounts are likely to be affected. Materiality depends on the size of the item or error, judged in particular circumstances of omissions or distortion. In other words, materiality provides rather a limit (quantitative data), than a qualitative attribute on which information should be based in order to be useful. In recent years, IFAC and other professional bodies have expressed a great concern about the misapplication of materiality in auditing, with serious consequences on the information provided to the users. Major financial scandals, at the end of the last decade and in recent years (Enron, Parmalat etc), has revealed weaknesses, including in the audit missions. Specifically, the nature or the extension of the audit procedures have been incorrectly determined or were wrongly assessed the effects of distortions. Both statements are consequences of the insufficient background of materiality.

Previous studies in the literature

As a starting point of our analysis, we have a number of previous researches, which occupies a fairly broad area of literature. Qualitative factors in determining materiality began to represent the subject of researches since the early '70s. We draw attention to the arguments made in 1998 by Arthur Levitt, SEC chairman, who made a speech called "The game of numbers". This speech had an impressive impact in the accounting profession worldwide. Levitt, points out in an abusive manner, that materiality is a tool that shapes the auditors „flexibility” in the financial reporting.

He argues against the use of materiality as a mean to hide or ignore „deliberate misstatements of performance”.

Another view is brought through the provisions of *SAB 99 (Staff Accounting Bulletin)* claiming that materiality can not be „reduced only to a numerical formula”. SAB has the merit of suggesting professionals to take into account the qualitative factors in determining materiality.

The determination of materiality-factors of influence

IFAC has long concerned about the approach of both types of criteria in determining materiality, both the quantitative and the qualitative factors.

a) Quantitative criteria refers to those elements that are easily quantified and expressed in value. The expression in currency is required in order to make comparisons with the amounts recorded in the financial statements. In practice, the calculus indicator for materiality can be represented by *total assets, equity or gross profit*. When choosing one of these indicators it must be considered the information needs of the users.

b) The qualitative criteria are related to the customer entity’s environment and are interpreted differently by the auditors and by the users of the information provided in the financial statements. Thus, omissions or errors of equal value may have different impact both on auditors and on the users of the financial information. Some of the most important qualitative factors that form the background of the auditor's judgment are:

- The size of the audited company;
- The sector of activity in which the audited company operates;
- The size of the audit company;
- The characteristics of the calculus indicator of materiality.

Next, we will make several arguments that support each of these factors:

1) The size of the firm. Depending on their attitude, there are three categories of auditors: permissive auditors, moderate auditors and severe auditors (*Montoya del Corte, Franciso Martinez, 2008*). Related to the size of the audited firm, auditors are more permissive with large sized entities, at least for the following reasons:

- *Increased quality of the internal control.* Big sized firms are considered to be mature enough, to have a significant market share and not to want it’s growth. Now, their goal is focused on maintaining the level of their business, so that they can manage the situation of the internal control in order to reach a quality as higher as possible. On the opposite side, the small and medium-sized firms, pursuing market expansion, tend to overlook the quality of their internal control. The auditor will determine materiality taking into consideration the quality of the provided information of the internal control.

- *The size of the auditors’ fees.* The big entities which have a wider activity need to be audited by applying multiple tests and procedures. That means that the audit team has to be bigger and has to work for a longer period of time, so that the audit mission becomes more expensive. The fear of losing the customer can determine auditors to be more liberal with the entity. Moreover, a large company is much more likely to receive an qualified opinion, because of a high risk of litigation and a higher exposure to regulatory controls by the authorities in the field.

2) The sector of the entity client. Qualitative factors that define this criteria are:

- *The economic situation.* The sector of activity of the customer entity can be expanding or declining. Expansion, as shown, can lead to the overlook of the internal control quality, which involves setting a lower materiality. The decline may cause the intention to embellish the financial statements (the financial position and performance).

- *The profile of the industry.* If the client entity belongs to the financial sector, the level of materiality will be lower, influenced by the high risk of their assets diversion. (*Iskandar and Iselin, 2000*).

- *The financing of the listed companies.* For these companies the auditors show an additional responsibility, because they consider that the investors give a greater importance to them. The major financial scandals of the last two decades, involving the large firms, determined the

auditors to pay more attention, in particular, when establishing materiality for the large entities whose potential problems might have an important social and economical impact.

3) *The size of the audit firm.* The studies conducted till now have examined the influence of certain characteristics of the audit firms in determining materiality. They show that the larger audit firms, especially multinationals (*Blokdiik et al, 2003*) determine a lower level of materiality, as may use more extensive and multiple procedure that provides a higher quality of the samples obtained.

4) *The characteristics of the calculus indicator of materiality.* The determination of materiality is achieved by comparing the effect of inaccuracy to the calculus indicator. But the calculus indicator is not always consistent. For example, the indicator Total assets will lead to an allocation of materiality and tolerable errors, for each group of assets, proportional with their share in total assets, but also by adjusting them with an adjustment coefficient (k). Professional judgment in determining this coefficient is influenced by many qualitative factors such as: differential liquidity of assets, the number of operations of the asset categories, the quality of the internal control.

Next, we would like to illustrate the determination of the materiality in the review phase, taking as an example a company that has registered the following indicators (*according to Minimum Auditing Norms*).

	Financial year 2008	Financial year 2009
Total assets	<u>19.501.977</u>	<u>25.810.074</u>
- 1%	195.020	258.101
- 2%	390.040	516.202
Turnover	<u>56.486.101</u>	<u>73.511.225</u>
- 0,5%	282.430,5	367.556
- 1,0%	564.861	735.112
Gross profit	<u>2.479.107</u>	<u>1.448.048</u>
- 5%	123.955	72.402
- 10%	247.910	144.805

Each element, in balance, can be determined as follows:

Elements in balance	Final balance 31.12.2009	Overall share %	Unadjusted tollerable errors	Adjustment coefficient k	Adjusted tollerable errors
1	2	3	4	5	6=4x5
<u>I. Noncurrent assets – total</u>	<u>10.941.494</u>	<u>42,4</u>	<u>218.870</u>	<u>0,66</u>	<u>144.454</u>
1 – Intangible asstes	363.055	1,40	7.227	0,66	4.767
2 – Tangible assets	10.398.020	40,28	207.926	0,66	137.231
3 – Financial assets	180.419	0,72	3.717	0,66	2.453
<u>II. Current assets-total</u>	<u>13.902.658</u>	<u>53,9</u>	<u>278.233</u>	<u>1,017</u>	<u>282.963</u>
2 – Receivables	3.349.476	13,0	67.106	1,017	68.247
3 – Short term investments	0	0	0	1,017	0
4 – Petty cash and bank accounts	-16.448.758	-66,9	-345.339	1,017	-351.210
III. Prepayments	<u>965.922</u>	3,7	19.009	1,00	19.009
TOTAL ASSETS (I+II+III)	<u>25.810.074</u>	<u>100</u>	<u>516.202</u>	<u>1,00</u>	<u>516.202</u>
IV. Debts – total	14.547.783	56,4	291.138	1,00	291.138
V. Accrued income	0	0	0	1,00	0
VI. Equity	11.262.290	43,6	225.064	1,00	225.064
TOTAL LIABILITIES		<u>100</u>	<u>516.202</u>	<u>1,00</u>	<u>516.202</u>

Considering the professional judgment of the auditor, the adjustment coefficients (k) were determined as follows:

- for noncurrent assets have been set lower adjustment coefficients (0,66), because these accounts can be fully audited with lower costs and in these accounts the auditors do not expect to discover significant misrepresentations;
- for current assets the coefficients are higher (1,017) because their volume changes faster, therefore, the samples taken in the survey will be larger. In this situation the costs of the audit mission will be higher, even in conditions of a high materiality level.
- for the other balance sheet items the size of materiality has not been adjusted.

Conclusions

This work represents a new perspective, which aims to highlight the need of achieving complementarity between quantitative factors and qualitative factors in determining materiality. We start from the quantitative limits, already a rule in practice, to increase the relevance of materiality by examining qualitative factors that define the client company and the professionals who conduct the audit mission.

Avoiding such issues as the environment in which the audited company operates and its characteristics, but also the position of the company involved in carrying out the audit may result in avoiding detection of distortions, which then may have repercussions on decisions taken by the users of the information provided through audited financial statements. Ensure a high relevance of the information provided through financial statements, accurate determination of the performance and financial position of companies audited are necessary conditions that can be satisfied only by using a materiality threshold as relevant as possible. This can be done successfully by determining this element both in the light of quantitative factors and the qualitative ones. The increase of the audit quality and the whole economic process of information among users can be achieved by applying a combination of qualitative factors with quantitative factors in determining materiality.

To strengthen this hypothesis, we propose for the next materials, using some empirical studies, to demonstrate how to determine the adjustment coefficient of the tolerable errors in the balance, in particular assets. The notion of professional judgment is pretty much discussed by practitioners auditors, so we believe that an econometric model could resolve the differences encountered in practice in the determination of materiality.

Mureșan Mariana

Babeș-Bolyai University, Faculty of Economics and Business Administration

Cristina Boța-Avram

Babeș-Bolyai University, Faculty of Economics and Business Administration

Starting from the stipulations of the two well-known internal control system models – COSO and CoCo - the purpose of this paper is to focus on the Romanian framework for credit institutions – trying to identify on which international model) is our national one most appropriate to. The research methodology is based on an empirical analysis between Romanian regulation and the models already mentioned. To reach to a conclusion we tried to identify several key issues closely related to information and communication, and to determine the degree of similarities and dissimilarities between the three selected frameworks, by using statistical indicators. The paper has some limitations, too, because it only approaches formal harmonization. So, those issues analyzed through the regulations’ perspectives need to be closely quantified in matters of their actual implementation, which offer us outlooks of future research.

Keywords: Monitoring, COSO model, CoCo model, Romanian framework

1. INTRODUCTION

Effective internal controls have always been the goal of every bank’s management in which achievement it typically has the following five objectives: to maintain reliable systems, to ensure timely preparation of reliable information, to safeguard assets, to optimize the use of resources, to prevent and detect error and fraud¹²⁴¹.

Along time, there have been designed different models of internal control, the most well-known being the COSO and CoCo models, which have also been the subject of various research papers¹²⁴².

As internal control frameworks, most authors¹²⁴³ reached to the conclusion that the two models (COSO and CoCo) complement each other. All these authors see internal control as a process

L, Martens F. and Landes C.E, *Internal control guidance – not just a small matter*, Journal of accountancy, March 2007; Hirth R.B.Jr., *Better internal audit leads to better controls*, Financial Executive, November 2008, www.financial_executives.org; Kinney W.R.Jr., *Research Opportunities in Internal Control Quality and Quality Assurance*, Auditing - A Journal of Practice & Theory, Vol. 19, Supplement, 2000, pg. 84

designed to facilitate and support the achievement of business objectives, which covers consideration of significant risks in operations, compliance and financial reporting, and which are mainly focused on the same objects, such as improving business effectiveness.

Romanian internal control system framework is a newer one, dated from 2003, when the our National Bank settled the regulation regarding internal control system and audit in banking field, emphasizing their importance in managing significant risks. Even if this framework is an implementation of the Basle Committee on banking Supervision's settlement, it designs an internal control system, so there has to be a more or less similarity between it and the two international well-known models, which is going to be the aim of our research.

2. AIM OF THE STUDY AND RESEARCH METHODOLOGY

Our empirical study is aimed to identify on which of the international internal control models (COSO or CoCo) is based the Romanian internal control system framework for credit institutions, as regards *monitoring*. In order to reach to a conclusion, we made an analysis with character of comparison between the two international models, as well as our national regulation and each of them. In this study, we focused our attention on aspects related to monitoring, one of the most important components on any internal control system.

Our empirical analysis was performed by testing the similarities and dissimilarities between the three sets of regulations regarding monitoring – the internal control system's component analyzed, taken two at a time in order to reach to a conclusion about the comparability degree existent between them.

The source of information for our research was the three regulations mentioned above which were codified and assayed by using a statistical method, which is being detailed in the chapter dealing with the comparative approach of the national framework by reference to the two international internal control models.

The findings of our study, which come from analyzing formal harmonization in the area of internal control system, are correlated to the literature review, but as every other research, our paper has some limitations, too, which offer us outlooks of future research. We should not forget that our study is only about a formal harmonization, which needs to be broadened to the current development stage of the national banking system, focusing on the degree in witch the regulation is put into practice and its purpose is being achieved.

3. LITERATURE REVIEW

Internal control has different meanings to different parties. That is why, it is very difficult to give an only-one definition of the internal control system, because it can be seen from different angles. In the followings we are going to focus our attention on two of the most important international models of control.

The first one is **COSO's** model¹²⁴⁴, which tries to establish a common definition. Under COSO's report, *internal control* in its broader sense is defined as a process affected by an organization's board of directors, management and other personnel, designed to provide reasonable assurance regarding the achievement of *objectives* in the following categories: (a) effectiveness and efficiency of operations; (b) reliability of reporting and (c) compliance with applicable rules, laws and regulations.

The second model of *internal control* is the **CoCo's** one, which is focused on behavioral values rather than control structure procedures as the fundamental basis for internal control in a company¹²⁴⁵. According to this, *internal control*¹²⁴⁶ is put into the context with how a task is

¹²⁴⁴ COSO, *Internal Control – Integrated Framework*, Committee of Sponsoring Organizations of the Treadway Commission, 1992, www.aicpa.org / www.coso.org

¹²⁴⁵ Protiviti Independent Risk Consulting, *An Overview of the COSO Internal Control – Integrated Framework*, 2004, www.knowledgeleader.com

performed, defining it as those elements of an organization (including its *resources, systems, processes, culture, structure and tasks*) that, taken together, support people in the achievement of the *objectives*.

If COSO divided internal control into five main components, CoCo uses four essential elements as groupings within which it articulates 20 criteria of control. These criteria create the basis for understanding control in an organisation and for making judgements about the effectiveness of it, a characteristic, which was from the very old time the subject of many studies¹²⁴⁷.

Starting from these differences identified between the two international models of control, it is appreciated that neither COSO, nor CoCo is a perfect model. According to some authors¹²⁴⁸, COSO framework is the standard for internal control guidance, which is why it was often used as a teaching tool in the university environment¹²⁴⁹. A recent survey¹²⁵⁰ of members of the Institute of Management Accountants and the Institute of Internal Auditors reports that approximately 90 percent of respondents rely on the COSO framework (to at least some extent) to evaluate controls.

As regards monitoring – the last component of the internal control system – which is the subject of our research, it is considered that unmonitored controls tend to deteriorate over time. So, monitoring, as defined in the COSO Framework¹²⁵¹ is implemented to help ensure “that internal control continues to operate effectively.” According to some authors¹²⁵² “it is not enough to put good controls in place. You must monitor them regularly.” This is the conclusion at which the authors reached after fictitious transactions remained undetected in a supposedly highly sophisticated internal control regime (the case of Societe Generale – 2008). They identified the following possible internal control weaknesses that may have led to the losses subsequently incurred: circumvention of control, inadequate security over the IT, poor password protection, lack of adequate confirmation / reconciliation, lack of review for canceled transactions / changes of transactions, inadequate monitoring employee behavior.

Another very interesting research¹²⁵³ aimed to determine whether compliance to Standards for the Professional Practice of Internal Auditors affected the quality of the internal control system reached to the following conclusion regarding the element of the internal control system analyzed by us: “*monitoring* is significantly influenced by management of internal audit department, professional proficiency, objectivity and review”.

4. EMPIRICAL COMPARATIVE APPROACH REGARDING INFORMATION AND COMMUNICATION BETWEEN ROMANIA, AMERICA AND CANADA

In order to achieve our aim - to identify on which of the international internal control models (COSO or CoCo) is based the Romanian framework for establishing the most efficient monitoring in credit institutions, we conducted an empirical study based on an analysis with character of comparison between the three sets of regulations (the two international models and the Romanian one).

We have started from the main principles for control activities required by COSO and the criteria of control also related to this aspect, as these are defined by CoCo, trying to establish the link between them. Thus, we have identified a series of issues regarding monitoring, which we organized within three main topics as follows: (1) *ongoing monitoring*, (2) *separate evaluations* and (3) *reporting deficiencies*.

Starting from these topics, we proceeded to compare aspects related to monitoring, one of the most important component of internal control system, as it appears within the three frameworks. Thus, we have allocated the 1 or 0 values for each possible and/or existent requirement within at least one of the considered regulation, where the 1 value shows that the requirement exists within that framework, and 0 value is given for the situation when the requirement is not found within the considered framework.

Table I. Exemplification of the analysis method used for the considered topics

Monitoring - Analyzed elements	The character of the requirement		
	COSO	COCO	Romania
Separate Evaluations			
- <i>the role of the responsible personnel</i>	0	0	1
- <i>the role of the internal audit</i>	1	0	1
- <i>the role of the external audit</i>	1	0	0
- <i>evaluations' frequency</i>	0	1	1
- <i>assumptions</i>	0	1	0

In the above table (Table I.) there are presented the 1 and 0 values that have been allocated to each requirement of one of the topic analyzed – *separate evaluation*.

In order to achieve the proposed comparison, we have considered that the best analysis, in case of this type of approach, is represented by the nonparametric correlation and the association degree between two or more than two considered variables. Thus, we have used for our research the Jaccards' association coefficients, which have been used before in studies focused on comparisons between different sets of regulations. On the other hand, the two Jaccard's coefficients offer the possibility of quantifying both the association degree and the dissimilarity degree between different sets of requirements regarding monitoring, taken into consideration for analysis.

So, in order to dimension the compatibility degree or, in other words, the association between two or more internal control systems, the calculation formula for the Jaccards' coefficient shows as follows:

$$S_{ij} = a / (a + b + c) \quad \text{and} \quad D_{ij} = (b + c) / (a + b + c)$$

where:

- S_{ij} represents the similarity degree between the two sets of analyzed frameworks;
- D_{ij} represents the degree of dissimilitude or diversity between the two sets of analyzed frameworks;
- a represents the number of elements which take the 1 value for both sets of frameworks;
- b represents the number of elements which take the 1 value within the j set of frameworks and the 0 value for the i set of frameworks;

- c represents the number of elements which take the 0 value within the j set of frameworks and the 1 value for the i set of frameworks.

Elements related to monitoring that have been analyzed in this empirical study are therefore given the 1 value for containing a certain requirement and the 0 value for non-containing that considered requirement.

As a result of the effective measurement of the comparability degree between the Romanian framework and the international models COSO and CoCo, based on Jaccard's coefficients, we have reached to the conclusion that our national regulation is much more similar to COSO's model of control rather than to the CoCo's one, as presented in the following table (table II.).

Table II. Comparison analysis based on Jaccards' coefficients

Monitoring	Romania vs. COSO		Romania vs. COCO		COSO vs COCO	
	S_{ij}	D_{ij}	S_{ij}	D_{ij}	S_{ij}	D_{ij}
<i>Ongoing Monitoring</i>	1,000	0,000	0,333	0,667	0,333	0,667
<i>Separate Evaluations</i>	0,250	0,750	0,250	0,750	0,000	1,000
<i>Reporting Deficiencies</i>	0,800	0,200	0,333	0,667	0,400	0,600

5. FINDINGS AND CONCLUSIONS

The results of our analysis show the level of similarities between the national framework and the two international regulations. As it can be seen, the Romanian stipulations regarding monitoring, issued by our National Bank is closer to COSO model rather than to the CoCo's one. Also, the values of the statistical coefficient used in our study demonstrate that there is also a high degree of dissimilarity between COSO and CoCo models, higher than the one between Romanian regulation and CoCo's model as it is also shown in the table above. This, we can conclude that the Romanian framework is a complex one, including a various types of characteristics and requirements needed for ensuring an effective monitoring in banking sector. But, we should not have to forget about the following breakdown: even if it has a permanent character and considers both internal and external sides, our framework does not stipulates anything about follow-up procedures, which should be established and performed to ensure appropriate change or actions occur, thus enabling control to remain effective.

According to the literature review regarding the two international models of internal control system, there isn't any kind of assessment on which of these models is better, or which of these is good and which is bad. Starting from this argument, we could reach to the conclusion that Romanian banking system is well settled as regards monitoring, in accordance to very well known international models and, also, to the international supervising authority that we should not forget - the Basle Committee on Banking Supervision.

In the end we need to mention the limitations of our study. First of all, we should not forget that that our empirical research only approaches formal harmonization in the area of internal control systems, more exactly regarding *monitoring* – the analyzed issue. In order to diagnose not only the existence of a "monitoring system", but also the functionality of it we need to go deeper and to continue our research. Only an empirical analysis on insights of the banks internal controls, based on the information provided by credit institutions, would show the degree to which the foresights of the international models of control, which seem to have been assumed by the national regulation, are actually put into practice and respect their purpose. These would show the level of material harmonization which should be analyzed in correlation to the formal one, which was the subject of this study. So, all these offer us outlooks of future research.

For decades the accountancy profession has responded to the “credibility crisis” by coining, reciting and hiding behind the phrase “audit expectation gap” — a phrase which denotes the differences between the public’s and Auditors’ perceptions of the role of an audit function. This paper reports the findings of a questionnaire survey on the audit expectation gap conducted in Romania. The aims of the study are to examine whether an expectation gap exists in Romania among the auditors, auditees and audit beneficiaries in relation to the auditors’ duties. The results proved the existence of an audit expectation gap in Romania. The study shows that the auditees and audit beneficiaries placed much higher expectations on the auditors’ duties when compared with what auditors have perceived their duties to be. The analysis of the expectation gap indicated the existence of unreasonable expectations of the part of users.

Key words: audit, audit expectation gap

JEL code: M42, G30

1. Introduction

External auditing plays a critical role in the business environment as modern industrial economies are based on capitalism, a system of economy designed to allocate resources using market mechanisms (Watts & Zimmerman 1983). To ensure efficient allocation of resources in a capitalist economy, credible information about the companies’ operation should be made available for decision making processes (Koo & Sim 1999). Such information can be obtained through financial statements.

The spate of corporate failures (for example Enron and WorldCom in USA), financial scandals and audit failures has led to a significant increase in criticism of and litigation against the auditing profession (Maccarrone 1993). According to Godsell (1992), this phenomenon may be due to common beliefs that the stakeholders of the company should be able to rely on its audited accounts as a guarantee of its solvency, propriety and business viability. Hence it is shown that the nature and objectives of auditing have been perceived differently by the users and these misperceptions are known as the “audit expectation gap”.

Despite the importance of the audit expectation gap to the auditing profession, there has been a significant lack of scientific study conducted on how to address this issue in Romania. The substantial research findings on the audit expectation gap (Chowdhury et al 2005; Epstein & Geiger 1994; Humphrey et al 1993; Leung & Chau 2001; Lin & Chin 2004; Dixon et al 2006) may not be applicable in Romania because the findings are influenced and possibly distorted by economic, social or legal factors unique to those countries in which the studies took place.

The purpose of this article consists in identifying the perceptions of the financial reports users regarding the responsibilities of statutory auditors in Romania, in order to ascertain to what extent we can speak of the existence of a certain differences in expectations on the work of statutory auditors in Romania.

2. Literature review

2.1. The concept of audit expectation gap

The definition of the expectations gap varies among researchers. The term “audit expectation gap” was first introduced to audit literature by Liggio (1974). He defined the audit expectation gap as the difference between the levels of expected performance as envisioned by both the user of a financial statement and the independent accountant. The Cohen Commission (1978) in the USA extended Liggio’s (1974) definition by taking into account whether a gap may exist between what the public expects or needs and what auditors can and should reasonably expect to accomplish. Porter (1993) claims that the definition of audit expectation gap provided by Liggio (1974) and the Cohen Commission (1978) is too narrow as they fail to recognize that auditors may not accomplish “expected performance” (Liggio 1974) or what they “can and reasonably should” (Cohen Commission 1978). Porter (1993) argues that the recent increase in criticism of and litigation against auditors is due to the failure of auditors to meet society’s expectations, whose failure in turn undermines confidence in the audit function. Limperg (1932 cited in Porter *et al* 2005 p.119) points out that the “audit function is rooted in the confidence that society places in the effectiveness of the audit and in the opinion of the accountant...if the confidence is betrayed, the function, too, is destroyed, since it becomes useless”. Hence, to narrow the audit expectation gap, it is necessary to ascertain: i) the duties society expects auditors to perform; ii) the duties that are reasonable to expect auditors to performance; and iii) the extent to which society’s reasonable expectations are satisfied (or, more pertinently, not satisfied) by auditors (Porter *et al* 2005). Porter’s (1993) structure of the audit expectation-performance gap has two major components, namely:

- 1 Reasonable gap - the difference between "what the public expects auditors to achieve and what they can reasonably be expected to accomplish"; and

- 2 Performance gap - the difference between "what the public can reasonably expect auditors to accomplish and what auditors are perceived to achieve".

The performance gap is further subdivided into:

- 2.1 Deficient standards - the gap between “what can reasonably be expected of auditors and auditors' existing duties as defined by the law and professional promulgation.”

- 2.2 Deficient performance – the gap between “the expected standard of performance of auditors' existing duties and auditors' perceived performance, as expected and perceived by the public.”

3. Research methodology

We used the questionnaire technique for collecting the primary data, as it is an efficient means of collecting answers from a large sample size. The questionnaire is adapted according to the one used by Alleyne and Howard (2005). The questionnaire was designed in order to enable us to extract the necessary accurate information from the respondents’ answers, and to make sure that collected information is adequate for achieving the objectives of this study. The questionnaire is divided in two sections, Section I and Section II. Section I consists of 8 questions related to

respondents' demographics. Section II consists 11 questions that targeted 11 duties of auditors in the following areas: i) the duties of auditors under the International Standards on Auditing (ISA), adopted by the Board of Financial Auditors in Romania, ii) a part of the inexistent duties of auditors advanced by Porter's study (1993), which focused on the following areas: i) auditors as guarantors of a company's financial statements accuracy and solvency, ii) auditors give an early warn of the company's failure, iii) the auditors detect fraud and report to the shareholders and iv) they discover illegal activities.

The questionnaire contains Likert-like questions, on a five-point scale, and respondents had to chose from a scale ranging from „strongly agree” to „strongly disagree”. The questions were designed based on a detailed review of the features of prior studies (Alleyne & Howard, 2005; Gay et al., 1997; Innes et al., 1997; Gay et al., 1998; Frank et al., 2001; Best et al., 2001) and subsequent to an in-depth review of audit standards disclosing auditors' responsibilities. Furthermore, the questions are arranged in an order corresponding to the order provided by the Approved Auditing Standards in Romania. The survey is applied at „national” level, as we aim to obtain representative results for entire Romania. The participants in this survey can be divided into four groups, namely: auditors, managers, bankers and financial analysts. Data were collected throughout Romania to avoid territorial subjectivity. On-line questionnaires were sent to all participants.

The auditors' group includes all auditors who may exercise this profession throughout Romania; the auditors are officially recognised by the Chamber of Financial Auditors of Romania, and therefore, they are included in the „Romanian Public Register of Auditors. In terms of the managers' group, the persons were selected from companies listed on the primary and secondary markets of Bucharest Stock Exchange, as these companies have to audit their annual financial statements. In terms of bankers' group, these persons were selected among employees in the credit departments of the major banking institutions in Romania. The fourth category consists of respondents in the category of financial analysts and investment analysts. The category includes all those persons or institutions that could use the information provided by the auditor in his report, for the substantiation of investment decisions, either on their own or on behalf of third parties as a profession.

The responses cover most of the development areas in the country, thus removing subjectivity. In our opinion, the technique adopted for data collection resulted in a very good yield of 38.3% response rate. A detailed disclosure on each category of respondents is presented in table 1.

Table 1 Situation of responses by category of respondents

Interviewed groups	Sample	Successfully sent	Returned	Answers received	% response rate / successfully sent
Auditors	978	889	89	319	35.88%
Managers	651	575	76	221	38.43%
Bankers	121	89	32	43	48.31%
Financial analysts	178	131	47	62	47.33%
TOTAL	1928	1684	244	645	38.3%

In terms of percentage, the most representative group is the one of the financial auditors, with 30.2%, followed by the group of managers, with 27.3%, and the one of bankers, with 21.2%.

The analysis of the general answers related to respondents (first section) enabled us to observe that most of the respondents have accounting qualifications and audit experience. Furthermore, more than 90% of the respondents claimed that they were aware of what auditors do. The high level of awareness, combined with their accounting qualifications and audit experience, should add credibility to the findings of the study.

After the responses were received, a model developed by Cronbach was applied (meaning the extent to which respondents gave correlated answers). Thus, after applying "reliability analysis", we obtained the following results:

- § For the first group of questions on the "function" of the auditor, we obtained a value " $\alpha = 0.867$."
- § In the second part, comprising questions about "understanding" the report issued by the auditor, we obtained a value " $\alpha = 0.5287$ ".

4. Findings and discussions

As formerly asserted, the second section was designed to enable us to verify the existence of some discrepancies between expectations and reality in audit activity in Romania. To determine whether in Romania there is a gap of expectations in audit, about the responsibilities of auditors, we first performed the tests of "normality" of distributions that different study groups represent for each variable. To this end, we applied the test of "Kolmogorov-Smirnov" depending on the hypothesis we wanted to oppose. After applying this test separately for each group of respondents, we ascertained that virtually none of the cases is the condition of normality. The next step was to oppose the hypothesis, using the non-parametric test of "Kruskal-Wallis", used in the case of more than 2 independent samples. For this study we used an importance level of 0.05. Respondents' answers are presented in Table 2.

Table 2. Kruskal-Wallis test for the interviewed groups of respondents (first case)

Questions proposed	Mean values of groups of respondents				Chi square	Asymp. Sig.
	A	M	BA	FA		
1. The responsibility of the auditor is:						
1.1. The development of the audited company's financial statements	1,32	3,4	2,59	2,5	113.597	0.000*
1.2. Ensuring the full uprightness of the audited financial statements	2,47	3,63	3,61	3,64	87.583	0.003*
1.3. Checking all accounting transactions	2,76	3,76	3,66	3,85	111.990	0.000*
1.4. Detection of all fraud and error in the financial statements	2,25	3,72	3,64	3,78	159.594	0.000*
1.5. Prevention of all fraud and error within the company	2,25	3,72	3,64	3,78	159.594	0.000*
1.6. Plan accounting and internal control systems	2,1	3,14	2,73	2,64	47.583	0.003*
1.7. Analyzing and presenting the audit report information on the efficiency and effectiveness of internal control of the auditee	2,76	3,76	3,66	3,85	111.990	0.000*
1.8. Confidential reporting to a legislative authority, if the auditors discovered a fraud committed by an employee of the entity that has a leading position	2,77	2,86	3,08	3,15	8.672	0.034 ^{ns}
1.9. Presentation in the audit report of illegal activities committed by the entity's management, which are discovered	3,77	4,11	3,66	3,48	19.097	0.000*

during the audit and have a direct impact on the audited financial statements						
2. The auditor is the one expressing whether the financial statements reflect the company's financial and economic situation	4,83	4,88	4,96	4,88	4.459	0.216 ^{ns}
3. In his report, the auditor only expresses opinions on the annual financial statements	4,69	4,26	4,36	4,33	42.813	0.000*
4. To ensure that accounting standards are met	4,72	4,77	4,86	4,82	9.710	0.021**
5. To audit the semestrial financial statements	3,84	3,95	3,73	4,06	3.621	0.305 ^{ns}

* Statistically significant at 1%, ** statistically significant at 5%, NS = statistical insignificant

The average values measured correspond to a scale from 1 - totally disagree to 5 agree.

Where: A - Auditors, M - Manager, BA-bankers, BR - brokers

There is a total of 13 statements and for each statement in part we calculated the mean and deviations of the responses. Responses to an average of less than 3 indicate that users have lower expectations from the auditors on those tasks, whereas responses with a high average value (over 3) indicate that users understand the duties and responsibilities of auditors. The study results indicate that statistically, there are significant differences between the four groups in terms of perceptions on the responsibilities of the statutory auditor, which means that there is an expectations gap between auditors and other groups of respondents related to 10 of the 13 responsibilities.

Moreover the result (claim 1.2 to 5) indicates that users have higher expectations regarding the duties and responsibilities of auditors. Although statistically the differences between the categories of respondents are related to the first statement, it should be noted that the results for each category of respondents in part , the threshold stands below 3, with the exception of the manager, meaning that other categories of users outside managers do not consider preparing financial statements to be the responsibility of auditors. This result is consistent with the results recorded by other researchers (Gay et al., 1998 and Best et al., 2001). Users agreed that the auditors are responsible for preventing and detecting fraud and error (statement 1.4, 1.5). This result is showing the existence of a discrepancy between expectations and reality on the auditor's responsibilities concerning the prevention and detection of fraud.

A discrepancy exists here because the audit standard ISA 240 „Fraud and error” in its revised form which enter into force on December 15, 2009, clearly states „that management is responsible for preventing and detecting fraud and error, and the main responsibility of auditors is to detect fraud and errors with significant impact on the financial statements. It is interesting to note responses to statements 1.2. and 1.3, which from our standing-point, highlight some unreasonable expectations (medium levels of response except the auditors’, ranks above the average of 3) in so far as it is practically impossible to verify all transactions in an audit mission. This means that by resorting to samples, there is an inherent risk involved, which is why it is impossible for the auditors to ensure full accuracy of the information in the financial statements. Users seem not to understand how an auditor shall perform the tasks of the audit, and that usually sampling is resorted to.

We introduced within the questionnaire questions covering responsibilities that are not reviewed by the auditing standards applicable in Romania but which we found in other studies (Porter,

1993). They regard liabilities related to the reporting and presentation of illegal activities discovered during an audit. The answers to these two claims (claim 1.7, 1.9) should be considered in the context of the requirements of auditing standards applicable in Romania, which do not require the auditor to submit these aspects in his report, but advise the auditor to seek legal aid to initiate proceedings usual in this case.

The results presented lead to the idea of "rejection" of the hypothesis, regarding equal perceptions between groups, in terms of function of the statutory auditors.

5. Conclusions

This study explores the perceptions that different categories of users of audit reports have on the responsibilities of statutory auditors and to the way they understand the information in the auditor's report. Analysis of these perceptions actually seeks to identify differences in expectations on statutory audit work in Romania.

The study highlights that there are significant differences between different categories of respondents in the survey on both responsibilities of auditors and the manner in which they understand the information in the audit report. Thus we should note that some components of this concept that we talked about in the literature analysis are valid in the environment in Romania. Thus we have identified some exaggerated expectations (irrational) such as those related to verification of all transactions or fully guarantee the correctness of the financial statements. From our standing-point, we believe we can also talk about poor standards and we have in mind here the problems caused by understanding the concept of the materiality, whose level would be beneficial if it were stated by the auditors in the audit report in this way each user having the possibility to make decisions advisedly. Thus, users of the audit report would have the possibility of appreciating the suitability of the materiality threshold size from case to case.

In our view, this situation may be improved through different strategies, of which most likely to succeed being: i) educating the users on the role and actual duties of auditors; ii) by expanding the scope of the audit to meet market expectations. Education may help in solving the misconception problem. Expanding the scope of an audit may help to improve the expectation gap. It is hoped that by implementing both approaches, the public expectations and the auditors' duties will be better attuned.

EMPIRICAL EVIDENCE ON THE EFFECTS OF SOCIAL WELFARE AND TAXATION ON INSURANCE

In this paper is realized an empirical analysis of the influence of social welfare and taxation on insurance. The analysis is performed on a sample of 36 countries and a horizon of 3 years (2005, 2007 and 2008), being tested 4 linear regression models (life premium subscribed, non-life premiums subscribed, number of companies and number of employees in the insurance sector). The results of study confirm a relationship between the development level of countries and insurance, but exclude the existence of the relationship between taxation and insurance.

Keywords: insurance, premiums, taxation, economic development

JEL codes: G22, H24, H25

1. Introduction

In today's financial crisis emphasized by high unemployment, fulminate bankruptcy of many firms and impossibility of quantification of negative economic and social consequences, the taxation of insurance represents an important issue both for insurers and the European or/and national supervisory body of insurance market, and also for individuals or/and legal entities.

In addition, the CEA – the European Insurance and Reinsurance Federation – draws attention frequently to the negative effects of the tax deduction of certain premiums for the European budget proposal. Closely following the G20 process, the CEA tries to insure that consistent measures are taken across the globe, to avoid regulatory fragmentation and reduce market distortions. In some European countries the fiscal treatment granted to the insurance products subscribed under the 2nd and the 3rd pillar of Solvency II is not generally different from the one that is usually foreseen for a normal investment product. This is why EU attempts to harmonize first the national legislations regarding the taxation and then those relating to insurance (as specified in the quantitative impact studies QIS 1-5), aiming to ensure: (1) adequate financial resources and system of governance, supervisory review process, public disclosure and regulated reporting requirements (according to Solvency II); and (2) certain level of own funds to limit the risk of insolvency.

This action encountered serious difficulties arising from the existing differences between regulations, terms of economic and social life, traditions and culture, lack of information regarding the usefulness of insurance and their political group interests. Taking in consideration the significance of fiscal considerations in the decision to subscribe insurances contracts, different European countries, including Romania, have tried and managed through its fiscal laws to apply different ways for fiscal deductibility of insurance expenses. In fact, after 1990, in the majority states worldwide, this form of fiscal relaxation through deductibility stimulated growth of gross premiums subscribed per capita.

In this article we continue our investigation on the fiscal and economic effects on insurance on global level. Our first study (Sucala *et al.*, 2009) focused on years 2005 and 2007 using a sample

of 36 countries. Here we add year 2008 and use the same 36 countries for consistency in the results and their explanation.

2. Fundamental concepts in the taxation of insurance activities

The taxation of insurance should be regarded and analyzed both from the perspective of gross premiums subscribed and received by insurance companies and services from the insurer. Regarding the taxation of insurance, it can be tackled by technical and socio-professional perspectives.

Technical approach to taxation of life and non-life insurance can be achieved through taxation of insurance premiums and/or insurance indemnities. The taxation of insurance premiums summarized either on their deductibility/non-deductibility, either to reduce tax.

The deductibility/non-deductibility of premiums is capped and capping may operate individually or globally in insurance products, in fixed amount (per person, couple, husband and family member) or percentage of total taxable income and in the form of limiting on bonus, income, premiums and income. Tax reduction instead is always limited, and operate in absolute size, in the percentage share of tax or part of income, in the amount determined by the law.

Tax benefits of the insurer may be achieved through the analysis of rents in the form of payments through periodic sums insured. Periodic payments for operating are different from one country to another, and its taxation may be total, partial differential or exempted. In case of insured sum we find taxation or non-taxation of the amount insured by the insurance policy (known as capital) and/or non-taxation or taxation differences between the amounts paid by the insurer and the total insurance premiums paid by the insured person.

Socio-professional approach concerns taxation of insurance premiums through the different socio-professional categories (natural persons, legal persons, authorized persons) and the pensions insurance.

Insurers' benefits may take various forms (daily allowances, sums insured in case of life or death, rents, amounts provided for single-premium policy, those with capitalization) depending on the policy and concluded the nature of risk covered. Taxation of these benefits are achieved with the principles and logic of tax (a tax on insurance premiums or benefits), but depends on the binding and/or voluntary policy.

Today, the CEA works on the review of existing legislation of VAT invoicing. The introduction of mandatory VAT invoicing requirements for insurance services would create delicate problems and material difficulties for the economic operators.

3. Literature review

Boyer (2002) presents an interesting case in USA where the taxation of insurance benefits is preferable to the taxation of premiums. When insurance fraud is present - in the form of ex post moral hazard - a tax on insurance premiums increases the number of fraudulent claims in the economy, whereas a tax on insurance benefits may reduce fraud. More importantly, however, policyholders are made better off with a benefit tax than with a premium tax.

Altenburger *et al.* (2008) develop a common solution for the separation problem in accounting and in taxation which is innovative, theoretically correct and practically applicable. The principal design innovation is the way of distinction of different deposit components and their classification into different types. Dividing them into 'implicit' and 'explicit' deposit components delivers the theoretically correct results for unbundling of insurance contracts both for accounting and tax purposes.

Tzeng and Huang (2004) examine in their paper the impact of tax deductions on optimal insurance contracts. Their results show that the implementation of tax deductions increases the deductible but may or may not decrease the coinsurance.

Grace *et al.* (2008) using a state-level panel data set from 1992-2004 for the property-casualty insurance industry, find in their paper that the insurance premium tax has a negative but modest effect on employment in the insurance industry.

In the recent Romanian literature there is an increasing interest in the field of insurance.

According to Mateoc *et al.* (2008) the evolution of insurance in the Romanian context can be separated into three consecutive periods: (1) the years 1871-1948 in which the insurance activity emerged, the first company being called “Dacia”; (2) the period between 1949-1990 in which the insurance activity continued under state institutions and the State Insurance Administration was founded; and (3) the reform period of 1990-2010, in which this sector regained its true importance in the economy.

Stoicescu and Teodorescu (2003) published a research regarding the national insurance market in the context of accession to the European Union, paper which draws a comparison between the insurance system in Romania and other European countries in 2002, where they highlight the low level of insurance premiums subscribed by the population reported, and the low value of the insurance premiums subscribed per capita.

Once with the introduction of the optional insurance premiums (the 3rd pillar of the pension system), the interest for debate over insurance taxation has increased. Various studies have addressed the level of deductibility of voluntary health insurance premiums from the date of introduction of these premiums and concluded that their interest for signing them was well below the level at which employers might be tempted to purchase such policies for their employees (Mosoianu, 2007). After the study was published, the value of deductibility of health insurance premiums was changed, meaning the increase of them.

Insurance in our country is characterized by an incipient state of development compared to the developed countries where insurance is part of tradition and education. Factors leading to the limitation in the interest about insurance in Romania concern at least the following courses of action: misunderstanding the role of insurance and thus ignoring the benefits that arise from the signing of an insurance policy, lack of interest in insurance, low proportion of middle class correlated with the financial factor, the existence of unfair competition practices, too little inspired management and focused on immediate advantages, problems related to inflation, unemployment, low income citizens. (Cristea *et al.* 2008).

Countries that have a culture in insurance activities have implemented certain tax advantages for insured persons, one of which is the deductibility of insurance premiums. By comparison, Romania is situated very low as the deductibility of insurance premiums is concerned and our legal approach tends to develop insurance premiums at a level considered satisfactory compared to the average states of the European Union. Thus, in March 2008 PRIMM magazine published a comparative study of the evolution of insurance in Romania between 1997-2007 (Ghetu and Doreonceanu, 2008) which shows that the evolution of insurance premiums subscribed were growing, but in terms of the degree of penetration in GDP and insurance density per capita, which had a tendency to increase during the period under study, are well below the average of the European Union countries.

According to Ionescu (2008) the degree of insurance penetration and the level of insurance density has increased in the least five years (the period under analysis is 2003-2007). This is further confirmed by a longitudinal study on the economic significance of insurance market (on 11 years), in which Cristea *et al.* (2009) found that insurance is connected to economic growth.

4. Hypotheses, variables and data sources

Based on the general economic literature we can suppose that the level of life of the society is linked to the capability of the people to spend for security purposes. This can explain the lack of interest in insurance in Romania, as discussed by Cristea *et al.*, 2008 and 2009; Ionescu (2008). Therefore we issue the following hypothesis:

H1: The level of life is positively associated with insurance activity.

On the basis of the previously presented literature (Boyer, 2002; Grace *et al.*, 2008; Stoicescu and Teodorescu, 2003; Mosoianu, 2007) we conjecture a negative relationship between taxation and insurance activities, i.e. as the level of taxation decreases this favors and stimulates the insurance sector. Our next hypothesis is therefore:

H2: Taxation is negatively associated with insurance activity.

Since we are interested on the effect of several factors on insurance activity, we developed the following variables:

- Proxies for insurance activity: *premiums subscribed* (life and non-life premiums, mil. USD), *number of companies* and *number of employees* in the insurance sector;
- Proxy for level of life: *GDP per capita* (USD/inhabitant);
- Proxy for taxation: *premium tax* (life and non-life, mil. USD).

The underlying econometric model is:

$$\text{Insurance activity} = \alpha_0 + \alpha_1 \text{Level of life} + \alpha_2 \text{Taxation} + \varepsilon$$

Our sample comprises 36 countries worldwide. Since these countries are followed by most of the (international) regulators and institutions, we consider them as the most relevant, securing the representativeness of our sample on international level. To enhance the robustness of the research we collected data for 3 years (2005, 2007 and 2008) as specified below:

Table 1. Sources of data

5. Data Analysis and Discussion of Results

For the analysis of our data we used SPSS 17.0 software. Since we lack the necessary space here to discuss the technical issues related to the analysis (please see Table 2 for these details), we explain the steps as we generated the findings.

Three years have been analyzed as we found fiscal data only for these years (Table 1, taxation). For each year we ran four models, testing all the proxies for “insurance activity”, such as: life

premiums subscribed, non-life premiums subscribed, number of companies and number of employees in the insurance sector and the corresponding dependent variables (see model specifications in Table 2).

According to our findings, GDP per capita is positively associated with the insurance activity proxies on acceptable significance levels (t-values are positive and the computed significance is between 5% and 10%), as is shown by models 1, 2 and 3 in all 3 years, which confirm that the level of life has a significant impact on insurance.

Model 4 behaves differently, where the number of employees is used as proxy for the insurance activity. We believe this is for data management reasons, since the status of 'employment' is defined differently in the countries worldwide (some count only full time contracts while others include also collaborators), thus the data being heterogeneous.

We therefore accept the first hypothesis, according to which the level of life is positively associated with insurance activity.

Table 2. Results generated

Panel A. Year 2008				
<i>Model 1: Life premiums = $\alpha_0 + \alpha_1$ GDP per capita + α_2 Life premium taxation + ϵ</i>				
	Sign	t	Signif.	Adj. R ²

	Sign	t	Signif.	Adj. R ²
GDP per capita	+	2.655	0.015	0.183
Number of companies	-	-1.235	0.231	

<i>Model 4: Employees = $\alpha_0 + \alpha_1$ GDP per capita + α_2 Non-life premium taxation + ε</i>				
	Sign	t	Signif.	Adj. R ²
GDP per capita	+	1.580	0.132	0.031
Number of employees	-	-1.078	0.295	

As the connection between taxation and insurance is concerned, our empirical findings do not support the hypothesis we developed (H2), since the t-values of the taxation variable are not significant in neither of the models on an acceptable level (5% and 10%). One can observe, however, that the predicted negative sign is always verified (we have negative t-values for the taxation variable). This situation can be explained as a result of many specific rules in legislation that exist from one country to other. We must therefore reject the second hypothesis, according to which the level of taxation is negatively associated with the insurance activity.

6. Conclusions

Growing interest of companies for insurance is due to global economic evolution in recent years, and especially the economic crisis. This interest is manifested as a result of the company's desire to ensure against risks to which they are subjected, and to ensure their employees in this respect, companies benefiting from the various fiscal facilities offered by any countries.

On the other hand, regarding the interest for insurance is manifested by IASB (there are concerns regarding insurance taxation dealt with through the Exposure Draft of IAS 12 Income Taxes conducted in 2009). At the European level through European Directives is attempting to achieve and strengthen the solvency of insurance companies, job insecurity and financial difficulties of firms create negative economic repercussions on the insurance.

A form of fiscal loosening in this field would be very welcome, so that the interest for insurance to be able to record an increase, and we mention the experience of the Central and East European countries, where, especially after 1990, the volume of insurance premiums distributed per capita has increased substantially due to favorable tax deductibility of insurance premiums.

DISCLOSURE PRACTICES CONCERNING CONSOLIDATED FINANCIAL STATEMENTS OF ROMANIANS GROUPS OF ENTITES

Tiron Tudor Adriana
Babes Bolyai University,
Economics and Business Administration Faculty

The main object of this paper is to examine accounting harmonization in a sample of companies with regard to the presentation of consolidated financial statements. The results of the study indicate that listed firms tend to comply with IFRS requirements

Keywords: disclosure, consolidated financial statements, IFRS

JEL: M41

Motivation and objectives

From the beginning of 2005 companies from the European Union have to comply with the International Financial Reporting Standards (IFRS) when reporting their consolidated financial statements, as publicly listed companies subject to Regulation 1606/2002 of the European Union. European Union (EU) Regulation 1606/2002 was a watershed (Cairns, 2003). EU Regulation 1606 states that "member states are required to take appropriate measures to ensure compliance with international accounting standards" (EC,2002). It requires all listed companies of member states to prepare consolidated financial statements based on IFRS beginning 1 January 2005 (Brown and Tarca, 2005). The announced aim of IFRS adoption in the EU was to improve the quality of companies' financial reporting by increasing its comparability and transparency, and to promote the development of a single capital market in Europe (Federation des Experts Comptables Européens, 1999).

This change affected Romania also, because even if the country gained membership only in 2007, therefore it had to be prepared and implement IFRS in the domestic accounting regulation. This problem was solved by changing the national accounting regulations.

The objective of this study is to analyze if the Romanian groups respect or not the requirements concerning the disclosure of consolidated financial statements. In our sample were included just financial and non-financial companies listed at BVB, first category.

Romania has now only one stock exchange: the Bucharest Stock Exchange (BVB). BVB has a total of 2,078 listed securities, 59 on the main market (BVB) and 2,019 on the unregulated market (previously known as RASDAQ). Most of the securities listed on the RASDAQ are not traded at all and are the result of the early privatization of state owned enterprises.

For the purpose of our paper, information from annual reports of the Romanian companies in the sample has been collected for the period 2006-2008 with a special focus on the consolidated financial statements. This data allowed us to observe the evolution of harmonization process concerning the disclosure of consolidated financial statements, and for each year the degree of material disclosure harmonization.

Our objective was to calculate the material disclosure harmonization for consolidated financial statements, which tests the extent of the information disclosed through the consolidated financial statements. So, we analyzed if the consolidated financial statements of the selected groups disclose certain information.

The paper is organized as follows. In the next two chapters we present a short review of the Romanian accounting regulation concerning consolidated financial statements and growing literature which is important is setting the context of the study as well as the hypotheses. This is

followed by discussion of methodology of research. In the fifth part findings are critically evaluated and then the conclusions chapter closes the paper.

Legal framework concerning the disclosure of consolidated financial statements in Romania

Accounting rules are aligned with the Fourth and Seventh Company Law Directives, as well as with the Transparency Directive, the IAS Regulation (EU Regulation 1606/2002), and the Bank and Insurance Accounts Directives. Since 2007, listed companies have been required to use International Financial Reporting Standards *as endorsed* by the EU to prepare their consolidated financial statements. Financial statements are available at the trade registry, albeit not electronically.

CNVM Orders 75/2005 and 74/2005 transpose respectively the Fourth and Seventh Company Law Directives for companies that the CNVM regulates and supervises. Listed companies regulated by CNVM prepare their consolidated financial statements under *endorsed* IFRS.

The Accounting Law 82/1991 amended and republished sets the obligations to prepare consolidated financial statements for a parent company.

In 2005, The Ministry of Finance (MoF) Order 1752/2005 seeks to cover financial reporting requirements applicable to companies of all sizes in one piece of legislation, with differing levels of disclosure according to the size and public interest consideration. The MoF Order 1752/2005 has been effective from January 1, 2006 for reporting year ending December 31, 2006.

The following types of entities were required to comply with the applicable elements of IFRS: financial lending institutions, insurance and re-insurance companies, listed entities and entities with securities traded on a regulated market, state-owned entities and entities that benefit from state support or state guarantees.

The preparation of financial statements based on IFRS for the financial year ending in 2006 was required for 2007 IFRS compliance to enable comparatives to be available for 2007 reporting.

OMF 1752 provides for exemptions. Entities other than public-interest entities are exempt from preparing consolidated financial statements if, at balance sheet date, the entities to be consolidated do not together exceed the limits of two of the following three criteria: total assets of EUR 17,520,000; turnover of EUR 35,040,000; and average number of employees during the financial year of 250. A group (if not a listed entity) may be exempt from preparing consolidated financial statements if more than 90% of the parent company belongs to another group. Public-interest entities, other than banks and listed companies, prepare their consolidated financial statements in accordance with either *endorsed* IFRS or accounting standards compliant with the Seventh Company Law Directive.

The provision of OMF 907/2005 providing that banks have to prepare a set of consolidated financial statements in accordance with IFRS for the year ending 31 December 2006 has been confirmed by OMF 1121/2006 for subsequent periods (however in accordance with *endorsed* IFRS). MoF Order 1121/2006 provides some additional guidance on the application of IFRS commencing with the year ending December 31, 2007.

The Company Law obliges the Management Board of the parent company to publish the annual financial consolidated statements at the trade registry within 15 days from the date of their approval.

Literature review

Disclosure harmonization is concerned with the extent of information disclosure and measurement harmonization is concerned with the nature of the information disclosed. Van der Tas (1988)

Research in disclosure level and compliance with IAS/IFRS began around the year of 2000 and showed a great deal of non-compliance with IAS requirements in various fields (Street *et al.*, 1999). Later studies focus on cross-listed companies seeking to identify significant differences between US listed (and also filing in US) and non-US listed companies. Findings indicate that the

overall level of disclosure is greater for companies with US listings (Street and Bryant, 2000; Glaum and Street, 2003).

Unfortunately there is a total dearth of such studies and evidence in Central and Eastern European countries except for those that have been carried out using an international sample, such as Street and Gray (2002)³. Fekete et al (2008) develop a study about Hungarian data and contributes to understanding the level of compliance with IFRS disclosure requirements and its determinants.

Cooke (1989) measured the extent of the information disclosed by 90 Swedish companies (disclosure harmonization). The index was composed of 224 items which we considered should be included in the financial statements. Each item is considered a dichotomous variable; we assigned the value one if the information was provided and zero if not. Weightings were not used, so each item had the same importance. An improvement was done in 2003 by Sánchez (2003) by modifying the Cooke index, to avoid penalizing a company for those items that it need not disclose.

Methodology

1. Measurement tool

To evaluate the disclosure harmonization, in our study we used a disclosure index, as was described and used by Cooke (1989), because through a disclosure index we can provide by a single figure summary indicator the entire content of the report (e.g Ahmed and Courtis, 1999; Coy and Dixon, 2004).

2. Consolidated financial statements Disclosure Index

A major task was to establish which items were going to conform the index, in other words, we sought those aspects that in our opinion, ought to be included in the consolidated financial statements. Being the first study which analyze the disclosure harmony of BVB listed entities concerning the consolidated financial statements, we structured our study in two parts: the first, which is presented in this paper analyze the disclosure of the complete set elements and the second go deeply and analyze the content.

The index is composed by the elements of the complete set of consolidated financial statements and was complemented with an item about the audit report. The Items subchapter shows the 6 items selected, bringing the maximum score to 6. Disclosure index $(DI) = \sum_{i=1, \dots, n} X_i$ where $X = 1$ if the item X_i is disclosed and 0 if not. A set of 6 index score for period 2006-2008 was calculated for each group surveyed. The constructed index is going to allow us to reflect which groups disclose the information of their consolidated financial statements according to the content of the IAS/IFRS, and at the same time, to verify which groups disclose a greater amount of information.

3. Data sources

Data instruments or sources of data which can be used in de facto harmonization studies are mainly of five types: annual reports, accounting regulations, public databases, questionnaires and laboratory techniques. The choice of data source has important repercussions for the overall research design, since there are advantages and difficulties involved with using each of them. We will focus on the two data sources used in the studies shown in table 0, survey data and annual accounts.

The use of annual reports obviously has great advantages, but also difficulties. It does not have the disadvantages mentioned above, but the collection of data is tedious, companies sometimes do not send the financial information and the reports may not be available in a language the researcher can understand.

4. *The sample*

The Transparency Directive, requires for listed companies annually and semi-annually information for listed companies, so we analyzed the existence and the content of the six sets of consolidated financial statements prepared in accordance with *endorsed* IFRS for the period 2006-2008, in the case of first category listed entities on BVB.

The entities included in the study are those that were listed in the Bucharest Stock Exchange (BSE), the official stock exchange of Romania on the date of balance sheet for financial year 2006, 2007, 2008. We analyzed also individual financial statements and auditor report to see if the entity was obliged or not to prepare consolidated financial statements.

From the total of 21 entities, 7 were excluded from our sample because for them was not mandatory to elaborate consolidated financial statement. The structure of our sample is the follow:

Table 1. Sample description

<u>Number of entities (2006, 2007, 2008)</u>	<u>14</u>
Romanian listed companies :	
- Banks -	3
- Investment funds -	5
- Entities in non-financial sector	6

5. *Items*

For years 2006, 2007, 2008 we analyzed if the entities obligated to present consolidated financial statements, present the complete set of consolidated financial statements containing:

- consolidated balance,
- the consolidated profit and loss account,
- the consolidated statements of the treasury flows,
- the consolidated statements of the changes in shareholder's equity,
- the group's accounting policies and the explanatory notes.
- the audit report attached o consolidated financial statements

Dichotomy for each item was used. We have opted for conceding the same importance to all the items selected. Lapsley (1992) explains that there is a general agreement among researchers about who the users of the annual accounts are but there are major doubts about the information that satisfies their needs. Consequently, we have not considered any information more important because its depends on the user. In addition, we made no attempt to give additional weight for the quality or quantity of the disclosure.

And for the each element we considered the minimum information required by IFRS. The consolidated balance sheet must present at least the following information, extra to individual balance sheet: financial investments accounted for using the equity method, goodwill, minority interest, presented in the shareholder's equity, issued capital and the reserves allotted to the holders of shareholder's equity of the parent company, group result.

The minimum information that must be presented in the consolidated profit and loss account extra to individual profit and loss account refers to: quota-part in the result of associated enterprises and of associates in participation equated, group result.

The consolidated accounting policies and explanatory notes extra to individually content the follows elements: the consolidation methods, the treatment of the purchasing differences, the conversion methods and the date of account closure; the evaluation methods and rules used for the significant posts in the balance and the consolidated profit and loss account; the consolidation perimeter;

Results

For the period 2006-2008 there were 14 Romanian entities, from the first BVB category which should present annual and interim consolidated financial statements. Just a part of them full fill these requirements as we can see in the follow table:

Table 2. Evolution of CFS disclosure for our sample

Entities	2006		2007		2008	
	INTERM	FINAL	INTERM	FINAL	INTERM	FINAL
TOTAL	14	14	14	14	14	14
SFC	0	5	3	9	4	13
%	0%	35,7%	21,4%	64,3%	28,6%	93%

About the annual CFS there is positive evolution, for instance if we compare 2006 with 2008, in 2006 the number of CFS is limited at 5 but in 2008 the number increase at 13, so only one entity not present CFS. About the interim CFS, the situation is not the same as for annual CFS, due to the less importance gave to interim CFS, by the entities: in 2006 there were nu interim CFS, in 2007 there were 3 interim CFS an in 2008 there were an insignificant increase at a total of 4. The set of CFS and the audit report for CFS were analyzed, and the Disclosure indexes of CFS for our sample were presented in the follow table:

Table 3. Disclosure indexes of CFS for our sample

Entities	2006		2007		2008	
	INTERM	FINAL	INTERM	FINAL	INTERM	FINAL
A	0	1	1	1	1	1
B	0	0	0	1	0	1
C	0	1	0	0,833	0	0,833
D	0	1	0	1	0	1
E	0	1	0	1	0	1
F	0	0	0	1	0	1
G	0	0	1	1	1	1
H	0	1	1	1	1	1
I	0	0	0	0	1	1
J	0	0	0	0,833	0	0,833
K	0	0	0	0	0	0
L	0	0	0	0	0	0,667
M	0	0	0	0	0	1
N	0	0	0	0	0	0,833

In 2006 the 5 sets of annual CFS were complete, with all elements of CFS and also the audit report for them. In 2007 the number of CFS increase at 9 but the content is less qualitative because there are two entities who present only the consolidated balance sheet, profit and loss account, cash flow statement and own equity movement, without accounting policies and explanatory notes, but joined by the auditor report. In 2008 the evolution is in the same trend like in the previous year, so the number of annual CFS increases at 13 but the quality also decrease, there are 4 CFS which not receive the maximum disclosure index because there are missed parts of the complete set of CFS or are not audited.

Conclusion

There are two important aspects about the CFS disclosed by the Romanian entities from the first BVB category:

- concerning the number of entities which must present CFS, we can conclude that for the analyzed period the number was constant and in time the evolution was good taking into consideration that only after 2007, Romania became an EU member with all obligations concerning the disclosure of financial and nonfinancial information.
- concerning the presented CFS, no significant non-compliance issues were identified during the review of the consolidated financial statements for companies of the sample and none of the audit opinions was qualified. The auditor role is important as we consider that in the auditor report for

individual financial statements of previous years, before the presentation of CFS the auditor emphasis the matter about the mandatory CFS presentation.

Generally speaking, we consider that all entities quoted must realize, the adoption of IFRS is an effort to improve company credibility, in our case, the credibility of Romanian companies, particularly those listed on the Bucharest Stock Exchange (BVB).

THE BUDGET, AN INSTRUMENT FOR PLANNING AND CONTROLLING THE COSTS

Todea Nicolae

Univ. 1 Decembrie 1918 Alba Iulia

Călin Anca

Parchetul de pe lângă Curtea de Apel Alba Iulia

The budget is a management instrument used by any entity, financially ensuring the dimension of the objectives, revenues, expenses and results at the management centers level and finally evaluating the economic efficiency through comparing the results with those budgeted for.

A major component of the managerial control, the effectiveness of the budgeting process is reflected in the fact that: requires the strategic planning and implementing the plans, offers a frame of reference for performance evaluation, contributes to personnel motivation, encourages the coordination and communication.

Keywords: budget, management centers, managerial control, strategic planning

Cod JEL lucrare: H61

The Budget and Budgetary Cycle Concepts

All throughout the activity, regardless of how perfect the unit's strategy is, controlling the predictions is necessary to track down the causes that lead to certain deviations, to assign responsibilities and to anticipate some corrective measures for them. This prediction control system that contributes to achieving the time-targeted objectives, of one year deadline usually, is called *budgeting*.

Budgeting represents the accounting instrument used by companies on a regular basis to plan and control their actions in order to satisfy their clients and secure their success on the market¹²⁵⁴.

The budget can be defined as a „financial plan that includes calculating the revenues and expenses of the state, a social or economic organization for a determined period of time”¹²⁵⁵.

The budget is the quantitative expression of the plan framed by the administration for a specified period and a support for the coordination of the necessary activities in implementing that plan. A budget may reflect both financial and non-financial issues concerning the plan and represents a „schedule” regarding the forthcoming period. A budget that includes financial aspects quantifies the administration's predictions regarding the profit, treasury's cash flows and financial statement of the entity. The financial statements for the forthcoming period can be drawn up the same way as those for the former periods. Non-financial budgets can be drawn up in addition to these financial budgets such as those regarding the number of products, the number of employees or the number of new products introduced on the market.

The budget may become an instrument for the amortization and optimization of the relation between revenues and expenses within an entity whereas the costs budgeting may become a systematic economical practice that demands carrying out a formal process by which financial resources are distributed in order to achieve the time-objectives for the forthcoming periods¹²⁵⁶.

¹²⁵⁴ Charles T Horngren, Srikant M. Datar, George Foster, *Costs accounting, a managerial perspective*, Arc Publishing, Craiova, 2006, p. 198;

¹²⁵⁵ Gheorghe D. Bistriceanu *Finances, banks and insurances thesaurus, Vol. I*, Economica Publishing, Bucharest, 2001, p. 234

¹²⁵⁶ Sorin Briciu, *Managerial accounting, theoretical and practical issues*, Economica Publishing, Bucharest, 2006, p. 248.

Practically, the budget can be viewed as a list, a document that includes the predictable revenues and expenses of an entity, regardless of its size, within a certain period of time. The budget represents the underlying activity of the economical agents.

The budget reflects the economical unit's revenues and expenses, financial results, proper funds including the employees' contribution to the profit, bank loans and their reimbursement, payments to the treasury and information regarding the main indicators of its activity.

The budget contributes to maintaining a permanent balance between receivables and payments and also ensures a continuous capacity of payment. The budget of an enterprise reflects the potential of achieving its revenues, the expenses' limit as well as its final results. The unit's financial balance must permanently reflect the match between the monetary resources and the actual needs, according to the requirements of a lucrative economical-financial activity.

In the context of economic competition, where the companies' activity must be lucrative, the budget contributes in increasing the profit and decreasing expenses, therefore the budget represents a leading instrument. The budget is an instrument used by any entity, financially ensuring the dimension of the objectives, revenues, expenses and results at the management level and finally evaluating the economic efficiency through comparing the results with those budgeted for.

The elaboration, monitoring and controlling the budgets is mandatory for the purpose of acknowledging the results and delivering private information necessary for the decision making. If the budget is designed to present all the predictable figures of the enterprise, it is questioned whether autonomous subsystems called expenses centers (places) aimed at optimizing the use of resources and making profit should be created within. The expenses center is a recognizable function or a part of the enterprise for which the expenses can be identified. In the case of the profit center, both the expenses and revenues can be identified.

The budget center represents a sector of an entity that can be controlled and budgeted. A budget center may be an expenses centre, an assembly of expenses centers or may coincide with a profit center. Depending on its size, a common profit center may consist of several budget centers which may independently consist of either a single expenses center or an assembly of interconnected expenses centers.

The budgeting process is characterized by the following features:

a) Planning and coordination

The budgeting process is based on some more general long-term objectives with the purpose of elaborating thorough operational plans for different sectors or executive links of the enterprise. Planning is the key to success in any business and it is encouraged by the allotment of budgetary resources.

Planning is reflected in the *master budget* that includes all the *secondary budgets*, a fact that determines the managers to consider the relation among the function of the budgets and the various departments of the enterprise and to analyze the way in which they contribute to achieving the objectives.

b) Authority and responsibility

The budgeting process assumes that the entity is organized in responsibility or budgetary centers and follows clear instructions regarding the responsibilities of each manager that has a budget as well. Adopting a budget includes the authorization of all its activity plans, allowing the exceptional management which means that a subordinate is given a specified role and also the authority and necessary resources to carry out the assigned part of the plan but if the activities do not follow the plan, the variations are reported to the superior authority.

c) Communication

The budgeting process involves all the managerial levels and constitutes an important means of communication between the superior and middle management regarding the targeted objectives and their achievement. When the budgeting process ends, the approved plans are communicated to the entire involved personnel.

d) Control

This element of budgeting is the least expected by employees. The process of comparing the current results with the planned or budgeted results and reporting the comparison's results, which is in fact the budgetary control, establishes a guideline for carrying out the plans within the set limits for the expenses.

e) Performance evaluation

The performance of the managers is partially evaluated according to their ability to implement the budgets. The data regarding the manager's budget and his ability to achieve the budget objectives is an important factor whenever a manager is evaluated to be promoted, to be given a raise or in any other kind of assessment. The budgets used as objectives may assist a manager in monitoring his own performance.

The budget objectives are:

- provide the basic information, the cost for elaborating the development plans;
- indicate the conditions under which the patrimonial unit must work to achieve the targeted objectives (e.g. the amount of sales that ensure the predicted profit until the end of the trimester);
- represents an instrument for coordinating the activity within the patrimonial unit encouraging the information circuit regarding the costs and increases the awareness among the individuals responsible for the expenses centers;
- increases the capacity to anticipate the consequences of the decision made or that are about to be made, since the budgets are a referential image directed by the decision makers.

The budgeting procedure can be divided into the following stages:

1. Setting of the company's objectives for the following year (operational plan) by the general administration and communicating them together with the information regarding the business environment to the management centers;
2. Elaboration of the provisional budgets (prebudgets) by each individual responsible for the designated centers within the enterprise and the selection of one desirable version;
3. The assessment of budgetary coherence according to which the provisional budgets of each responsibility center are regrouped at the level of general administration so that the coherence among the different components of the budget is evaluated. The management centers and the budget committee organize a debate on the objectives and resources allotted for their achievement, negotiating the objectives and assigned resources for each budget. The management controller has a very important role in this stage because he analyzes the credibility of the initial hypothesis and objectives, evaluates the sensitivity of the results in relation with the most uncertain variables and ensures the existence of a reserve fund at the level of general administration that can be used throughout budgets' execution in the case of an unfavorable turn of events or an unexpected management situation at the level of budgeted entities.
4. The elaboration of definitive budgets and their delivery to the responsibility centers;
5. Monitoring the budgets' execution and their update depending on the evolution of the business environment and the achievement of the objectives;

The advantages of the budgeting process are:

- the manager of the patrimonial unit has the possibility of coordinating all of its functions (supply, production, sale);
- indicates the conditions under which the patrimonial unit can achieve the targeted objectives;
- provide the necessary information for setting up future actions;
- allows the comparison of the targeted objectives with the performance of the patrimonial unit;
- allows the anticipation of certain difficulties that might be met and the solutions for their prompt counteraction.

The disadvantages of the budgeting process are:

- the risk of having the patrimonial unit's activity blocked on one single plan of action;
- the aversive reaction of the employees in the case of unrealistic objectives;

- the risk of losing control over the costs due to the misconceptions of the employees and chiefs of departments according to which smaller resources will be allotted for the next year if during the current year a smaller amount of resources than allotted are used.

Another important issue regarding budgets is the *budgetary management*. The budgetary management or the budgetary system represents the management process consisting of translating the numerical action plans called budgets, the decisions made by the administration with the participation of the responsible agents. The budgetary management includes preparing the budgets, analyzing the errors and correcting them.

The budgetary management is based on the following principles:

- *the integrity principle*, which entails that all the activities of a patrimonial unit should be characterized by a perfect coordination between the various functional and operational services;
- *the principle of superposition* of the budgetary system over the authority system from the patrimonial unit, which means that the budget must be identified with a responsible individual and its accounting authority description;
- *the principle of maintaining the solidarity among departments and the congruence with the strategic objectives of the patrimonial unit*;
- *the versatility principle*, which means adjusting the budgets to the changes in the economical variables;
- *the principle of personnel policy coupling* to determine the motivation and adhesion of the personnel to the targeted strategic objectives;
- the principle of updating the budgetary predictions.

The budgetary management has the following characteristics:

- is a result of the strategy and predictions;
- is an element of coordination among several levels of activity, since the budgets are inter-correlated;
- has some limitations such as being too theoretical, expensive and sometimes unusable.

The effectiveness of the budgetary management depends on the quality of predictions but also on the corrective measures taken.

The elaboration of an organization's budget is important to its success for three reasons. First of all, the elaboration of the budget requires the management to analyze the future activity and plan the objectives and events in the short run as well as in the long run. Second, the entire managerial team must collaborate in the setting and following these plans. Third, performance analysis on each managerial level is possible by comparing the budgets with the actual results.

The budgetary system of an entity is one of the most practical management control procedures, precisely organizing the tasks for enhancing the enterprise's performance and correcting the potential errors. It indicates the way in which profit is obtained, allowing the decision makers to understand the factors that generate profit and to operate upon the controllable variables that influence the achievement of foreground objectives. Moreover, the budgetary system directly contributes to the elaboration of provisional synthesis documents: provisional balance sheet, provisional income accounts, treasury and financing plans.

In order to achieve its objectives, the budgetary system must meet the following conditions:

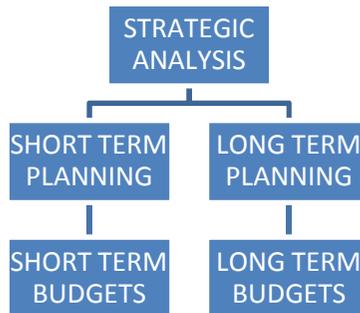

- implication and support from the top management;
- implication of all department managers in throughout all aspects of the budgeting procedure;
- clearly defining the long-term objectives;
- a realistic organizational structure, with clearly defined responsibilities;
- the accounting and informational system must be adequate;
- the regular revision of the budgets and the objectives;
- the administration of the budgets in the most flexible way¹²⁵⁷.

¹²⁵⁷ Briciu Sorin, *The Informational System regarding the management accounting and calculation of costs in industry*, Argus Publishing, Bucharest, 2000, p. 47.

A major component of the managerial control, the effectiveness of the budgeting process is reflected in the fact that: requires the strategic planning and implementing the plans, offers a frame of reference for performance evaluation, contributes to personnel motivation, encourages the coordination and communication.

1. Strategic planning and implementing the plans

Budgeting is effective if it is a part of a company's strategic analysis, which means that the long term planning is used in the elaboration of long term budgets whereas the short term planning is used in the elaboration of short term budgets.

2. The budget, a frame of reference for performance evaluation

A company's performance can be evaluated through its reference to the elaborated budgets for those plans, which contributes to the elimination of some difficulties concerning the use of past results in analyzing the current results such as:

- the past results include the activity's failures, the substandard performance within the previous period;
- the activity's conditions can differ in the future as compared to those in the past.

The evaluation of individual professional performance represents the set of processes and procedures implemented annually through the application of performance criteria for the degree of accomplishing the professional objectives based on the job description.

The individual objectives must meet the following requirements:

- the activities must be specific and in accordance to the requirements listed in the job description
- to be measurable, and have a concrete form of achievement;
- include deadlines;
- set realistic expectations that can be accomplished within the specified deadlines and with the allotted resources;
- are flexible in the sense that they can be revised depending on the encountered modifications and priorities.

The evaluation of individual professional performance is based on special legal regulations for each personnel group, requiring the different approach of these issues.

The score for achieving the objectives is obtained by calculating the arithmetic average of the grades given for the achievement of each objective, including the individual revised objectives in the case a revision was necessary during the evaluation period. The score for achieving the performance criteria is obtained by calculating the arithmetic average of the grades given for achieving each criterion. The final score of the annual evaluation is obtained by calculating the arithmetic average of the individual objectives and performance criteria grades.

The evaluation procedure consists of three stages as follows:

- drafting the evaluation report by the evaluator;

- the interview;
- registering the evaluation report.

3. The budget, a motivational factor for achieving the objectives

Research studies report that “bold” budgets contribute to improved results since the incapacity to accomplish the predicted levels budgeted for is perceived as a failure. The majority of the employees is motivated by the desire to avoid failure and succeed; as soon as they get closer to achieving an objective, they intensify their efforts to attain it. For these reasons, setting high but achievable objective is important.

Training is a difficult task of the management, entailing decisions that determine the personnel to participate in the process of targeting and achieving the objectives, taking into consideration the motivational factors.

Therefore, I estimate that the chief of departments should try to get to know each subordinate’s personality and more importantly their professional interests and their predispositions with regard to a certain working activity.

From the point of view of the instrumentality of personnel motivation, the manager of each organizational link may intervene in the following ways:

- through positive motivational factors, offering the subordinate employees the possibility to attain their professional goals, to publicly recognize their achievements, to facilitate their promotion, to facilitate their personal development;
- through diminishing the effects of negative motivational factors (hygiene factors), the supervision strategies, promoting interpersonal relations, ensuring an adequate working environment, organizational culture.

4. The budget, an instrument for promoting the coordination and communication among the institutional structures

Coordination represents the deployment and trimming of all production or service factors from all economical functions and departments in the most effective way to allow the company to achieve its objectives.¹²⁵⁸

Communication assumes that the personnel from all organizational subunits understands and accepts these objectives.

HUMAN RESOURCES ACCOUNTING – ACCOUNTING FOR THE MOST VALUABLE ASSET OF AN ENTERPRISE

Vatasoiu Cristian Ionel

Valahia University of Târgoviște, Faculty of Economics

Cornescu Alina

Valahia University of Târgoviște, Faculty of Economics

Motoniu Ioan Dumitru

Valahia University of Târgoviște, Faculty of Economics

Employees are the most important assets of an enterprise and its success or failure depends on their qualifications and performance. Human resources are not properly evaluated because the enterprises consider the wages, actually an investment in the qualification and improvement of the staff as expenditure and not as an investment in the most important asset of an enterprise – the human capital. The current accounting system is not able to provide the actual value of employee capabilities and knowledge. This indirectly affects future investments of a company, as each year the cost on human resource development and recruitment increases. Human resource accounting is a direct part of the social accounting and aims to provide information on the evaluation of one of the most important components of the organization, namely human capital. This article seeks to show the importance of human resources for an enterprise, what human resource accounting is, which would be its implications and what are its main objectives.

Keywords: Human Resources Accounting, human capital, knowledge, intangible assets, Lev & Schwartz model

Jel code: M41 Accounting

1. Introduction

In recent years, the economic, political and social environment underwent profound changes that caused a higher level of globalization and an increasingly greater competition. Corporations have become increasingly strong and rising the problem of responsibility assuming, the companies have started to give increasingly more importance to corporate social responsibility. Customer expectations increased regarding product quality and environmental protection by producers.

We are in an unbelievable economic crisis, but this will end, sooner or later. It is therefore very important to know what role investment in human capital plays in solving this dilemma. In an economy based on knowledge, people being knowledge-holders become the most valuable asset of an organization¹²⁵⁹.

In the economy of knowledge, there are the typical organizations developing, called knowledge or cognitive-intensive organizations. The term "knowledge-intensive" apply to organizations in which knowledge has more importance than other inputs and human capital predominates over other forms of capital¹²⁶⁰.

Specific to knowledge are two dimensions - human and economic. At company level, knowledge is reflected in the workforce (human capital), in the requirements and preferences of customers (customers as capital), in the products, processes, capabilities and its systems (structural capital). As a result, the value of knowledge assets can significantly exceed the value of tangible assets. Assessments of companies like Microsoft are telling in this regard.

¹²⁵⁹ Nicolescu O., Nicolescu L.: *Economia, firma și managementul bazate pe cunoștințe*, Editura Economică, București, 2005.

¹²⁶⁰ Starbuck W.: *Learning by knowledge-intensive firms*, Journal of Management Studies, No.3, 1992.

2. Human resources. Most valuable asset of an enterprise.

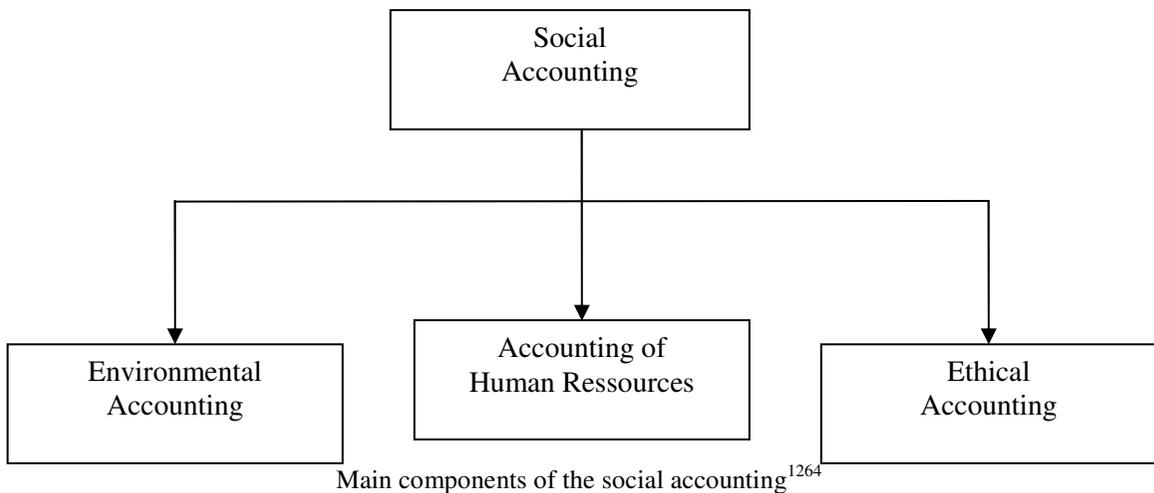

Resources are "all human, material, real and monetary elements that can be drawn and used in the production of economic goods to satisfy social needs"¹²⁶¹. With the advent of the new economy, knowledge-based economy it has been concluded that human resources becomes increasingly more important in determining the total value of an organization. Human capital refers to a set of knowledge and competence, skills and training, innovation and capabilities, attitudes and skills, learning ability and motivation of the people who form the organization.

Although the technical installations, equipment or financial capital are important, human resources, in particular, very important¹²⁶². Manolescu asserted that the traditional approach is to treat people as mere "expenditure" or in the accounting approach tendency as mere costs¹²⁶³.

Joint human resource paradigm is incomplete and limited. It takes your mind to a consumable resource type at a cost and therefore the administration in terms of minimizing costs. Actually it is about an essential strategic element in the company's future, it is about human capital. Human capital includes the combined knowledge, skill, creativity, resourcefulness and ability of each employee of a firm to conduct routine activities. It also includes the company's values, its culture and philosophy.

3. Accounting of Human Resources

Accounting of human resources forms direct part of the social accounting with the environmental and ethical accounting:

The American Accounting Association's Committee on Human Resource Accounting has defined Human Resources Accounting as the process of identifying and measuring data about human resources and communicating this information to interested parties. Human Resources Accounting, thus, not only involves measurement of all the costs/ investments associated with the recruitment, placement, training and development of employees, but also the quantification of the economic value of the people in an organisation¹²⁶⁵. Flamholtz¹²⁶⁶ too has offered a similar

¹²⁶¹ Dobrota N. - coordinator: Dictionar de economie, Ed. Economica, Bucuresti, 1999, 159.

¹²⁶² Armstrong, M., " A Handbook of Human Resource Management, Kogan Page, London, 2001.

¹²⁶³ Manolescu, A., " Human Resources ", Economic Publishing House, Bucharest, 2003.

¹²⁶⁴ Giju George Ciprian. Social accounting to make the social results visible, 2007.

¹²⁶⁵ American Accounting Association Committee of Accounting for Human Resources, Report of the Committee on Human Resource Accounting, 1973.

¹²⁶⁶ Eric G. Flamholtz: *A Model for Human Resource Valuation : A Stochastic Process with Service Rewards*, 1971.

definition for Human Resources Accounting. They define Human Resources Accounting as “the measurement and reporting of the cost and value of people in organizational resources”. Looking at different proposals¹²⁶⁷, the resource theory considers human resources in a more explicit way. This theory considers that the competitive position of a firm depends on its specific and not duplicated assets. The most specific (and not duplicated) asset that an enterprise has is its personnel. It takes advantage of their interdependent knowledge. That would explain why some firms are more productive than others. With the same technology, a solid human resource team makes all the difference¹²⁶⁸

Characteristics of Human Resources Accounting:

- Its a system of accounting in which identification of human resources is made.
- Investment made in human resources is recorded.
- Measurement of costs and values are made.
- Changes occurring in human resources over a period of time are also recorded.
- Communicates information through financial statements to interested parties.

The main objectives of Human Resources Accounting are:

- Proper management of human resources
- Improvement of human resources.
- Depicting the true value of the organization.
- Provides quantitative information on human resources which helps the managers and investors in making decisions.
- Human Resources Accounting communicates the worth of human resources to the organization and to the public.

4. The treatment of Human Resources Accounting

According to Barcons et al¹²⁶⁹ Human Resources Accounting can be treated from two perspectives:

4.1. Treatment from a Financial Accounting Perspective

Romanian accounting records to be kept in harmony with accounts in Class 4 Third party accounts and Class 6 expense accounts, namely:

- Group 42 “Personnel and assimilated accounts” (in which find both the accounting function of active accounts, the economic content of debt and liability accounts with the accounting office, the economic content of debt);
- Group 43 "Social security, welfare and similar accounts" (accounts with the accounting function of liability, the economic content of debts except the account 4382 "Other social debt "which has the function of active accounts, the economic content of debt);
- Account 444 "Tax on income from wages" account according liability account, the economic content of debt
- Group 64 "Staff costs" accounting with asset accounts function, uses economic content.

Following the definitions already explained, as long as future benefits are expected to come from these training costs, they can be treated as assets. However, this does not hold true in reality. As Cea García¹²⁷⁰ states: "There is a clear absence of correspondence between the real assets in the present firms and those recognised in the balance sheet... In fact, assets are too related to its juridical conception (that is, owned by the firm...), in front of a pure economic approach where

¹²⁶⁷ Conner, K.: A Historical Comparison of Resource-Based Theory and Five Schools of Thought Within Industrial Organization Economics: Do We Have a New Theory of the Firm?," *Journal of Management*, 17, 1, 1991, 21-54.

¹²⁶⁸ Archel, P.: Activos intangibles: análisis de lagunas partidas polémicas, *Revista técnica del Instituto de Censores Jurados de Cuentas de España*, 7, 1995.

¹²⁶⁹ Barcons et al: Human Resource Accounting, *International Advances in Economic Research*, 1999, 386-394.

¹²⁷⁰ Cea García, J. L. "Las cuentas anuales y la imagen fiel," *Partida Doble*, 4, September 1990.

asset is every instrument or way that can be used in the production-distribution firm's process or, in general, every category of economic value which can be transformed into goods or service or any instrument at the service of the firm or that the firm uses, regardless [of] its juridical state...and also all those goods and rights that the firm does not own now but used to own or will own later on, by virtue of collateral contracts or agreements which may induce it."

So, a diagnosis is reached about the predominant asset concept. This situation can be explained by two important problems that are met when referring to intangibles: Identify the assets cost and estimate the period in which the asset should be amortized.

In international accounting, besides clearly recognizing some items as assets (cash, stock, machinery, and so on) there is great debate whether certain other items are considered capitalization. These are known as deferred charges in English accounting literature¹²⁷¹. It can be said then that not only are the limits unclear between intangible, fixed assets and deferred charges, but also which elements are considered assets and which elements are considered expenses.

4.2. Treatment from a Managerial Accounting Perspective

Personnel working for a determined enterprise is actually participating in a value-creation process. That is, any economic activity makes the firm incur costs. One traditional classification takes into account the cost categories of raw materials, industrial plants, and personnel. When adding income flow to an organization's market goods and services, if it is superior to the cost flow, it becomes added value. This value is a consequence of the interaction between material and human resources in production. Because it is difficult to know and measure value, accounting has used substituted measures such as acquisition cost, substitution cost, and even opportunity cost¹²⁷².

5. Methods/Models Of HUMAN RESOURCES ACCOUNTING

Many models have been created to value human capital. Some are based on historic costs while some are based on future earnings. But each has its own limitations and one model has proved to be more valid than other. In The following we will make a short description of the most important models of Human Resources Accounting:

Historical Cost Method. Actual cost incurred for recruiting, hiring, training and developing the human resources of the organization are capitalized and amortized over the expected useful life of the human resources.

Replacement Cost Method. This is the measure of the cost to replace a firm's existing human resources. This method has the advantages of adjusting the human value of price trends in the economy.

Opportunity Cost Method. In this method, the human resource of an organization has to be valued on the basis of the economist's concept of opportunity cost which is value of benefit foregone by putting it to present use.

Present Value Of Future Earnings Method. It recognizes an individual's expected economic value to the enterprise during his remaining service period. An estimate about the future earning is made, and these earnings relate to the period which extends to the date of retirement of the employees. Such earnings are discounted by an appropriate range to get the present value.

The Lev & Schwortz Model. The Lev and Schwartz model states that the human resource of a co is the summation of value of all the Net present value (NPV) of expenditure on employees. The human capital embodied in a person of age r is the present value of his earning from employment

Under this model, the following steps are adopted to determine HR Value.

¹²⁷¹ Hendriksen, E. S.; Van Breda, M. S. *Accounting Theory*, Homewood, IL: Richard D. Irwin, 1992

¹²⁷² Marqués, E. "Contabilidad y gestion de los recursos humanos," *Pirámide*, 1974

- Classification of the entire labour force into certain homogeneous groups like skilled, unskilled, semiskilled etc. and in accordance with different classes and age wise.eg. In Infosys the classification is based on software professionals & support staff etc.
- Construction of average earning stream for each group.eg. At Infosys Incremental earnings based on group/ age have been considered.
- Discounting the average earnings at a predetermined rate in order to get present value of human resource's of each group.
- Aggregation of the present value of different groups which represent the capitalized future earnings of the concern as a whole,

$$V_r = \frac{I(t)}{(1+r)^{t-r}}$$

Where, V_r = the value of an Individual r years old

$I(t)$ = the individual's annual earnings up to retirement

t = retirement age

r = a discount rate specific to the cost of capital to the company.

Critical appraisal of the Lev & Schwartz model:

- It is essentially an input measure .It ignores the output i.e. productivity of employees.
- Service state of each individual employee is not considered.
- The training expenses incurred by the company on its employees are not considered.
- The attrition rate in organization is also ignored.
- Factors responsible for higher earning potentiality of each individual employees like seniority, bargaining capacity, skill, experience etc. which may cause differential salary structure are also ignore.

Just like the environmental accounting, human resources accounting is necessary to get incorporated into the financial statements due to internal or management usefulness in taking decisions by potential users as well as externally for making decisions on staff by management. Accounting of Human Resources incorporates in the present financial statements of information on the assessment of one of the most important components of the organization, namely human capital.

In order not to conflict with International Accounting Rules we consider the easiest solution to be the legislation on the adoption of an annex to the annual financial statements that should include information about human capital, namely:

1. *Non-financial information:* leadership; motivation; ability of execution of delegated tasks; relation; number of employees; seniority in the company; stability in the company post; number of managers; number of women managers; percentage of managers with higher education; the average age of employees; the average length of training programs (hours/employee); IT knowledge.

2. *Financial information:* expenditure on advertisement for recruitment; cost of selection; training cost; on the job training cost; subsistence allowance; contribution to provident Fund; educational tour expenses; medical expenses; ex-gratia payments; employee's welfare fund.

As you can see all the individual capabilities, skills and experience of employees and management, creativity and spirit of innovation, investment in recruitment, selection, contracting, personnel qualification and improvement are included in the term of human capital. From the above discussions, it is felt that, Human resource accounting provides quantitative and qualitative information about the value of human asset, which helps the top management to take decisions regarding the adequacy of human resources. Hence, It is Concluded that, the Human Resources are an indispensable but often neglected element is thus to be foregrounded into the industrial area for the betterment of the economy.

Conclusions

The claims of the investors, the need for greater transparency and the free access to information, as well as the increasing of the value of intangible assets will make the financial report of companies have a much broader approach in the future. Thus, it could include the measurement of sustained effort, of corporate governance or human capital. The nature of the financial ratio will change in the future, as the importance of figures will not be the only aspect to consider. Thus, a financial report could measure human capital, the company's social responsibility or even carbon emissions.

Present accounting system ignores the importance of human resource value and Managers lack information about the effectiveness and efficiency of human resource investment. IASB treats most human capital related costs as expenses, instead of assets. The more the company invests in human capital, the less the current net income.

No model of human resources accounting is accepted by the accounting bodies all over the world. However, still we find some application of Lev & Schwartz model is most public sector units and IT based sectors. What is needed is measurement of abilities of all employees in a company, at every level, to produce value from their knowledge and capability. Human Resource Accounting (Human Resources Accounting) is basically an information system that tells management what changes are occurring over time to the human resources of the business. Human Resources Accounting also involves accounting for investment in people and their replacement costs, and also the economic value of people in an organisation

Recommendations:

- Use data and information on human resources costs to base internal decisions and their disclosure through an annual report of the organization;
- Treating investments in staff development at the same level with other investments;
- Treating costs like staff training and development as capital investment expenditures that increase the productive capacity of employees.

OPERATIONAL ASSETS BOOKKEEPING IN CREDIT INSTITUTIONS

Zaharia (Chiru) Rodica

“1 Decembrie 1918” University of Alba Iulia

Faculty of Science, Doctoral School

Socol Adela

“1 Decembrie 1918” University of Alba Iulia

Faculty of Science

Through this work I wanted to present the structure and the emphasis on the key accounts operations on operating assets, mentioning that only the most important accounts or those by which accounting operations may be more widespread have been given. Operational assets are those parts of balance with which the credit institution normally operates and by which, along with the operating liabilities, the basic credit institution activity is accomplished. Operational assets are revenue-generating operations in the credit institutions, with their help the bank resources are used in different interest-bearing assets to maximize the profit and to reduce the risk margin, mainly aimed at reducing losses. By both the theoretical approach and by describing the aspects of the operating assets, the survey presents with particular importance of these revenue-generating operations in the credit institutions, and identifies major issues to be taken into account by the credit institution in order to use various resources interest-bearing assets to optimize profit margins and to reduce risk, having as main objective to reduce losses.

Keywords: Operations assets, incomes, deposits, credits, securities accounts.

JEL code: M41

1. Introduction

The banking system, through its extensive involvement in both the economic and the social life, is a special structural element in the society, whose good organization and efficient working condition the whole economical life.

The activity of the commercial banks operations is divided in two distinct groups:

- *Active operations* – namely the operations that reflect the use of funds raised to obtain profit by the difference between the paid interest and the received one to attract resources, and
- *Passive operation* - namely, operations that reflect the own funds of a bank or the attracted ones that a bank possesses in order to deploy its activity.

The balance, as part of the financial statements, is the instrument through which the principle of the double reflection of the assets elements is done by its form and standard content, which all units must comply with is drawn, it reflects the equality between the assets and the economic liabilities¹²⁷³. The operational assets are those elements of the balance-sheet assets with which the credit institution usually operates, and through which (along with the operating liabilities) the business credit institution base is accomplished. They generate revenues which are correctly done and managed, being accounted for Class 7 accounts – „Incomes”.

The structure of the *operational assets* contains:

- The house and other values;
- The bank deposits, namely: the current account/credit institutions correspondent, sight deposits, term /colateral deposits;

¹²⁷³ D. Mătiș -,„Bazele contabilității - aspecte teoretice și practice”, Editura Alma Mater, Cluj - Napoca, 2005, pag.390.

- The loans to banks, namely: ordinary loans, loans to raise claims / simple repurchase transactions, overdraft;
- The loans to customers (including the customer accounts), namely: ordinary loans (cash loans, export credits, loans for equipment, real estate loans, other loans), loans to raise claims/simple repurchase transactions, financial customer credits, overdraft;
- Titles such as: securities trading, securities investment, securities investment¹²⁷⁴.

Pointing out both the operational assets and the incomes generated by them is done using synthetic grade accounts I, II, III, Class 1-„Cash transactions and interbank transactions”, Class 2-“Customer operations”, Class 3 -“Transactions in securities and various operations” and class 7 -“Incomes”.

2. Proposed objectives and research methodology

Approach focused on investigating the main emphasis in accounting operations on operating assets, by presenting the general framework of reference of the theme in both the literature and the specific national legislation. The structure of the operational assets has been studied initially, the need to use funds raised in different interest-bearing assets, trying to find out how credit institutions organize their core business to reduce the risk margin and to get the most profitable income. Arguments for the need to study this type of operation were essential. Once the need for studying the structure of operational assets presented, each structural element was presented separately, as well as its emphasis in accounting. Information on the theme analysis was conducted by studying the national literature in the field, analyzing legislation and direct documentation in order to seek practical phenomenon of determining the structure of operational assets, at the level of the credit institutions operating in Romania.

3. Cash operations accounting

The cash is the asset on which the credit institution takes the decision to abandon an investment gain, in order to insure a proper liquidity. The cash register and circulation in commercial banks cashes is based on explicit regulations of the National Bank of Romania and is accomplished through account 101-“Cash”- which is an active account to be debited with the collected amounts and it is credited with the amounts paid in cash. Cash transactions at ATMs are recorded through account 102 -“Cash in ATM and PTT. The main cash transactions are:

- Cash purchase from the National Bank of Romania

Between the time when the cash is bought and the moment it is paid from the current account opened at the National Bank of Romania (for lei) or from the NOSTRO accounts (for currency) an intermediary liabilities account is used, namely account 1621- „Other amounts due”.

- registering the bought cash in the Cash account

101- Cash	=	1621- Other amounts due
-----------	---	-------------------------

- paying both the bought cash and its related commission

1621- Other amounts due	=	111- Current Account at BNR (lei)
-------------------------	---	--------------------------------------

		121/122-Nostru/Loro (currency)
--	--	--------------------------------

6019 - Commissions	=	111- Current Account at BNR (lei)
--------------------	---	--------------------------------------

- Cash sell towards the National Bank of Romania

Between the time when the cash is sold and the moment the current account opened at the National Bank of Romania (for lei) is fueled or from the NOSTRO accounts (for currency) with

¹²⁷⁴ Iosif Heteres Gavra - „Organizarea și operațiunile bancare”, Editura Orizonturi Universitare, Timișoara 2003, pag.82.

the sold cash equivalent an intermediary liabilities account is used, namely account 1611- "Values to recover".

- *cash release*

1611 - Values to recover = 101 - Cash

- *cashing both the sold cash and its related commission*

111- Current Account at BNR (lei)

121/122 - Nostro/Loro(currency) = 161 - Values to recover

111- Current Account at BNR (lei) = 7019- Commissions

4. Deposits bookkeeping at banks

- *Current accounts/accounts* that are the accounts which contain the lei or the currency amounts of the credit institutions, and they can benefit of them at any time. The account name through which they are pointed out is "The current account at BNR" for the available assets in the National Bank of Romania, and the "Correspondent accounts with credit institutions"¹²⁷⁵ for the available assets in the other commercial banks. Entrances and exits of account money are held through these accounts. The cash, the available assets in lei are held only in the National Bank of Romania, while the currency can be held both by banks in the country and by those abroad, called correspondent banks.

Similarly to credit and bank loans, the bank deposits are a way to place availability, namely to attract resources from other banks. On the interbank market, these deposits are made on the short and very short run, as follows:

- *Sight deposits* are deposits in lei or in foreign currency that the credit institutions form other banks, and which are formed only for one working day. This deposit has three main stages: *the creation date*, that date of the deposit off-balance registration starting from the date it has been contracted until the date it has been placed, *the time of placement*, ie the date on which assets are available to the party with which the convention has been concluded and *the maturity date*, respectively the date both the capital and the interest return to the credit institution which carries out the placement. The cashed interests are recorded in account 70131 - "Interests from the sight deposits".

- *Term deposits* are deposits in lei or in foreign currency that the credit institutions form in other banks, and whose term is longer than a working day. Where there are differences in time between the date of contracting the money and the date it is placed, then a registration in off-balance accounts will take place. The recording accounts of these deposits and interests are:

1312 - "Term deposits at banks";

1313 - "Collateral deposits at banks";

70132 - "Interests from the term deposits";

70133 - "Interests from the collateral deposits".

These term deposits are not concluded on the basis of contracts, but on some ceilings that the management of the credit institution approves in relation to each credit institution, depending on the cooperation from the previous period, the profitability, the shareholders of the credit institution where the money will be placed.

5. Accounting the loans to banks

- *Ordinary loans* are loans placed at other credit institutions based on advantageous credit agreements concluded. These loans may be granted for a day or on terms (for more than one day).

Credit grant

¹²⁷⁵ Biblioteca digitală ASE București - Adrian Enciu, "Contabilitate bancară", Cap.2 - Operațiuni de trezorerie și interbancaară, pag.6.

1412 - Credits on terms / lei	=	111- Current account at BNR
1412 - Credits on terms /foreign currency	=	121- Nostro/foreign currency
<i>Lei due time</i>		
111 - Current account at BNR	=	1412 - Credits on terms / lei 70142 - Interests
<i>Foreign currency due time</i>		
121 - Nostro/foreign currency	=	1412-Credits on terms /foreign currency
121 - Nostro/foreign currency	=	3712 - Currency exchange position
3722 - Counter value exchange position	=	70142 - Interests

- *credits for debt factoring* are the credits that have trade effects as warranty (Bills of exchange, promissory notes), the ownership of these assets temporarily transferring to the bank that has granted the credit. These credits' bookkeeping is done using the account 151-“Stock repurchase”, and the interests are recorded in account 7015 - “Interests on securities repurchase”;

- *overdraft* is the loan granted to the credit institutions that have opened an available assets account in other credit institutions records. The overdraft is the debit balance of this liability available asset account, which normally has a credit balance.

For example, a credit institution has an available asset account of 100.000 euros, but must make a payment of 300.000 euros. An overdraft credit of 200.000 euro is granted to it in order to achieve its purpose.

6. Accounting of the credits to customers

The customer loans are, for any commercial bank, the most important *asset investment*, the highest yield, bringing revenues, the financial support of its existence. They include:

-*The ordinary credits* represent the most important compound of a credit institution assets. Their bookkeeping is done through accounts specific to the destination they have been granted for, namely:

- account 202 - Treasury credits;
- account 203 - Consumption credits and hire-purchase ;
- account 204 - Credits for financing the exterior trade operations;
- account 205 - Credits for financing the stocks and the equipment;
- account 206 - Credits for the real estate investments;
- account 209 - Other credits for the people.

All these accounts are debited the moment the credits are granted.

- *Debt factoring credits* are loans to non-customers based on bonds, certificates of deposit, treasury bills. These transactions are called repurchase transactions and they represent the transfer of assets, based on a contract under which an institution undertakes to take back and the transferee institution, to repay the same assets at a price and a date set by the repurchase agreement. The transferee, that credit institution granting the credit, bookkeeps the operation in account 2412 – “Stock repurchase”.

- *Loans to financial customers* are loans to leasing companies, factoring companies, investment companies, and investment companies. These loans may be granted within one day and are recorded in account 2311 - “Loans to financial customers for a day” or on terms and registered in account 2312 - “Term loans to financial customers”.

- *Overdrafts* are loans to customers who opened a current account in the credit institution record - 2511. The overdraft represents the debit balance of this bifunctional account, but which currently has a credit balance¹²⁷⁶.

¹²⁷⁶ Mădălina Antoaneta Rădoi – „*Gestiune bancară*”, Editura Economică, București, 2009, pag.102.

For example a customer has, in a bank, a credit balance of 100.000 lei, and wants to make a payment of 150.000 lei to another customer from the same bank. Following this payment execution, this customer was given an overdraft payment of 50.000 lei. The accounting article is:

2511 - Current Accounts = 111 Current account at BNR 50.000 lei

- *Loans granted based on the commercial effects* are loans in group 201, and refers to standard, discount and factoring credits.

7. Accounting transactions

Besides loans, transactions in securities are one of the most profitable activity, leading to maximizing the shareholder wealth, the basic requirement of an efficient financial decision. In this category we have:

- *Securities transactions* are the securities acquired to generate short term profit. The interest calculated for the period since the bond are recorded together with the purchase price of the instrument in account 3021- "Securities Transaction". These securities are valued at fair value;

- *Coherent securities* are securities that do not meet the criteria of being included in the securities category. These securities are revalued at the market value. For unfavourable differences provisions are established, and the favourable differences are not accounted for. Claims from interests calculated for the short period since their issuance until the time of purchase may be registered in both the corresponding attached securities accounts or claims accounts- account 3037;

- *Investment securities* are securities used in a sustainable manner in the credit institutions. They are treated as financial fixed assets since they are investments characterized by fixed or determinable parts and with predefined maturity that the credit institution is capable to hold until maturity. On entering the patrimony, these securities are recorded at their acquisition value, which consists of the purchase price that also includes the transaction costs directly attributable to the acquisition. The short-run interest may be recorded in the corresponding attached claims account or may be registered in securities accounts.

8. Conclusions

Studying the relevant literature in operational assets and national rules allowed us to identify both the structure and the way of highlighting the accounting of such operations. We also recognize the complexity of the credit institutions related to the use of the more efficient funds raised by them for profit margin and in order to reduce the risks to which they are continuously exposed. However, credit institutions are not content with making only a regular income, they seek where possible and prudent to obtain other profits too by banking assets and liabilities maturity structure. Before an institution acts to change assets to increase profit, it must ensure that it is able to maintain an adequate liquidity and to consider the quantification of risk factors and symptoms of risk. In this context, we consider appropriate the need for both the diversification opportunities and the placement of the operational assets.

SECTION: MANAGEMENT AND MARKETING

SUB-SECTION: MANAGEMENT

HR TRAINING PROGRAMS – CASE STUDY: WHAT ARE THE PARTICIPANTS’ EXPECTATIONS?

Abrudan Maria-Madela
Universitatea din Oradea
Facultatea de Științe Economice

Hatos Roxana
Universitatea din Oradea
Facultatea de Științe Economice

Matei Mirabela-Constanța
Universitatea din Oradea
Facultatea de Științe Economice

When conducting a training program, training providers should ask themselves this question: What are the participants’ expectations? Training providers must correlate their programs with the needs and expectations of participants in order to be successful.

Considering there is a need for the professionalization of human resources management activities, we focused our attention on three key occupations of HR: Human Resources Analyst, Human Resources Inspector and Human Resources Manager. To assess the effectiveness of these trainings we used the following research instruments: focus group, monitoring questionnaire and evaluation questionnaire. Our experience with the training programs organized within the Training and Excellence Centre in Human Resources Management has shown us that participants have a great need for knowledge and personal development.

Keywords: HR, occupation, training, efficiency, methodology, case study.

JEL Classification: M53

Even though it is now universally understood that the acquisition of knowledge is the foundation of the competitive advantage of individuals and organizations in today’s economy, the question of how much to invest in workforce education and training has remained an issue for companies. Employees’ knowledge and skills are as important as the companies’ financial and material resources. In Romania, training programs are still widely used only by multinational companies, and less by national companies or non-profit organizations.

1. Training programs: evolution and prognosis

Although, Romanian training market has been in an obvious development in the years before the crisis, it is still far from similar markets in the region. In 2008, our national training market has been estimated at around 30 million euro, 30 percent up from 2007. Comparatively, Hungary, having half the population of Romania, has a training market four times bigger than the Romanian one, with a turnover of more than 100 million euro in 2007.

Despite the growth of the last years, the training market recorded significant decline in 2009 due to the world economic crisis. Companies have frozen their professional development budgets and training market lost 40 to 50 percent in 2009¹²⁷⁷. However, the first three months of 2010 show an upward trend and experts are confident that training market will recover the loss from the past year.

¹²⁷⁷ Iloviceanu Robert, *Ascendis: Piața de training a scăzut cu 50% în 2009*, published on October 5, 2009, http://www.standard.money.ro/articol_107629/ascendis_piata_de_training_a_scazut_cu_50_in_2009.html, consulted on April 10, 2010.

In 2006 the Ministry of Labour Social Solidarity and Family has developed a monographic research of a sample of occupations in the occupational field of Romanian economy, which has sought to highlight the main changes in content and networking of a number of 105 occupations.¹²⁷⁸ Instrument used to conduct scientific monographs had a high complexity, combining semi-structured interview techniques and questionnaire. Respondents to the semi-structured interview or questionnaire (by case) were technologists, department heads / workshop / team, representatives of human resources, technical director, workers, or, generically naming them: key respondents able to provide relevant and comprehensive information about the occupations. One of the major findings of this study is the growing importance of activities in the field "communication", "social sciences" and "management" skills and mastery of languages (including English language emerges with the highest importance) and computer working skills and electronic equipment.

This year, the main interest of companies will be for the sales training sessions. At the same time, experts believe that the demand for employee evaluation programs will increase also, as many companies will access European funds for human resources development¹²⁷⁹.

Most of the training programs in Romania develop the skills needed for one of the occupations described in the Classification of Occupations in Romania (COR).

2. Classification of Occupations in Romania

The Romanian Classification of Occupations (COR) was first published in 1995, and currently includes 3852 occupations. COR is the identification, ranking and codification system of all occupations that exist in the economy, regardless of their type and place. Using COR codes is mandatory for all central public administration bodies and local businesses, business organizations, trade unions, professional and political foundations, associations, individuals and legal entities.¹²⁸⁰

The review and updating of COR is the responsibility of the Ministry of Labor, Family and Social Protection. However, labor market increasingly leaves behind the COR. Many of the 3852 occupations that currently exist in the COR have no correlation on the labor market, while others newly created to meet the ever changing needs of the market are not included in this list. Although they have the possibility to insert new occupations in the classification, private sector employers prefer to report to the Territorial Inspectorates of Work other functions for employees whose occupations are not included in the COR, in order to respect the law.

Related to Human Resources, there are currently over 40 occupations defined by the COR. These include the following: HR analyst, labor market analyst, employment agent, human resources inspector, HR reviewer, manpower and unemployment expert, labor consultant, HR specialist, human resources manager, professional skills assessor and others. However, HR professionals consider it necessary to update the Romanian Classification of Occupations by placing

¹²⁷⁸ Blaga, E., Occupation evolution in 2010 perspective. In F. Chipea, Cioară, I., Hatos, A., Mihai, M., Sas, C. (Ed.), *Culture, development, identity, current prospects. 10 years since the establishment of departments of psychology and sociology at the University of Oradea* (pp. 55-80), 2007, Bucharest: Expert.

¹²⁷⁹ Mihai, Cristina, *Ce training-uri se vor vinde anul acesta în România?*, published on January 22, 2010, <http://www.dailybusiness.ro/stiri-cariere/ce-training-uri-se-vor-vinde-anul-acesta-in-romania-37255>, consulted on April 10, 2010.

¹²⁸⁰ www.mmuncii.ro, consulted on April 10, 2010.

approximately 10 new occupations which, although long been practiced in our country, are not yet defined by the COR. These new occupations relate to niche and specialist positions, such as: specialists in recruitment, training, organizational development, compensation and benefits, and human resources consultants.¹²⁸¹

Each of the occupations listed in the COR must comply with an occupational standard. The Occupational Standard (SO) is the document that specifies the units of competence and quality outcomes associated with the activities contained in an occupation. Based on the occupational standard that is nationally acknowledged, training programs are developed.

3. HR training programs

Training programs ensure the acquisition of new skills or the development of skills already acquired, and they can be: start programs, qualification programs, requalification programs, and specialization training programs. The responsibility for organizing training programs rests with training providers. The training providers' authorization activity is coordinated by the National Council for Adult Training (CNFPA). Record of training providers is included in the National Register of Authorized Providers

In Bihor County there are over one hundred occupations for which training programs are conducted, of which only five are human resources occupations. These are:

- Human resources analyst;
- Safety inspector;
- Human resources inspector;
- Human resources manager;
- Health and work safety specialist.

For these five HR occupations there are 14 authorized training providers in Bihor County.

Considering there is a need for the professionalization of human resources management activities conducted at county and national level, we focused our attention on three key occupations of HR: Human Resources Analyst, Human Resources Inspector and Human Resources Manager.

For the Human Resources Analyst occupation there are currently two authorized training providers in Bihor, while national wide their number is 21. For the occupations of HR Inspector and HR Manager, in Bihor County they are 9 authorized training providers, 4 of them organize training programs for HR Manager occupation. Nationally, there are over 420 such suppliers, of which 112 are for Human Resources Manager.¹²⁸²

3.1. HR training programs – Case study

In order to induce an attitude and mindset change among employees involved in human resources activities, our institution has accessed European funding for the organization of three training courses for these three occupations.

The title of the project was *Training and Excellence Centre in Human Resources Management*, and it was implemented between December 2, 2008 and November 30, 2009. The project was financed through PHARE 2006 Economic and Social Cohesion - Human Resources Development, under the program *Promoting lifelong learning and retraining for employment qualification*, contract number PHARE 2006/018-147. 04.02.02.01.605.

The Human Resources Analyst, Human Resources Inspector and Human Resources Manager training courses were conducted during 2009 at the Training and Excellence Centre in Human Resources Management (CFP - MRU).

1, published on December 18, 2009, consulted on April 10, 2010.

¹²⁸² Registrul Național al Furnizorilor Autorizați, www.cnfpa.ro, consulted on April 11, 2010.

3.1.1. Case study - methodology

To assess the effectiveness of these trainings we used the following research instruments: *focus group, monitoring questionnaire and evaluation questionnaire*. All the 61 trainees attended the training evaluation process and the instruments were designed to determine participants' perception of training effectiveness.

Monitoring questionnaire was designed to identify the usability of the information and skills learned during these training. For this purpose a methodology was developed that took up two research tools: questionnaire and focus group. Questionnaires were applied three times for each training program, at different time intervals, in order to capture the evolution of behavior and changes in work activities; the focus group was organized at the end of each training program.

Evaluation questionnaires were applied to participants at the end of each training program and referred to the following aspects: satisfaction with the training assessment of issues related to the training elements, evaluation of each training lecturers. The last part of the questionnaire had three open questions: to point out three positive and three negative aspects related to the training, to point out three issues they would like to change in the organization of the training attended.

The questionnaires were input in a database and processed in SPSS program.

3.1.2. Case study results

Overall, satisfaction of participants in the three trainings is held high, students declaring themselves satisfied with the most valued aspects. Of the 61 participants, 27 representing 44% said they were very satisfied with the training attended, and 48% said they were satisfied. A 5% of participants said that they are neither satisfied nor dissatisfied with the training attended, while 2 participants, representing 3% of the total, said they were dissatisfied.

Exhibit 1. Participants' level of satisfaction

Some *conclusions* of our case study, based on the results of monitoring research are:

- These trainings were an opportunity for each student for personal development; improve knowledge and obtaining a diploma.
- They have appreciate unanimously the fact that people with extensive practical experience were involved as lecturers
- Students would like a greater involvement of practitioners in HR for all training topics, and several examples of HR practice and conducting workshops.

- Discussions were open, face to face that encouraged dialogue and exchange of experience. Participants appreciated this kind of interaction that encouraged discussion, claiming that they had learned from the example of others.
- Participants of the Human Resources Manager training, unlike participants in the training of human resources analyst and human resources inspector, had no objections with regard to the mixed groups A and B (A-for those who work in human resources departments and B-for those who are not working in human resources departments).
- For most indicators their value grew up, which means an increase of responsibilities of staff working in human resources involved in the human resources analyst, inspector and human resources manager.
- In most cases, consequent to enrollment in the trainings, our participants have increased the responsibilities and the frequency of activities related to HR at the workplace.
- Increase the percentage of those who during the training:
 - Have received responsibilities without changing the job description.

Exhibit 2. Have received more responsibilities without changing the job description.

- Have planned their specific activities of human resources area.
- Have used a database of personnel records using computer.
- Have prepared and managed the accounting documents of staff.
- Have prepared retirement documents.
- According to monitoring questionnaire responses decreases the number of those who: organized training program for personnel worked in interdisciplinary teams, represent human resources department. These decreases can be explained by the fact that those activities are activities that have a lower frequency within a year in the HR department.

4. Conclusions:

Although in recent years we have seen a growing training market, Romania still has a long way in order to reach other countries. The year 2009 represented a decrease in training market, but the first trimester of 2010 shows a slight recovery as companies take into account employee training as a solution for overcoming crisis.

The number of training providers and authorized training programs has grown in the last years, but so did the expectations of participants and companies. Training providers must

correlate their programs with the needs and expectations of participants in order to be successful. At the same time, they need to take into account the demands of companies. When conducting a training program, training providers should ask themselves this question: What are the participants' expectations? Our experience with the training programs organized within the Training and Excellence Centre in Human Resources Management has shown us that participants have a great need for knowledge and personal development. Participants want to learn practical things, as well as to understand how HRM systems and methods are operating.

At the same time, participants expressed their desire to know and understand the real problems that practitioners have experienced. The training programs organized revealed that participants believe that a hundred hours are not sufficient to understand HRM strategies; they would like if more hours were assigned for the courses. Participation in workshops, solving exercises and a greater emphasis on legislation are also among the requirements of training participants.

As for our purpose to induce an attitude and mindset change among employees involved in human resources activities, we believe that a shift in the mindset has been made, but efforts are needed still to inoculate in their thinking a non-discriminatory and ethical attitude.

INTERCULTURAL WORK TEAMS, A CHALLENGE IN THE NEW CONTEXT OF ROMANIA'S EUROPEAN INTEGRATION

Bibu Nicolae Aurelian

Has Daniela

West University Timișoara

In the context of globalization, organizations proceed to adapt to exploit new opportunities by creating intercultural work teams (IWT). Consequently, their management acquires new dimensions. To be successful, international companies should adapt to cultural norms of the host country, without neglecting their own organizational cultural values that have ensured their success. IWT are the main instrument used currently to achieve this fit. IWT are the basic unit for performance in any global organization. We analyze the situation of IWT in Siemens VDO Romania and Alcatel-Lucent Romania, as promoters of teamwork and intercultural knowledge transfer inside them.

Keywords: work teams, intercultural, globalization, management

JEL Classification codes: M 12

1. The Need and Opportunity of Work Teams

Globalization is a continuously growing phenomenon which requires organizations to consider more complex factors in an international framework, something that rarely occurs without teamwork.

A management approach in a country does not necessarily give the same results in another country. Performant managers must know how to overcome this cultural barrier, either be it national or organizational, which makes people react differently to the same challenges, transforming the opportunity offered by working in teams in a success. Performant management appears to be problematic in IWT, as individuals tend to bring widely different views on appropriate ways to reward, recognize, evaluate, train and develop the members of global teams. Teamwork and, management of work teams have been the subject of numerous researchers in several fields, thus denoting the difficulty of exercising this in practice. The more difficult appears to be managing a work team whose members are from different national and/or organizational cultures or whose manager comes from a different national and/or organizational culture, a management that is to be oriented towards achieving performance. We refer especially to the management of IWT, a new challenge for managers in the context of European integration. Forming teams is generated by the organizations' need to adapt to the external environment, ensuring their flexibility and competitiveness¹²⁸³ in the new context of globalization.

Changes in the structures of the company, enterprises, markets, transactions, call for a focus on teams, only them being able to assume continuity, flexibility, professionalism and long-lasting performance. Teams "with a variable geometry" and "distance" teams show this more than ever¹²⁸⁴.

Teams are the basic unit of performance in any organization. In any situation requiring a real-time combination of multiple knowledge, skills and judgment, teams inevitably get better results

¹²⁸³ Escriba-Moreno, M. Angels, Canet-Giner, M. Teresa, "The combined use of quality management programs and work teams. A comparative analysis of its impact in the organizational structure" www.emeraldinsight.com/1352-7592.htm *Team Performance Management* Vol. 12 No. 5/6, 2006. pp. 162-181.

¹²⁸⁴ Nifle, R., „Le management des équipes à distance, Une application du modèle de Management Communautaire Avancé”, <http://journal.coherences.com/article361.html> jeudi 10 août 2006.

than some people with restrictive roles and responsibilities. Teams are more flexible than a larger group, being more easily formed, developed, refocused and dismantled. Teams and performance are an unbeatable combination¹²⁸⁵.

If the work group means a sum of component parts, namely of individual work, by contrast, teamwork is more than that amount¹²⁸⁶, it is that “group of individuals with complementary skills which develop a distinctive identity, working together in a coordinated manner and being committed to achieving a common goal of whose achievement they are considered equally responsible.”¹²⁸⁷

Many definitions approach the team as a group of two or more persons. Can a working group composed of two people be considered a work team? Is the dyad a work team? We say no, because it does not hold all the “ingredients” that give it this quality. Who coordinates, who exercises control, who oversees the work?

2. Work teams' typology

In organizations specific to the new international configuration, teams are found in different forms.

According to the criteria of cultural diversity, we identify:

1. *Team culturally homogeneous.*

2. *Intercultural team* – characterized by diversity of the national, organizational, managerial, culture etc.

3. *International team* – people from at least two different national cultures working together in the same organization or the same project, who have at least one common objective, which is the project goal. So, they can work together, interrelate, cooperate under the same management¹²⁸⁸.

All these types of work teams are themselves found in the following forms:

A second criteria is department number:

1. *Improve departmental team* – consist of employees working in the same department, led by the manager of the department concerned. Are established to identify and solve department problems, being authorized to implement solutions with a small number of approvals from outside¹²⁸⁹.

2. *Interdepartmental team* (problem-solving teams, special teams) – are made of people from at least two departments, for finding alternative solutions to complex problems, members being elected according to experience in the field. They are limited decision-making teams, being dismantled after solving the problem. Members of these teams engage only partially, being mainly engaged in tasks of the departments they work in.

Another criteria is homogeneity of skills needed to perform of the team:

1. *Functional team*, or stand alone teams – operate with traditional organizational hierarchies, their members possessing similar skill sets and qualifications, with the same functional specialties.

2. *Interfunctional team* (of processes improving, policy-making organizational teams) – their members belong to several functional areas of the organization, who are focused on a specific objective. While other teams usually have a more focused mission to a particular task,

¹²⁸⁵ Katzenbach, J.R., Smith, D.K., *The Wisdom of teams-Creating High Performance Organization*, A Harperbusiness Book, 1994, p. 15.

¹²⁸⁸ Bibu, N.A., Brancu, Laura, „Convergences of the Romanian societal culture with European culture clusters in the process of European integration. The role of intercultural teams management in increasing European cohesion”, 2008, <http://mpr.ub.uni-muenchen.de/9476/>.

¹²⁸⁹ Harrington H. J., Harrington J. S., *Management total în firma secolului 21*, Ed. Teora, București, 2000, p. 213.

multifunctional teams focus on a specific process. The multifunctional team or the process improvement team identifies process issues that will be corrected by an operational team. While the process team works on, the operational team only meets until the reported process problem is solved¹²⁹⁰.

Fourth criteria is management:

1. *Managed team*.
2. *Semi-autonomous team* – are composed of interdependent members jointly responsible for achieving goals, being assisted by a coordinator who liaises with the organization.
3. *Self-managed team* (self-directed, self-determined, self-regulated, and autonomous) – are composed of individuals having an interfunctional training, which interact and have responsibility and authority to perform a series of specific activities. They operate in the context of minimum intervention from management. Self-managed teams are favored by today's business environment, being agreed by employees, who want a greater freedom of action at work. Self-managed teams require significant interaction and a greater cohesion among members. They are the proper environment in which its members conduct efficient work in reduced surveillance.
4. *Self-managed interfunctional team* – self-managed interfunctional teams¹²⁹¹ have a specific role in achieving continuous improvement in all activities within an organization. Facilitating communication, innovation, and increasing autonomy of decision, in a self-managed interfunctional team everyone is aware it must take first responsibility for the results. Within self-managed interfunctional teams, members show a basic training, plus several additional trainings, they being experts in their own field and able to work with specialists in other departments of the organization.

Fifth criteria is objective:

1. *Creative team* – focusing on discovering the new.
2. *Tactical team* – formed to carry out well-defined plans.
3. *Project team* – a team formed for a limited time in which members cooperate to achieve the unique objective of the project.
4. *Quality circle team* – identify, analyze and solve problems at work, recommend solutions to management.

Sixth criteria is territorial division:

1. *Traditional team* – characterized by the face to face communication style, working in a given space.
2. *Virtual team* (geographically dispersed or not, the members are not in the same physical location) – These are teams whose members primarily interact electronically and who meet face-to-face only occasionally, usually temporary. Examples of such virtual teams include work teams whose members are located in different geographic areas, characterized by cultural diversity, or project teams. Their effective leadership and management can be very different from that applied to traditional teams.

Last criteria is level objectives' achievement

1. *Ordinary team* – fulfill the objectives at the proposed level.
2. *Performant team* – achieve their objectives at a level higher than proposed.
3. *High performant team* – very high effectiveness and efficiency, due to a tremendous effort and productivity.

3. Intercultural work teams

We bring into discussion an new approach to describe project teams: according to the “Hollywood model”¹²⁹², they are groups of individuals from various corporations that come to work together to develop a project (a movie-metaphor of reality), then dissolve, coming perhaps back together at one point to accomplish another project. In our opinion it represents an intercultural project

¹²⁹⁰ Harrington-Mackin, Deborah, Cum se formează o echipă de succes, Ed. Teora, București, 2002, p.15.

¹²⁹¹ Petrișor I, Progresul organizațional, Schimbare, Transformare și Inovare organizațională, Ed. Mirton, Timișoara, 1999, pp. 169-173.

¹²⁹² Bennis, W., Powell, Sarah, “Great groups and leaders”, <http://www.emerald-library.com>, *Team Performance Management: An International Journal* Volume 6. Number 1/2. 2000. pp. 34-36.

team in terms of organizational culture, and not necessarily in terms of the national one. Therefore, an international team is always an IWT, reciprocity not being valid. We will further use the term of IWT referring to the diversity in terms of the national culture of its members.

Why is the use of an IWT so important?

The IWT is a more complex version of a national team. This is currently the best existing form of organization to make best use of new technologies and knowledge, expertise and creativity of people from different cultures. Teams are organized as support networks for the mission of the organization, its objectives and strategy by creating, acquiring and transferring knowledge. There are new types of forms of IWT, such as the intercultural project teams. Also, there is a shift from the traditional model of building IWT to the model of intercultural virtual teams, to improve the knowledge creation process. IWT are different and therefore their potential for creativity is greater than culturally homogeneous teams¹²⁹³.

Multinationals, in particular the network type, use IWT as:

- a mechanism for encouraging innovation, organizational learning and transfer of knowledge;
- a path of breaking national boundaries, encouraging development of information flows through horizontal communication;
- a means of encouraging the various inputs in decision making, problem solving and evaluation of strategies;
- a way to develop global perspective;
- a way of sharing values through social development, supported by an informal, normative control.

To a certain extent, for certain international tasks, teams are formed by sending employees in different locations of the organization. Expatriates develop relationships that persist even after the tasks are completed. These informal links can then be activated for work, providing the project team members. Not everyone wants to be an international operator. In order to have available potential operators, multinationals are aware that they must provide international experience at all managerial levels, regardless of nationality. The idea of having a team of employees able to work in different environments, having different duties and jobs is promoted¹²⁹⁴.

The individual will bring in the IWT besides thinking patterns, feelings and personal reactions also fundamental features of the original national culture, generating an additional source of conflict. The way this conflict will be resolved within the team will make it creative, or not, in achieving its objectives.

Some conditions for effective IWT, adapted by research¹²⁹⁵ which has found the factors contributing to the effectiveness of multifunctional teams, could be:

- composition – all relevant specialties are needed, the more the team is diverse, the greater its creative potential is;
- objectives have to be complex, their accomplishment can only be achieved through collaboration;
- physical closeness – it is preferable that team members are close each other to facilitate informal contacts; otherwise techniques to replace the spatial closeness have to be applied;
- autonomy – teams need a certain autonomy from the organization and functional specialists need a certain degree of authority in decision making;
- rules and procedures are necessary to prevent chaos;
- team leaders need technical expertise and skills to work with people.

¹²⁹³ Bibu, N.A., Brancu, Laura, „Convergences of the Romanian societal culture with European culture clusters in the process of European integration. The role of intercultural teams management in increasing European cohesion”, 2008, <http://mpira.ub.uni-muenchen.de/9476/>.

¹²⁹⁴ Dowling, P.J., Festing, M., Engle Sr, A.D., International human resource management-Managing people in a multinational context, South-Western Cengage Learning, USA, 2009, p. 151.

¹²⁹⁵ Johns G., Comportament organizațional, Ed. Economică, București, 1998, pp. 249-250.

At this point, the interpersonal relations between team members formed after meeting face to face still have a great importance. They are the basis for building trust. Teamwork largely depends on the ability of members to trust each other¹²⁹⁶. If we are to think about IWT dispersed geographically, this means that management methods must be applied to replace the lack of spatial closeness between team members, by using appropriate communication techniques by which members can communicate sensitive information. Also, an aspect that leaves room for discussion would be the system of motivating members of IWT. What would be best so it is also the most effective – the one of the national culture or the one of the organizational culture? Perhaps, that of the team culture.

Thus, IWT management becomes more complex, including aspects of national culture of various members and the most effective ways to supplement its characteristics and bring those skills in line with the needs of the team.

3.1. Interculturalism and work teams of Siemens AG

Siemens AG, the leader in manufacturing and services in the electronics and electrotechnics field, can be regarded as one of the pioneers in promoting diversity in Germany. In 2001, the company published “Principles for promoting and managing diversity”¹²⁹⁷, showing that in countries with many nationalities, cultures, ethnic groups, religions and different conceptions Siemens wants to attract people from all these groups, motivating them to develop their abilities, giving them equal opportunities in professional and personal development. Within Siemens VDO Automotive in Timișoara most of the activity takes place in IWT. Our study made on one of the project teams (formed in the division called “Quality Team”) has shown that an important role is played by the degree of fusion or assimilation of the cultures involved. The team has eight members and each of them is responsible for completing a number of projects. Often they overlap, meaning that two or even more members have to handle the same projects, discuss with the same customers, thus working as a team. The German organizational culture has asserted itself, Romanians assimilating it quite easily, even if the number of German managers, initially the majority, dropped; on the other hand, however, one can observe that Romanian culture makes its presence felt. The specific German order and discipline, correlated with the Romanian creativity and diligence, make up an ongoing objective that the team manager does not overlook. In this case, we cannot talk about assimilation, but rather about a mutual complementation of cultures.

3.2. Interculturalism and work teams in Alcatel-Lucent

Another company that focuses on intercultural skills development of employees is **Alcatel-Lucent**, the largest manufacturer and supplier of equipment, technology and integrated telecommunications solutions, with a presence in over 130 countries on all continents, with a representation over 100 nationalities. Alcatel-Lucent Romania Timișoara operates in department teams, intercultural project teams. A feature offered by the company to its employees worldwide is the access to international learning and/or online documentation tools, which include the “Culture Wizard” solution¹²⁹⁸, specific for intercultural training and information. When the financial-accounting department has introduced a new working model based on the concept of *shared service center*, and the team from Romania gradually took over projects from across Europe, both team leaders and employees have noticed that they started to encounter more difficulties in communicating with colleagues abroad. Moreover, working with 20 different countries on the European continent, employees began to be increasingly annoyed while for the same kind of demand they found that were receiving very different feedback and responses,

¹²⁹⁶ Benson-Armer, Richard și Tsun-Yan Hsieh, 1997, „Teamwork across time and space”,

https://www.mckinseyquarterly.com/ghost.aspx?ID=/Teamwork_across_time_and_space_246.

¹²⁹⁷ <http://www.siemens.com/responsibility/en/employees/diversity.htm>.

¹²⁹⁸ <http://rw-3.com/>.

without understanding why. It was actually a problem of intercultural misunderstanding. Thus arose the opportunity to merge traditional communication training with interculturality elements, having as support the tools Culture Wizard already existing in the organization.

The first group participating in the training was the team that took over the project “Nordic countries” – Denmark, Sweden and Norway. The interculturality section of the training aimed to clarify the following issues: definition and content of cultural dimensions, comparative description of cultural profile of Scandinavian countries compared to Romania, focusing on major differences, the impact of intercultural differences on interpersonal relationships. One aspect that has surprised the participants referred to the communication style, Nordic countries being characterized by a more direct way of communication than we are used with in Romania. Once this issue was clarified, training participants agreed that direct style approach practiced by their foreign colleagues is not an insult, and in no case has it any connotation of impoliteness. Romanian employees understood that they need to structure their messages in a more clear and concise manner to capture the attention of their northern partners. Again by the analysis and discussion of this dimension, Romanian employees have found that Latin style to interrupt, to speak all at once, creates an impression of an extreme lack of professionalism in front of their Danish, Swedish and Norwegian colleagues. As advancing in accumulating intercultural knowledge, problems that the team had in the beginning within the joint project began to resolve. Such modules can be developed so that they can have direct applicability to specific problems encountered by different types of teams.

4. Conclusions

We talked about companies whose professionals are brought in and sent all over the world to form teams almost like a puzzle. Globalization and IT technological progress make possible to conduct activities and collaborations with anyone anywhere. These are challenges that professional managers must face, beyond overcoming the intercultural implications of a possible status of expatriate manager.

The multinational companies that are present in Romania use ITW in order to develop their activity, to implement new technology, to realize research and innovation projects. These teams are enhanced due to diversity's potential. Our studies, performed on the two companies, show that Romanians are open and adaptable to work in intercultural teams; this has been proved by their team's performances. The Romanians know to adapt to defined rules, clear procedures, specific to another's cultural organizations, succeeding in transmitting their creative spirit to the team. The rules and procedures are German, Austrian, Swedish, Danish, the atmosphere and human relations have all the best out of Romanians spirit.

THE IMPACT OF ORGANIZATION'S PERSONALITY ON MANAGERIAL BEHAVIOR

Bucurean Mirela

University of Oradea, Faculty of Economics

Costin Mădălina-Adriana

University of Oradea, Faculty of Economics

Organizational climate and the conditions that determine the "personality" of an organization represent important factors in determining the managerial behavior. Climate and behaviors are strongly influenced by organizational culture. Managerial behavior is determined by the variety of ways of realizing functions and by their attitude to employees and subordinates. These features of the each manager' behavior is defined management style.

This study examined the relationship between individual's personality, organization's personality, the environmental factors and managerial behavior. Data were collected from thirty enterprises (micro, small and mediums) from Bihor County. The results obtained from these sources suggested that the size of the lead group has a great influence on managerial behavior.

Keywords: culture, organization, personality, managerial behavior

Cod JEL lucrare: M10

1. The influence that culture have on organization's personality

Organizational culture is a way of thinking, a specifically way to see problems and solve them and a sense of belonging to a team. This feeling exists because people have found that everything works fine within the organization. Taking into consideration Edgar Schein's view, organizational culture is formed primarily to resolve two problems that any organization faces with: adaptation to external environment and internal integration.

Personality is the key element behind any organization and what it stands for, and the story that its products tell to customers. Every business element, from interactions with customers to the product packaging is an element of organization personality, and these are the aspects that inspire customers' delight or indifference¹²⁹⁹.

Organizational culture has a number of economic and social effects on the organization as an open system, on its employees and on the management practices. For employees, knowing organizational culture provides the understanding of organization's history and the behavior that will better fit to the community they belong. Employees will adhere to the specific values, to the philosophy of the organization, strengthening their confidence that they achieve the objectives in which they strongly believe. The organizational culture provides numerous criteria by which managers can make a useful behavior control in order to stop unwanted events and to acquire those accepted in that organization. Many experts consider that organizations that have strong cultures also obtain remarkable results, although it is difficult to make a link between organization culture and its performance¹³⁰⁰.

The main organizational culture's functions can be¹³⁰¹:

- It defines the boundary between one organization and others.
- Conveys a sense of identity for its members.
- Facilitates the generation of commitment to something larger than self-interest.

¹²⁹⁹ Bhargava, Rohit, Personality not included, Why companies lose their authenticity and how great brands get it back, McGraw Hill Publishing, New York, 2008, p.5.

¹³⁰⁰ Burdus, Eugen, Management Treaty, Economic Publishing, Bucharest, 2005, p.261.

¹³⁰¹ <http://www.scribd.com/doc/23413135/Organizational-Culture>, accessed on 18.04.2010, at 15:55.

- Enhances the stability of the social system.
- Serves as a sense-making and control mechanism for fitting employees in the organization.

In certain organizations there is strong culture because managers and employees respond positively to the stimulus from the organization due to their alignment towards the organizational values. In organizations where people have minimal alignment towards organizational values we can talk about weak culture. In strong cultured organization people don't challenge organizational thinking in spite of the fact that they have different thoughts, psychology and ideas for it. The charismatic style of management, the friendly atmosphere among people or the evangelical belief in the organization's values can provide a strong organizational culture. The requirements of a good organizational culture can be considered the following¹³⁰²:

- There should be openness and humility in the nature and behavior of every person in the organization from top to bottom.
- The environment in the organization should induce accountability and personal responsibility.
- The employees should have freedom of taking risks with their new ideas but within their limits.
- Managers should encourage employees to experiment and convert the aspects that they consider negative into positives ones.
- The organizations should work only on the basis of clarity, transparency and reliability between the people and the organization.
- By integrating the people to put the effort collectively multiplies the organizational strength.
- Collaboration with organizational culture consultants whose theories can lead to business success.

Organizational culture's orientation towards results and performance can be done by achieving the sense of employee's satisfaction and by induction of loyalty feeling. For obtaining and maintaining a strong culture, employees must be treated with respect and encouraged to take initiative, be creative in everything they do and it is necessary for managers to set some reasonable clear standards, and to give them enough autonomy¹³⁰³.

2. Factors that determine the managerial behavior

Organizational climate determines factors or variables that influence members and groups' activities and attitudes in an organization: rules and regulations, organizational or environmental constraints, decision-making strategies and motivating people, means of transmission of information, etc. The main dimensions of organizational climate are¹³⁰⁴:

- The structure of tasks and the methods used for accomplishing the tasks are well controlled and organized.
- The relationship reward-punishment: additional rewards for promotion and increased salary are based on performance and merit, rather than other considerations, such as seniority, favoritism etc.
- The centralization or decentralization of making decisions.
- Increasing people's achievements or desire to do good work and contribute to company performance.
- Increase training and development and the degree to which the organization seeks to support training and development performance.
- Security and risk or the degree of pressure and employees' uncertainty feelings and anxiety.
- The general feeling that individuals have a good job.
- The employee's sureness that their work is approved and appreciated by supervisors.
- The organization knows that the objectives can be achieved in a flexible and innovative way.

¹³⁰² <http://www.scribd.com/doc/23288238/Organizational-Culture>, accessed on 18.04.2010, at 12:56.

¹³⁰³ Nica, Elvira, *Managerial Psychology*, Economic Publishing, Bucharest, 2008, p.23.

¹³⁰⁴ Prodan, Adriana, *Successful Management*, Polirom Publishing, Iasi, 1999, p. 91.

Managerial behavior cannot be independent of any of these components which form the organizational climate. For example, at the upper levels of the hierarchy there is a wider space of freedom on setting goals, decision making and motivational strategies, the monitoring arrangements, etc.

Behavioral scientists agreed that there isn't an ideal recipe that managers should follow in order to obtain success. Each manager organizes and leads in the way that he/she considers is better for the organization. Even if there are some rules concerning organizational management, each manager will interpret and adapt them according to his/her natural mode of being¹³⁰⁵.

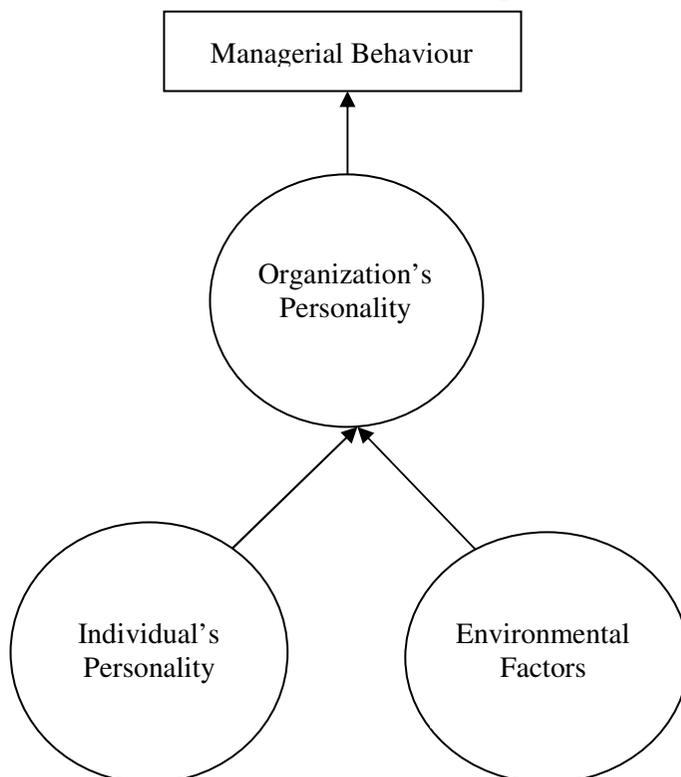

Often it is assessed the participatory management because of the involvement of all employees in problem solving and decision making hence, due to favorable effects on performance. But not always such a management style is positive when a change is to be made within organizations.

Between organization culture and managerial behavior within it there is a direct link. An organizational culture may lead to a positive behavior by promoting values. Also, managers in an organization, through their daily behavior by performing roles and performance management may foster an ethical behavior within the organization.

To maintain the organization culture and the managerial behavior at a high level, the following recommendations will be useful¹³⁰⁶:

- Realism in determining objectives and values support in accordance with the organization's possibilities.
- Encouraging all initiatives within the organization that contributes to maintenance of the culture accepted by managers and employees.
- Allow the expression of different opinions that belong to organization's employees.
- Development of training programs for managers and employees, which can contribute to the cultural values promoted by the organization.

Graphically, the relationship between environmental factors, individual's personality, organization's personality and managerial behavior can be represented like this:

¹³⁰⁵ Burciu, Aurel (coord.), Introduction in management, Economic Publishing, Bucharest, 2007, p.131.

¹³⁰⁶ Burdus, Eugen, Management Treaty, Economic Publishing, Bucharest, 2005, p.265.

Figure nr. 1 Factors that determine the managerial behavior

3. How does the size of the group influences the managerial behavior?

When talking about managerial behavior, we can identify eight roles managers play according to the size of the lead group¹³⁰⁷:

- *President* Controlling and coordinating team members, recognizing their talent and focusing more on what is feasible rather than imaginative and exciting.
- *Involved* Assumes all the needed actions instead of forming the employees' thoughts and decision-making abilities.
- *Innovator* Demonstrates a creative thinking.
- *Evaluative* The ability to analyze problems and make suggestions objectives.
- *Organization's employee* Role based on the implementation of ideas by taking those skills which transfer ideas and plans into practice.
- *Team's employee* Requires a good understanding of needs and support of employees.
- *Resources investigator* Searches for resources and ideas outside of the team and support team's efforts in achieving goals.
- *Implementer* Ensures that the objectives are achieved on time and at a high standard.

When trying to enhance managerial skills it is imperative for managers to understand that their behavior is interpreted differently according to a subordinate's personality. Indeed, the same message that a manager is communicating (even if the content is the same) could be interpreted in several different ways depending on the personalities of the subordinates¹³⁰⁸.

Managers tend, depending on the group he leads, to adopt a certain behavior. Although the ideal conditions are difficult to meet, managers choose their teams from the best people they have, encouraging their flexibility role. There is a need for managers to distinguish between the roles assumed by each team member. Knowing the expectations of colleagues, the manager may end the tension and avoid the group collapse earlier.

In order to give a real answer to the question presented in the subtitle 3, we made a research on a number of thirty organizations from Bihor county (ten of them were micro enterprises; ten were small and the last ones middle). The thirty managers had to note the following decisional situations from 1 to 10, taking into account the frequency of using them within their enterprise, (using 10 for the most frequent): manager makes decisions, manager "sells" decisions, manager presents and discuss decisions, manager presents the attempt of making decisions and manager defines the limits (the groups make the decisions). The table below represents the final values calculated by simple arithmetic average for each type of enterprise that we studied.

Type of enterprise	Decisional situations				
	manager makes decisions	manager "sells" decisions	manager presents and discuss decisions	manager presents the attempt of making decisions	manager defines the limits (the groups make the decisions)
micro enterprise	1	3	8,5	9,5	10
small	8	5,5	9	9	7,5

¹³⁰⁷ Prodan, Adriana, Successful Management, Polirom Publishing, Iasi, 1999, p. 96.

enterprise					
middle	9,5	9,8	4	1,5	1
enterprise					

Table nr. 1 Final value of decisional situations

Group size can influence the decision-making style. From the sample of firms that we surveyed, is seen that, when talking about groups of 1-9 employees, managers prefer to make decisions taking into account employees' proposals and establishing the limits, when group increases at 10-49 employees, managers prefer to make decisions, present and discuss them with the employees and when talking about groups larger than 49 employees, managers "sell" and make decisions without employee's participation.

The results of our research can be graphically presented in the following way:

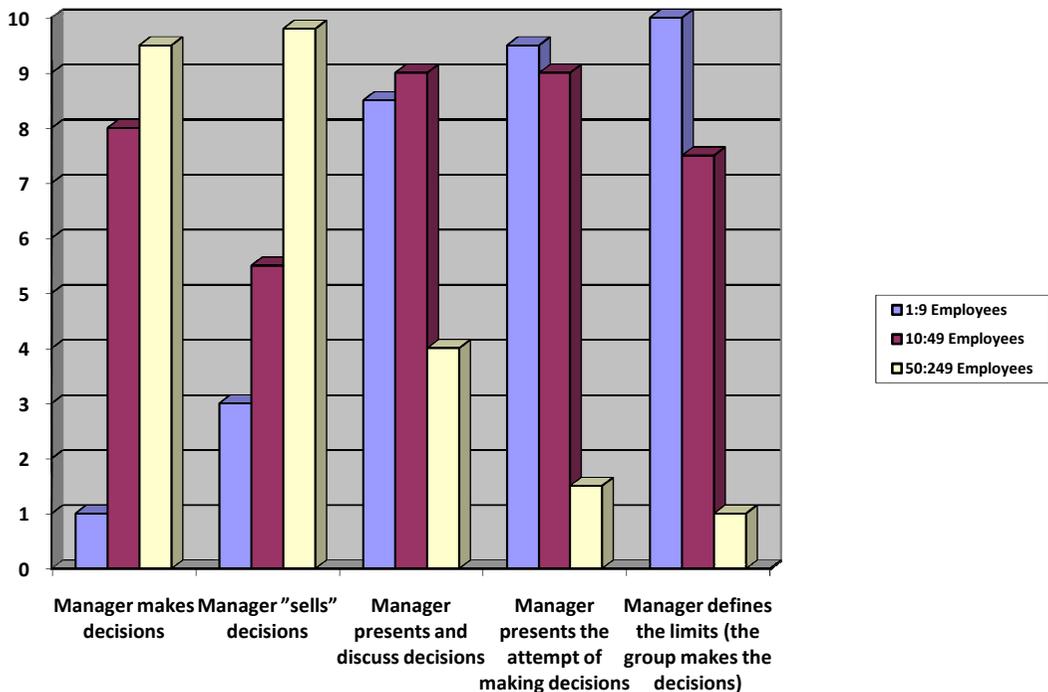

Figure nr. 2 The correlation between employees group and making decisions styles

4. Conclusions

Organizations are evolving, adaptive, strategic, and rule-based cultures which act on and respond to changing internal and external environments.

The cultural match between an individual and an organization is determined by the degree to which the individual's personal traits fit the organizational culture, or perhaps vice versa. A lower cultural match may indicate that the individual is drained of important resources by having to continuously adjust to the workplace environment. A higher cultural match suggests the potential for a more satisfying interaction for both the individual and the organization.

In order to increase the organization's performance, managers have to ensure that employees feel comfortable in the specific organizational environment, they feel motivated by this environment and they will be able to achieve organizational goals.

The success of any company depends in part on the match between individuals' personality, manager's personality and organization culture and personality. Organizational culture is the set of operating principles that determine how people behave within the context of the company. All

the different behaviours of people need to have the same base: beliefs, values, and assumptions that dictate individual's actions.

Managers need an accurate understanding of the organization's culture in order to direct activities in a productive way and to avoid the destructive influence of having employees who are not committed to the company's goals.

CORPORATE SOCIAL RESPONSIBILITY OF ROMTELECOM

Budica Ilie

University of Craiova

Faculty of Economics and Business Administration

Puiu Silvia

University of Craiova

Faculty of Economics and Business Administration

Budica Bogdan Andrei

University of Craiova

Faculty of Economics and Business Administration

In this paper we try to explain this concept, why it appeared and also make a study regarding the corporate social responsibility in Romania. As a research methodology we use empirical research collecting data from the firm and other statistical media. We chose to discuss about the projects of social responsibility in which Romtelecom is involved, in different fields such as: education, environment, social and human rights. Romtelecom supports Romanian society through art projects, sports, philanthropic, educational, social events, media and health. Some products are controversial and for those companies involving in corporate social responsibility programs is a must.

Keywords: CSR, Romtelecom, Romania, environment, children.

JEL Classification: M14

Introduction

Global CSR practices can be defined as “business decision-making linked to ethical values, compliance with legal requirements, and respect for people, communities, and the environment around the world.” (Aaronson and Reeves, 2001). Every multinational that respects its clients has adopted voluntary CSR initiatives, which can include codes of conduct, auditing and monitoring strategies, social and environmental labels, as well as philanthropy.

According to Werther and Chandler (2006), corporate social responsibility covers the relationships between large organizations and the societies with which they interact. CSR defines society in its widest sense and, on many levels, to include all stakeholder and constituent groups that maintain an ongoing interest in the organization’s operations.

A CSR agenda is likely to give the companies more power by placing greater control in their hands and enabling them to pursue their profit-motivated objectives without need to worry about potential external limits placed upon them (Boeger, Murray and Villiers, 2008).

Romtelecom is one of the largest telecommunications companies in Romania, 54.01% owned by OTE (Greece) and 45.99% of the Romanian state. Since 2003, the company has undergone a comprehensive transformation process. This transformation has meant loss of land by landline - the main services offered by Romtelecom - and development of Internet and data services and satellite television. In new areas of activity was recorded massive growth - over 300% - from one year to another. Also, Romtelecom has become and supplier of IT products, especially for clients-companies, with services that Cyber Host (hosting data center in Romania).

In 2007, the company created a department dedicated to customer-company relationship (both micro-businesses and multinational corporations). In 2007, as part of new business strategies, was established a call center dedicated to these clients, which ensures a fast response. For example, 99% of callers are answered by the center employees in less than 20 seconds. In late 2007, Romtelecom had about 3 million clients for fixed phones, over 360,000 broadband Internet

customers and almost 400,000 digital televisions. Romtelecom supports Romanian society through art projects, sports, philanthropic, educational, through social events, media and health.

Among the programs with the greatest impact Romtelecom office includes:

- Phone Child - a hotline where anyone can report cases that endanger the safety of children.
- Pink line - the program to prevent breast cancer.
- The environment to protect the largest ecosystem in Europe, the Danube Delta.

Phone Child

Romtelecom supports and hosts its headquarters phone Child. The service addresses of child victims of abuse, people who want to claim an abuse of a child and parents who need advice. In 2007, the phone Child recorded 1090 valid request. In Romania there are over 3.3 million copies. They depend totally on who gave them life. But statistics are staggering: in the first half of 2007, 52 minors were sexually abused, of which four, even parents. (www.romtelecom.ro). General Inspectorate of Romanian Police statistics show, in June 2007, 18 cases of children were victims of parents' anger. Four of them died. For solving such problems, Romtelecom has supported since 2001, foundation of a phone line that offers information and counseling for abused children and parents - Child phone.

Phone Child service is a free information and counseling, specializing in child protection. Established with the support of Romtelecom, it addressed the children-victims of abuse, people who want to claim an abuse of a child, young people will leave the state system of child welfare, parents and professionals working in child protection.

Among the services offered there are:

- Information and advice on promoting and respecting children's rights.
- Guidance to institutions able to provide necessary assistance to each case.

The service was established in 2001 under the name "Green Line for Child Protection", originally designed as a tool for monitoring the "House of Children's Home". Very large number of calls and of cases led to a permanent special telephone line.

In 2007, phone Child involved a lot of volunteers to provide advice to callers. For this purpose, there was drawn up a manual guide for those who train volunteers. There was made recruitment, and in June there were held three training sessions for volunteers recruited. During the training sessions there were discussed techniques and tools used in business telephone counseling. There were 33 trained volunteers who have joined the Child phone.

International Telecommunication Union has designated the day of May 17 - International Day of Children and Telecommunications. The Youth Park in Bucharest, phone Child and Romtelecom Association organized an event in which there were presented moments supported by Children: music, dance, ballet, folk music, theater, acrobatics, fashion show, face painting. It also held 3 contests: origami, computer games and drawings on the asphalt on "magic phone". To enable all children to participate, four editions were held for each competition, the winners received diplomas and gifts. All children attending the event received gifts and a CD with the story "Child phone". The event was attended by over 700 children.

Child phone activity is conducted in close liaison with the General Directorate for Social Assistance and Child Protection (DGASPC) occurring to address cases of abuse. In order to improve collaboration, representatives of phone Child visited the premises DGASPC. There were identified effective solutions to resolve existing cases. The visits have started with meetings in the DGASPC Buzau, Braila and Galati (May), Dolj (August), Arges, Brasov, Prahova (September), Vrancea, Bacau, Botosani, Suceava (November). (www.responsabilitatesociala.ro).

National champion for the Promotion of Child phone in schools, colleges and orphanages which ran from October 2006 - July 2007, resulted in significant increase in the number of phone calls to the Child. Along with initiating the campaign there was launched the site www.telefonulcopilului.ro and also an attached email. This email address is being protected from spam bots, you need JavaScript enabled to view it and forum for children. Counseling by

telephone has been extended by advice on the Internet as a means of communication used increasingly frequently by children.

Results of the project

In the year 2007, there were estimated 1090 cases and 574 valid feedbacks from callers. Most cases were related to reporting of child abuse (389 cases), followed by requests for legal advice (288).

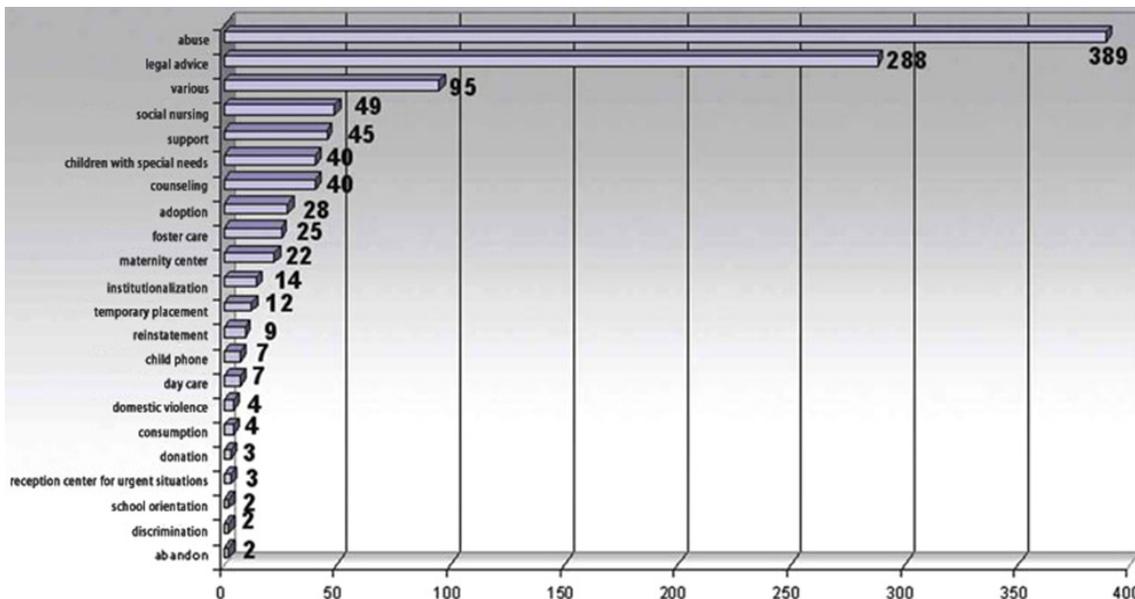

Fig.1 Statistics regarding abuses and phone child service

Source: www.responsabilitatesociala.ro

The most numerous cases of abuse reported were those related to physical molestation and emotional abuse, followed by cases of neglect, verbal violence, discrimination, child exploitation through work, sexual abuse, deprivation of freedom, trafficking in children.

Most children who have claimed such cases were boys and the adults have sounded particularly among women. Most cases were received from sector 5 of Bucharest, followed by sector 3 Bucharest, Prahova county, sector 2 Bucharest, Timis county and Varna.

The environment in which abuse occurred most frequently reported, is the family, followed by school, extended family, public space, the center of the family investment house.

Conclusions

CSR of companies serve the objectives of sustainable development, came the need for international standards to define what a "desirable corporate behavior. United Nations, European Union and the Organization for Economic Cooperation and Development are the three most important institutions that were involved in developing a CSR framework to define and establish indicators that can be evaluated in a transparent manner.

This framework was accompanied by recommendations and principles to guide states and local authorities in formulating public policies to promote, ensure transparency and to support initiatives of CSR.

The European Union is interested in CSR, which he sees as a means to achieve the goal set at the Lisbon European Council of 2000 to become "the most competitive and dynamic economic

system in the world capable of sustaining economic development through job more and better jobs and greater social cohesion".

Romtelecom is one of the Romanian companies that involved a lot in campaigns of CSR, applying social, cultural and educational programs and being helped by other national or international institutions. Child Phone is just an example of its social responsibility.

PROS AND CONS FOR THE KNOWLEDGE ENTREPRENEURSHIP IN UNIVERSITIES

“It Is Always Knowledge to Some End”

Novac Carmen

“Lucian Blaga” University of Sibiu

At the beginning of the 21st century the interest in the field of knowledge entrepreneurship increased among academic, economic, entrepreneurial and government representative institutions and, of course, upon social life all over the world. Many authors have dealt with ideas and opinions regarding the knowledge entrepreneurship but few of them agreed to apply it in a university. The original character of the university has to be protected against what it is seen as a business takeover. If a university becomes a business, then it is no longer a university, and still pros and cons upon this idea of knowledge entrepreneurship in universities have to be taken into account.

Keywords: entrepreneurship, knowledge, entrepreneurship education, research, innovation, funding

COD JEL: M10

The actual context of “knowledge entrepreneurship”

Much of the documentations and literature written upon this subject regarding improving the higher education in Romania promote entrepreneurship as an important solution in raising educational quality. But the Romanian higher educational system defies changes due to its rigidity and traditionalism.

The concept of “knowledge entrepreneurship” has to be discussed “in the context of different relationships such as alliances, joint ventures, partnerships, different agreements in which no one controls and no one commands”¹³⁰⁹ meaning that there is a common understanding of objectives, policies and strategies, in a word “teamwork”.

What is knowledge in the context of economy? How can knowledge influence performance?

The quest for an indisputable definition for this concept is still ongoing.

This concept was largely developed and a large variety of authors have dealt with topics related to knowledge but only a few of them really expressed the essence of it.

Knowledge is, in fact, an economic resource and a relevant scientific indicator strongly connected with the development in any domain of activity, especially now in the higher education evaluation. The main indicator of quality in the higher education system is basically knowledge because it influences performance at the highest degree.

Nonaka (1995), a well-known management specialist in Japan, in his major work “The knowledge creating company” speaks about the way in which Japanese companies created knowledge in the form of research and new innovative products. He states that “knowledge unlike information is about team-action, it is always knowledge to some end and knowledge, like information, is about meaning.”¹³¹⁰

¹³⁰⁹ Gurteen, D., *On the performance of the knowledge worker* quotations retrieved on the 31 of may 2006 from Peter Drucker – on the site www.gurteen.com/gurteen/gurteen.nsf/id/X00077286/ accessed on the 12 of April 2010

¹³¹⁰ Nonaka, I., Hirotaka Takeuchi, *The knowledge-creating company: how Japanese companies create the dynamics of innovation*, Oxford University Press, New York, 1995

What is entrepreneurship?

“Entrepreneurship is the process of creating an opportunity and pursuing it regardless of the resources currently controlled”¹³¹¹ as Timmons called it in 1994.

This concept strictly belongs to modern world of economy and it is understood as a special characteristic, an exceptional ability of special people. This term is only used with a positive sense, when a venture or partnership is successful.

The French economist Jean Baptist Say stated that “an entrepreneur is a person who shifts economic resources out of an area of lower and into an area of higher productivity a greater yield.”¹³¹²

Schumpeter described an entrepreneur as “one who destroys the existing economic order by introducing new products and services, by creating new forms of organization, or by exploiting new raw materials.”¹³¹³

Peter F. Drucker gives another definition in which he says that “the entrepreneur always searches for change, responds to it, and exploits it as an opportunity”¹³¹⁴

“Entrepreneurship is a process of exploiting opportunities that exist in the environment or that are created through innovation in an attempt to create value”¹³¹⁵

Entrepreneurship is considered an essential ingredient for strong innovation and economic growth, especially in a Knowledge Based society. An entrepreneur is one who organizes a new business venture in the hopes of making a profit.

Entrepreneurship is the process of being an entrepreneur, of gathering and allocating the resources - financial, creative, managerial, or technological - necessary for a new venture's success.

Knowledge entrepreneurship

Knowledge entrepreneurship is not a concept that regards the financial or the monetary profit. It focuses on realizing opportunities that are meant to improve the production through the help of knowledge. The term entrepreneurship applies both to individuals and to organizations and aims at realizing innovative knowledge practice or product.

Knowledge entrepreneurship cannot exist without: organizational learning, leadership, culture, project support, vision, strategy, and mainly without communication. Communication is the key factor that influences knowledge entrepreneurship as a dynamic complex human system in which all members are knowledge and innovative agents.

In order to transform knowledge in innovation, universities have to seize this opportunity. Such a capability of turning knowledge into research and innovation is called “knowledge entrepreneurship” or “the ability to recognize or create an opportunity and take action aimed at realizing the innovative knowledge practice or product.”¹³¹⁶

The Entrepreneurial University vs. the Intrapreneurial University

¹³¹¹ Timmons, J., *New Venture Creation: Entrepreneurship for the 21st Century*, 4th Edition, Ed. Irwin, Boston, MA, 1994

¹³¹² idem

¹³¹³ Schumpeter, J., *The Theory of Economic Development* (Translated by R. Opie.), Ed. Harvard University Press, Cambridge, MA, 1934

¹³¹⁴ Drucker, P., *Innovation and Entrepreneurship: practice and principles*, 1st Edition, Ed. Harper and Row, New York, 1985

¹³¹⁵ Brown, T., Uljin, J.M., *Innovation, entrepreneurship and culture: the interaction between technology, progress and economic growth*, Ed. Elgar Publishers, Cheltenham, UK, 2004

¹³¹⁶ Clark, B.R., *Sustaining change in universities. Continuities in case studies and concepts*, Ed. Open University Press, Oxford, 2004

Universities serve both as a provider of knowledge and human capital for all the other domains that form the human society. As organizations they are very special and that because they are neither part of the state nor are they part of the economy.

The Entrepreneurial University

Burton Clark first presented the concept of “entrepreneurial university”¹³¹⁷ in the late 1990’s but this theme was received by the specialists with a negative attitude, being a controversial issue. It was seen as a battle between the traditionalists and modernists in the educational field. It was said, at that time, that through his examples Clark was trying to sell out the academic and scientific values, practices and services, missions and goals to the economy or shortly that professors were to be turned into entrepreneurs.

A university was found out to have several important missions among which one can count: education for cultural and technological citizenship, research, economic development, politics, creating and recreating knowledge. The goals of a university concern the transfer of research results to the industry so they can transform them into innovative products and services, leading to the economic growth and wealth creation.

Also, in the case of the Romanian higher education institutions such as universities, the government agrees and helps this knowledge transfer through partially funding it (the basic funding of the university comes from the ministry) and facilitating legal and political help and conditions.

Both economists and academics had a strong reaction to Clark’s statements and they all said that if a university becomes business then it is no longer a university and its original character will be lost, and still universities tend to become more and more independent in front of the state due to the lack of funding. So, how can universities survive? The independence in front of the state will lead to dependence in front of other institutions or even persons that are willing to “pay”.

The competition between tradition and modernism has to stop in the favor of equilibrium between the two.

The pursuit of funding is like a double knife: It is a must for financing the social mission but a danger for the mission at the same time. Not for profit but not for loss.

The term “entrepreneurial” can be used in the academic context as long as the original mission of the university can be maintained. Due to the involvement of the term entrepreneurial many universities are perceived as business and the education as a market and this must be changed but in what terms? Which are the consequences?

One of the main consequences would be a huge gap between the mission of the university and its funding, mission and money. Prospective students ask for the expanding of the number of applicants while government demands that universities produce more research and innovative products.

Universities are supposed to be a not-for-profit domain and the connection with the entrepreneurial concept has apparently no sense.

For public universities the missions are neither measurable nor explicit, and still a university must educate students, carry out research and provide services to the community outside the university.

Significant additional revenues are needed in order for a university to survive and to maintain their original missions and still universities cannot become a business.

A university is, in fact, like any another not-for-profit organizations: it has a budget, it employs people who earn a salary and develop a career, it also has students who receive an education and participate to the educational, social and economic life of the academic community.

¹³¹⁷ Clark, B.R., *Sustaining change in universities. Continuities in case studies and concepts*, Ed. Open University Press, Oxford, 2004

Entrepreneurial university is the academic body or institution that produces knowledge as a form of development and innovation through knowledge. A discussion about the intellectual property and about sharing the knowledge should be largely debated. Higher performance in a university means higher performance in knowledge production, both in research and teaching as essential parts of the educational process.

Fuller describes the university as “an intrinsically entrepreneurial institution”¹³¹⁸. The university constantly creates and creatively destructs knowledge as a constant circulation. University creates knowledge through research. Then knowledge is de-constructed through its dissemination to the students and the industry. This process is immanently entrepreneurial because some of the students become further researchers, who then develop new knowledge through the creative destruction of the known. Fuller depicts a constant creation of human capital (through education) and knowledge capital (through research) which flows towards the third mission and is there invested for the fostering of business, governmental and social causes.

In Fuller’ vision a university has three special missions: education, research and dissemination of knowledge. The three missions of the university together with the business administration task represent the knowledge entrepreneurship.

The Intrapreneurial University

“Intrapreneurship is the art of working within an organization to effect change, by developing new ideas, procedures or products, by innovating practice and thereby enhancing the business.”

¹³¹⁹ Intrapreneurship appears within the already functioning organizations.

The premises that imposed the development of the intrapreneurial activities in the European Union and United States of America are mainly generated by:

- “The existence of a great number of companies of large or medium sizes that are hard to run, inflexible, even rigid, with different problems generated by their relation with an often unfavorable environment;
- The existence of subdivisions or many services or compartments within the organization;
- The existence inside the organization of a large number of important specialists even managers or leaders with a high intrapreneurial potential and with a strong initiative regarding intrapreneurship.”¹³²⁰

As far as a university is concerned the General Manager or the Administrative Manager who is supposed to be in charged with the budget of the university has to be the first intrapreneur. He has to have the initiative to implement innovative systems and practices in order to improve the economic performances of the university by using both its financial and human resources that were not previously used.

Given the fact that most universities in Romania still have a rigid economic system depending on the state they should reorganize on the basis of intrapreneurship principles and thus some of their subdivisions would offer performance and they should give an internal freedom to the human resources to express themselves in a progressive innovative way.

Conclusion

For the intrapreneurship to become a largely used tool for the Romanian companies, some conditions should be ensured, namely: a strong economical education by organizing post-university and academic programs to familiarize the students and potential intrapreneurs with the specific of intrapreneurship in general and especially in Romania, strong collaboration with companies of managerial consultancy that can supply solutions for the structural organization of

an institution or company and can maintain the evidence of the changes within that company, and good training for specialists in the field of management.”¹³²¹

Universities have enormous potential for innovation and economic development, their role being also that of providing a theoretical understanding of the phenomenon of entrepreneurship. Mobilizing them for entrepreneurship, enhancing the student’s skills for entrepreneurial careers and providing support for business start-up are very important for the future.

PROSPECTIVE LEADERS' VIEW ON ROMANIAN SOCIETAL CULTURE

Catană Gheorghe Alexandru

Technical University of Cluj-Napoca, Faculty of Electrical Engineering

Catană Doina

Technical University of Cluj-Napoca, Faculty of Electrical Engineering

This study deals with Romanian prospective leaders' perceptions and expectations concerning the societal culture. It is a part of a European research project, *GLOBE Students*, dealing with the interrelations between societal culture and leadership. The basic theoretical constructs and methodological framework of investigation are those developed by GLOBE international research project. In adapting our research to student population peculiarities, *GLOBE Beta* questionnaire was altered through adding new items (scales). The sample consists in 429 students in business/economics and engineering, belonging to three Romanian universities. The findings show that in student's opinion there are significant differences between societal culture practices and values (expectations) on all nine cultural dimensions in GLOBE model.

Keywords: cultural dimensions, cultural values, cultural practices

JEL classification: M19

Introduction

More than one million students are enrolled in Romanian universities and other tens of thousands abroad. Their number tripled in the last decade (Numarul studentilor din Romania a ajuns, în 2008, la un million, '2009). The students are a very important group of population, because from it will be selected the next generations of managers and leaders. And for many reasons, they will be different from the present managers and leaders. In this context, it is surprising how little knowledge is available about the students' values and the impact of these values on their perceptions on management. Same surprise is encountered on reverse case: students' weak knowledge about present leaders' cultural values. This is why we hope that the present study will contribute to a better understanding of the students' perceptions of present societal culture dimensions and their cultural expectations.

During the last edition of Romanian students in United Kingdom Conference (London, October 25, 2009), the Director of one of the biggest audit and consultancy companies in the world (British native), asserted that the fundamental difference between Romanians and British behaviour is that while Romanians focus on *practices* – *doing things as they are told to do*, the British focus on *values*, *doing things as they should do*. On the positive side, he acknowledged that Romanians are good communicators in foreign languages and are in the world top in IT. At the same time, among the drawbacks he mentioned excessive bureaucracy, lack of long term planning, "astounding" H.R.M., corruption and legal regulation fluidity (Boros, 2009). The mentioned advantages and drawbacks could get a rational explanation based upon a closer look at societal *cultural practices and values*. For this, the school should teach the pupils *how to learn, practice and develop* our cultural values, while the academic education should provide the students lectures on how to measure and compare different societal practices and how to build own cultural expectations.

The present study aims at answering the following questions: 1. How do the students perceive the societal cultural dimensions? 2. Which are the students' cultural expectations (values)? 3. What are (if any) the differences between the perceived cultural *practices* and expectations (*values*)? 4. Are the students' perceptions and expectations sensitive to their demographic variables?

Theoretical remarks

It is well known that there is no one generally accepted definition of societal culture. Probably this is why cultures differ one from another. Our study shares the definition used by GLOBE international research project: *Culture* (in general) is a set of shared motives, values, beliefs, identities and interpretations or meanings of significant events that result from common experiences of members of collectives and are transmitted across age generations (House et al. 2004:15).

How we measure the culture of different entities (groups) in order to compare them? The word “measure” is linked to some *measureable dimension*. So, if we want to measure cultures, than must accept that these cultures can be characterized by *sizes* (probably different) of the same dimension.

GLOBE research characterizes the culture through nine *discrete global dimensions: performance orientation, future orientation, assertiveness, power distance, humane orientation, institutional collectivism, in group collectivism, uncertainty avoidance, gender egalitarianism* (House et al, 2004). The definitions and their theoretical support are provided by GLOBE books (House et al, 2004; Chhokar et al. 2007). GLOBE compares these dimensions across 62 societal cultures, analysing *how* different or similar are those cultures and *why* are they different or similar. But the cultural dimensions of a group are *not static*. The culture is not only a given set of beliefs, norms, patterns, projections and institutions configuring the cultural aspirations of a given group. This is why, GLOBE model distinguishes between cultural *practices* (*how the culture it is*) and cultural *values* (*how the culture should be*). While practices describe the (actual) *cultural product* of analyzed community, the values describe the *desired cultural product*. In other words, practices display the socio-cultural *phenomenology*, while values concern the *targeted future* of that community in the field. Of course, the distinction between practices and values is a relative one. Philosophical speaking, a good practice is a *learned* value. Almost always the values are about something important. This is why they are followed by individuals and groups. This might explain why some authors consider that values express the effectiveness of most efficient individuals, such as leaders (House et al. 2004; Javidan et al. 2006a; 2006b), while practices express the average effectiveness of a society. Values distinguishing a culture from the others are *predictors* for cultural practices, as well as for leadership features and behaviours in that culture (House et al. 2002). The shared values become good future practices. Values distinguishing a culture from the others are *predictors* for cultural practices, as well as for leadership features and behaviours in that culture (House et al. 2002).

Based upon GLOBE model, studies from different societal cultures proved that there are significant differences between practices and values all over the world (House et al.2004; Chhokar et al. 2007), including Romania (Catana, Catana, 2010 in print). The mentioned findings are based on data collected from present middle managers. Or, our study pursues to discover the *cultural identity of future managers and leaders* in Romania. The findings about the students' perception on cultural practices and their expectations about societal culture are helpful in imagining the societal culture in its dynamics. Axiological speaking, the values the students aspire to, will probably be their future practices (as managers and leaders), their future behavioural patterns. From cultural perspective, a society oriented towards future leaders' values is a dynamic one. We expect to discover significant differences between practices and values due to the simple fact that the *values are more important than practices in the students' world*.

Research methodology

As shown above, in performing our study on Romanian students' opinion about societal culture *dimensions* we used the methodological framework created by the GLOBE project. Data about societal culture dimensions has been collected using GLOBE II Beta questionnaire. *Culture dimensions* have been measured using the scales in section 1 (*as it is*) and, respectively, section 3

(as should be). Scales in section 1 ask the students to value “the way our society is” (practices), while scales in section 3 ask the students opinion about “the way our society should be”. In order to test the *statistical significance* of the differences between societal practices (“as it is” variables) and societal values (“as it should be” variables) the paired-samples *t-test* was employed, using the 0.05 significance threshold. All the answers are assessed with seven points Likert scales (1=strongly agree; 7= strongly disagree, with some items reverse coded; see the GLOBE Culture and Leadership Scales Guidelines and Syntax for the GLOBE Leadership and Culture, 2006).

Data collection run between November 2008 and April 2009. The *sample* consists in 429 students attending business/economics and engineering in three Romanian universities. The basic assumption in choosing the sample was that most of future managers and leaders will be economists and engineers. The sample is structured based upon the following *criteria*: gender, age groups, field of study, level of study, interest in management career, and interest in founding a business venture (see *Table 1*). In testing *statistical significance* of differences between different groups of the sample, the *independent samples* test was employed, using the 0.05 significance threshold (equal variance assumed or not for Levene’s test).

Table 1 Sample demographics

	Gender		Age groups		
	Female	Male	18-22	23-27	≥ 28
<i>Field of study:</i>					
Business/Economics: 168 (39.16%)	128 (76.2%)	40 (23.8%)	81 (48.2%)	72 (42.8)	15 (9.00%)

TOTAL: 429	239 (55.7%)	190 (44.3%)	268 (62.5%)	148 (34.5%)	13 3.00%)

Findings

The preliminary findings of our research are presented following the succession of research questions. *Table 2* displays the mean values, ranks, significant differences and ratios between cultural practices and values in students’ opinion.

Practices perception: The way Romanian society it is

It seems the students make up a cultural community perceiving a high power distance (5.80) and a relatively high in group collectivism (5.13). They also feel Romanians have practices less future oriented (3.44) and enough uncertain (3.49). The other practices got lower scores than the scale midpoint (4), while gender egalitarianism is situated in the scale midpoint.

Cultural values (expectations): The way Romanian society should be

The students believe the cultural dimensions should change their hierarchy comparing with current perceived practices. They expect: performance (5.89), institutional collectivism (5.71), humanism (5.41), future orientation (5.24) and control of uncertainty (5.10). In their cultural

logic, these expectations could be attained if the power distance is significantly reduced (2.64). Gender egalitarianism (4.14) and assertiveness (4.00) are scored in the middle band of the scale.

Differences between practices and values

All the dimensions of societal culture record significant differences between practices and expectations (t-test values are high and sig-2tailed got 0.000 for all). The highest difference is recorded for power distance (t = 51.576; sig = 0.000). Very high difference is also recorded for performance orientation (t = -37.525; sig =0.000), uncertainty avoidance (t = -29.636; sig =0.000), humane orientation (t = -29.279; sig =0.000) and, respectively, future orientation (t = -26.878; sig =0.000). Even though the differences between the other pairs of cultural dimensions are statistically significant, they have a lower *differentiation potential* in students' mind. The differentiation potential is shown by the size of the ratio between practices and values in *Table 2*.

Table 2 Differences between perceived cultural practices and cultural expectations* (N = 429)

Cultural dimension ("as it is")	Rank	Mean	t-test (sig 2-tailed)	Mean	Cultural dimension ("as should be")	Rank	Practice/Values
<i>Uncertainty avoidance</i>	8	3.49	-29.636 (0.000)	5.10	<i>Uncertainty avoidance</i>	5	0.68
<i>Future orientation</i>	9	3.44	-26.878 (0.000)	5.24	<i>Future orientation</i>	4	0.65
<i>Power distance</i>	1	5.80	51.576 (0.000)	2.64	<i>Power distance</i>	9	2.19
<i>Collectivism 1</i>	5	3.78	-19.155 (0.000)	4.94	<i>Collectivism 1</i>	6	0.76
<i>Humane orientation</i>	4	3.84	-29.279 (0.000)	5.41	<i>Humane orientation</i>	3	0.70
<i>Performance orientation</i>	6	3.66	-37.525 (0.000)	5.89	<i>Performance orientation</i>	1	0.62
<i>Collectivism 2</i>	2	5.13	-11.474 (0.000)	5.71	<i>Collectivism 2</i>	2	0.89
<i>Gender egalitarianism</i>	3	3.99	-11.271 (0.000)	4.41	<i>Gender egalitarianism</i>	7	0.90
<i>Assertiveness</i>	7	3.51	- 8.717 (0.000)	4.00	<i>Assertiveness</i>	8	0.87

*paired samples, t-test

Sample demographics and differences in cultural dimensions

Table 3 shows that seven out of nine cultural dimensions are sensitive to the sample demographic variables. *Statistically significant* differences between societal practices and values were found in the following cases (based on *t* value):

Study level (bachelor or master) influences the students perception on *practices* concerning *gender egalitarianism* (t = 3.499; sig =0.001) and *performance orientation* (t =2.659; sig = 0.008). At the same time, the study level influences the students *expectations* concerning *uncertainty avoidance* (t = 2.727; sig = 0.007), *performance orientation* (t = -2.360; sig = 0.019) and *humane orientation* (t = 1.983; sig = 0.048).

Field of study (business/economics or engineering) influences the students perception on *practices* concerning *institutional collectivism* (t = 2.342; sig = 0.020), and their *expectations* about *performance orientation* (t =-2.841; sig =.005) and *gender egalitarianism* (t = -2.270; sig = 0.024). *Gender* (female vs. male) leads to differences in perception of *gender egalitarianism* in *practice* (t = -2.102; sig = 0.036) and *in group collectivism* (t = -2.653; sig = 0.008) and *assertiveness* (t = -2.188; sig = 0.029) at *expectations* level.

Students interest in following a management career (Yes vs. No) influences respondents perception on *practicing institutional collectivism* (t =2.170; sig = 0.036) and *gender egalitarianism* (t = -2.198; sig = 0.029).

Finally, the *interest for setting up own business venture* (Yes vs. No) is a factor differentiating the *expectations concerning institutional collectivism* ($t = 3.124$; $\text{sig} = 0.002$).

Table 3. Sample demographics and significant differences in cultural dimensions

Cultural dimension	Sample Mean (N=429)	St. dev	Mean (G1)	Mean (G2)	t-test (sig-2 tailed)
GENDER (G1=female; n=239; G2 = male; n=190)

<i>Practices: none</i>					
<i>Values</i>					
a. Collectivism 2	5.71	0.902	5.79	5.48	3.124 (0.002)

Conclusions

The present study shows that next generation of Romanian managers and leaders (students in business/economics and engineering) looks like a cultural body with homogeneous perceptions on societal cultural practices and with well outlined cultural expectations. The main two characteristics of the Romanian students' cultural portray are perception of a significant *power surplus* in the hands of elites and, respectively, of a significant *deficit* in society performance orientation. Students' cultural dynamics is highlighted by (statistically) significant differences between current cultural practices and their expectations (values).

Our study has theoretical and practical relevancy. From theoretical point of view, it proves GLOBE theoretical model based on CLT and ILT. From practice perspective, our study has relevancy for employers, universities, government and students. The employers could get an image of the cultural profile of future managers and leaders, based on which can design development programs for present managers and leaders, according to the trend expressed by students' population. Universities and government could use our findings in designing the strategies aiming at preparing the students for the market of next elites in economy, for creating

and developing a leadership culture among young generations. Students themselves could take into account our findings in clarifying their options for own business or management positions. Our research is an ongoing, thus its findings and conclusions should be taken in this context. Certainly, they could be influenced by the sample size, structure and geographic location. At the same time, it is probably that certain perceptions and expectations had been influenced by the fact that the data collection took place in full economic crisis. Additionally, the students form a specific population, still in molding process. They are influenced by a lot of social factors which were left out of our attention. The methodological limits should be also, mentioned. Some of them might be diminished in future research, pursuing two major objectives: a) performing comparative studies based upon the data collected in GLOBE students research for other European countries and b) comparative studies based upon Romanian students population and middle managers (GLOBE II research).

PROSPECTIVE ROMANIAN LEADERS' VIEW ON LEADERSHIP DIMENSIONS

Catană Gheorghe Alexandru

Technical University of Cluj-Napoca, Faculty of Electrical Engineering

Catană Doina

Technical University of Cluj-Napoca, Faculty of Electrical Engineering

This study deals with Romanian prospective leaders' perspective on outstanding leadership dimensions (styles). It is a part of a European research project, GLOBE Students, dealing with the interrelations between societal culture and leadership. The basic theoretical constructs and methodological framework of investigation are those developed by GLOBE international research project. The sample consists in 429 students in business/economics and engineering, belonging to three Romanian universities. The findings show that the most preferred leadership styles are team oriented and charismatic (value based). Only a few leadership styles seem to have weak, but statistically significant correlations against a sig. = 0.50 probability threshold with important socialization agents for the students.

Keywords: leadership dimensions; Implicit Leadership Theory, Culturally endorsed Leadership Theory

JEL classification: M19

Introduction

In trying to explore and develop the leadership skills and abilities in the Romanian students, both teachers and students could use as starting point the findings of different *field inquiries*. Here there are some of them. A *Gallup* inquiry discovered that in 2009 one in four Romanian employees believed that his role in the company is of a “simple doer”. At the same time, the majority of managers do not know how to assume a strategic role (Mihai, 2009a). For the same year, *Hart Human Resource Consulting* showed that more than 67% from 100 executives in large local companies had a narcissistic and arrogant behaviour, 60% did not share the outcomes with their teams and 58% took excessive risky decisions (Mihai, 2009b). According to *Institute for Leadership & Management*, about one third of employees lost their confidence in organizational management and leadership and 46% would live the company along with the first offer from another organization (Mihai, 2009c). *Hay company* asserts that two third of Romanian managers constantly create a negative working climate, making the employees to feel frustrated and offended (Mihai, 2009d). When asked about “how are Romanian managers in power positions”, a foreign consultant of *Hermes Advisors*, answered: “You address to a boss with *long live* greeting. He is the one taking decisions and telling you when to stop talking. The boss does not develop people because this would threaten his position. Is authoritarian and acts being obsessed by power. Even though they are creative and determined, the Romanians choose too often to play the role of *boss* in the detriment of manager or leader role”. (Cum sunt romanii la putere, 2008).

With such a “helicopter view” on management and leadership practice, our study aims at answering the following questions: 1. Which are the leadership dimensions (styles) valued by Romanian students? 2. Which are (if any) the significant correlations between students' opinion on outstanding leadership dimensions and the socialization agents influencing their *cultural* beings? The answers to these questions will help us in imagining *quo Vadis* the next generation of Romanian leaders is oriented.

Theoretical remarks

The term *leadership* does not have a univalent understanding. Our study shares the meaning given to it by GLOBE research: “the ability of an individual to influence, motivate and enable others to contribute toward the effectiveness and success of the organizations of which they are members” (House et al.2004:15).

The leadership theories are fascinated by the cultural approach in the last two decades. Explicitly or not, their aim is to study the correlations between cultural dimensions (at societal and organizational levels) and effective leadership dimensions. It seems that the members of a given society or group possess in their minds a package of dimensions (features, styles) characterizing an effective leadership and assess successful leaders based upon these dimensions. In short, this is the core idea of *Implicit Leadership Theory* (ILT) (Lord, Maher, 1991). In other words, an individual cannot be an effective leader if the others do not *perceive* him as being such. This perception springs from the societal culture (Schein, 1992). GLOBE project extended ILT paradigm at the community culture level (society, organization, group), setting up the *Culturally Endorsed Leadership Theory* (CLT) (House et al.2004; Javidan et al. 2006). The central idea of CLT is that the cultural *expectations* of a given community can be predicted from *perceived* leadership dimensions (styles, attributes) in that community. A leadership style is a reflection of a certain societal culture (Kopelman et al, 1995), meaning that cultural values influence the leadership practices (Lombardo, 1983; Trice and Beyer, 1984; Schneider, 1987; Schein, 1992; Schneider et al. 1995) and both are found in the group perception about successful leadership (CLT). Leader acceptance by the followers depends on the interactions between *CLT* attributes and leader behaviours. Leadership effectiveness essentially depends on leader behaviour and *CLT* attributes. In other words, in group members’ perception, a leader is the most effective if applies *CLT* dimensions. This means that successful leadership dimensions are normative in group members’ perception, reflecting how should be a successful leader and not how he actually is.

On a solid theoretical basis and using 112 personality and behavioural descriptors, GLOBE research developed 21 first order, and then 6 second order universally accepted leadership dimensions: charismatic, team oriented, participative, humane, self protective (narcissistic) and autonomous. The definitions and theoretical basis of these dimensions are found in GLOBE books (House et al.2004; Chhokar et al. 2007).

The six dimensions are *universal* but always and anywhere *culturally dependent*. This means they have different *sizes* in different societal cultures. In fact, the differences concern the way in which they are applied by leaders. In the end, we deal with some theoretical constructs, useful ideals in modelling behaviours. They help us to understand the leadership success sources. But the universality of the six leadership dimensions should not be taken as meaning optimum leadership, as universal leadership pattern.

In developing students’ leadership abilities, some authors distinguish between *traditional leadership* and *shared leadership approach*. For instance, Glen Omatsu argues that in traditional leadership approach the leader is a rare, strong and powerful person, using his charisma when deciding, commanding others and communicating. In shared leadership approach, the leader is a part of the team, leadership is embedded in leader’s ability to work well with others to get things done, and it is based upon commitment to dignity, equality, democracy and transformation in human beings (Student leadership training booklet). It is our belief that shared leadership concerns a leadership style in convergence with students’ cultural values

Research methodology

In performing our study on Romanian students’ opinion about leadership dimensions we used the methodological framework created by the GLOBE project. Leadership dimensions were measured using the scales in sections 2 and 4 (leadership attributes and behaviours). These scales

ask the students to value if the attributes and behaviours stated in the items *inhibit or contribute* to outstanding leadership.

To adapt the study to the population of interest, in section 5 (importance of decisional criteria) seven new scales were added for measuring the influence of important reference groups (family, teachers, friends, managers, TV/radio stars, models from society and science) on students' value system and leadership expectations. All the answers are assessed with seven points Likert scales, where 1 = this behavior or characteristic greatly inhibits a person from being an outstanding leader and 7 = this behavior or characteristic contributes greatly to a person being an outstanding leader. Some items were reverse coded, following the GLOBE Culture and Leadership Scales Guidelines and Syntax for the GLOBE Leadership and Culture (2006).

Data collection run between November 2008 and April 2009. The sample consists in 429 students attending business/economics and engineering in three Romanian universities. The sample is structured based upon the following criteria: gender (55.7% female, 44.3% male), age groups (62.5% belong to the age group of 18-22 years, 34.5% to 23-27 years and 3% to 28 and over), field of study (39.2% is enrolled in business/economics and 60.8% in engineering), level of study (64.8% bachelor, 35.2% master), interest in management career (67.1% Yes), and interest in founding a business venture (73.9% Yes). The basic assumption in choosing the sample was that majority of the future managers and leaders will be economists and engineers.

Findings

Which are the leadership dimensions (styles) valued by Romanian students?

Table 1 displays the rank (mean values and standard deviations) of students' preferences in assessing the second order leadership dimensions (from GLOBE model).

Table 1. Second order leadership dimensions
(N=429)

Leadership dimensions	Minimum	Maximum	Mean	Std. Deviation
Team-Oriented	2.07	6.83	5.8940	.64304
Charismatic/ Value Based	1.16	6.91	5.7605	.67109
Humane orientation	1.75	6.88	4.7270	.83871
Participative	2.25	6.75	4.7264	.82644
Self-Protective	2.39	5.86	3.7159	.53216
Autonomous	1.00	6.75	3.6608	1.09483

Team oriented leadership (5.89) and charismatic leadership (5.76) are the most preferred leadership dimensions. The low standard deviations for these dimensions (0.643 and, respectively, 0.0671) show the relative high homogeneity of the answers. The third preferred styles are humane oriented (4.727) and participative leadership (4.726) with mean values situated on the middle band of the scale and higher standard deviations. Finally, the students do not prefer, but tolerate protective (3.71) and autonomous leadership (3.66). The answers are homogeneous in the case of protective leadership (standard deviation 0.532), but not homogeneous in the case of autonomous style (standard deviation 1.09).

Table 2 shows the students preferences for more detailed leadership attributes and behaviours (questionnaire items and first order leadership dimensions). This data is congruent with that displayed in Table 1, all of examples belonging to the first two preferred leadership styles.

Table 2. Selected leadership items (top 10)

Item	Mean	Belongs to	
		First order leadership dimension	Second order leadership dimension
Effective bargainer	6.38	Diplomatic	Team oriented
Diplomatic	6.34	Diplomatic	Team oriented
Intelligent	6.33	Malevolent (reversed)	Team oriented
Communicative	6.28	Team integrator	Team oriented
Administratively skilled	6.25	Admin. competent	Team oriented
Coordinator	6.19	Team integrator	Team oriented
Inspirational	6.19	Visionary	Charismatic
Motive arouser	6.18	Inspirational	Charismatic
Trustworthy	6.17	Integrity	Charismatic
Decisive	6.17	Decisive	Charismatic
Informed	6.15	Team integrator	Team oriented
Team builder	6.13	Team integrator	Team oriented
Dependable	6.13	Malevolent (reversed)	Team oriented

Correlations between leadership dimensions and socialization agents influencing the students' life

Data in Table 3 portray the correlations between leadership dimensions valued by student's community and the socialization agents influencing their value system.

The dominant note is the lack of significant correlations. In the cases the correlation is statistically significant against a sig. = 0.50 probability threshold, it is very weak. Self protective style has positive correlation with models from society, politics, economy and sports (Pearson coefficient = 0.095; sig. = 0.049) and negative correlation with the education got in family (Pearson coefficient = -0.102; sig. = 0.035). Participative leadership has negative correlation with models from society, politics, economy and sports (Pearson coefficient = -0.104; sig. = 0.031) and with examples from science and research (Pearson coefficient = -0.104; sig. = 0.031). Autonomous leadership is positively correlated with models from science and research (Pearson coefficient = 0.097; sig. = 0.044).

Conclusions and future research

Due to the fact that space constraints do not allow discussing the findings, we only focus on general conclusions and future research options.

The students' first two leadership preferences are *team oriented* leadership and *charismatic/value based* leadership. Some of leadership dimensions correlate with certain socialization agents which influence students' cultural and leadership expectations. Universities and government could use our findings in designing the strategies aiming at preparing the students for the market of next elites in economy, for creating and developing a leadership culture among young generations, for setting up national mentorship networks in educating and developing managers and leaders. Students themselves could take into account our findings in clarifying their options for own business or management positions.

The findings and conclusions should be taken in the context of an ongoing research. Certainly, they could be influenced by the sample size, structure and geographic location. At the same time, it is probably that certain perceptions and expectations had been influenced by the fact that the data collection took place in full economic crisis. Additional, the students form a specific population, still in molding process. They are influenced by a lot of social factors which were left out of our attention. The methodological limits should be also, mentioned. Some of them might be diminished in future research, pursuing two major objectives: a) performing comparative

studies based upon the data collected in GLOBE students research for other European countries and b) comparative studies based upon Romanian students population and middle managers (GLOBE II research).

Table 3 Correlations between second order leadership dimensions and agents of socialization

Second order Leadership dimensions	Pearson coefficients and significance level						
	Parents/ family	Teachers	Friends	Superiors	Radio/ TV stars	Examples from society	Examples from science

SMEs are playing a critical role in the economic development of Romania. Under the current circumstances – economic crisis, high level of unemployment – their role became even more important. SMEs are the engines for economic growth, but many of them don't have the processes and structures that larger corporations employ to manage and grow their businesses. For them, the critical issue is market – the ring of survival or death for hundreds of thousands of companies.

Key words: market, customers, Romanian SMEs

JEL classification: D8, L2, M1

1. Introduction

The analysis of the markets where SMEs sell their products shows that 69.52% of the companies are active only in the local and national market, 39.22% of the companies only in the local market, 18.56% in the EU market, 6.28% sell their products/services in other European countries and 3.46% are also active in the markets of certain countries outside Europe. Almost 40% of the SMEs focus exclusively on the local markets, as their smaller size cannot give them the necessary economic power to enter other markets.

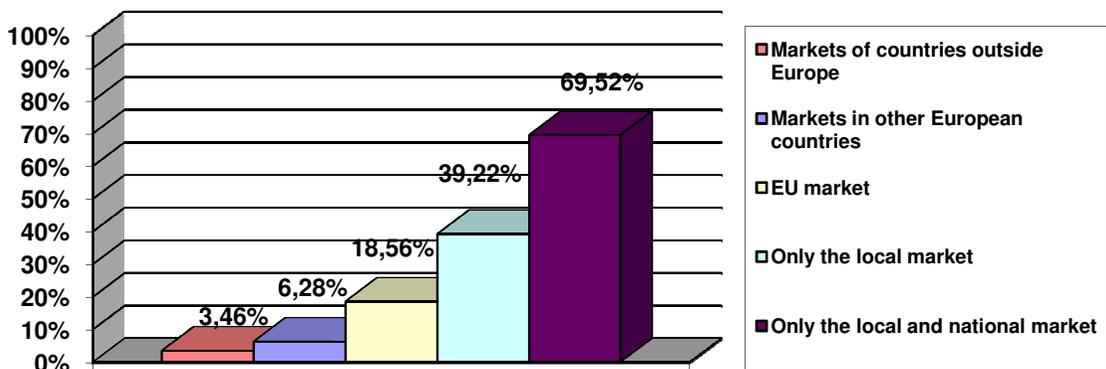

Figure 1 Distribution of SMEs on markets

The analysis of **SMEs depending on size** shows that:

- as SMEs grow in size, the proportion of companies active only in the local market or only in the local and national markets decreases (from 50.65% and 77.29% - microenterprises, to 18.90% and 49.61% - medium-sized enterprises);

- the percentage of SMEs producing for the EU market or for other European markets increases in direct proportion to the company size;
- the average share of the local market in the overall market of SMEs and the average share of the local and national market are in reverse proportion to the size of the companies.

Table 1 Destination of SME products by company size

No.	Destination of products	Size of the company		
		Microenterprises	Small enterprises	Medium-sized enterprises
1	Only local market	50.65%	26.94%	18.90%
2	Only local and national	77.29%	63.33%	49.61%
3	EU market	11.93%	23.33%	37.01%
4	Other European markets	3.43%	8.06%	14.96%
5	Markets outside Europe	2.12%	5.83%	3.15%

Table 2 Average share of local/local and national markets in the overall markets of SMEs by company size

No.	Index	Size of the company		
		Microenterprises	Small enterprises	Medium-sized enterprises
1.	Average share of local market in the overall market of the company	69.33	57.58	40.94
2.	Average share of local and national markets in the overall market of the company	86.93	81.38	72.58

If we consider the market of **companies by sectors of activity** the findings are:

- in the tourism sector, there is a smaller proportion of SMEs active only in the local and national market (20.00%), but a higher proportion of companies that sell their products/services only in the local market (48.00%), in the markets of other European countries (12.00%) and in the markets of certain countries outside the European Union (8.00%);
- in the construction sector, there is a higher percentage of companies that are active only in the local and national markets (35.40%) and the lowest proportion of SMEs active in the EU market (9.73%), as well as no companies active in countries outside Europe;
- industrial companies demonstrate a higher availability for the markets of other EU countries (29.39%) and a limited opening to the local market exclusively (24.12%);
- the average share of local markets in the overall markets of SMEs is higher in the trade sector (81.65%) and lower in industry (63.01%), while the average share of local and national markets is higher in the construction sector (96.71%) and lower in tourism (87.22%).

Table 3 Destination of SME production depending on the field of activity

No.	Destination of products	SMEs by fields of activity					
		Industry	Construction	Trade	Tourism	Transportation	Services
1.	Only local market	24.12%	42.48%	47.37%	48.00%	34.43%	34.45%
2.	Only local and national	28.51%	35.40%	21.05%	20.00%	24.59%	25.63%
3.	EU market	29.39%	9.73%	15.31%	24.00%	16.39%	18.91%
4	Other European markets	8.77%	3.54%	5.50%	12.00%	3.28%	7.14%
5.	Markets outside Europe	4.39%	0.00%	2.63%	8.00%	3.28%	5.46%

Table 4 Average share of local/local and national markets in the overall SME markets by sectors of activity

No.	Index	SMEs by fields of activity					
		Industry	Construction	Trade	Tourism	Transportation	Services
1.	Average share of local market in the overall market of the company	63.01	80.04	81.65	79.55	77.68	77.63
2.	Average share of local and national markets in the overall market of the company	90.31	96.71	91.34	87.22	91.59	92.34

2. Customers of the small and medium-sized enterprises

The analysis of SMEs in point of categories of customers shows that, of the companies surveyed, 70.15% sell their products to individual customers, 53.87% to wholesalers, 52.32% to companies in other sectors, 51.71% to industrial companies, 50.86% to retailers, 43.59% - to local governments, 37.94% to exporters and 36.12% to the central government. A surprising fact is that a considerable number of Romanian small and medium-sized companies have contracts with government entities. See Figure 2.

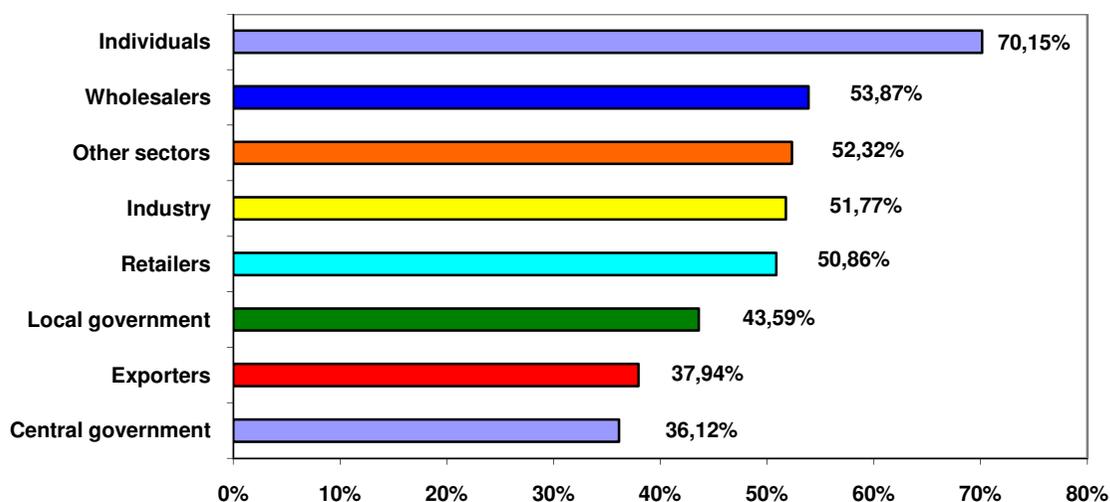

Figure 2 Structure of SMEs depending on the nature of their customers

The **proportions of various categories of SME customers**, as detailed above, show that:

- considering the percentages up to 30%, the most frequent customers are the central government (a customer mentioned by 79.60% of the companies), the local government (73.07%), exporters (68.59%) and retailers (62.43%);
- in the range of 30% to 60%, the most frequent are the customers from other sectors of activity (33.04%), followed by industrial companies (27.07%) and retailers (23.43%);
- for percentages above 60%, the most frequent customers are individuals (48.12%), industrial companies (17.93%), wholesalers (17.40%) and companies in other sectors (16.35%).

For additional information, see Table 5.

Table 5 Proportions of various categories of customers of SMEs

No.	Customers	SMEs by proportion of customers		
		0 - 30 %	30 - 60 %	60 - 100 %
1.	Wholesalers	61.99%	20.61%	17.40%
2.	Retailers	62.43%	23.43%	14.13%
3.	Industrial companies	55.01%	27.07%	17.93%
4.	Exporters	68.59%	20.62%	10.79%
5.	Companies in other sectors	50.61%	33.04%	16.35%
6.	Local government	73.07%	18.37%	8.56%
7.	Central government	79.60%	14.86%	5.54%
8.	Individuals	33.07%	18.81%	48.12%

The analysis **by size** (see Table 6) shows that:

- the percentages of SMEs having wholesale and retail customers vary in direct proportion to the size of the company;
- the proportion of companies selling their products to individuals decreases for larger companies, as companies usually diversify their customers and activities as they grow in size;
- small companies mostly sell their products to industrial companies (53.89%), exporters (40.28%), organizations in other sectors of activity (55%), local government (44.72%) and central government (39.17%);

Table 6 Structure of SMEs by size, depending on the nature of their customers

No.	Customers	Size of the company		
		Micro-enterprises	Small Enterprises	Medium-sized enterprises
1.	Wholesalers	49.35%	58.61%	62.20%
2.	Retailers	47.22%	52.50%	63.78%
3.	Industrial companies	50.65%	53.89%	51.18%
4.	Exporters	37.42%	40.28%	33.86%
5.	Companies in other sectors	51.47%	55.00%	48.82%
6.	Local government	43.30%	44.72%	41.73%
7.	Central government	35.46%	39.17%	30.71%
8.	Individuals	76.96%	64.17%	54.33%

Considering the **sectors in which SMEs are active** (Table 7):

- the customers of SMEs in the sector of services mostly include industrial organizations (56.30%), exporters (42.86%), companies in other sectors (62.61%) and central government (41.18%);
- the SMEs in the tourism sectors have less customers among the wholesalers (48.00%), retailers (36.00%), industrial companies (44.00%) and exporters (28.00%), but have the largest share of individual customers (92.00%);
- the small and medium-sized companies in industry have a great proportion of retailers as customers (56.58%) and the smallest proportion of companies whose portfolios include companies in other sectors (46.05%), individuals (59.21%) and entities of local government (36.84%)/central government (29.82%).

Table 7 Structure of SMEs by sectors of activity, depending on the nature of their customers

No.	Customers	SMEs by fields of activity					
		Industry	Construction	Trade	Tourism	Transportation	Services
1.	Wholesalers	54.82%	57.52%	55.02%	48.00%	52.46%	51.68%
2.	Retailers	56.58%	45.13%	50.48%	36.00%	47.54%	51.26%
3.	Industrial companies	50.00%	53.98%	50.48%	44.00%	55.74%	56.30%
4.	Exporters	35.53%	35.40%	37.56%	28.00%	42.62%	42.86%
5.	Companies in other sectors	46.05%	59.29%	48.80%	52.00%	52.46%	62.61%
6.	Local government	36.84%	48.67%	44.50%	44.00%	42.62%	47.48%
7.	Central government	29.82%	37.17%	36.36%	36.00%	39.34%	41.18%
8.	Individuals	59.21%	69.03%	73.21%	92.00%	72.13%	71.85%

3. Conclusions

- 69.52% of the companies are active only in the local and national market, 39.22% are active only in the local market, 18.56% of the companies are active in the EU market, 6.28% of the companies sell their products/services in other European countries and only 3.46% of the SMEs are active in countries outside Europe.

- the small and medium-sized companies have the following categories of customers in the specified proportions: 70.15% - individuals, 53.87% - wholesalers, 52.32% - organizations in other sectors of activity, 51.77% - industrial companies, 50.86% - retailers, 43.59% - local government, 37.94% - exporters, 36.12% - central government

- only 48.00% of the SMEs are aware of the notion of knowledge-based economy/company.

The concept of knowledge-based economy/company is more frequently known in organizations that have been active for 10 to 15 years (53.17%), based in the Central Region (63.,64%), medium-sized (58.47%), limited liability companies (48.42%), active in the sector of services (55.09%), companies managed by entrepreneurs with a university degree

PERFORMANCE ASSESSMENT IN OPERATING DRY PORTS

Ciortescu Cezar-Gabriel

“Alexandru Ioan Cuza” University of Iași

Faculty of Economics and Business Administration

In this paper, an approach for recognizing and defining correct and operable performance will be presented with the purpose of evaluating the effectiveness and efficiency of processes in dry ports (inland intermodal hubs). The challenge in evaluating the possible improvements of the underlying processes lies in the special nature and the complex structure of dry ports. It is important to consider that all the processes are highly interconnected and that changes in parameters in one process also have an impact on parameters in other processes. Furthermore, the performance of dry ports, seen as the backbone of the system, has a significant impact on the overall performance of the whole transportation network.

Key words: dry ports, logistic performance indicator, container, freight, transportation, TRANS-TOOLS, ASYCUDA

JEL codes: A12, C53, C83, D78, D85, F14, L92, M13, O21, O47, Q55, R11, R4

Introduction

The first shipping container was invented and patented in 1956 by an American named Malcolm Mc Lean. From that moment on, the container shipping industry has improved its performance at an impressive pace, with containers production reaching high numbers, megacarrier container ships reaching 14000 TEU¹³²² (World Cargo News, 2006), and the seaports container terminals expanding the capacity already increased by the existing ones (McCalla, 1999). As container transport volume continues to grow, seaport inland access becomes a critical factor for the seaports' competitive advantage. Therefore, progress only in the maritime part of the transport chain and in seaport terminals, without improvements in seaport inland access, is not sufficient for the entire transportation chain to function successfully.

One of the issues, which has been neglected for many years or sporadically implemented on different continents, is the dry port concept, which represents the focus of this paper. The concept was recently reborn due to increased interest in environmental issues related to growing containerized maritime transport. Many studies and researches have been made for the concept to be integrated into world freight trade.

Methodology used in this paper is based on extended literature review, interviews and case studies, with external validation regarding dry ports implementation, and is primarily meant to highlight the main impediments which influence implementation of dry ports and the actors involved in containerized freight trade, after a proper definition or at least after defining the concept.

Definition and classification the concept of dry ports

The definition of the concept required investigation of previous names for inland intermodal terminals, as there are different names all over the world: Gueterverkehrszentren in Germany, Plateformes Multimodales Logistiques in France, Freight villages in UK or Interporti in Italy, Inland Port in US, Inland Container Depots in India and Asia, Estacao Aduaneira do Interior in South America, particularly in Brazil, meaning Interior Customs Station. They all provide transshipment from one mode to

¹³²² One freight container standard size = twenty equivalent unit, TEU

another as well as auxiliary services such as warehouses, customs, maintenance workshops, insurance offices and other (Roso, 2009). India introduced Inland Container Depots – ICDs, in 1983 and Indian Customs (2004) bases its definition of an ICD on the UN ECE definition below, but restricts it to containers. India also uses the term Container Freight Station - CFS, which differs from an ICD since containers are stuffed and stripped there. Hence, an ICD is a consolidation node for containers whereas a CFS aggregates individual consignments into containers. A CFS function might be added to an ICD. ICDs are normally located outside the port towns but there are no site restrictions regarding CFSs. In Europe there has been a focus on business areas offering a wide range of logistics services. In a survey (Cardebring and Warnecke, 1995), a definition was provided for an Intermodal Freight Centre as a concentration of economically independent companies working in freight transport and supplementing services on a designated area where a change of transport containers between traffic modes can take place. An Inland Freight Terminal is “any facility, other than a port or an airport, operated on a common-user basis, at which cargo in international trade is received or dispatched” (UN ECE, 1998). An Inland Port is located inland, generally far from seaport terminals; they supply regions with an intermodal terminal offering value added services or a merging point for different traffic modes involved in distributing merchandise coming from ports (Harrison et al, 2002). The term dry port is used synonymously. Finally, according to the Economic Commission for Europe (ECE, 2001), a dry port is simply “an inland terminal which is directly linked to a maritime port”. However, a dry port definition that corresponds to the definition of an Inland Clearance Depot - cited above - was used (Beresford and Dubey, 1990). Since the former definition on dry port is rather broad in its meaning, all above mentioned terminal facilities might use the notion of dry port due to their links to seaports. Another definition describes a dry port as “an inland intermodal terminal directly connected to seaport(s) by rail where customers can leave/pick up their units as if directly to a seaport” (Roso, 2009). Despite the fact that the frame of reference is ambiguous, we nevertheless get a general perspective from the above quoted definitions. Research done in 2007 (Roso, 2009) classifies dry ports as it follows: close dry ports, mid range dry ports and distant dry ports. This classification is based on the distance between the seaports that dry ports are servicing and the dry ports themselves. However, one such classification could not be sufficient in order to get a clear definition of the dry port concept. There is still a wide area for research regarding the concept and we will mention other criteria of classification as it follows:

- According to size (meaning how many TEU it can handle per year): small, medium, large and mega dry ports, which can be implemented in land-locked countries.
- According to means of access: depending on how many rail tracks and roads are in and out of facility.
- According to value added services: as stuffing / stripping of containers, maintenance of container, handling and storage of refrigerated / frozen and dangerous goods.

A summative definition, as observed from above, is that dry ports, having the word “dry” as a structural part of their name, are supposed to be viewed as different from inland intermodal terminals which have, in addition to standard dry port facilities, at least one inland waterway, by means of which goods can also be transferred also by water means: either by barges, tugs, or other navigational equipment; moreover, its handling equipment is at higher scale than that of dry ports.

There are still a lot of academic debates over dry ports definition and classification, as research field in container trade and inland logistics has been developing over recent years.

Assessing performance of dry ports

The underlying concept for assessing performance indicators to measure the process quality of inland terminals is a first approach towards a standardized process for collecting and evaluating data on the performance of dry ports. It is intended to show that inland terminals have to be considered complex systems that will need much more attention in the future. This will allow bearing in mind the big picture while not losing sight of operating details. There is one particular study (Gronalt, Posset and Benna, 2008) which focuses on a discrete event simulation which was developed in an earlier stage of our research. The simulation model is based on three standard processes (Gronalt, Benna, and Posset 2006). It takes consequently into account the delivery and pick-up process of train and truck, the storage of containers in the yard and the handling of empty containers. In this context the aim of the simulation model was to conduct experiments regarding causes and effects within the underlying process. The simulation model is used to quantify and evaluate performance indicators which are used as input for the evaluation of the dynamic cause and effects model by setting the following parameters:

- Throughput (ITU/Year)
- Rate of fast movers and non stackable ITU (%)
- Average storage time of fast movers (days)
- Average storage time of slow movers (days)

The better the operating efficiency of the dry port equipment and staff, the more customers the terminal can attract and the more customers will place handling orders. More handling orders result in an increase of the storage usage rate which also induces a greater order fulfill-rate. The higher the order fulfill rate, the higher the available capital of the terminal and the greater the resources budget. A greater resources budget allows the management for more staff training to increase equipment exploitation which again results in an increase of operating efficiency. An increase in the operating efficiency induces extra handling orders which generates more gains and further allow for more staff training and better equipment exploitation. As a result, an increase in the operating efficiency has a reinforcing impact on the customer's handling orders.

Performance indicators are assigned as a loop to emphasize the impact of an improvement or deterioration within the context of the system. Furthermore, it is possible to point out the corresponding causes to deduce necessary actions. In a study conducted in 2008, (Gronalt, Posset and Benna, 2008) expert interviews and field studies practitioners always pointed out that there is a need for a theoretical model to support the understanding of the underlying simulation model, but the results of simulation were still viewed as a black box for dry port operations. When thinking of actions and the expressiveness of performance it is important to formulate corresponding objectives to measure the impact or contribution of performance indicators. Still in the world economic crisis, the above scenario is expressed too optimistically. Despite this, we have at hand another two of the main tools for assessing a dry port performance: TRANS-TOOLS and ASYCUDA.

TRANS-TOOLS "TOOLS for Transport Forecasting and Scenario Testing" is a European transport network model that has been developed in collaborative projects funded by the European Commission Joint Research Centre's Institute for Prospective Technological Studies - IPTS and Directorate-General for Transport and Energy - DG TREN. It covers passengers and freight transportation, as well as intermodal transport. It combines advanced modeling techniques in transport generation and assignment, economic activity, trade, logistics, regional development and environmental impacts. It can be used both by public and private bodies, for prediction and forecast for traffic and evaluation on environmental impact. The main issue for the development of TRANS-TOOLS was the need to construct an IPR-free instrument, with open architecture in order to facilitate access by potential users and developers (EC JRC IPTS, 2008).

The implementation of the ASYCUDA - Automated System for Customs Data) software,

developed by UNCTAD, will be a future standard for the operation of dry ports. ASYCUDA is a computerized customs management system which covers most foreign trade procedures. The system handles manifests and customs declarations, accounting procedures, and warehousing manifests, as well as suspense procedures. It generates detailed information about foreign trade transactions which can be used for economic analysis and planning. The system project is directed at reforming the customs clearance process. It aims at speeding up customs clearance through the introduction of computerization and simplification of procedures and thus at minimizing administrative costs to the business community and the economies of countries. It also aims at increasing customs revenue, which is often the major contributor to national budgets in most countries, by ensuring that all goods are declared, that duty/tax calculations are correct and that duty/exemptions, preference regimes, etc. are correctly applied and managed. Furthermore, it aims at producing reliable and timely trade and fiscal statistics to assist in the economic planning process as a by-product of the customs clearance process. An important objective of the ASYCUDA projects is to implement the systems as efficiently as possible with a full transfer of know-how to national customs administrations at the lowest possible cost for countries and donors (UNCTAD, 2009).

The other macroeconomic indicator which will include dry ports performance will be the LPI – Logistic Performance Index. It is a joint venture of the World Bank, logistics providers, and academic partners. The LPI is a comprehensive index created to help countries identify the challenges and opportunities they face in trade logistics performance. The World Bank conducts the LPI survey every two years. The LPI uses standard statistical techniques to aggregate the data into a single indicator. This approach makes it possible to conduct meaningful comparisons across countries, regions, and income groups, as well as to undertake country-specific diagnostic work. Because these vital aspects of logistics performance can best be assessed by operators on the ground, the LPI relies on a structured online survey of logistics professionals from the companies responsible for moving goods around the world: multinational freight forwarders and the main express carriers. Freight forwarders and express carriers are in the privileged position to assess how countries perform. It helps by directly affecting the choice of shipping routes and gateways and influencing firms' decisions about production location, choice of suppliers, and selection of target markets (Arvis et al., 2010). Implementing dry ports and increasing their performance will increase LPI of the country, which will bring a higher rating in the world freight trade.

Integrating and combining the above mentioned indicators will provide a better picture regarding the performance of a dry port, and to what extent this will constitute part of the solution for the future of transportation, climate change, regional sustainability, security and safety.

Conclusion

Dry port implementation is not a straightforward solution for the seaport terminal decongestion or for providing easier seaport inland access; it can, nevertheless be part of the solution. The implementation and operation of freight containers through dry ports would bring a series of advantages: environmentally, CO₂ emissions would decrease, by splitting and shifting a part of freight market share of road to electrified railway networks and application of the "last mile" principle; from the traffic and infrastructure point of view, decongestion of trucks queued at seaport terminals gates would become possible; regarding security and safety of trade, customs and government control would improve and the risk of road accidents would be reduced. On the other hand, durable regional sustainability would evolve, new jobs would be created and costs would be reduced by value-added services. On a different level, competitiveness of importers and exporters would be increased, with or without economic growth, chaotic movements of cargo in

hinterland would be eliminated, and finally, the issue of empty containers would be solved by reallocation. Although it is obvious that the relocation of containers from road to electrified rail would result in lower CO2 emissions, a dry port is not merely the equivalent of rail implementation – it is a set of efficient services such as transshipment, storage, depot and containers' maintenance, customs clearance, tracing and tracking. Anyhow, the dry port performance depends on the quality and quantity of ways of land access such as railway and road.

Ilieş Liviu

Babeş Bolyai University Cluj-Napoca, Faculty of Economics and Business Administration

Mureşan Ioana

Babeş Bolyai University Cluj-Napoca, Faculty of Economics and Business Administration

This article is a theoretical article regarding Six Sigma. Six Sigma has been interpreted over time within quality theory as a metric, methodology or a management system.

We explain Six Sigma using a logistics context: Delivery-On-Time (DOT) rate problem. It is a theoretical context useful both for academic users and practitioners.

At the beginning of the paper the DOT problem is generally described, while Sigma is presented according to statisticians view in the second part of the paper. Six Sigma is then presented as a metric for process' capability. The fourth part of this article contains details regarding Six Sigma usage as a methodology for improvement, while the fifth part of this article refers to Six Sigma as a management system which can be used at firms' level.

The last chapter is dedicated to conclusions regarding the possible use of Six Sigma in Romania.

Key words: Six Sigma, delivered-on-time, metric

The article's JEL code: M11

1. Introduction

Logistics – the movement of goods at global level has become an important subject on the agenda of economists, politicians and ecologists especially after 2000 and once more with the actual economic crisis. Logistics has been perceived as a cost once with the introduction from military field to business in 1950-1960 by Americans. At the present moment discussions suggest that 10 percent from the final price is paid for logistics by the high performing nations (Crişan et al., 2010). Logistics can be considered a part of operations. There are several managerial problems which are to be solved by logistics managers, from logistics network design and performance management (as strategic problems) to daily problems related to customer service.

As logistics insures the movement of goods to the customer, one of the measurements of logistics performance is the delivery-on-time (DOT) rate. It is a proportion between the number of orders delivered on time and total orders delivered. There are discussions that the number of delivered orders is not a relevant performance measure for delivery, but the value or volume delivered. We shall not insist further on this aspect, for this article DOT refers to the number of orders delivered on time.

DOT is a result, is a measure of logistics performance. According to a previous research we have performed in 2009 (Crişan, 2009), only 43,14% Romanian logistics managers use such a measure. Measurement is not a goal itself, but improving performance. The main goal of this article is to present Six Sigma as a metric, a methodology for problem solving or a management system using the DOT example.

The paper has six parts: introduction; Sigma presentation as a statistics' measure for central tendency; Six Sigma presentation as a metric for process capability; Six Sigma description as a methodology for improving the capability of a process; Six Sigma as a management system useful at firms' level. The sixth part contains conclusions regarding Six Sigma possible usage within Romanian business.

2. Sigma

Sigma (σ) is a Greek letter used by statisticians to denote the standard deviation for a set of data. Let's consider the variable X - the values of daily DOT for a given company A for 365 days. If variable X has the mean μ , then the variance of X is given by:

$$Var(X) = \frac{\sum_{i=1}^n (x_i - \mu)^2}{n},$$

where n represents the volume of the population (in this case 365), $i = \overline{1, n}$ denotes each value (day in our case) of the population.

The standard variation (σ) is the square root of variance.

3. Six Sigma as a metric

Six Sigma concept comes from statistics. A process which has a normal distribution¹³²³ is represented as a bell-shaped distribution, also called a Gaussian distribution (figure 1) (Breyfogle et al. 2001, p.38). The shape of this normal curve depends solely on the process, equipment, personnel, and so on, which can affect companies' A delivery activity. This normal curve represents the spread of DOT resulting from daily delivery, using current equipment, materials, workers, and so forth. The normal curve says nothing about the range of DOT acceptable to the customer. This curve is the empirical quantification for the variability that exists within the DOT delivery process.

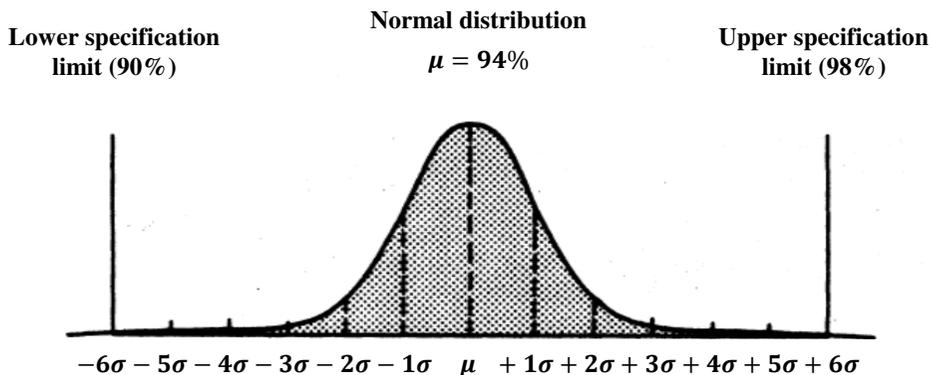

Figure 1: A capable process

The normal curve is represented by statisticians considering the value of σ regarding this variable and the average DOT value, which is shown as the middle of the curve on the x-axis. The standard deviation is expressed in percentages in this case. The total area under the normal curve is assumed to be equal to a proportion (decimal value) of one. This means that all possible DOT values range from - infinity to + infinity on the X-axis. Although this normal distribution theoretically allows for DOT to have 10% or 100% values, this is a practical impossibility and has such a low probability of occurring that it is irrelevant.

We do not have to deal with the infinite properties of the normal distribution. The normal distribution in science, engineering, and manufacturing is typically between $\pm 3\sigma$ about the target mean. $\pm 3\sigma$ represent 99.73 percent of the total area under the normal distribution (Breyfogle et al. 2001, p.39). The difference of 0.27% is the probability of our firm to obtain DOT values outside of the interval $\pm 3\sigma$. If a process is centered, for every 100 days, 99.73 of them, approximately 99,8 days, will have DOT values that fall within the interval $\pm 3\sigma$. Still this corresponds to 2,700 defective DOT per million DOT measured. Just imagine 2700 organs not delivered on time in 1

¹³²³ Not all processes are normal distributed, but most of them are. Specific statistical tests should be used to establish this aspect for specific processes.

million opportunities. For the interval $\pm 6\sigma$, the ppm (parts per million) value is 0.002. In Motorola Six Sigma quality program the number of errors expected is 3.4 ppm because they have considered a possible mean variation of $\pm 1,5\sigma$ (Brigham, 2005).

According to figure 1 each process can be considered a Six Sigma process. Any process normal distributed can be represented using a normal curve and has the values in 99.999998% of the cases within the interval $\pm 6\sigma$. The problem is weather the values -6σ and $+6\sigma$ from the mean are below or upper real needs.

Things are more specific in business: any process has to generate an output considering requirements. In order to understand the Six Sigma concept in business, we have to explain the term customer requirement. In quality management literature the goal of economic organizations is to satisfy customer needs. As customer needs are intangible, economists and engineers use measurable features for defining customer needs. These measurable features are called requirements and refer to products which firms manufacture in order to satisfy customer needs. Products are now described using sets of requirements – measurable features. Requirements are set for a product considering customer needs (the so-called VOC – voice of customer) regarding the product, but also other stakeholders' (for example the VOB – voice of business, which is the voice of the shareholders) requirements regarding the product but also the process. DOT is a service requirement generated from VOC. Considering VOC, the management establishes lower specification limit (LSL) for the DOT requirement (it could be 90%) and upper specification limit (USL) (98% - quality costs and performing better than 98% means that the company spends more than it has been planned for better deliveries). The value of DOTs without management's specification limits are defined as defects, failures, or nonconformities.

The mean for this interval is 94%. Figure 1 describes a process which has the DOTs values between 90% and 98% in 99.999998% cases.

It is a capable business process because LSL and USL are exactly -6σ and $+6\sigma$. A **capable process** is that one where customer requirements objectives (LSL and USL) are both within the interval $[\mu - 6\sigma, \mu + 6\sigma]$.

It is also a **centered process** because the mean of the requirements interval [LSL,USL] is the same as the mean of the population $[\mu - 6\sigma, \mu + 6\sigma]$. This means that DOT values are between -6σ and $+6\sigma$ and it also takes into account customers' specifications.

Six Sigma is now in business a metric of process capability. The capability of a process is related to the standard deviation of a process and it can be measured by the following expression:

$$C_p = \frac{USL - LSL}{12\sigma}$$

If C_p is higher than 1 and the process is centered, we deal with a capable process - it means that the difference between LSL and USL is bigger than 12σ , which, if the process is centered, means that the number of errors is below 0.002 ppm. In figure 1 C_p is exactly 1 because $LSL = \mu - 6\sigma$ and $USL = \mu + 6\sigma$.

If C_p is smaller than 1 and the process is centered, we deal with non-capable process - it means that the difference between LSL and USL is smaller than 12σ , which, if the process is centered, means that the number of errors is greater than 0.002 ppm. In figure 2 $LSL = \mu - 4\sigma$ and $USL = \mu + 4\sigma$. C_p is:

$$C_p = \frac{USL - LSL}{12\sigma} = \frac{(\mu + 4\sigma) - (\mu - 4\sigma)}{12\sigma} = \frac{8\sigma}{12\sigma} = 66.66$$

Normally, the process will have results within the interval $[\mu - 6\sigma, \mu + 6\sigma]$, while the customer asks for values within the interval $[\mu - 4\sigma, \mu + 4\sigma]$. Considering C_p value, our process is capable on 66.66% of the interval $[\mu - 6\sigma, \mu + 6\sigma]$. The probability of appearance for values without the interval $[\mu - 4\sigma, \mu + 4\sigma]$ is only 63 DPMO (Defects per Million Opportunities), or 0.63%.

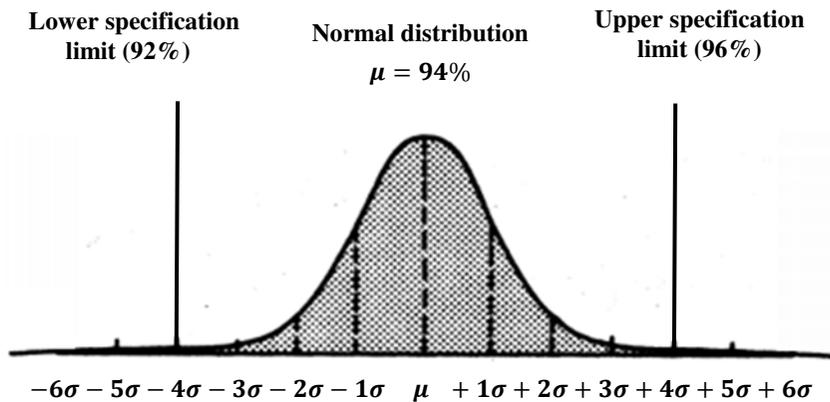

Figure 2: A non-capable process

In figure 2 we have a 4 σ capable process. The process capability measured in σ values can be interpreted according to the next table:

Sigma level	Percentage of the total area under the normal distribution	Defective ppm
1 σ	68,27	317.300,000
2 σ	95,45	45.500,000
3 σ	99,73	2.700,000
4 σ	99,9937	63,000
5 σ	99,999943	0,570
6 σ	99,9999998	0,002

Six Sigma has become in this way a metric for any process capabilities. It can refer to any requirement established by the management, considering only the value of sigma (measured in processes' units) and the values of LSL and USL, both measured in processes' units. It is relevant whether these units are liters, centimeters, percentages or anything else.

4. Six Sigma as a methodology

Measuring is not a goal itself, but improvement. Six Sigma practitioners use Six Sigma to measure the capability of a process, but they also used specific tools for improving the level of quality, usually for decreasing the variation within processes (diminishing sigma and bringing processes at capability levels). Six Sigma has its own steps for improving a process capability, which are denoted by the acronym DMAIC (Define, Measure, Analyze, Improve and Control), established at Motorola. DMAIC is recognized as a methodology to analyze processes in order to root out sources of unacceptable variation, and develop alternatives to eliminate or reduce errors and variation.

While processes not capable are identified, management and statisticians can work for improving the capability gaps using this methodology. In our case the process is delivery and figure 2 denotes that we have a problem with delivering on time. We further present the general goals of each step within DMAIC methodology, the main outputs and the main tools which can be used:

The goal of the **Define** step is to define the project's purpose (goal – DOT in our case) and scope (area where we shall focus - delivery) and obtain background information about the process and its customers.

The outputs of the Define step consist of the following:

- The team charter - a clear statement of the intended improvement and how you will measure it, containing also the scope, the goal and the team which is going to perform this action;
- A process map.

- A translation of the voice of VOC into critical to quality measures (DOT is transformed from CCR – Critical Customer Requirements or CBR – Critical to Business Requirements).

For performing this step several statistical and management tools can be used: affinity diagrams, team charters, communication plans, control charts, critical to quality trees, data collection, Kano model, Pareto charts, Run Charts, SIPOC diagrams, tollgate review questions (Brassard et al., 2002). In our case, the goal of define should be describing how this low level of DOT is perceived by customers and which is the process behind DOT level (DOT is only a result of delivery process).

The goal of the **Measure** step is to focus your improvement effort by measuring the current situation. The outputs of the Measure step include the following:

- Data that pinpoints the problem's location or rate of occurrence.
- Measure the actual capability (sigma) of the process considering the chosen performance metrics (DOT).
- An understanding of how the current process operates.
- A more focused problem statement.

For this step several tools can be used: control charts, data selection, flowcharts, histograms, Pareto charts, process sigma, run charts, Taguchi loss function, tollgate review questions.

The goal of the **Analyze** step is to identify root causes and measure them with data. The output of this step is a theory that you have tested and confirmed whether there is a relation between the great Y (in our case DOT value) and small steps within the process which influence delivery on time (documentation on time, order packaging, order manipulation).

The Analyze step pinpoints the specific cause(s) of the focused problem. Several tools can be used: brainstorming, cause-and-effect diagrams, design-of-experiments, histogram, hypotheses testing, scatter diagrams, tree diagrams, tollgate review questions.

The root cause(s) are addressed through solutions implementation in the Improve step. The goal of the **Improve** step is to develop, try out, and implement solutions that address root causes and to use data to evaluate the solutions as well as the plans you use to carry them out.

The outputs of the Improve step include the following:

- Planned, tested actions that eliminate or reduce the impact of the identified root cause(s) of a problem (such as changing delivery routes considering several alternatives).
- “Before” and “after” data analysis that shows how much of the initial gap was closed.
- A comparison of the plan to the actual implementation.

It is a data driven approach: DOT is influenced in different percentages by different causes. Eliminating these causes DOT level shall be improved.

Several tools can be used: Gantt charts, brainstorming, control charts, FMEA (Failure Mode and Effect Analysis), histograms, involvement matrix, Pareto charts, PDCA (Plan-Do-Check-Act) matrix, process sigma, run charts, tollgate review questions.

The goal of the **Control** step is to maintain the gains you have made by standardizing your work methods or processes, anticipating future improvements, and preserving the lessons you learn from this project.

The outputs of the Control step include the following:

- Documentation of the new method – changing the documentation regarding delivery process.
- Training of fellow employees in the new method – new routing methods, new ways for preparing documentation, order manipulation or delivery).
- A system for monitoring the consistent use of the new method and for checking the results (introducing new forms useful for capturing several performance measures regarding delivery process).

- Completed documentation and communication of the results, leanings, and recommendations.

The Six Sigma projects should be perceived by the whole organization, they shall become a part of firms' knowledge.

In this phase the tools which can be used are: communication plans, control charts, PDCA cycles, process management charts, run charts, Six Sigma storyboards and tollgate review questions. The DMAIC methodology has been built as a managerial and statistical tool for solving problems within business. The main advantage is that this new set of tools can be used for any problem at any level. The question is whether this methodology is to be used by companies at all levels and if this can become a management best practice.

5. Six sigma as a management system

Six Sigma comes from statistics, but it is now the best practice for problem solving within several companies: Motorola, General Electric, Allied Signal, Nokia or other big companies have adopted Six Sigma projects using this name or making specific “rebrandings”.

As a best practice, it is more than a set of metric-based problem solving and process improvement tools. Six Sigma offers the opportunity for management to make data driven decisions (Pyzdek and Keller, 2009, p.87).

Six Sigma has been implemented at firms’ level by projects with 4 to 6 months to be completed. The objectives of these projects were chosen considering key results related to stakeholders needs. The priorities are developed based on analysis of key stakeholder needs and wants, including the customer, shareholder, and employee groups. In this way, data-driven management provides a means of achieving organizational objectives by quantifying needs or wants of stakeholder groups relative to current level, and acting upon the data to reduce those critical gaps in performance. Methodologies for performance management, such as the Balanced Scorecard, Tableau de Bord and Benchmarking are now completed with this data driven methodology.

The main advantage of this management system is making aware steps to improvements. As such, the *Six Sigma Management System* encompasses both the Six Sigma metric and the Six Sigma methodology. It is when Six Sigma is implemented as a management system that organizations see the greatest impact (Breyfogle et al., 2001, p.45).

6. Conclusions

Though we have focused on this article more on the metric side of Six Sigma, Six Sigma is a powerful tool for problem solving within business. As we have discovered in previous researches, we believe that the problem for Romanian managers is not whether they use or not Six Sigma, but is whether they make general measurements of business performance. DOT value is measured by 43.14% logistics professionals. Six Sigma is a metric, methodology and management system which helps you to improve performance if you are aware by the poor level of performance. More awareness is what we need, more focus on numbers and on data driven improvements. Six Sigma can then become a best practice within Romanian companies.

THE HUMAN FACTOR AND THE SUCCESS OF ORGANIZATIONAL CHANGE

Deaconu Alecxandrina

The Academy of Economic Studies, Faculty of Management

Rașcă Lavinia

Exec-Edu Asebuss

Manolescu Aurel

The Academy of Economic Studies, Faculty of Management

The topic chosen for this study regards the concept of change, associated nowadays with the notion of existence. Starting from statements according to which change involves the direct participation of the members of the organization, we have formulated the study hypothesis from the perspective of the symbolic-interpretative theories which sustain that social changes result from the interaction between organizations, their members and the social actors.

Using specialty literature, we have offered a pertinent sociological perspective on change processes. We have discussed different analysis perspectives and some models of change analysis. We have investigated, on the basis of a research launched in the Academy of Economic Studies, the willingness to change of some young students that will graduate soon and we have drawn conclusions useful for the educational process in the field of business management.

Key words: organizational change, models of change, dynamic models, willingness to change

JEL code: M12

1. Mechanisms of organizational change

Organizational change represents an almost obsessive concern in the sociology of the organizations, maybe because of the importance paid to the bureaucratic slowness and rigidity or to the concrete problems permanently faced by the organization managers and by those responsible with the administrative reforms. In order to understand the mechanisms of organizational change and innovation, we should take into account, as M. Crozier and E. Friedberg¹³²⁴ do, the created character of change. *Change is not natural: it is a problem that must be researched.* That is why we will discuss in the following the next aspects:

a) *change by crisis and adaptation:* Michel Crozier and Erhard Frierberg¹³²⁵ (op.cit.) state that an organizational system whose main characteristic is rigidity cannot adapt easily to change and consequently will tend to resist to any change. *Yet, the resistance to change, on which the organizational managers keep on insisting, is only an aspect of the bureaucratic problem, either public or private.* Their excessively centralized character makes change be considered a descendent trend, which should be applied uniformly and impersonally to the whole organization. Michel Crozier notices that from this fact results a crisis, often profound, which affects all the levels of the organization. The period of crisis is accompanied by unexpected behaviours: personal authority tends to replace the rules and the members are constraint to obey the arbitrary of some of them. The readjustments of the system of bureaucratic organization are operated by the means of such a crisis. Consequently, these involve not necessarily a transformation, but an adaptation meant to contribute to the continuity and development of the system of bureaucratic organization. It results that this system is formed not only from routine procedures, as we used to

¹³²⁴ Crozier M., Friedberg E., *L'acteur et le système*, Editions du Seuil, Paris, 1977.

¹³²⁵ Crozier M., Frierberg E. – op. cit.

think, but also from short periods of crisis that fuel, by the adjustments they facilitate, the long stability phases.

In the last chapter of the book *L'Administration en Miettes*, Francois Dupuy and Jean-Claude Thoenig¹³²⁶ develop a similar point of view, analyzing the existence of mechanisms of adaptation in the French administration. Thus, the negotiated arrangements or the successive adjustments that eventually prove a great flexibility of the administration are meant only to avoid some more profound changes: administration “adapts by not changing”.

b) change by collective learning: Crozier and Friedberg suggest that any type of change action is conditioned by the discovery and acquirement of some new collective capacities, new ways of thinking, new modalities of living together. Change means thus learning, especially learning a different way of cooperation - that is of inventing and establishing new “game” models. Imposing a model from outside or from above is replaced by involvement in a collective process, in which individuals and groups become actors of change.

Yet, this way to conceive change is confronted with a series of obstacles. The first of them consists of the previous structure of the concrete systems of action. The actors acquired abilities and competences related to this structure. This allows solving certain problems, but represents an obstacle for the collective learning, as it structures the participants’ experience, their ways of thinking and acting, conditioning thus their capacities to invent new “game” rules. However, do all the organizations succeed in favouring a collective change process?

The answer offered by Crozier and Friedberg can seem paradoxical at a first glance, as the most favorable changes prove to be the organized assemblies in which there are many vicious circles – these are the most diversified assemblies. Indeed, where there is a redundancy of the vicious circles, the rigidity is lower because each of them put a weaker pressure on the system on the whole. At its turn, the system is less dependent on each of the regulation mechanisms it established and is not profoundly affected if one or more of them are broken. The multiplicity of the vicious circles produces within the organization new intervention limits. Change is thus facilitated by the game of the integration mechanisms. For Crozier and Friedberg, both the solution and the difficulty of change consist in breaking the existent vicious circles and in establishing some new ones. On the contrary, the poor diversified organizations, such as army, maintain themselves by strict constraints: coercions, a simplistic ideology etc. These types of rigid organizations cannot afford the smallest change without risks: this would affect the whole assembly and would lead to a crisis.

Does this mean that, according to Crozier and Friedberg, change can be done without crisis? We could doubt it, as well as we could regard skeptically the criteria on the basis of which it can be established if we deal with a reproduction or a transformation of the system of action. Despite of these, such an analysis draws attention on the fact that change is an open process that remains contingent.

c) change as a form of development: The change analysis proposed by Renaud Sainsaulieu¹³²⁷ develops around the concept of development, largely used by economists interested in the future of the third world societies. Renaud Sainsaulieu transfers in the field of enterprises the concept according to which the development and the changes it involves can result only from certain local initiatives based on the progressive learning of other production and management practices. This conception on the change attributes an essential role to the cultural phenomena: they will determine the learning possibilities. Following Crozier and Friedberg, Renaud Sainsaulieu considers that the social development of an enterprise results not necessarily from an action change decided *ex nihilo*, but from a series of complex collective reactions to the pressures of the external environment and of the internal functioning. The common strategic „games” and the

¹³²⁶ Francois Dupuy and Jean-Claude Thoenig, *L'Administration en Miettes*, Paris, Fayard, 1985.

¹³²⁷ Renaud Sainsaulieu, *L'identité au travail, Presse de la Fondation Nationale des Sciences Politiques, Paris, 1985.*

cultural adjustments they favour can contain thus a dynamic of the learning and can bear creativity and renewal.

Understanding change as development seems to be from many points of view a variant of change as an effect of learning. Indeed, this last term is in the centre of the both approaches. Undoubtedly, Renaud Sainsaulieu's approach is interesting, as it pays special attention to the existent resources, to the processes on the verge to begin, to the already started transformations and to their chances to spread and generalize. A similar perspective oriented also the hypotheses of a research programme focused on the analysis of the innovations within the public services. This programme followed especially the identification of the local renewal resources, as well as of the modalities to generalize them.

Yet, this latter approach delimitates from the strategic analysis, understanding change not as a crisis, as adaptation or as development, but as manifestation of multiple shifts and inter-shifts of the actors, cognitive schemes and involved tools. Renewal can be thus done in different ways, according to the resources used by actors in those organizations. On the other hand, the notion of shift, inspired by Michel Callon¹³²⁸ and Bruno Latour¹³²⁹, offers a more flexible framework for understanding various innovations and changes, drawing attention on the way some of them are acquired and consequently modified.

d) change and modernization: The common feature of the above mentioned papers is that all of them consider change as a problem and propose a conceptualized interpretation for it. Things are different with the notion of modernization that gained field at the end of the '80s, as an attribute of some different change processes, initiated both in the private enterprises, and in the public administration.

The notion of modernization has multiple meanings. It covers a diversity of actions, whose compatibility is not necessarily self-understood: investments in sophisticated technical material, redefinition of the relations with the clients or with the users, labour reorganization, applying the quality circles and other important managerial techniques in Japan, communication campaigns aimed at modifying the internal and external enterprise image, etc. Moreover, it sends to different debates, as it is approached from the point of view of the public policies analysis and of the organizational sociology, or from the point of view of labour sociology and economy.

2. Models of change

The theories of the classical management and of the early modernism have always been focused on the idea of finding instruments of motivation, of knowing the organizations from the point of view of performance.

In these theories oriented towards stability, changes used to be seen as the result of the intention to do a good thing, more routine, more structure, and more rationality. A perspective focused on change gradually replaced the dominance of the views centered on stability, and all the three perspectives of the organizational theory embrace more now the dynamic ideas regarding the processes of the organization.

On the other hand, in the post industrial societies, the interest for change has become more spread. More theoreticians believed that economic and technical changes were meant to lead to new organizational forms, such as the global structures and networks, but this idea did not prove to be true.

Modernists explained the needs for the new organizational forms in the terms of environmental change, without taking into account the predictions of the permanent and fast changes in

¹³²⁸Michel Callon, Réseaux tehnico-économiques et irréversibilité, Les figures de l'irréversibilité en économie, Paris, Ed. De L'Ecole des Etudes en Sciences, 1991.

¹³²⁹Bruno Latour, *Organizational Studies, Critical Perspectives on Business and Management*, Edited by Warwick Organizational Behavior Staff, London, 2001.

products, markets, technology and society. In order to keep pace, the organizations had to be modeled for change and the organizational theories needed dynamic methods to be described and explained. As change has been more and more accelerated, theoreticians realized that the static models, although useful once, proved to be often inadequate.

All the symbolic-interpretative researches in the organizational theory are based on the dynamic methods because the processes of social construction regard aspects of the day-to-day life, which reproduce the existent structures and circumstances, or lead to their alteration. According to the symbolic-interpretative perspectives, organization is not a static entity, but rather a dynamic process in a permanent state of change. Similarly, the postmodernist view upon fragmentation and chaos rejects the vision of stability in the favour of a paradox of stability / change within the organizations. Thus, as the organizational theory continues to develop towards the directions defined by the symbolic-interpretative and postmodernist researches, the notion of organization is replaced by that of organizing, this change being called by Weick many years ago as the “theory of inaction”.

Anyway, it should not be believed that modernism is left away by the discourse regarding the organizational change. On the contrary, the evolutionist and development models, such as population ecology and the organizational theories of the life cycle have become more and more sensitive and dynamic to change. Moreover, the recent discoveries as regards the theory of systems introduce ideas about the own reproduction and the own reference system of the organizational theory, which contribute to creating a new metaphor – learning organization. This metaphor challenges the ex modernist models of organizational change that assumed that the organization adapts to external pressures. Instead of these ones, they suggest that the organization creates its own internal dynamics which is described as a process of the organizational learning.

In order to illustrate the evolution of the way of thinking as regards the organizational change we will start with a first model of planned organizational change – Kurt Lewin’s model: “unfreezing – change – freezing” – and we will continue with the “Big Tree” model that offers an example of the dynamic and evolutionist thinking about change from the perspective of the modernist trend.

a) *Lewin’s model*

Kurt Lewin¹³³⁰ developed a theory of social change that defines the social institutes as equilibrium of forces, some of them favouring change, and others restricting it. According to Lewin stability was not defined by the forces opposable to change, but it was rather a dead end between the pro and con forces. Lewin’s theory was more a theory of stability than of change because he defined change as an instability that interrupts a stable equilibrium. According to Lewin’s model, change involves three separate activities: *unfreezing* that melts the equilibrium sustaining the stability of the institutes; *change* that involves influencing the direction of movement in the system that was unbalanced by the unfreezing and *freezing* that takes place when the new behavioural patterns become stable or institutionalized.

b) *Change according to the Big-Tree model*

Kanter, Stein and Jick¹³³¹ called Lewin’s model “the model of the organization as an ice cube”, criticizing it as a static and linear concept that reduces an extraordinarily complex process to a childish formula. They state that change is ubiquitous and multidirectional and that is why Lewin’s model cannot reach the level of complexity necessary for analyzing the phenomenon of the organizational change.

¹³³⁰ Kurt Lewin, *Principles of Topological Psychology*, McGraw – Hill Book Company Inc., New York, 1936.

¹³³¹ Kanter, Stein and Jick, *The Challenge of organizational change: How companies experience it and leaders guide it*, Free Press, New York, 1992.

Kanter and his colleagues sustain that according to Lewin's model organizational change is seen only as an application of the efforts concentrated in a single direction, at a certain moment. Their theory considers change multidirectional and more or less continuous. What apparently has stability at the surface is an unfelt or unprovoked change.

Kanter and his colleagues had divergences as regards the concepts of organization that do not fit the conditions of apparent stability, considering necessary a new understanding of the organizations and management. For instance, rather than planning and directing change as in Lewin's model, the manager's duty within in a new organization is to react to, exploit and generate change. For the new organizations, Kanter and his colleagues presented their own Big-Tree model.

The Big-Tree model demonstrates as a variety of key concepts and theories produced by the theoreticians of the organization can be combined to form an integral explanation of the organizational change. In this regard, Kanter and his colleagues presented a theory of the relation between organization, environment, social structure, organizational culture and physical structure. What is intriguing at the Big-Tree model is the fact that it is built on evolutionist models, as a base for the theory of organizational change. In contrast with Lewin's model, there is not a single agent of change in the Big-Tree model. According to it, change is implemented during the process of organizing, which is sustained by a multitude of forces.

Kanter and his colleagues define organizations as a "bunch of activities" that are modified together with the change of the activities or when are included new unities and individuals. They sustain that this influence on the activity is restrained and the change takes place at the all three levels of analysis specified by the organizational theory – environment, organization and individual.

While Kanter and his colleagues present a theory of change considered more complex than Lewin's, it is not clear that their point of view is as dynamic as they state. Thus, they present only another picture of other combined theories and this picture is itself at level 1 (a non-dynamic system). Another reason can be the fact that the researches in this field are focused on the transmission of the patterns of organizational change, rather than on the change at the ordinary level of the day-to-day life in an organization. In other words, they incorporate the theories of the life cycle and of the ecologic population less dynamic than it happens in the symbolic-interpretative and post-modernist perspectives.

3. Research regarding the young people's willingness to change

The discussion upon the organizational change cannot avoid its relation with the organizational members. Under these circumstances, it is natural to know the effects produced by change and the modalities through which we can educate the individual's capabilities related to change.

Aiming to promote the psychological advantages at the workplace, J.M. Burns¹³³² draws attention on the fact that both the employees and the management should learn how to effectively face change. Burns offers a concept of change through which he recommends to know ourselves and to develop personal strategies, more efficient in conflict with the stress. He says that people generally prefer stability, but nowadays each of us should become more skillful to adapt to the fast change of the labour environment. The common stress factors at the workplace should be identified and where possible the stress sources should be reduced and eliminated.

According to Burns, the potential stress factors are: *problems of career development; lack of safety at the workplace; too many or too less responsibilities at the workplace; inability to adapt to the new work practices; boring or unchallenging work; weak management support; lack of the required qualities; inability to use the existent qualifications; inappropriate preparation*

¹³³² Burns J.M., Strategies and the Management of Organizational Change – a strategic alignment model, Journal of Information Technology, nr. 8, 1993, www.palgrave-journals.com.

/requalification; lack of involvement in the decision-making process; lack of socio-emotional support/counselling; rumors about future changes; uncertainty regarding future.

Each individual should face the stress challenge. Colleagues, friends, family and experts can help by offering information and emotional support. Burns draws attention on the necessity to practice a positive management, a positive self-coordination including the relaxation techniques, appropriate diet and sleep patterns, physical exercises, time planning. It is important to cultivate the self-confidence and to overcome the anxieties and fears by the means of increasing the capacity to give up the negative and self-destructive thoughts.

Education plays an important part in enhancing the individuals' chances to face the process of organizational change. In this regard, we have tried to investigate the willingness to change of some students of the Academy of Economic Studies by carrying out a survey that took into account the students of the Faculty of Business Management taught in foreign languages, where we delivered the course of Change Management.

We used the questionnaire proposed by Liz Clarke (Managementul schimbării - Ghid practic privind producerea, menținerea și controlul schimbării într-o firmă sau organizație), on a sample of 97 students. The questionnaire allowed us to frame the respondents in four categories: *heroes* – who distinguish themselves through real capacities of coordination and even leadership (14 %), *artisans* – who pay little interest to the routine tasks of the management activities as they dedicate most of their time to carrying out the product or the service (39%), *strategists* – having the most recommendable style for approaching change and developing the business (36%) and *pedants* – who are concerned with study, who spend time to solve problems, but who are also attracted by details, almost insignificant (11 %).

Conclusions

All the information provided by the past experiences creates the necessary and useful framework – even if it is not complete – to manage changes that will take place in our organizations. The success of our actions is decisively influenced by the capacity of the human resources to understand the specific of change, its nature and the actions to follow in each step. The development of the human resources starting from this request is a strategic axis that cannot be ignored without condemning us to economic, social and cultural stagnation with extremely harmful long-term consequences.

THEORETICAL AND METHODOLOGICAL ASPECTS OF THE PROFESSIONAL PERFORMANCES EVALUATION

Feraru Andreea
University of Bacau
Faculty of Economics

Ciucescu Nicoleta
University of Bacau
Faculty of Economics

Evaluating performances is an operation that is periodically completed within organizations, analyzing the work balance of the employees in order to discuss with the employees the recorded progresses and the required measures to be taken in the future. Within the Romanian organizations the evaluation process of the human resources has encountered a series of particularities determined by the existing conditions in which it is completed, by the pursued targets and by the selected methods.

Keywords: human resources, professional performance evaluation, organisations, employee, methods and technique of performances evaluation

JEL classification codes: O 15, M 12

1. Human Resources Performances Evaluation Process

In a time where the technological progress has dramatically increased, the velocity with which the goods and services are produced and delivered has facilitated the communication between organisations, the most valuable factor for a more efficient function of a business remaining the human performance level.

The employees working under a performing management system know their priorities, their current activities, their goals, as well as how should they contribute to their team or their organisation performance.

According to Anton Rotaru and Adriana Prodan “the professional performances evaluation represent the process of establishing the way and the measurement in which the employee fulfils its duties and responsibilities that come with the job description, in comparison with the established standards and transmission of the results to the employees”¹³³³.

As a result, the performance evaluation has a central role and constitutes an important element or a fundamental component of the performance management system, furthermore the means through which the organisational objectives develop into individual ones. From this point of view, the performance evaluation holds a significant number of the performance management system characteristics.

Evaluating performances is the fundamental activity of the human resources management developed in order to determine the degree in which the employees of an organisation efficiently fulfil the assigned tasks.

Evaluating performances is an efficient management process, in which the manager constantly performs a surveillance of the employees' performance and offers a feedback.

Non-formal assessment appears when a leader chooses to. The daily work relation between a leader/manager and his/her subordinates offers the opportunity to make assessments on the

¹³³³ Rotaru A., Prodan A., *Managementul Resurselor Umane*, Editura Sedcom Libris, Iași, 1998.

performances. These assessments are transmitted through non-formal means of communication or when examining some aspects of the work, within some operative debates or meetings.

Formal/systematic assessment is performed when the contact between the managers and subordinate is formalised and it has already been established a system of reference the employees' performance observations and assessments of their direct leaders/managers.

The responsibilities of evaluating performances belong to managers as well to the personnel department:

Managers:

- bring up to date the way in which the performances are evaluated;
- draw up formal reports concerning the performance evaluation;
- foresee/analyse the evaluations/assessments with the employees.

Personnel department staff:

- plan, maintain and bring up to date the formal system of performances evaluation;
- establish on time the report of the assessments of the employees performances;
- instruct and train the specialists who are in charge with evaluating performances.

Within Romanian organisations, the main objectives are achieved through employees' performance evaluation:

- to insure the agreement between the demands from the job description and the employee's qualities (professional, abilities, attitudes);
- to stimulate the employees in order to increase the individual professional performance;
- to choose the persons for which the results of the professional activity evaluation motivate an adjustment of the job position into a higher one and/or an adjustment of the salary according to the appropriate applicable normative legislation.

At the same time, the human resources performances evaluation provides:

- detection of the areas in which professional training actions of the employees are required;
- detection of the situations in which a reorientation of the employee is necessary, according to his/her capacity, abilities, attitude and behaviour in comparison with the job demands;
- detection of the required elements in order to select the staff to accomplish new, urgent or important projects/documents/programmes;
- presentation to each employee the way in which his/her activity was appreciated.

Professional performance evaluation is applied to all organisation employees, except the top manager in proportion with the requests from the job description, with the requests for the specific job position, as well as with the professional evaluation criteria according to the *Personnel Professional Performances Evaluation* operational procedure and established by the leader of the organisation.

It is important that the evaluation to be performed regularly, systematically (usually half-yearly or yearly) for good results. Such a systematically evaluation does not leave out some possible non-formal assessments when are considered required, for example at some organisation or employees' events.

Professional performance evaluation of the staff take place at a given time, which is fixed by the top manager of each organisation and it may take place as it follows:

- *usually once a year and has as its main goal to establish the general rank that characterises the activity of an employee;*
- *every time it is required – when by this action some useful information may be gathered in order to take a decision.*

During the year, at each adjustment of the job position or the salary of an employee a professional performance evaluation of that employee is performed, according to the same procedure.

Staff professional performance evaluation consists in the analysis of the performance criteria, according to the form Professional Activity Reference (if this particular form exists within the organisation), respectively Professional Activity Chart, that leads to the estimation of the employee activity results, the detection of the positive and negative qualities and to establish a plan to improve the future results.

Personnel professional performance evaluation is performed in conformity with the stipulations of the Collective Work Contract and with the Personnel Professional Performance Evaluation procedure, when referring to those organisations that have implemented a good quality management system.

The participation of the employees is mandatory in the evaluation of their professional activity. It has to be mentioned the fact that the assessment of the performances evaluation, of the human resources in an organisation may be realised in different ways, such as:

- *the superiors may assess their subordinates;*
- *the subordinates may assess their superiors;*
- *the employees of the same rank evaluate one another;*
- *self-evaluation;*
- *external sources of evaluation.*

The evaluation of the employees by their superiors is manifested by different assessments that the superior makes. This type of evaluation is based on the presumption that the manager is the most qualified to realistically, objectively and correctly evaluate the performances of each employee, and the “unity of command” principle underlines this approach. Within an evaluation system, the superiors’ assessments have to be objective and based on the present performances. To achieve this goal, the manager has to keep a strict record of what the employees did or did not performed, a record of individual performances, so not to forget certain achievements of the employees during the time. The assessment is an important part of the personal file of the employee. Managers and employees have different assessment elements when dealing with the system of evaluating performances. The manager appreciates the system according to the way in which it helps to establish and communicate the performances to the employees. The employees appreciate the system according to:

- the salaries and rewards are based on the evaluation;
- the evaluation are based on the present performances;
- the performance standards are consequently applied;
- it is assured the double communication between the manager and the subordinate.

The evaluation of the superiors by the subordinates is a frequent applied concept in some organisations from all over the world and newer in Romania. It is considered that there are two advantages of this type of evaluation. The first one is that, in case in which the relations superior-subordinate are critical, the subordinate’s evaluation may be useful to identify competent superiors. The second advantage is that a system like this determines the superiors to be responsible towards their subordinates. Nevertheless, this advantage might become a disadvantage when the superior – knowing that his subordinates evaluate him/her – tries to be “pleasant” and conciliating.

A major disadvantage is the negative reaction of many superiors to be evaluated by their subordinates. The fear of the subordinates of retaliation from their superiors may lead to unrealistic evaluation. The principles of the relation superior-subordinate may deteriorate or distorted by this type of evaluation. The problems and disadvantages connected with the evaluation of the superiors by the subordinate may be eluded by moderately use of this system in some special situations.

Self-evaluation may be used in some situations. In fact, self-evaluation is an instrument of self development that determines every employee to identify its strong points and weaknesses and to establish certain tasks to improve its proficiency and work results. Self assessment produces a

strong feedback and may be a way of increasing every employee trust in its ability to fulfil a certain given assignment.

External Evaluation is completed by groups of specialists, experts from a certain field of activity. The external experts are requested in special cases when higher rank persons are to be evaluated or to determine the potential of a person before a possible promotion. This way of evaluation has the disadvantage that the external experts do not know all the specific aspects of the organisation and furthermore is expensive and time consuming.

An external, clear and useful source is considered the group of the clients, suppliers and consumers of the organisation products and services, which on different ways may supply information that enlighten the way in which the employees fulfil their duties and may influence the organisational performances.

2. Methods and techniques of evaluating performances

The necessity of evaluating the personnel or evaluating the performances in work regardless of the field of work, finally lead to the necessity to develop various methods and techniques of personnel assessment or systems of performances evaluation.

The diversity of the evaluating methods, techniques and procedures is relatively vast, and the dynamics of the development has encountered an ascendant evolution. The personnel assessment quality or performance evaluation became higher and higher, due to the fact, as the literature in the field stipulates, that the quality of the information on performance greatly depends on the quality of the evaluating methods or systems.

The most well-known methods that may be used in performances evaluation are:

The Essay is a written report or a description on the quality and quantity of the work, assessments on the ability of team work, on ways of improvement the work tasks are emitted, some general recommendations for the field of activity are given. The method is useful for the individual feedback and for the development, but it doesn't allow the comparative evaluation of several employees. Being a free form of evaluation, the evaluator describes the performances of an employee, the essay does not require a complex printed form or a complete professional training for the evaluator.

Comparison/in pairs is a more systematic method, that consists in comparing the employees, two by two, until the best one is chosen. The method uses only one criteria of assessment and it is useful for a group evaluation, but it deficient in case of individual evaluations that is compulsory for development.

Forced distribution requires a comparison of every employee with the other ones, taking into consideration several assessment criteria, "forcing" the results to define into a curve; the given hypothesis is that the great majority of the subjects provide mediocre results and few provide weak or excellent results, the curve of the results has in the end the shape of Gauss bell curve. The advantage of the method is that one may be able to make an efficient assessment of the employee groups, as well shaped entities.

The checklist method helps to establish the assessment criteria, to which is attached an importance coefficient, encoded through percentage, the sum being 100%, and ordering the subjects, on a numeric scale, according to the obtained percentage. The ordinal level scale is Likert scale alike (from 1 to 5), assimilating grades such as "unsatisfactory" (score 1), "satisfactory" (scale 2), till "good" (scale 4) and "very well" (scale 5). The method is easy to use and offers a close connection between the job description analysis and the performance evaluation, that may be numerical expressed.

Critical Events start from identification of the behaviours that lead to weak or exceptional results, generated by the work environment; it constitutes an important feedback from the employer point of view, but it is a time consuming method.

Graphical scale method is, probably, the most exploited method, more rapid than the essays or critical events, the results may be quantified by quantity, more assessment criteria are taken into

consideration, a standardisation of the scales is performed, that allows afterwards comparing a greater number of subjects. The scales distinguishes by three characteristics: (1.)- qualifier that express an affirmative response from the evaluator (“fully agree”, “agree“, “neutral”, “disagree”, “absolutely disagree”); (2.)- degree of clarity of the interpretation of the answer by the evaluator; (3.)- the way of define the level of performance, from the evaluator point of view (unsatisfactory, satisfactory, well, very well). The only amendment to the efficiency of this evaluating method consists in the lack of clarity that appears sometimes at the scale reference.

Evaluation Centres are a specialised system of evaluation that contains an organised way of completion. The system evaluates a person for 3-5 days, using a complex of methods, in an institutionalised enviroment. The evaluation tests, alone or in groups is monitored by a specialist that completes the assessment with the observation results. The final characterisation is accompanied by recommendations that are useful in solving the problem.

Despite the inconveniences in evaluating the employee performances, the implementation of a human resource performance evaluation programme must be a priority. The managers should be greatly and constantly concerned to apply the most effective and judicious methods of assessment, taking into consideration their motivational character.

3. Conclusions

Top managers and middle managers form Romanian organisations are confronting with situations in which they have to evaluate to employee performances, a process that assesses the contribution of each employee, regardless its rank at a certain time. In other words, these managers should underline at the same time the negative aspects of the employee performance, and on the other hand to provide support through counselling to the employee, establishing which are the possible ways of improvement. Performances evaluation may lead to discover the weak points but at the same time the potential and the professional training requests.

The assessment process may be used by organisation and by the employees. The organisation may have an evaluation on the quality of its employees and their capacity to obtain the desired performances. However, sometimes, the performance evaluation may produce some tensions, especially if it is not performed objectively. As for the employee, he/she may get to know the way in which the evaluation performed by his/her superior corresponds to his/her self evaluation and if there is a correlation between the results of the work, the performances and the salary.

To improve to professional performances and abilities in the majority of Romanian organisations it is absolutely mandatory an efficient foresight of the future evolution of the work environment, the human resources activities, the motivation of the employees and the continuous professional development of the employees.

ASSESSMENT OF THE ORGANIZATIONAL CULTURE OF THE COUNTY EMERGENCY HOSPITAL "DR. CONSTANTIN OPRIS", BAIJA MARE

Gavrilescu Liviu

North University of Baia Mare, Faculty of Sciences

Barbul Claudia

County Emergency Hospital "Dr. Constantine Opris", Baia Mare

The study proposes assessing the organizational culture of the County Emergency Hospital "Dr. Constantine Opris" of Baia Mare, as a basis for developing a strategic plan to facilitate the successful implementation of organizational goals and objectives. As research instruments were used: OCAI (Organizational Culture Assessment Instrument) and the semi-structured interview. The identified organizational culture of the County Emergency Hospital "Dr. Constantin Opris" has characteristics of a weak culture with strong hierarchical accents. Regarding the preferred situation, is obvious the predilection for type clan culture values, based on participation, group cohesion and individual development. The results obtained from the application of the OCAI questionnaire reveals a mismatch between current organizational culture and preferred organizational culture, which requires adapting to contemporary society.

Keywords: *Baia Mare, hospital, organizational culture, OCAI, interview, hierarchic-type culture, clan-type culture*

The Assessment Method

Through culture, organizations show a certain image in the environment. The culture represents that "something" that renders the human dimension of the organization and allows a fresh perspective to reaffirm the role of behavior and experience about the method and rationality.

Based on these considerations, we propose assessing the organizational culture of the Emergency County Hospital "Dr. Constantin Opris" Baia Mare, as a prerequisite to develop a strategic plan for change this culture, so that to facilitate the successful implementation of organizational goals and objectives proposed by management.

The study included 50 subjects, hospital employees: 12 men (24% of the total sample) and 38 women (76% of the total sample). Sample analysis by gender showed a roughly similar proportion existing within the organization, the hospital having 2,037 employees, including 1,661 women and 376 men.

Of the total participants, 12 subjects (24%) are physicians heads of department, head nurses or coordinator nurses, 28 (56%) are doctors, nurses or nurses, and the remaining 10 subjects (20%) are employed by IT, Accounting, Audit and Welfare Departments.

The average age of the sample is 42.58 years, ranging between 25 and 63 years, and the average activity length within the organization is 16.34 years, ranging between 3 months and 36 years.

Regarding the training, 26% of subjects have postgraduate studies, 24% university studies and 50% post-secondary studies.

Sample selection was random, ensuring voluntary participation and anonymity.

Assumptions from which we started were:

H1: The Emergency County Hospital "Dr. Constantin Opris" Baia Mare has hierarchical / bureaucratic culture, old and deeply rooted.

H2: Organizational culture preferred by employees of the Emergency County Hospital "Dr. Constantine Opris" Baia Mare is different from the current organizational culture.

As research instruments were used: OCAI (Organizational Culture Assessment Instrument) and semi-structured interview.

The purpose of using semi-structured questionnaire was so complete data obtained by questionnaire and to identify issues not addressed by the questionnaire, but may have great importance for the organization.

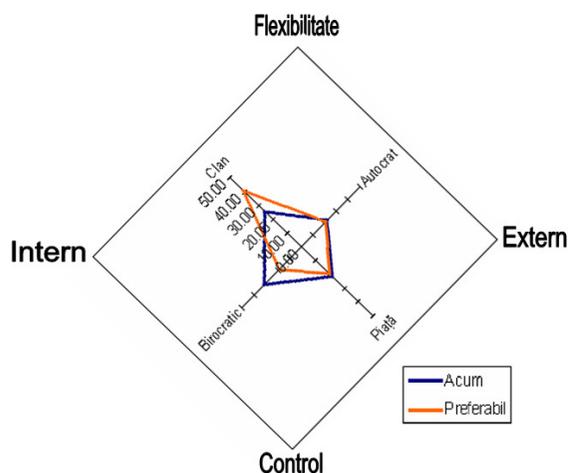

Data Interpretation

Table 1. OCAI statistical indicators for present and preferred situation

Type of culture	Media		Standard Dev.		Minim		Maxim	
	Present	Preferred	Present	Preferred	Present	Preferred	Present	Preferre
<i>Clan-type culture</i>	25.43	40.88	11.46	12.90	2	19.16	58.33	8
<i>Autocrat-type culture</i>	21.80	20.92	8.87	7.00	0	0	46.66	32.
<i>Market culture</i>	21.34	19.63	6.50	6.57	0	0	31.66	3
<i>Hierarchic culture</i>	30.98	18.18	13.67	7.75	10	6.66	74.16	47.

Statistical start indicators and the cultural profile of the organization obtained from the application of OCAI reveals for the present situation the dominance of hierarchic-type cultural values $m = 30.98$, but the differences obtained between this average and the averages for other types of cultural values are not significant, ie more than 10 points, so they do not support the existence of a strong hierarchic culture within the organization analyzed, but rather a weak culture, with strong hierarchic accents. Comparing the averages for the hierarchical cultural profile obtained for the current and the preferred situation reveals a significant difference (approximately 12 points), which indicates the willingness of employees to reduce the hierarchical culture values of the cultural profile of the organization they serve.

Hierarchical culture is characterized by emphasis on respect for authority, rational approach procedures and division of labor. The structure is hierarchical and power is based on formal authority (Pitariu & Budean, 2007), and communication is done through written arrangements from the top to bottom level.

Regarding the preferred situation, is obvious the predilection for clan-type culture values $m = 40.88$, but also the trend to reduce the hierarchical characteristics of the cultural profile of the organization, in favor of the characteristics of the clan-type culture.

Clan-type culture is based on participation, individuals, the social element, mutual trust, group cohesion and individual development. The communication system is primarily verbal and informal. Decisions are often based on informal contacts (Pitariu & Budean, 2007).

Next, we have analyzed the cultural profiles on each dimension, to observe their matching with the general cultural profile.

Table 2. Upper averages obtained on OCAI dimensions

Dimension	Current Situation			Preferred Situation		
	Average	St. Dev.	Type of Culture	Average	St. Dev.	Type of Culture
1. Dominant Characteristics	27.98	22.30	Hierarchical	40.90	22.55	Clan
2. Leadership	35.20	22.13	Hierarchical	36.90	19.13	Clan
3. HRM	34.20	23.02	Hierarchical	39.90	21.62	Clan
4. Organizational Binder	30.60	22.98	Hierarchical	39.70	19.23	Clan
5. Values	28.80	21.29	Hierarchical	41.50	21.52	Clan
6. Success Criteria	29.40	20.27	Clan	46.40	20.92	Clan

The global examination of the upper averages, resulting from the application of OCAI for each cultural dimension in part, reveal a high congruence of organizational culture within the County Emergency Hospital “Dr. Constantin Opris” Baia Mare, both for the present and for the preferred situation, but, according to Cameron and Ettington, corporate efficiency is better associated with the type of culture, than the power or congruence of culture.

Cultural profiles conducted separately for each cultural dimension reveal about the same issues as the overall cultural profile, indicating a shift to interiority and control for the present situation, and to flexibility and interiority for the preferred situation.

Data obtained through interviews, and results from the application of OCAI indicates an organization with strong bureaucratic accents, functioning as means of legitimizing power, of the need for stability and predictability, balance and consensus. Content analysis of interviews revealed some aspects that could not be identified through OCAI.

Reduced employee satisfaction regarding their work is largely due to shortcomings in the interpersonal relationships, organizational communication, or leadership style sometimes too directly, also to faulty design of health reforms. Reward system is perceived as unfair and demotivating.

Communication is done mainly from top to bottom in weekly reports, or through written arrangements. Healthcare teams form a pyramid structure, almost military, i.e. a type of organizational system that is closed. The power (decision making, the means to put the decision into effect and to control action) decreased as the employee is closer to the bottom. In general, cooperation and open communication are missing, and support for developing other skills beyond those strictly monitored by the institution, are not a priority. A cold and formal atmosphere is

prevailing. Rituals, although frequent, were more intended to show the hierarchy of power than to create an environment for creative thinking.

Top management is focused on control and accomplishment of tasks, with reduced interactions with employees. There is also a low interest for the personal development of the employees and ensuring complementarity between the goals of the organization and employee needs.

Conclusion

Questionnaire items allow the classification of the organization in a specific culture, but the interviews seem more appropriate to identify deep aspects of organizational culture.

The results obtained from the application of the OCAI questionnaire reveals a mismatch between the organization's current culture and the organizational culture preferred by employees, which will require the need to change its orientation. Bureaucracy proved to be an appropriate organizational form under a stable environment, and following purely economic purposes, but in the conditions of the present society, characterized by rapid change and a deeply unstable environment, are necessary organizational forms able to respond adequately to these challenges.

Identified organizational culture County Emergency Hospital "Dr. Constantin Opris" has the characteristics of a weak culture with strong hierarchical accents. The lack of market orientation, the discouragement of the initiative, the lack of motivation, and communication difficulties dominate. Renewal spirit and innovativeness face obstacles because of inability to understand market mechanisms, but also because of attitudes, disinterest, blocking in the routine, and, sometimes, use of an inappropriate management style.

A worrying aspect is the static nature of the knowledge in the Emergency County Hospital "Dr. Constantin Opris", mainly due to the division into "occupational castes", but also to issues related to internal competition, which were taken up and internalized by members of this organization.

Practice shows that a person's expertise, however high, shall not ensure by itself a higher productive behavior. Moreover, the organization central unit is not the individual, but the relationship between behaviors that constitutes the collective mind (Chirică, 2003). Of course, without the necessary instruction, people cannot get superior results, but the continuum of training and service quality is an important value. They act as an informal control system more powerful than any other control system, because it provides purpose and meaning for what must be done to obtain performance results.

What we know for sure is that, currently, there is not a set of shared values, in order to connect members of organization. What unites them is an engagement into a deep and inefficient routine whose outcome is most often dissatisfaction.

INTERACTIVE AND GRAPHICAL MANAGEMENT SYSTEM AT THE MARAMUREȘ COUNTY COUNCIL

Gavrilescu Liviu
North University of Baia Mare

Berlingher Vasile
Western University „Vasile Goldis” of Arad

Macelaru Mara
North University of Baia Mare

The Maramures County Council (Romania) implements a computerized graphic system for assisted public management. A performing public administration is a key issue for the present local and regional development. Having an interactive graphic interface based on the county geographical map, the SIGMA2 system act as a scoreboard for the management of the County Council, as well as an integrator of different software modules that consolidate local administration data. Among its results are the automatization of different financial operations and the provision of informational support for managerial analyses and decision making.

Keywords: assisted management, scoreboard, computer system, county council, Maramureș

Introduction

The concept „Interactive and Graphical Management System at the Maramureș County Council” (SIGMA2) aims to assist the management in public administration in the analysis and decision-making regarding resource management, expenditure, and relations with partners and citizens. SIGMA2 has in center an interactive interface based on graphical representation of the district composed of elements of interest (roads, settlements, investment objectives, elements of road safety, etc.). Connections are based on Web services (XML) functional in Intranet and Internet.

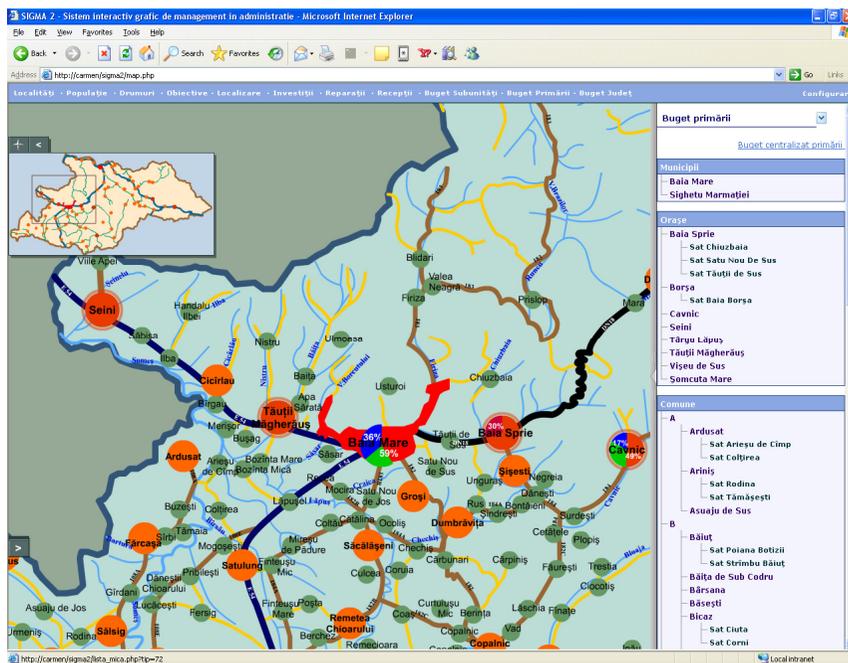

Fig. 1 The main window of the SIGMA system

The system is designed in a flexible and scalable architecture and structures a solid framework for computerization of activities of management and tracking specific to County Councils. SIGMA2 is also a scoreboard for the Maramures County Council management and an integration solution for specialized software modules and of consolidation at the county level of data managed by local authorities.

Research Methods

1. The specialized modules on which SIGMA2 is based are:

1.1. eCUB Complete integrated accounting system for budgetary units

1.2. INVEST records of investment and maintenance and rehabilitation works that involves public funds.

1.3. SPASGEN tracking and management of social benefits (complementary and single-parent family allowance, minimum guaranteed income, local transport, canteen).

2. SIGMA2 - central panel

2.1. Login

Access to system facilities is allowed only after the authentication based on user-password.

Granting of access rights is done by a system administrator. It has provided a module that allows management:

a. Users

b. User groups

c. users belonging to groups

d. relations between groups (inheritance rights)

e. rights of interaction with data: view, add / change, delete

Menu options vary depending on the rights granted to the user.

2.2. Map

It is the core element of the system and is composed of interactive graphical objects that facilitate access to information.

The system allows navigation on the map using the active areas at the edge of the window or arrows on the keyboard, i.e. increasing - decreasing scale (zoom) by buttons on the toolbar of the map or the + / - on the keyboard. Positioning visible area of the map can be tracked / specified on the miniature representation of the map.

Hiding / showing the map is done with the gray vertical bar marked with an arrow.

Active elements of the map are:

a. road - allow selecting a road (European, national, county) for which further information will be provided:

→ locations list, ordered by location on the road (at km.);

→ road investments - work positioning, cost and security;

→ road signs, indicators - positioning, type;

→ objectives of economic, social and cultural interest;

b. locality - used for displaying its data:

→ budget, budget execution (income and expenditure);

→ population;

→ objectives of economic, social and cultural interest;

c. other objectives - completely configurable at system implementation or after.

Road structure and spatial position of the localities are fixed based on county map digitizing, other graphics (objectives, institutions, road signs and works) may be positioned dynamically from SIGMA.

2.3. Main Menu

Is displayed at the top of the window and allows entry into areas of system configuration, consultation - detailed data update, visualization of advanced statistics.

Access to menu options is limited by the rights granted to the user, depending on the competences of the user's group. Connections to restricted functional areas will not be shown to simplify the interface.

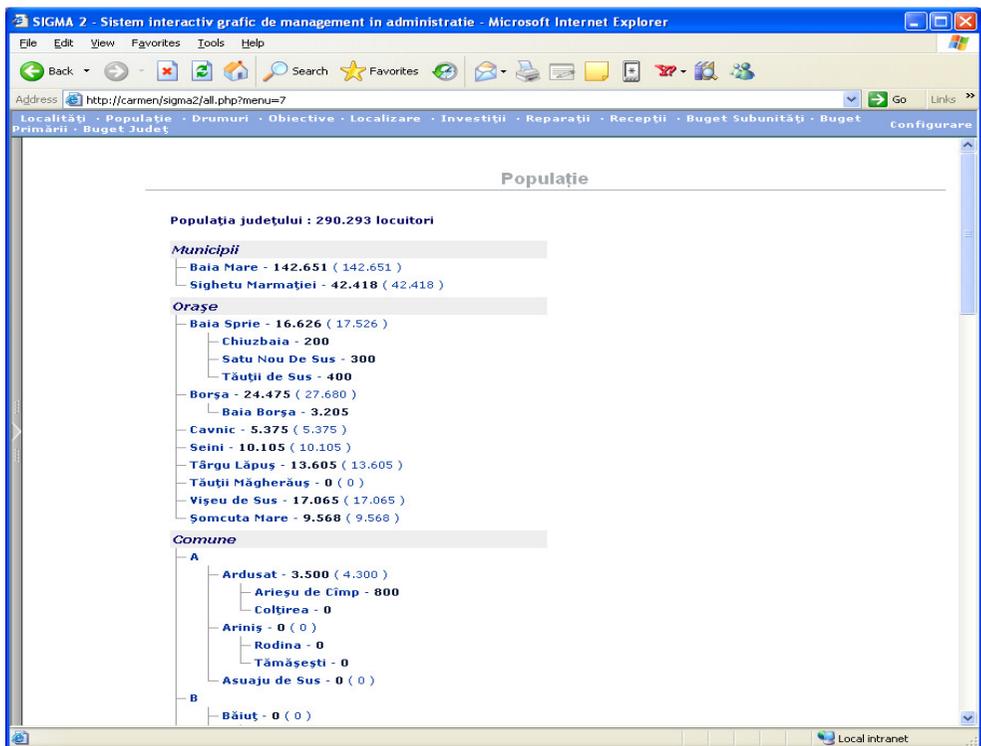

Fig. 2 Main Menu

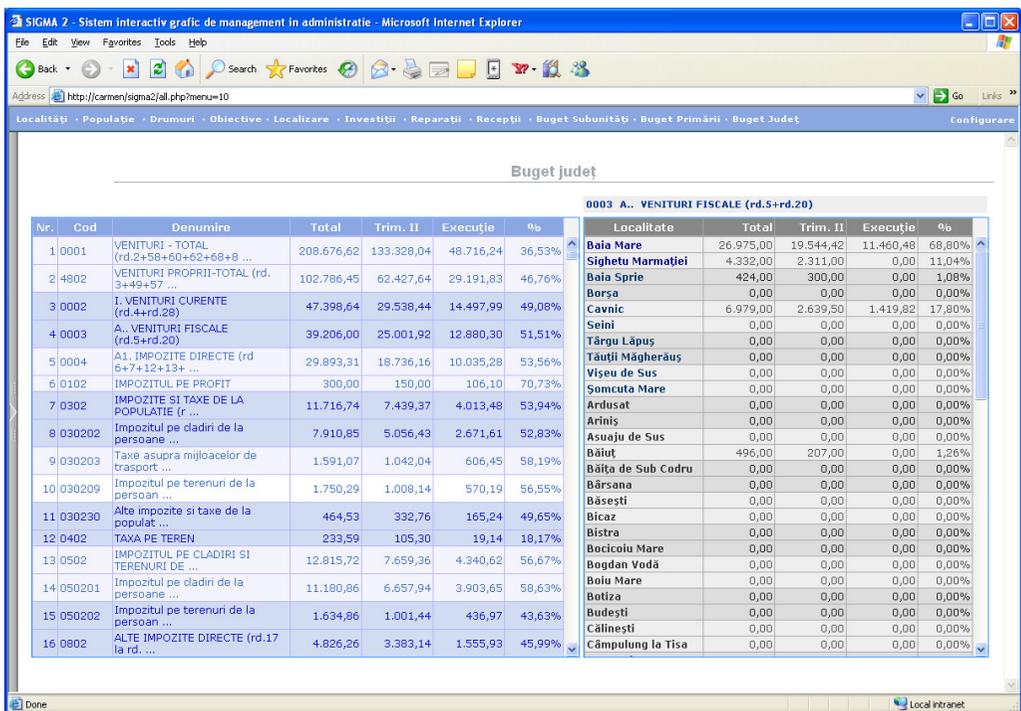

Fig. 3 Budgets

2.4. Implementation of requirements of systems, hardware and software applications or modules, specific to un-computerized departments

For the results of implementation of integrated computer system to be conclusive, it is necessary that all activities in a county council to register the relevant data electronically.

The current project will cover areas:

- Budget Management
- Financial and accounting management
- Management of inventory items and fixed assets
- Inventory and supply management
- Investment Management
- Financial analysis
- Human resources (integration of existing solutions)
- Building permits (integration of existing solutions)

The system architecture is shown in the following figure.

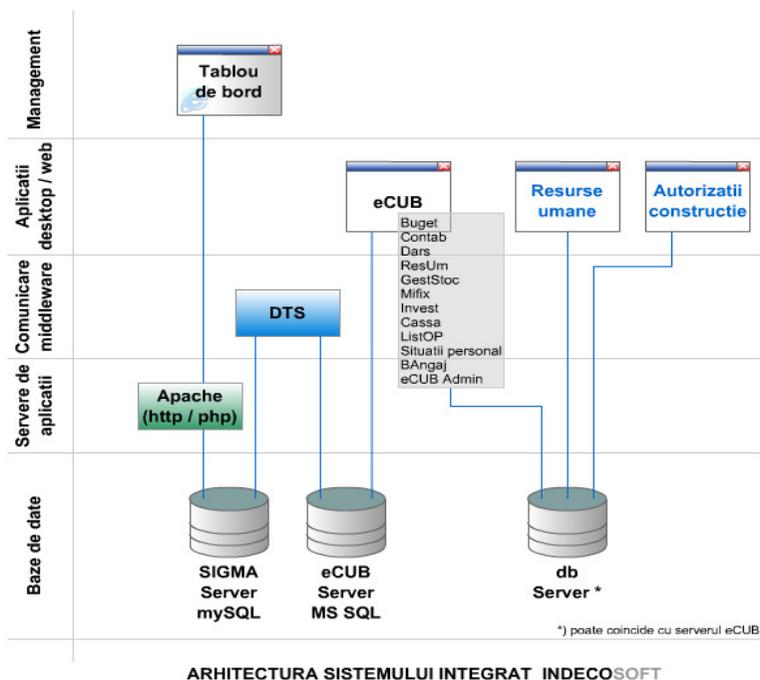

Fig. 4 System Architecture

a. Coherentization of IT components in covered areas

– Standardization and unity maintaining of common data, by bringing together similar databases, respectively identical replication

- Creation of data maintenance and management tools
- Delineation of responsibilities to these data
- Establishing standards for use and handling of common information

b. Implementation of high-level capabilities

- Implementation, configuration and launching of the manager scoreboard
- Installing access components for councilors
- Implementation of solutions for publishing information on the Internet, with open access or secured (authenticated) by category of information
- Installation of integrated computer system management and monitoring components

c. Awareness of the need and usefulness of the system and user empowerment

- Training of system controllers and administrator

- Assessing the impact of implementation, opportunities of value continuing and increase

The project is expected to be implemented over 2 months since launch. The solution is adaptable and scalable and can be replicated at the county council subunits, with capabilities of information consolidation at the central level.

Estimated results of the project

The integrated computer system carries out the automatization of financial transactions and will provide informational support for analysis and decision making. Data management will thus be more effective, departments will be able to follow more easily and accurately specific situations and be able to provide synthetic and detailed reports more complex and in less time. Harmonizing the institution activities and use of the management software tools will make public administrations more efficient.

Result:	Method of verification / assessment:
County Council informatization by implementing software modules according to operating specifications and needs.	Database and applications servers are installed and configured according to the architecture. Client software modules are installed on all workstations according to the diagram, are functional and have passed the quality validation tests, communication between them goes well, response times are acceptable, it can work online and competitor.
Securing access to information.	Users can access the system solely based on user / password account type, the rights will be limited by the job competency. Interactions with the system will be monitored, with the possibility of obtaining reports of “who, when and with what data they interact” type.
Data security.	Backup mechanisms are tested and validated. The data can be restored based on backup files. Transactions are persistent.
Decision support.	The scoreboard-type financial analysis module provides online, in a clear manner, valid and actual information that can be support to decisions.

Conclusions

Success of an organization depends on its people. Increasing emphasis given to the training side of organization management comes from the perception of the strong conditioning between quality human resources available, the stock of knowledge, skills and experience on the one hand, and obtained efficiency on the other hand.

All this is not possible without a strong economic informational system - a complex of people, machines, programs and practical work, a gear that collect data, transform them into information they store, process and transmit selectively to managers at all levels.

Informational system must assume a part of the managers’ work, namely data and information processing, results analysis, developing variants of problems solving, and providing permanent connections between the manager system and the managed system. Investments are very large, but by introducing automatic data processing (ADP) the rate of generation of documents increases and information reaches in good time to the managers that requested it. Information obtained on time helps managers to adopt and implement the right decisions, and the profit (the result of effort) contributes to the growth and development of the organization.

Effects of its introduction and use may be: technical, embodied in reducing the workload and time of data processing, freeing personal from routine work, etc., or may be economic, caused directly by the difference between operating costs of old system and the new system, expressing increased productivity in data collecting, processing and transmission or, indirectly, from the overall results of the business given by the increased productivity in management and execution processes.

In conclusion, by introducing the computer system in the public administration, the corruption is greatly reduced by eliminating the taxpayer's physical contact with civil servants, documents are tamperproof, and processing accuracy can not be put in doubt.

A NEW GENERATION - QUALITY DESIGNER

Boca Gratiela Dana
North University of Baja Mare
Faculty of Sciences
Department of Economics

Now more than ever the quality management need some changes, not because of generation changes but because of the new provocation " green products".

The "green products" provocation needs changes to be implemented in each manufacturing technology and also in quality management. The organization must to be flexible to costumers needs and also to the new trends in industrial fields. This new generation for quality management change appear as a result of new eco-age , when in every second a new method, a new discover in researching work will bring more and new solutions to similar problem but in different places. The paper present the investigation results in a common manufacture organization who produce industrial products and also the solutions propose by author to improve the quality products and organization quality management.

Keywords: green products, manufacturing change, quality simulation

JEL: 032

Introduction

Any system performance improvement processes in an enterprise, is effective when internal processes are stable and controlled.

For that reason companies wishing to become or stay competitive, they need competent persons in the planning and control processes but also identify specific methods for improving internal coordination changes.

The new generation of green products can be realize only with the implementation of the new methods of simulation and modeling products characteristics and shape from the first stage of product design, when the engineer-designer can anticipate the future damage and failures of the products in his life cycle curve.

The implementation of a maintenance service, represents an important function of the enterprise which leads not only the possibility of both foreseeing and anticipating the possible flows , but also the opportunity of planning the interventions which will permit us to avoid them, as well as to get certain cuts of the expenses under crisis circumstances of the firm.

Maintenance must also be the production partner. Maintenance role is often undermined and productive function is not recognized.

Now that the old term maintenance and repair is replaced with maintenance, serving as a higher level of fixed assets, which must aspire to any enterprise, optics has a new culture-oriented management and achieves maximum business efficiency.

Our maintenance costs are extremely complex, requiring a thorough knowledge of their workload.

Lowest costs are the prevention and remedying defects. Unlike them implement a corrective policy is very expensive. Many of the maintenance costs are not covered by the records of the company, they are difficult to identify and measure.

They are hidden costs and the expenses are situated in the hidden parts of iceberg product quality. Economic and technical characteristics of equipment can match the availability, thus paying maintenance activities are carried out by the entire organization, this leads to undue expense, and paid the outstanding work and providing the necessary resources to conflict in their servicing.

A good manager wants to have accurate records and information on the state system which he leads, because efficiency resulting from the correctness of decisions.

Research and methods

The paper presents some solution for a traditional organization which have problems in adaptation

and be flexible to the new trend in management and quality management.

The investigation identifies the quality problems in technological process and present some solutions.

Some companies have already made a beginning by introducing and certification systems quality management and the environment. Known as reference standards for these systems focus on identifying key processes and process leaders.

Following the consultancy services offered to implement management systems Quality environment and training to improve managerial skills revealed clear need to identify support for the reorganization of production and management processes, but nobody pay attention to the maintenance management

The progress of various categories of cost and efficiency indicators leads to the best solutions in solving everyday problems little things who can give the solution key for organization problems.

Available remember dashboard, develop a budget for maintenance activity, the monthly allocation for each machine or plant part.

Building maintenance budget can be achieved only by changing the traditional optical manager in terms of management effectiveness of each action is characterized not only technically but also economically.

Starting with the organization dates and elements we can present a new management concept of total productive maintenance, which together with other pillars of the company can realize a house of quality and a house for quality. For that reason the base of the quality house is TQM total quality management, the columns are:

- preventive maintenance,
- maintenance-productive;
- 5 S;
- auto maintenance,
- Continuous-improvement gives the answer to the link between quality and maintenance.

The roof of quality house is TQP, total preventive maintenance sustain by all five columns.

These keys TQM and TPQ together with production efficiency, configure up golden triangle quality, weakness of one full set of columns compromise the triangle and the quality house.

Total quality is the basis of total productive maintenance, we can define eight basic points of total productive maintenance system: abolition of losses, self-maintenance, maintain productive, technical training and operational, design and management, quality products, service-site performance, safety management, all these factors lead, in turn, the success of the company's productive activities.

Company's mission is to provide technical conditions for obtaining total quality through effective exploitation of the means of production.

The six major sources of losses that lead to support the implementation of such a system are:

a) Stop-time accidental: time to change, adjustment and adaptation of equipment, micro-machine stops, slow-functioning equipment,

B) Defect quality: start-faults.

It requires the resumption of Ishikawa diagram to outline the steps necessary to obtain a practical quality in manufacturing activity.

Applying Ishikawa's strategy may be removed where, considering the price as the main criterion, is made to purchase second-hand equipment, which in the short term, are advantageous due to lower investment costs, but inhibit the medium and long term competitiveness.

5S concept is good to comment, for any type of organization and to identify the sources of success:

-SEIRI -setting, elimination of unnecessary things,

-SEITON-order, methodical

-SEISSO - inspection control

-SEIKETSU-cleaning

-SHITHSUKE-discipline, moral education, and respect for others.

Initially, the 5S increase production and maintenance costs, but contribute substantially to strengthening labor motivation, employees and improve company's image in the eyes of providers and beneficiaries.

As adopted by all members of the company the 5 S are elements of culture and, while no longer necessary additional expenditure.

In the Romanian tradition, the technological process inside the organization was seen as a noisy place, filled with dirty equipment, served by workers in gowns, oil stains, leaving the assembly by visual measurement and hammer to corresponding technical documentation, recent years have brought changes, so the first steps were made.

In the process of implementing the 5 S, everything starts from the manager, from top to bottom, the holder of the established human intelligence and machines characterized by force and precision.

Man can improve its qualities and capabilities through training and practice, and companies can move pushing for continuous training of employees.

The key to success in implementing quality and its diagnosis is to make all the steps in six sigma programs, which is a wizard with no errors in the production of products, manufacturing tolerance errors 0.

Quality control movement has expanded the original named new quality control method, means providing a product that is better than the best, no better than most.

Also, starting from control, planning, implementation, quality must be closed circle, spread across the following segments of the new product: product research, production planning and production.

Six-sigma is home-sigma statistical term used to measure the standard deviation of average distance, is a program of excellence, as allocated no more than four errors in one million operations.

Target level of damage is the same for both producers and service functions. Six Sigma is a rigorous standard, expensive, because we know that quality brings investment, and vice versa, because so many operations to monitor costs, but at the same time and correct them immediately.

The companies have resorted to this method have found that improved quality means fewer defects, eliminate stagnation, greater customer satisfaction.

Improving quality is more important than the cost of implementing and maintaining six sigma programs.

Organization of work and the possibility of rescue efforts have led to a return to investment is the best solution compared to years to find solutions to save the company to use the process correctly.

The method is based more heavily on quality control, to have a competitive advantage, to produce error-free, to make good things come alive on quality.

We could allow employees mistakes?

A single mistake could not slow down too much company and management style. If in the course of occasional errors, they do not affect too much production, but considering the many errors could be made in the course of the entire company, the economic impact on productivity, customer satisfaction and profitability is dramatic.

This method of management approaches organization to find and identify what he know or should not, what he need to know and to act to reduce errors and their adjustment, which for organization means time, money, opportunities and consumers.

The method applies the following steps:

a) measurement, identification of Y and X options: plane measurement, accredited-measurement system, measurement process;

b) consumer-finding design: high-precision processes, development projects;

c) implementation-generating and evaluating alternatives: constructive remedies, control design.

The best method, six sigma projects is the beginning, not inside the company as a business, but outside them, focusing on the answer to:

How can we make our products more competitive on the market?

Six Sigma is the key to open new levels of quality, performance, provision of services and achievement of profit. The manager has in his hand the destiny of the company, everything depends. The method is today the ideal solution for busy managers, the first steps are choosing the project team, systematic education of employees is known on various levels.

Who are the major players in the program: Masters Black Belt, Green Belt, Orange Belt, Yellow Belt, this structure allows visualization of transfer tasks in the organization levels, each performing specific tasks under the program:

-Enforceable are those that deal with method and explain its implementation within the organization;

-Champions will try to present and explain what was used in this program and remove any barrier;

-Master Black Belt is actually the one who will train staff, will manage and oversee the production process of the activity;

- Black Belt, who would work effectively only nonstop for the project;

-Green Belt, are those who will assist those working in the Department of Black Belt. It is vital that everyone knows exactly what to do and its role in achieving quality.

Of course nobody wants that after investment in Six Sigma and after time spent coaching and training people, project selection favorable for the production company to lead, eventually, lower profits and achieve a satisfactory quality.

The method is a way of life for business, they continue throughout the implementation period is initiated at the same time use other production projects, by finding new methods for obtaining profit increase.

Implementation of quality takes time requires achieving infrastructure in first year, followed by total quality house building foundation with the following magical elements:

- defining objectives, gaps and desires of consumers;

- current performance measurement process;

- analyzing and determining the causes that led to defects;

- implementing a new project to eliminate the defects;

- monitoring the performance, following the implementation of the new project.

Six Sigma, for manager is actually the solution to any problem if it satisfies the following:

- learn the basics of the method it will use;

- select the best specialists and projects;

- makes a team work;

- apply appropriate methodology with tools.

In other words, if:

- define the target group for six sigma project, ie internal and external customers;

- measure and analyze the features of the process;

- implement, monitor and maintain phases.

Through them we discover, in fact, the new method DMAIC-define, measure, analysis, implementation, monitoring.

Like any start virtually any method will be in Six Sigma, should start going through all the steps needed to know all the internal and external factors.

Obviously, they could not obtain satisfactory results if we go directly to the fourth or fifth step. We can measure if we set the unit and we do not define the problem we face. Below is the logical scheme of the five steps of DMAIC methodology:

-Definition of the problem- identify the major problems of process, selecting a project to combat one or more of the problems, vital factors determining required measurement, analysis, implementation and control.

-Measure problem- selecting critical characteristics of the product or process quality, standard - definition performance variables Y, a system of measurement for Y, establish a process able to create the size of Y;

-Problem-analysis- defines Y one implementation targets, identifying sources for Y, finding potential causes that could affect the size of Y and identified several vital Xi;

-Implementation-issue-discovering vital link between the variables Xi, setting acceptable tolerances for Xi, establish a measurement system for Xi, control problem, measurement accuracy determination for Xi, control system implementation.

Conclusion

Studies shows that in organization works long day, workers are perceived a rhythm witch is very intense, but at the same time there is a low productivity, competitiveness and restricted items. It is evident that the development needs economic performance is about upgrading the skills and human resources areas such as labor organization, design - sizing - measure - control - improvement - from business process management, quality management, change management, risk management, project management and not at last maintenance management with direct consequences on labor productivity and competitiveness performance.

Some companies have already made a beginning by introducing and improving business through quality products, services macroeconomic market at an affordable price is what is sought using the method. Tools and techniques applied so far known to improve quality are of the past, no longer satisfy consumers the economy today, as a result of changes in society.

Manager is focusing and promote a new management on:

-channeling efforts of all employees in achieving product quality;

-to identify and isolate the factors affecting product quality, company image;

-to encourage the entire organization personal in business activity;

In conclusion this method is a guide to understanding and management of each sector of business on the road to quality.

MODERN INSTRUMENTS FOR MEASURING ORGANIZATIONAL PERFORMANCE

Grigore Ana-Maria

Badea Florica

Academia de Studii Economice București, Facultatea de Management

Radu Cătălina

Academia de Studii Economice București, Facultatea de Management

Any significant management action can be assessed both in terms of success of immediate goals and as effect of the organization ability to embrace change.

Market competition intensifies with the development of Romanian society and its needs. Companies that offer different products and services need to impose certain advantages and to increase their performances.

The paper will present modern tools for measuring and evaluating organizational performance, namely: Balanced Scorecard, Deming model and Baldrige model. We also present an example for Balance Scorecard, of an organizations belonging to the cosmetics industry.

Key words: management, performance, balance scorecard, performance measurement

JEL Code: M10, L25, L66

1. The concept of performance

Performance can be defined as “*a state of competitiveness of the organization, reached through a level of efficiency and productivity which ensures a sustainable market presence*”¹³³⁴. In our opinion performance needs both effectiveness and productivity simultaneous. Hence we conclude that a performing organization is efficient, competitive and productive.

P. Druker considered that to be effective means “to do planned things well”; by efficiency he meant “the extent to which objectives were achieved”.

T. Katarbinski defined effectiveness as precision in achieving targets. He suggested that efficiency is the action by which an organization achieves its goals in terms of minimal cost.

Both management specialists come to reinforce the above statements on the concept of performance.

The purpose of the paper is to find indicators and instruments that reflect as closely as possible the subtleties of how an organization is functioning. We started with the following questions. What indicators reflect best organizational performance? Profit level? Different rates of efficiency? Achieve planned results? The answer must take into account the multiplicity and diversity of factors that influence both individual and organizational behaviors.

Performance measurement represents results quantification of activities undertaken within an organization over a period of time. For performance measurement we started from a series of questions: Is there a link between objectives, performance measurements and organization results? Are performance metrics relevant? To answer these questions we identified a series of modern management methods for measuring and assessing organizational performance.

¹³³⁴

M. Boulescu, M. Ghiță, V. Mareș, “Auditul performanței”, ed. Tribuna Economică, București, pg. 13, 2002.

2. The Balance Scorecard

In the early '90s two experts from the Harvard Business School introduced a new performance measurement tool they called The Balanced Scorecard¹³³⁵. The two experts Robert Kaplan and David Norton have started identifying the weaknesses of previous management approaches and through their approach of the balance scorecard provide a clear prescription of what companies should measure in order to balance the financial perspective.

The balance scorecard is a measuring instrument that offers to the organization the opportunity to clarify its vision and strategies and translate them into action. This provides feedback on both internal business processes and on external achievements in order to continuously improve strategic performance and business results.

The balance scorecard is a concept that allows performance evaluation and assessment by focusing on presentation of the results. This instrument is characterized by flexibility. Results areas should be specified depending on the interests involved:

1. Shareholders or financiers (financial results)
2. Clients (external results)
3. Staff (internal results)
4. Managers (results of improved processes)
5. Results of learning and innovation

Results in each area must be observed as a multitude of objectives, performance indicators and standards involving the relevant key-factors and authorities. Balance scorecard suggests that managers look at the organization from four perspectives: learning and growth perspective, business process perspective, customer perspective and financial perspective.

It is recommended to use this management method in all managerial situations. The balance scorecard can be used:

- When the managers want to track the degree of objectives achievement and the level of results to ensure improvement in the degree of substantiation of managerial decisions.
- When one area or another are checked, monitored by top management due to continuing poor results recorded in a previous period of time.
- When the time budget for managers, especially those from top management is busy, when they are assaulted by numerous information, some with a low relevance to the objectives.

3. The Deming model

In the traditional industrial activity “quality control” and “zero defects” were keywords. In order to defend the client from receiving poor quality products numerous efforts were undertaken to try to control the products at the end of the production line.

The problem with this approach - as Deming said, is that the true causes of defects will never be identified and there will always be inefficiencies due to the rejection of defects.

What Deming says refers to changes occurring at each step in the production process and causes of variation must be identified and fixed. If this is possible, then there is a way to reduce defects and improve product quality indefinitely. In order to establish this process, Deming also stresses that all business processes should be part of a feedback system with chains. The feedback should be examined to determine the causes of change, which is what presents significant problems (See figure below):

¹³³⁵ D. T. Corodeanu, “Management comportamentul și performanța întreprinzătorului român”, ed. Tehnopress, Iași, p. 248-250, 2008

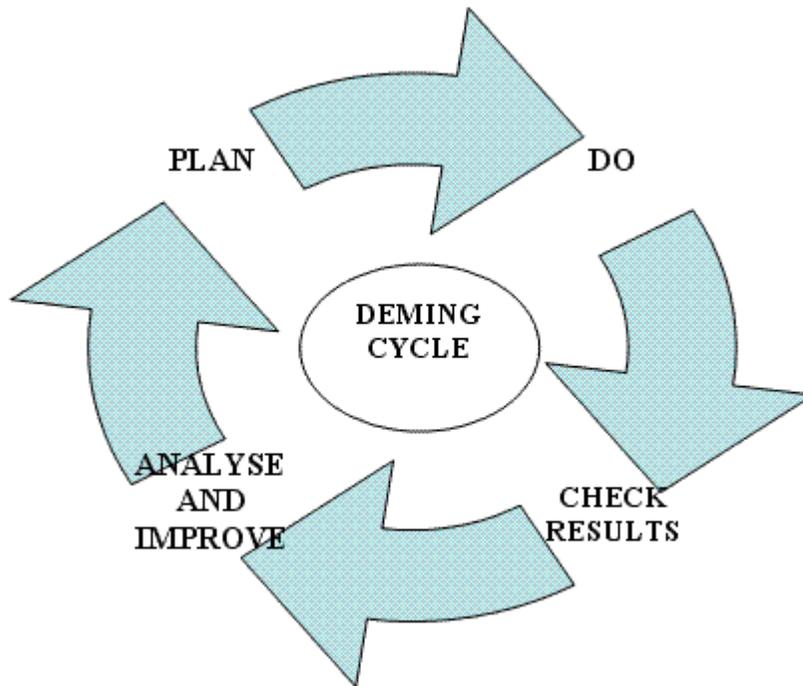

Figure 1: The DEMING cycle¹³³⁶

4. The BALDRIGE model

The Baldrige method (1997) reiterates the concept built on facts-based management: **modern businesses depend on performance measurement and analysis**. The purpose of measurements is to obtain information that allows managers to know the company and to take responsible long-term decisions.

Measurement standards must derive from business strategy and provide critical data and information about key processes, productivity and results. There are many types of data and information necessary for performance measurement and improvement, including: consumer performance, performance products and services, operations, marketing, competitive comparison, suppliers, employees' performance related and financial cost.

Of major importance in performance improvement is the creation and use of performance measurement standards or indicators. Performance measurement standards or indicators are measurable characteristics of products, services, processes and operations that the company uses to track and improve performance. These measurement standards and indicators should be selected to represent the best performance factors.

Among the most important benchmarks for measuring performance, the Baldrige model (2005) identified: income from sale of products and service delivery, customer-based results, financial and market results, the evaluation results of human resources, organizational effectiveness results, social responsibility and organizational results.

5. Example of Balance Scorecard at L'Oreal

5.1 The cosmetic market

Cosmetics are important consumer products, with a key role in everyone's life: beside traditional cosmetics that include makeup and fragrance products, these include also personal hygiene products such as dental care products, shampoos and soaps.

¹³³⁶

Source: http://www.valuebasedmanagement.net/methods_demingcycle.html

Current cosmetic market is oriented towards innovation, by including new color palettes, treatments directed to certain types of skin and unique formulas that focuses on different needs. Most cosmetics have a life expectancy of less than five years and 25% of producers reformulate its products each year. They must constantly improve their products to maintain its position on the highly competitive market. The consumer expects a more diverse range of options and greater effectiveness.

The current cosmetics market is dominated by several multinational corporations: L'Oreal, Colgate Palmolive, Beiersdorf, Kao Corporation and Avon Products.

5.2 Proposal for improving the activity at L'Oreal Company

Many companies need a model for measuring and evaluating performances that truly pulls together all parts of the organization. The balance scorecard model offers an optimum image on the key activities in the business. Keeping the points above in mind we developed an example of balance scorecard which can be used in the cosmetics companies. The model identifies the key success factors for financial, customers, internal processes and knowledge and learning activities. Also for each strategic objective we identified the performance indicators, targets and improvement actions.

Table 1: Balance Scorecard at L'Oreal¹³³⁷

BALANCE SCORECARD				
<i>FINANCIAL</i>				
Key success factors	Strategic Objectives	Performance Indicators	Targets	Improvement actions
Good financial results and increasing profitability	Maximizing shareholder value	Increase sales	5% in 3 years	– Penetrating young markets. - Increasing prices for the best quality products.
	Higher profits	Profit on equity consistently	Increase by 15% in 3 years	- Wider range of products. - Intensification of promotional campaigns.
<i>CUSTOMERS</i>				
High global market share	Greater market share	Market share	3% in 3 years	- Developing marketing programs focused on objectives - Communicate with customers using electronic instruments.
	Global market presence	Number of potential customers approached	5% increase in 5 years	-Developing a plan for penetrating untapped markets. egotiating a strategic partnership with other local firms.

¹³³⁷ Adapted after the Balance Scorecard from Easy Jet: H. K. RAMPERSAD, “*Total Performance Scorecard*”, ed. Didactică și Pedagogică, București, p. 111-113, 145, 315-322, 2005

	Deeper knowledge of the global market for personal care products.	Revenue potential	10% increase in 5 years	Creating a database that includes characteristics of potential customers.
High quality products	Increased degree of loyalty on products purchased	The number of complaints from customers	Decrease by 10% per year	- Providing additional bonuses to employees who are customer oriented.
		Degree of customer loyalty towards brand	1.2.1 Increase by 5% per year	Design of procedures to resolve customer complaints Measuring the degree of customer loyalty.
Image	Improved awareness of audience target	Awareness of brand	At least 50% in 4 years	- Benchmarking in terms of customer loyalty.
INTERNAL PROCESSES				
Team spirit and motivating work environment	Managers act as mentors	P e r c e n t	At least 70% in 3 years	-Formulating a development plan for managers. - Provide guidance for training teams.
		Degree of satisfaction with the feedback	At least 70% in 3 years	- Study the employee satisfaction.
Successful introduction of new products (innovative)	New products developed	urvey score of employee satisfaction	Increase by 5% per year	- Offering products that meet customer needs.
		Percentage of sales from new products and services.	Increase 5% per year	- Develop a formula for extending the range of products for men.
		Time required to launch a new product on the market	Reduction by 10% in 3 years	- Better organization of research and development department. - Determining the criteria for developing new products
KNOWLEDGE AND LEARNING				
Competitive advantage based on	Improved managerial skills	Sales per month	Increase by 10% in 3 years	- Matching skills with the performance evaluation system.

knowledge, abilities and skills of employees		Percentage of managers trained in management skills essential.	80% in 3 years	- Learn effective leadership.
---	--	--	----------------	-------------------------------

6. Conclusions

Successful organizations depend critically on the ability to differentiate themselves from the competition through continuous and consistent concern in increasing prosperity of the organization. In this context change adaptation and progress have a vital role in creating a high degree of competitiveness of organizations.

This paper tried to offer a few examples of modern performance measurement and evaluating methods like the balance scorecard, the Deming and Baldrige models. Also we presented a simplified balance scorecard example used at L'Oreal.

The aim of the present paper is to identify and comment on the existing relationship between corporate social responsibility (CSR) and the current economic crisis, by focusing on the experience of the Romanian companies. After briefly defining the concept of CSR, the article presents the above mentioned relationship from a triple perspective: the lack of ethics as a cause of the economic crisis, the threat of CSR in periods of crisis and the opportunity of CSR in periods of crisis, considering that the last perspective could be maximized if companies are going to approach CSR from a strategic point of view. Finally, the second part of the paper presents what Romanian companies really do, but, more important, what they should do in order to increase their effectiveness in terms of CSR implementation when social budgets seem to remain constant or even decrease.

Keywords: Corporate Social Responsibility, Economic Crisis, Stakeholders, Risk Management.

JEL Codes: M14, G32, G33.

Introduction

Before the crisis that has begun in 2007, CSR was considered just a luxury and a set of voluntary assumed initiatives implemented by successful companies in good times for ethical, altruistic or branding purposes, but definitely not a part of a corporate core strategy, and companies would have reduced or even abandoned their commitments to CSR in times of economic difficulty. Nowadays, the evidence of the last three years suggests that commitments to CSR are neither being reduced nor abandoned during the crisis, except in those cases of total bankruptcy, and a well institutionalized, communicated and reported strategy of CSR is granting the responsible company “a license to operate” in the new world economy emerging after the crisis.

The global economic crisis and the collapse of trust in the capital markets are strengthening CSR, while the rules of the game are changing by considering sustainability and responsibility the main new pillars of the game. According to KPMG (“KPMG International Survey of Corporate Social Responsibility Reporting 2008”), the proportion of the world’s 250 largest companies issuing annual reports on CSR increased from only 50% in 2005 to 80% in 2008, the main drivers for implementing CSR strategies being risk management, investors’ pressure for long-term profitability and ethical considerations¹³³⁸.

1. Current State of Corporate Social Responsibility

The most accepted definition of Corporate Social Responsibility (CSR) is the one of the European Multi-Stakeholder Forum on CSR (2004) considering it “a concept whereby companies integrate social and environmental concerns in their business operations and in their interaction

¹³³⁸ Møller, K., 2009.

with their stakeholders on a voluntary basis”. Two aspects are relevant in this definition and they actually represent the essence of the notion: first, the fact that CSR is about simultaneously satisfying economic, social and environmental needs of the company and the community it is acting in; second, the fact that these obligations are voluntarily assumed and they are not imposed by any type of rules or regulations¹³³⁹.

2. Relationship between Corporate Social Responsibility and Economic Crisis

Often it takes a crisis to precipitate attention to CSR. The present global crisis emphasizes stronger than ever the idea of *corporate responsibility*, a new commitment to responsibility being demanded of companies in order to create economic and social value. As a result of the combination of the economic crisis with what has been called “an entrepreneurial crisis of maturity”, CSR has risen to prominence in the last decade and, even though CSR is a new controversial concept, everybody in the academic and business spheres agree that it is a fundamental strategy for achieving the sustainable development in the globalized world¹³⁴⁰.

The results of the GlobeScan Salon: “CSR in the Economic Crisis” – that took place in London, on February 2009 – emphasize the fact that companies are now facing enhanced expectations, pressures and opportunities regarding their social and environmental behaviour, even if they are confronting with the worst economic crisis in 80 years. The presented data (based on compiled results from 32 highly developed or large developing countries) showed that expectations of CSR are on the rise again and have reached a new high point since tracking started in 2001; at the same time, perceived CSR performance continues to fall and have reached a new low point, with a lowest one in the banking sector, which registered the sharpest decline. The new pressures imposed by the crisis on CSR commitments include the reduce time available for short-term decisions, the cost reduction and a more cautious approach to CSR in companies. Finally, companies not fully committed to CSR face growing risks, whereas those with CSR at the core of their business model could gain ground and new business opportunities¹³⁴¹.

The relationship between CSR and the economic crisis could be analyzed on three levels:

The lack of ethics of the financial decision-makers as one of the causes of the economic crisis:

A scientific paper on the analyzed topic¹³⁴² presents a set of arguments for reducing the magnitude of the economic crisis, perhaps not systematically but definitely in some of the organizations that have been most affected by the crisis, by appealing to and implementing generalized practices of CSR within financial institutions. The author considers that it would have been necessary to apply a CSR with ethical background – a voluntarily-assumed code of ethics – in order for the financial decision-makers to cope with self-generated duties.

The threat of CSR in periods of crisis: The negative potential of CSR is particularly represented by the high cost of its implementation, considering the fact that putting into practice responsible policies and strategies is a long-term process. More than that, the overuse of corporate sponsorship, based on CSR only with marketing purposes, can change the customers’ initial positive perception because customer sensitivity is much more likely to break out during crisis.

The opportunity of CSR in periods of crisis: CSR could also be considered an opportunity that increases the corporate core values on the long run, especially because organizations must redefine and coordinate their essential business objectives in order to implement responsible practices. Some of the main advantages that CSR could bring during crisis periods are: innovation; comfortable atmosphere; adequate treatment to stakeholders and better engagement with them; reinforcement of business strategy; strengthening of market position; consumers’ loyalty; guarantee and confidence for investors; deep internal reflection. Generally speaking, successful CSR policies might contribute to the sustainability of companies in times of global

economic crisis, by rehabilitating their corporate image on the market and by positively involving all the interested stakeholders, especially for the sectors that have caused the economic recession, like the financial and banking one, for example.

CSR in crisis periods can be converted from being a threat to an opportunity¹³⁴³: CSR, as a management tool, can be helpful in identifying ways to overcome the crisis and meet the social and ecological challenges of the future¹³⁴⁴.

3. What Romanian Companies Do

Usually when an economic or financial crisis appears, the normal reaction is to cut costs or, at least, to try doing this in all the business sectors. This is why many companies acting on national or international level are firstly cutting the costs that are not aggressively impacting their core business and CSR appears to be an attractive area from this point of view, especially when companies intensively rely their responsible initiatives on non-strategic philanthropic forms of CSR that are most at risk in times of economic crisis.

CSR in Romania is rather a PR fashion and it is frequently strictly associated with multinational companies, lacking strategic vision, long-term commitment, coherence and unity. The main areas of corporate social involvement in Romania are: environmental protection, social problems, civic behaviour, human rights, health, education, research, arts and culture, sports. The most important forms of corporate social involvement in Romania are represented by donations and charity, sponsorships, philanthropic and volunteering activities, CSR being usually considered just a tool to react to certain situations or a PR instrument. CSR in Romania is not correlated with the core business activities of the companies and it is not fully integrated into business practices.

Projects that are limited to sponsorships or donations – as it is the case with the majority of CSR initiatives in Romania – and have no direct connection with a company's core business have little to do with true CSR, and during a recession they are usually the first activities to fall victim to budget cuts. This type of social engagement is, more than anything else, a cost item whose benefit to the company is difficult, if not impossible, to measure and its value to society is also limited, since the corporate resources for philanthropic purposes are not sufficient to achieve a comprehensive solution to social problems¹³⁴⁵.

Romanian Donors' Forum (RDF), a NGO promoting philanthropy and CSR in order to contribute to the sustainable development of civil society in Romania, yearly celebrates Top Romanian Corporate Awards, emphasizing the first 10 companies in terms of their social involvement. First year when such a research took place was 2006 (quantifying the social involvement of the most responsible Romanian companies in 2005) and the last one, for the time being, was 2009 (quantifying the social involvement of the most responsible Romanian companies in 2008). The yearly analysis of Top 10 Romanian most philanthropic companies shows a sharply increase of CSR involvement (it was financially quantified the corporate social involvement through cash and services donations, in-kind contributions, sponsorships and own developed social projects): 2,963,928 EUR in 2006; 7,035,586 EUR in 2007; 7,565,100 EUR in 2008; and 16,215,000 EUR in 2009. The 4th edition of Top Romanian Corporate Awards (2009) prized organizations from five main categories: Top 10 big companies, Top 10 medium and small companies, Top 10 corporate foundations, Top 10 financing foundations and Top 10 philanthropic individuals; the social involvement of these 50 winners of RDF awards was about 31 million EUR.

In the field of CSR, a paradoxical situation appears in Romania: although NGOs and different types of social beneficiaries or stakeholders are complaining about the CSR decrease because of the economic crisis and the logical economic thinking is supporting their assumptions, the yearly researches conducted by Romanian Donors' Forum (since 2006) demonstrate all the contrary,

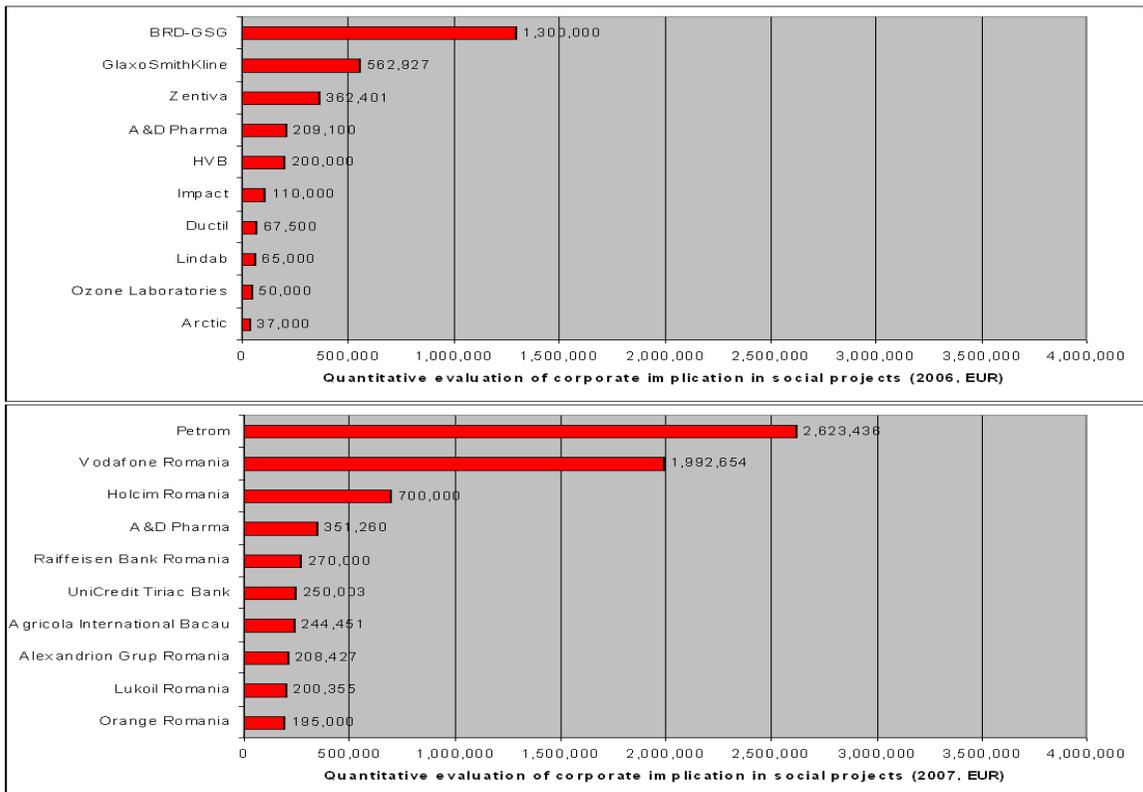

¹³⁴³ Fernández-Feijóo Souto, B., 2009, pp. 36-47.

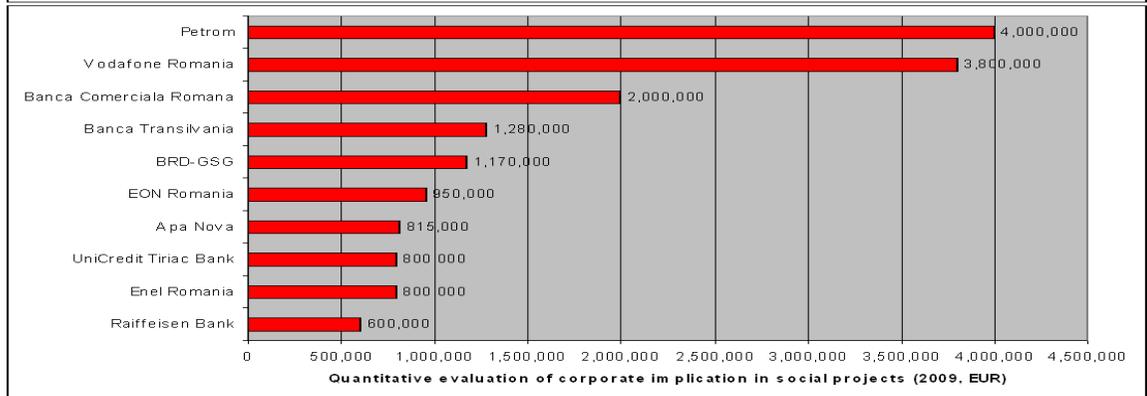

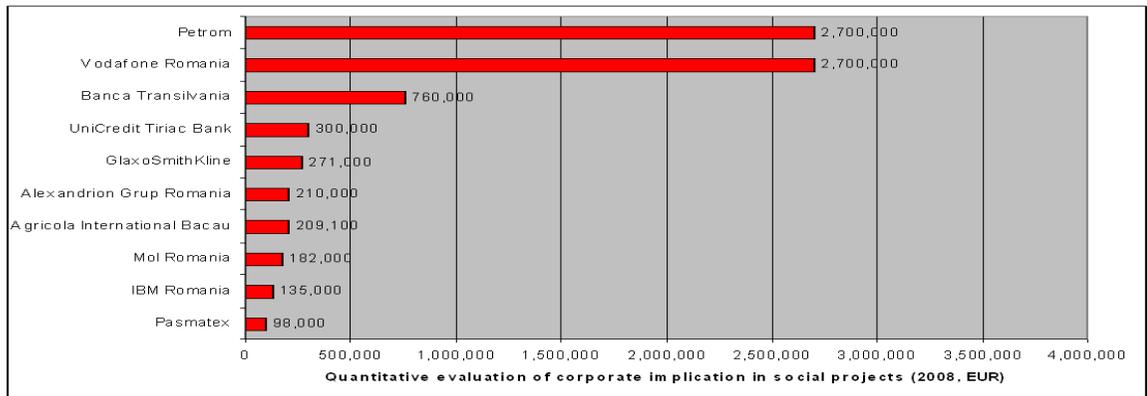

¹³⁴⁴ Peters, A., 2009, p. 5.

¹³⁴⁵ Idem, p. 8.

showing an increase interest of Romanian companies from one year to another in supporting social causes (see *Figure 1: Top 10 Romanian Corporate Awards (2006, 2007, 2008 and 2009)*). The explanation for this paradox consists in the following three arguments: first, the beneficiaries of CSR initiatives usually take into account only the cash donations that they receive from the responsible companies, meanwhile companies financially quantify all their types of social involvement; second, the economic and financial crisis made companies more accountable than ever for their actions and more conscious about the importance of strategic social involvement, that should be highly correlated with their core business activities (cash donations are basic CSR forms and do not represent strategic social involvement); third, companies are more eager to transparently communicate their social involvement also for pragmatic reasons. Although some companies – especially the SMEs – were obliged to diminish their CSR budgets (strictly considering here the cash donations), this does not mean that their social implication decreased, because usually cost reductions are accompanied by increased employees' volunteering. The CSR representatives of the most responsible Romanian companies (Petrom, BRD-GSG, Vodafone, Orange etc.) announced that their CSR budgets for 2009 were the same as the ones for 2008, but the economic crisis put a pressure on them in order to restructure the jobs, improve the efficiency of their operations or prioritize the investments.

4. What Romanian Companies Should Do

In order to maintain the corporate commitment to improve CSR performance for consolidating the financial performance and not cutting costs with CSR, a company should respect at least the following five main action lines: a) to sharply align CSR efforts with core business objectives for supporting the company's cost-savings efforts; b) to increase research and development spending, including in new CSR initiatives; c) to measure the CSR benefits; d) to build partnerships across important business units and functions; e) to strengthen the implementation of CSR in all the departments of the company¹³⁴⁶.

A study conducted last year by Braun Partners consultancy firm in order to identify the current state and the main problems associated to CSR in Hungary, Poland, Bulgaria and Romania emphasized the strong need of the Romanian companies to consolidate their responsibility regarding the human resources, to integrate the fundamental principles of CSR in their business strategy, to strengthen systematic projects with civil society and to transparently communicate the corporate initiatives in the field to all interested stakeholders. Especially in times of economic crisis, the human resources – their capabilities and behaviors – are becoming an extremely important corporate asset. More than that, integrating CSR in the business strategies and the HR policies of the Romanian companies could improve the “rumple” reputation of the firms, particularly in the financial sector (considered to be the most responsible one for the crisis).

When companies carry out well considered, strategic activities that are in keeping with their core business rather than simply distributing random donations, this produces far greater benefits for both the company and society at large. This type of engagement promotes sustainable stakeholder management, leads to greater confidence and helps to integrate the company into the surrounding

¹³⁴⁶ <http://mpiweb.eu/cms/mpiweb/community/commblog.aspx?viewblog=1786&groupblog=4>.

society. As a responsible corporate citizen, a company could test new partnerships, engage in serious dialogue with stakeholders, gain insight into their interests and acquire new expertise¹³⁴⁷. Stop sponsorship and investing in CSR programs can have a boomerang effect, both in corporate image as well as in sales, especially now that companies are facing the largest deficit of trust. Waiving these programs practically shatters the positive results achieved in the past and the corporate effort of being “a responsible citizen” would become much less credible for the public. Although CSR is usually associated with big or international companies, SMEs in Romania should also play a role by pursuing specific socially responsible approaches, engaging in social dialogue and contributing to community development at local level. Moreover, at international level, socially responsible investments as a specific component of CSR are confirming their potential of increasing financial returns by incorporating environmental, social and governance (ESG) issues into the decision-making process¹³⁴⁸.

5. Conclusion

Assuming CSR activities proves to be a necessary, but not sufficient, endeavor in systemic risks situations, when the main disequilibrium affects the macroeconomic environment. In this context, the Romanian companies have understood the necessity – both in deontological and pragmatic terms – to maintain and consolidate their implication in social projects, especially in times of economic crisis. The fundamental change that the crisis brought in terms of CSR implication, excepting the thorough awareness considering the potential of socially responsible actions, was represented by the shift from philanthropic activities and simple cash donations to more strategically coordinated CSR actions, related with the core corporate business activities. This trend is the one that should be emphasized and developed in the future, in order for both the companies and the society to gain significant advantages.

SOME ASPECTS REGARDING TRADE FOR SUSTAINABLE DEVELOPMENT IN THE CONTEXT OF THE ECONOMIC CRISIS

Ioana Adrian

University POLITEHNICA of Bucharest, Romania

The trade (qualitative and quantitative level of trade) can promote the concept of sustainable development.

The concept of Sustainable Development involves the implementation of theoretical and practical components for making decisions in any situation in which features a man-type medium, be it the environment, economic or social.

The goals of sustainable development include the harmonization of the economic, social and environmental targets.

This paper presents the main types of the correlations: Trade – Sustainable Development – Economic Crisis.

Keywords: Trade, Sustainable Development, Economic Crisis.

JEL Clasification: L25

Introduction

The world must quickly design strategies that will allow nations to move from their current, often destructive, processes of growth and development to sustainable development paths. This will require policy changes in all countries, with respect to both to their own development and to the impact on other nations' development possibilities [1,7].

The concept of sustainable development designates all forms and methods of socio-economic development, whose foundation is primarily to ensure a balance between these systems and socio-economic elements of natural capital.

Development is sustainable when it addresses the problem of the large number of people who live in absolute poverty - that is, who are unable to satisfy even the most basic of their needs. Poverty reduces people's capacity to use resources in a sustainable manner (it intensifies pressure on the environment). Most such absolute poverty is present in developing countries (it has been worsened by the economic stagnation of the 1980s).

A necessary but not a sufficient condition for the elimination of absolute poverty is the relatively rapid rise of per capita incomes in the Third World. It is therefore essential that the stagnant or declining growth trends of this decade are reversed.

Growth must be revived in developing countries because that is where the links between economic growth, the alleviation of poverty, and environmental conditions operate most directly. Yet developing countries are part of an interdependent world economy; their prospects also depend on the levels and patterns of growth in industrialized nations.

Such growth rates could be environmentally sustainable if industrialized nations can continue the recent shifts in the content of their growth towards less material and energy-intensive activities and the improvement of their efficiency in using materials and energy.

About the trade for sustainable development

The most known definition of sustainable development is given by the World Commission on Environment and Development (WCED) report "Our Common Future", also known as the Brundtland Report [4]: "*Sustainable development is development which aims to meet the needs of present without compromising the ability of future generations to meet their own needs*".

The concept of Sustainable Development involves the implementation of theoretical and practical components for making decisions in any situation which features a man-type environment, be it the environment, economic or social.

In the human-environment correlation (more precisely the human-environments correlation), the trade is of particular importance [2,3,5,6]. This importance is that the trade may affect (positively or negatively) all three types of environment (the environment/ ambient, economic and social environment). Figure schematically presents the importance of the trade for the human-environments correlation.

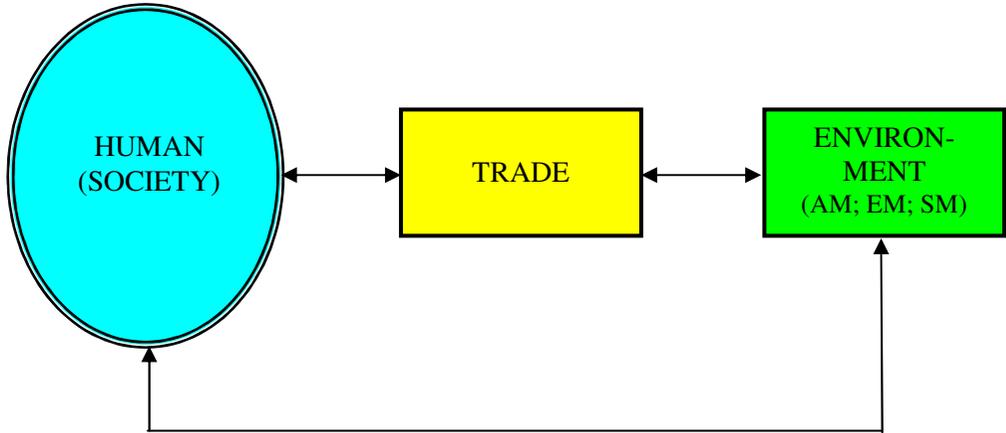

Figure 1. The importance of the trade for the human-environments correlation.

AE – Environment (Ambient Environment); EE – Economical Environment; SE – Social Environment.

The importance of trade in human-environments relationship is revealed by the central position of the trade. The double correlations trade-man and trade-environments is also highlighting the importance of trade in this relationship.

For the detailing of the human-environment relationship schematically presented in figure 1, we may define two specific types of trade:

- Ecological Trade (“Green Trade”) in direct correlation with the environment (ambient). The Ecological Trade-Environment correlation consists of: the trade that applies and extends the requirements as to the protection of the environment positively influences the latter (↑). Implicitly, under these circumstances, the ecological trade is the sustainable development generator (figure 2).
- Social trade, in direct correlation with the social environment. This correlation suggests that a trade that puts the forefront of continually optimizing the price/quality ratio in terms of customer (that is the increase of this report without being affected quality) is a trade positively affecting (↑) the social environment.

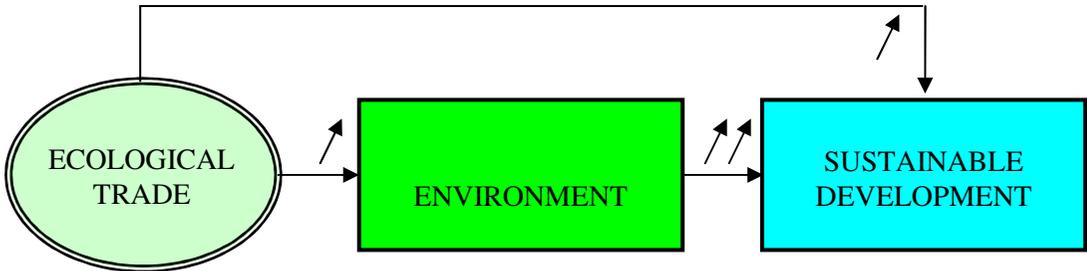

Figure 2. Ecological Trade – Environment – Sustainable Development correlation

The multiple correlation human (society)-trade-environment-sustainable development is schematically in figure 3.

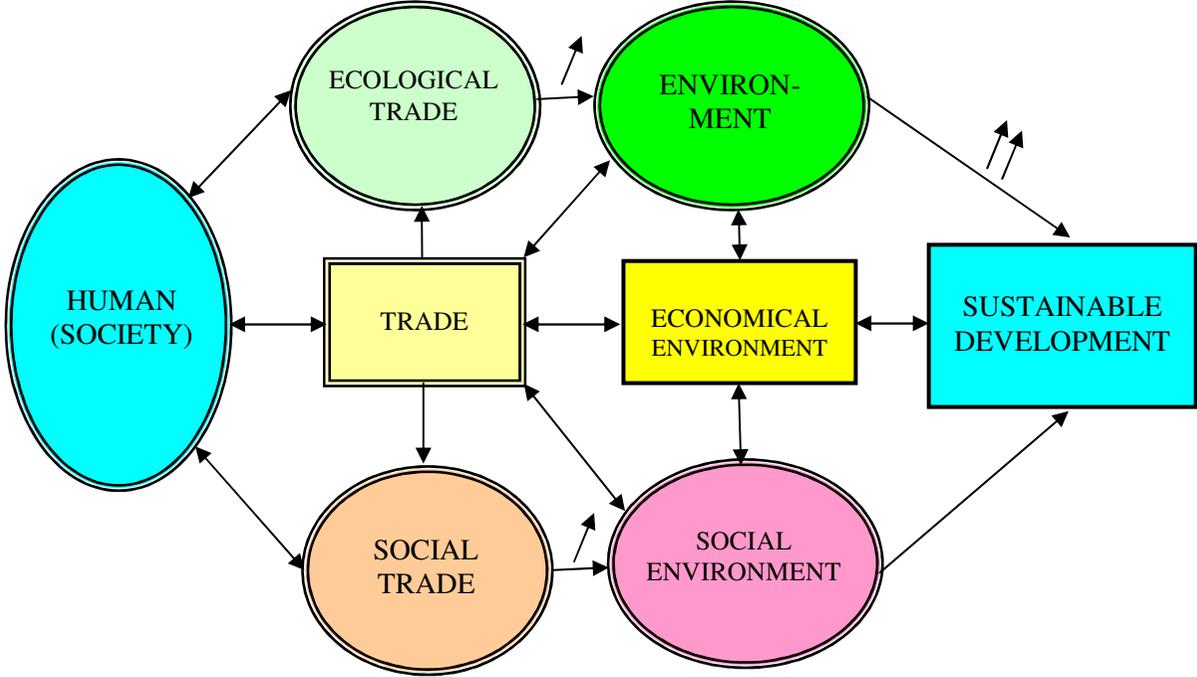

Figure 3. The multiple correlation Human (Society) – Trade – Environment – Sustainable Development

The following positive influences (favorable, ↑,↑↑) are identified:

- Positive influence (↑) of the ecological trade on environment.
- Positive influence (↑) of the social trade on social environment.
- Clear positive influence (↑↑) of environment on sustainable development.

About correlation: Trade – Sustainable Development – Economic Crisis

The main types of the correlations Trade (T) - Sustainable Development (SD) – Economic Crisis (EC) are presented below (figure no. 4).

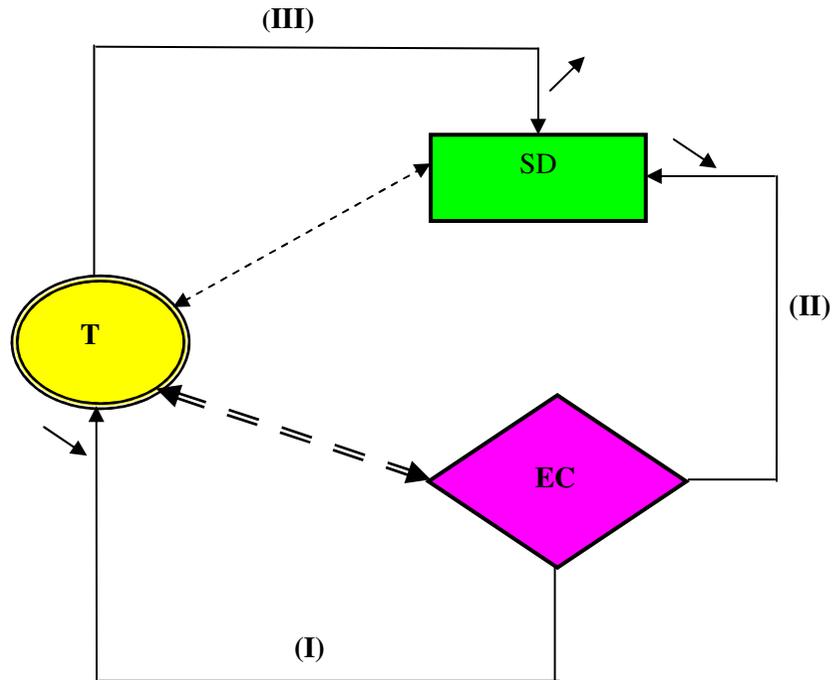

Figure 4. The main types of the correlations Trade (T) – Sustainable Development (SD) – Economic Crisis (EC)

There are three types of correlations:

- The negative influence (↓) of economic crisis on the trade (decrease of the sales volume).
- The negative influence (↓) of economic crisis on sustainable development.
- The positive influence (↑) of trade (ecological trade) on sustainable development

Conclusions

The concept of sustainable development designates all forms and methods of socio-economic development, whose foundation is primarily to ensure a balance between these systems and socio-economic elements of natural capital.

Many correlations may be identified among trade, sustainable development and economic crisis. Of these correlations the following are most important:

- Positive influence (↑) of the ecological trade on environment.
- The negative influence (↓) of the economic crisis on sustainable development.
- Obvious positive influence (↑↑) of environment on sustainable development.

ISSUES OF HUMAN RESOURCES, MEMBERS OF PROJECT TEAMS IN THE NGOS: A CASE STUDY

Lungu Carmen Claudia

„Alexandru Ioan Cuza” University of Iasi

Faculty of Economics and Business Administration

Romanian non-governmental organizations (NGOs) have the specialists and the capacity necessary to attract funds from European Union for European integration aim. For this purpose they create and implement different kind of projects (social, cultural, etc.). To create such project it is only needed one or two specialists in writing a project, but to successfully implement one, it is needed a whole special united team, motivated and committed to the purpose. In making this successful team, the project team management confront with a lot of challenges. This paper illustrates, from a human resources perspective, some of the most common issues that a project team manager has to deal with. Using the case study method, this thesis suggests the challenges that the manager has in building the team, creating a united team, motivating the members and solving potential conflicts.

Keywords: human resources, project teams, NGO, voluntary work.

Cod JEL lucrare: L31, M12

1.Introduction

In the past decade increasingly European funds were allocated for Romania's integration in European Union, funds that were either pre or post accession. The purpose of these funds is to reduce the gap between the Romanian economy and other European Union's members. Romanian non-governmental organizations (NGOs) have an important role in this process because they have the experts and knowledge for attracting the necessary funds for development and European integration.

In Romania, NGOs have emerged as a result of the desire to mitigate social problems of society, once economic prosperity began to enlarge.¹³⁴⁹ Currently, non-governmental organizations create projects for supporting society and the economy default, not only in social matters. Specificity of these organizations is given by their way in structuring the activities - project teams - which involve different personnel management issues.

This paper refers to the challenges and implications that arise in human resources management, members of project teams. The issues presented below should be taken into consideration by project team managers given the fact that members can easily become unmotivated. If the team members are unmotivated, then the work quality will become poor, the project's objectives will not be reached (both qualitative and quantitative goals) and the European values will not be transmitted, making the European integration more difficult. Consequently, funds provided to reduce disparities between Romania and other European Union members will no longer be efficient (further efforts, projects and additional money are needed) and effective (not doing what is required).

This thesis offers an approach of human resources management challenges that an NGO is facing in our days. Even if these organizations meet a lot of other problems like financial, marketing, management, the personnel problems seem to be more complex and determinant in facing the

¹³⁴⁹ Ioan Strainescu, Ben-oni Ardelean, 2007, *Managementul ONG*, Ed. Didactica si Pedagogica, Bucuresti, p.3.

other challenges. Peter Drucker claimed that there is no other area in which more differences between businesses and NGOs are, than in managing people and relationships between them.¹³⁵⁰

¹³⁵⁰ Peter Drucker, 2001, *Managing the Non-profit Organization*, Ed. Butterworth-Heinemann, Oxford, p.143.

2.NGO's role in Romanian economy

In the emergence of NGOs they offered only social services, but in present, there is a much wider range of services that the community benefits. These services were classified according to International Classification of Nonprofit Activities in twelve categories: culture and recreation, education and research, health, social services, environment, development of housing, law advocacy and politics, philanthropic intermediaries and voluntarism promotion, international, religion, business and professional associations, unions, not elsewhere classified. NGO's actions are support activities for the economy (besides those of the state) and their necessity appeared together with economic prosperity. The actions of these organizations rely mainly on voluntary work and come often to supplement services provided by local public authorities. This relationship is inclined to create a positive image of the public institutions and to facilitate the access of the community to public services. Without substituting public sector, NGOs mobilize funds that would be inaccessible, offer a quality service and solve additional semi-free community social problems.

In Romania, NGOs have a facilitator role in helping for European integration and often promote European values and determine their clients – in contrast with public sector - to become active. These organizations also create links between users and public authorities using a referral system and sometimes even offer support for benefit the supplementary services.

Jose Luis Monzon Campos (1992) identified a growing need of NGOs in business practices, as there are a lot of problems (both new and old) that capitalist companies, public enterprises and public sector generally can not solve. NGOs integrate “(...) both social and economic function and they are capable of creating wealth in an efficient manner, and then distribute them fairly.”¹³⁵¹

3. Teams features of a non-governmental organization

David Mason claims that there are fourteen NGO's characteristics that differentiate the non-governmental sector from other types of organization. Of these, those that have direct relationship on staff and team member are illustrated below:

- the main tool used in staff motivation is voluntarism produced by persuasion;
- money are just an instrument for NGOs, not the aim;
- NGOs tend to accumulate more targets, therefore volunteers and employees are always exposed to newer needs;
- NGOs tend to have a great social feature, which influence the management style (for example: the staff has a great need for affiliation - McClelland motivational theory);
- NGOs are more complex, in a characteristic way than other types of organizations;
- performance standards tend to be replaced by the ethical standards.¹³⁵²

The literature review on teams and teamwork offers a wider range on classify them, taking in consideration criteria like: the purpose of building the team, the amount of control over the objectives that team has, the team composition, the size. Romanian NGO's teams are project teams, a common type that also exists in profit organizations. Project teams are the key to success of an NGO functioning and therefore highlights the need of human resources management skills for those that manage these type of teams. Even though the NGO still need a strategic vision on human resource management at the top of the management hierarchy. The project team manager's actions have been often linked to those that human resource management does and often the accent was on leadership skills.

¹³⁵¹ Jose Luis Monzon Campos, 1992, *The “Social Economy”*, Third Sector in a Evolving System, pp.22-23, in Ion Boboc, 2004, *Managementul organizatiilor non-guvernamentale*, Ed. Didactica si Pedagogica, R.A., Bucuresti, p. 49.

¹³⁵² David E. Mason, 1984, *Voluntary Nonprofit Enterprise Management*, Ed. Plenum Press, New York, pp. 67-165.

According to Larson C.E. and LaFasto F. M.J. team's classification, depending on the broad objectives, the teams are: problem solving, creative and tactical. NGO's teams can be both creative type designed teams and tactical. The creative type involves skills such as persistence, independent thinking, self-determination and their process emphasis exploring possibilities and alternatives for successfully project implementation.¹³⁵³ Another team classification is offered by Hackman J. R. and take in consideration the amount of authority of the team. According to this criteria the teams are: manager-led teams, self-managed teams, self-directed teams, self-governed teams.¹³⁵⁴ The NGOs ordinary develop manager-led teams and sometimes, when the team cumulated some experience in working together, they develop self-managed teams.

4. Research method

This paper uses the case study research method in order to illustrate the most common challenges faced by Romanian NGOs. It was used a single case study applied on a subsidiary organization of a national NGO, named Romanian Association Against AIDS, ARAS Iasi. Choosing this NGO was due to their extensive experience of fifteen years in local activities and also due to the fact that it was among the first NGOs appeared in Iasi. ARAS Iasi was, until the year 2000, the only local NGO who worked in HIV/AIDS domain.

The case study proposed in this thesis is mainly descriptive and less explanatory and answers most often to the question: "how?". The information described below resulted form two semi-structured interview guidelines with two project team managers of the organization. For illustrating the volunteers motivations it was used a number of thirty "entrance questionnaires" of the volunteer department taken at the last two recruiting sessions. The research's results asserted that the situation in NGOs is more complex then in profit companies and that people require a lot more attention.

5. Human resources issues in project teams from ARAS Iasi NGO

5.1. Brief description of the NGO

ARAS Iasi is an NGO with fifteen years experience in educating the general public on health issues and in providing primary social assistance to vulnerable groups. Because young people are the main target group of the association, its members are dynamic, flexible and innovative people willing to promote the values of the European Union for the benefit of integration. According to the classification made in the year 2000 by teachers Frumkin and Andre-Clark from Harvard University, ARAS Iasi is a charitable organization having a strong commitment to values and a weak commitment to performance.¹³⁵⁵

The association has seven employees, specialists in various fields - psychology, social work, health care, economy, public relations - and twenty volunteers involved in information, education, counseling and advocacy projects. Given that Iasi is a university city and that most volunteers are students (80%), ARAS Iasi held many seasonal activities that make management work very difficult (retention and motivational issues). Most of activities are held on the streets, in direct contact with beneficiaries, but there are also activities held at the office, like counseling and writing reports and evaluations.

Most actions taken by the association are engaged in projects, but there are also some support type activities like: accounting, human resource management, counseling and referral. The director is the one who also meets human resources responsibilities, at the strategic level, while

¹³⁵³ Carl E. Larson, Frank M. J. LaFasto, 1989, *TeamWork. What Must Go Right/What Can Go Wrong*, Ed. Sage Publications, Inc, California, p. 43.

¹³⁵⁴ J.R. Hackman 1987, *The Design of Work Teams*, in Leigh L. Thompson, 2004, *Making the Team: a Guide for Managers*, second edition, Ed. Pearson Prentice Hall, New Jersey, p. 18.

¹³⁵⁵ Peter Frumkin, Alice Andre-Clark, 2000, *When Missions, Markets and Politics Collide: Values and Strategy in the Nonprofit Human Services*, in Ion Boboc, 2004, *Managementul organizatiilor non-guvernamentale*, Ed. Didactica si Pedagogica, R.A., Bucuresti, p. 47.

the project team manager meets them at the team and individual level. If the director has to have predictive and planning abilities, the project team manager has to have interpersonal, analytical and leadership skills for meeting all the teamwork challenges.

5.2. Challenges in building and developing functional project teams

Each project team has several development stages to get to high performance. The common stages of a team are: forming, storming, norming, performing, adjourning. The success of the project team depends most on the team manager abilities to make all these stages easy to pass and understandable for each member of the team.

The forming stage is the most important, complex and critical in success of the team. First, the project team must have the required knowledge, skills and abilities necessary to the project. For that to be accomplished it is necessary a good selection of its member. The features that have to be taken in consideration in this stage are the purpose, the type, the composition and the size of the team. In ARAS Iasi teams are only project teams, creative and cross-functional with implementing the project's objectives purpose. At the beginning, teams are **manager-led** because it has to execute tasks as they are being defined by the project manager. After the first stage, of knowing the activities to be undertaken and after accumulating enough knowledge and experience of work, the project team becomes self-managed and has the authority to choose the methods that can achieve the goals.

Cross-functional teams have proven over time the most important advantage of summing talents. Association's projects aims are offering health education and social support. That is why the members of teams are social assistant, psychologist and medical assistant who were able to provide integrated and quality services (primary care, testing, counseling, referral) to a number of 130 beneficiaries from 980 had in the year of 2009.

Cross-functional teams have also a great disadvantage: due to professional differences it can occur disputes regarding problem solving or referral to the local public institutions. For example, the most common conflict is that counseling is offered by all team members and has nuances, depending on profession. The contradictions in which type of counseling is more appropriate and who will carry out the counseling session can often arise among team members.

Since the association's principal value is voluntary work, but the projects also ask for employees, ARAS Iasi is dealing also with **composition team** issues. Most of the time, ARAS Iasi works with a minimum number of employees and rest of it are volunteers. Project team composition within the European-funded projects is:

- team developed mostly of employees: when there is a budget line project for staff;
- team developed mostly of volunteers: when there is not a budget line project for staff.

In the first case, responsibilities are first divided - depending on the importance, safety and security in doing the task - between the employees and afterwards to the volunteers. Importance of the tasks is based on the type of influence they have on the key indicators of the project (directly or indirectly influences), the complexity of the task (counseling, education, information, referral), the content of the task (member's competence). Considering the fact that beneficiaries of these types of projects originate from vulnerable groups, volunteers are more involved in office and advocacy actions, because these presume less risk. Even though, volunteers are trained before and they have the chance to give up anytime if they do not feel attracted enough in doing what they were asked to do.

In the second case, in which the teams are made up mostly of volunteers, employees are often project manager, but they also can be implementers. If there is a volunteer with at least one year experience, he can be project manager. Employees from these type of project have the volunteer status, because besides the activities required by the job description they also do extra activities. These extra-activity, often represent a tool for measuring employee commitment towards the organization and to the work.

This type of involvement, both volunteers and employees has its own benefits, but also arise some issue that ARAS Iasi has to deal with, mostly in *storming, norming and performing team stages*. Some of them were relieved bellow:

- volunteers: making them responsible in meeting the task on time, even if their actions are voluntary work, training them for being prepared to represent the association, clearly defining roles;

- employees: clearly defining assessment system (that its applied only on paid activities and that there will be no remuneration involved for volunteer work), offering recognition and permanent encouragement for volunteer work, dealing with inclination for exclusion and discrimination of the employee who does not involves in voluntary work.

Other problems in the project team may come up when there is a new project that involves employees recruitment and volunteers are not graduates of specialization required by the project. Although volunteers demonstrates involvement, commitment, competence and have great results, they cannot occupy positions in this project, because there are certain requirements - eligibility criteria - of the financing authority. In such moments team manager has to deal with disappointed, frustrated, unmotivated volunteers.

The manager will have to appeal to external recruitment, but considering the fact that the interview does not always provide sufficient information about a candidate, there is the possibility that he will not fit in organizational culture and have different values from those promoted by the association. This stimulates the emergence of conflicts and involves a much longer period of insertion of the new member. If this culture modeling of the new member is not obvious its cause frustration among team member and the manager has to take a decision on the weak "chain joint".

Another challenge that had to be held in the *forming and performing stage* of project teams in ARAS Iasi was hiring people with a part-time working program. This implied a different management, based on good communication among team members (informing the part-time member about what happened during his absence), a rigorous labor organization and more understanding people inside the team. If the communication system does not work properly - the informal one is very important here - there is the risk that part-time employee to feel excluded from the team, or at least uninformed.

5.3. Human resources motivations, members of project teams

ARAS Iasi is a charity organization whose aim is to help the society to prosper by offering the necessary support in education and health issues. This is the reason why it expects from organization's members to have humanitarian values and commitment to this purpose. These issues involve intrinsically motivated and self-determined project teams (staff and volunteers), people that can solve all sorts of problems that can occur in achieving objectives.

Motivational methods for employees differ from those used for volunteers. The team managers claim that employees from ARAS Iasi are primarily motivated by professional development in a less rigorous environment, which allows some beginner mistakes. They are also motivated by challenges and by the work itself, often waiting to be offered more responsibility and special recognition. That is the reason why motivational process focuses more on *intrinsic motivation* (the financial reward is also not too flexible), on trying to keep them motivated, rather than actually motivate them extrinsic. An important strength of the recognition system is staff development through participation in all kinds of trainings (mostly provided for free by other NGOs) both on the project and personal interest.

Regarding volunteer's motivation, according to data centralization of "entrance questionnaire", appeared that they are motivated: first, by a desire to do something useful in their spare time; second, to be part of a group; third, for personal development. ARAS Iasi has defined a clear path for volunteer promotions and has also a recognition system which includes: designation volunteer of the month, offering a degree in the festivities, offering medals for activities that they engaged,

nomination on different festivities: Volunteer Portrait or Volunteer Gala, offering the possibility to apply to wide variety of trainings and youth exchanges.

ARAS Iasi offers a carefully attention to all the needs of its members, because it believes that high degree of motivation leads to strong commitment towards the organization and its objectives, and by default to qualitative results. Although the NGO's turnover is high, this is due to seasonality activities and also to financially unstable environment (people look eventually for financial security, because needs also change).

6. Conclusions

Romanian NGOs become an important participant in decreasing the gaps existing between Romania and European Union. Therefore, they have to deal with a large amount of new expectations from the outside of organization and by default with new challenges. The project team management seems to be the most complex issue to deal with. Even if the project team members in NGO's have a common purpose and special motivations that differ from people in profit sector, they are also professionals coming from different areas, with different personalities and different vision in purpose achieving.

This paper illustrate, from a human resources perspective, the most common challenges that a project team manger from a non-governmental organization can meet in building a functional team for implementing the European-financed projects. The team management has to deal a large amount of issues so as to prevent potential conflicts. The forming stage represents the most complex work that team leader has to perform because involves an evaluation system, recruiting skills, training and coaching, managing the part-time and full-time job as part of the same project. Developing the team is also very important in achieving project's objectives, in motivating and creating committed team members.

Because of humanitarian values and intrinsic motivation, the members from a NGO tend to implicate personal in solving the tasks, they become committed to their work and to the organization. That is the reason why team managers have to be very close to the organization's members, to their needs, to their expectation and to respect their values, to recognize and appreciate their efforts.

7. Research limits and further research.

The research proposed has method limit. It was used a single case study based on two semi-structured interview guidelines and thirty volunteer's "entrance questionnaires". Another limitation could be the interview guidelines, that may have been subjective interpreted.

For further research it will be taken in consideration the team's member opinion, in dealing with human resources issues and then compare it with manager's opinion. Further researches could also take in consideration the team management style which may be a cause for challenges that appear during storming, norming or performing team stages.

EFFECTIVE PROCEDURES USED IN QUALITY MANAGEMENT OF COMPANIES

Mihaela Mateescu

Gabriela Suba

CEIS, Academy Romanian

The paper deals with elements concerning the application of the new “real options” approach system in project management of small and medium sized companies. The real option approach has the advantage of a great flexibility when a high degree of uncertainty is present. Also, it suggests to estimate the maximal profit obtained by investing a certain amount of capital using: updated monetary flow methodology, Monte Carlo simulation method and other stochastic optimization techniques like those using minimum and imposed risk problems. Generally, this new approach was used in the project management of large companies.

Keywords: real options, stock exchange options, risk, simulation method, stochastic problem.

JEL Classification: C02, C15, C51, C53, C61, C73, O12

1.Real Options approach introduction

1.1.Basic elements concerning real options concept

The new real option system regards the strategic management and decision taking process as a process aiming at the same time, at the reduction of risks and enhancing of favourable opportunities. Real option approach takes into account the investment financial system (particularly shares) and also other fields concerning decision making in risk circumstances (e.g. project assessment in a market input-output organization restructuring and reintegration, taking over new technologies concerning climate change decision making, organization reintegration, biodiversity, etc).[2]

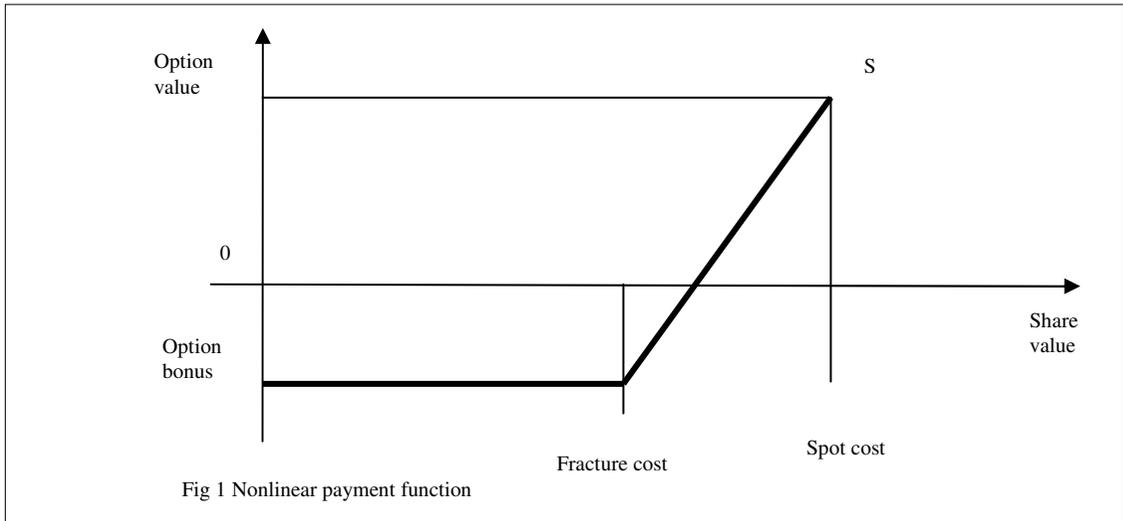

This approach is used in various activity fields of modern companies: market covering and developing finance, human resources management, technology and knowledge management, etc.[4] It represents an important change in strategic management but it is relatively almost unknown, despite the fact that it was adopted by many large trusts like: Airbus, HP, Intel, Toshiba, etc. At a macroeconomic level financial system efficiency is based on a thorough assessment of risks and a good project management. Real options approach is a crucial analytical instrument for this assessment and is also the connection between the financial system and the project management sector for actual investments.[8]

1.2.Financial options connection – real options

Real option approach is based on financial options working systems on Futures stock exchange. A financial share gives the owner the right but not the obligation to buy (or to sell) a given amount of shares in the future at a predetermined cost. The share owner will execute the option only if it is profitable. That is the cost on the market is high; otherwise the option is not executed and the bonus (the amount paid for the right of exercising the options) is lost (Fig.1).[1],[11]

In time it was found that some actual investments are correlated with financial options.

Let's consider the example of a plane ticket. A fixed date plane ticket is cheaper but the loss in case the owner is ill represents the whole cost of the ticket. In exchange of an additional bonus the ticket may be returned or another departure date may be chosen. In this case, if the flight is not possible the ticket can be returned and so the loss is limited to the additional bonus. Similar options can be found for planning strategies in project management or in project financing.[7]

So, project managers can forecast the possibilities of some reactions to various risks occurring during the ongoing project so that when costs are similar to option bonuses the losses are limited to this cost, the manager being able to choose another way or to give up the project when it becomes unprofitable.

1.3. Risk categories

The risk is regarded as an exposure to uncertainty for which most of the investors show some aversion, because investors are interested in obtaining maximum profit from a share, respectively from an invested capital.

On this basis were defined a set of models dealing with risk and gain. In this models the risk is divided into two components:

- Systematic risk affecting all investments on the market.
- Specific risk affecting only specific investments.

According to some of these models the expected gain is proportional with the systematic risk associated to the investment. As the investments are practically different in a certain field, only the specific risk shows the benefits are proportional with the exposure to the systematic risk.[6]

Risk level can significantly change in various phases of the project (development, research, marketing).[3]

1.4. Assessment binomial model

Ordinarily every option is connected to the value of a share. So, the future value of the option directly depends of the future value of the share. For this reason the current cost of the share and its future development is most important information for the assessment of the share which can be considered as representing a part of the assets of the company.

The actual cost of a share S – represents the market value. After a given time interval the value of the share can evolve to two possible limits. Let highest value be S^+ and the lowest be S^- . The fraction S^+/S is called growth factor u and the fraction S^-/S is called reduction factor d . Actually the cost of a share can take an infinity of values after a certain time and taking into account several intervals one can obtain a most realistic distribution of the cost of a share.

Volatility σ is a measure of the total risk of the share and is used as a magnitude of the uncertainty concerning the cost variations of the share. For the binomial model a combination of factors u and d may be calculated as below:

$$u = e^{\sigma} \text{ and } d = \frac{1}{u} \Rightarrow S = \begin{bmatrix} S^+ = u \cdot S \\ S^- = d \cdot S \end{bmatrix}$$

At the end of the interval the net gain is given by the cost of the share minus the X fracture value. If the value of the net gain is negative the option is not executed and its value is zero. The future values will be noted C^+ , C^- and the actual value C .

$$C = \begin{bmatrix} C^+ = \max(S^+ - X, 0) \\ C^- = \max(S^- - X, 0) \end{bmatrix}$$

Eventually, the binomial model shows a computed equivalent of the real option similar to that of the model computed using the formula Black and Scholes for financial options.[10]

Elements for the assessment of the options	
S	Actual value of the share (of the investment)
(S^+, S^-) or (u, d) or σ	Assessment values for the future development of the investment
X	Fraction cost
r	Interest rate for zero risk (the interest rate for state bonds)

The actual value (S) of a share can be observed in the market. The fracture cost X may be deliberately chosen so it may be known. The interest rate at zero risk is the interest rate for state bonds. So, the historical data may give enough information on volatility making possible the assessment of the share cost development from the beginning until the end of the considered time interval.

2.The transition from the financial options to the real options

2.1. The similarity between financial options and real option assessment

The assessment techniques of financial options can as well be used to the assessment of real options. While the financial options are based on the evolutions of some shares on the market, the real options are based on the evolution of some investment values on the market. The first example of real options is found when the value of some investments is very close to the market value. The financial shares are traded meaning that on the market appears a momentary cost called market cost.[2]

The financial markets prove that information concerning the future development of the share cost of is reflected in the market cost. Actual investments that have many common parts with financial investments are presented in the following examples:

- The right of drilling for crude oil (correlated with the future cost of the crude oil) and assets of the company. The crude oil is traded on the market so there is a cost called spot cost and also some information concerning the volatility of this cost. The cost of a company may be also transacted at a cost fixed by the market. The information concerning the future cost is included in the spot cost. The approach of cost evolution of an investment to the option system is obvious. In these circumstances the value of the optional investment can no more be calculated using the traditional system of the analysis of the updated value of DCF (discounted cash flow) in project management.[5],[8]
- The option to launch a new product is based on the market volume; if the demand is high, the product is launched, if the volume is not large that is the demand is low the product will not be made and launched on the market. Starting from such examples a new theory of actual options is developing based on ideas such as a new technology leads to the option to develop a new product. The new product leads to the option of trading it or not when the market is favourable or not. For a

right modelling of the market updated value assessment of volume and volatility are necessary which sometimes are very difficult to obtain because it is not about elements transacted on the market.

2.2. Techniques used to assess volatility

- The **Correlation Technique** makes the correlation between a nontransactionable investment value and a similar transactionable share. It is about the rule of shares strongly correlated with the nature of the investment value. These shares are frequently called tracing shares because they trace the market volatility aimed at. As an example many western pharmaceutical companies use the shares of medical companies transacted on options market to compute updated values for projects concerning the launching of new products. Many other business opportunities especially projects based on new technologies are unique, so that finding new shares in similar areas is difficult and we can use the following technique.
- The **Assessment technique** based on the assessment of the market potential for the respective product and then on the attempt to assess this potential and to use the assessment as a basis. The expected value of the investment may be found in the computing methodology for the updated monetary a flow computations made in traditional analyses found in investment projects, hence maximal and minimal estimated values may be determined using risk maximal and minimal values taken into account. In more complex cases the estimation may be performed using the Monte Carlo method for simulation by which the probabilistic distribution function of the gains generated by project completion is synthesized.[5] Then an evaluation of the interest rate on the market is necessary for a right determination of the risk, more exactly of its systematic component. Computing the updated net value, the values of S (and X) may be determined when using a right interest rate.[9] Maximal profit estimation for a certain amount of invested capital may be carried out using also stochastic optimization techniques. This may be approached in two different ways:
 - Minimizing the risk of not obtaining for the objective function of the profit a value smaller than a given one (these are called minimal risk problems).
 - The risk we take can be chosen and the decision resulting in the highest value of the profit function can be determined.

3. Conclusions

The use of real options is difficult and requires substantial know – how to perform the quantitative analysis. The difficulties in performing the quantitative analysis are a true barrier in the development and dissemination of that methodology. Another major difficulty is the access to confidential and protected data resulting from previous researches. This seems to be the hardest problem knowing that small and medium sized companies depend on the way they protect their research and technological information.

The intensive development of tourism represents a unique challenge in history. That is why we have to be prepared that in the 21st century we should cope with the "avalanche" represented by the quality of life, especially related to the food quantity and quality needs and the greater need of people to recover rapidly and pleasantly through holidays and tourist travels. A first step in this sense, which we assume, is the superior educational effort to train real professionals with certain competences for solving the complexity of these realities that we live. The society becomes more and more aware of all these realities.

The activity of the international organisations shows that their efforts for the development of food and tourism are more and more appreciated by the population. Urgent actions based on the mature thinking and quality scientific interpretations are necessary, in order to stop, on the one hand, the food decline in certain areas of the world, and on the other part, for the proportional and harmonious development of food and tourism on more expanded areas, and to reconcile man with nature, to focus on agriculture and on the ecological and biologic food and eco-tourism, to leave future generations an environment at least as favourable as the one we inherited. All these wishes mean important changes in the economy and of everyday life, request large investments and sacrifices, a new mentality. It is not easy to fulfil these tasks, but we must think about what would happen if we did not solve these problems. In a short while we would block the normal evolution of the contemporary human society.

Keywords: tourism services, quality, sustainable

JEL classification: M50, Q01, Q56, L83

The establishment of the potential markets, the marketing strategy and the radical change of the training manner for the personnel in tourism represent the main areas where Romania needs to act in order to reevaluate the tourist potential in the next 20 years.

We all believe that it is the moment that the main tourism operators in Romania¹³⁵⁶, the local tourism agencies, the consultancy companies in the field had the last word regarding the development and the promotion of tourism in Romania, that they accepted the change, even if the change produces enthusiasm when we are its authors and it seems threatening when we are its subjects...

¹³⁵⁶ Mazilu Mirela Elena, *The Actors involved in sustainable tourism of a destination*, published in Proceedings of The 2nd International Tourism Conference: "Sustainable mountain tourism-local responses for global changes", Drobeta Turnu Severin, Sept. 26-27, 2009, Universitaria Publishing House, Craiova, pg. 215-221;

The transparent access to the funding offered by the European Union will facilitate the development of tourism and of infrastructure in the tourist potential areas of Romania. Of course this depends to a great extent on Romania's capacity to "create viable projects" for tourism, and here the human resources have an important role.

The impact on tourism is not relevant on a short term. There is no guarantee of the fact that the foreign tourists will be more interested in Romania upon its entry in EU, but only a chance which must be reevaluated through an aggressive promotion on the member states market, doubled by the offer of quality services. We must take into account the improper infrastructure in many regions of the country, the poor quality of the tourist services and the existing prejudices towards our country in the West.

On long and medium term, if Romania knew how to take advantage of the opportunities offered by the quality of EU member, it could become one of the veritable tourist destinations not only exclusively for the old member states, but also for all the member states or not from the Central and Eastern Europe. It would be ideal to transform professionally and especially with the tourist potential, exceptional even, the recognition at the highest forums from the European and world tourism field, the Illusion into a sustainable reality!

This article tries to offer a pertinent analysis after 3 years since the adhesion to the European Union, of Romanian tourism following the 2 diagnosis informational axes: advantages + disadvantages offered by the adhesion and the impact on the quality of services in tourism, themselves dependent on the quality of the human resources who perform it:

Advantages:

- Europe, the first destination of the world: over 60% from the world tourism;
- the desire of the European people to discover the aesthetic borders;
- "the opening of the gates" for the spa tourism of the EU countries;
- a huge market of consumers, including tourists;
- the rapid development of the low-cost flight market and their arrival in Romania;
- the cancellation of the customs check-ups - ease of the traffic flow;
- the pressure for the Romanian authorities to hurry the development of the road, railway, naval infrastructures, funded with European public money;
- the competition, including for the tour-operators, the hotel managers and the Romanian restaurateurs will develop.

Disadvantages:

- the material basis - approx. 50% from the hotels and restaurants - is not ready for the competition with the neighbouring countries;
- infrastructure: especially the road one, behind the one of the countries which adhered;
- closing the access for retired persons and the persons with health problems, to the medical services through MMSSF in the Spa resorts;
- the high taxes on the work force - small wages, the migration of the qualified and skilled work force to other markets;
- the incapacity of the institutions which train the work force - vocational and for adults - to provide an optimal number of personnel with qualifications (more diplomas than skills) - in comparison with the demand of the internal market for the basic jobs, supervisors and top-management;
- non-concluding some commercial conduct codes between the hotels and the tourism agencies - barrier in the correct function of the internal tourist market.

The quality of the services in the hospitality industry

Who generates/closes the quality of services in a unit?

- the owners of the business;
- the management;
- the employed personnel;

- the utility providers: chosen or imposed (the monopolies);
- the business partners;
- the central and local state authorities;
- the Parliament, the Government and the governmental agencies through laws (with a positive or a negative effect on the tourism sector);
- the local councils through decisions on the development plans, the taxes and the fees, the investments in the infrastructure, utilities etc.;
- the forces of the tourist market (internal and external);
- the clients - the guests.

The quality of the human resources, the key to the success of the tourist services

The training, the recruiting and the employment of the specialised human resources

- the vocational system;
- the professional training system of the adults;
- the apprenticeship at the work place;
- the evaluation of the acquired skills using other methods than the formal ones;
- the lack of practical abilities of the ones from the university educational system;
- the lack of transferable credits systems, for the access to a carrier;
- the economic operators' lack of interest to ensure the access to a productive practical course for the students;
- the families' lack of interest to financially support the access to a carrier of the young people who turn to the industry of hospitality;
- the lack of national marketing policies for the tourism carriers (similar campaigns to those for the military carriers);
- the expenses with the professional training etc. of the human resources considered, unfortunately, expenses not investments - from the employees part: approx. 1% from the total of investments;
- the human resources are not perceived as "assets", but as employees, thus it is very difficult or impossible to apply the principle "HR Assets Management".

The competitive advantages¹³⁵⁷ of the hospitality industry in Romania

- the Relatively positive attractiveness of the basic jobs;
- the still cheap work force - a trap for the employers;
- tourism and the hospitality industry: are not gathered by the EU under one company, they function based on the subsidiary principle;
- Romania - still unknown to the European public, who travels, so this becomes a target for the coming years;
- very many natural products: vegetables, fruit, dairy products etc., which can, by their revaluation, in hotels and restaurants, ensure the quality of the Romanian tourist product
- the Romanians have a preference for the services, having as proof their success in the employment in the hospitality industry from EU countries, especially Italy, Spain, Great Britain, Germany;
- the ones who come back home and work in the same sector - over 75% - will bring added value to the quality of the services provided, based on the exigencies for quality of the citizens of the countries where they have worked for a short while;

¹³⁵⁷ Melinda Cădea, Felicia Aurelia Stăncioiu, Mirela Mazilu, Roxana Cristina Marinescu, The Competitiveness of the Tourist destination on the future Tourism Market, published in WSEAS Transactions On Business And Economics, VOL.6, Issue 7, August 2009, pg. 374-384, www.wseas.us/e-library/transactions/economics/2009/29-592.pdf

- the tourist potential, the improvement of the infrastructure, the coming of the great tour-operators and of the international chains will push forward the development and the competition; hence they will generate the acute need for quality of the performances and of the hospitality services.¹³⁵⁸

Conclusions

According to the data published by the Statistics Office of the EU, the financial crisis propagation has obviously affected tourism in the EU. According to the statistics, last year, the number of night spent in the EU hotels was of 1.578 billions, recording a decrease of 0.5% compared to the previous year. The same figures knew an increase of 3.4% in 2007 compared to the previous year and respectively an increase of 2.9% in 2006. If we make an analysis of the different periods, we can notice the obvious influence of the financial crisis on tourism. Compared to the similar period of 2007, between January and April 2008, the number of nights spent in the EU hotels recorded an increase of 1.6%. This figure dropped 0.5% between May and August, and between September and December, when the crisis worsened, this number decrease drastically with 3.2%.

- The crisis transferred to the private sector, thus tourism suffered a lot. This was felt in the degree of occupation of the accommodation units in the country, which decreased significantly with 20% (in hotels).

- The world economic crisis has a powerful effect on Romania, which does not have a developed market economy, but an economy based on the consumption and loans. What we can expect from the tourist point of view, nobody can answer. The rich persons suffer less; unfortunately, there is the wide majority of the population, affected by the economic crisis effects, which will suffer its costs: unemployment - due to the bankruptcies from the private sector, the investors leaving to other countries etc.

- All these make Romania very vulnerable from a financial point of view, because Romania's economy of 19 years has functioned according to a model of the so-called market economy, which has had as basis the privatization of all the state companies, from all the domains of activity: industrial, extractive, communications, agriculture, tourism etc. After 1989, for the development of industry and the private sector, the attraction of foreign and Romanian investors, the development of infrastructure and of agriculture and tourism had to be done through the granting of fiscal facilities and bank loans with low interests, with a grace period of 5 years. If these facilities had been granted, Romania's economy would have developed these 19 years, which passed and we would not have had to borrow from IMF.

Thus, although the predictions say that the number of tourists will drop this year, the operators must try to make a profit offering service packages at attractive prices. The predictions for this year estimate that the number of tourist who visits Romania will drop with approximately 10%. According to the organizations from the Romanian tourism, the world crisis will be guilty of keeping the foreign tourist far from Romania. Only that even before the launching of the financial problems, our country was avoided by the foreigners who preferred to go to Bulgaria, Hungary, Croatia or Montenegro.

The promotion only within the tourism fairs with slogans of the type "Romania - always surprising", made with a budget of only five million Euros, equivalent with the one from 1980, did not have any results. The race for enriching of the hotel managers from the seaside who offered terrible services for Ibiza type prices is no longer a solution. Romania has more attitude and human value. We do not have to want to transform our country into another France or another improved Germany.

¹³⁵⁸ Mazilu Mirela Elena, Roxana Marinescu, *The Competitiveness of the Romanian Tourism - a ghost or sustainable reality?*, in Annals of Faculty of Economics, vol.4, Issue 1, Oradea, 2009, pg. 367-372.

Tourism will be affected by the global economic crisis the following years, because all the prices will rise, and the people will pay more attention when they will spend their money. "Tourism will be affected by the world financial and economic crisis these next few years, which first started in the United States of America. This, because everything will be more expensive and people will have to take care how they spend their money. Financial and economic reductions will take place and, certainly, there will be a reduction of tourism. Also, the climate changes and the price of the oil barrel are other factors that will affect the world tourism" (Eduardo Fayos Sola - regional representative for Europe of the World Organisation of Tourism, seminar for the World Day of Tourism, in Poiana Brasov 2008).

From the date we have so far, we can draw the conclusion that the holiday market will record stagnation.

After the worsening of the world economic crisis, the Romanian internal tourism seems to be more interesting so far for the Romanian tourists, but the holiday products for external destinations are launched on the market only at this moment, so that it is too early to express an opinion. It is certain that, at least for the first half of 2009, the tourism for events will be seriously affected, because the majority of the corporations have drastically reduced the travel budgets. These aspects were noticed as early as October, November and December 2008.

2009 represented for Bucharest first year of decline after the spectacular increases recorded in all the fields. 2008 had a decrease of 8% compared to 2007, accelerated during the last trimester and noticed along 2009. This fact was noticed first in the main cities, especially Bucharest, because the travel expenses were the first ones to be reduced from the companies' budgets, and Bucharest was 65% based on the external business tourism and, thus, here the first signs of crisis were felt.

The external business tourism decrease from two points of view, firstly as traffic within the degree of occupation and secondly as duration of stay, which reduced. After the first trimester of 2009, the hotel owners panicked and started the war of prices, which, together with the reduction of the average rate of occupation, meant the entrance into a spiral difficult to stop and control. This war of prices dominated much of 2009 the hotel market in Romania, on all the segments, fact that led to a decrease of the overall turnover of 25%.

In this case we cannot speak about profit, but of survival, respectively to keep all the properties functioning at a certain standard of services and quality. Anyway, the effects of this crisis in our country will be seen during the following years in the decrease of the quality of services to the clients and of the deterioration of the properties, because the majority of the operators have reduced the maintenance expenses, the personnel training and even the personnel, and all these will be noticed on a medium term. Until the end of the year the minimum level of the reduction is expected to be felt from all the points of view of the hospitality market, because, according to the estimations of Trend Hospitality, the trend this fall is decreasing, so that a very difficult first trimester of 2010 is predictable, and only as early as the second trimester the stabilisation is expected to start. The increases in 2010 are not estimated higher than 9% compared to 2009, on this segment.

"The market in 2010 shows signs of revival - at least internationally - but in Romania the state institutions and the economy have to settle first, and then we can hope that the hotel occupation recovers. In a captive market, considered expensive, Romania has the chance to come back through quality service at an optimal price. It depends, I repeat, on the political stability which will generate the economic revival and the healthy travel of the hotel services consumers on all the segments: business, events, leisure, seaside and mountain holidays, circuits etc. The revival, for those who survive, will be felt around September 2010", concludes Mihai Rajnita, general secretary of FIHR.

What brings 2010? The inflation and the interest rate will remain within relatively low values. The investments in hotel structures will stagnate. The major risk will come from the labour

market and will determine a lower number of tourists, because of the growth of the number of unemployed people (the unemployed rate in EU was of 9.5% in July, increased at 10.2% at the end of the year and will remain around 10% in 2010).

The European industry of hospitality will have an evolution of "W" type, in other words the graphics of the main indicators will look like the letter mentioned, with ups and downs which mark 2010 as a period of instability, in which the winners' advantages will be the flexibility and the reaction speed.

Since the production has been found to be an economical means for satisfying human wants, this process requires a complex industrial organization together with a large investment in equipments, plants and productive systems. These productive systems are employed to alter the physical environment and create consumer goods. As a result, they are consumed or become obsolete, inadequate, or otherwise candidates for replacement. When replacement is being considered, two assets must be evaluated: the present asset, the defender and its potential replacement, the challenger. Since the success of an industrial organization depends upon profit, replacement should generally occur if an economic advantage will result. Whatever the reason leading to the consideration of replacement, the analysis and decisions must be based upon estimates of what will occur in the future. In this paper we present the Mapi algorithm as a procedure for evaluating investments or for analyzing replacement opportunities.

Keywords: replacement/renewal policy, Mapi formulas, adverse minimum, defender and challenger plant, operating inferiority, one-more year test

JEL Classification Code: M10, M11, M20, M21

1. The replacement-renewal problem for firms

Due to the typical activities of industrial firms and their increasing need for mechanized and automatized productive systems, plants, machinery and equipment play a central role in investment decisions.

In fact, in the present context of international development, industrial firms tend to increase in size in order to strengthen their supply pool and to reduce the threats from the competition. On the one hand, this growth in size requires increasingly larger investments in industrial plants; on the other, trends in demand, the pressure from the competition, which reacts with contrasting strategies, and, above all, the important trends in scientific and technical progress, which heighten the obsolescence processes, make such investments in industrial plants riskier.

Management must thus continually evaluate with even more care the convenience of their plant investments; once the investments are undertaken they must monitor the prospects for future use in order to determine the economically useful life cycle, determining the optimal period in which to discontinue operating the plant.

In determining the economic viability of medium-term industrial plans, calculations regarding the *optimal duration of the plants* are taking on more importance. Such calculations estimate the period of time beyond which the continued utilization of a plant, already installed and operational, is no longer economically viable and should thus be *replaced* or *shut down*.

Regarding the size of the invested capital, an appropriate *replacement/renewal policy* is one of the most important and thought-out decisions for industrial firms, precisely in order to maintain the maximum economic efficiency in the productive structure, thereby improving quality and

increasing productivity without increasing fixed unit costs.

If we consider the firm as a *viable system*, adopting Beer's sense (Stafford Beer, 1972) of the term, or as a system of efficient transformation, in Mella's sense (2007), it is clear that the decision to replace the plants is fundamental for maintaining the conditions of vitality and, more generally, for the necessary economic operating efficiency.

The replacement problem does not only concern plants and other fixed assets but is much more general: in fact, it can refer to the same businesses in which the plants participate.

In fact, as has been highlighted for years by the BCG (www.bcg.it), every business, after the start-up, boom and maturity phase, begins a period of decline.

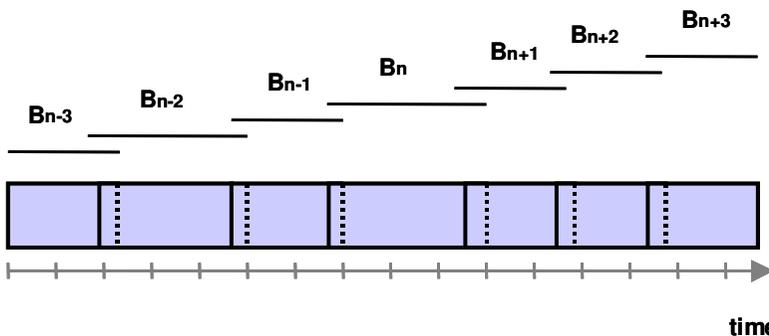

The manager must then determine the optimal moment not only to discontinue the business in decline but also to replace it with another business, in a typical operation of the renewal of the business portfolio over time, thereby giving rise to a true *chain of renewal*.

Obviously the renewal of a business depends on the availability of other replacement businesses, and the moment for renewal is conditioned by the activation time of the new business.

We can thus view a business B_n as a link in a chain of business renewals in which its life cycle is not determinable in an absolute way, but only in relation to the business B_{n-1} that precedes it and B_{n+1} that replaces it (fig. 1).

Prolonging the life of B_n means delaying the start-up of B_{n+1} ; calculating the optimal replacement time for B_n would thus mean optimizing the profitability and cash flow of the composite business $B_n + B_{n+1}$. However, the same reasoning must apply as well for B_{n+2} , and so on; this means there are no businesses that succeed each other over time with an autonomous existence, and autonomous profits and financial flows, but rather a chain of businesses where the life of each depends on that of the others.

Fig. 1. The business chain

The above discussion leads to an important implication: from the financial viewpoint the time factor can be recognized on the basis of two linked elements: timeliness in starting up a business and, at the same time, timeliness in ceasing operations. The former occurs when a firm perceives (or generates on its own) the potential for new demand; being first in the business means being pro-tempore in a position of near-monopoly and creating a competitive advantage until the time when competitors come on the scene.

This type of timeliness leads to notable advantages, among which: being the first to gain a consistent market share (Smith & Reinartson, 1991), setting high prices before the arrival of competitors, fidelizing the clientele that is served first, fully exploiting the learning of costs in order to gain internal competitive advantages, anticipating the recovery of fixed costs by reducing the risk on invested capital, and obtaining good profitability, which improves the firm's credit capacity for future growth.

2. Plant replacement

The renewal problem can specifically refer to the calculation of the optimal date for replacing the

industrial plants, understood as the *set of instrumental goods in a productive system, which are necessary to carry out a given business*.

The economic value of the industrial plants varies over the life cycle, and this variation depends on several factors, all of which are linked to the physical wear and tear and the economic obsolescence due to technical progress of both the plant as well as the product obtained with its help. These factors act to modify the firm's profitability, which tends to gradually diminish, thereby necessitating the decision to replace the plants.

The calculation of the *optimal operating period* for a plant \mathcal{E} , not included in a chain of renewals, is thus a typical economic-financial problem: it is necessary to determine how much time is needed to cover the purchase and operating costs for the plant with the sales revenue of the production obtained from its use, with the desired operating result.

The problem could be solved through Break-Even Analysis; since the life of industrial plants is usually several years, the financial present value of the future costs and revenues relative to the purchase cost must be taken into account.

It is also necessary to consider that the length of the operating period of the plant itself conditions the costs and revenues that derive from it, in that:

- the purchase cost of a plant equivalent to the one to be replaced presumably varies from year to year since, due to technological progress, the retired plant is replaced with one technically more advanced and with greater productivity;
- the cost and revenue flows are sensitive to the period of reference, because of both the volume of demand and the prices, if the more modern plant allows the same products to be obtained at lower costs, or products of higher quality and with more attractiveness for the market;
- the disposal value of the retired plant varies according to the year it is shut down.

The replacement policy does not concern the single firms but rather an entire productive system, since the totality of replacement policies of the various firms is in turn a factor that determines the level of activity of the productive sectors involved in manufacturing the plants, with effects that can extend to the entire economic system and to the latter's growth.

When firms begin to postpone the replacement of their plants, the immediate result is a decline in production and/or innovation regarding these industrial plants and this process – being part of a productive network (Mella, 2009) – can lead to a general crisis.

3. Conditions for replacement

Since for industrial firms the costs of plants represent a considerable portion of production costs, replacement policies play a key role in industrial plans.

In general terms, we can observe that renewal is not a simple operation that concerns only a single plant, but one that involves the entire productive system.

Especially with regard to complex plants, on which an entire business is founded, replacement involves all the plants that make up the productive network, since the introduction of a new and modern plant at a point in the network makes the other plants connected to it technically obsolete. The renewal of large plants also involves implications, often relevant and radical, for the entire production, commercial and administrative organization, so that the replacement must be linked to measures that concern the firm as a whole.

Considering the time frame of the operation, we must always keep in mind that the convenience of undertaking renewal depends on the moment when the operation must be realized. Only if this occurs at the supposed optimal moment, from the economic point of view, will it allow the firm to maintain and improve its existing economic equilibrium or its re-establishment, when this is more or less seriously compromised by obsolete plants.

Negative consequences always result from carrying out renewal too late or too early with respect to the optimal moment.

When the replacement is delayed the firm will most likely see its production costs increase at an

increasing rate and will not be able to remain price competitive with respect to its competitors, the more so if the latter use more modern and efficient plants.

If the delay of the renewal is too long, the business connected to the plant will enter its declining phase, becoming “dog”, so that it will have increasing difficulty raising the necessary capital for replacement, which is more urgently required due to economic necessity.

Similar problems would be encountered by anticipating the replacement since, due to the contraction of the pay-back period, the cycle of economic utilization of the previous investment would not be completed, and the capital that is invested and not yet written off through the depreciation process cannot easily be fully recovered through the sale of the retired plant.

Even from these simple considerations it is clear that management must place the renewal problem in the context of overall corporate strategy, understanding in a timely way the evolution of the organizational and environmental forces that influence its business and, more generally, its overall business portfolio.

If it is necessary to be attentive at the moment of replacement, this means that the optimal utilization period for a plant also depends on the characteristics of the rival plants that can be considered as alternatives.

From the above considerations it follows that, more than referring to an individual operation, renewal must be viewed more broadly to include the concept of “chain of renewals” in which the replacement of each link in the chain inevitably ends up conditioning all the subsequent links and, as a result, the entire chain of subsequent substitutions.

We inevitably associate with the concept of a chain of renewals that of obsolescence, viewed as a continual process of technological progress of the new plants with respect to those in use, both as regards productive efficiency, through an increase in productivity, as well as manufacturing quality.

Precisely because of the continuity of technological progress we need to take into account this important variable when making renewal decisions, since such choices involve the entire future chain of renewals and not merely a single replacement of a plant.

The first attempt in this direction comes from Terborgh and the MAPI formula he developed.

4. The MAPI formula

In 1949 the Machinery Allied Production Institute in Washington set up a study committee chaired by George Terborgh to come up with a new evaluation system for investments aimed at the equipment-replacement problem, which led to a general rule, usually referred to as the MAPI formula, that allows for the determination at a given moment of the opportuniteness of replacing an existing plant with a *new plant* that has come on the market, called the potential challenger plant. Even if the MAPI formula has been the focus of criticisms, it offers a general solution to the equipment-replacement problem that covers a wide range of cases.

“Essentially, it provides a quick test of current replaceability on the basis of a prefabricated structure of assumptions and projections into which the analyst can insert the necessary stipulations and estimates for the case in hand (the amount of the investment, the income tax rate, the interest rate, the service life, the terminal salvage ratio, etc.). It is an elaborate gadget to simplify an otherwise almost insoluble problem.” (Terborgh, 1956: p. 138).

The novelty of the potential replacement plant should be understood both in terms of its complete technical efficiency – since it has not yet been utilized – as well as the improvement it embodies due to technical progress. With particular reference to the latter, Terborgh assumes continual technological evolution, which posits that progress is continuous and capable of making available to the firm a plant perfected at every future instant (in an abstract sense). There is thus the assumption of a continued operational superiority of future plants with regard to those the market offers and will offer; or, conversely, a continual operational inferiority of the plant to be replaced with regard to the new ones.

- Plant E_t in use at instant t is called the *defender*. The new plant, $E_{t'}$, available at t' , is called the *current challenger*. Compared to the challenger, the defender has an *operating inferiority* that manifests itself in the following values:

- gross revenues, E_t , less than those obtainable from $E_{t'}$;
- annual costs, E_t , greater than those required by $E_{t'}$;
- consequently an annual margin, E_t , less than that obtainable from $E_{t'}$; this margin has a monotonic non-decreasing trend for each future $t > t'$.

If the defender's margins have a *monotonic non-decreasing* trend year-to-year, then its *operating inferiority* will also have a monotonic non-decreasing trend.

From the theoretical point of view, if the cost of capital were zero then the optimal renewal policy would obviously consist in replacing the plant every year (even at every instant, given the hypothesis of the continuity of technical progress) in order to have the best plant at every moment. In fact, Terborgh writes: "Now we consider a hypothetical question. What would be the proper equipment policy if capital goods were available free? The answer is obvious. Equipment would be replaced with great frequency, generally once a year or more often. With this high turnover, we should have continuously a state of "perfect" or "total" mechanization, yielding at all times the very highest operating performance the technology is capable of". (G. Terborgh, 1962).

If we abandon this unrealistic hypothesis and assume that every investment entails a cost for the invested capital, then it is realistic to assume that the cost of the capital invested in the defender plant decreases as its period of utilization increases.

Regarding the challenger, as the utilization period increases there are two opposing trends at work: on the one hand, the cost of the invested capital declines, but on the other the *operating inferiority* increases.

The optimal solution is to find the point where the sum of the values of these trends is at a minimum – Terborgh defines this as the "adverse minimum" – that is, the minimum of all the alternative magnitudes, each of which is adverse: "Unfortunately machines are not to be had for nothing. They cost money, a fact which precludes the attainment of this state of technological blessedness. For when their cost is taken into account, mechanical perfection can be no longer the exclusive goal of equipment policy. The analyst has to choose between more capital cost with less imperfection or less capital cost with more imperfection. Now when we have alternative magnitudes, each of which is adverse, the best we can do is to find the proportion or combination of the two which minimizes the sum. This proportion is the key to correct equipment policy. It is the policy that minimizes the time adjusted sum or combined average of capital cost, and operating inferiority. This brings us to the concept of adverse minimum". (G. Terborgh, 1962).

Two fundamental hypotheses are posited to formulate the evaluation criterion:

- All the future plants (the succession of challenger plants) have an adverse minimum equal to that of the best plant at the time of the survey. This is equivalent to hypothesizing not only the continuity of technical progress but also its constancy and uniformity over time. This serves to narrow the analysis to the data regarding the defender plant and to the best plant available for substitution at that moment, without worrying about what would instead happen if, due precisely to technical progress, the successive challenger should have very different economic-technical improvements.
- The operating inferiority of the defender increases linearly over time; that is, both the costs regarding the physical deterioration of the plant (costs for maintenance and lower productivity) and those linked to the plant's obsolescence grow linearly.

These hypotheses reduce the analysis of the opportuneness of an investment in plant substitution to a comparison of the adverse minimum of the most technically-advanced plant (the challenger)

and the plant in operation at that moment (the defender), based on the procedure indicated in the following section.

5. The calculation of the adverse minimum

We indicate by E_0 the defender plant and by $E_1, E_2, E_3, \text{ etc.}$, the challengers available for substitution in the subsequent years.

We indicate by $m_0, m_1, m_2, m_3, \text{ etc.}$, the annual margins (revenues less operating costs) that would occur under the assumption that after t_0 the best new plant is always utilized.

For convenience sake we assume that the margins are discrete and achievable at the end of each year.

If we set t as the instant in which the plant E_0 begins operating, and setting $h = 1, 2, 3, \dots$, then the initial annual margins for each new and improved plant will be:

$$m_1(t+1), m_2(t+2), m_3(t+3), \dots m_h(t+h)$$

and, based on our hypotheses, we will initially have:

$$m_1(t+1) < m_2(t+2) < m_3(t+3) < \dots < m_h(t+h)$$

If the firm keeps plant E_1 in operation in the year subsequent to year one, when technically better plants are instead available which, through technical progress, can offer increasingly greater initial annual margins, it will achieve lower annual margins: in other words, the firm would sustain costs due to the obsolescence of the plant with respect to new ones.

If the firm should thus maintain E_1 in operation past the first year, it would achieve lower annual margins, even while plants with higher annual margins would be available.

If we indicate by:

- _ $m_1(t+1)$ the annual margin achievable with plant E_1 one year after it has entered into service at instant t ;
- _ $m_1(t+2)$ the margin achievable with E_1 two years after it has become operational; ...
- _ $m_1(t+h)$ the margin attainable with E_1 h years after its adoption by the firm,

then we obtain the following relation:

$$m_1(t+1) > m_1(t+2) > m_1(t+3) > \dots > m_1(t+h-1) > m_1(t+h)$$

The above relation indicates that if the firm should continue to utilize E_1 for periods subsequent to the first year, it would suffer disadvantages from lower margins owing to the gradual deterioration of the plant, together with:

- an increase in the operating costs due to a reduction in the technical productivity of the plant;
- a reduction in sales revenue from products which, due to the wear and tear on the plant, may have lower quality;
- an increase in maintenance costs.

We thus define the *operating inferiority* of E_1 , for each subsequent year of utilization $(t+h)$, as the difference between the net margin of a new plant and that of the plant in consideration:

$$m_h(t+h) - m_1(t+h) = g_1(t+h)$$

The *net present value* of the operating inferiority, for a duration of “ n ” years of plant utilization, after adding the purchase cost C_1 , and subtracting the revenue from salvage obtainable after “ n ”

years, $S_1(n)$, at a chosen given discount rate, “ i ”, takes on the meaning of the *total opportunity cost* of the plant for “ n ” years:

$$B_1(n) = C_1 - S_1(n) v^n + \sum_{h=1}^n g_1(t+h)v^h \quad [1]$$

where $v = (1+i)^{-1}$ is the present value coefficient at discount rate “ i ”.

Using [1], it is more significant to determine the *average annual burden of service of the plant* in use for “ n ” years:

$$b_1(n) = B_1(n) \frac{i}{1 - v^n} \quad [2]$$

If we take “ n ” as a variable, we can calculate [2] for periods of increasing length, $n = 1, 2, 3, \dots$, and determine the period “ n^* ” that corresponds to the minimum average annual burden of service [2]. This value, $b_1(n^*) = \min$, represents the *adverse minimum* of E_1 , “ n^* ”.

However, since we are looking for the desirability of substitution of the *defender* plant E_0 , we must compare the adverse minimum of the challenger E_1 – that is, $b_1(n^*) = \min$ – with the *annual replacement cost* of the defender E_0 , called the *adverse cost*, which is calculated as follows:

$$\Delta_0(t) = [S_0(t) - S_0(t+1)] + S_0(t) i + g_0(t+1) \quad [3]$$

where:

$[S_0(t) - S_0(t+1)]$ represents the loss in value of the scrap due to an additional year’s utilization of E_0 ;

$S_0(t) i$ is a year’s lost interest on the *terminal value*;

$g_0(t+1)$ is the operating inferiority of E_0 following its prolonged use for another year.

The defender E_0 should be replaced with the challenger E_1 when:

$$\Delta_0(t) > b_1(n^*) \quad [4]$$

If this optimality condition is not satisfied then it is economically more useful to utilize E_0 for another year, at the end of which a new comparison will be needed, but this time between E_0 and E_2 for the following year.

If the inequality $\Delta_0(t+1) > b_2(n^*)$ does not still exist, then it will be necessary to utilize E_0 for another year and then compare E_0 and E_3 .

The process should be repeated every year until the optimality conditions exist.

6. The MAPI formula as an approximative method

The procedure presented to this point is difficult to apply in practice due to the difficulties in estimating the *adverse minimum* of the challenger plant relative to the length of utilization of the defender. In fact, a too forward-looking knowledge would be required, which is almost impossible to satisfy.

To overcome this difficulty Terborgh suggests a simplified formula, commonly known as the MAPI Formula, which allows us to determine the sum of the adverse minimums of the challenger plant (thus its adverse minimum), thereby reducing the calculation to a comparison of data regarding only the subsequent year.

In practice, starting from the assumption that the simple average of the *operating inferiority* of the challenger for each period is higher than the corresponding equivalent annuity and that, on

the other hand, the simple average of the cost of capital is lower than the corresponding average annual cost, financially calculated, then in order to avoid cumulative calculations for each year we can approximate the results by substituting the simple averages for the equivalent annualities that are theoretically required.

In fact, based on the assumptions made, the errors made as a result of this substitution are in opposite directions, and thus basically compensatory; since the sum of the simple averages is thus not that different than the sum of the equivalent annualities, then the adverse minimum of the challenger can thus be approximated with a good degree of accuracy.

Rather than calculate for each year of the probable life of the challenger plant the annuality equivalent to *total opportunity cost*, as is the case in [2], Terborgh, in order to calculate the adverse minimum, provides the following formula, which is easier and more practical to apply:

$$b_1(n^*) = \frac{1}{2} [(C_1 i) - g_1] + \sqrt{2 C_1 g_1} \quad [5]$$

Where, assuming a salvage value of zero and an interest rate “i”:

C_1 is the purchasing cost of the challenger plant;

g_1 is the average, constant over time (in case of the linearity of technical progress), of the *operating-cost inferiority gradient*; this is assumed to be equal to that of the plant in current operation;

The adverse minimum thus found is compared with the replacement cost of the defender plant, as shown in [3]. We thus return to the optimality condition [4], which determines whether or not renewal is appropriate.

7. An initial numerical example

A numerical example will clarify the application of the MAPI Formula given in [5].

Let us suppose the following data:

- the defender is operating for 12 years and has a residual value of € 20,000,000;
- after another year of operation the residual value is estimated to be € 12,000,000;
- the challenger, possessing greater technical efficiency, has an initial cost of € 200,000,000;
- the interest rate chosen is 10%;

- the challenger plant allows the firm to achieve, for the following year, the economic advantages indicated in Table 1, which compares the adverse minimums of the defender and challenger plants.

The value of the sum of the alternative minimums of the challenger plant is calculated by applying Formula [5].

Assuming a residual value of zero, a lower operating efficiency rate that is constant and equal to that of the defender plant, and inserting the following values:

$$\begin{aligned} I_1 &= 200,000,000; \\ g_1 &= 60,000,000/12 = 5,000,000; \\ i &= 0.10 \end{aligned}$$

we obtain:

$$\begin{aligned} b_1(n^*) &= \frac{1}{2} [(200,000,000 \times 0.10) - 5,000,000] + (2 \times 200,000,000 \times 5,000,000)^{1/2} = \\ &= (44,721,400 + 7,500,000) = 52,221,400. \end{aligned}$$

Since: $52,221,400 < 70,000,000$, and thus the optimality condition [4] exists, it is absolutely appropriate to replace the plant in operation with the new one.

Table 1.

EVALUATION ELEMENTS	ADVANTAGES FOR FOLLOWING YEAR IF THE CHALLENGER PLANT IS INSTALLED	ADVANTAGES FOR FOLLOWING YEAR IF THE DEFENDER PLANT IS MAINTAINED
Lower maintenance costs	3.500.000	
Lower labor costs	34.500.000	
Lower general production costs	25.000.000	
Lower insurance costs		3.000.000
	63.000.000	3.000.000
Inferior operating efficiency of the defender plant compared to the challenger plant for the following year		60.000.000
Loss in value of old plant		8.000.000
Passive interest on the residual value of defender plant		2.000.000
Sum of adverse minimums of defender plant		70.000.000

8. The new MAPI formula: one-more year test

With regard to the MAPI formula, Terborgh subsequently devised a new formula that, though based on the same principles as the preceding one, represents an extension and improvement over the latter.

This new Formula does not stop at indicating the optimal time for renewal but is extended to consider all types of investment opportunity for the firm, and thus even new business projects, thereby making the replacement problem more closely adhere to the logic of the renewal of businesses, which was touched on in section 1.

The intent no longer is to examine the economic conditions of use of an individual machine or plant but to examine whether or not an entire productive system can be improved by replacing one or more parts of the “whole”, leaving the other parts unchanged.

The new MAPI Formula is set up to uncover the economic advantage that would accrue in the subsequent year’s income by investing a given capital in a “new project”, evaluating the qualitative-quantitative improvements to production.

The new formula is different, in both how it sets out the problem and the solutions it envisions. As far as setting out the problem is concerned, Terborgh partially modifies his initial assumptions. In particular, there is no longer the assumption of the linear growth in the operating inferiority of the plant in current operation. While maintaining the assumption of the constancy of obsolescence, it is recognized that, during the use of the plant, the trend in costs due to its operation and maintenance will not always be constant.

Terborgh maintains the assumption of the equality of the adverse minimums of the future challenger plants, on the one hand, and the best available plant on the market at the moment of

the survey on the other, but this hypothesis is restricted in the sense that these plants must be similar: that is, have the same initial cost and the same residual value as the current plants when they are retired, after the same length of time.

A new procedure, called a “one-more year test”, is proposed according to which an *internal productivity rate* is determined for the subsequent year with regard to the net capital investment required to realize the project, and thus to replace the plants, which is compared to the hypothesis of not going forward with the renewal.

The algorithm provides an adjusted, after-tax rate of return criterion which the decision maker may use in replacement analyses or in selecting one investment opportunity from among many. The MAPI procedure is based on a one-year evaluation period. Alternatively, a period of several years might be considered with a “typical” single year obtained from an arithmetic average. Application of the MAPI formula requires the computation of six elements. These are used to calculate a rate of return for a one-year period based on average net investment. These elements are:

(1) The arrival operating advantage, expressed as the sum of the net increase in revenue and the net decrease in operating cost. From this we derive that the *next year operating advantage* is composed of the increase in the operating result in the following year deriving from the project.

(2) The initial net investment, expressed as the installed cost of the asset less any investment released or avoided.

At this point it is important to define several concepts.

– *Net invested capital*. This is composed of the capital needed to realize the project, and thus to purchase the new plant, install it, etc., net of the disposal value of the used plant and of any investment avoided due to the project’s implementation (costly repairs, improvements and change in the existing plants that would have been necessary without the new project).

– *Next year capital consumption avoided*. This is composed of the reduction in the residual value of the plant kept in service for another year if the new project is not implemented.

– *Next year capital consumption incurred*. This is the difference between the cost of the project and its value after one year, and in practice is equal to the amortization rate with interest of the new plant. Of all the above elements, *next year capital consumption incurred* is surely the most difficult to determine. The evaluations and forecasts required in this case extend, in fact, beyond the following year, since the annual share of costs for the investment project depends not only on the known amount of the purchase cost of the new plant but also on the residual value the plant will have at the end of the following year, and as a result on the estimated number of years of useful life. Thus, long-term forecasts are needed, which, nevertheless, can be avoided by using the diagrams developed by the MAPI formula, which allow the firm to determine a percentage which, applied to the net investment cost, allows it to calculate the value of the consumption of the required capital.

(3) The terminal net investment obtained from the appropriate Mapi chart.

(4) The average net investment, expressed as the sum of the initial net investment and the terminal net investment divided by 2.

(5) The average capital consumption per year, expressed as the initial net investment minus the terminal net investment divided by the comparison period in years.

(6) The increase in income taxes. The change in next year’s income taxes is basically the net increase in income taxes from the project in the subsequent operating year.

We can thus calculate the *internal productivity rate* for the following year – also called the “Mapi urgency rating” – with the help of a simple formula that permits a ranking of the investments, so

that the most urgent ones (in the sense of having a higher relative productivity rate) can be realized first.

The foregoing elements may be used to find the after-tax rate of return as:

$$\frac{(1) - (5) - (6)}{(4)} \times 100$$

This formula allows us to determine the return on investment from implementing the new plant; that is, the percentage of net income to the capital invested in the operation for the following year that the renewal will ensure.

At this point, in order to determine whether it is economically appropriate to renew the plant it is necessary to compare the rate of relative productivity, or the Mapi urgency rating, for the following year with the minimum productivity rate required by the firm to undertake the investment projects (Mella, 1997).

If the former is greater than the latter, then the investment to replace the plant should be undertaken.

9. A final numerical example

To better understand the new Mapi formula, it is useful to give an example from Terborgh's Business Investment Policy. The problem involves determining the net profitability, expressed in percentage terms, of the investment in a new plant, equipped with devices that allow savings in manufacturing times, as a replacement for a similar existing plant.

The old machine is 39 years old and has a residual value of 200. It is assumed that paying a cost of 3,850 to adapt the old machine will provide another 10 years of use.

The overall cost of the new plant is 15,700 and it is assumed its useful life is 18 years and that it has a final residual value equal to 5% of the original cost. Linear amortization at constant rates is chosen, a tax rate of 50% of gross income is assumed, and normal or standard obsolescence (with a linear reduction of the annual margins obtainable with the plant's use) is adopted.

The calculations and analysis from the above data are shown in Table 2.

Table 2

REQUIRED INVESTMENT		
1) Installed cost of project		15.700
2) Disposal value of assets to be retired by project		200
3) Capital additions required in absence of project		3.850
4) Investment released or avoided by project (2 + 3)		4.050
5) Net investment required (1 - 4)		11.650
NEXT YEAR ADVANTAGE FROM PROJECT		
6) Assumed operating rate of project (hours per year)		3.300
	<i>Increase</i>	<i>Decrease</i>
<i>Effect of Project on Revenue</i>		
7) From change in quality of products	---	---
8) From change in volume of output	---	---
9) Total	--- (A)	--- (B)
	<i>Increase</i>	<i>Decrease</i>
<i>Effect of Project on Operating cost</i>		
10) Direct Labor	---	2.000
11) Indirect Labor	---	---
12) Fringe Benefit	---	350
13) Maintenance	---	1.160
14) Tooling	---	---
15) Materials and supplies	---	---
16) Scraps and re work	---	500

17) Dow time	---	425
18) Power	---	---
19) Floor space	---	---
20) Property taxes and insurance	150	---
21) Subcontracting	---	---
22) Inventory	---	---
23) Safety	---	---
24) Flexibility	---	400
25) Others	---	---
26) Total	150 (A)	4.835(B)
27) Net increase in revenue (9 A – 9 B)		---
28) Net decrease in operating cost (26 B – 26 A)		4.685
29) Next year operating advantage		4.685
<i>Non operating advantage</i>		
30) Next year capital consumption avoided by project		
a) Decline of disposal value during the year		---
b) Next year allocation of capital addition		422
<i>Total advantage</i>		
31) Total next year advantage from project (29 + 30)		5.107
32) Total next year advantage after income tax (50%)		2.553,50
33) Mapi Chart – Allowance for project		785
34) Amount available for return on investment (32 – 33)		1.768,50
35) MAPI URGENCY RATING (1.768,5/11.650)x 100		15%

The value of 785 – that is, the share of capital cost – was calculated by recording from the appropriate monogram the percentage (4.7%) that must be applied to the original cost of 15.700 for a plant with a presumed useful life of 18 years, a disposal value of 5% of the original cost, and for which we assume that 25 out of each 100 of capital invested is obtained from credit operations with an interest rate of 3%, and 75 from stock issues that pay a 10% dividend. This explains how the calculation was made to determine the affect of the plant renewal on the “following year’s” percentage of net income to capital invested in the operation.

10. Critical considerations

The critical considerations which can be made about the Mapi formula basically refer to the particular nature of the hypotheses underlying the problem that is posed; these do not always appear to conform to the actual operating conditions of firms. Among these we wish to point out:

- the hypothesis of the linear diminution of costs of future new plants; that is, the linearity of obsolescence and the evolution of technological progress at a constant rate over time;
- the hypothesis of the equality of purchase costs of future plants and those of the best plant currently available at the moment of the survey;
- the hypothesis that the comparison should be limited to the productivity of the plant currently in operation and the new plant only for the following year.

These hypotheses clash with the reality the firms operate in, since technical progress shows instead an uneven trend over time and the purchase prices of the plants in subsequent periods are not easy to predict.

Limiting ourselves to considering only the costs and revenues from the plant for only one year, ignoring the trend in costs and revenues from the plant in subsequent years, can lead to unreliable results if, in effect, such costs and revenues turn out to be different from those considered in the analysis.

Obviously using data from the industrial plans could help in extending the calculations for a longer period.

The model developed is thus able to produce valid results only in so far as these are limited to the field of application fixed in the initial hypotheses.

This must always be kept in mind in order to best adapt the model's findings to the possible cases that arise in the actual management of the firm.

As Terborgh himself underscored, the formula does not solve all the renewal problems: "No knowledgeable person has ever claimed universality of application of the MAPI formula. It was conceived and presented as a replacement formula (the term "replacement" being broadly construed to include mixed replacement-improvement-expansion situations), its main purpose being to indicate the proper timing of re-equipment decisions. It was offered as an improvement over the primitive rules of thumb so widely employed in American industry to make these decisions. As such, it has proved very useful, as evidenced by the extent of its employment." (Terborgh, 1956: p. 138).

PROFESSIONAL PERFORMANCE OF THE HUMAN RESOURCES DURING A CRISIS

Mituț Iulian

Academia de Studii Economice București

In a vigorous social and economic environment dominated by multiple situational changes and complexity of organizational activities, professional performance tends to be a result of managerial competence. Crisis characterized by reducing organizational expenses and increasing occupational stress level is the best test for the ability of the manager who has to motivate and influence the human resources with low costs. Managing human resources was, for many companies, one of the main organizational problems of 2009. The feeling of uncertainty and insecurity specific to the crisis has augmented the organizational failure and occupational stress of human resources, leading to the loss of loyalty to the organization, poor health and even death of certain employees because of inadequate human resource management during a crisis.

Key words: organization, motivation, occupational stress, human resources, professional performance.

Cod JEL: M 12.

1. Professional performance of the human resources in modern market economy

In the current socio-economic environment the knowledge-based organization is efficient when human resources generate organizational excellence and efficiency. The origins of the organizational management theory are closely linked to the need of improvement of the industrial productivity, of economic power growth and increasing organizational performance, the main driver of this development/productivity is the human resource, “*The most valuable asset of an organization*”¹³⁵⁹.

Starting with the '50s, in order to achieve organizational performance and productivity growth of economic activities it was necessary an orientation to the human resource. It is when they emphasize the fact that employees, as members of the organization, have needs/expectations that can not be reduced solely to financial issues or work safety. Therefore a redesign was needed of the strategies of human resources activity and of the strategies for decision and control processes in order to enable human resources to identify with the objectives of the organization and to work efficiently to attain them. We can see today various forms of organizing of human resources in political, economic, industrial or military systems but each of them is based on activity ergonomics issues or on the orientation to own personnel through the focus on evaluation process and motivational aspects, as well as through the interest in employee health (stress, depression, accidents).

One of the main promoters of the orientation to human resources was Rensis Likert¹³⁶⁰, who after the Second World War compared simultaneously work groups with high productivity and work groups with low productivity, examining the influence generated from the managerial decision and control systems on professional performance. The result revealed that in the highly productive groups the management style is oriented towards human resources, while in low productive groups the management style is focused on production capacity. Likert has shown that the orientation towards human resources is more profitable than any other organizational activity.

¹³⁵⁹ Manolescu Aurel, *Human Resource Management*, Editura Economică, Bucharest, p. 21, 2003.

¹³⁶⁰ Likert Rensis, *New Patterns of Management*, McGraw-Hill Book, New York, pp. 249 - 263, 1961.

The main ideas regarding the professional performance of the experiment conducted by Likert reveals that in an organization the effectiveness of the human resources is influenced by the leadership style and the behavior of the manager, and the author recommends:

- Using the „*supportive relationships*” principle, this can prevent and eliminate the problems regarding the occupational stress and lack of organizational communication.
- *Cohesion of the members of the organization* that affects human resources productivity, directing it towards professional duties.
- Application of the „*participative management*” principle, which implies the existence of collaboration between managers and performers in establishing organizational objectives and the execution of the professional tasks.

In another conception, the professional performance of the human resource is reported to the motivational system. In a knowledge-based economy the human resource is the only capable of acting contrary to the organization’s objectives or to generate organizational excellence, aspect that is acknowledged by the major organizations of the modern market economy that “*get sustainable growth and profits because they do what other companies do not succeed in doing: they maximize innate individual talents of the employees into customer relations. They know that the use of human resources is the only area where significant improvements can lead to an unlimited source of competitive advantage in the marketplace.*”¹³⁶¹ The managerial motivation and training of the resource are essential elements for the modern organization for the process of planning for and obtaining organizational performance.

The study of managerial motivation comes from the *hierarchy of individual needs* or the so-called “*Maslow's pyramid*”. Further development and adaptation of Maslow’s theory generated more diverse classifications of the individual needs; relevant to the organizational environment is the “*Theory Z*” produced by the American professor of Japanese origins William Ouchi. It proposes a type of organizational culture based on:

- *Satisfying the higher needs of the member of the organization.*
- *Individual achievement in his working environment and the intersection between this environment and the family and social environment.*
- *Individual access to the organizational culture and his involvement in the development of the organization, setting goals and improving the results.*

Table 1 – Motivation by Maslow and Ouchi

<i>Maslow's Theory and its implications</i>	<i>Ouchi's Theory and its implications</i>
Self-actualization (self-development, personal achievement, career development)	Higher needs (recognition, esteem, status, self-actualization)
Esteem (assigned or assumed responsibilities, prestige, recognition of contribution and effort, status)	Increased focus on human resources (team work, decision-making by consensus, individual achievement in the organizational environment and its intersection with social and family environment, emphasizing the group responsibilities)
Social needs (belonging to a group, collegiality, communication)	

¹³⁶¹ Coffman Curt, Gonzalez Gabriel, “*The Galup Way – Emotional Economy*”, Alfa Publishing House, p. 15, 2007.

Safety (work safety, working conditions, personnel policy)	Increased confidence among members of the organization (job security – long term employment, individual access to the organizational culture and his involvement in the business development, setting goals and improvement of the results, informal control)
Biological (food, home, salary and other bonuses, transportation)	

According to Ouchi's theory, the manager must know his own employees and recognize the relevance of labor ergonomics on the productivity of the company/organization. From this point of view "Theory Z" provides solutions for a competent management of human resources, efficient organizational communication and eliminating occupational stress causing staff turnover and high financial costs.

In order to analyze business performance, besides "theory Z", the well-known "expectations theory" is relevant. This theory is developed by the Canadian Professor Victor Vroom who considers that from the organizational point of view, performance depends on the work climate, ability and motivation of the employees, according to the following equation:

$$PP = f(Me, A, M) \quad (1)$$

Where,

Me = Work environment (good/poor working conditions).

A = ability (effect of the qualification, involvement, experience of the employee).

M = managerial motivation.

In a socio-economic environment dominated by technological evolution, scientific organization of labor production, development of transport means, action and communication, the professional performance depends both on work ergonomics and capabilities of the employee supported by motivation and occupational stress which affects more and more intensely the physical/physical condition of human resources. Given that in the knowledge-based organization the working environment influences the stress level of human resources, professional performance is represented by:

$$PP = AxM - S \quad (2)$$

Where,

A = Ability (effect of the qualification, experience and involvement of the employee).

M = Managerial motivation.

S = Occupational stress.

With a high level of occupational stress (S) human resource needs to be re-positioned and to reassess the need to continue its work, feeling suffocated by work overload, the significant mental and relational pressures, destabilization and uncertainty of their future, aspects that are inversely proportional affecting professional performance, irrespective of the involvement (A) and managerial motivation (M).

Thus, employee skills, efficient use of managerial motivation together with appropriate involvement and organizational stress control are the foundation of competitive and sustainable results for organizations in the modern market economy both for normal economic situations and for the crisis.

2. Professional performance during a crisis

The prospect or the occurrence of a crisis is deemed, in all areas of socio-economic life, as deepening the difficulties, disrupting social, economic and/or financial stability, or conflict outbreaks.

At organizational level a crisis generated by endogenous and exogenous influences. Endogenous causes dysfunction consist in the dysfunctions of their own internal control system, conflicts of

interest, the professional conduct of human resources, mismanagement and inadequate motivation system, situations that usually deepen the occupational stress. In terms of exogenous causes, a crisis is difficult to foresee, as it can be triggered by unexpected causes, from political environment to unconventional wars or natural disasters.

A crisis can cause various effects upon organizations, from financial losses to underperformance, lack of productivity, loss of market position and even loss of image. Whatever the cause, exogenous or endogenous, crises entail changes in the conduct of economic and social actors, changes in the attitude of managers, entrepreneurs and consumers. Each participant in the economic life is affected and therefore reacts, according to one's own set of values and knowledge. In these circumstances, organizational stress is high, managers' motivation is difficult to attain, and the human resources are concerned with the insecurity, rather than organizational performance.

When a crisis occurs, the human resources have to bear the higher demands - physically and mentally-, which translates into high levels of stress. Due to stress and/or crisis members of the organization will react, depending on personality and education, in two different ways, namely:

- They will involve actively in the activity of the organization, reacting to the state of uncertainty and insecurity of work. A recent study conducted by researchers at the *Finnish Institute of Occupational Health* points out that the intensive activity of the human resources generates higher negative effects for long-term organization and its members. With a sample of 2214 subjects, the researchers of the above mentioned institute highlighted that those who work more than 50 hours per week face a higher risk as regards the brain functioning¹³⁶². Such a attitude leads to concentration problems and a poor quality in performing the tasks.
- They will develop/ amplify a feeling of insecurity and uncertainty, reaching high levels of occupational stress.

Thus, in times of crisis, when it is difficult to make the best choice, the manager's professionalism is paramount for raising the awareness and total involvement of the employees in the organization, with a view to obtaining excellence and avoiding organizational ineffectiveness. The manager has to train and motivate the human resources, with low costs, as the organization's expenses cuts, so specific for periods of crisis, affect, usually, "the *most valuable asset of the organization*" as well.

Analyzing the pyramid of needs developed by Maslow, one can notice that, in times of crisis, the needs of the employees are negatively affected, which eventually influences on to professional performances.

Table 2 – The hierarchy of the needs of the individual and their implications in crisis situations

<i>Motivational levels according to Maslow</i>	<i>Aspects affecting human resources motivation during crisis</i>
Self-actualization	- Lack of an efficient management of human resources, generated by the managerial orientation exclusively towards the economic and financial aspects of the organization.
Esteem	- Reduction of market positioning of the organization. - Organization image loss.
Social needs	- Social needs are not directly affected by the crisis.

¹³⁶² Virtanen Marianna, Singh - Manoux Archana, Ferrie Jane, Gimeno David, Marmot Michael, Elovainio Marko, Jokela Markus, Vahtera Jussi, Kivimäki Mika, *Long working hours may be a risk factor for decline in cognitive function*, American Journal of International Epidemiology, vol. 169, no. 5, pp. 596 - 605, 2009.

	- During a crisis, they may be exploited by providing a relative autonomy in decision making and work teams control.
Security	- Lack of job security. - Reducing employee health costs. - Failure to ensure salary growth according to the inflation rate.
Biological needs	- Salary losses. - Reducing/terminating financial rewards.

Regarding to the staff expenses policies, if possible, in times of crisis, as well as in situations of decreased performance, in terms of to maintain the salaries, rather that cut them, as a system characterized by decrease and steps back would lead to a decrease in the employees motivation and will entail irreversible process in the organizational performance. In times o crisis, the psychological incentives are recommended, as they increase the interest for career and the employees' commitment to the organization. Also, an alternative/complementary motivation policy determines a complex balance that has infinitely more nuances than the mere salary policies. The Employee Recognition and the feedback on performance achieved require very small costs, as it depends more on the creativity and openness of the decision makers, with considerable impact in terms of motivation. In times of crises, the advantage will belong to the organization which has implemented a motivation system which is not centered on salaries, and generalized it throughout the organization, transforming it into tradition. An organization that has a motivation system focused on psychological aspects will have a greater cohesion among employees, will avoid the organizational stress and, in term of employee's attitude, will easily overcome a crisis.

Professional performance in crisis situations can be achieved by using two types of strategies aimed at influencing the human resources:

1. Direct Influence - the strategy refers to direct interaction between managers and human resources that has to be motivated. The effectiveness of this type of strategy depends on the employee's set of values and on the manager's values as well. Thus, young employees will be oriented towards meeting basic needs, while employees will be oriented towards meeting the superior needs. Depending on the scale of the crisis, manager may choose to implement a series of incentives for the human resources:

- A training course chosen by the employee or organization.
- Purchase of books or tickets to an event from the organization's fund.
- Taking over part of the employee's tasks for a short period of time (a day).
- Offering a meaningful gift for the employee, etc.

Such methods do not require high costs, have a positive effect if the employee's needs have been properly assessed; it requires more than managerial creativity. Furthermore, such method reduces organizational stress, as it makes the human resources more emphatic with the management decisions.

2. Situational adaptation - adaptation strategy refers to the adaptation of human resources to the working climate, so as to influence situations within the organization. Specific methods mentioned strategy consists of:

- *Feedback*, recognition of merit, providing useful information to employees and achieving an effective vertical and horizontal communications.
- *Management by objectives*, participation of the employees in planning, setting goals and decision making within the organization.
- *Competition*, determining the desire to win the competition by placing several employees and/or departments in competition.

The incentives and bonuses are the easiest method of motivation, but in times of crisis, the manager's ability to work with people and influence human resources is paramount to success. In

addition these additional payments are used by employees to meet higher needs; in times of crisis, it is recommended that these needs are be satisfied with lower costs by the organization's manager. Thus, a crisis means, for the manager, an assessment of his own abilities and success/failure of the organization is the result of the test.

THE CULTURE OF ROMANIAN ORGANIZATION: THE DIAGNOSIS OF THE REMANING MENTALITIES

Pandelică Ionuț

AGORA Univestity of Oradea

Pandelică Amalia

University of Pitesti

Faculty of Economics

Jianu Eugenia

After 20 years of transition, the culture of Romanian companies is still dominated by some remaining block culture mentalities proper to Eastern and Central European countries. Although, from a technical point of view the transition may be regarded as an ended process, it is certain that there is still a communist inheritance strongly integrated in this culture in series of remaining mentalities. Such mentalities are to be found in the culture of Romanian companies framed into a vicious circle of inertia representing significant change resisting structures. Thus, this paper displays the results of a pilot study meant to establish the diagnosis of the dominant values of Romanian companies' culture. The results reveal the fact that although some reminiscences of the communist period are still integrated in the culture of Romanian companies some of those mentalities have been overcome.

Key words: organizational culture, block culture, remaining mentalities

JEL Code: M12, M14

Introduction

Within the transition toward a competitive market, the capacity of Romanian firms to initiate internal changes and to cope with the external ones that is their adaptation capacity is conditioned mainly by some old mentalities of block culture characteristic to Eastern and Central European countries. Block culture represent that cultural fund common to all Central and Eastern European countries, acquired in over 40 years of command economy regime. It practically synthesizes the entire range of cultural remains of a 40-year experience, being a drawback to effective change, an impediment to the reforming process. This occurred, as Sztompka (1994) stated, as a result of old socialist regimes intention to forcefully modernize the society but still preserving traditional elements. The existence of such a culture, with all specific features, was highlighted by the empirical results of some researches made on different capitalized and evolutive components of transition societies (Bakacsi and Takacs, 1997; Karacsonyi, 2006; Taarniczky, 2006).

In the 80s, most communist countries began their reforms. In Romania, the situation was a little different considering that 1989 was the year when Ceasescu was removed and the communist regime ended. The uniqueness of the Romanian case could be more evident if we mention also: (1) the aggressive anti-abortion policy stated by Ceausescu in 1965 and operated until 1989, (2) the rationing of some basic goods, (3) the higher level of communicative isolation of people in Romania as compared to other communist countries (Romania being the only one without a capitalist neighbor). Since 1990, Romania involved into a series of deep reforms of economic systems, institutions, economic processes, individual fundamental attitudes and concepts. According to Scarlat and Scarlat (2007), Romania experienced three major distinctive levels in her way towards a free market economy: (1). 1990-1997: this level represented the period in which the socialist model was abandoned and free market economy principles were adopted. This period was characterized by high transition social costs such as: a dramatical lowering of living standard, a high unemployment rate due to the fact that many state enterprises were closed; high

inflation and a low exchange rate for the national currency; (2) 1998-2001: represented the period when liberalization and privatization reforms were accelerated and policies for economic increase were adopted. This stage was dominated by a series of structural reforms and austerity policies; (3). 2002-2005: In the above-mentioned authors' opinion, this stage marks the end of the transition period in Romania. According to EU Country Report, the transition period for a country ends when the economic system of the respective country reaches the level of a functional market economy. Thus, in 2003, the European Commission, stated in the report: "Romania may be rated as a functional market economy considering the progress made and the continuation of these progresses." At the same time, this period was marked by the reformation efforts in order to accomplish the requirements for integration in EU. On 1st January 2007, Romania became full member of the EU.

Although from a technical point of view, transition in Romania may be considered accomplished, it is certain that Romania must also overcome the communist inheritance and some remains of mentality that are still deeply integrated in her culture. Thus, in spite of all reforming progresses in the last 20 years, the remains of the communist past have not disappeared completely, yet. They are to be found in the culture of Romanian companies being strong resistance structures against change that frame them into a vicious circle of inertia and affect their competitiveness and performances. For example, the fear for the superior or the spur to hide mistakes is still common realities in Romanian companies. That is why, the efforts of Romanian managers to change the organizational culture should be a priority. Romanian companies should break the vicious circle of inertia and involve into a genuine process of change for increasing competitiveness and performances. Although, low performances should represent a major force in considering the change steps as Hill and Hull (2004) point out, in fact it rarely happens that such performances represent a reason for unleashing the process. The authors above mentioned, empirically proved that usually the organization needs external events in order to break the vicious circle of inertia. Taking into account that nowadays Romanian companies are a part of the global hyper-competition and considering the unprecedented dynamics of changes that alter the business environment, the need for a change becomes an essential condition of survival for companies. But organizational change should not represent a mere effect of restructuring and reforming. This change cannot be effective and efficient as long as it remains clustered to some strictly structural factors such as: changing property, technology or organizational structure. A change that disconsiders the organizational culture may be formal and very often blocked and obstructed by a series of factors that belong to the way and manner of structuring and understanding the formal and informal relations within the organization. Behavior and attitude patterns developed during a certain period within an organization are not only difficult to change, because of their inertia, but practically represent the most important and difficult to change structures.

In the context above described, the main question of our research was: At what extent the culture of Romanian companies is still dominated by some remaining communist economy mentalities and how many of them have been overcome?"

Research Methodology

The diagnosis analysis focused on three major directions: (1) the assessment of perceptions about fundamental values of market economy vs. remaining block culture mentalities; (2) the assessment of perceptions regarding key values of organizational culture; (3) the assessment of perceptions over the organization itself. The questionnaire was subdivided into three groups of questions according to the directions of diagnosis analysis settled, containing 21 close questions with 3 multiple choice questions.

In order to constitute the sample, 15 Romanian companies were selected according to the size (number of employees). Only 11 companies contacted – out of the 15 initially selected - accepted the poll; thus the answering rate was of 73,3%. The 11 companies were grouped according to
