their size as follows: (1) one big company with over 250 employees, (2) seven middle-sized companies having between 50 and 249 employees; (3) three small companies having a number of employees between 10 and 49. These cover fields of activity ranging from processing industries (6), constructions (3), trade (1), and services (1). The turnover had a significant variability which represented an important asset for representativeness. A particular case is the fact that all companies had a profit or were even in 2008. The general profit rate (gross profit/ turnover) varied between 0 and + 9,7 with a consolidated value of 3,8%.

The 11 companies constituted the basis of the employees' sample, 881 were subordinates and 124 managers (top management and middle management) out of 1005 enquired persons. Out of 881 subordinates 14,67% ranged from 20 to 25 years old, 68,48% ranged from 26 to 45 years old and 16,85% ranged from 46 to 65. Out of 124 managers, 3,23% were aged between 20 and 25, 80,64% between 26 to 40 and 16,13% between 41 to 65. The sample structure according to age displays the structure of active population in Romania on age groups as well as the three generation-structure of active population taking as referential the year 1990: **the young generation** that was born in either the last years of the communist regime or in the first years after the fall of the communism. This generation has an innovative thinking, is very open to change yet has a low commitment to the organization; **the middle generation** encompasses the individuals that experienced both before-and-after-communism periods and are called "the children of transition", "fighters", or "survivors". "The survivors" prove a high degree of commitment to the organization and are open to change; **the old generation** is professionally trained during communism. Although the representatives of this group prove a high degree of commitment to the organization they are reluctant to changes.

The analysis and interpretation of the results

There are differences between managers' and subordinates' opinions regarding the manner in which the management took their vote. The employees that took part in voting the management were 55,4% subordinates and 38,7% managers; this confirms the inertia regarding the specificity of system changing in Romania. Its feature is that the employees vote for the management similar to the 1990s procedure which had negative results on the performances of Romanian enterprises through changing target function from maximizing economic efficiency to job protection and salary increase. One can notice that employees' vote for the managers is perceived as a way of controlling the future personnel. But this perception is unrealistic and it proves a serious change resistance source. At the same time, for both the subordinates and some managers it is not very clear the status of the owner who has the right to decide about the enterprises whose main shareholder is.

A high percentage of employees (71,1%) and of managers (58,1%) expressed in favor of protectionism stating that Romanian companies should be protected by the state against foreign competition in spite the fact that they think their own company can cope with this competition (50% subordinates, 74,2% managers). This apparent paradox may be explained by the remaining mentality according to which the state should interfere with companies' activities but also by the lack of information about the basics of free competition. On the other hand, the options of the enquired employees demonstrate the resistance to liberalization of trade which is a feature of the ex-communist countries.

At a social level there is an option for fair economic efficiency and competence criteria disfavoring the social egalitarianism. Regarding the salary differentiation, the results of the research showed that the enquired employees are willing to accept salary differences no matter how big according to individual performances, which implies that they reject the principled egalitarianism. From this point of view the research reveals that there are no remaining mentalities about equal salaries. After 20 years of egalitarianism, the idea of differentiation according to competences won.

The issue of job protection so sharp a few years ago, has now split. We can state that there is a de-radicalization of counter-reforming tendency, in which economic efficiency is sacrificed no matter how, for the job safety as it happened during the 1990s. When enquired if inefficient jobs should be saved only to prevent idling, only a minority (9,7% managers and 23,4% subordinates) answered “yes” in a categorical manner. After 20 years of transition, the remains of this mentality seem to vanish.

As to the delimitation between political and economic aspects, the enquired employees give a bigger importance to relationships that the management of the enterprise has with political environment (59,8% employees and 67,2% managers). This demonstrates that there is no clear delimitation between political and economic environment.

The quasi-unanimous opinion is that the success of a company depends on the way of managing it. . About the management of the organization, the preference is for a strong hand (63% subordinates and 83,9% managers). The option for a strong hand disfavoring employees’ active implication in decision-making process seems to be a consequence of employees’ lack of trust in democratic-participative mechanisms. The cause of this lack of trust lies on the idea that democratic institutionalized mechanisms work rather chaotically. Thus, this type of strong hand management seems to be the guarantee for a strategic coherence according to enquired subjects. Ready to act in group and to receive orders to execute, the subordinates but some managers, too, find it difficult to have initiative or creativity being thus, inhibited. This is in accordance with Romanian culture perception that power means distance.

With a view to criteria that should be used for salary differentiation there are different opinions of subordinates and managers. Managers state that the main criteria that should count are: the outcomes of the work (100%), competence and qualification (93,6%), position within the organization pyramid (51,6%). The subordinates state the following criteria for salary differentiation: competence and qualification (78,8%), outcomes of the work (76,1%) and number of work hours (60,3%). We have to notice that seniority, in general and length in service within the organization are the less important criteria for salary differentiation. This shows the choice for modern values compared to traditional values such as seniority. As to the criteria for choosing a job, the most important are those connected to work satisfaction and rewarding salary (in a reverse order for employees). We can notice that work safety is on the 3rd place for the subordinates and on the 4th for managers. This leads to the idea that job mobility concept won against the “I get hired and retired on the same job” concept. We can notice that the visibility of the company is not an important criterion in choosing a certain job.

Regarding the desirable attitude and behavior patterns of managers, according to the enquired subjects, the main qualities of a good manager should be competence and professionalism (86,4% subordinates and 96,8% managers). For both subordinates and managers the first three options comprise manager’s interest to solve employees’ problems (62,2% and 51,6% managers). The subordinates have also included employees’ motivation in the first three options while the managers rated it on the 4th position their 3rd option being decision-making. Thus, a rather modern value-focused orientation relying on competence and efficiency criteria is also noticed in appreciating the qualities a manager should have. As to the manner in which instructions must be followed there is a significant difference of perception between managers and subordinates. Managers are inclined to a formal task execution (54,8%) while the subordinates are inclined to an informal approach (68,7%) focusing more on a correct understanding of the decision. This demonstrates that orders-are-not-discussed-but-executed mentalities are overcome.

When asked “if your company didn’t have a retail market share or registered big losses” the enquired subjects rejected the idea of shutting down the company suggesting the reorganization of the activity. Should the company register big losses, the enquired subjects suggested first of all, to change the managers (51,61%) and after that reorganization of the activity (41, 94%). Only 3% of the enquired subjects think that the company should be closed in the first situation and 6,45% in the second situation.

The perception of the enquired subjects about the general situation of the company they work for is mostly favorable (63% subordinates and 77,4% managers) in accordance with reality as the companies included in the sample are profitable.

The answers of the subjects to the three questions concerning the organizational environment are convergent. Thus, managers and subordinates equally think that they have co-operation relations with the management of the company, conflict occurrence is reduced and team environment is pleasant or acceptable. Both managers and subordinates, with minimum disparities, mainly appreciate professionalism, correctitude and organizational capacity of their superiors.

According to the results, the level of communication within the company is differently perceived by managers and subordinates. Managers state that they are informed on a great extent, about the strategy of the company (87%) and the current problems of the company (93%). On the other hand, only 51,6% of the subordinates are informed about the strategy and 40,2% about the current problems. This difference in communication on the two levels is typical for all companies of the sample. This reveals a low communication degree inside the organization. From here we can see a median position of the companies enquired about the organizational culture dimension provided by the strict control vs. weak control.

Conclusions

The “communist legacy” is an expression used frequently after 1989 by Romanian governments when explaining their failure in improving the economic and social situation of the nation. Beyond the expression, there is an empirical reality with important consequences upon the transition period. After 20 years of transition, the culture of Romanian companies is still dominated by some remaining mentalities of block culture featuring the Central and Eastern European transition economies. These mentalities generate inertia and affect competitiveness and performance of Romanian companies considering that organizational culture represent the foundation to build a business strategy on. The adjustment of organizational culture to corporate strategy is an essential condition to achieve the competitive advantage. Although Romanian economy works according to market economy principles, values and mechanisms, our research emphasizes that at present, considering the employees’ values and attitudes, we can identify, on the one hand, modern values strongly associated with reforms and changes and on the other hand, values pertaining to a slowing-down reforming process mentality.

The conclusions of the study confirm what a well-known Romanian economic analyst, Silviu Brucan, stated in 1990, namely that Romania needed 20 years in order to learn market economy values. If in 1990 his affirmations seemed very pessimistic, after 20 years of transition we can say that they were realistic maybe even a little optimistic.

We believe that investing in the development of human resources is the most important direction for Romanian companies to act in order to overcome the remaining communist mentalities during the change of organizational culture. This is to be done by changing the mentality according to which the labor force is a cost with that according to which the labor force is an investment. Such investments should focus on the development of managerial education and the training of an efficient and productive labor force.

The limits of the research and future research directions

The limits of the research derive, first of all, from the fact that the dimensions of the sample of companies were too small in order to consider the results of the research relevant for all population of Romanian companies. Therefore, we intend to extend this research to a bigger number of companies. We would also like to repeat the research (longitudinal research) in order to supervise the evolution of remaining mentalities identified during time.

Drăghici Monica

Raiffeisen Bank Romania

This study investigates the climate change discourse as this is a highly debated topic nowadays. A case study is revealed in this paper, which consists of applying the critical discourse analysis method at Raiffeisen Bank, one of the most important international banks. The findings of this study disclose that misleading messages are construed in climate change discourse by using some persuasion means in order to support the statement of the discourse. The study was conducted by combining a wide variety of sources, such as articles, strategies, and reports.

Keywords: climate change, discourse analysis, Raiffeisen Bank

JEL Classification: M10, M14, M16.

1. Introduction

Actions for both adapting and mitigating climate change are fewer and smaller than it is necessary, may be because climate change cannot be perceived directly and the reaction to it depends on how it is communicated. Climate change could be seen as physical process (non-discursive), as well as rhetoric (discourse) of different stakeholders. The aim of this paper is to reveal the issues on which climate change debate is focused, as well as the discourse of Raiffeisen Bank in this area.

2. Background

Climate change is a strongly debated subject, but the debate was not always focused on the same issue. Firstly, the focus was on the process itself – does or does not happening, then it shifted to the human agency, and now it is about the consequences and actions needed. Thus, Crist (2007) suggests that since climate change is now a fact, it is worth focusing more on consequences where uncertainty is legion.

Climate change is beyond its physical dimension an invitation for action. Firstly, by assuming that humans are the causes, and not a natural process beyond their power and will, it results that they has to be the ones who do something to prevent the process. Secondly, if a change takes place in the environment humans will need to adapt to it. These also could be considered as reaction stages. Thus, Huq (2006) argue that two and a half decades ago the focus was on preventing climate change through mitigating emissions, while now adaptation has to be twined with mitigation, because some effects of climate are inevitable.

The scientific debate is not entirely settled (since the “climate consensus” was already criticized by Corcoran in 2006), but it has gave a consistent explanation of the processes and also provided indications on what is to be done. In addition, climate change information is now a mighty flow that reaches far in society.

Despite these premises, appropriate action is lagged, a strong emphasis being on the need to be more active. Since developed countries already have a climate policy, there is a global market for greenhouse gas emissions, renewable energies have stronger support as ever, businesses disclose

their contribution to climate change mitigation we could say that society is already active. Thus, the issue is not to be active, but to be more active. What more active means could be approximated by looking to the gap between what is needed and what is achieved. Research done in this respect has revealed that the difference between active and more active is huge.

What prevent an appropriate reaction to climate science's findings is therefore considered an issue of communication and is researched as such using semiotics and discourse analysis. Some of the outcomes are contradictory. Gare (2007) explores the semiotics of global warming and finds that market, as a field defined by Bordieu, has overlapped all facet of life and this transferred the debate to individuals or institutions that do not have the expertise needed to handle it. Therefore, the blend of climate change messages that often contradict themselves is not convincing enough to change behaviour. Discourse analysis of climate change related articles, web pages and ads in the United Kingdom has brought Ereaut and Segnit (2006) to the conclusion that climate change discourse "looks confusing, contradictory and chaotic". Nevertheless, solutions are viewed differently. Gare (2007) considers that in order to have more meaningful climate change messages it is necessary to restrain market's field by heavily taxing advertising. Thus transnational corporations will have less power to corrupt semiotics through rhetoric that undermines people's capacity to think rationally. Ereaut and Segnit (2006) consider that the most effective way of stimulating climate-friendly behaviour is to treat this activity as a brand to be sold, thus expanding again market's field.

3. Raiffeisen Bank's climate change rhetoric

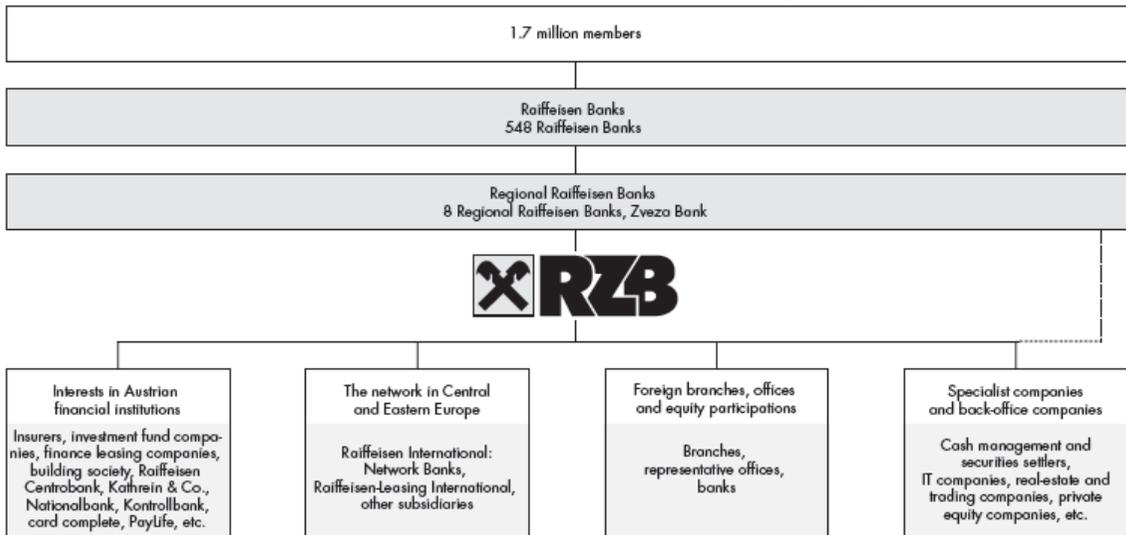

The **Austrian Raiffeisen Banking Group** dates back to the year 1886 when the first local, cooperative Raiffeisenbank was founded in Mühldorf in Lower Austria. 10 years later there were already as many as 600 savings and loan banks operating according to the Raiffeisen system in Austria. From 1894 on these individual cooperatives founded Regional Raiffeisen Banks (Raiffeisen Landesbanken; the first one was founded in Tyrol) with the primary purpose of liquidity equalisation. Finally, Raiffeisen Zentralbank (RZB) was founded for the same reason (equalisation of liquidity for Raiffeisen Regional Banks) in 1927 as Genossenschaftliche Zentralbank (GZB) and was renamed in 1989. Today, Austria's Raiffeisen Banking Group has the largest retail banking network and a market share of approximately one quarter of the domestic banking business (RZB, 2010a). The structure of the Austrian Raiffeisen Banking Group is highlighted in Figure 1. The Raiffeisen Banking Group is Austria's market leading banking group with EUR 260.2bn of total assets as at 31.12.2009. Its principal focuses in the financing field are retail customers as well as small and medium-sized enterprises. It employs around 85,000 people around the world (RZB, 2010a).

Raiffeisen Zentralbank Österreich AG (RZB) was founded in 1927 and is the central institution of the Austrian Raiffeisen Banking Group (RBG) and the core company of the RZB Group. With a balance sheet total of € 147,9 billion as of 31 December 2009, Raiffeisen Zentralbank Österreich AG (RZB) is the third-largest bank in Austria and one of the country's leading commercial and investment banks (RZB, 2010b; RZB 2010d).

Raiffeisen International is a fully-consolidated subsidiary of Raiffeisen Zentralbank Österreich AG (RZB). RZB owns about 70 per cent of the common stock, the balance is free-float. The shares are traded on the Vienna Stock Exchange. Starting already in 1987 by founding what is today Raiffeisen Bank Hungary, Raiffeisen International has consistently entered growth markets and expanded its regional and local presence (Figure 2). Recent examples are the acquisitions of banks in Kosovo, Belarus, Albania and Ukraine in 2002 through 2005. In January 2006, Raiffeisen International acquired 100 per cent of Russian Impexbank. In July 2006, it purchased Czech eBanka. Both banks were integrated into the network by merging them with the existing local Raiffeisenbanks. As of year-end 2009, Raiffeisen International managed subsidiary banks, leasing companies and a number of other financial service providers in 17 markets of the region. 56,500 employees served more than 15 million customers in around 3,000 business outlets. This

presence provides Raiffeisen International with the most extensive and closely-knit distribution network of the international banking groups active in the region (Raiffeisen Zentralbank Österreich AG, 2009; RZB, 2010c).

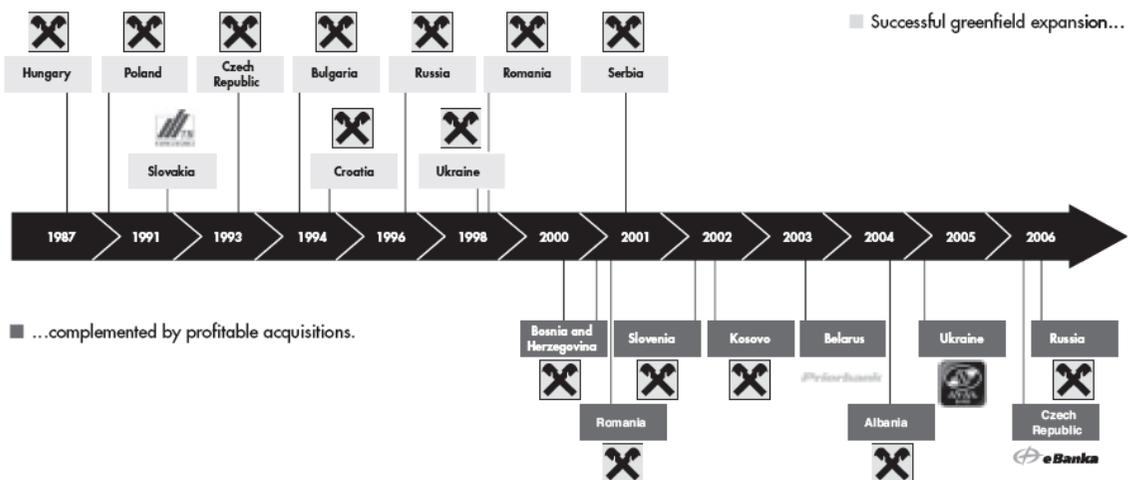

Figure 1 Structure of the Raiffeisen Banking Group

(Source: Raiffeisen Zentralbank Österreich AG, 2009b: 25)

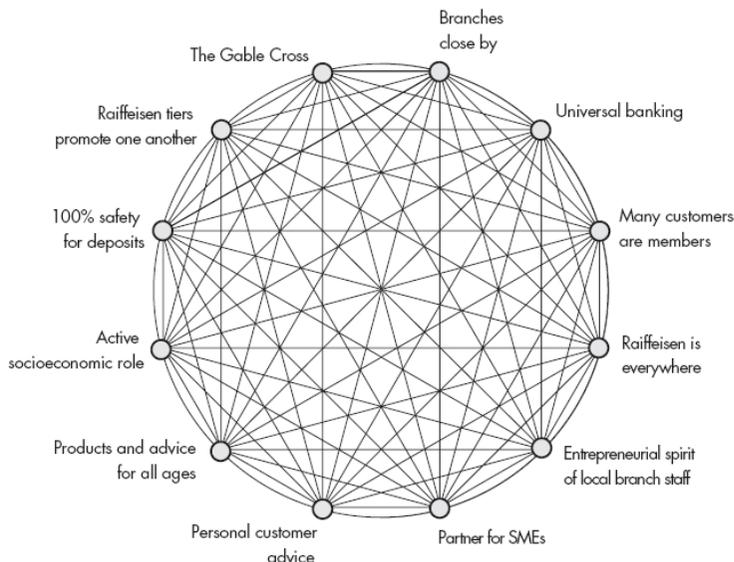

The “DNA” of the Raiffeisen brand consists of 12 success factors (Figure 3): (1) branches close by; (2) universal banking; (3) many customers are members; (4) Raiffeisen is everywhere; (5) entrepreneurial spirit of local branch staff; (6) partner for SMEs; (7) personal customer advice; (8) products and advice for all ages; (9) active socioeconomic role; (10) 100% safety for deposits; (11) Raiffeisen tiers promote one another; and (12) The Gable Cross, meaning the time-hallowed symbol of safety for Raiffeisen’s owners, customers and employees (Raiffeisen Zentralbank Österreich AG, 2009b: 26-27).

RZB addresses climate change in its Corporate Responsibility Report 2007/08 issued in March 2009, and also in its Corporate Responsibility Report 2008 issued in July 2009. The structure of these reports is based on five “guiding principles” of RZB, separate chapters being devoted to each of these principles, preceded by an overview of the company’s values: (1) “who we are”; (2) “a future always needs a past”; (3) “we are here to stay”; (4) “our clients’ success defines our own success”; (5) “the best become better with us”; and (6) “a strong cultural mix”.

The first chapter of the reports entitled “Who we are” firstly presents the RZB Group and afterwards addresses the corporate responsibility in the RZB Group. The authors of the reports are emphasising the idea that the company is “committed to protecting the environment – especially against climate change; upholding human rights; fighting corruption; and contributing to the stable economic development of the regions where we operate” (Raiffeisen Zentralbank Österreich AG, 2009a: 15). In addition, the authors are using a diagram (Figure 4) and are citing Simon Zadek’s model of the various stages of corporate social responsibility in order to demonstrate that corporate responsibility is a core component of RZB’s culture.

Figure 4 Stages of corporate social responsibility and RZB’s achievement

(Source: Raiffeisen Zentralbank Österreich AG, 2009a: 16)

In the end of this first chapter the authors put emphasis on the five above mentioned principles and briefly explain each of these principles that are detailed in the following chapters.

Even though the report issued in March 2009 comprises 80 pages, and the one issued in July 2009 comprises 70 pages, both reports address climate change in only one page (subchapter 3.4 “Raiffeisen Climate Initiative”. This may be surprising having in mind that the first guiding principle of Raiffeisen, declared by the authors, is “protecting the environment – especially against climate change”. However, the authors are tangentially referring to climate change in other chapters (for instance subchapter 4.2 “Consideration of environmental and social factors”), trying to convince the reader that Raiffeisen is actively involved in solving the problem of climate change.

The Raiffeisen Climate Initiative (Raiffeisen-Klimaschutz-Initiative), as it is explained in the report, “brings together all the activities planned and implemented by Raiffeisen organisations relating to sustainability, climate change, energy efficiency and renewable resources. Its purpose is to exploit synergies, make a significant contribution to combating climate change and raise public awareness of the problem” (Raiffeisen Zentralbank Österreich AG, 2009a: 78). This climate protection was called into being in November 2007. “The goals of the *Raiffeisen* climate protection initiative are to take suitable action capable of making a significant contribution to climate protection; to create the prerequisites that will enable the members of the association to make the greatest possible use of potential synergies in the climate protection field; and to promote public awareness of the need for sustainability, climate protection, energy efficiency and renewable resources” (Ecker-Nakamura, 2008: 67-68).

The reasoning begins with the claim that RZB itself “makes a significant contribution to combating global warming”. The main ideas, actions and facts described afterwards signify reasons in support of the claim. The second paragraph starts with the declaration that “RZB sets a good example on climate change”, and some examples are given in support of this statement, such as: internal energy saving days at Raiffeisen; employees are informed about how to save energy outside work (based on the principle that “climate protection begins at home”); exhibitors provide comprehensive advice. The third and fourth paragraphs are also trying to demonstrate that RZB is actively involved in solving the problem of climate change. Other examples are given, and figures are used in support of the main claim (“limiting the average CO₂ emissions of new company cars to 150 g/km”).

Furthermore, after “guiding” the reader to believe what the authors want him/her to believe some objectives and actions are highlighted in both reports. This is the part where the authors are trying to persuade that Raiffeisen has an important role in protecting the environment. However, it is to mention that the goals of “10% reduction in energy consumption at the headquarters building by the end of 2010” and “effective use of donations in response to regional social challenges” appear only in the report issued in March 2009, and they are not stated in the report issued in July 2009. Therefore, we may assume that these two goals have been achieved from March to July of 2009, or they are no longer important for the company. In addition, the actions planned in 2009 identically appear in both reports and these are: (1) helping employees to help: time off for employees to act as volunteer helpers after natural disasters or accidents; (2) training focus on corruption prevention: increased inclusion of corruption prevention in employee training courses; (3) internal environmental actions: implementation as part of the Raiffeisen Climate Initiative; (4) European Energy Service Initiative: planned entry of the RZB headquarters building for the European Energy Service Award; (5) solar energy: installation of PV arrays and solar collectors at the headquarters building; and (6) environmental indicator system: improvements to the RZB Group environmental reporting system.

The authors of the reports claim in subchapter 4.2 (named “Consideration of environmental and social factors”), that the loans are evaluated by focusing on environmental impacts. They even mention that “in one instance the review resulted in the rejection of a loan application”. This way they are suggesting that the environmental impacts are more important for the company than its own profit. Also, the authors mention the company’s “highly specialised teams of advisers on renewable and conventional energy sources”, and the fact that the company financed small

climate change and environmental protection projects, including solar energy equipment. In addition, some figures, pictures (for instance a Bulgarian wind farm financed by Raiffeisen-Leasing International Ges.m.b.H.) and examples are used in order to sustain the claim that the company is sustaining and promoting environmentally friendly projects.

4. Conclusions

Climate change debate has undergone several stages and now it settled on the need for more action. The delay in acting is explained by several studies which are focusing on communication and which reveal that climate change messages come from many sources and crush in an inconclusive and endless public debate. The messages construed by an important climate change stakeholder, Raiffeisen Bank, could be evaluated as misleading since they use truncated or distorted information, and construe immutable facts and goods that justify both uncertainty and slowness in action. On the other hand, this company invests a lot in “greening” its image and preparing its future role as an environmentally friendly company.

ANALYSIS OF HUMAN RESOURCES MANAGEMENT

Popa-Lala Ion

West University, Faculty of Economics and Business Administration

Aniș Cecilia – Nicoleta

West University, Faculty of Economics and Business Administration

Along with other material, financial resources, human resource is an indispensable element of each work process. The concept of human resource derives exactly from the fact that it has a limited nature and it is consumed by usage in the workplace.

Any work process cannot be developed without the labour factor. Work is essentially a conscious activity specific to humans through which they release certain labour objects and transforms them according to his needs.

Keywords: human resources, analysis, indicators, labor profitability.

JEL classification: M, M2, M21.

1. Introduction

During work, the man highlights his physical and intellectual capacities, that is workforce.

The analysis of how human resources are managed in an enterprise follows the next issues:

- ensuring the human resources analysis;
- using (extensive and intensive) the existing human resources at the enterprise level analysis;
- the effects of insurance and human resource use.

2. Ensuring the human resources analysis

Ensuring the human resources analysis has the following priority objectives:

- provides quantitative human resources
- ensures the human resource in the units
- analysis in terms of human resource skills;
- term insurance with human resources.

2.1. Providing quantitative human resources at a company level analysis

Setting up a strategy for the development, the continuous deployment of work process involves knowing the human potential in quantitative terms.

Its size, the classification, its co-interest must be consistent with the output produced, the technological potential the company disposes of. Managerial attributes are met when one knows, after the analysis, the human resource available, and could thus make decisions on hiring, restructuring or reducing staff.

Human resources available in an enterprise can be characterized by the following indicators:

1. Number of employees at a time - is the number of employees and is aimed at the beginning and at the end of management period.

This indicator includes all the employees with individual employment contract (indefinite or fixed) at a time, people who worked and those who have not worked, being on sick leave, maternity leave for childcare, holidays, leave without pay. Such an indicator highlights the whole human potential, but does not show its usability.

2. Number of employees at some point – it has the same information content as the number of employees at a time, but this indicator relates to both employees and contract personnel service, collaboration, agreements, being greater in size than the number of employees at a time.

3. *Average number of employees* - this indicator is calculated as a result of the existence of the movement of staff phenomenon (personnel entries and exits) and is considered as an indicator of the flow of personnel;

Average number of employees is calculated as a simple arithmetic medium of the daily employees livestock and it can be done daily, monthly, quarterly and annually.

4. *Average number of staff* – it is calculated as the simple arithmetic medium of the daily personnel livestock.

5. *The maximum allowable number of staff* - is the upper limit of the number of staff and it is determined having given the volume of activity and the average labour productivity, being noted down in the budget revenue and expenditure costs of undertaking.

Sizing the human resources shall be based on the production and labour standards. Labour standards are currently set by each company based on technical equipment, measurement, timing of the human resources, etc, these rules may be:

- of time;
- of production.

2.2. Ensuring the human resources in the units analysis

Such an analysis is necessary to highlight certain features of the workforce in an organization. Conformation of an optimal proportion between operational staff and the inoperative one represents a condition for an efficient activity. Grouping people to study and discover the causes which led to inefficient use is essential.

Depending on the purpose, the structure analysis is performed using several grouping criteria:

1. *according to the role occupied in the production activities we distinguish:*

a. workers:

- directly productive
- indirectly productive;

b. technical staff: - economic, engineers, sub engineers;

c. economic trained personnel;

d. technical management staff: foremen, technicians;

e. management and administrative staff;

f. general service personnel: service, security, firemen.

Such an analysis, in relation to the personnel occupation highlights the personnel needs of qualifications, of employment or dismissal.

2. *by age:*

- a. under 25 years;
- b. between 26-35 years;
- c. between 36-45 years;
- d. between 46-55 years;
- e. over 55 years.

3. *by seniority in the enterprise:*

- this criterion aims the existence of a balance between experience and maturity of the elderly and the enthusiasm and initiative of the young. One can watch from seniority intervals from - 5 years, 5-10 years, 10-15 years etc., or selected age groups with a spacing of 5 to 10 years.

4. *by sex:*

- a. male;
- b. female,

5. *according to training:*

- a. workers (skilled, unskilled);
- b. professional staff (with secondary or higher education);
- c. administrative technical staff (high school or higher);
- d. management staff.

6. according to business functions:

- a. research and development;
- b. production;
- c. marketing;
- d. staff;
- e. the accounts function.

Applying these criteria should not be a rigid, but flexible depending on the purpose and could also be found other classification criteria and applying the above criteria according to different levels of the human setup of the economic agents.

As a method of analysis it is used the total weight of each category of staff (rates structure) method.

2.3. Analysis in terms of human resources qualification

Workforce (human resources) is analyzed in dynamic both in terms of volume and of structure, but also in terms of its classification, so a qualitative analysis of human resource.

By qualification, in a narrow meaning, we understand the acquiring in a certain period of time of a minimum level of knowledge and skills in a domain, a checked and accepted quality by a committee based on examination of the theoretical or practical evidence.

Specific indicators of quality human resource analysis are:

1. *Qualification weighted average (Km):* $K_m = \sum N_i \times k_i / \sum N_i$

where:

N_i = number of categories of skilled workers

K_i = skill category

If workers, these categories range from 1 to 7.

2. *Complexity of workers weighted average (Kt):* $K_t = \sum V_{li} \times K_i / \sum V_{li}$

V_{li} = Volume of work: in days /man, hours /man, standards/ man

K_i = category of complexity of the work (from 1 to 7).

Qualification is not a static size, it changes from one period to another, a change due, first, to the degree of complexity of the work that must be executed and on the other hand due to the technical progress. It is necessary to pursue the correlation of the qualification levels with the level of efficiency to determine the economic limit for qualifying expenditure growth. There are attempts in this regard, which correlates the indicators of skill increase with the economic efficiency growth indicators.

The deficiency of these indicators is that they issue from the assumption that the economic effects get the same proportion with the increase in skill level, in reality, economic efficiency growth is not only the result of the staff qualification, but of other direct factors of the nature of the setup and of the technical progress. The most commonly used indicator in this regard is the coefficient of elasticity which shows us how the efficiency indicators increase when change with a percentage of skill levels indicators takes place.

Qualitative aspect of workforce a trader disposes of is an important component in the functional companies organizational system, because, largely, the dimensioning of the volume of production and economic efficiency expressed in various forms (productivity, profit per employee, etc.) depend on its level. It is useful that the staff qualifications analysis to be done in "levels" according to the human organizational structure of societies. In this way, one can watch for:

- staff working in production units;
- average and higher wage staff from the functional departments;
- management and security personnel;
- management board personnel of the company (company management).

2.4. Term insurance with human resources analysis

Qualitative side of the workers related to ensuring the stability of personnel is an important

prerequisite in the efficient use of workforce.⁷⁴

Workforce mobility is actually given by the interference of two flux of staff, which develops at the economic agents level, namely:

- personnel input flux;
- personnel output flux.

Depending on the nature of causes that lead to the mobility of working personnel, the economic agents are facing in terms of two different phenomena:

- a. the labour movement is an enterprise staff movement during a period, both in terms of inputs and outputs for normal reasons: transfer, illness, retirement, death, disability;
- b. labour turnover is an abnormal phenomenon which refers to labour output in an enterprise without the management's approval, or termination, as a result of breaking of employment contract.

Labour mobility and stability analysis is achieved through specific indicators:

1. Indicators of labour mobility:

a. indicators of the labour movement:

a 1) average ratio of staff input (Ci) : $CI = I/Np$

where:

I = input

Np = average number of staff

Analysis of personnel entries must be made considering the employment and namely their source.

Sources of employment come from:

- a. labour-offices;
- b. vocational schools;
- c. high schools;
- d. post-secondary schools;
- e. higher education.

The principle that must underpin employment must be that of professional competence.

a 2) the average ratio of staff exits (Ce) : $Ce = E/Np$

where:

E = exit

Np = average number of staff

Within the staff output analysis there should be a clear distinction between natural leaves category and those with unjustified causes. For the second category, the implications of such a business phenomenon should be established.

a 3) Average ratio of total movement (Cm): $Cm = (I+E) / Np$

Where:

I + E = input + output

Np = average number of staff

b. indicators of labour turnover - staff turnover coefficient (Cf) : $Cf = En/Np$

where:

En = total personnel output of unjustified reasons

Np = average number of staff

The analysis based on these indicators is carried out dynamically from one period to another, for at least 3 to 5 years. Such an analysis highlights the increasing or decreasing trends of the phenomenon of personnel movement.

2. Indicators of workforce stability:

a. age in the same unit is calculated by the relationship : $Vt = \Sigma t / \Sigma T$

where:

Σt = seniority expressed in years of all staff in that unit;

ΣT = total seniority of each worker, expressed in years

The value of this coefficient in ideal conditions should be also 1.0, this value would indicate a perfect stability of the workforce. The more it deviates from 1 value, the lower employment stability, with unfavorable implications on business.

b. the average age in the same unit is calculated as a weighted arithmetic medium between seniority of workers in the unit and the number of employees having the same experience:

$$I_m = \frac{\sum N \times t}{\sum N}$$

Calculation of average age indicator in the same unit and its analysis should be made in dynamic to determine the trend. The values of this coefficient should be linked to the alleged economic and financial indices: production year, commodity production, turnover, added value.

3.Conclusions:

Practical work shows that the most common underlying causes of fluctuation are:

- dissatisfaction of employee- driven by causes more or less objective, from misunderstandings about the way of establishing entitlements;
- deficiencies in the work of organizing production and labour often lead to conflicts with the boss directly: deficiencies in planning workplace (facilities, equipment, supplies materials, lighting, ventilation, temperature, noise, danger, etc..) work schedule (shift work, overtime or holidays, granting leave, etc.), chiefs and colleagues attitudes ;
- poor working conditions with a higher degree of toxicity;
- psychosocial dissatisfaction: providing housing opportunities, proximity to home, transport desires and aspirations instability (lack of maturity, people change their work after various fads), unrealistic expectations prove
- profession complaints: a desire for better conditions in terms of the nature of the work(According to competence, to avoid monotony, opportunities for self-improvement), prospects for promotion.

Evidence shows that at least 50% of leaves are due to factors inside the enterprise, they can be directly influenced by foreman, head of department or co-workers by following a few rules:

- the permanent knowledge of members of a group and their behaviour in and outside the enterprise;
- training and fostering team spirit and creating an appropriate work environment;
- open and direct approach of problems which leads to the desire of changing jobs;
- particular attention given to newcomers in the band, regarding their group integration.

Academy of Economic Studies Bucharest, Faculty of Management

Ciocârlan-Chitucea Alina

Academy of Economic Studies Bucharest, Faculty of Management

Popescu Daniela Oana

Academy of Economic Studies Bucharest, Faculty of Management

Small and medium sized enterprises (SMEs) are the most dynamic and vital factor of progress in the contemporary society, main generator of economic performance and substance in any country, employment opportunity provider for most of population, major contributor to the national budget, and engine to improve the living standard of the population. SMEs represent 99% from all enterprises, drawing up the main human resource agglomeration. In Romania and other countries from The European Union, SMEs play an essential role in economic life, having special features that make adaptation process to the knowledge-based economy easier. In a knowledge-based economy context, SMEs should act as learning entities, by developing the most important resources they own: the human resources.

Keywords: learning organization, knowledge-based economy, small and medium enterprises, Romania

The article's JEL code: M3, M31, L81

SMEs features and regional distribution

Small and medium sized enterprises (SMEs) represent the most numerous and important category of enterprises, with multiple economic, technical and social functions. SMEs are the most dynamic and vital factor of progress in the contemporary society, main generator of economic performance and substance in any country, major contributor to the national budget, and engine to improve the living standard of the population. SMEs represent 99% from all enterprises, drawing up the main human resource agglomeration. SMEs generate the most of Gross Domestic Product (GDP) in every country - usually 55%-95%, provide employment for most of population, and generate a major part of the technical innovation applicable in the economy¹³⁶³.

The higher flexibility of SMEs, the permanent contact of the entrepreneur with the organization, the capacity of producing goods and services to satisfy different needs and demands, the organizational environment favourable to change and innovation represent the elements that explain higher performance of the SME sector¹³⁶⁴.

Unlike larger organizations, SMEs enjoy a number of advantages, such as small number of employees, which facilitate communication and propagation of change within the organization, a smaller proportion of total tangible assets, economic and relatively simple management, adaptability and flexibility to changing external environment, entrepreneurial spirit, faster growth, development potential, but more intense interpersonal relationships and greater cohesion.

¹³⁶⁴ Chivu, I., Garcia-Sanchez, A., Lefter, V., Popescu, D., Ramos, *Human Resource Management in Small and Medium Sized Companies, Contemporary Tendencies*. Ed. Economics, 2001, Bucharest, p.76

These features allow easier adaptation of SMEs to change imposed by the knowledge based economy, in particular economic sectors based on art techniques and technologies, the permanent renewal is key to success. We consider that all the specific characteristics of SMEs define a profile of those who can harmonize with the specific knowledge based economy and organization. Concentration of enterprises differs according to the development regions, as typological economic evolution areas. The region Bucharest-Ilfov, with 144,018 companies, has the largest density, approximately 23.33% from the total number. The other extreme is the South-West region with 45,889 companies, meaning fewer than 8% (Table 1).

<i>No. crt.</i>	<i>Region</i>	<i>Number of enterprises</i>	<i>Weight</i>
1.	North-East	67,333	10.91
2.	South-East	71,585	11.59
3.	South	65,001	10.53
4.	South-West	45,889	7.43
5.	West	58,745	9.51
6.	North-West	88,315	14.30
7.	Centre	76,519	12.39
8.	Bucharest-Ilfov	144,018	23.33
Total	-	617,405	100.00

Table 1. Small and Medium Sized Enterprises distribution by regions¹³⁶⁵

The average level for a regional unit is 77,177 companies, with a 10% increase compared with the previous year. The Bucharest-Ilfov region is over the national average by 1.87 times, being 3.1 times higher than the South-West region. These differences highlight entrepreneurial environment specificities, having as a result differentiation between country areas.

Higher values correspond to Bucharest-Ilfov, West, North-West and Centre, which indicates a strong polarization of small and medium sized companies, while lower values correspond to North-East, South-East, and South-West.

Predominant among SMEs are the micro enterprises, with up to 10 employees, companies that represent over 90.66% of the total number, only 31.95 from the total number of employees (Table 2).

<i>SME Groups (by number of employees)</i>	<i>2001</i>		<i>2007</i>		<i>Dynamics of number of employees</i>
	<i>Number of employees in SMEs</i>	<i>Weight %</i>	<i>Number of employees in SMEs</i>	<i>Weight %</i>	
1-9	459,210	26.64	917,514	31.95	199.8
10-49	564,651	32.75	946,237	32.95	167.6
50-249	700,072	40.61	1,007,742	35.09	143.9
<i>Total</i>	1,723,933	100.00	2,871,493	100.00	166.6

Table 2. SMEs distribution by number of employees

The number of SMEs increased in 2007 compared to 2001 by approximately 40%. After 2001, the main category that increased was that of micro enterprises. In 2001, the number of employees in enterprises with over 250 employees was 1,240,211, representing 41.84% of the total labour force employed in the enterprise sector. Compared to the numerical dynamics of the SMEs (152.1% between 2001 and 2007), the dynamics of the employees' number (166.6%), demonstrates strengthening of the SME sector.

¹³⁶⁵ <http://www.cnesmc.ro/CARTA%20ALBA%202009.pdf>, access date 09.03.2010

Knowledge-based economy as favourable environment for SMEs

Knowledge has always been an important driver of competitive advantage, but changes in the economy have made it increasingly so. In order for knowledge to provide competitive advantage, it must be explicitly integrated into a firm's strategy. Knowledge development lies at the heart of organizational innovation and growth and can be achieved through learning activities. Human resources, main owners of knowledge, develop especially within organizations¹³⁶⁶.

Economic activity is increased in sectors that intensively use knowledge and technology and increase production and employment in high-tech sectors. Success in the knowledge based economy depends on the ability to innovate. Researchers¹³⁶⁷ have identified the following characteristic of the knowledge based economy: physical distances represent no longer an obstacle to economic development, communication, education, successful implementation of projects and integration into society, economic system is open the world.

Key change involving the transition to a new kind of economy is not only the concern of the scientific world. Leaders of developed countries in European Union policy areas identified transition options to the new type of economy, the knowledge based economy: building an information society to citizens, by extending the Internet, electronic commerce, telecommunications, building a dynamic business environment, stimulating, developing small and medium enterprises, supporting scientific research as a vector of competitiveness and the enhancement of human resources, investing in education and training, promoting social protection systems and incentives to work¹³⁶⁸.

To create a competitive advantage, SMEs need to be able to learn faster than their competitors and also develop a customer responsive culture. Argyris (1999)¹³⁶⁹ identified that in light of these pressures, modern organizations need to maintain knowledge about new products and processes, understand what is happening in the outside environment and produce creative using the knowledge and skills of all employed within the organization. This requires co-operation between individuals and groups, free and reliable communication, and a culture of trust.

Learning Organization main characteristics and importance

Organizations with the best chance to succeed and thrive in the future are learning organizations. There are some fundamental aspects that need to be reinforced inside the company, in order to become a learning organization. Main tools and techniques include: continuously seeking information, encourage creativity (brainstorming, associating ideas), management techniques that imply the development of skills like leadership and mentoring, using and develop the latest and best information and communication methods and means.

The concept of "learning organization" is a relatively new one¹³⁷⁰, that has been developed in the last three decades and that has been successfully implemented by an important number of companies. Of course, the "learning" concept is not a new one; quoting no one else but the creator of the Theory of Evolution himself, Charles Darwin who said: "It is not the strongest of the species who survive, nor the most intelligent; rather it is the most responsive to change.", we realize that this concept existed since the beginning of times: men progressed by learning.

¹³⁶⁶ Harris, L., Leopold, J., Scholes, K., Watson, *The strategic managing of human resources*, Ed. Prentice Hall, Englewood Cliffs, 2005, p.234

¹³⁶⁷ Prusak L., Matson E., *Knowledge Management and Organizational Learning*, Oxford University Press, New York, 2006, p.156

¹³⁶⁸ Harrison, R., Kessels, J., *Human resource development in a knowledge economy: an organisational view*. Ed. Palgrave Macmillan, Hampshire, 1997, p.76

¹³⁶⁹ Argyris C., *On Organizational Learning*, Blackwell Publishing, 1999, p.235

¹³⁷⁰ first developed by Argyris and Schon in their work, "Organizational learning", 1978

Even if this statement is based on an obvious argument, many organizations refuse to acknowledge certain facts and continue to repeat dysfunctional behaviors over and over again. Huber (1991)¹³⁷¹ considers four constructs as integrally linked to organizational learning: knowledge acquisition, information distribution, information interpretation, and organizational memory. Senge¹³⁷² defines the Learning Organization as "a group of people continually enhancing their capacity to create what they want to create."

The present reality and the fierce competition created the need of theorizing the concept of organizational learning in the entrepreneurial environment and the creation of the **learning organization model**.

Argyris and Schon talk about 2 learning models:

- the single loop learning: the organizations modify their actions starting from the comparison of the obtained results with the expected results;
- the double loop learning: the organizations analyze the politics, values and the suppositions that lead to these; if they are capable of modifying these politics and values, then we have a process of double loop learning.

Peter Senge, developed the term of organization learning, in 1990, in his work that quickly became a best seller: "*The fifth discipline: The Art and Practice of the Learning Organization*".

Senge defines two concepts that need to be accomplished in order for a company to be named a learning organization:

- the ability to shape the organization to be in accordance with the desired results;
- the ability of recognizing the moment in which the direction of the organization is different from the desired result and to follow the necessary steps to correct this imbalance.

The learning processes within a Learning Organization

The first process refers to external sources knowledge acquisition. The organization human resources come into contact, socially, with external sources, which facilitates the information and knowledge input. For instance, scientists engaged by a private organization to offer their professional knowledge, gained within academic environments and research centers, that eases employees access to outdoor sources. Similarly, one of the reasons for companies to form partnerships is to build social connections with the local market, with the political environment¹³⁷³.

Knowledge transforming from tacit to explicit form represents the second process. The advantage is using employees knowledge for all organization and reducing management dependence on a limited number of people owning tacit knowledge.

The third process regards a collective contribution of different social groups for creating new knowledge, as a result of different competencies. Knowledge conversion refers to exploring existing knowledge, meanwhile creating knowledge refers to exploring new knowledge.

Human resources development refers to the skilful provision and organization of learning experiences, primarily but not exclusively in the workplace, in order that business goals and organizational growth can be achieved. Changing to a new economic and social organization model, a knowledge model, implies employees, as part of the organization, higher adaptation capacity. Within organization, the learning process takes place at individual level, team level and organizational level. Continuous concern for training and professional improvement of human resources knowledge and capacities has favorable results for employee and organization.

Learning Organization contributions to SMEs performances are:

¹³⁷¹ Huber, G., *On organizational learning: The contributing processes and literature*, *Organization Science*, 2(1), 1991, p.88-115

¹³⁷² Senge, P., *The fifth discipline: The Art and Practice of the learning organization*, Ed. Random House, USA, 2006,

¹³⁷³ Lopez S., Pen J., Ords C., *Organizational learning as a determining factor in business performance*, *The Learning Organization*, Vol. 12, Nr. 3, 2005, p.6

-links individual performance with organizational performance. In terms of Planning and Strategy, SMEs from Romania are still in an incipient stage. Planning is used to a higher extent in 45.5% of the cases, but a career plan for employees exists in only 18% of the firms and there is a small declared linkage of the human resources recruiting strategy to organizational objectives¹³⁷⁴. The management of the firm is in these conditions mainly intuitive and does not apply the rules and rigors found in large companies. By their nature, SMEs nurture with their reduce dimensions and small number of employees the existence of a less rigid business work frame.

-develops collective as well as individual learning. This characteristic is also sustained by the fact that 75% of the entrepreneurs encourage the employee's involvement in other areas than those specified in their job description. A less favorable characteristic revealed by the study is that in SMEs the predominant way of working is still very individualist, the majority of the respondents (45%) neglecting the benefits of team work for the organization.

Over 35,63% of the microenterprises, 40,69% of small enterprises and 54,06% of medium enterprises allocated 1 to 5 training days for their employees (Table 3). SMEs which preferred training programmers for more than 6 days long, represent an important percentage, for all three enterprises dimensions types. All these data results indicate that significant importance is given to human resources development, although resources owned are more reduced than for larger organizations.

	Number of training days	Enterprises		
		Micro (0-9 employees)	Mici (10-49 employees)	Mijlocii (50-249 employees)
1.	Over 10 days	12,78%	12,57%	15,38%
2.	6-10 days	12,14%	24,54%	9,85%
3.	1-5 days	35,63%	40,69%	54,06%
4.	0 days	39,45%	22,20%	20,70%

Table 3: Medium training days number within SMEs evolution in 2009 compared with 2008¹³⁷⁵

Development may be a characteristic of the culture, values, processes and resources of the organization, not just specific of individuals. Initiated at the organizational level, development involves change, change in behavior, beliefs, attitudes. The role of management becomes as new values: the definition of processes, methods and techniques for managing development processes of the human factor, setting clear environmental impact of changes in internal and external, ensuring the availability of tangible resources (financial, material) and intangible (skills, facilities) in the development process, there is consistency between plan development and organizational strategy¹³⁷⁶.

Conclusions

Small and medium sized companies represent 99% from all enterprises, drawing up the main human resource agglomeration. In Romania and other countries from The European Union, small and medium sized companies play an essential role in economic life, having special features that

¹³⁷⁴ Chivu I., Artenie C., Popescu D., Ciocârlan-Chitucea A., Popescu D. - *The Profile of the Romanian Entrepreneur and its Compatibility with the Characteristics of a Learning Organization, Review of International Comparative Management, Vol.10, nr.4/2009, p.13*

¹³⁷⁵ <http://www.cnesmc.ro/CARTA%20ALBA%202009.pdf>, access date 09.04.2010

¹³⁷⁶ Chivu I. (coord.) *The Learning Organization and Human Resources Development, Ed. A.S.E., Bucharest, 2009, p.35*

make adaptation process to the knowledge-based economy easier. The results of the study demonstrate that learning capacity and knowledge sharing within SMEs consists of maintaining levels of innovation and remaining competitive, being better prepared to respond to external pressures, improving corporate image by becoming more people orientated. At the organizational level, a successful human resources development programme will prepare the individual to undertake a higher level of work, to provide the possibility of performance change and consequently.

There is a competitive advantage for an organization whose workforce can learn quicker than the workforce of other competing SMEs. In these settings, human resources development represents the solution that focuses on the organizations competencies at the first stage, training, and then developing the employee, through education, to satisfy the organizations long-term needs and the individuals' career goals and employee value to their present and future employers.

Human resource development (HRD) has gained a permanent role within SMEs, agencies and nations, increasingly as not only an academic discipline, but as a central theme in development area. Being a combination of training and education, in a broad context of adequate human resource policies, HRD ensures the continual improvement and growth of both individual and organization.

Development people as part of an overall human resource strategy means the skilful provision and organization of learning experiences, primarily but not exclusively in the workplace, in order that business goals and organizational growth can be achieved.

THE IMPACT OF ORGANIZATIONS' POTENTIAL OF COMPETITIVENESS ON THEIR CURRENT STRATEGIC AND TACTICAL MOVEMENTS

Radu Cătălina

Academy of Economic Studies, Faculty of Management, Bucharest

Grigore Ana Maria

Academy of Economic Studies, Faculty of Management, Bucharest

Badea Florica

Academy of Economic Studies, Faculty of Management, Bucharest

Organizations' competitiveness is an effect of their current strategic and tactical movements and also a cause, a driver of future performance. This paper aims to analyze competitiveness in dynamics, by taking into account the impact of organizations' potential of competitiveness on their current actions, which of course will lead to a higher or lower level of competitiveness in future.

Keywords: organizations, potential of competitiveness, sustained competitive advantage, strategy, management, dynamics

JEL classification: L14, L21, L25, M16

Introduction

Any organization should try to be competitive and, moreover, any organization's performance is directly related to the quality of its strategic and tactical movements. Therefore these movements deserve special attention. However, they are partly the result of the organization's current potential of competitiveness and we will explain our view in the following pages.

Literature review

Competitiveness – a dynamic concept

Competitiveness clearly implies dynamics, by being a time-dependent structure (if an organization is currently competitive, this does not mean it will also be competitive in the future).

We define competitiveness as *the capability to successfully compete, to provide products and services as or more effectively and efficiently than relevant competitors for a specific time frame* (Radu, 2009).

There are many theories and models that try to explain why some organizations perform better than others. These theories and models can be grouped in three categories: **the internal perspective**, which concentrates on resources and capabilities, **the external perspective**, which focuses on the structure of industries and **the dynamic perspective**, which bridges the internal and external perspectives and explain why competitive advantages do not typically last over long periods of time (Carpenter and Sanders, 2007).

In order to have a good vision regarding a company's future, a careful analysis of the whole system a company is part of and the ability of the company to achieve future growth are clearly necessary (Woodhead and McCuish, 2003). It is clear that current competitive position and potential influence the future level through company's current responses (actions). However, an incorrect assessment of the current situation may lead to two errors: an under-response (in terms of relative competitive force) should result in deteriorating relative competitive position; the over-response is also a problem, as it can result in wasted resources with little gain in advantage (Oliva, Day and Macmillan, 1988).

A company's long term adaptation is actually produced by a series of strategic behaviors and organizational innovations. Therefore the organization's capability to develop effective strategic behaviors and organizational structure is critical for any company's growth (Kuwada, 1998). Strategic decision speed is very important; it matters for companies' growth (competitiveness as a result). Therefore, companies need to master fast decision-making (Baum and Wally, 2003).

The potential of competitiveness

In practice, when we analyze competitiveness dynamically, we refer less to specific strengths or weaknesses, and more to "a potential of competitiveness", a response capacity, and adaptation to various evolutions in the environment in which a company activates (Radu, Grigore and Cătăneț, 2009). The difficulty of dynamical analysis consists of the variable certainty of the predictions (regarding the environment), as well as the difficulty of obtaining relevant information, which many times happens to be confidential. However, the potential of competitiveness may be analyzed in dynamics, by using an extended Porter's model in dynamics (Radu, Grigore and Cătăneț, 2009), a dynamic analysis of the five competitive forces and of the macro-environment. The idea is to identify the organization's responses to the main evolution trends regarding competition, potential competitors, substitute products, customers, suppliers and general environment. In this way we obtain a response capacity of the company to the evolution of its environment, which we considered to be "the potential of competitiveness".

Evaluation of organizations' current strategic and tactical movements

It is not easy at all to evaluate organizations' current actions, strategic and tactical movements. Respondents to our questionnaire would not have answered to specific questions (or perhaps they would have answered, but not sincerely). However, we understood that the main points to be attained refer to cost, time and quality in an extended view (Radu, 2009) and these aspects could be pursued in our questionnaire. With respect to cost, we were particularly interested in analyzing the cost of actions seen as use of resources and tendencies towards outsourcing or not non-core activities. With respect to time, we followed to rapidity of organizations in adapting to various new conditions (flexibility). Last but not least, with respect to quality, we looked for organizations' focus on customer.

Conceptual framework

It is clear that any organization's potential of competitiveness will impact its future level of competitiveness. However, this influence is not a direct one. The main idea is actually one hypothesis we were interested to test: **The potential of competitiveness has a direct and positive influence on organization's current actions.**

Methodology

In order to test our hypothesis, we developed a questionnaire of 54 questions that was applied in two periods of time (June – September 2007 and June – September 2009), in order to see the causal relationships and the transformations over time. Almost half of the questions were actually translated and adapted after a standard questionnaire developed by European Foundation of Quality Management (EFQA) and used to assess business excellence.

223 questionnaires were distributed to managers of different Romanian organizations (7 of them non-profit organizations, the rest of them companies of different scales and from different fields of activity). Our final analysis was limited to 98 organizations.

Main findings

After processing the completed questionnaires we analyzed the average scores for each company regarding both the potential of competitiveness and their current strategic and tactical movements. Therefore we could analyze the distribution of results and also to perform a

regression analysis in order to test our hypothesis. The following figure shows the distribution of average scores for organizations' potential of competitiveness:

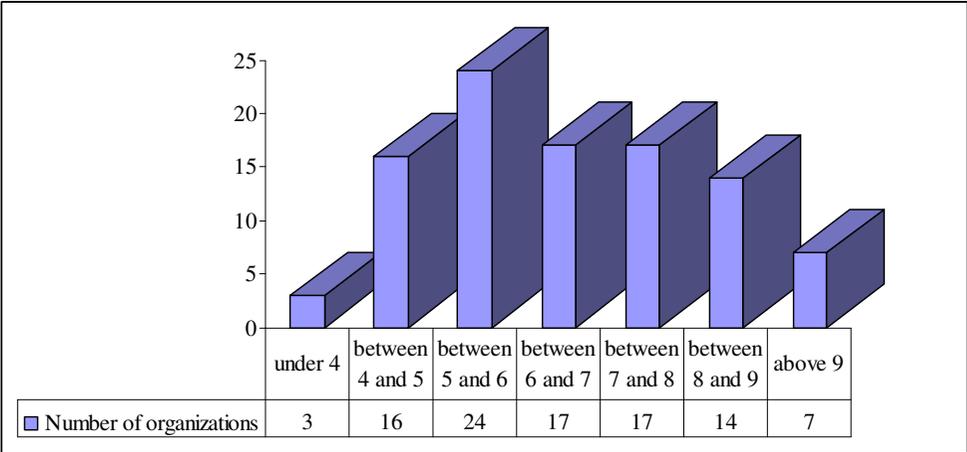

Figure 1. Distribution of average scores for potential of competitiveness

With respect to the average scores obtained for the potential of competitiveness, the distribution is quite uniform. Most of organizations have an average score between 5 and 6 (24 out of 98, which corresponds to 24.49%). The averages scores are between 4 and 5 for 16 organizations, between 6 and 7 for 17 organizations, between 7 and 8 again for 17 organizations, between 8 and 9 for 14 organizations. 3 organizations have very low scores (under 4), and 7 very good scores (above 9).

Figure 2 shows the distribution of average scores for organizations' current strategic and tactical movements:

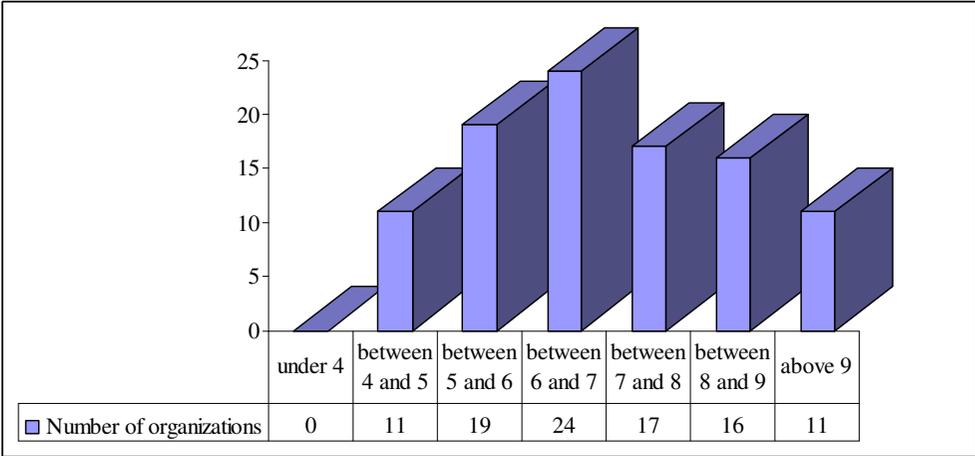

Figure 2. Distribution of average scores for current strategic and tactical movements

Most of organizations that participated in the questionnaire led to a distribution with the highest proportion of results between 6 and 7 (approximately one quarter – 24 out of 98 organizations, meaning 24.49%). The distribution is quite uniform, and there is no organization with a lower score than 4. We can also notice that the number of organizations with a score between 4 and 5 is the same with the one with scores above 9 (11 organizations).

Although distribution of average scores indicates some elements, for our analysis what happened with each organization in part is more important. In order to test this hypothesis we used the simple linear regression. The graph that shows the dependency relationship is the following:

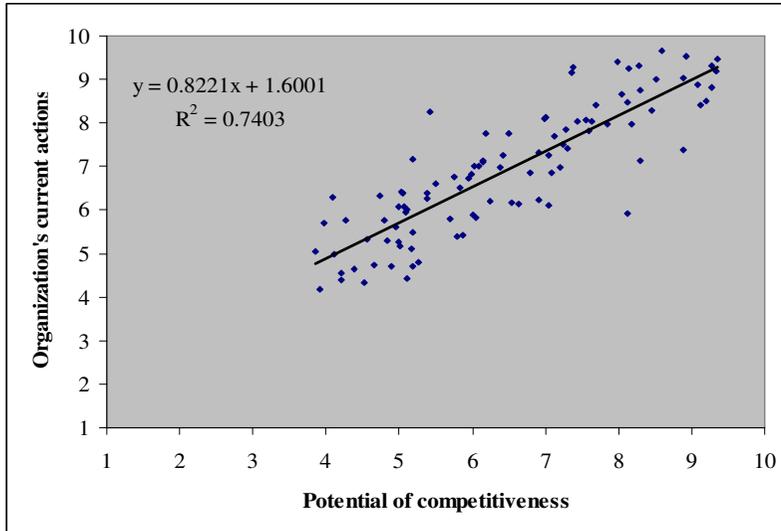

Figure 3. Regression line – “Potential of competitiveness – Organization’s current actions”

The coefficient of determination R^2 has a high value (0.7403). Linear relationship of dependence between the two variables is strong, as it can be seen from the figure, as there are quite few distant points (outliers). F test and p value show that the model is valid:

Table 1. Information regarding the regression line

Regression line:	$y = 0.8221 \cdot x + 1.6001$
Coefficient of determination (R^2):	0.7403
Standard error:	0.76
F test (Fisher):	273.7224
p-value:	$7.32 \cdot 10^{-30}$

Conclusion

We can validate our hypothesis. Indeed, the potential of competitiveness has a direct and positive influence on organization’s current actions.

FINANCING SOURCES FOR SUPPORTING INVESTMENTS AND INNOVATION WITHIN SMALL AND MEDIUM ENTERPRISES (SME)

Ranf Diana Elena

*Romanian-German University
Faculty of Economic Sciences*

Todarita Elida Tomita

*Romanian-German University
Faculty of Economic Sciences*

The SME are the key sector to generate economic growth and a sustainable and permanent economic development. The Small and Medium Enterprises contribute to the creation of an important number of jobs, absorbing part of the available labour force as a result of economy's restructuring. Besides all these, Small and Medium Enterprises may influence, through their mobility and flexibility, the production's adjustment process to the market's requirements. The article is a glance of the main financing sources of the SME and attempt a description of how they are applied in the current economic context from Romania.

Keywords: innovation, financing, resources, venture capital, factoring.

Cod JEL lucrare: M20.

1. Introduction

The organization has to be receptive to **innovation** and willing to perceive change as an opportunity, rather than as a threat¹³⁷⁷.

In order to face the **innovation** challenge, in order to encourage the entrepreneurial spirit, the company has to be able to allot **financial resources**.

During the last decades, on the financial level we have seen a proliferation of the new financial instruments, which justify an older description made by James Tobin to the world economy: "a paper economy". The importance of innovation and of the structural changes within the financial system of the developed countries have been without precedent: new financial instruments have appeared, new negotiation markets have been created and new regulations emerged, the rapid succession of changes finding a necessary support in the "big bang".¹³⁷⁸

The financial innovation was defined as a creation (development) process of some new financial products; in a broader sense, the methods of mobilizing or placing funds are included, or the development and evolution of some new financial bodies. Consequently, the financial innovation is present not only within the capital market context, but within the entire financial market: the NOW accounts or credit derivatives, together with the financing of certain acquisitions (leverage buy-out type), the electronic funds transfer and credit cards, the real-estate euro-values, all of them being the result of the financial innovation.

2. The main financing alternatives of the SME

Roxana Ștefănescu has identified a number of conventional and unconventional financing sources of the SME.¹³⁷⁹

Conventional financing sources of the SMEs:

- entrepreneur's own, personal economies;
- family's and friends' money;
- the incomes from the enterprise's patrimony;
- the business partners;
- the loans from banks.

I would add here the non-reimbursable funds of the Phare Programme and from structural funds and financing from the state budget and from guarantee funds.

Unconventional financing resources of the SMEs:

- the issue of shares and bonds on the capital market;
- venture capital funds;
- the factoring;
- the leasing;
- strategic alliances (franchise, joint venture, common licensing of some products, technologies).

Small and medium enterprises seem to choose the financing from own economies, from the family's resources, from different business partners, from the incomes of the enterprise's patrimony.

Self-financing is rightly considered the "healthiest" way to finance any type of company. It is strictly based on the company's self abilities, having as main sources the depreciation of fixed capital and the undistributed part of the profit which is put as savings and it represents the financing source of forming the capital. Self-financing is thus a company's ability of internal accumulation.

In 2006, approximately 70% of the small and medium enterprises in Romania have self-financed themselves.¹³⁸⁰

2.1 The loans from banks

The bank loan, depending on the company's activity and profit, may be a very comfortable financing way of a small and medium enterprise. The bank offers the petitioner an amount of money that will be returned at a specified moment.

During 2009, loans decreased in intensity. Cost of credit has increased significantly due to worsening economic environment in terms of attracting financial resources increasingly scarce and expensive.

The number of units decreased bank with 90 branches and over 3,000 employees of banks and have lost their jobs. Profitability of the banking system was positive, although profit fell banks. But no bank in the Romanian banking system has not been in default during 2009.

In 2010, banks have preferred to deposit money in exchange for an interest in National Bank which fell from 3.5% on year in January to 2.5% in March, instead of crediting the private sector at between 14 and 25% interest per year. This phenomenon occurs not only in Romania but also in the U.S. and Europe.

It is estimated that the banking system will be relatively quiet in 2010 but banks will still have to adapt to problems in 2009.

2.2 The SMEs access to non-reimbursable financing through European funds

¹³⁷⁹ Ștefănescu, R., *Managementul întreprinderilor mici și mijlocii*, curs disponibil online la adresa <http://www.scribd.com/doc/22747303/Www-referat-ro-Managementulintreprinderilormicisimijlocii-88e00>

¹³⁸⁰ Nicolescu, O., coordonator, *Carta alba a IMM-urilor din Romania – 2007*, editata de Consiliul National al Intreprinderilor Private Mici și Mijlocii din Romania (CNIPMMR)

The Poland Hungary Aid for Reconstruction of Economy Programme (PHARE) – is one of the three pre-accession instruments of the European Union to aid the candidate countries of Central and Eastern Europe to adhere to the European Union. Until 30.11.2010 two other assistance programmes are still valid which provide non-reimbursable financial support to small and medium enterprises

- PHARE 2006 „SME assistance for the acquisition of business consultancy services”;

- PHARE 2006 „The investment scheme to support the SME private sector initiatives within the waste management sector”.

Beginning with 2007, the **structural funds** are available for access.

The structural funds are post-adhesion funds supplied by the European Union’s budget, whose purpose is to offer support to the member states. Investments in education, research, agriculture, infrastructure, SMEs development and measures for the development of rural areas are sustained. A special attention is given to less developed regions, in order to consolidate economic and social cohesion in the European Union.

During the last years, the 23 million SMEs in Europe have been the main point of interest both at the European level and at the level of the member states. But more is requested and more can be done in this respect. In June 25, 2005, the European Commission has adopted “Small Business Act for Europe”, a document through which **the SME become the central point of interest in formulating the European and national policies.**

The most important European financing programmes aim to promote the growth and to create new jobs for the European economy, and the SMEs play a key part in reaching those objectives. The variety of programmes offers a multitude of opportunities, the role of this instrument being to help the SMEs find the opportunities that best fit their specific situation.

The EU sustains the financing offer for the SMEs for covering establishment or development costs.

During 2007-2009 Romania has attracted approximately 600 million euro of the 5,624 billion available, with a 10% rate of absorption.

The SMEs have spent only 5 million euro from the budget of over 700 million euro allotted by the European Union for the 2007-2009 period. The manager of the financing programme for SMEs, Catalina Melia, states that at least one beneficiary out of 10 gives up the approved projects due to co financing problems.

2.3 The shares and bonds issue on the capital market

Small and medium enterprises resort to a small extent to share and bonds issue, them being an important financing source for the big companies, and are very less accessible to newly-established companies.

The financing through the capital market is an alternative to the bank loans; unfortunately this possibility is very less known and used in our country. This type of financing is done through public issue for shares to sell.¹³⁸¹

Financing through the capital market is a possibility that should be taken more seriously into consideration, since most of the Romanian companies are at the banks’ and their regulations’ disposal for getting funds necessary to their activity.

As far as the public issue of real-estate values (shares or bonds) is concerned, the issuing company establishes the conditions of this sale (these conditions, however, must comply with the investors’ requests in order for the sale to be successful). Therefore, any company in Romania may diversify its financing structure and may include the capital market in its plans.

The capital market offers the dynamic companies the possibility to be listed at the **Bucharest Stock Exchange (BSE)**, the single market for securities’ trading in Romania. Listing also brings

¹³⁸¹ *Ghidul emitentului de actiuni si obligatiuni*, disponibil online la adresa http://www.intercapital.ro/componente_pagini/documente/ghidemitent.pdf

important advantages for the company: increased visibility among business partners and current and potential clients; free advertising; the establishment of “market” value of the company, a value that can be much higher than the one from the documents; the trust increase of Romanian and foreign partners; attracting new business partners; increasing the efficiency and effectiveness of exchange of shares between shareholders; capital raising; the issue of shares and bonds.

2.4 Venture capital funds

A special type of financing was invented in the developed economies, for financing the innovative development projects, especially for the small and medium enterprises, the risk capital, known as the **venture capital**.¹³⁸²

Venture capital have extended at the end of the ‘80s, aiming the emerging markets, the greatest expansion being noticed in the new industrialized countries of Asia and in the countries in transition to the market economy in Central and Eastern Europe. In 1995, there were 72 such funds, holding a capital of 4,5 billion USD.

The emergence and development of these funds have been supported both by the International Financial Corporation and the European Bank for Reconstruction and Development¹³⁸³.

Venture capital is a long-term financing of a company’s needs in the form of capital investment in the company’s assets.

Venture capital is among the most efficient development instruments of the small and medium enterprises, also playing an important part on the capital market of big companies in developed countries.

According to the **European Venture Capital Association**, venture capital is a long term investment in companies at different stages of development: it also includes an early stage, of financial expansion and replacement, being a temporary source of capital given to the small and medium enterprises by the venture capitals.

Harvard Business Schools defines venture capital as a long term investment in companies that are not listed on the stock exchange, referring to all stages of development of a company.

2.5 The Factoring

Factoring is a business financing method, especially of the import-export transactions, less known in Romania.

The factoring operation consists of the selling by the bank or a specialized company of the debts generated from commercial invoices. During the transaction, the bank (or the factoring company) offers immediate financing. Therefore, when the client shows the invoices for the purchased products or services, an 85% percentage is immediately paid from their value. After recovering the invoices’ equivalent, the factor will pay the 15% difference from which he keeps the commission’s and interest’s equivalent. Practically, the factoring is the financing mechanism to **get liquidities fast** by selling invoices whose maturity is short (usually between 180 and 360 days). Since the factor is the one who takes the debtor’s non-payment risk, he must take into consideration the external partners’ seriousness. To this respect, the bank (or the factoring company) will request financial statements and reports on the importers’ loans, so that it can check their situation. The factor will also take into consideration the debt’s quality. If some debts will prove risky from the point of view of how they are paid, they will not be taken over.

Factoring is a complete financial package which combines the work capital financing with the credit risk protection, with the non-payment risk management and the collection services. Based on the understanding between the factor and the seller, the factor buys the non-payment risk, normally, without appeal, thus taking the responsibility regarding the debtor’s financial payment

¹³⁸² Markova, V., *Probleme aparute in urma utilizarii capitalului de risc in intreprinderile mici si mijlocii din Slovacia*, Revista Studia Universitas, Universitatea Vasile Goldis din Arad

¹³⁸³ Matei, M., *Fondurile cu capital de risc – o noua sursa de finantare a investitiilor din Romania*, Buletinul Universitatii Petrol Gaze din Ploiesti, 2002, p. 1-5

ability. When the seller and the buyer are in different countries, this is called **international factoring**.¹³⁸⁴

The factoring market's value in Romania was of 1,8 billion EUR in 2008, which is a significant increase of 63,64% as compared to 2007 and places Romania on the seventh place in a classification of the markets that had the greatest development in 2008.

In 2009, the factoring market fell 27.8% to EUR 1.3 billion, but International Factors Group, an international association of banks and factoring institutions, estimated 15% growth for 2010.

2.6 Leasing

Leasing is a good financing method basically due to the efficiency which can satisfy the financial needs of the economic agents and natural persons as well. Complicated procedures of contracting some new bank loans can be avoided with a leasing operation, procedures which sometimes involve the immobilization of the company's patrimony, to produce guarantees.

Leasing is the operation through which one party, called lessor, transfers to the other party, called user, for a periodic payment, called leasing rate, the right of possession and usage of a good, whose owner is, for a determined period of time.

Leasing implies the existence of a **third party**: the supplier, the financing company (the leasing company) and the user (the financing beneficiary). The leasing company buys from the supplier the good solicited by the users and gives to this one to the latter one, for a specific period of time, against some monthly charges. This is basically the financing operation through leasing.

The leasing market in Romania decreased in 2008 with 2,6%, as compared to last year, and in 2009, the sales dropped with approximately 74%, the financial crisis having a much stronger impact on the internal leasing market than in other countries.

In countries from Central and Eastern Europe, the leasing market decreased by approximately 60%, while in Western Europe, the decrease was more moderate (15%).

In 2010, the leasing companies do not expect the market conditions to change, their efforts now being focused on rendering profitable the repossessed assets.

2.7 Strategic alliances

Entrepreneurs sometimes resort to strategic alliances which consist of a relation between two or more organizations, in which partners pool certain resources, in order to achieve certain common strategic objectives. The most used strategic alliances are the franchise, the joint venture and the common licensing of certain products and technologies.¹³⁸⁵

2.7.1 The franchise

The franchise is **an agreement** (a contract) through which a bigger company – franchiser – owner of a trademark of products or services, offers to another company – the franchisee – the right to exploit the trademark of products or services in franchising system, under his name and assistance, for a price.

The franchise is an indirect source of financing which replaces liquidities through the management, production, commercialization, consultancy etc. system, which the franchiser offers.

The franchise market in Romania has had, over the years, a **generally an upward trend**, this trend maintaining over the 2008 year. Although the economic-financial crisis has also affected our country, we can not talk about an obvious stagnation in the local landscape of this type of business, not even in the year of 2009.

¹³⁸⁵ Stefanescu, R., *Managementul intreprinderilor mici si mijlocii*, curs disponibil online la adresa <http://www.scribd.com/doc/22747303/Www-referat-ro-Managementulintreprinderilormicisimijlocii-88e00>

2.7.2 Join Venture

Within the geographical space of business, dominated by partners who communicate through the English language, the physical and legal enactment of some joint cooperation, based on obtaining profit, has led to the appearance of the so-called “**join venture**”.¹³⁸⁶

In our space and in the Romanian legislation, the common names are: “**mixed company**” or “**foreign participation company**”.

All types basically refer to the same content: the existence of at least two partners, who invest capital into the business, one of which is a foreign citizen or organization.

Join venture means the type of company formed by business partners, natural and/or legal persons from different countries, who aim to maximize profit in the national and worldwide competitive environment.

2.7.3 The common licensing of certain products and technologies

The licensing is the operation through which a company (beneficiary) gains, against a price, the right to use patented technological knowledge of another licensing company.¹³⁸⁷

The advantages are cost economies, the rapid generation of incomes, the introduction of advanced technologies etc.

3. Conclusions

The most frequently used ways of financing by the SMEs are: self-financing – the most frequently used, followed by the banking credits, then the leasing; some of the SMEs have resorted to non-reimbursable funds and then the factoring. A part of the SMEs have taken loans from specialized institutions or they have accessed the National Fund for Credit Guarantees for the SMEs. The shares’ issue on the capital market is the most less used as a financing source for the SMEs.

EVOLUTION TENDENCIES SPECIFIC TO THE FIELD OF QUALITY IN THE CONTEXT OF KNOWLEDGE BASED ECONOMY

Roșca Remus

Universitatea din Oradea, Facultatea de Științe Economice

In the actual rivalry environment characterised by the exacerbation of the competition, quality is getting the most important factor. Sequel every organization has to consider a priority the improvement of their products quality. Set going from these realities, we consider convenient and interesting to present the most important tendencies in the field of quality, which understanding depends on the turning to account of numerous improvement opportunities.

Keywords: quality, tendencies, competitiveness, knowledge economy.

Clasificare JEL:A00

1.Introduction

In the actual rivalry environment characterised by the exacerbation of the competition, quality is getting the most important factor. Sequel every organization has to consider a priority the improvement of their products quality. Quality improvement is an organised way for generating a positive change, an advantage for the company. Appropriate to the current matter is this quote from W. Churchill: “To improve means to change; to be perfect means to change often”.

Set going from these realities, we consider convenient and interesting to present the most important tendencies in the field of quality, which understanding depends on the turning to account of numerous improvement opportunities.

2.Evolution tendencies specific to the field of quality in the context of knowledge based economy

Further we would relate and study thoroughly these tendencies and their implications also.

2.1.Integration of customers in the process of obtaining quality and bringing forth the value that was intended

This could be done by setting down the client to the following roles:

Customers are providers of information. We have to consider the following categories of information: information of the needs and exigency of our customers about the desired quality of our products (it is a special duty of marketing to obtain these kind of information); feed-back information about the grade of satisfaction after sau during the use of the product; know-how – not infrequently customers are very well informed and have gathered evidence in a specific domain, acquireing distinctive abilities. To improve the role of provider of information of clients organizations use the following methods: marketing research, customers telephone, customers loyalty club, virtual chat rooms, box of complaints, drive test, etc.

-Designing customer, who sets the structure and configuration of the product desired, or sets some quality features only (like endowments of an automobile, the configuration of a PC, the structure of television programes). Herewith assumes an extreme demasification, since every customer represents in the main a market niche. It is clear the abandon of standardizing in favour of personalization.

-Maintenance assuring customer. In the future bearers will offer a wide series of facilities (infrastructure + ability by instruction) for their clients in order to assure themselves the maintenance of the acquired goods. In this way they could secure considerable cost savings and advanced customer satisfaction.

-Carrying out services customer: e-banking services, services of transport and mounting (see IKEA sistem), self-service in the field of commerce. In most of the cases these situations provide advantages not only for the organization but for their customer too.

-, „Opinion leader” customer, is generating intangible value for a brand by its image on the market. Also, he can play the role of a consultant for the actual or potential customers, providing them information and survey.

-Manager customer. This could mean the set up of a team of customers involved in the management activities of the firm. For exemple, the team could be involved in the launching on the market of a new product. Customers would always understand better the needs of their peers (we refer here to the people with the same sistem of values and lifestyle), unlike a manager who does not use the respectiv products. An actual exemple of manager customers is of the students who sit on the Board of Faculty where they study. In this way they have an approved understanding of the necessities of students, and can find more suitable solutions. Such a measure could be taken for the improval of a company’s image.

The turning to account of the right customer presented above it is possible only when you can rely on a mutual and advantageous partnership between him and you company.

2.2.Promotion of a holistic view, integrator of the process of quality improvement and the value creation chain

Suggestiv in this respect is the quote from professor Ion Stanciu: „ Today, more and more companies does not put their interest into quality programes for reducing deficiencies only. This is the traditional broach of activities ment to improve quality. Now the emphasis is put in the constitution of programes of quality by integration and correction of all the processes associated with quality during the long chain of value creation for the customers. Acting this way we can stimulate the whole potential not only of the company, but of the bearer’s and distrubitor’s too, in order to rise the value of the products/services dedicated for the customers with beneficial effects for the sales and the profits. ” We can’t exclude the customer itself from this value creation chain for customers, fact brought up in the previous chapter.

2.3.Proximity in time and space between the bidder organization and client, due to the modern means of transport and communication, especial the internet

The implications of these in terms of quality management:

-*easy communication*: presentation of products, informing (site, newsletter), customer’s feed-back (e-mails, chat groups, telephone);

-*easy acces and provision of service* like e-banking, e-learning, e-commerce, with an 24 hours/day availability;

- *reducing the carryinn out a product ordered by a customer*;

- *significant reduce of costs* not only for the seller but for the customer too;

- *possibility of checking the condition of the product or service ordered by the customer*.

Exemple: an order from an e-shop, a package sent by an express courier;

- *growing transaparency of the market* following the presentation of the offers in the virtual space, which let customers make the best choise. This situation determine organizations to focus on the continuous improvement of quality, and on offering superior value for their customers.

The existence of virtual space have created the premises of a similarity between preindustrial age of crafts and our contemporary information society under the appearance of customer’s feed-back. If in the age of craftsmanship the bearer met his customer face to face, now they can very easily connect using the virtual space.

2.4.Promotion of a holistic view in terms of the concept of quality by inclusion and recovery of intangible quality characteristics

Quality is not resuming only on product characteristics which fulfill the functions for which they were created; ie the quality of a product is not supposed to satisfy only the generic needs for which satisfaction it was projected (a car – the need of transport, a public food service – the need of food). In defining quality we have to keep in view the intangible quality characteristics too, the most important ones are:

- prompt delivery of the product, very important to keep in view de current business environment characterised by a remarkable dynamic;
- the set of services „joining” a product which it makes more accesible and interesting: payment methods, information methods, transport, installation, commissioning services, instructions, etc;
- the purchase experience of a customer determined by: the quality of relationship between the customer and bearer (professionalism, kindlyness, promptness, emotional intelligence) and the specific environment of space for sale;
- environmental friendly aspects of the product, are getting more and more important in the decision making of responsible customers;
- customer status achieved by the purchase of a good. We have to keep in view the prestige of a brand and the values this is promoting (exemple: exclusivity, prestige, safety, friendship, innovation, performance). These days, the decision of purchasing a product is also based on the wish of the customer to communicate his status to the others. Precisely why perhaps the greatest responsibility of marketing is the creation of a unique personality, unique even for the brand had in managing.

Relevant to the issues presented above is this quote from professor Ion Stanciu: „Quality is an emotional experience for the customers. They wish to feel good after purchasing a good, wisg to feel that have obtained the highest value. They intend to know their money were used to help and to be proud with associating themselves with a company obtaining a high quality image.”

2.5.Tranzition between the interest for quality standards type iso 9000 and the business models providing world class performance

Quality standards type ISO 9000 represent a ghide on which a company can base it's quality management and would be capable to generate the quality promised their customers constantly. One of the purposes of a company's authentication, according to these standards, is to rise the trust of employees and clients' in the capability of offering the promised quality consequently; ie it is possible that two rivals to be certified according to the same quality standard even if their products on the market has eloquent difference in their level of quality. The target in the case of standards is represented by the quality promised to the market and it's improvement in time.

Through the implementation of the business models which are providing world class performance (Sis sigma, Kaizen), companies follow to reach world ranking, and to excel. The target in the case of these business models is represented by the highest quality achieved at a global level, making an obsession from the continuous improvement of it. ISO standards can help a company to survive on the market, transforming to an elementary necessity, until world class performance providing business models assure succes only.

2.6.Integration of economic issues of quality in the sistem of financial – accounting indicators of a company

During a long period of time companies have slighted the importance of an objective and fix cost generating non-quality evaluation. This was due to issues like: the lack of understanding the scale of these costs (it is estimated that in some companies they can represent up to 20% of the incomes); inexistence of a unified approach, at the level of concept and practice, of the measuring sistem of the generated non-quality costs. Yet companies that apply value analysis for maximizing the rate between quality and costs in order to improve their competitiveness on the

market, understood the importance of the exact evaluation of these type of costs. Issues represent a premise for the initiation of improvement projects which will lead to the reduction of non-quality costs. Non-quality costs means not only costs generated by the internal non-conformities but the external shortcomings and lost opportunities also, due to a weak good-will of the company in terms of the quality offered (issue which is hard to quantify). In order to piloting a company managers need exact information about the costs and proportion of non-quality, being a relevant indicator of the companies overall performance. General Electric was the first american company which introduced a sistem of management based on costs of quality in 1946.

Only those companies would survive and would have succes on a highly concurential market who would consider these kind of tendencies.

2.7.Extension of concern for quality in all the spheres of socio-economical life of a society

Here we are talking about the central and local public administration, the activities of non-governamental organizations, educational institutions, health care sistem, cultural institutions, etc. Quality is not a unique concern of a profit based company anymore. This is the only way we can consider a significant improvement of a societies quality of life. Unfortunately, we have to admit that Romania has a lot more to do in this sense.

2.8.Quality becomes a priority for decision making factors at national level or at the level of supranational structures

A good exemple for this is the European Union, where a wide training campaign of „european quality culture” is taking place by: the achievement of a common infrastructure in quality management policy; the broadcast of a considerable amount of information of quality management policy in order to strenghten the unique european market; preparations of documents of the E. U. like the „European Quality Management Policy”, „The European Way Toward Excellence”, „European Programe of Quality Management Policy” – all of these provide measures for obtaining a strategic view of quality in all the member states. Understanding the importance of quality is evident in the next provision drawn from the „European Carta of Quality”: „In global economy, competition exists everywhere. To win, european products and services has to be the best if our continent requires to get a chance on the international market.” It is regrettable that decision making factors from the macroeconomic level in Romania poorley understood the importance of quality promotion in the means of growing national competitiveness on the global market.

Unfortunately many romanian companies did not understood the importance of quality like major factor in competitiveness, neither did understood the tendencies presented above. The role of quality in the actual global economy, characterised by a strenghtened competition is emphasized by Jech Welch: „Quality is the best guarantee for the loyalty of our customers, the best defence from foreign competition and the single way to a lasting growth and sustained gains.” All of these are demonstrating the fact that quality is a social responsibility. Consequently an individual, a company, the professional organizations, the employers’ organizations, civil society through partnerships and non-governamental organizations must get involved in obtaining quality due to the following advatages:

-Improving the competitiveness of economical organizations. „Quality has become a strategic element of global management for organizations, because it determines the competitiveness of products/services at a high national and international level”. This is due to the following implications of obtaining quality: increasing sales due to the superior grade of satisfying the needs and exigencies of customers, customer loyalty, reducing of costs due to the improval of productivity (quality management aims the disposal of all the activities that are not adding value) and due the reduction of waste; recognition of the organization – the excellent quality obtained by an organization represents the most important marketing tool which could be used for it’s

promotion; development of a motivating environment – it has to be one of the best in terms of quality achieved, you have to set high quality as goal, which represents a challenge for the human resource of an organization; it stimulates the development and accumulation of knowledge in a company; it is a facilitator of change by connecting the company to the newest market tendencies (customer requirements, new technologies, etc.).

-Improving the competitiveness of national economy on the global market and is assuring macroeconomical balance. Relevant in terms of national importance of quality is the quote from A. Feingebaum: „High quality products are the key of economical health for contemporary nations”. The health of organizations, specially determined by their competitiveness, would have the following implications on their national economy: generating bugetary resources for the local budget; creation of new jobs with positive effects on reducing unemployment; increasing incomes of the population with positive effects on the standard of life; contribution to the growth of the gross domestic product; it has a dinamic effect on economy simulating it’s development and of other fields and organizations; it has a contribution in the foundation of a national brand; it is a source of national pride when a brand is getting well known internationally; it is facilitating the accumulation of know-how not only for the economy but for the society also; it has a strong training role in the promotion of quality cult and in dissemination of management practices.

-It ensures the health of the population and the environmental protection.

-The growth of overall satisfaction of people in their capacity of customers.

At present, taking into consideration the economic situation and the aspects related to the social life, the students need permanent guarantees that the standards of their diplomas are acknowledged by the future employees at a national and international level, and the employees need guarantees that they may choose from well trained future employees. Among the important elements of quality assurance, the feedback of the employers or potential employers – respectively of the business market, represents a strategic element of a competitive and efficient quality assurance system of any university.

Keywords: practical training, lifelong learning, higher education, tutors.

JEL Classification Code: M 20

Higher education is a service offered to society, which has a very strong impact on the personal development of individuals, as “it offers them the chance of being more freestanding, to have increased social mobility, professional and international mobility, increased incomes and increased empowerment”¹³⁸⁸.

The permanent increase of the population who has access to this service (at least at the level of year 2008) has created higher expectations, increased demands of the beneficiaries of these services. Although several young people do not succeed in making the necessary effort to graduate, the profit brought by this kind of education is clear and unanimously recognized in the Romanian society, so that we may uphold that all Romanian competitive universities are engaged in lifelong learning.

At present, taking into consideration the economic situation and the aspects related to the social life, the students need permanent guarantees that the standards of their diplomas are acknowledged by the future employees at a national and international level, and the employees need guarantees that they may choose from well trained future employees.

There is a common belief, presented in the Standards and Guides for Quality Assurance¹³⁸⁹, that the formal policies and procedures, prepared by the Romanian Agency for Quality Assurance in Higher Education (ARACIS) together with the Ministry of Education and the management of universities, offer a framework where each higher education institution may develop and monitor the efficiency of its own system of quality assurance, and thus, the superior quality of the educational services offered. By the development and implementation of its own strategies, policies and quality procedures, the higher education institution engages explicitly to promote quality in all its activities.

¹³⁸⁹ www.aracis.ro

Among the important elements of quality assurance, the feedback of the employers or potential employers – respectively of the business market, represents a strategic element of a competitive and efficient quality assurance system of any university.

In this context, according to Law no. 258/ 2007¹³⁹⁰ on the practical training of pupils and students, Order no. 3955 / 2008 on the approval of the general organization framework of the practical training strategies of the bachelor and master degree programs, of the Ministry of Education, Research and Youth, and the Regulation¹³⁹¹ on the professional training of the students of “Dimitrie Cantemir” Christian University, Bucharest, the Faculty of Economic Sciences of Cluj – Napoca has made a study on the perception of the employers related to the training of the students. This study is a preliminary test of the questionnaire which the faculty wants to use in the future in all its collaborations with the practice partners.

Based on an evaluation questionnaire for the interns, prepared at the faculty, the tutors (persons appointed by the practical training partner, who assure the observance of the training conditions and the knowledge of professional abilities planned for the period of the practical training), and the members of the department that prepares the practical training were asked to complete these questionnaires. We have interpreted the answers in this paper.

We have to mention that the staff of our training partners for 2009 – 2010 academic year, for the students of the Economy of Commerce, Tourism and Services are persons from the sales and marketing departments of various companies, performing commercial activities, in Cluj – Napoca:

No.	Practical training partner	Department	Number of employees in the department	Number of interns	Number of processed questionnaires
	Company 1	Sales department	5	3	15
		Marketing department	3	2	6
	Company 2	Sales department	4	4	16
		Marketing department	1	1	1
	Company 3	Sales department	3	3	9
	Company 4	Sales department	4	4	16
Total			20	17	63

The questionnaire includes several questions. The respondent has evaluated each intern practicing in his department, using an evaluation scale from 1 to 5, where 5 means “very well” and 1 means “insufficient”.

Respondents’ answers related to the evaluation indicators of the interns

Evaluation Indicators	Number of answers					Total
	Very well (5)	Well (4)	Indifferent(3)	Sufficient (2)	Insufficient (1)	
Work quality						
- understanding	9	29	4	18	3	63
- speed and amount of work performed	11	27	9	9	7	63

Ability to use the logistics (computer, telephone, etc.)	26	21	5	9	3	63

Respondents' evaluation

	Evaluation indicators	Average score
	<i>Work quality</i>	
1	- understanding	3,36
2	- speed and amount of work performed	3,41
3	- achievement of the tasks given	3,33
	<i>Reasoning</i>	
4	- capacity to make logic and viable decisions	3,76
5	- capacity to act independently or to ask for help	3,82
	<i>Creativity</i>	
6	- capacity to suggest viable alternatives	2,89
7	- capacity to apply efficiently the knowledge and abilities	3,46
	<i>Problem solving</i>	
8	- capacity to identify, analyze and solve the problems	3,49
9	- capacity to analyze the impact of decisions before performing them	2,87
	<i>Planning and organization abilities</i>	
10	- capacity to prioritize	2,86
11	- capacity to observe the planned program	3,87
12	- capacity to manage time in an efficient manner	2,87
	<i>Communication and interpersonal abilities</i>	
13	- capacity to express correctly and concise, both orally and in writing	2,87
14	- capacity to be a good listener	3,17
15	- capacity to interact tactfully when he has contact with internal and external staff	3,27
16	- capacity to adapt to the team work, to collaborate to the achievement of the tasks	3,21
17	- punctuality	3,57
18	- capacity to evaluate critically his own activity and to be impartial	3,35
19	- capacity to maintain confidentiality and to be trustworthy	3,97
20	<i>Professional curiosity and wish to learn</i>	3,54
21	<i>Ability to use the logistics (computer, telephone, etc.)</i>	3,96

If we make a graph of the results obtained, respectively the average value of the marks, taking into consideration that the maximum mark that may be obtained for each indicator is 5, we have the following information:

– the lowest average score is for the *“capacity to prioritize”* – 2,86 (when 41,26% of the respondents gave the mark “satisfactory” for this indicator). If this result is correlated with the very low score of the indicator *“capacity to manage time in an efficient manner”* – 2,86, we have an unfavorable image of the element “Organization and planning activities”; namely, the future graduates have problems with organizing activities. The majority of these students are not capable to identify the priorities and manage their time to fulfill their tasks. We may ask the question if this result is a signal related to the way the students are “fed” with theoretical elements, without having enough time to practice; or if there is a deficiency in the relationship with the practical training tutor, who cannot send the adequate information to the student. We think that both situations may be improved if in the future we lay stress on teaching strategies focusing on the student, on creating learning methods focusing on the student and if we renounce partly to the classical teaching method, which concentrates especially on giving information.

– we think that the low result obtained for the indicator *“capacity to express correctly and concise, both orally and in writing”* – 2,87 is the unfavorable effect of the examination methods, as we know that in the higher education system, the written examination is the most used examination form. As if it weren’t bad enough this way, we have gone further and generalized the level of the bachelor programs, and the students have multiple choice forms to complete for their exams. If for the written exams, where the students have to present the exam subjects, we have the possibility to see at least how they think, how they express in writing, at present, using the multiple choice tests and eliminating almost totally the oral examination, based on the hours spent by the students in front of the computer – we have “stolen” from them this minimum possibility to express themselves! We ask ourselves if this is a strong signal that the examination methods should be re-thought for the benefit of the student, by choosing methods focusing on the student, as we have already mentioned: case studies and role – playing games during the seminars, respectively oral examination or based on projects for semester examinations. Is this the result of the pressure made by universities that register many students, without being able to offer them the necessary conditions for a quality education service?

- as related to the result obtained for the indicator *“capacity to maintain the confidentiality and to be trustworthy”* – 3,97, we think that this is the result of the confidentiality conventions that the interns have signed with some practical training partners, by which they have undertaken to observe the confidentiality of commercial information they would find during their practical training;

– it is important to notice the results obtained for the indicators “capacity to act independently and to ask for help”, respectively “capacity to observe the planned program”, which make us see better the employment possibilities of the future graduates.

We think that this is a present-day subject. The partnership between universities and business environment is only the beginning, because as we try to understand each element that may connect the university and business environments, we find more and more questions that we have to answer as quickly as possible.

Analyzing the first information, we think that the persons in charge with the practical training of the students, together with the practical training partners, permanently involving the students and all academic staff, have to be responsible for these practical trainings and analyze the following aspects:

- alternatives of the teaching strategies focusing on involving the students in the teaching process, in order to offer them the possibility to improve their communication abilities, both in writing and especially the oral communication;
- involvement of the Student Career Orientation and Counseling Centre, which operates at each university and / or faculty and which should concentrate its whole activity according to the needs identified as a result of these studies, and at the same time to be a collaborator of the faculty in its relation with the business environment;
- re-thinking of the examination forms and change of the written examinations with other forms of examinations as projects, test based on oral examinations;
- organization of round table discussions where the representatives of the universities should discuss the best practices in the field of these strategic partnerships between the universities and the business environment;
- organization of periodic meetings with the representatives of the business environment to identify the contradictions between the training of the future graduates and the requirements of the employers, as related to their training for their profession;
- determination of performance indicators for the students’ professional activity, correlated to the results of these permanent studies of the employers’ perception, in order to obtain a quality educational service.

We think that within the context of the present reform of the Romanian education, the attention of the Romanian universities for the practical research activity, respectively for the students’ practical training, both at the bachelor and master degree programs (or maybe especially at these levels) should represent an important part of the process for the adaptation of the institutional evaluation procedures to the European standards for higher education.

In the related literature, there are many ways in which company competitiveness can be defined and understood. The purpose of this research is a better understanding of the SMEs competitiveness from the West Region of Romania. This study presents preliminary results of a research focussed on SMEs competitiveness. There are some positive and negative local and national factors which are influencing firms' competitiveness. This study confirms us our presumptions. The internal and external environment's influences on SMEs are very strong. Managerial competence and good managerial practices are very important factors in the durable success of SMEs.

Key words: SMEs competitiveness, entrepreneurs, environmental influences

JEL Classification: L26, O18

1. Introduction

SMEs plays an important role in our local economy. This role will increase in the future. It is very hard to determine the influences on SMEs competitiveness. We are sure that both factors, internal and external, are important for SMEs competitiveness. We do not propose here a methodology to find which factors are very important in SMEs competitiveness. It is difficult, because the importance of factors is changing now from one period to another. But we can say that, in the actual turbulent environment, these factors are constantly important for SMEs competitiveness: managers and their managerial ability.

2. Literature Review

In the related literature, there are many ways in which company competitiveness can be defined and understood. There is not a universally accepted definition of company competitiveness and there is a lack of precise definition of this concept.

At a country level, competitiveness is determined by productivity, depends on firms strategies, is, partially, the results of relationship between companies and local business environment, depends on social and economic objectives synergy and is influenced by factors from external environment (M. Porter). According to Porter, there are some internal and external factors that create a context in which firms compete and determine the ability of a firm to maintain its market share, to compete successfully.

During the time, many researchers focused on company international competitiveness, with examples from multinational companies. A neglected subject was the SMEs competitiveness, especially those companies, start-up firms, from Central and Eastern Europe, which are operating only in a local and/or regional market.

Many researchers are considering that competitiveness is synonymous with success and that means achievement of firm's objectives.

3. Research Methods

Our research is going on from the following *assumption*: the SMEs competitiveness in the Timis county is influenced by external and internal environment including entrepreneur's profile and competency.

We have used a questionnaire with 23 pages, 6 sections (with subsections) and 111 questions. The first section contains information about founder, company, field, employers, turnover in the last 5 years. (basic information). The 2nd section (the entrepreneur) contains information about the entrepreneur: education, training, experience, motivations to start a business, success factors. The 3rd section (companies profile) contains information about human, physical, financial resources, companies performance. The 4th section contains information about business environment. The last section contains information about entrepreneurship and ethics. This questionnaire was used in a previous research of a finished grant about SMEs competitiveness, directed and managed by Professor Nicolae Bibu, PhD. We also ask a question concerning the current crisis. We want to know if their firms were prepared for economic crisis.

The sample included only companies with income statement and balance sheet from an official database. We received and processed questionnaires with valid responses. The companies questioned were from *different fields*: production (70%), trade (20%), others (10%). The majority of questioned enterprises are in the top of *first 50% of competitors*. We focussed our attention on some SMEs county.

4. Results

In Romania, in 2007, the number of active SMEs was about 487,628. In 2009, the estimated number of SMEs was 600,000. Most of the SMEs were microenterprises, (88%), while 10% were small enterprises and 2% were medium-sized enterprises.

Sample structure by field of activity in 2007 shows us that there are many SMEs in the services sector, (75.5% including trade, different services, and tourism). In the industry and energy field were 12.41%, in construction 9.41% and in agriculture and forestry were 2.88%. In our country the number of SMEs was growing continuously since 2002. There was a favourable macro-economic context which influenced many people to start a small company.

In Romania, in 2009, the number of SMEs per 1000 habitants was about 26, very far from the EU average, 50.

In the Timis County, in 2007 there were 22,394 SMEs. Most of them were microenterprises (88.7%), while 8.9% were small companies and 2.4% were medium-sized company. Since 2002, when the number of SMEs was 12318, the number of SMEs was increasing continuously. Year by year, we can talk about a slowly growth. Most of SMEs were in services (79%). In the industry and energy field there were 11%, in constructions were 10% and in agriculture & forestry. The number of SMEs per 1000 habitants was about 32.5 in 2007.

We found that our companies have only internal competitiveness. This concept means that a SME is competing with other companies only in the local/regional/national market, in our case Timis / the West Region or Romania. We think that most of studied SMEs were defensive, very preoccupied to maintain their market share and gain an acceptable profit.

In our studied companies, the turnover was growing slowly in the last 5 years. The profitability rate was 15% (per all). In production SMEs the average of profitability was 10%. In the field of services, the profitability rate was 30%. It is important that we can discuss about the growth process. The net profit has increased continuously, but the growth was very slow. The main factors for this continuous increase were: improvement managerial skills; new distribution channels; modernization in technology, growth in production capacity; improvement in people motivation. The products are sold in the domestic market.

We found that *entrepreneurs* are important in the firm's growth process. They are the key in the entrepreneurial process. The owners have learned to become good managers for their business. Most of them have higher education (70%). They have technical education (80%) and economic

education (30%). 40% from all entrepreneurs have followed managerial training programmes. The average age for entrepreneur is 45 year. About the entrepreneur position in company, 80% are also managers, in most than 50% cases they are top managers.

The *external environment* influence on SMEs perceived by owners/managers is very strong. The actual environment is more uncertain, very difficult to understand.

The external environment, is influencing the small and medium sized competitiveness, and of course, management decisions. Through our questionnaires, entrepreneurs-managers have identified some external factors with positive influences on their productive business, in the 2005-2009 (during the first 3 months) period: the increase in the demand for their products in local markets; infrastructure modernization; opportunity for investments financing (EU money, structural programme) simplified access to loans; best quality of raw materials; production methods and modern technologies; growth in population buying power; positive modification in rules, governmental policies.

90% from questioned companies recognized that growth demand for their products in local markets is a very strong positive factors for their business, especially for companies with low performance. 60% from SMEs said that simplified access to loans is not so important for profit growth average rate. Infrastructure modernization is a very important factor for 50% questioned SMEs, per all. 84% of SMEs evaluate as being important the influence of investment financing opportunities on profit and of course on development process. Financing is also very important for business development and for profit growth average rate. Financing opportunity is also important for turnover average growth rate, for 80% of SMEs.

In the same time, we have identified factors which may have a negative impact on business development. Raising prices on raw materials and utilities have a strong influence on SMEs profits. The growth of competition is a very important factor, with a strong influences on turnover and profit rate. Entrepreneurs are expected that competition for resources and clients will be very strong. Legal and political factors are also influencing managerial decisions in company. To many taxes creates problems for small firms.

Entrepreneurs were asked about their strengths against competitors, which helps them to obtain good results: excellent organization; planning competence; good relationship with workers; marketing abilities; technical competence. Good workers, modern technologies, a good quality of the product/services, a good relationship with actual clients, innovation, enough financial resources, good strategies are also important for company competitiveness.

New EU regulations, including environmental protection, is a important factors with strong influences on companies profit (48.1%).

The main obstacles for business were: the payment for delivering products; the low level of qualified workers and the weakness financial power (difficulties in obtaining financial resources). Most of firms have appreciated that integration in EU is a positive factor for their business because of opportunities (new markets, free circulation of goods, a better access to raw materials). The influence of this factor on profit rate evolution is not so strong. All of entrepreneurs believe that increasing loyal competition is good, forced them to be more attentive to their products and clients.

Our questioned companies have the ability to provide products/services to consumers in an efficient and effectiveness manners. They have a competitive advantage among competitors and are able to generate profit (even the profit rate is low it is important that is profit).

Entrepreneurs consider that achieving success requires rapid, efficient and effective actions. Companies must be proactive, must be able to forecast the actions of external environment, anticipates changes and to prepare the answers. In our study, micro enterprises and small firms are active-reactive firms. They know that they must react in a short time, since the opportunity/threats have identified.

We can say that in most of the cases we found that there is a strategic approach, thinking, but few companies are really having a strategic plan.

There are many factors, from inside and outside the company, which can create a favourable conjuncture and the company achieve a temporary competitive advantage. The success consolidation depends on entrepreneurs, on their managerial ability to adapt environmental changes. Small firms are not so oriented to innovation (product, process, method).

In the future, the entrepreneur-manager must talk about sustainable success in both markets. That is why it is not enough for companies to compete only on the internal market.

Most of entrepreneurs said that they were not prepared for the crises. They were not enough interested in growing economic efficiency in their companies, especially reducing costs.

5. Conclusions

After this research, we are able to formulate *some conclusions concerning the SMEs growth and competitiveness*, from our questioned companies:

- For small business entrepreneurs, forecasting time horizon is limited under two years; in most of cases, entrepreneurs are managers and they are very implied in day to day activities. They do not have enough time to prepare long time plans.
- They have personal objectives which are related with companies. We found especially short time objectives.
- They do not use planning modern instruments (for studying external environment).
- They do not use contingency plans.
- Most of entrepreneurs have a flexibility in behaviour.
- Small businesses are very strong market oriented.
- Some external factors (economic factors) have a strong influence on internal competitiveness in the Timis County.
- A very important problem is the quality of qualified workers. We know that people, workers and managers make the difference between companies.
- Personal implication of entrepreneurs in problem solving helps many small companies to obtain favourable economic results. But is not a good practice for long time. As companies grow, managers must learn to delegate authority.
- Management style is influenced by entrepreneur's personality, his knowledge about management styles;
- Many companies, especially small companies have lack of formal information system; they are not able to process efficiently external information. In forecasting, entrepreneurs need many and different information
- In decisional process, managers are based more on creativity and their experience.

PSYCHO-SOCIAL PERCEPTIONS AND MANAGERIAL PREFERENCES OF WOMEN ENTREPRENEURS IN WESTERN ROMANIA

Săveanu Tomina

University of Oradea – Reserach Center for Adult Education

Borza Adriana

University of Oradea – Center for Career Services

Our study aims at identifying correlations between preferences and psycho-social choices of women entrepreneurs, more precisely the effect of these characteristics on a given managerial strategy. Based on the data obtained through the administration of two types of questionnaires, we analyzed the relations between social and psychological set of perceptions and managerial strategy. Social success and managerial performance are related with these perceptions and thus we can identify a significant conversion of mentalities determined by the governmental changes which took place in Eastern Europe after 1990. The data presented here are driven from the research conducted within the project "Entrepreneurship and equality of chances. A inter-regional model of entrepreneurship training for women in western Romania".

Aspecte metodologice

Datele pe care le prezentăm în această lucrare sunt preluate din cadrul proiectului „Antreprenoriatul și egalitatea de șanse. Un model inter-regional de școală antreprenorială pentru femei în vestul României”, coordonat de prof. univ. dr. Anca Dodescu în activitățile de selecție a participanților la cursuri respectiv activitățile de cercetare – monitorizare. În cadrul acestui proiect unul din grupurile țintă este reprezentat de femei manager care doresc să își dezvolte propria afacere, grup asupra căruia ne oprim în cadrul acestei prezentări. Datele prelucrate au fost obținute prin aplicarea unui chestionar de selecție, respectiv un chestionar de cercetare, aplicate femeilor manager de la nivel teritorial: orașele Oradea (30 de persoane), Timișoara (24 de persoane), Arad (27 de persoane), Baia Mare (24 de persoane), Reșița (24 de persoane) și Satu Mare(24 de persoane).

Descrierea eșantionului:

	N	Minim	Maxim	Media
Varsta	152	20	66	37,60
Venit pe gospodarie_luna trecuta	119	100,00	20000,00	5276,4454
Venit personal_luna trecuta	124	,00	15000,00	2611,8306

Majoritatea respondentelor (66%) sunt căsătorite și locuiesc în gospodării cu 2-4 membri, având în cele mai multe cazuri 1 sau 2 copii (14% nu au niciun copil). În proporție de 94%, participantele sunt de naționalitate română. Din punctul de vedere al vârstei, majoritatea (66%) au vârste cuprinse între 30 și 49 ani.

Din punctul de vedere al afacerilor reprezentate de femeile manager participante la aceste cursuri trebuie microîntreprinderi în proporție covârșitoare (78%), urmate de firme mici și mijlocii; domeniile prioritare: turism, servicii, comerț (în total peste 80%).

	N	Minim	Maxim	Media
Cifra de afaceri în anul 2008 (RON)	122	0	28097921	969342,33

Profitul în anul 2008 (în RON)	95	0	8800000	150462,67

In this paper we present a new and competitive personnel assessment procedure, developed and tested on the General Social Care and Child Protection Department of Bihor County. The procedure is based on behavioral anchors evaluation scales and has a seven folded structure, completed by the employee and the hierarchical coordinator. The evaluation of this scale proved valid and also revealed the fact that in assessing the professional performances we cannot use only the self-evaluation, which is under the risk of subjective influence, but in the same time we cannot use only the evaluation of managers because they don't capture specific aspects of behavior on the workplace.

Key words: performance assessment, personnel evaluation strategies.

Cod JEL: M00, M1, M52, J39

Performance assessment between theory and practice

The efficiency of organizations can be analyzed also in terms of the efficiency of its personnel: to what cost and with what results a certain activity can be carried out, how can one improve the results obtained, and how does each individual contribute to the achievement to the organization's goals are important questions. In the dynamic of labor markets and theories as well as practices of human resources, the role of assessment of goals, of structures and as people became an important dimension of evaluation of a given organization. Having efficient employees is a key element in both public and private organizations.

In an organizational structural, the appreciation of professional performances represents a goal which focuses mostly on an objective measurement of results. This activity is based on self evaluation as well as on a received feed-back regarding personal achievements. Nonetheless, personnel assessment can offer a starting point in stimulating performance, a method of correction deficiencies related to work results, as well as the foundation of human resources management strategies.

Romania is one the first countries that regulated this activity through the Law no. 12/1971 and then consequently in 1998, 1999 and 2001 (Laws no. 154/1998, 188/1999 and Governmental Regulations no. 775/1998 and 1084/2001) through which there was initiated a personnel assessment system first for public employees and then for other categories of personnel (Pitariu, H., 2003, p. 113-115).

Professional performance assessment represents a complex activity based on a synthetic analysis of previous activity undertaken by a person. This procedure starts from establishing the objectives of assessment, continues with the investigation of the situation and the construction of assessment instruments, data gathering and analysis, interpretation of results, description of performances and the creation of a strategy.

“Personnel assessment can be defined as a set of processes through which critical judgments are issued on the personnel, considered individually, as employees in a concrete position, with the aim of reveling the key elements of the way objectives are achieved, concrete actions are carried out and the responsibilities and competences are practiced, as well as to set the retributions,

define the training strategy in terms of qualification improvement needed and elaborate the promotion perspectives". (Nicolescu, O., Verboncu, I., 1995, p. 324)

It is a complex process, often controversial. In order to ensure the correct measurement of results it is important to correlate this activity with an advanced evaluation technology which can offer logically set criteria, realist performance standards, as well as the use of adequate evaluation instruments and methods. In this context the evaluation procedures should correspond to the firm's vision regarding the way activities are organized and coordinates personnel, the procedures being standardized to avoid biases induced by the evaluator. Standardization is ensured through training of evaluators, use of written forms and audio-visual materials. More, the information used should be reliable to avoid errors in the results (Byars, L., Rue, L. W., 1991, p. 311-343).

Analyzing the way organizations assess personnel performances one can draw the conclusion that there is no ideal procedure, the methods and techniques used being the result of several factors such as: organization culture, the size of the firm, domain of activity, strategic trends, objectives, the employment methods, remuneration and promotion system, etc. (Mathis, R. L., Nica, P. C., Rusu, C., 1997, p. 162). In this context it is crucial to set several methodological and organizational standards for the assessment of personnel;

- the assessment criteria should be differentiated on the nature of jobs, the potential of the organization and its objectives;
- assessment should be unitary,
- assessment should be relevant, conducted during a longer period of time,
- assessment methods should focus on the characteristics of each separate jobs,
- assessment should be based only in correct information which can be verified,
- assessment results should be communicated to the persons evaluated, along with necessary recommendations. (Burloiu, P., 1997, p. 157)

The elaborated models of personnel assessment, as opposed to the empirical ones (Pitariu, H. D., 2003), are determined on criteria, concepts, methodologies and evaluation standards based on scientific knowledge. These models target the performance analysis of managers and personnel on the following elements: the structure of personality and specific experience, process related mechanisms of professional behavior, and the product of professional behavior.

Another relevant aspect of the characterization of performance assessment systems is represented by the social actors involved in this process. Thus, depending on the organizational structure and culture, one can find only the involvement of the employee and its direct coordinator, or we can find also the involvement of: colleagues and collaborators, subordinates, internal or external clients, or even external evaluators (Abrudan, M., 2009). In this sense, it is worth mentioning that participative managerial styles promote an assessment procedure in which the assessed person is actively involved sometimes even at setting sanctions and personal developmental plans.

Professional evaluation scales

One way of assessing the professional performance refers to the use of behavioral scales. They proved to be the most effective types of performance appraisal systems, mainly due to their reliability, high validity and the possibility to reduce systematic errors compared to other evaluation methods. In this category are included the behavioral anchors scales (S.E.A.C) and the mix standard evaluation scales (SEMS) (Codoban et. all, 2003, p. 46). The evaluation scales that are focused on behavior are continuous assessment techniques in which the items used for classification are possible examples of conduct relating to a specific job. This kind of scales measures the specific level of performance for each dimension of the job. The evaluation scales based on behavior reveals concrete conducts, observable and measurable corresponding to the target job. Using behavioral anchor scales in the professional performance evaluation process we can obtain specific information about the persons which are evaluated. The first step in this technique is to establish the criteria that need to be followed in the evaluation process, and further to award grades for each criterion (Pânișoară, G., Pânișoară, I., O., 2007, p. 154). The starting

point for the elaboration of a assessment system such as the behavioral anchor scales is the idea that the assessment errors can be avoided if the assessor is actively involved in the grading process, objectively filling up the evaluation form. Also, is extremely important to involve the assessor in the elaboration of the scoring system (Pitariu, H. D., 2003, p. 153).

The logic of the scales with behavioral anchor S.E.A.C. (Landy, F. J., Trumbo, D. A., 1980, p. 276) is that the anchors are explanatory statements that can accurately distinguish a good from a weak one employee. These types of scales meet three important criteria: professional success factors are defined with great accuracy, anchors describe with precision the positional categories of each job dimension, and the grading process is based on specific instructions for operating the scale.

The construction of an expectation evaluation scale implies the involvement of specialist in the elaboration process (Smith, P. C., Kendall, L. M., 1963, p. 149-150). In the initial phase, specialists establish the dimensions of a certain sector. Subsequently, to each dimension are assigned professional performance behaviors: superior, medium and inferior. These examples of behaviors are then selected using a group of experts whose task is to eliminate those behaviors that cannot be properly framed in the dimensions. The selected items will represent the final scale used in this research.

Data and measure

To measure the job performance recorded by the social workers from the General Directorate of Social Work and Child Protection Bihor, we used an evaluation scale with behavioral anchors, based on the model of behavioral anchors scales SEAC. The scale was build using the support of professionals operating in the institution in order to capture specific aspects of the activity from this type of institution. We note that the scale with behavioral anchors used in this study was not validated before.

The research was conducted with the participation of 50 social workers and 8 head of services, employees of the Directorate of Social Work and Child Protection of Bihor. For the construction of the scale we involved the 8 head of services. Using the information gathered from them and the legal information regarding the performance criteria used in the individual performance evaluation of employees in public institutions (Order no. 13 012 of 13 November 2007), together with the experts, we drawn the items and the description of each item from the scale. This form was examined by a number of 7 experts (sociologists, social workers, psychologists), who were tasked with the discussion and the selection of the items included in the final scale. This evaluation scale uses professional performance criterion for the social workers who work directly with the beneficiaries of social services.

The scale is built on 7 dimensions (see Table 1). For each item, the assessor can give grades rating from 1 to 9, where 9 represents exceptional performance, 5 represents average performance and 1 represents poor performance.

One of the objectives of the study is the validation of the scale, both for the self-evaluation and for the evaluation by the manager. The research also sought to capture the difference between the self-evaluation scores and the evaluation scores.

Results

As presented in the table below, results show differences between the scores obtained through self-evaluation and scores obtained through evaluation by directors. Also the graphic representations of the distribution of scores for each dimension reveal us differences regarding the normal curve. The graphics implies higher Kurtosis values for the distribution of scores from the evaluation scale, compared to the self-evaluation scales. This means that managers more frequently use values from the two poles of the scale, compared with employees who have a tendency to use central values for the self-positioning on the scale. For each dimension of the evaluation scale, employees obtained lower scores from the directors, compared to the values given by themselves.

Table 1. Mean values for each dimension

	SELFEVALUATION		EVALUATION	
	Mean	Std. Deviation	Mean	Std. Deviation
D1. Theoretical and practical competences	7,53	0,680	6,67	1,546
D2. Professional interest, self-evaluation	7,90	0,941	6,80	1,369
D3. The ability of problems solving	7,73	0,861	6,98	1,233
D4. The ability of organization and planning	7,94	0,899	7,18	1,034
D5. Interpersonal relationships and communication abilities	8,18	0,882	7,53	1,120
D6. Compliance with labor discipline	8,45	0,738	7,43	1,000
D7. Ethic behavior	8,69	0,508	8,35	0,561

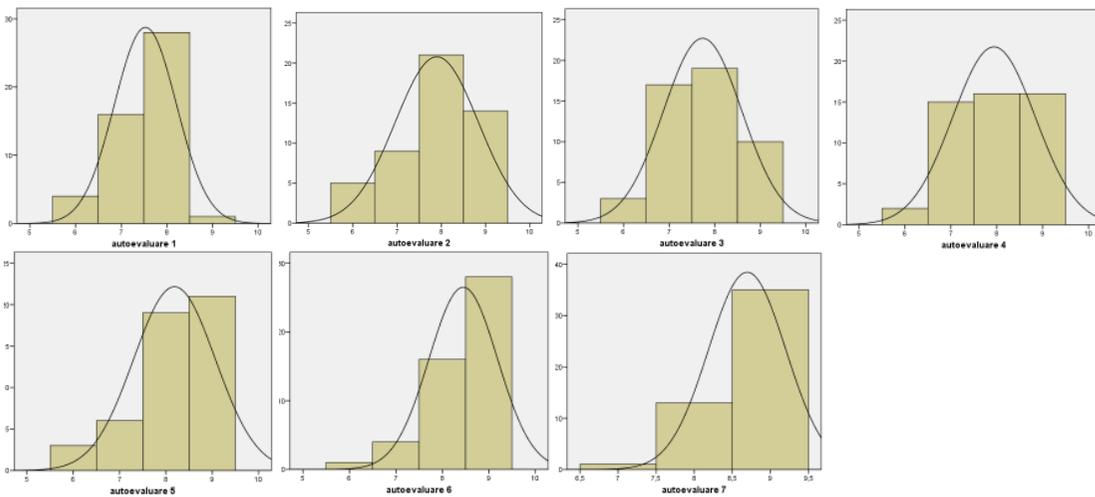

Figure 1. Distribution of the dimensions from the SELF-EVALUATION scale

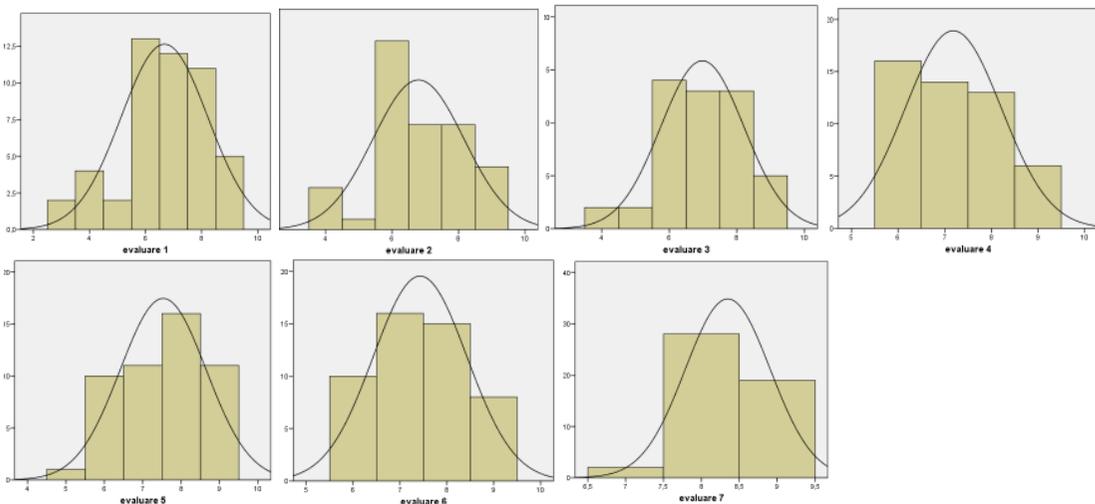

Figure 2. Distribution of the dimensions from the EVALUATION scale

Further analyses reveals significant statistical differences between all the dimensions used in the evaluation scale ($p < 0.001$). The test results suggest that the directors significantly gave lower

grades to their employees, compared with the values given by the employees for themselves. In this sense we draw attention to the subjective issues that may arise in the process of self-evaluation.

Table 2. Differences between the mean values of each dimension from the Self-evaluation scale (SEV) and Evaluation scale (EV)

SEV-EV	Paired Differences					t	df	Sig. (2-tailed)
	Mean	Std. Dev.	Std. Error Mean	95% Confidence Interval of the Difference		Mean	Std. Deviation	Std. Error Mean
	Lower	Upper	Lower	Upper	Lower	Upper	Lower	Upper
D1	0,857	1,620	,231	,392	1,323	3,703	48	,001
D2	1,102	1,279	,183	,735	1,469	6,033	48	,000
D3	0,755	1,315	,188	,377	1,133	4,018	48	,000
D4	0,755	1,283	,183	,386	1,124	4,119	48	,000
D5	0,653	1,267	,181	,289	1,017	3,607	48	,001
D6	1,020	1,108	,158	,702	1,339	6,444	48	,000
D7	0,347	0,663	,095	,156	0,537	3,663	48	,001

The professional evaluation scale we tested is valid: for the self-evaluation scale, Cronbach alpha=0.827 and for the Evaluation scale, Cronbach alpha =0.908. The mean value for the EV is lower, compared to the SEV mean value. The scales register a normal distribution (see figures below).

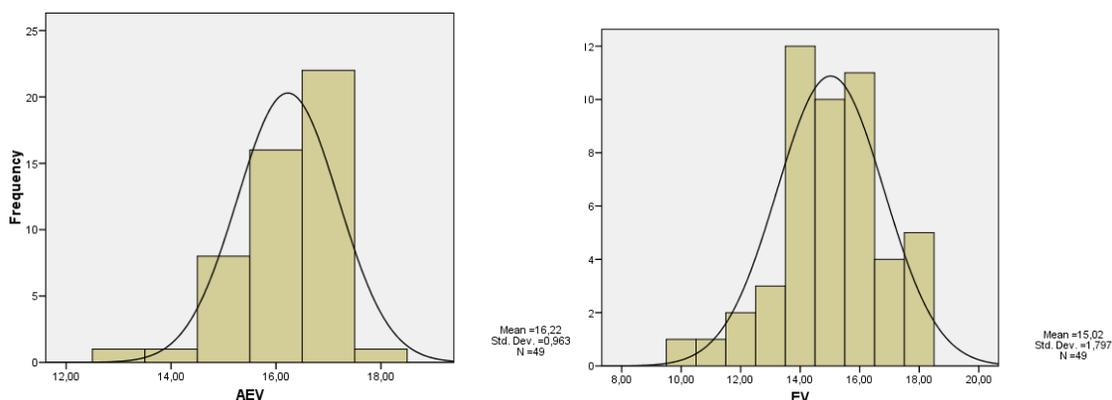

Figure 3. Distribution of SEV scale and EV scale

Test results show significant difference between the mean value of the self-evaluation scale and the mean value of the evaluation scale. The more objective evaluation by the directors places employees lower on the scale. This situation provides us a segment on the scale that refers to the difference between self-evaluation and evaluation.

Table 3. Differences between the mean values of the SEV and EV

SEV-EV	Paired Differences					t	df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		Mean	Std. Deviation	Std. Error Mean
	Lower	Upper	Lower	Upper	Lower	Upper	Lower	Upper
SEV-EV	1,20408	1,84819	0,26403	0,67322	1,73494	4,560	48	,000

Discussion

In our study we tested a professional evaluation scale based on the behavioral anchors evaluation scales (S.E.A.C.). Our scale turned out to be valid, and thus we reinforced the conclusion that it is crucial that evaluation systems should be based on scientific knowledge, with the contribution of experts in this area, adapted to the characteristics of job description and should also be based on behavior.

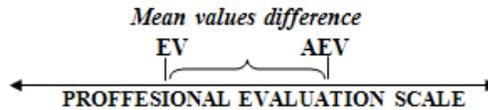

Figure 4. Proposed model for the professional evaluation

Also the analyses revealed significant differences between self-evaluation scale and the evaluation scale. In assessing the professional performances we cannot use only the self-evaluation, which is under the risk of subjective influence, but in the same time we cannot use only the evaluation of managers because they don't capture specific aspects of behavior on the workplace. Using both types of evaluation, and measure the final score based on the difference between the two values obtained, it provides higher fidelity for the evaluation process.

Consequently, an assessment procedure should include at least the appreciation of self and the appreciation of a direct coordinator, yet it would be interesting to evaluate the extent to which the assessment of others in the organization (subordinates and colleagues) as well as assessments of external clients can contribute to a more valid result. In further activities in this area we propose such an approach.

A product cannot fulfil its role, its calling, unless it enters the final consumption, satisfying the need of the consumer who has bought it. But, the road from the producer to the consumer, in the contemporary conditions is not general, nor simple, nor short, nor cheap. The processes of globalisation, the internationalisation of the markets have lead to the intensification of the distribution of products, and, at the same time, to the amplification of the distances they travel. All these have determined the awarding of greater attention on the maintenance of the quality of the food products on the entire technical-economical circuit.

Keywords: storage, transport, trading, food products, quality

Cod JEL lucrare: M31- Marketing, Q18 - Agricultural Policy; Food Policy

1. Intrinsic factors that influence food quality

The quality of the food products is a dynamic feature, a status quo which is modified in time due to certain influence factors, modification which can be done in favour of the food products (as it is in the case of the vegetables) when the storage conditions are controlled and directed, or which can damage it when the optimal conditions of transportation, storage and trading are not met.

Regardless of the technical and economical process where the food products are found, these are found in a continuous process of storage. Due to this fact, this process must be kept all the time under control and we must intervene for the product to keep its quality features, in order for the processes and the modifications that can manifest in the food products to affect its quality.

The influence of the factors which act on the quality of the food products on the path of the technical and economical circuit can be noticed during the storage, their preservation in warehouses, the transportation of the food products, as well a during their trading.

One of the main factors that have a major influence on the quality of the food products is the chemical composition of the products. The chemical composition of the live organism, animal or vegetable, is complex, including numerous chemical compounds whose structure and proportion differs a lot according to the nature of the organism, the age, the food and the environment conditions. Nevertheless, the food products have certain common features, in the limit of each group, especially related to the chemical composition. Either they are native chemical substances (water, mineral salts, sugars, fats, proteins, vitamins, pigments etc.) or they are added chemical substances (tonic substances, aromatic substances, colour substances, emulsions, stabilisers, flavours etc.) or accidental substances (herbicide, insect powder, anti fungal substances, substances from the machines and the wrappings etc.), these influence and can negatively affect the quality of the food products while preserving, transporting and trading.

The quality of a product is appreciated through the level reached by all its properties, which represent, each in part, the multiple faces of the quality. One of the ways that lead to the

knowledge of the quality of a product consists in the identification of the properties which, finally, lead to the satisfaction of the need for which they have been produced. The structure of the food products, the relations that form between the different components of the system-merchandise, the interactions products - environment and products - human being, must be known in detail in order to find the way to follow to maintain the level to which the product preserves its optimal quality.

2. Environmental factors that influence food storage

The preservation, the transportation and the trading of the food products depend on the series of influence factors, internal as well as external, process during which there can appear physical changes, chemical changes or biochemical changes with more or less intense implications on their quality. These factors must find themselves in a certain balance for the preservation of the quality of the food products intact.

The maintenance of the temperature at a certain level during the storage influences the quality as well as the storage duration of the food products, for each type of product an optimal regime of temperature being necessary.

The humidity is another factor which influences the quality of the products while preserving and storing them. The relatively high humidity of the air from the storage facilities has as a result the development of the micro-organisms, the humidity of the products etc. In the case previously presented, of the horticultural products, when the humidity is too low or the temperature is too high, the water losses from the stored products are high and, thus, the vegetables and the fruit fade. Hence, the relative humidity of the air is maintained to a certain level in order to record the lowest total losses. The optimal limits of the relative humidity vary, generally, for the products stored between 55 - 95%. For the relatively high humidity (95-100%), moulds can develop on the storage walls, on the wrappings, on the products.

The air circulation also is important during the preservation and the storage of the food products, through the means of the ventilation the temperature and the humidity of the warehouse being able to adjust.

During the preservation, the products come into direct or indirect contact with the atmospheric air. Interactions with repercussions on the quality of the products can take place between the products components and the air components. The atmospheric air is a mixture of gases and liquid or solid particles, its components being: fix, variable and random. For a series of products the preservation within a controllable atmosphere is imposed, that is an adjustable atmosphere especially regarding the proportion of oxygen and carbon dioxide.

The air components can have, in certain conditions, positive effects. Thus, the ozone helps to disinfect and refresh the air in the storage, the carbon dioxide, in a certain proportion, reduces the development of the micro-organisms, and the sulphide dioxide fight mould.

The food products constitute good environments for the development of the biological agents, especially of the micro-organisms and the insects. In favourable conditions of temperature and humidity, the micro-organism develops rapidly, producing enzymatic complexes which attack the products. Among the degradations provoked by the biological agents, the most important are the ones that lead to the reduction or even to the total loss of the mechanical resistance of the products. The presence of the fungi affects the aesthetic of the products through a disagreeable aspect and through a specific smell, unpleasant, developed by moulds. Other biological factors would be the xylophages insects and the rodents, which constitute a danger for the integrity of the wrapping, the products and their hygiene.

Along with these factors we must take into account the hygiene of the storage facilities, the existence of the foreign smells in the warehouses and the principle of vicinity of the products, for the features of the products, especially the organoleptical one, not to have to suffer.

The means of transportation constitutes also an environment which can maintain or not the quality of the food products; certain measures being necessary in order to protect the food from

the potential sources of contamination, in order to protect the food from deterioration, this becoming non-fit for consumption, as well as to ensure an environment which cannot favour the development of the pathogen micro-organisms or the alteration and the production of the toxins in the food.

While transporting the products there can appear risks caused by the hygiene status and the technical status of the transport means, by the physical and the hygiene status of the transport wrapping; by the improper unfolding of the loading - unloading operations; by the hygiene of the personnel involved in the transportation activity; and the micro-climate conditions specific for the transported products etc.

The transport constitutes one of the most important stages of the food products distribution. Due to their specific and their perishability in their great majority, the condition in which the transport is executed contributes to a great extent to the maintenance of the quality features. The problems that appear in this stage refer especially to the choice of means of transportation proper to each type of product, to maintaining a constant temperature all the duration of the transport, the manner of arranging the products in that transport, the choice of the routes from the starting point to the destination point.

Taking into account the considerable size of the European Union space, the means of transport as well as the routes that those transport companies shall travel must be carefully chosen, so that to maintain between normal limits the quality features of the food products. The critical roads should be calculated between the shipment locality and the destination one, choosing the optimal variant. Any delays or distractions from the set route can affect the transported products.

In the decision regarding the transport of the food products one shall take into account the differences of temperature among the different countries and locations, according to these and according to the specific conditions of transport, storage and preservation of each product, choosing the best way to transport it.

The food products, due to their chemical composition, present a favourable environment for the development of the micro-organisms, being an excellent source of energy and development of the metabolic activity. Within the same product, there can exist more types and species of micro-organisms, but also the ones which have the optimal food, humidity, pH, oxide-reduction potential conditions shall develop. Until a certain point, there prevails a certain micro-flora, but through the modification of the environment conditions, under the influence of some micro-organisms, there starts to develop another micro-flora, which until then has been latent. For the food products, a huge interest belongs to the bacteria, moulds and the yeasts.

The humidity of the food products is a huge important factor; because for 12% under the water content, no micro-organism can attack the food products (see water in the food products).

The temperature is an external factor which contributes in a certain measure to the diversity and the variability of the micro-organisms.

The light is an external factor which can influence the activity of the micro-organisms to a great extent. If the orange and yellow radiations from the electro-magnetic spectrum are indifferent, the yellow and green radiations are active, while the ultraviolet radiations are destructive.

The level of the food products pH influences the activity of the different types of micro-organisms, taking into account the fact that the majority of the bacteria develop at a pH of 6.5 ... 7.5. The more the value of the pH exceeds these limits, the slower the development becomes, and for the limits of the pH <4 or pH >8, it stagnates. The yeasts and the moulds do not have the same behaviour; they prefer the more acid environments, some of them being able to develop in a very low level of the pH, around 2.

Among other external factors with influence on the micro-organisms activity we enumerate: the electricity, the pressure, the osmotic pressure, the superficial tension, the ionisation radiations etc. The main micro-biological processes which can take place in the food products are: the fermentation, the rottenness and the moulding.

Within the fermentation process, many chemical compounds appear. The ones found in the greatest quantity are the main compounds, the accumulated in smaller quantities are called secondary compounds. The fermentation is called after the main product - alcoholic (ethyl alcohol), acetic (acetic acid), lactic (lactic acid) etc.

Generally, the micro-organisms need air, heat, humidity and food to exist and multiply. So, there are the following possibilities to control their evolution: the humidity change (dehydration); the thermo processing and the elimination of the air (cans conditioning); the reduction of the temperature (refrigeration and freezing); the transformation of the food into the product improper for the development of the micro-biologic life (salting, smoking, pickling, adding sugar).

Fortunately, researchers pay a special attention to the correct direction of the manufacturing processes and preservation processes which aim the reduction to a maximum of the danger of falling ill because of the pathogenic micro-flora.

As a consequence of these factors, within the food products there can take place different changes while their preservation such as: modifications due to the temperature, modifications due to the humidity, chemical changes, biochemical changes, enzymes and micro-biological changes. Thus, the preservation in optimal conditions of the products in the storage facilities means the control and the direction of the size of the atmospheric parameters - temperature, humidity, composition and the speed of the air circulation, according to the standardised stipulations.

We mention that through the storage facility we understand the means of transport (mobile storage facility) and the warehouses (fix storage facilities). The operations occasioned by the control and the direction of the size of the atmospheric parameters differ according to the type of the warehouse where the products are kept, taking into account the particular features the respective products have. These operations, connected to creation of the optimal preservation regime of the products, aim at: the control and the direction of the temperature, the humidity of the air in the warehouse, the circulation speed of the air, as well as the content of the storage facility air.

3. The distribution and the trading

The distribution and the trading constitute an important stage of the technical-economic circuit of the food products, stage in which there can appear all sorts of economic and social problems. Due to the nature of these products, any distraction from the conditions of trading and any non-concordance with the technical norms stipulated for the food products can lead to the deterioration in quality of the products, becoming improper for human consumption. As a consequence, to prevent the problems that can appear along the distribution and trading path, and to maintain the quality of these products, the distribution channels of the products, the trading forms, the manner of wrapping, the manner and the conditions of transportation, the preservation and the storage facilities must be chosen carefully, all these on the background of the hygienic and sanitary conditions strictly regulated.

Due to the specific of the manufacturing process specific for the evolution of the request and the manner of organisation of the rural environment, the agricultural products are traded very differently, this fact leaving its mark on the structure of the distribution channels. The difficulties of the agricultural products trading refer mainly to the following aspects:

- the agricultural production is located very unevenly and dispersed in space and time. The products are almost all very perishable and the majority of the products appear on the market at the same time. Moreover, while the individual request is non-flexible, the industrial request is speculative, waiting for the overproduction, to obtain a reduction of the price which allows the profitable supply;
- the purchase process of the products is long and especially very expensive as a consequence of the dispersion and the dividing of the agricultural exploitations. The preservation of the agricultural products of perishable nature needs large interventions regarding the storage and the transportation, as well as the technical endowments.

Under these conditions, in distributing the fresh food products, all types of circuits must be used. Thus:

- a) the direct channels and the shortest one appear frequently in the trading of the agricultural products, because the majority of these agricultural producers sell their products directly to the final consumers, either at the residence of the producer or in the agricultural market places;
- b) the short channels are quite well used, because a part of the retail traders have the possibility of supplying directly from the agricultural exploitations and the slaughter houses, the animal farms etc. with a series of products, which they later on offer the consumers through the means of the different forms of sale;
- c) the distribution channels of medium length are used when the central unit of purchases has the possibility of purchasing the products from the agricultural exploitations, assuming the responsibility of the storage and the conditioning during these periods of storage, in order to direct towards the retail sales points;
- d) the long channels are used when a series of economic agents, specialised in the storage and the conditioning of the products for larger periods, they store the products and then they sell them either to the en-gross seller or to the retail sellers, who, in their turn, place them at the disposal of the consumers. Having as an object of activity the take over, the processing and the trading of the agricultural products, the economic agents with a mixed feature assume the responsibility for the storage and the selling by instalments to the en-gross sellers and the retail sellers existing on the internal markets, but also on the external ones.

In the choice of these distribution channels, one should take into account the expiration date of the food products which make the object of the distribution, so that the products that have a small expiration date should not stay too long on their way from the producer to the final consumer.

The food products are under the impact of the environment agents, so their properties are constantly changing from the moment of the end of the manufacturing process and until the products reach the non-edible stage when the attitude of the negative changes make an impression on the consumption, needing to take it out from the food circuit. Within this frame, one must take into account the following time parameters: the maximum duration of the product circulation, the validity period given by the manufacturer, the maximum duration to store it and the maximum duration of the edible stage. The producer guarantees the quality directly during the validity period, within this period the merchandise should be wrapped, transported, manipulated and stored according to the instructions, in order to preserve the initial quality unchanged. The validity period set forth experimentally by each manufacturer in precise conditions, is lower than the durability of the food product, which in turns is smaller than the consumption of the food product.

In order to reduce the trading risk, it is indicated that the manufacturer to deliver rhythmically food products, after the end of the technological process, in order for the validity period to be as much as possible at the disposal of the trader and the consumer.

It is mandatory to write down on the wrapping or on the label the validity period or the expiration date for consumption of the respective products. The problems connected to this can take many shapes: either the expiration date is missing from the wrapping or it is overdue, situation in which the respective products shall be pulled out of the economic circuit and destroyed, or, due to the improper conditions of storage and preservation of the respective products are altered, although they are within the normal validity period.

4. The hygiene and sanitary conditions of food products

The food products must fulfil hygiene and sanitary conditions. The food products in general and the food products of animal origin especially, must fulfil the hygiene and sanitary norms in force in the European Union.

The hygiene and sanitary conditions must be complied with starting with the hay for the animals, the sacrificial facilities, the halls of the slaughter houses, the warehouses and the preservation place until the shops.

The feeding of the animals with the hay that does not comply with the norms lead to their falling ill, the meat obtained from the animals becoming inadequate for consumption. Not a few time, the inspectors have found discrepancies in the slaughter houses halls, in the storage facilities, the respective unites being closed down, withdrawing their licence.

Even if the products reach in fairly good conditions the retail units, many irregularities have been found regarding the products trading (without being kept in the right conditions of temperature, the non-compliance with the principle of vicinity, the precarious conditions of hygiene). Including the persons from the commercial sector who come into contact with the respective products like the transport companies, the seller etc. must fulfil certain hygiene conditions.

5. The wrapping conditions of the food products.

The wrapping is the key point in maintaining the quality features of the food products along the technical and economical circuit. Besides the protection function fulfilled by the wrapping, the consumer can obtain information about the respective product through it.

The problems that appear in the case of the wrapping are connected to the manner of wrapping and the material of the wrapping. This must be chosen so that it can protect the product from the external factors and must ensure an environment for the preservation of the optimal quality of the product.

Along the technical and economic circuit of the product, an improper manipulation of the products can deteriorate the wrapping fact that might lead to the partial or total loss of the respective product to the contamination of the product or to the loss of the quality features of the product. Even the wrapping operations must be performed in such a way to avoid the contamination of the products or their deterioration.

6. The products traceability

The traceability of the food products, of the animals from which the food products are obtained and of any substance destined to the incorporation into a food product is set forth for all the stages of the production, manufacturing and distribution. The operators from the food sectors and the operators with an activity in the field of animal food must be able to identify any person who has provided them with a food product, food for the animal, an animal from which food products are obtained or any other substance destined to be incorporated into a food products or animal food. To this purpose, these operators dispose of the systems and procedures which allow this information to be placed at the disposal of the competent authorities, upon request.

The food products which are introduced on the market or are expected to be introduced on the market in the Community are labelled or identified accordingly for the facilitation of their traceability, through documentation or adequate information, according to the relevant requirements of the special dispositions.

There are specialists who state that the complete traceability is impossible to achieve. A system which follows every input and process, with an adequate degree of accuracy, is almost impossible. In essence, according to the EU Directive no. 178/2002, the concept of traceability means the ability to follow the agricultural product or the hay, an animal which produces food or a substance which is about to be incorporated in a food product or in the hay, in all the stage of the production, processing and distribution. For the European countries, the traceability has become a key concept in the are of the logistics, in the context of the crises from the '90, related to the mad cow disease which appeared first in Great Britain and then in other EU countries, as well as in the context of the very powerful debates referring to the genetically modified organisms or bio terrorism.

The concept of traceability refers not only to the upstream sequence, but also to the downstream sequence of the marketing channels. Besides the ability to identify the supply sources, any operator must dispose of the ability to identify the organisations which have supplied its products.

The specification of each operator's obligation to ensure the traceability is a real challenge under the organisational and informational aspects. Each economic agent from the production, processing and distribution field of the agricultural food products and of the hay must dispose of the systems and procedures which allow the information to be available at any time within the organisation and to be place at the disposal of the competent authorities, upon their request.

Abstract: In this paper we try to analyze the meaning of the public administration term. In our opinion it is necessary to be able to define exactly what public administration means but at the same time to clearly distinguish it from the other sciences. This is due to the fact that very often confusion is made between public administration and public management, public administration and bureaucracy or public administration and policy.

Throughout this paper we hope to clarify some of the aspects related to what exactly distinguishes public administration from the above mentioned sciences and what are its own particularities.

Keywords: public administration, public management, new public management

JEL Classification: H 83

The Concept of Public Administration

The public administration term has a latin origin and comes from the latin „administer” which means servant, or from another point of view, instrument. The verb „administro” means to lead, direct or lend a helping hand. The word „administer” almost synonymous with „minister” – which means: servant, care-taker, helper was formed from the root „minus”-„minor”, which means „less” and the prefix „ad”, which point direction, „sensul” and highlights the state of inferiority related to „magister”, translated as the one who orders, the superior, the boss – word that was formed from „magis”, which means more (Matei, 2006).

In the Romanian dictionary, administration refers to the activity of administrating, leading, directing, as well as to the total of administrative organs in a country or section of an institution encharged with administrating that institution.

The Illustrative Oxford Dictionary defines administration as business management, public affairs management, governing.

In the Public Administration Dictionary (Fox & Meyer, 1996) is shown that administration involves performing activities by persons encharged with comun objectives.

Some authors believe that administration means public affairs management or the way in which a country functions in exerting government duties (Maheshwari, 2002).

Administration is the most obvious part of governance, it is the governance itself, it is the executive side, the operational one, the most visible part of governance, and it is of course, as old as the governanace itself (Pestrit, 2005).

Of all the numerous meanings that the term of administration can have, the accent is predominantly put on what public administration means, having as purpose to clarify the meaning the later has.

Most of the times there is a tendency to confuse the terms, although at a closer examination, the aspect that diferentiates administration and public administration is the purpose and the method of organizing activities.

Defining public administration is necessary, firstly in order to establish the general boundaries and to express the main concept of discipline and practics of public administration, secondly in order to help including this area in a large political, economical and social context, and third to

be able to show that by considering the major definitions of public administration there are three major approaches for this field (Ioan, 2007).

Public administration, as many human efforts, is difficult to define, but people all have given a sense to it, although there are different opinions on how it could be achieved (Ioan, 2001).

A simple approach of public administration is that it refers to two distinct, but close activities: a professional practice and an academic area. On one hand, it refers to administering or management of the aspects related to society, politics and its subparts that are not private, familial, commercial or individualist, and on the other hand, it refers to the disciplined study of these aspects (Marini, 2000).

In spite of the apparent similarities, nowadays public administration is an entirely different organism from the public services in the past. It is wider than before and is still expanding. It is much more complex than in the past and it continues to grow each day. It has more responsibilities towards the citizens and it still needs to handle the increasing demand of the population. It needs more qualifications, but more than before, it needs to restrain activities and to reach the standards of equity, justice, social justice and most of all of assuming responsibility (Vigoda, 2002).

Public administration is the activity that consists in using managerial, political and judicial processes and theories, in order to achieve legislative, executive and judicial government mandates, to ensure the regulations and services for society in its ensemble, as well as for its segments (Ioan, 2007).

Public Administration and Politics

Public administration has frequently been understood through the political analysts point of view or the point of view of political researchers. Alternatively, it was considered to be a specific field of the management science. Meanwhile the origins of administrative processes are firmly identified with political science, political studies and managerial construction of public institutions, it would be inaccurate to show the nature of public administration strictly referred to these aspects (Vigoda, 2002).

Eran Vigoda (Vigoda, 2002) shows in „Public Administration An Interdisciplinary Critical Analysis”, the main approaches of various American authors, which refer to the connection between politics and public administration as follows:

-„the political approach of public administration made by Rosenbloom shows the value of representativity, of political responsibility and of the responsibility towards citizens through the officially elected persons”;

-Wallace states that in fact, public administration represents „a problem in political theory. It operates with the responsibility of administrative and biocratic agencies as opposed to the officially elected, and through them, towards the citizens”;

-Shafritz and Russell mention a few definitions of public administration, oriented towards politics: „it is what Government does, it is a phase in the politics cycle, it is a first tool in implementing public interest and achieves in a collective manner what cannot be achieved individually” .

Although seldom mistaken for politics in general, public administration is different. The delimitation is superficial as each definition of public administration contains both terms that refer to administration and terms that refer to government, to the political process in general (Cziprian-Kovacs, 2005). The boundary between the public, the private sector and the volunteer sectors has a crucial importance in the understanding the future course of public administration (Fenwick & McMillan, 2004). Delimitating politics from administration, reformers believed that scientific rationality would eliminate the political conflict (Rabin et al., 2007). However, there is a dichotomy between politics and administration (Rosenbloom & O'Leary, 1997). If this mechanism, composed of politics and public administration, could be compared, it would resemble

a human body, with politics as the head and public administration as the body (Cziprian-Kovacs, 2005).

Public Administration and Bureaucracy

Very often, the terms „administration” and „public administration” are mistaken for bureaucracy. In the eyes of the public, the governmental administration is „bureaucratic”; the private administration is „expeditive”; governmental administration is „political”; private administration is „apolitical”; governmental administration is characterized by „formality”; the private one is not (Simon et al., 2000).

In Max Weber’s vision, bureaucracy is a social and political phenomenon, whose characteristics were defined as the following: (Weber, 1997):

- a strict definition of upper- and subordination, meaning the authority relationships;
- a high work division according to the specialisation of the human factor;
- a complex system of rules, converted for each post and person, part of the system, as related to rights and obligations;
- impersonal interpersonal relationships, which exclude subjectivism in interhuman intra- or extraorganizational relationships;
- selection and promotion of personnel by strictly professional criteria;
- a series of procedures for the work done.

Administration, as related to bureaucracy is a subspecies, meaning that it is higher than bureaucracy. The definition of administration is wider than the one of bureaucracy. In other words: all bureaucracies are administrations, but not all administrations are bureaucracies. (Cziprian-Kovacs, 2005).

Public Administration and Public Management

Another interesting debate is the referring to the connection between public administration and public management. As long as the sector was small, public management was defined as administration, the exercise of public authority in accordance with a fixed system of rules. The accent was placed on the administrative action, the formal decision-making process and the implementation according to the established procedures (Matei, 2001). At the same time with the increase of public sector dimension, with service functions more important than administrative functions, the relevance of public administration has started to be deformed. As opposed to public administration, often mistaken for bureaucracy, public management (Păunescu, 2008), is not limited to following the procedures (although it includes them), but it also involves focusing on results, on establishing strategies (short and long term ones) and attention to the environment, depending on the external evaluation of services, especially by the citizen. The idea that public management is based upon is related to the concern for the quality of public services that are offered to the citizens and for their satisfaction. The failure of implementing governmental programs was due to the focus on the results of public programs, instead of focusing on the behaviour of government agencies and their employees (Sindane, 2004). Public management wishes to be reformed by the New Public Management and by the New Government. The paradigm of change The New Public Management, or the theory of the most recent paradigm of changing the way in which the public sector must be governed (Lane, 2002), involves a reformation of the public sector based on the model of the private sector, meanwhile the New Public Management (Păunescu, 2008) has as a basis the idea of a partenerial collaboration between the private, the public and the volunteer sector and of producing value for the citizen.

There are no successful economies without successful administrative states (Ellison, 2007), some authors believe.

As a result of all the above mentioned, public administration, having the role to actively participate in achieving the general interest, expressed by law, represents the activity through which law is organised, executed and its execution is guaranteed up to the material facts (Negoiță, 1993).

Conclusion

The public administration is one of the often mentioned fields of study, in the specialized literature. Its complexity is due to the fact that government actions have implications for all inhabitants of a state and also to the many changes in this area over the time, some of them due to a historical context of each country.

In our opinion, public administration is the activity exercised upon by the government, for the welfare of its state citizens, an activity which inspires itself from the procedures of management and public management, trying to limit, at the same time, the influence of politics and bureaucracy in its field of action.

ECONOMIC EFFICIENCY AND PROFESSIONAL ADVANTAGE OF PARTICIPATING AT TRAVEL FAIRS

Szavo Sebastian Mihai
University of Oradea
Faculty of Economic Sciences

The article is meant to create an idea about the opportunities of participating at a travel fair by acknowledging about the most important facts regarding preparation, participation and evaluation. Knowing the reasons of participating both for visitors and participants and getting information about the economic costs that arise at a travel fair will raise the fog from the question of which show to attend and what are the professional advantages if there are any.

Keywords: travel fair, efficiency, advantages, reasons

What are travel fairs?

Travel fair represents a wonderful opportunity to meet travel professionals in a single place. This kind of events reunites under the same roof not only the promoters of inbound, outbound, but those of the internal tourism, too.

Travel fairs offer unlimited opportunities to promote and sale the company's special destination or special product.

Fairs are able to stimulate travel, tourism, hospitality both inside and outside the country. It represents a place where travel professionals and potential customers meet face – to – face and develop a potentially advantageous relation.

Travel fairs are valuable occasions both for already active companies and for those who's activity are about to begin. These companies can later remember what they've learned from the show and they can network with potential business partners, they can study the sales strategies of the participants. For these reasons and not only, it should be paid maximum attention in participating at travel fairs as a visitor and as an exhibitor as well.

Good preparation for the travel fair will eliminate the obvious stress which comes few days before the show.

Advantage of promotion at a travel fair

Before they begin, during the shows and after they shows there is a concentrated promotion campaign to ensure and to inform an interested public. The means are:

- invitation campaigns by email and post for potential guests from different domains: transport, tourism, hospitality industry, aviation industry, government and private institutes, travel industry related companies

- publicity in main local newspapers, publicity in the most important magazines, TV publicity, Internet publicity, radio publicity etc.

- briefings from the travel show in travel related magazines

- the event is strategically programmed it should take place before the beginning of the season.

Promotion at the show is realized with the help of a media company which through its travel fair experience can ensure an adequate image of the exhibitor.

Who is participating?

Visitor's profile

- Visitors from the travel industry
- Business people visitors
- Visitors - potential holiday makers, travelers
- Visitors with a role in decision making (business, local authorities, institutions of the government)
- Potential investors in the hotel, travel and entertainment industries
- Travel agents
- Tour operators
- Visitors without any relation to the industry

Exhibitor' profile

- Government institutes and travel industry organizations
- Tour operators(inbound and outbound industry)
- Travel offices
- Tourism associations
- Professionals in relation with the travel industry: sport equipments makers, means of transport makers(buses, minibuses, camping cars) etc.
- Producers and sellers of hotel management and catering relating goods
- Publishing houses of travel related literature(books, maps etc.)
- Educational institutes

Participating at a travel fair is above all an investment for both exhibitor and visitor as well. They must take a decision about participation or not at a certain travel fair. Above the things that might have to be considered before taking any decision are: the name of the travel fair, location, date, who is the organizer, type of the show, relative number of exhibitors, relative number of visitors, the cost of rental of the booth and the necessary equipment, cost related to the travel, accommodation, meals, cost of the promotional materials and their transport(brochures, catalogues etc).

Before taking a final decision exhibitors try to determine the necessary budget. In order to be capable to realize that it must consider creating a handout with the approximate number of employees who will represent the company at the show and the estimated costs that will arise.

Although travel shows are a very good occasion to make business, limits must be considered, especially financial limits, because the investment will not necessarily determine an immediate raise of sales. In general, expenses with travel, accommodation will highly depend on the show's location, namely the distance from the company's residence.

Reasons for participating

Of course, here are certainly hundreds of reasons for participating at the travel fair. For an active travel business, participation means the opportunity to meet hundreds or maybe thousands of potential customers who visit its booth. One of nowadays sale strategies is exhibiting at travel fair, *where customers come to companies and vice versa. Speaking about difficult times(after the Gulf war, 9. 11 events, actual economic crises) travel companies must reconsider all previously tested sale strategies and implement new ones.*

Travel fair are perfect exhibition spaces to introduce new travel products or destinations, for establishing new contacts or selling or buying products or services, all these in the same spot with maximum efficiency. In order to develop customers portofolio and for a better visual presence participation is vital both for older comapnies and new comers as well.

Main reasons for an exhibitor:

- Create awareness of products/services with potential buyers
- Evaluate the competitors

- Research for demand.
- Generating sales.
- Enhancing the image of the company
- Reach of a specific targeted public
- Establishing a strong market presence
- Distribution of brochures, catalogues, promotion objects
- Enhancing marketing politics.
- Meeting face to face the customers, competitors and distributors
- Evaluation of potential or new competitors/customers.
- Demonstrating products in ways not possible using other marketing channels
- Recruiting new distributors
- Education and information for targeted customers.

The importance of a professional booth

The exhibition booth must be professionally designed. It must be able to attract the audience’s attention by using different themes(tour operators who promote a certain destination use colors and objects to remind the culture of the destination country).

Travel fairs are very important for small companies as well because exhibition are is not expensive and booth are easy to design very attractively even with the small amount of money. This way smaller company can look like a much bigger business giving a kind of an advantage.

Travel shows are a very powerful marketing atmosphere because they take place in a single location, they have limited time(usually 2-3 days) and unite hundreds of exhibitors and potential customers. It is very common for an exhibitor that during a show he will meet many of his suppliers, customers and dealers.

But, which show is worth to attend?

A research conducted by the National Fair Exhibitors Association in America revealed the top 15 criteria used by exporters in selecting which fairs to attend were:

The quality of Visitors

The proportion of visitors with decision-making power	1
The proportion of target customers among the visitors	2
Fair limited to a certain type of clientele(domestic tourism fair)	8
Number of new contracts made in previous fairs	9
Visitor rating	15

The quality of Visitors

Number of visitors	3
Extension of promotions during the fair	5
Number of visitors to the fair last year	6

Booth Location

Booth Position	4
Ability to perform requirements and specifications (size, location)	7
Traffic between the lines of traffic side booth	13

Logistical issues

Easy Registration	10
Safety (security)	11
Ease of entry or exit from the booth / fair assistants	12
Bringing / removal equipment / facilities needed	14

The decision to participate or not at a certain show belongs to each company's head and the result itself reveals the importance of that specific show for the business. Sometimes trade simulations are made to evaluate if employees are ready enough. This study reveals the importance given to people with decision power, followed by the proportion of targeted customers from the number of visitors. Facts like easy registration, security are on the end of the top.

Budgeting for the show

Budgeting for an exhibitor is not only about the cost or space and booth rental. Below there is an estimation in euro for the 3 fazes of a travel show(before, during and after) for a travel agency who finally have not attended a local travel fair organized on Oradea, in Selgros mall parking in 2009.

Before the fair

The cost of renting space / booth	300
Cost of booth design	30
Construction cost with stand	40
Creating promotional materials	300
Cost of transport	50
The cost of moving	10
The cost of preparing the team	100
Other expenses	100
TOTAL	930

Cost over the fair

Accommodation	0
Local travel (e.g. Hotel - fair)	30
Staff pay cost over fair	150
Expense for receiving guests	100
Expenses necessary equipment	20
Entertainment expenses	50
Other expenses	0
TOTAL	350

After the fair

Travel home	10
The cost of transportation advertising equipment / materials home	20
Other expenses	0
TOTAL	30

GRAND TOTAL

930 + 350 + 30 = 1310 EURO

Measuring the economic efficiency

To determine the economic efficiency indicators can be used:

- Total number of visitors(e.g. 10.000)
- Number of visitors who attended company booth(e.g. 2.000)
- Percentage of visitors who attended company booth from total number of visitors (2.000 x 10.000/100)
- Promotion level – number of catalogues/brochures distributed(e.g. 1.000)
- Number of new contacts established during the show(e.g. 50)
- Number of new requests during and after the show(e.g. 200)
- Number of effectively realized booking(e.g. 100)

If we want to appreciate the economic efficiency we must create a report containing all the fact we encountered. First and foremost the objectives must be considered if they were achieved or not, the results can be compared to previous shows or previous years.

Conclusion

Among the advantages of participation at a travel fair are the new experiences we get, enhancement of customer relation abilities dealing with a large number of potential customer in a very short time, the enhancement of company and personal image.

DESIGNING A MANAGEMENT MODEL FOR ACHIEVING ECONOMIC-ENVIRONMENTAL BALANCE IN INVESTMENT PROJECTS

Research conducted in the Concept Research Project 1239 PN II 2007 CNCSIS

Szentesi Silviu Gabriel

Universitatea "Aurel Vlaicu" din Arad

Facultatea de Stiinte Economice

Franțescu Marius

Administrația Națională de Meteorologie

This paper describes a method for achieving the economic-environmental balance based on the assessment of environmental and/or pollutant factors in connection to community option on the evaluation of investment projects having a major impact on environment. This assessment is based on the concept of welfare, the distinction between satisfaction and dissatisfaction and implies a practical approach including the scientific aspects of environment pollution degree and the community position on developing an investment project, by assuming responsibility for negative and positive aspects of such a project, respectively for satisfaction and dissatisfaction, in order to fulfill the supreme goal of preserving the environment and ensuring human welfare.

Keywords: welfare, Pareto optimum, satisfaction/dissatisfaction, model, economic-environmental balance

JEL Code: A12

1. Definition of welfare and the historical evolution of the welfare concept

Social welfare indicates the satisfaction or utility degree gained by each participant, but is not equal to the sum of individual welfare.¹³⁹²

Pareto concept of welfare represents a milestone in economics history. Until then it was considered that the welfare is the sum of communities' quantifiable cardinal utilities, the optimal resource allocation maximizing the welfare.

As noted before, Pareto optimum is defined as the point that allows the improvement of a certain individual welfare, meaning his movement to a preferred position by adjusting goods or services through production or exchange without affecting someone else's welfare. In order to remove the need for interpersonal utilities' comparison, Pareto has refused to assess any other changes of welfare. Therefore, his definition drops the concept of unique social optimum, providing instead an infinite number of unmatched optimums.¹³⁹³ The comparability area can be extended by introducing the concept of compensatory payment. This concept was mentioned first by Enrico Barone in his famous article called "The Ministry of Production in the Collectivist State" (1908). Barone suggested that all individual welfare changes can be expressed using the real equivalent income an individual agreed to receive or pay in order to regain his original welfare.

A change that favors certain individuals in the detriment of others can still generate an improvement of global welfare, if those who earn can compensate the losers, so they voluntary accept this change, after compensatory payment is made, and the winners are better off, but also the losers are not in a worse situation. In order to better understand this statement, we consider the example of coexistence of an airport and its surrounding areas. The airlines company and its

¹³⁹² Gilbert Abraham-Frois -" Political Economy' Editura Humanitas București, 1994, pag. 312.

¹³⁹³ X^* vector is the optimum solution if from the equations: $f_i(x) \geq f_i(x^*)$ ($i=1,2,\dots, m$) we have $f_i(X) = f_i(X^*)$ ($i=1,2,\dots, m$). When $f_i(X)$ are concave, and the admissible set of solutions x is closed and convex, then for each Pareto optimum x^* we have weighting coefficients that maximize the amount at x^* . This point provides the best available welfare.

passengers are the winners, while the neighbors are the ones that lose because of sonic pollution. The inhabitants have nothing to lose if they are compensated for their loss, finally obtaining an increased community welfare.

The Pigovian economy of welfare implies a Pigou analysis of the divergence between private marginal profit and social marginal profit. It is the problem of real external economies or diseconomies in relation with income marginal benefits. Pigou describes in his work „The Economics of Welfare” social losses such as: industrial accidents, professional diseases, child and women employment, air and water pollution, technological unemployment. The measuring of such diseconomies is a difficult task because of their pretty difficult “internalization” as they are considered outside the price system by definition.

A reward of Pigovian economics of welfare when the society goal is to maximize the difference between global benefits and global costs, shows that in a market where the price equals the marginal social cost of a product, the Pareto optimum condition is met. This can be better explained in the case of an economic activity generating external effects (diseconomies).

2. Practical considerations on designing an economic-environmental balance model for investment projects

The investment projects for fixed assets having a major impact on environment must be assessed and classified according to models that lead to their approval or rejection. The major pollutant investment projects are thermal plants, electric plants, power stations, nuclear plants, etc., but also investments in the chemical, petrochemical, steel and rubber fields. The development of a model implies, besides scientific and theoretic issues such as the acceptable pollution level, eco, green and clean technologies, also a responsible involvement of all parties involved in the positive and negative outcomes of an investment project development. These parties can be the beneficiary of the investment, the environmental agency, the developer, local administration, population, farmers from the affected area, other individuals or legal entities affected by the investment project development. Therefore, in taking the approval or rejection decision, the parties involved must assume a point of view based on a scale derived from the one suggested by the theoretic model, that can be a Stapel scale, as follows::

Stapel scale

Maximum pollution

Null pollution

-5 -4 -3 -2 -1 0 +1 +2 +3 +4 +5

In addition to assessing the pollution level on the main environment components – air, water, soil, etc. – we need to quantify the importance of each type of pollution and/or pollutant, using a weighting or importance scale (similar to the one included in the theoretical model). Through this practical approach we can determine the degree of satisfaction and/or dissatisfaction for each issue of the analyzed investment project. For example: noise level, level of suspended particles in the air, radioactivity level, thermal pollution, chemical substances soil pollution, water pollution, etc.. Such an approach facilitates the classification of suggested project alternatives, the decision-taking process regarding mutually exclusive projects and the collectivity involvement in assuming both benefits (satisfactions) and pollution (dissatisfactions) generated by such an objective.

Its practical implementation implies an active collaboration with the Environment Agency, environment experts and professionals in investment projects’ design, in order to develop a model for pollutants that allows the measurement of the perceived satisfaction or dissatisfaction level, and finally to achieve a global level of satisfaction or dissatisfaction regarding the

development of an investment project, based on weighting these elements with the importance assigned to each pollutant.

The main equation is:

$$B_j = \sum_{i=1}^k AB_i \cdot p_i$$

where:

B_j - is the j party score for a project or project alternative, which indirectly expresses a certain level of welfare as a result of project development;

AB_i - is the welfare level influence degree generated by the influence factor or pollutant i

p_i - is the weight of the influence factor or pollutant i

$i=1, \dots, k$ is the number of pollutants

$$B = \frac{\sum_{j=1}^n B_j}{n}$$

where:

B- is the global score of a project or a project alternative, which indirectly expresses a certain level of welfare as a result of project development;

$j=1, \dots, n$ is the number of parties involved in assessment.

For each investment project, the Environment Agency identifies the parties involved in preserving the environment and the parties affected by the project development, on the basis of an impact study. The Environment Agency provides the assessment applications to the beneficiary and the parties involved, and requires their response before the final notice of the project. The assessment application can also be provided to a representative sample of the affected population; in the case of major investment projects having complex implications on the economic-environmental balance, a full research can be done.

3. Case study CET Arad

"Centrala Electrică de Termoficare Arad" company, under the authority of Arad City Council (CMA), administers by concession the assets of the former Electrocentrale Branch Arad, founded on the basis of Governmental Decision 105/2002 from [S.C. Termoelectrica S.A. București](#). S.C. CET Arad S.A. provides electricity and heat through two thermal plants: CET Lignit Arad and CET Hidrocarburi Arad. From the perspective of heat production necessary to cover the needs of Arad city inhabitants, the two stations are interconnected in order to ensure a continuous provision of heat to consumers. Considering the local meteorological conditions, and especially the directional wind frequency, we consider the location of Centralei Electro-Termice (CET) Hidrocarburi Arad downtown and of Centralei Electro-Termice (CET) Lignit Arad in the north of the city of Arad inappropriate.

In order to obtain the values on the Stapel scale, presented in the table below, we considered the air pollution, water pollution and soil pollution (including underground waters, especially groundwater) with carbon oxide (CO), sulfur oxide (SO), nitrogen oxide (NO), lead and lead composites (Pb), hydrocarbons (HC), sedimentary and suspended particles + noise. The results are far from encouraging, with particular focus on air pollution (value -3) and soil pollution (value -2), according to the data provided by the Environment Preserving Agency (APM) Arad. Regarding other dissatisfactions and discomforts generated by Centrala Electro-Termică (CET) Arad, we notice human health in general and respiratory diseases in particular, according to the data provided by the Public Health Department (DSP) Arad.

Company /Indicators	Weight	Environment Preserving Agency (APM) Arad	Public Health Department (DSP) Arad	Land Reclamation Department (DIF) Arad
Air pollution	0,5	-3	-2	-1
Water pollution	0,3	-1	-1	-1
Soil pollution	0,15	-2	-1	0
Noise	0,05	+2	+3	+4
Global score per party involved		-2		
Project global score				

Stapel scale

-5 -4 -3 -2 -1 0 +1 +2 +3 +4 +5

A more analytical assessment approach for an investment project, based on the model described above, involved the following data:

Identification data _____ _____												
No.	Pollutant	Satisfaction level										
		Maximum pollution	-4	-3	-2	-1	0	+1	+2	+3	+4	Null pollution
1												
2												
...												
n

THE STIMULATION OF EMPLOYEES' PERFORMANCE AT THE LEVEL OF PUBLIC INSTITUTIONS

Author Țeculescu Silviu Alexandru

National Institute of Scientific Research in the Field of Labor and Social Protection

The performance of public institutions depends especially upon their low and middle ranked employees. Therefore, in the context of our country's integration in the European Union's structures, there must be elaborated the best strategies for motivating the employees of these institutions to achieve higher performance levels. The motivation of the public sector employees is not without constraints. Usually, these are different from the ones faced by profit making private organizations. Money is widely used by profit making organizations as a motivator, whereas this is not usually available for motivating public sector employees. Similarly, the punishment including firing is often used in private organizations, whereas civil servants are protected by the civil service rules. In this paper, we'll analyze the incentive of performance in case of government and European Commission employees.

Keywords: incentive, performance, motivation, commitment, government

JEL classification code: H11, J24

1. Stimulation of employees' performance within the government

The government and its subordinate institutions are important employers in a country. Their success finally depends upon how well or badly their employees perform the job tasks. The leaders of ministries and high ranking government officials offer to the nation plans and visions for the future. These are based on the effort of the state employees to bring those plans to reality. Without their motivation, commitment and hard work, all the plans and the goal setting will go to waste. Therefore, where care is taken in sound planning, care should also be given to how to motivate the employees who are actually going to transform effectively these plans to reality.

Compared to the employees from private organizations, there are limits for the motivation of government's employees. The private sector has always had a variety of positive and negative incentives to motivate individuals or teams of employees. The positive ones include the payment of bonuses, share options, gifts and promotions. The negative ones are based on the firing threat. For a government it's not usually possible to use any of these methods. Financial rewards are out of question because most governments use a rigid grade-based system for determining payment across the entire public sector. Neither is it possible to remove a non-performer from service. And in most countries, the law makes it very difficult to fire a civil servant for poor performance. According to some international studies¹³⁹⁴, a governmental job analysis project addressing both to the taking of measures for the decrease of employees' labor monotony and to the establishment of a reward system in full accordance with the employees' needs, could be expected to result in a higher level of motivation and satisfaction of labor. Options such job enlargement and enrichment, promotions, stipends, monetary and non-monetary rewards should be considered. Providing these factors can be challenging considering the bureaucratic difficulty in bringing about a change and the lack of funds available to carry out such audacious incentive plans, especially in countries recently integrated in the European Union such as Romania.

To make the job more interesting, a creative job project could serve as a motivator. One way to doing this is by **aligning organizational goals with employees' personal goals**, namely the implementation of management by objectives (MBO). But in most countries, at government level

¹³⁹⁴ William R, 2005.

MBO might be difficult to apply because the goals aren't set by the government employees, but by the parliament members or ministers. To make the MBO work, decision making and goal setting should be treated in full accordance. However, within the government, MBO can be applied at a lower level, for example at the level of an office that is responsible for its own targets. There the managers or supervisors can make decisions together with the employees as to achieve the best the targets of their office, and how much they can achieve in a particular time, thus setting their own internal objectives or reference points.

The strength of the employee's participation in the decision making process as a motivator can't be ignored, and if MBO cannot be applied, there must be considered simpler ways to make employees feel that their involvement is important to the management. In this regard, evidences show that even letting employees give their suggestions can contribute to employee motivation. One of the most well-known and widely used recognition method, resulting in motivation, is the use of suggestion systems. Employees offer suggestions for improving processes or cutting costs and they are stimulated with bonuses. These awards are nominal and their purpose is only symbolical. Besides bonuses, employees also receive intrinsic rewards under the form of recognition for their method suggesting in order to improve the activity.

Employees in most organizations would like to feel that their ideas can make a difference at their workplace. For many people, in fact, there are few things more important than involvement and assisting in the successful implementation of an idea they suggested.

If the employees choose to work for government despite the fact that the financial resources are limited compared to the private sector, this means that the non-money benefits must be higher in government work for these employees. In conclusion, the employee motivation factor can be found in these non-financial benefits.

The prestige and respect one receives from the society for being a government employee is part of the non-financial benefits in addition to job security and rich experience that could open doors for lucrative positions in the private sector, in national or multinational companies or abroad.

At the same time, we could mention that there are similarities between working for non-profit organizations and government. The government is in fact a non-profit organization. So, the motivation techniques used by non-profit organizations could be applied to motivate government employees. Motivating factors for volunteers are very alike to those found among satisfied government employees within the executive power: **a sense of public service, skill acquisition and the work environment that features more security and less stress than in the private sector** (to name just three of those that the researchers found). This is just another proof that motivation through non-monetary means is possible. There are aspects of government jobs which are often overlooked, but they can serve as powerful motivators. **Job security**, for instance, is difficult to find in the private sector, but is the mainstay of any government job. Therefore, it can be surely stated that it is possible to motivate a public sector employee without using money as a motivator. The need is to understand very well the concept of motivation and then to apply it creatively.

As a conclusion, we can emphasize the importance of the contribution of government employees to its success from the perspective of achieving its goals. This doesn't mean hiring some well qualified employees in the key jobs. It is rather the whole government machinery that needs to be motivated to build a country, to take it from where it is at that moment to higher plans. No one else is more responsible for this thing than the government employees. They are the ones who make or break a nation.

A recently performed study in the United States¹³⁹⁵ followed the emphasizing of determinant factors of job satisfaction in the case of government civil servants. In this respect 400 persons from the above mentioned institution were interviewed. The following independent variables

¹³⁹⁵ Friesen, D. & Williams, M.J., 2007.

were considered: **demographic variables**, namely: gender, education level, age, commitment (it is considered that civil servants have many interests and these are sometimes satisfied at the workplace. Nevertheless, the more the civil servants discover they can satisfy their interests at the workplace, the more and more satisfied they are at the institution they work) and, respectively, **environment variables**, these being: *variety of abilities, task identity, task significance, autonomy* and, respectively, *response from the work itself*. There was envisaged the measuring of the impact these variables have concerning *job satisfaction, satisfaction given by supervisors and satisfaction given by colleagues* (**dependent variables**). The results of the study emphasized the following: whereas in the case of job satisfaction, the most important predictive factor of work satisfaction for civil servants was the variety of abilities, the response from the work itself had the most important role for the satisfaction given by supervisors. It is important to know the fact that, in both situations, education level had the lowest impact concerning job satisfaction for that case. Talking about satisfaction given by colleagues, autonomy was the strongest predictive factor of the public servant satisfaction given by colleagues, whereas the variety of abilities was at the opposite side.

2. Stimulation of employee performance within the European Commission

During the last years, public service motivation has become one of the most important challenges for experts in human resources management. Most researches on this subject have focused only at the level of national government, while no study has examined this problem in the environment of an international organization such as the European Commission. The interviews realized by the Commission personnel at all levels show clearly that many people are motivated to join the Commission through a commitment for its whole mission, or in a certain politic area. Consequently, we think that public service motivation has an important role in the motivational framework of the European Commission employees.

First, we will refer to the conceptual framework, namely we will analyze the existing link between job satisfaction, organizational commitment and motivation.

Job satisfaction is defined as a positive emotional state resulting from the appraisal of one's job or job experiences. Organizational commitment has been defined as the identification power of one employee in an organization which is characterized by:

- a strong faith and acceptance of organizational goals and values;
- a willingness to exert a considerable effort in the name of the organization;
- a definitely expressed desire to maintain the organization membership.

Job satisfaction and organizational commitment are associated one way or another to efficiency, performance, behavior of organization member or the general psychological well-being. As job satisfaction and organizational commitment are also linked to the public service motivation, these factors can act like mediators in the relationship between public service motivation and the above mentioned variables as it has already been demonstrated for the public service motivation - performance relationship by recent studies¹³⁹⁶. Thus there is justified to stress on the relationship between the public service motivation on one hand and, respectively, service satisfaction and organizational commitment on the other hand.

Next, we will reflect the above described relationship applicability in an international environment.

The European Union is unique among the international organizations, but it has some resemblance to a federal government including the ability to impose its policy in some areas. It administrates a big budget which is especially used for the transcription into practice of some strategic projects to guarantee a continuous social-economic progress of the member states. Within the complex institutional framework of the UE, the role of the European Commission is

¹³⁹⁶ Park and Rainey, 2007 and 2008; Vandenabeele, 2008.

exclusively political. New policies are built within the European Commission before being discussed by the Parliament and the European Council. The implementation of these is actually the responsibility of the governments of the member states. It is controlled by the personnel of the European Commission responsible to ensure the harmonization of national policies and development programs with the directives of the European Union.

Employment in EC differs in one significant way from that in national governments. The level of payments and benefits is very high comparing to the one existing among the national governments. This policy was especially set to make service attractive for the people who fulfill the competence criteria required for these jobs. Thus, **we might expect the employees from the EC to be very motivated comparing to the ones from the national governments especially due to the financial rewards.**

In full accordance with the above described conceptual framework, for determining / measuring the satisfaction degree as a basis for the policies that follow to be adapted for the stimulation of personnel within the EC, the following hypotheses were taken into consideration:

-public service motivation will lead to a higher degree of job satisfaction in an international organization.. Autonomous motivation will lead to a higher degree of job satisfaction in an international organization;

-public service motivation will lead to a higher degree of normative organizational commitment. Autonomous motivation will lead to a higher degree of normative organizational commitment;

-public service motivation will lead to a higher degree of affective organizational commitment. Autonomous motivation will lead to a higher degree of affective organizational commitment;

-public service motivation will lead to a higher degree of continuous organizational commitment. Autonomous motivation will lead to a higher degree of continuance organizational commitment.

The necessary data for the achievement of this study¹³⁹⁷, developed between 2006-2008, was collected by some questionnaires distributed to all the employees of the EC by G.D. of Personnel and Administration as a part of their annual satisfaction surveys.

The main dependent variables of the survey are **job satisfaction** and **organizational commitment**.

Job satisfaction is a one-dimensional concept and it refers to: the existing relationship between the job content of one employee and his/her expectation at the moment of employment; the belief of employee that his/her job is interesting and, respectively, to what extent this person would like to find another workplace, because at present he/she isn't satisfied. This variable is measured by a Likert-type scale with five answer levels, as follows: "very unsatisfied" (1), "unsatisfied" (2), "average level" (3), "satisfied" (4) and, respectively, "very satisfied" (5).

Organizational commitment is a multi-dimensional concept that is divided – as we already have said – in: normative commitment, affective commitment and continuance commitment. The first one tries to answer the following questions: to what extent the employee considers it is an accordance between his/her values and the value of the EC; to what extent he/she is proud to affirm that he/she is a Commission's employee. The affective commitment refers to the employee's availability to make an additional effort comparing to the existing requirements to help the Commission to gain success. The continuance commitment tries to answer the following aspects: the decision to work for the EC was a mistake; it will not take long to the employee to be determined to leave the organization; the employee won't earn much working for the EC for an indefinite period. This variable is also measured by a Likert-type scale with five answer levels, as follows: "I do not agree" (1), "I partially do not agree" (2), "neuter" (3), "I partially do agree" (4), "I agree" (5).

Public service motivation is one of the independent variables of this study. To measure it, six indicators were used as follows: a) serving the European public interest, looked as an important target among the EC employees (public interest); b) the contribution to the well-being of

¹³⁹⁷ Park and Rainey, 2007 and 2008; Vandebaele, 2008.

European citizens (public interest); c) the importance of serving the public European interest comparing to the individual interests (public interest); d) the degree of availability among the EC employees to make important sacrifices for the well-being of the European Union (self-sacrifice); e) the importance to make a difference in the European society matters more than personal achievements (self-sacrifice); f) the importance to find by the European officials of the resources that are used in the EC for the assurance of the continuous development of the European Union (democratic government). Again there was used a five-level measuring scale.

Another main independent variable is the **autonomous motivation**. The measuring scale was based upon the Academic Self-Regulation Questionnaire. Eight indicators measuring the type of identity regulation were assessed, namely two indicators for **external regulation** (at work, the employee gives all the best of him or else **he would create problems for himself**, on one side, and, respectively, **he would risk to receive an insufficient assessment**, on the other side), **introjection's regulation** (at work, the employee gives all the best of him or else **he would feel guilty**, on one side, and, respectively, **he would feel bad**, on the other side), **regulation of identification** (at work, the employee gives all the best of him because **he considers it's his duty**, on one side, and, respectively, **he would like to be a good official or member of staff**, on the other side) and the **intrinsic regulation** (at work, the employee gives all the best of him because **he likes his job**, on one side, and, respectively, **he thinks his job is interesting**, on the other side). The interviewed persons had to mark these indicators on the basis of a five-level answer scale.

The third independent variable added into the analysis measures motivation on the basis of **financial rewards associated with the job**. This one can't be attributed to a certain type of motivation, although Herzberg affirmed that wages had characteristics of both the types of motivation (intrinsic and extrinsic) although conceptually it is extrinsic. There was again used a five-level answer scale.

Not at least, in the analysis there were included lots of **control variables**. First, these contain a set of **pure demographic variables**, namely: **gender** (men are the reference category), **age** and **nationality**. The last one was organized on its turn in five variables as follows: "North", "South", "CEE1", "CEE2" and respectively "CEE3"¹³⁹⁸, where the first two refer to geographical placement and the last three to the different phases of the widening of the adherence to the European Union process. A second set of control variables refers to **organizational variables**, namely: **if a person has or not a management position, the position group one belongs to** (AD, AST, CAI, CAII, CAIII and, respectively, CAIV¹³⁹⁹), **the status one has** (civil servant, full or part-time employee, contract agent, secondary national expert or trainee) and, not the least, **what type of management someone is employed for** (general manager, coordination manager for the policy of organization, second-in-command, etc).

The results of the study showed that **the control variables have a low impact upon the dependent variables**. The only variable with a significant consistent effect is **age**. When people become old, they tend to have a lower score at each of the dependent variables although they have high levels of public service motivation. Another relative effect is that **of being in a management position**. This thing is found to a certain extent in direct correlation with all the dependent variables, except for the continuance commitment. Second, **public service motivation exercises a significant influence upon the dependent variables**, that means the employees of the European Commission who have a very high coefficient of public service motivation, record higher values both from the perspective of job satisfaction and from the one which refers to the

¹³⁹⁸ Northern countries include: the United Kingdom, Ireland, Denmark, Germany, the Netherlands, Luxembourg, Belgium, Finland and Austria. Southern countries include: France, Italy, Greece, Spain, Malta and Portugal. CEE1 is formed of the Baltic States. CEE2 includes: Poland, Hungary, Czech Republic, Slovakia and Slovenia. CEE3 includes Bulgaria and Romania.

¹³⁹⁹ AD: Administrator; AST: Assistant (technical or secretarial); CA: contract agent (the fourth one is the highest in rank doing a work comparable to an AD).

organizational commitment, independently of the type of commitment taken into discussion. At the same time, the study shows that **the ability to participate directly at the substantiation and making of political decision represents a first major source of satisfaction**. The second and the most frequent source of satisfaction is **the general achievement feeling**, the fact that the employee can comply with the multiple challenges which appear regarding to the guidelines taken into consideration for the assurance of a continuous social and economic progress at the level of the European Union. We must not neglect also the aspects referring to **the opportunity to accumulate new knowledge and competences, to work in a multicultural environment or with a good team of specialists**. Third, although the members of the European Commission are, without doubt, the best paid public employees in Europe, **the influence of financial rewards upon the dependent variables is, oppositely to the assumptions, less significant comparing to the other independent variables we considered**.

Out of these showed in the present paper, we can conclude that public service motivation and autonomy are both important motivators in the international environment. We think the presented studies could be the basis for the elaboration of other researches intended to develop more complex measuring instruments for a relevant analysis of employees' stimulation at the level of public institutions, in general, and at government level, especially.

Concurrently, our opinion is that, in the context of the recent integration of our country in the European Union structures, the taking into consideration by the decision-makers of all the mentioned factors will contribute to the increase of employees' motivation in the public sector for reaching high performance levels intended to lead to the decrease of the gaps that separate Romania of the developed countries of the European Union.

WAGE FLEXIBILITY IN THE CONTEMPORARY SOCIETY

Țeculescu Silviu Alexandru

National Institute of Scientific Research in Field of Labour and Social Protection

The paper follows to offer the most efficient solutions for the attainment by Romania of the economic development level associated to the Western European countries. It proposes the division of the flexibility of labour market in three components, namely: internal flexibility, external flexibility and wage flexibility. The analysis performed within the present study will emphasize the wage flexibility. Wage flexibility can be classified in four components: a) plans of individual and group incentives; b) plans of assigning wages out of productivity; c) plans of distribution of profits and, respectively, d) plans of suggestions. The labour market flexibility, in general, and especially the wage flexibility contributes to the increase of employee motivation at the workplace, aspect which leads to the growth of labour productivity, through this one being put the bases of the medium- and long-term economic development.

Keywords: flexibility, security, incentives, efficiency, productivity.

JEL classification code: J24, J33.

Flexisecurity of labour market, that has two biunivocal dimensions, namely: a flexible labour market concomitantly with the guarantee of employees' security, is nowadays one of the most important problems of the modern society for ensuring the economic development on a medium and long term, a reason for which it has to be taken into account by all the worldwide economic agents with decision power. It is necessary that it be applied in the context of strictly orderliness with action directions – axes – afferent to the Lisbon Strategy, revised, formulated by Jose Manuel Durao Barroso. Only in this way the mentioned strategy can achieve its purpose, namely the one that – **in the context of overcoming the actual economic recession – on a medium term, there be created not less but 6 million workplaces on the background of the generation of a medium economic growth at the European Union level of approximately 3% per year.**

The axes of the revised Lisbon Strategy are the following:

- to make Europe a more attractive place for investments and for working, by accomplishing an internal market in those fields where there is place for increase and employment;
- it is necessary that innovation and knowledge be put in the service of economic growth based on investments on a medium and long term, and on this purpose it is necessary that 3% of the GDP should be directed to the fields of research, development, innovation;
- creation of more and more attractive workplaces. The principle is that more and more individuals would be attracted on the labour force market by reducing unemployment among young people and by modernizing the social protection system.

Regarding the labour market flexibility typology, we can distinguish among internal flexibility, external flexibility and **wage flexibility**. Wage flexibility is translated through transposing into practice some incentive plans / programs for employees. They divide into the following categories: 1. plans of individual and group incentives; 2. plans of assigning wages out of productivity; 3. plans of distribution of profits and 4. plans of suggestions. Following, we will undertake a detailed analysis upon these categories of plans.

1. Plans of individual and group incentives

1.1 Merit payment plan

By this plan, wage increases, known as **payment raises depending on merit**, are determined in correlation with the performance at workplace, the employees that reach a certain level of

performance earn a payment raise to the basis salary that varies between 15 and 30 % depending on the organization. Organizations with exclusive or mainly private capital, but also public companies tried to implement a system to stimulate employees for increasing their attachment to the enterprise, an aspect that has positive effects both upon work productivity, and upon the position occupied by the firms on internal and international markets.

Despite their relative popularity, these plans proved to be, sometimes, ineffective motivators of performance. If, for example, the performance assessment system within the company does not adequately distinguish among superior levels of performance, it is possible that decisions regarding wage raise or fall would be influenced, along objective factors (**achievement of organization objectives**, both the short-term ones, and the long-term ones, **observation of each employee's habits in part, critical incidents**, namely adverse performance), including variables that are irrelevant for performance, such as **perception of others, personality, age, gender, race**, or **anticipation of (positive or negative) reactions** of the group of employees or of the trade union. Along these aspects, there come also **internal and external forces in the organization** that translate through **budget constraints, the need of correcting inequities, the need of making a difference among groups and levels, education and instruction, moral levels, inflation / cost of living or competition on the labour market**.

1.2. Incentive plan for employees in production

This type of plans usually offer additional compensations to those employees that produce goods over a certain quantity/quality previously specified. When these plans are well grounded, they can contribute to the organization's efficiency by increasing the employees' productivity and decreasing production costs for each department. However, such plans tend, by our opinion, to contribute to the increase of efficiency, but not to perfect it. For instance, in industrial production, incentive plans are often in correlation with important changes in work methods for supporting the increase of efficiency gained through time and movement studies or through work simplification. Along another line, some strategies of job description can be used for organizing tasks more efficiently or for simplifying them, and the incentive system is intended so that the employee use some more and more efficient methods.

A traditional incentive system that is used for the employees in production is **the plan depending on the quantity of items** where wage is correlated to the number of items produced. In many such plans, the worker is guaranteed a basic salary, or a minimum income per hour that supposes a certain number of items and is paid additionally for the production realized over this norm. For each item that he realizes additionally, the employee is paid a greater amount than the employees that realized only the minimum standard.

Through the **production bonus**, employees that exceeded the minimum production standards receive a supplement that is correlated to the decrease of production costs and to the increase of labour productivity. An example is the **standard-hour plan**, through which the standard time for the realization of a particular task is established. The worker is paid with the standard ratio even if he reached his norm in a shorter time. For instance, if the standard time associated to a certain task is nine hours, and the employee fulfills it in six hours, his earning represents the equivalent of nine hour ratios.

1.3. Incentive plan for employees in sales sector

Wage plan applied in the sales sector by the majority of organizations supposes **commissions** or bonuses that are granted depending on the number of products sold or in correlation to the income obtained through their sale. These can be thus considered as being individual incentive plans.

One of the **advantages** of commission-based payment is that the present system is closely linked to the income and profit obtained by the firm. Usually these are stimulated, but when the company passes through a recession period, a commission-based system allows the decrease of

its costs. The main **disadvantage** of this system from the employees' point of view is represented by the fact that their standard of living can be lower than if they were paid the basic wage.

1.4. Incentive plan at the management level

The most frequently used incentive plans for the management staff are represented by **performance bonuses**. Details linked to these bonuses vary, though, to a great extent from a company to another. For instance, they can be granted on the basis of a general assessment referring to the contribution that each manager had to the improvement of the firm activity. Regarding the bonus that can be granted at the end of each year, it depends to the extent in which the respective individual reaches the objectives that were agreed upon on the basis of annual collective negotiations.

Bonuses, paid a single time annually, represent gradual wages accepted as supplements both for the managing staff and for the other categories of employees. One of the **advantages** of such bonuses is the one that they do not additionally complicate a waging structure, if it is established that this structure is too branchy. A **disadvantage**, seen especially in the case of employees, is the one that bonuses do not increase benefits such as pensions and insurances, that, usually are in close connection with the wage level.

Another form of incentives is represented by the **sale of shares**. Through such a plan, both the managing staff and the subordinates have the right to buy a certain number of shares of the company to the established price on a certain date. The number of shares that each person is entitled to is in direct correlation with the performance of each employee. If the value of shares is superior to the predetermined price, then the person that owns them obtains a substantial profit from the exercise of the right of sale upon these. In the contrary situation, this right will not be exercised.

During the last years, incentive plans that refer to the managing staff made the object of several criticisms for the reason that the majority of these give results rather on a short term than on a long term. For instance, a study performed upon the multinational companies in the United States and the Occidental Europe¹⁴⁰⁰ emphasizes the fact that 85% of the interviewed companies reward the managing staff on the basis of the increase of earnings that can be realized from the company's shares. However, the increase of earnings per share must not be automatically correlated with the increase of the price of shares. Earnings per share can be easily manipulated on a short term, this thing non-contributing to the long-term success of the organization. Therefore, many corporations from Great Britain and the United States¹⁴⁰¹ established incentive systems that reward the managing staff on the basis of the efficiency of investments or of the economic growth.

2. Plans of sharing earning from productivity

More and more companies offer prizes based on the productivity of the organization. These prizes, often encountered under the denomination of **plans of dividing earning from productivity**, follow to stimulate the production efficiency, allowing the employees to receive a quota of the total savings reported to the costs with work and production, by the grant of some periodical prizes. The wide participation of the employees is a definitory characteristic for this type of plans. Generally, employees participate in commissions that develop and propose suggestions about the various problems of production such as work methods, necessary equipments and materials, reduction of rejections, placement plans etc.

2.1. The Scanlon plan

This is a well-known plan of earning distribution that not only allows, but it also requires a massive participation of employees. The plan grounds on a ratio between the costs of labour force

¹⁴⁰⁰ BOS, AIG, General Electric, Bayer, Colgate-Palmolive.

¹⁴⁰¹ BG Group, Hanson, AT&T, Citigroup, Mitchell Fein.

and productivity. When the costs of labour force decrease compared to productivity, employees are entitled to receive bonifications. When costs related to labour force do not decrease, there are no possibilities of dividing savings. Normally, all the employees benefit from the cost savings, also including employees from production, the ones in sales, supervisors etc.

The Scanlon Plan distinguishes through the fact that it puts the accent on the cooperation among the leadership of trade unions and the production commissions formed of employees, at all the levels. In fact, the father of this plan, Joseph Scanlon, would have not elaborated a plan without the agreement between the leadership of trade unions and employees. A production commission from each department that includes those members chosen by the trade union or by the majoritary vote of the employees of an organization and the supervisors, gathers regularly for taking into discussion of some modalities of increasing production and for assessing the proposals come from the part of the employees for improving the efficiency of the activity developed.

2.2. Rucker and, respectively, Kaiser plans

Another group of systems of rewarding and participating regarding the receiving of bonuses for decreasing the costs of production is represented by the **Rucker** respectively **Kaiser plans**. The **Rucker Plan** resembles to the Scanlon Plan, but the granting of bonuses has at its basis a more complex analysis including here the economic audit of activities for the preceding years. This audit is used for the professional check of some activities, procedures, processes for expressing a competent, well-founded and independent opinion on the basis of reporting to a quality standard. Through the **Kaiser Plan**, savings to the labour force, deliveries or materials based on the increase of efficiency are shared with the employees. The company benefits of the advantages resulted in a ratio of 67.5%, the rest of 32.5% being distributed to the employees under the form of monthly benefits.

2.3. The Lincoln plan

The **Lincoln Incentive Plan**, applied within the American company Lincoln Electric, combines the characteristics of the plans of widened planned productivity, plans of group rewarding and individual plans based upon the number of achieved pieces. At Lincoln Electric, employees are rewarded individually depending on the number of pieces achieved, but employees work together within the productivity commissions for establishing ways to reduce costs and to increase the profit of the organization. Each employee is paid by the superior depending on the quality and quantity of work and the bonus is calculated accordingly. The payment that an employee takes at home is approximately double compared to those that perform similar activities in competition companies. This plan is correlated also with other benefits, such as life insurances or the purchase of shares by the company's employees. This plan tends to become one of the most widespread incentive instruments used within strongly industrialized states.

2.4. The Improshare plan

One of the newest plans to allocate earning from productivity is the **Improshare Plan** that is correlated to a less extent to participation compared to the other plans mentioned. This plan is based **on the achievement of a pre-established number of items in a time, measured in hours, shorter than the envisaged one**. For instance, if in a company there is envisaged to achieve three clothing items in eight hours, and the employees of the respective company fulfill this objective within six hours, then for the time savings of two hours they receive a bonus with a value of 25% of their daily reward. In the situation this objective is realized, the resulted earning is distributed by the company to the employees.

The present plan distinguishes by the fact that the participation of employees within the commissions and the consideration of employees' suggestions regarding the improvement of work efficiency are **optional**. For this reason the leading staffs of the companies put a smaller accent on the employees' participation than on the corresponding rewarding system. In order that

a plan to have success in a company without trade unions, it is necessary to exist a minimum level of confidence and cooperation between the managing staff and employees.

3.Plans of profit allocation

Through such a plan there is understood a rewarding system through which a part of the organization's earnings is distributed to the employees as a supplement to their usual wage. Generally, the purpose of these plans is that of motivating the employees to contribute to the organization's rentability. The plans of profit distribution can be used for encouraging cooperation, increasing moral and for increasing the financial security of the employees. Within an organization they can include all the employees, only a selected group of the executive council or the management staff.

Following, we will analyze the typology of these plans.

3.1.Plans of Current Distribution

The respective forms of incentives are also called cash plans. Through them, a certain percentage of the company's profits – for example 25% of the net profit - is distributed under the form of cash to employees at intervals of one year or less.

3.2.Differenced Repartitive Plans

Through this type of plans, a part of the company's profits are transferred into a deposit following that the accounts of individual employees be credited. Money becomes available at the moment the employees retire. Some plans allow employees to contribute with supplementary amounts to their accounts. There are used various methods for allocating the funds resulted from the distribution of profit to employees. For instance, the amount that an employee receives can have as a ground the individual basic wage, years of service, merit-based or a combination of these factors.

4.Suggestion Plans

A **suggestion plan** is a rewarding system through which employees are rewarded if they provide useful ideas for the improvement of the organization efficiency. The usual reward is **payment in cash**, although a number of companies provide instead of this products or trips abroad. This type of plans is usually used for obtaining from the part of employees suggestions referring to the decrease of production costs, work protection or the improvement of products' quality. However, some companies promote suggestion plans for granting employees more opportunities to get involved in the company's problems. On the other side, these plans can be useful for the improvement of the communication with the managing staff. However, supervisors are often excluded from these plans because the control upon costs is a part of their job description.

Suggestion plans take the form of some boxes placed in convenient places close to the workplaces, accompanied by some forms. Employees use these forms for writing their own suggestions, then they put them in the boxes for being assessed by a commission. If suggestions are accepted, employees are paid in cash on the basis of a percentage that takes into account the productivity increases that will be possible to be obtained during the first years through the application of the respective suggestions. A standard amount is paid if the decrease of costs is difficult to be quantitatively expressed, or for suggestions that do not have a direct relation with the income, such as the improvement of work protection.

The number of companies that use individual incentive plans tends to decrease. It is not clear if the use of group incentives increases in importance, but certain companies passed, at least during the last years, from the individual plans to the group ones. It seems that plans for allocating earnings from productivity present an increasing importance. The plans of merit payments are used on a more larger scale than the other incentive systems.

Therefore, we can draw the conclusion that the **flexibility of the labour market** in general and the **wage flexibility** in special **contributes to the increase of the employers' motivation at the workplace**, an aspect that is reflected in the **increase of the work productivity**, through this **being put the bases of the economic development on medium and long term**. At the same

time, on the purpose of achieving this strategic objective, so that as until 2030 Romania would recover the differences existing at present comparing to the countries that are senior in the European Union, it is necessary that **the governmental strategy, independently of its orientation, should propose as an objective a budgetary policy intended to guarantee the continuous flexibilization of the labour market, concomitantly with the insurance of employees' security irrespective of the company where they develop their activity.**

MANAGEMENT CONSIDERATIONS REGARDING THE TOURISM FACILITIES WITHIN THE ROMANIAN PILGRIMAGES PLACES

Țirca Alexandra-Maria

Religious pilgrimages have a real history as economic generators for the visited areas and the elements of supply involved. Romanian monasteries are experiencing some continuous and constant flows of pilgrims, but, at the same time, they also turned into attractions for mass tourism. The aim of this paper is to identify tourism facilities and to establish their development level. The research method of this study was a questionnaire based survey among more than one hundred monasteries' superiors from different regions of Romania, places known as "holy" destinations for the Romanian religious people.

Keywords: religious tourism, tourism facilities, religious sites management, Romanian monasteries.

JEL classification: L83, M10, M21, R10.

1. Introduction

Tourism is a complex phenomenon regarded as an engine in many countries and areas which became one of the economic activities most spread worldwide (Bazini and Nedelea, 2008). The development of spiritual journeys coincided with the development of tourism in the modern era. Even though industry and "its related practices interact with religious life and religious institutions, hypothetically, in every corner of the world" (Bremer, 2005, p.37), *religious tourism is one of the least studied fields in tourism researches* (Vukonić, 2002).

Moreover, as a result of marketing programmes and of the high interest in cultural tourism, religious sites are more and more visited by rather curiosity-driven visitors as compared to genuine pilgrims and this is the reason why *they are promoted, adapted and comprised in products meant for tourism market* (Timothy and Boyd, 2003).

Moreover, many tour operators think that for an individual or a tourist is not mandatory to be very religious to make a journey or to enjoy visiting some attractions endowed with religious significance (Stoykova, 2009). Also the differences between pilgrims and tourists at sacred sites are vanishing, as new similarities are emerging (Collins-Kreiner, 2010).

At the same time, *the structure of the services supplied within religious attractions have changed*, as it was aimed at their adaptation and diversification according to the needs shown by various types of visitors or categories of the general public.

Therefore, *the purpose of this work* is to establish the development level of tourism facilities and the percentage share of each activity of a different nature than religious found in the main places of pilgrimage for Orthodox spirituality, which is the majority religion in Romania, yet regarded as traditionalist and conservative as compared to other denominations.

2. The tourism facilities within the religious travel

A number of economic realities determined the religious settlements to obtain funds by means of trade, collection of entrance fees and provision of some restoration services, guide or accommodation. As for religious tourism, in certain areas, the demand for services from the part of tourists and pilgrims changed the environment, the structure of local economy, while urbanization followed the track of pilgrimage centres.

Lourdes in France and Fatima in Portugal are clear examples as in these cases pilgrimage area can be divided in two: commercial or profane area made up of restaurants, shops, hotels etc. and the sacred area comprising churches, sanctuaries for pilgrimages etc. (Gesler, 1996). Lourdes' urban design has considerably changed in the sense of agglomeration of souvenir shops and restaurants lined all along the road connecting the commercialized area of the city to the pilgrimage area of the city (Rinschede, 1986). Following the same line of ideas, the number of hotels in Lourdes exceeds 200 units, starting from 4**** (stars) and up to 1* (star), without counting for „bed & breakfast” accommodation units and other residence to rent. In Romania, the number of boarding houses in the close neighbourhood of one monastery highly renowned, for instance Humor of Bucovina, exceeds 20 units.

Souvenir shops adjacent to many religious objectives have a more significant economic importance. In many cases, these are owned by the religious organization in charge with that respective destination, but often, these belong to local communities. *The souvenirs which are most looked for and sold are those representing religious symbolism*, especially if they can be associated with the place or the events that occurred at the place of purchase (Timothy, 2006). Objects which are more often traded in Christian religious sites are crosses, icons (this is especially the case with Orthodox Christians), statues (mainly in the case of Roman-Catholics), books, postcards, holy water or myrtle, rosaries, little things made by hand and handicrafts.

Like any other tourist, pilgrims must spend the night somewhere. *Accommodation means to which they resort vary from tents, little guest houses, houses for pilgrims up to luxury hotels.*

A special situation is encountered among religious settlements providing accommodation services within their own premises as is the case of the Romanian monastic complexes of Nicula, Neamț, Afteia, Portărița, etc. which are offering more than 100 accommodation beds each or the case of Bârsana monastery, which besides the accommodation beds within the monastic complex has its own tourist villa. Accommodation within the premises of the religious site is a rather frequent practice also in Guadalupe, Mexico, Medjugorje, Jerusalem etc., and in the case of monasteries or temples.

People may be provided a meal within the premises of Romanian pilgrimage sites, even within the premises of monastic settlements, while some settlements have a capacity to provide meals of more than 300 seats (Rohița Monastery of Maramureș County or Sănmărtinu de Câmpie of Mureș County). But many of them do not have fees for these services. It is the choice of every person to pay a certain amount of money for these services.

2. Study methodology and objectives

The main objective of the study were to identify tourism facilities existing within the central attractions for religious tourism in Romania and the activities carried out here which could turn into attractions, but, at the same time they represent means to obtain the financial resources which are necessary for the preservation of the religious settlement. The hypotheses from which the study started aimed at:

- *H1.Existence of some significant differences concerning the development level of facilities provided to visitors according to the identification features of the monastic complex.*
- *H2.Existence of some significant differences concerning the activities provided according to the identification features of the monastic complex.*

Therefore, the population investigated has been made up by all Orthodox monasteries all throughout Romania, while the sampling unit has been represented by the monastic settlement by means of the abbot, as its representative and the person in charge with the place.

Based on the sampling frame identified by means of the Directory of Orthodox Monasteries of Romania, we excluded the monasteries located in larger cities in order to identify with precision the locations where the demand is exclusively or mainly oriented towards religious tourism attraction. Moreover, we took into consideration the lack of permanent inhabitants within monasteries and paid a special attention to monasteries specified in tourism guide books as these monasteries, by their very nature meet at a larger extent the purpose of this survey aiming at identifying the features of religious tourism supply. As a method of data collection we used “face to face” punctual survey at the site of monastic settlement. With respect to data collection tool, we opted for a questionnaire.

Sample size comprised 151 monasteries. The choice of the units within the sample was made, in the first stage, according to a probabilistic method: the areal method. Thus, we divided the territory into 6 areas corresponding to the 6 Metropolis Community Churches, and from these we counted out 3 areas from where we were to inquire all the units. It was impossible to inquire all the units in every area due to high expenses for travelling, so we applied convenience sampling. Sample structure is outlined in the table below (Table 1):

Table 1. Sample characteristics

<i>Monastery Type</i>		<i>Percent</i>	<i>Metropolis Churches</i>		<i>Percent</i>
Monks		51.08%	Ardeal Metropolis Church		6.47%
Nuns		48.92%	Muntenia and Dobrudja Metropolis Church		2.88%
<i>Monastery Size</i>			Moldavia and Bucovina Metropolis Church		15.11%
1- 5 members		34.71%	Oltenia Metropolis Church		7.19%
(5-10] members		19.01%	Banat Metropolis Church		10.79%
(10-15] members		15.70%	Cluj, Alba, Crişana and Maramureş Metropolis Church		57.55%
(15-20] members		7.44%			
(20-25] members		6.61%			
More than 25 members		16.53%			

3. Research results

The first set of questions aimed at establishing the accommodation facilities within monasteries as well as their structure. Thus, more than 61.00% of religious settlements have accommodation facilities within the monastery (generally, within a single building called “guest house”), the number of beds ranging between 3 and 200. In the case of most of them, people are not charged for accommodation services as it is a service free of charge. However, pilgrims make donations and leave money most of times for these services. Percentage share of accommodation facilities and fees are listed in the table below (Table 2):

Table 2. Analysis of accommodation facilities existing within monastic settlements

<i>Type of accommodation services</i>			<i>Number of beds</i>	<i>Room type</i>	<i>Remarks on fees</i>
<i>Within the monastic complex</i>	Yes	61.80%	M= 43.44 (n=73) S=3171	1,2,3,4,5,6,8, 10,12,15,20, 25 beds	Average price per night = 10. 83 lei (2.5 Euro);(n=73) * at 77.30% of monasteries, accommodation is free of charge
	No	38.20%			
<i>Outside the monastic</i>	Yes	13.00%	M=60.31 (n=16) S=784	1,2,3,4,6,7,8, 10,20 beds	Average price per night = 31. 10 lei (8 Euro); (n=16) *at 20.00% of units, accommodation
	No	87.00%			

<i>complex</i>					<i>is free of charge</i>
----------------	--	--	--	--	--------------------------

M= Average of the number of accommodation beds; S=Sum of the number of accommodation beds

Only 13.00% of the monastic settlements subject to our study have accommodation facilities located outside the monastery (we referred here to accommodation units which are within the property of the monastery or are run by monastery's inhabitants) and the number of beds within these accommodation units ranges between 15 and 150 beds. These units located in the close neighbourhood of monasteries usually take the form of chalets, villas, pilgrim houses or motels. Fees generally vary.

We have to underline that the rules regarding monastic life do not allow a layman (a person not belonging to clergy) to spend more than 3 consecutive nights in the monastic complex. For these reasons, some monasteries decided to build accommodation units where such rules do not apply. In case of Bârsana Monastery, for instance, a three-star villa was built having almost 54 beds in double and single rooms with phone, fax and PC access.

Some of monasteries' abbots stated that the existing accommodation beds within monastic complexes are sometimes not enough. Therefore, during peak periods, especially in the summer, the demand exceeds the existing supply to spend the night within religious settlements. In the case of Bârsana monastery, for instance, it is mandatory to make a prior reservation for an accommodation bed during summer time, one month prior to arrival at the least.

We continued by examining meal providing related facilities (restoration services) existing within monastic complexes (Table 3). The research outlined that for more than 80% of the monasteries subject to our study, tourists or pilgrims may be provided a meal while for more than 15% of monasteries, visitors are provided a meal only if they are accommodated in one of monastery's facilities.

Table 3. Analysis of meal providing facilities existing within monastic settlements

<i>Possibilities to provide meals</i>	Non	19.51%	M=63.46 (n=89) S=5648	<i>There is a fixed schedule to provide a meal for 63.60% of monasteries.</i>	<i>Seats number</i>	
	Yes, under all conditions				64.22%	33.71%: less than 20 seats;
Yes, only if lodged		16.27%				
<ul style="list-style-type: none"> - 13.79% of monasteries provide only meal without meat; - 86.21% of monasteries, except for fast days, visitors can be provided any kind of food (in certain cases without meat); - In certain monasteries, people suffering from various diseases may be provided special meals. 						

M=Average of the number of seats to be provided a meal; S=Sum of the number of seats to be provided a meal.

The following investigated aspects referred to the number of additional facilities existing within monastic settlements which are used on the one hand, but also expressly looked for, on the other hand, by tourists or other visitors.

The *hypotheses from which the survey started*- concerning the significant differences which might exist among facilities and activities of a different nature than a religious one which can be encountered or conducted within the main pilgrimage settlements according to their identification characteristics, they were tested by means of Pearson's correlation coefficient, specific to nominal variables.

The *hypotheses taken into consideration* were sub-divided each into 3 secondary hypotheses, concerning the influence of monastery type, size and Metropolis Church (administrative structure

of The Romanian Orthodox Church). The testing of these hypotheses allowed only their partial validation. Significant differences between these facilities emphasized two relationships of an average intensity as presented in the table below (Table 4):

Table 4. Additional facilities existing within monastic settlements and monastery characteristics influence

<i>Facilities existing within religious settlements</i>		<i>Influencing factors</i>	<i>Relationship intensity</i>
Souvenir / religious objects shop	70.50%	Monastery size	C=0.375 (<i>df</i> =5; <i>p</i> =0.028<0.05)
Arranged parking lot	43.40%	-	
Meeting/ conference room*	19.70%	Metropolis Church	C=0.500 (<i>df</i> =5; <i>p</i> =0.013<0.05)
Access to internet	11.50%	-	
Banking service (ATM, etc.)**	0.80%	-	

(C= Pearson's correlation coefficient; *p*= Significance level of study)

*more frequent in Cluj, Alba, Crişana and Maramureş Metropolis Church and Muntenia and Dobrudja Metropolis Church

**Bârsana Monastery

The main facility encountered within more than 70% of the monasteries investigated (the extremes values were 100% for the monasteries with 10-15 members and 47.6% for small monasteries) aims at giving to all those visiting the monastery the chance to buy souvenirs or religious objects from specialized shops which are usually located at the entrance of monastic complexes.

In tight connection to the commercial side we *identified the activities of a different nature than a religious one, which are carried out within monastic settlements and which might represent a source of funds*, but also an attraction element for many visitors. Significant differences between the activities carried within the monasteries (especially in what concerns the monastery size and type) emphasized a number of relationships of an average intensity (Table 5).

Table 5. Activities of a different nature than religious carried out within monastic settlements and their influence on these activities

<i>Activities carried out within monasteries</i>		<i>Influencing factors</i>
Painting	29.50%	Monastery size: C=0.383 (<i>df</i> =5; <i>p</i> =0.001<0.05) Monastery type: C=0.371 (<i>df</i> =1; <i>p</i> =0.000<0.05)
Embroidery	14.90%	Monastery size: C=0.334 (<i>df</i> =5; <i>p</i> =0.011<0.05) Monastery type: C=0.369 (<i>df</i> =1; <i>p</i> =0.000<0.05)
Weaving	9.80%	Monastery type: C=0.332 (<i>df</i> =1; <i>p</i> =0.000<0.05)
Tailor' workshop	6.50%	Metropolis church: C=0.574 (<i>df</i> =5; <i>p</i> =0.031<0.05)
House-keeping and gardening	6.50%	-
Agriculture and animal breeding	5.70%	-
Sculpture	4.06%	Monastery type: C=0.465 (<i>df</i> =1; <i>p</i> =0.023<0.05)

(C= Pearson's correlation coefficient; *p*= Significance Level of study)

Thus, most activities carried out in a monastery, other than religious activities refer to painting, embroidery, weaving workshops (specific to monasteries of nuns and to large monasteries). Among other activities carried out by monastic settlements we can also mention the tailors'

workshops specializing in clerical clothes (specific to monks monasteries), rosaries, candles, objects made by hand, etc.

4. Conclusions and managerial implications

The investigation of tourism facilities existing within monasteries allowed the identification of the following essential issues:

- More than 60% of monasteries provide with accommodation services within the monastic complex, and 13% outside the complex in own villas, chalets, etc. Accommodation service within the monastery is free of charge for almost 80% of the monasteries subject to our study. Nevertheless we have to specify that tourists pay most of the times for these services on their own initiative in the form of donations, amounts to pay for church service, etc., while in the case of the units run by monasteries where these unites are located outside the complex, accommodation fees amount to 30 lei (8 €) per night on an average.
- It is possible to be provided with a free meal at about 75% of the monasteries comprised in our study, sometimes only if the visitor is also accommodated within the monastery; more than half of the monasteries have a fixed schedule for meals and 20% of them provide only meal without meat.
- In more than 70% of the Romanian monasteries we can find souvenir shops; almost 40% of them have arranged parking lots, 20% have conference rooms, while 10% have access to the internet.
- Painting and embroidery are the main activities carried out within Romanian monasteries.
- Some of these facilities vary according to monastery type, size and Metropolis Church to which they belong.

Within such religious attraction settlements, people conduct a number of activities, *whether cultural or related to objects made by hand contributing to the raise of funds*. These activities represent also an attraction for visitors. Quite often, the sale of the objects made in monasteries is intended for foreigners who are more likely to appreciate their special beauty and authenticity. Issues related to religious tourism economy and commercial activities can also be found, in broad outline, in Romanian religious destinations, but on a smaller-size scale and not so much focused on the material side. One can also notice that the services and the facilities provided are at an incipient stage in the case of some religious settlements, generally smaller or less known, but in the case of other monasteries we can talk about a developed tourism and religious supply ranging from spiritual services to banking facilities or communication and information technology-related facilities.

Therefore, the *potential to develop these religious tourism attractions is extremely high*, although the crystallization of this market has hardly begun at domestic level. Nevertheless, we can talk of an ever increasing development and adaptation of the facilities provided by main places of pilgrimage as a response to a more and more diversified demand, as a significant integrant part of religious tourism phenomenon.

„Entrepreneurship allows women to become economically independent, the essential premise for a change in mentality, attitude and behaviours.”¹⁴⁰²

Specialists claim that the only certitude of the XXIst century is change, as these decades have been marked by the fastest and most spectacular changes in the history of human kind. Difficult to forecast, the transformations that took place can be found in all areas: technical, economic, social, IT, educational, cultural and political. One of the most important, but insufficiently captured and considered changes is represented by the situation of the SMEs in the front line of the development: their transformation into the most dynamic factor and, in this context, the more and more active presence of women in management positions in SMEs.

In Romania, The National Agency for SMEs has implemented for the first time a promotion program for entrepreneurship among women managers of the SMEs sector. The program enjoyed a great success and resulted in a big impact in the business community. The program stimulates¹⁴⁰³ the growth of women entrepreneur within the business community, the development of the skill and entrepreneur spirit among women and efficient use of the human capital formed by potential women entrepreneur, improving the economical performances of existing enterprises, led by women through the growth of the training of their employees. Other aims are equal access to the knowledge based economy, experience sharing among business women, establishing partnerships and encouraging the will to represent personal interests in the civil society.

Keywords: SMEs, entrepreneurship, women entrepreneur, human capital, knowledge based economy

Current context

Numerous studies developed by researchers and experts in the field of entrepreneurship have shown that starting a new organization is a key element in the process of economic development and rebound. Nowadays, we are all aware that in any modern economy, SMEs are the “heart of the economy” as they represent 99% of all EU enterprises and have provided over the past years over 80% of the new jobs in the EU.¹⁴⁰⁴

Recent statistics from the developed countries complete this picture: most of the GDP comes from the SMEs, most of the employed work force is located in SMEs as they are, within the

¹⁴⁰⁴ http://ec.europa.eu/enterprise/entrepreneurship/sba_en.htm, accesat aprilie 2010.

current economic context, the only ones who create jobs and represent a favourable environment for creativity and innovation. The adoption within the EU of the law concerning SMEs is an essential stage for implementing the Lisbon Strategy for growth and work places. This results in “public administrations that that respond better to the expectations, less late payment of bills, access to a greater support through financing, innovation and professional education, lower VAT for local services and a better access to public procurement contracts. Moreover, this package will offer SMEs access to a Statute of the private European companies in order to decrease bureaucracy and increase transparency.”¹⁴⁰⁵

Philippe Maystadt, president of the European Investment Bank (EIB) has pointed out in a discussion that “*small and medium-sized enterprises wellbeing and growth will be key to Europe's future competitiveness. The market alone is unable to provide sufficient and appropriately priced finance for SMEs, in particular for high growth, innovative businesses. The EIB Group will therefore seek to address gaps in the market by broadening the scope of its financing.*”¹⁴⁰⁶

The level of entrepreneurship activities varies from one country to the other, as well as within one country, from one region to the other or from one social group to the other. Generally, regardless of country, the studies from the past years concerning the level of entrepreneurship activity show that, although the importance of female entrepreneurship shows an upward tendency in any economy, the rate of starting new companies is higher in the case of men.

Charles Handy, a management guru, states in his paper, *The Empty Raincoat* that “Organizations want quality people, well educated, trained and adaptable for management positions. They also want people who can tackle more tasks at once, people who want to act and who are not preoccupied with the title or position they have, but are more interested in the phenomenon of power and influence, rather than the social statute. They want people who will make the best of instinct and intuition as well as analysis and rationality, who can be tough, but sensitive, firm but friendly, people who can reunite all these necessary contradictions. Consequently, they want as many women as possible.”¹⁴⁰⁷

Nevertheless, female entrepreneurship still represents “an unused source of economic growth. Therefore idea that in order to fully benefit from the entrepreneurship potential of a country or region, the emphasis of female entrepreneurship is necessary.”¹⁴⁰⁸

The approach of the female entrepreneurship issue is not new, but it is more popular nowadays. The wish to expand female participation in the management activity is based on three major arguments, presented by Susan Vinnicombe and Nina L. Colwill in the paper “Essence of women in management”, as follows:¹⁴⁰⁹

- the natural style of women in work is more easily adaptable to job and structure shifts within companies than that of men;
- women can offer companies a competitive edge on the global market, helping them to better reflect in the management teams the gender composition of the markets where they are active;
- qualified women represent a vital resource. As the demographic results show, in the near future as well as in the far future, women involvement in management positions can be an imperative request

Nowadays, statistics show that women get involved in businesses at in an overwhelming degree as compared to the past years. Changing the rules of the game, women entrepreneurs create their

¹⁴⁰⁸ idem.

¹⁴⁰⁹ Vinnicombe, S., Colwill, N.L., *Femeile în management*, Ed. Teora, București, 1998.

own style of leading, totally different from that of men. This new style of management has nothing from the predefined notions of tough competitiveness, aggressiveness and leadership, claims Margaret Heffeman, writer and entrepreneur.¹⁴¹⁰ In her opinion, organization, empathy and relational management represent advantages in the management of a company; the reasons that underlie the involvement of women in business are also very different than those of men. More than half of women entrepreneurs rely more on intuition when it comes to market analysis, which allows women to see opportunities that men generally fail to notice. Moreover, the feminine nature offers them a better mix of analysis and creativity – essential point for start-up companies.”¹⁴¹¹

We will present below some statistic data for the year 2009, data that will complete the female entrepreneurship picture in Romania.¹⁴¹² The data shows that:

a. Women represent:

- 51.2% of the total population of the country
- 45.6% of the active population
- 53.0% of the employed population (64.7% men)
- 5.2% are unemployed (8.2% in the case of men)

b. The female employed population divided on economic activities

- Industry – 35.0% (35.9% men)
- Construction – 1.9% (14.1% men)
- Commercial services – 32.6% (31.3% men)
- Social services – 30.5% (18.7% men)
- Specialists in intellectual and scientific areas: 52.08% women
- Doctors in sciences – 38% women
- Female physicists – 67% (40.9% in the EU)

c. Employed population according to professional position

- Owner of businesses 37.000 women, respectively 24.8%
- Freelancers 512.000 women (28.9%)
- Employees 2.843.000 women (46.1%)

d. Statistics for female entrepreneurship

- 31% of Romanian companies have a woman as an associate

e. Characteristics of companies that emerged

Women

Age of company 5.07 years

Sole owner 47.06%

Owner-manager 78.90%

Initial size 2.9 employees

Growth of business 39.2% new jobs

All these explain the major interest among specialists not only concerning female entrepreneurship and its role in the knowledge based company, **the prototype of the knowledge based company being the SME**, but also its main characteristics: fundamental competitive edge based on increased knowledge, creativity, flexibility and dynamism, high ability to learn and use new knowledge and generate added value.

The involvement of women in this type of business is a fact undisputed nowadays. More and more women become entrepreneurs and choose to be in charge of their own lives and careers, setting up successful businesses. Which are the most common qualities that all women entrepreneurs possess? In the opinion of Oana Maria Banu they are:

Ambition

A successful woman entrepreneur is extremely ambitious, has a special talent in transforming an idea into reality. The ambition to win helps her have a flourishing business.

Confidence

Confidence that she has all the requirements in order to succeed is another quality of a business woman. She is prepared to learn from the others, to ask for advice from experts and add value to her purposes. The woman entrepreneur has to be optimistic and take risks. The ability to explore new territories is also connected to self-confidence. Moreover, self motivation is an essential factor in keeping the business in high standards.

Openness towards change and will to learn

The woman entrepreneur is conscious of the importance of evolution and adoption of change. Always ahead of competitors, she is open towards what is new and willing to learn. She is curious, interested and can cope with innovations fast.

Realism regarding costs

A business is, first and foremost, money. In order to be successful, a woman who is in charge of a business prepares realistic budgets and her estimates are confirmed by the reality. Minimizing costs without sparing quality regarding services/products is one of the basic characteristics that leads to profit.

Taking advantage of team work and honesty

A business woman has the ability to work with all kinds of people, regardless of their education. She can maintain relations and communicate clearly and efficiently. This helps her negotiate even in the most sensitive aspects.

Maintaining the balance between work and personal life

Concerned not to become a workaholic, the business woman is skilled in maintaining the balance between various aspects of life. Her ability to deal with a lot of problems and also to support the loved ones helps her assume responsibilities in which the business as well as the family is concerned.

Specialists believe that women have nowadays more initiative to go into entrepreneurship and are more open to developing new businesses. Concerning the reason that women get into business, specialists also agree that they are very different from those of men. Women look for a place where they can capitalize on their qualities. For this, most of the women are willing to assume a greater risk in their career than men, claim experts in entrepreneurship.

Moreover, another reason for which women start their own businesses is, in the specialists opinion, that most of them are mothers and they want to be able to work less in order to take better care of the family. “While most of these women operate an *unusual* environment, from the point of view of income, purchases and marketing, it still is like other businesses. Just like in the case of other start-ups, the initial investment is crucial. Most of these have proved to be successful and sometimes have had better outcomes than those owned by men”¹⁴¹³, shows a study ordered by the American investment company Venture Worthy.

The study also shows that the skills of the woman entrepreneur, such as intuition, empathy, leading instead of commanding and multitasking without getting lost in details are the true values that lead their business.

¹⁴¹³ Studiu realizat de compania Venture Worthy găsit pe <http://www.ventureworthy.com/>, accesat aprilie 2010.

The Global Entrepreneurship Monitor (GEM) concludes in its study that women entrepreneurs represent an important contributor to economic growth, especially in the countries with low or average incomes. The aforementioned study shows that:¹⁴¹⁴

- In higher income countries, there is no gender difference regarding the rate of survival of businesses led by women as compared to those led by men.

- Women who are employed and have persuaded a social network of entrepreneurs are more likely to become entrepreneurs. The social and economic benefits of women who work represent a driving force for female entrepreneurship to a higher degree than family income or a high education.

- Women tend to be less optimistic and less self-confident than men when it comes to starting a business. However, once they are involved in the entrepreneurship activity, the self-confidence of women increases and they start to know the other entrepreneurs and exploit valuable opportunities, such as men do. Taking into account the differences between the various cultures worldwide regarding the financial independence of women, the lack of trust is not a surprising fact. The good news is that once they are involved in the entrepreneurship activity, they start to gain more self-confidence. Entrepreneurship does not have only financial implications for women, but also social ones.

- The fear of failing is higher in the case of women than it is in the case of men in all groups of countries. Women from low and average income countries in Asia and Europe presented a high rate of fear of failing (40.3%) as compared to women from Latin America and the Caribbeans (34.2%) and women from higher income countries (27.1%).

In which the profile of the business woman in Romania is concerned – here is how the business woman in our country looks like, according to the result of the study Eurochambres-Women in business and in decisions-making¹⁴¹⁵:

- The person is very ambitious

- Married with children (81.8% married, 77.8% with children)

- Higher education, well trained

- Devoted to her own business, sometimes even neglecting the family

- Work over 60 hours a week, deals well with effort

- Very perseverant, managing to surpass obstacles

- Independent (the main motivation for starting a business)

- Will to outdo herself (the lack of time is a barrier)

- Uninterested in participating in decision-making

We would like to take a look in what follows at the main problems that in general Romanian entrepreneurs are confronted with and female entrepreneurs in particular. Therefore, in the opinion of specialists¹⁴¹⁶, the problems that the majority of entrepreneurs are confronted with are: the instability of the fiscal system – the lack of a simple, clear and stable financial legislation; a financial context less favourable for the development of SMEs: high cost of credits associated with the instability of the fiscal system which generate the fear of investors of becoming incapable of repaying the debt; the difficulty in accessing credits in the case of a new firm; administrative bureaucracy, lack of a correct measurement program that would insure the survival of SMEs in the new competitive context created by Romania joining the EU; difficult access to entrepreneurial training due to high costs and lack of time of business women.

In which the gender barriers are concerned¹⁴¹⁷ – the specific obstacles that get in the way of female entrepreneurship are the following: type of education, lack of entrepreneurial role models, entrepreneurship based on gender, weak social statute, professional stereotype (12% lower than

¹⁴¹⁴ Global Entrepreneurship Monitor găsit pe <http://www.gemconsortium.org/>, accesat aprilie 2010.

¹⁴¹⁶ idem.

¹⁴¹⁷ *Programul național multianual pe perioada 2001 – 2012 pentru dezvoltarea culturii antreprenoriale în rândul femeilor manager din sectorul IMM-urilor* găsit pe <http://www.aippimm.ro/articol/comunicate>.

the average salary); social stereotypes, lack of policies, programmes for setting up and developing female-led businesses; lack of studies concerning the accession impact that would include the threats and opportunities of the SMEs led by women; difficulty for business women to enter certain economic areas that are considered exclusively masculine; lack of accessible quality facilities for taking care of the child, sometimes combined with lack of family support; difficulties in accomplishing a balance between the personal and professional life and, most importantly, credit difficulties – difficulties in accessing unrefundable funds, which are due to the lack of education of the entrepreneurs and to Ministry clerks who do not have an “interest – performance coefficient” in making the funds available for businesspersons.

The state supports female entrepreneurship first and foremost through the “National multiannual program for 2005-2012 for developing the entrepreneurial culture among women managers in the SMEs sector”¹⁴¹⁸, program which is aimed at facilitating the mobility of women in the labour market and developing their entrepreneurial skills in order to involve them in private financial structures in the context of the problems connected to maintaining a balance between personal and professional obligations and prejudices that exist at a local level.

The main objective of this program is “Supporting the women entrepreneurs to promote their activity in the Romanian business environment.” The objective is the promotion of an educational system that facilitates women’s mobility in the labour market and develops their entrepreneurial skills. Since there has been no financial support until 2005 in Romania to promote women in the business world, the National Agency for SMEs has initiated this program starting from the necessity to prepare and develop the entrepreneurial culture of women involved in all types of activities, including those who come from a rural environment. Among the measures the program promotes are access to quality and business counselling. The latter helps women consolidate their trust in a positive view for the development and growth of their own businesses. In our country, in the SMEs sector, the required harmonized measures are aimed at:

- The promotion of culture and conditions for entrepreneurship among various categories of women, including those who are farther from the most common financial activity can be supported by innovations regarding the training, well planned innovations which are oriented towards a local level;
- Providing high quality financial support and business services which would create a bridge between private, public and semi-public agencies with the purpose of facilitating the access of women to these types of services is possible with the involvement of the municipality;
- Supporting the development of business incubators which encourage women by concluding business and university partnerships at a municipal level;
- Changing the procedures of public procurement by including social clauses can be successful in expanding the markets for family businesses.

The phenomenon of a developing female entrepreneur culture in our country is both interesting and important. “As small businesses develop, going through successive stages of organizing or legal statute, a slower process takes place, but one that is not less interesting – one of forming a collective mentality regarding business women. It is not only about the other’s attitude towards female business owners (area in which misogynistic qualifications start to give in), but also about an open recognition of the natural abilities of women to coordinate other’s work, their easily adaptable style to the environment conditions and their ability to work in a team and to develop networks, the negotiation and decision-making skills, etc.”¹⁴¹⁹

What else is required for creating a strong female business segment in Romania?

¹⁴¹⁸ *Programul național multianual pe perioada 2001 – 2012 pentru dezvoltarea culturii antreprenoriale în rândul femeilor manager din sectorul IMM-urilor* găsit pe <http://www.aippimm.ro/articol/comunicate>.

¹⁴¹⁹ Vinnicombe, S., Colwill, N.L., *Femeile în management*, Ed. Teora, București, 1998.

This is one of the questions that women associations and NGOs try to answer. We believe that it is critical to create this segment due to the following reasons: “women become themselves more powerful through business, they become more financially independent and bring wellbeing to the family. Women are inventive and creative and these traits will always influence the businesses they develop.”¹⁴²⁰

A series of opportunities have been developed in social and home activities, activities which are perfectly suited for women. Moreover, specialists believe that an increasingly greater number of women who are involved in businesses will generate a business environment that is less corrupt while financial independence and performance in business of women will give them the visibility and credibility they need in order to develop successful careers.

If “many times, women manage to enter the management of large organizations just by copying the male style (in order not to be different from the male majority of management structures), in their own businesses, women can behave naturally, which makes them more credible; they can even emphasize upon those typically feminine abilities which are sensitivity, concern for the others, empathy – which are in high demand nowadays. The good news is that more and more, the true value of a business person is regarded in relation to the results and type of relations with the others and not regarding their gender.”¹⁴²¹ We believe that it is normal that in the competition between men and women, the only selection criteria be the skills, team spirit and performance.

TRENDS IN DELIVERING EDUCATIONAL SERVICES WITHIN THE KNOWLEDGE-BASED SOCIETY

Zamfir Andreea

Academy of Economic Studies Bucharest

Faculty of Management

Education and implicitly educational services become extremely important in the context of the knowledge-based society. Therefore, this study investigates the trends in delivering services identified through research of literature, as well as based on personal experience in providing educational services. It has been concluded that information and communication technology creates a vast opportunity to improve the way of delivering educational services within the knowledge-based society, to develop (educate) people's awareness of the need for knowledge, as well as their skills for the knowledge-based society.

Keywords: management, educational services, information and communication technology, knowledge-based society

JEL classification: A22, I20, L80.

1. Introduction

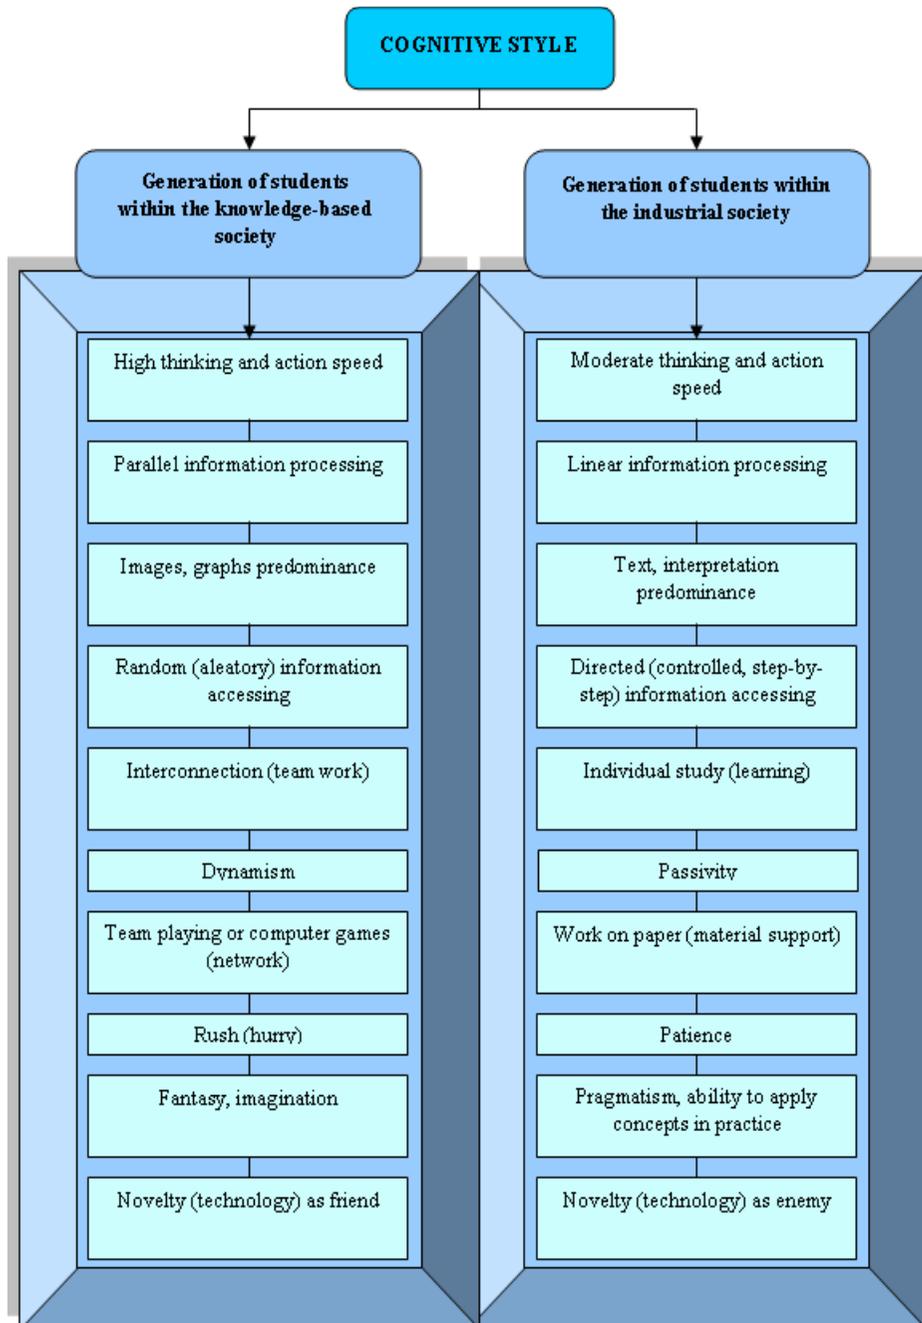

The “key words” in managing services within the knowledge-based society are knowledge, people and networks. Therefore, education (and implicitly educational services) becomes extremely important in the context of the knowledge-based society. This is the reason for trying to briefly disclose in this study some of the trends in delivering services identified through research of literature, as well as based on my personal experience in providing educational services. Since knowledge is assessed throughout people's life (lifelong learning), people's awareness of the need for knowledge should be developed (educated), as well as their skills for the knowledge-based society. Given that information and communication technology plays a major role within the knowledge-based society, it is reasonable to use it for delivering educational services.

2. Developing (educating) students' need for knowledge

The task of developing (educating) the student's need for knowledge is a challenging one because it implies changing the educational practices, its adjustment to new contexts within the knowledge-based society. The generation of learners within the knowledge-based society is different from the preceding one within the industrial society (Figure 1), in the sense that some main cognitive style changes have been observed (Mitchell and Savill-Smith, 2004). For instance, high thinking speed, action speed, interconnection and “friendship” with technology are all changes in the cognitive style of modern students. These changes may be considered in the process of teaching and learning in order to stimulate learners' awareness, interest, and desire to know more and more and to induce them the feeling that they cannot survive as workers within the knowledge-based society without lifelong learning.

Therefore, educational policies and practices should give emphasis to a lifelong learning perspective (Zamfir and Plumb, 2007). The main reason for this is that the spiral of knowledge everlastingly expands due to the application of knowledge to knowledge. Consequently, we may assume that if students are educated to apply knowledge to knowledge in the process of learning as well as in day-to-day life, then this process will become habitual, and their permanent need for knowledge will be encouraged and developed.

Figure 1 Comparative approach of the cognitive style within the knowledge-based society and within the industrial society

(Source: Adapted from Mitchell and Savill-Smith, 2004)

Learners growing up and working within the knowledge-based society are far more experienced and able to process information rapidly than were their predecessors within the industrial society. Therefore, they may be bored and lose interest for continuous knowledge (learning) if their capacities are not exploited and properly stimulated in school, in the process of teaching and learning (Zamfir, 2008b). However, it has been noted (Plumb and Zamfir, 2008) that to some extent curricula still tend to contain theoretical knowledge, which dominates practical learning

and thus changes the educational practices. In this context, applying a learning-oriented approach is a must.

Furthermore, the learning-oriented approach has to consider the cognitive style of the learners within the knowledge-based society. They are intensely using new technologies such as computers, internet, cell phones, simulations and computer games (Mansour and El-Said, 2008: 772). Moreover, the generation of students within the knowledge-based society find modern technology very useful when they search for things of their own interest (Milkova, 2008). As a result, the traditional teaching methods no longer match the current student's needs and behaviour. As teachers cannot change students, the best way is to adjust their pedagogical approach to the students and to create new learning environments supported by artificial intelligence (Prepelita-Raileanu, 2008; Dondon et al., 2008; Paladini and De Carvalho, 2008; Saarinen et al., 2008). These learning environments facilitated by the development of information and communication technology add value when compared to traditional learning environments, and also respond to the learning needs of 21st century students (Saarinen et al., 2008).

Practically, based on my personal experience, I can assert that having in mind the elements which define the cognitive style of students within the knowledge-based society one can educate the students' need for knowledge through various means, such as: assignment of team tasks, appeal to the students' imagination, practising open (free) discussions, avoiding answers to some questions, etc.

With regard to team tasks, instead of individual tasks, these stimulate knowledge sharing and as a result, students may ask themselves new questions starting from the ideas and knowledge shared. Trying to answer these questions in order to solve the team task will require searching the literature, making logical connections, discussing and identifying new aspects of the subject they are studying. As well, when teachers avoid answering to some of the questions posed by the students, the latter will be interested to find it themselves. Appealing to the students' imagination by asking them to imagine different situations, cases or solutions to the problems may contribute to educating their need for knowledge because afterwards they might be interested to know if their imagined solutions were or not discussed in the literature, applied in practice, or if it can actually be applied in the future and how.

3. Developing students' skills for the knowledge-based society

Living, learning and working within the knowledge-based society requires specific skills, emphasising on creativity and innovation, as well as on communication and collaboration. Students should be able to demonstrate creative thinking, to construct knowledge as a means of individual or group expression, to use models and simulations to explore complex systems and issues, to interact and collaborate using a variety of digital environments and media in order to support individual learning and contribute to the learning of others (ISTE, 2007). Technologies that support teacher-student and student-student interaction, whether real time or asynchronous, promote and support collaboration and discussion (Yoder, 2008). People have now more diverse and frequent interaction opportunities than they have ever experienced before, due to the development of the Internet and its communication possibilities such as Email, chat, Web discussion forums, etc. (Woo and Reeves, 2007). This fact could lead to a better teaching-learning process and also to the creation of new and attractive methods for teaching and learning. Educational process could be improved with communication tools that provide synchronous and asynchronous opportunities for interaction and collaboration. Blogs, podcasts, real time interaction, and virtual worlds could be incorporated in education to create a learning environment that strengthens teaching and motivates learners (Yoder, 2008) so as to gain the skills needed within the knowledge-based society.

In the last few years, there has been a growing understanding of the important role of information and communication technologies in education. Various new models of education are evolving in response to the new opportunities (Barak, 2007) that are becoming available by integrating new

technologies and computer applications into the process of teaching and learning. The new educational model is characterized by the interdependence of communicative interaction, new technologies, the development of computer applications, the design of computer-based tasks and focused activity for learners to become critical thinkers and creators of knowledge (Kimber et al., 2007).

Recent educational research from a socio-cognitive perspective has validated students' collaborative engagement with new technologies and heightened understanding of influential factors shaping the effectiveness of peer interactions, learning contexts and computer interfaces for enhancing learning (Kimber et al., 2007). All these changes pose considerable challenges for the educators and business trainers who wish to promote literacy skills (Mitchell and Savill-Smith, 2004).

One significant pedagogical approach gaining credence through research and classroom practice is students' collaborative engagement with problem-solving, computer-based tasks for more effective learning (Kimber et al., 2007). There are some characteristics of the computer applications that contribute to the engagement of the students in the process of learning, such as rules, goals, interaction, outcomes and feedback, challenge, problem solving, etc. (Mitchell and Savill-Smith, 2004). Teachers should focus their efforts to ensure that students are given opportunities to work collaboratively with electronic knowledge-creation tools in their learning process to enhance their learning. When students are encouraged to externalise their mental schemas and clearly communicate their understanding of the interconnectedness of ideas verbally and graphically, then student-designers are effectively engaged in productive, reflective, creative practices (Kimber et al., 2007).

4. Using information and communication technology for delivering educational services

Nowadays educational practices are profoundly changing by integrating information and communication technologies into the process of teaching and learning. Knowledge society and growing demands for highly skilled and educated people are elements that claim for the change of traditional teaching and learning processes. Modern students need to update their knowledge, skills and competences (Beleviciute and Sileikiene, 2006). Therefore, teachers should redesign their courses by adopting new educational methods and appropriate technologies to fully exploit the benefits of web-based learning environments (Lee et al., 2007) and computer applications in education (Zamfir, 2008b). Although some progress is being made, relatively few authentic web-based learning and lifelong learning programs have been developed and implemented at different levels of education (Zamfir, 2008a). One type of changes is related to an integration of various kinds of computer-based learning systems as supplements to conventional teaching methods (Zamfir, 2007).

Many possibilities are available for using information and communication technology for delivering educational services (e.g. PowerPoint presentations, E-mail, Chat, discussion forums, or special software). One of them is computer simulation (which integrates computers, software, virtual networks, people, and knowledge iterative processes) that could be successfully used in economic and managerial education. Some recently conducted studies (Zamfir, 2008c, Zamfir et al., 2009) have confirmed that it is very useful to simulate the activities of a company in order to develop students' competences and skills that they need for their real-life activities. Teachers could integrate into their teaching activity technological tools such as computer simulation, which promote interaction and critical thinking among students, and seem highly motivating and make learning enjoyable for students.

5. Conclusions

Education and implicitly educational services become extremely important in the context of the knowledge-based society. Consequently, we have briefly disclosed some of the trends in delivering services identified through research of literature, as well as based on personal

experience in providing educational services. Since knowledge is assessed throughout people's life (lifelong learning), people's awareness of the need for knowledge should be developed (educated), as well as their skills for the knowledge-based society. Given that information and communication technology plays a major role within the knowledge-based society, it is reasonable to use it for delivering educational services. If students are educated to apply knowledge to knowledge in the process of learning as well as in day-to-day life, then this process will become habitual, and their permanent need for knowledge will be encouraged and developed. In this respect, we have briefly illustrated how information and communication technology could be used to deliver educational services.

MARKETING AND SALES OF THE BODY SHOPS CONNECTED TO GENERAL MOTOR'S COLLISION

Hahn Rada Florina
The North University of Baia Mare
Faculty of Sciences

The product and the services offered by Body Shops consist of work, parts and materials demanded for repair the damaged or cosmetic degraded vehicles. The client of the Body Shops is somewhat unusual in that two parties are likely to be involved. The first party is the vehicles owner. The second party is the insurance company responsible for pay. Both parties may be involved in selecting a repair shop, but ultimately the vehicle owner has the final authority in almost the cases.

Key words: body shop, sales process, target customers, customer perceptions

M: Business Administration and Business Economics;Marketing;Accounting

1. INTRODUCTION

The document which starts the whole process regarding the repair sometimes referred to as the damage appraisal. Effective Body Shops use Marketing and advertising efforts for motive the potential clients. The client is free to have estimates written by other shops and make a selection based on his or her perception regarding the store's ability to meet his or her needs. The estimator's objective is to create a good impression upon the customer throughout the estimate process, resulting in customer's approval to perform the repairs. The approval is documented by creating a repair order for client to sign. The process of marketing and sales must enhance the estimator's ability to close the sale. They might be excellent technicians but in many cases they have not been prepared properly to become business people.

2. THE INVESTIGATION

This research study concluded that many potential customers have a negative perception regarding Body Shops. Effective shops are working to reverse this negative perception. The important factors which are having influence above the imagine are: location, signage, appearance of a shop, office appearance and the personal.

2.1. Location

The location has an important role in the development positive imagine for Body Shops. Dealerships have generally good locations but the Body Shops are normally behind of their facility. This sets "a back end of the business message" to customer. These factors can be overcome by using tall facility facades and large lighted signs or lettering.

2.2. Signage

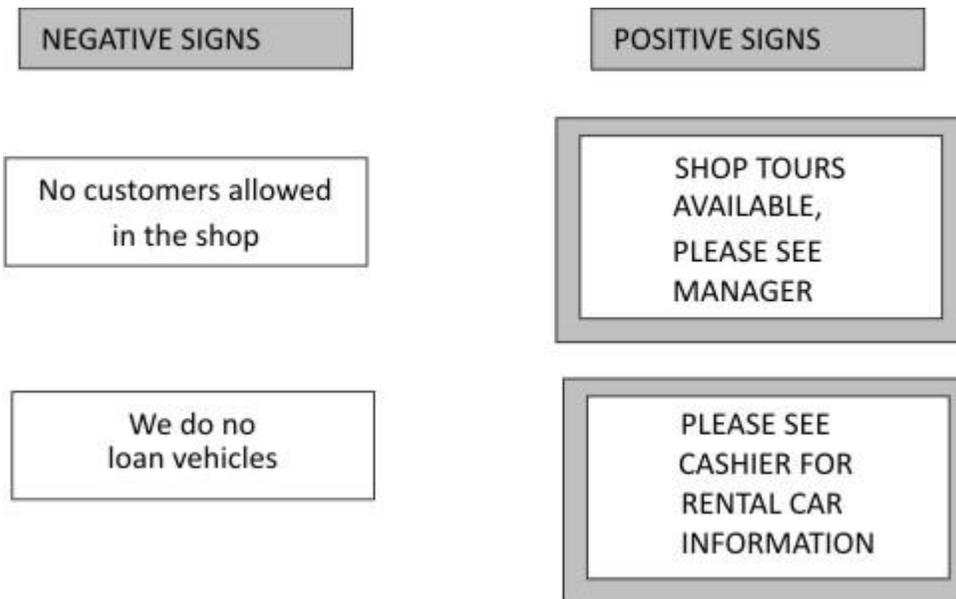

Facility signs should portage an professional imagine. They should be adequate in customer's direction to the proper location for an estimate. These signs must begin on the entrance of the

street and continued to an exactly place on a parking. The location must be reserved exclusive for estimate preparation and must be aesthetically pleasing.

2.3. Office appearance

Once customer is inside the Body Shop, the physical appearance of the reception area and Estimator's office impact the customer's perception. The office should be clean, uncluttered and have an air of professionalism, while being warm enough to make the customer feel comfortable and welcome. The furniture, fixtures and housekeeping send non-verbal messages to the customer. Similar items leave an impression in the customer's mind including desk organization, wall posters and hangings, books and magazines, and file racks.

All of these items should be evaluated for their positive or negative effects on image and how they contribute to the sales process. If they do not contribute in a positive way, they should be eliminated or improved. Wall hangings should include certificates, diplomas, certifications, and credentials of technicians and management. The shop's mission statement, awards, recognition, certificates etc. should also be visible. As a general rule, if it's not framed, it shouldn't be hang. Reading material should be limited to items intended to impact image. These include a portfolio of customer testimonials, before and after photos of previous jobs, thank you letters from customers etc. Signs relative to policies should be in a positive tone. Examples include:

Personnel appearance

As in any sales environment, the personal appearance of the salesperson (in this case, the Estimator) is critical. This is the first opportunity for an individual to impact the shop's image. Clothing standards vary from market to market and may range from shirt and tie, to golf shirt and shorts. The key factor is that the attire separates the Estimators from the other staff members. It should identify him/her as the person with authority. Shirt logos, name tags or badges are strongly recommended. Habits and personal grooming also affect the customer's perception of the shop's image.

Features, advantages & benefits

Highly effective shops developed a list of features, advantages, and benefits (FAB's) offered to customers. Communication of these FAB's is the customer helps deliver the value of the shop's products and services. Examples of FAB's include:

- warranties;
- business hours;
- technician certifications/training;
- equipment;
- rental/loaner cars;
- facilities;
- insurance company relationships;
- storage and towing capabilities.

Features, advantages and benefits (FAB's) are communicated to the customer through various marketing techniques during the sales process. Tools used to convey these FAB's include:

- brochures;
- pamphlets;
- estimate presentation folders;
- signs and displays;
- promotional items;
- verbal and media advertising.

Marketing materials

All printed material should be designed to enhance the Body Shop's image. The message, format and logos should be consistent with FAB's used in the selling process. Examples include:

- warranty certificate;
- special promotion coupons;
- flyers;
- letterhead
- thank you cards/letters;
- invoices;
- note pads;
- purchase orders.

Target customers

The dealership's customer base is a primary target market. These customers have been previously "sold" on the dealership. Other information from dealership's database should be a starting point for marketing efforts. The insurance company database should be developed to include names and addresses of local companies and Agents. Key office and field personnel should also be listed. Potential Body Shop customers include:

- new vehicle buyers;
- used vehicle buyers;
- service customers;
- fleet/commercial accounts.
- insurance agents;
- insurance adjusters;
- tow companies

Special events

The dealership Body Shop should be included in all customer special events. These include new owner receptions and service clinics. The Body Shop should host at least one reception or clinic per year. Guests should include:

- insurance agents;
- insurance adjusters
- insurance company office staff;
- police officers;
- fleet/commercial accounts.
- tow companies;
- dealership General Manager;
- dealership Sales Manager;
- dealership Cashier;

Support for such functions can be solicited from paint companies, equipment vendors, rental car agencies, manufacturers, General Motors Parts, and other suppliers.

2.4. Road to the sale

The sales process is centered on the preparation of the estimate. This process begins with the meeting and greeting of the customer and ends when the customer selects a repair location. Effective Estimators use a systematic method of presentation that includes basic sales techniques. The technical aspect of estimate preparation requires knowledge of repair processes. This knowledge can be acquired through training or through experience as a Technician. Virtually all estimates are prepared electronically utilizing a database supplied by one of several vendors. These databases include flat rate repair times and retail parts prices required to perform the specific job.

When a customer pays a personal visit to a Body Shop, it is important that the estimator follow a set of steps or procedure every time he/she comes into contact with a customer. These pre-

defined steps and procedures insure that every customer is consistently treated properly, and that important points are not overlooked. The “Road to the Sale” will help the sales opportunity become a sales probability, i.e. the estimate becomes a repair order.

Step 1. Friendly meeting & greeting

There is finite amount of estimate opportunities available to Body Shops. Therefore each opportunity should be viewed as a value chance to increase sales. Body Shop Estimators have this responsibility, and should take it seriously.

The first step in the “Road to the Sale” is a friendly meeting and greeting. This can be as simple as offering a smile and a handshake to every customer that enters the door. It is essential that the customer perceive a warm welcome when first entering the Body Shop. This perception will eventually become the catalyst for the Body Shop’s image in the mind of the customer. Key elements that are critical to becoming an effective Body Shop Estimator are:

- extend a sincere feeling of welcome to the customer;
- introduce themselves by name to the customer;
- maintain good eye contact;
- find out the customer’s name and use it;
- smile;
- wear a name tag;
- project a neat and clean physical appearance;
- act in a polite and professional manner.

Less effective Body Shop will neglect to obtain the customer’s name, disregard their own physical appearance, be unavailable to greet the customer at initial arrival, and will respond to the customer unprofessionally.

It is important that the customer is approached in a manner which invokes a feeling of sincerity. It must be clear that the Estimator cares about the situation and wants to help in any way possible.

Step 2. Listen & learn

Estimators neither should nor assume that the customer will elect the Body Shop to perform the repairs simply because he/she chose the shop to write the estimate. Instead, Estimators should listen to the concerns of the customer and identify the customer’s wants and needs. Effective Body Shop Estimators will ask the following questions:

- How did you find out about our Body Shop?
- Which insurance company are you using?
- Are you the claimant or the insured?
- What is the deductible amount?
- Is there vehicle rental coverage?

How long can you do without the vehicle?

Once the estimator determines the customer’s want and needs, FAB’s can be presented to address those needs.

Step 3. Sell features, advantages & benefits (FAB’s)

By presenting a shop’s features, advantages and benefits, the Estimator can enhance the shop’s image. Effective Body Shop Estimators will include the following FAB’s in their sales presentation:

- sheet metal and/or paint warranty literature;
- manufacturer’s consumer guides;
- state-of-the-art equipment;
- alternative transportation;
- training certification.

Step 4. Ask for Business

Once the customer is aware of the reason why he/she should choose the shop, the Estimator should ask for the opportunity to perform the repairs. Effective Body Shop Estimators will ask closing questions such as:

- Could I get your OK to order the repairs parts?
- When would you like for us get started?
- Will you need a rental car?

A more aggressive technique is the assumptive close. Statements that assume the close of the sale include:

- I'll order parts immediately. Please OK the repair order.
- With your OK, I'll call the insurance company now and handle it for you.
- Here are the keys to a loaner car you can use.

Step 5. Follow-up

A percentage of customers will not commit to the repair at the time of estimate preparation. In an effort to secure the close, customer follow-up is a critical step in any sales process. It lets the customer know that the Body Shop values and wants his/her business. Also, it allows the Body Shop a great advantage over its competition.

Customer follow-up activity improves estimate sales. It also shows that management is aware of what is going on and they care about the Estimator's performance and the customer. Effective Body Shop use these follow-up tools for customers:

- thank you cards;
- thank you letters from management;
- phone calls to identify additional needs, restate FAB's and close the sale.

Once Estimators have learned the "Road to the Sale" and are using it properly, they need to incorporate estimate tracking. This will provide each shop with an accurate record of detailed information concerning the estimate process. This will also pinpoint areas that Estimators need to develop in order to compliment their own selling practice.

A good procedure for the Estimator is to follow-up until a buying decision is made. The Estimator should keep a record of estimates written and determine the reasons for any lost sales. Finding out which competitor was awarded the business and why will help Body Shops develop future sales and marketing planes.

2.5. Estimate tracking

Regardless of whether a sale was made, Body Shops should keep a record of all estimates written. Effective Body shops use an Estimate Tracking Log, which serves as a performance indicator to measure the effectiveness of shop's techniques. The Estimate Tracking Log measure the following factors:

- the number of estimates written;
- who the estimates were written for;
- the insurance companies involved;
- the estimate closing ratio;
- the two companies involved;
- the value of the estimates written;
- the reason for job loss.

If completed and used properly, the Estimate Tracking Log will give benchmarks for standards of performance for the Body shop. Computerized estimate tracking systems are also available, and include measures for the year, make and model of vehicles. The manager should collect all of the Estimator's tracking logs for the month and perform the Estimator Performance Summary.

After completing the performance summary, performance trends should be evaluated. This information can be utilized as an internal communication tool in the Body Shop.

2.6. Conclusions

In the process of estimate tracking there are some practices to avoid. Less effective Body Shops typically have the following characteristics:

- charge fees for writing estimates;
- wait for the insurance company to prepare an estimate first;
- assume that new and used vehicle buyers know there is a Body Shop;
- fail to follow-up with every potential customer until a buying decision is made;
- display offensive posters or calendars in areas of office and shop;
- assume that their shop is on all insurance agency recommendation lists

The aim of the paper is to propose a new approach to urban planning, evaluating the culture-led regeneration processes. In the last few years, the cultural turn in urban planning played a central role in the urban studies. In this way we try to elaborate a more robust perspective interpreting the complex phenomenology emerging from the culture-led regeneration processes. Within the concept of complexity we discuss about the “metabolic process” that are the processes necessary to transform energy, material and information in goods and service functional to the complex urban system life. The approach that will be employed is the MuSIASEM that is based on several novel concept and an innovative methods never applied in this research field.

Key words: Culture led regeneration, complexity, European integration, progressive system, MuSIASEM

JEL codes: R10, R20, Z10

1. Introduction

The issues of cities development trajectories and culture-led local regeneration have become more and more present within the urban studies (see Miles and Paddison, 2005, for a critical review). These emerging phenomena arose in a period of turbulent socio-economic change fuelled by globalization processes. According to these dynamics, virtually all of the cities, that are characterized by advanced levels of industrial development, are experiencing a massive re-shaping of their productive sectors. In this context, culture and creativity are clear examples of sectors characterized by high value added, high incidence of service and other intangible components, and by an interesting socio-economic impact on the local economies. At the European level this issue finds its institutional collocation inside the European research strategies developed by KEA Europe Affair. The year 2009 was designated as the “European Year of Creativity and Innovation”. In that sense the European Commission (E.C., 2009) has drawn attention to the usefulness of culture and creativity in sustaining the emergence of innovation-led economy within the EU integration policies¹⁴²².

Moreover it is widely acknowledge the culture’s contribution at a local level of analysis (OECD, 2005) in improving economic performance of local systems (Santagata, 2002;

¹⁴²² Actually, the culture and creative sector is found (E.C., 2006) to have both a direct, quantifiable socio-economic impact (it contributed to 2,6% of EU GDP in 2003 and accounted for 3.1% of total employed population in EU25 in 2004) and an indirect, non-quantifiable influence on the productivity of economic systems (by underpinning innovation dynamics).

Sacco and Ferilli, 2006; Scott, 2004; Valentino, 2003). The urban policy agenda is gradually including cultural and creative activities as a key driver in urban regeneration processes. As a matter of fact, it seems that culture and creativity are becoming new keywords in the understanding of new urban transformation (Musterd and Ostendorf, 2004). In that sense the “cultural turn” that emerged across the social sciences in recent years (Amin and Thrift, 2007) influences both the urban economic and policy systems (Crociata, 2009). Actually urban planning processes, fuelled by the culture-led regeneration, are moving toward complexity. This contribution aims to provide a new conceptualization of the cultural and creative sector by using an innovative set of semantic and analytical categories.

The paper is structured as follows: in the next section, we cope with the complexity and the relevance of time in the cultural and creative sector. In section 3 we present the MuSIASEM approach for the culture-led regeneration. Section 4 concludes.

2. Toward complexity.

2.1 Cities as a progressive system

A city can be conceptualized as a progressive system (Calafati, 2007) because it represents a sum of heterogeneous agents and a sum of heterogeneous relationships among them, coevolving progressively during the time, showing emergent pattern of development very difficult to predict. Since urban performance trajectories strictly depend on city’s specific “structure”, it is necessary to develop a methodological perspective able to capture the emerging phenomena that originate from the complex match between sustainable urban planning and the culture-led regeneration processes. That is possible by delineating three pertinent levels of description: (i) the structure of the system; (ii) the metabolic processes of the system, i.e. the processes that organize inputs as matter, energy and information into goods and services, functional to the system’s objectives; (iii) the regulation mechanisms of the system.

In this paper we provide a new conceptualization of the cultural and creative sector by using an innovative set of categories derived from the bio-economics theory elaborated by Georgescu-Roegen (1971). When studying a socio-economic process in terms of energy, material and information conversions, there are two different categories of elements which have to be considered in order to be able to perceive/represent the cultural and creative sector in terms of metabolic processes¹⁴²³: “fund categories”¹⁴²⁴ and “flow categories”¹⁴²⁵.

2.2 The time relevance in cultural economics

Another important factor of complexity is the time relevance within the cultural economics studies¹⁴²⁶. A number of works show that time has a cost. The existence of these costs suggests a major feature of cultural activities: they are time intensive in consumption (see Becker 1965, Owen 1969). When time factor is applied to the analysis of demand the same conclusion is always reached: the price of leisure time negatively affects cultural consumption, therefore, these activities can only be described as time-intensive products (see Withers 1980, Zieba 2009).

The theories on the cost of time also attempted to the weak growth of cultural consumption associated with rising income. So, on one hand, higher revenue coincides to

¹⁴²³ See Crociata and Veneri (2009) for an application of these categories.

¹⁴²⁴ Fund elements have to be able to preserve - throughout the duration of the analysis - the same definition of themselves as converters.

¹⁴²⁵ Refer to elements disappearing over the duration of the representation (that enter but do not exit) and/or elements appearing over the duration of the representation (that exit without having entered).

¹⁴²⁶ Cultural economics is a branch of studies that grow up within economic theory (see Throsby, 1994; Towse, 2003).

a higher willingness to pay but, on the other, high revenue implies more working hours and consequently less free time.

A second reason that drives us to make considerations on the time factor concerns the temporal evolution of consumer preferences. There is a sort of progression, so as that the more the time people devote to artistic and cultural activities in their past, the greater the present and future consumption will be (Becker and Stiegler, 1977; Brito and Barros, 2005; McCain, 1979). It should be also noted that the consumption of the arts and culture is characterized not only by the effects stemming from previous experiences but also by the effects arising from social interaction; past consumption and social consumption interact mutually reinforcing each other over time.

3. The MuSIASEM approach for the culture-led regeneration

The MuSIASEM approach (Giampietro, Mayumi and Ramos-Martin, 2009), originally proposed as MSIASM by Giampietro and Mayumi (2000), has been developed in relation to the emerging field of science for governance. In particular it can be seen as an attempt to generate a methodological approach capable of providing a quality control on quantitative analyses applied to the issue of sustainability.

The MuSIASEM approach is radically different from conventional scientific tools. It uses a combination of conceptual tools derived from: (i) Complex System Theory, such as “Complex and progressive system”, “Multi-Purpose Grammars”, “Multi-Scale Integrated Analysis” (hierarchy theory); (ii) the seminal “Fund-Flow model”, proposed by Georgescu-Roegen to implement the concept of Bioeconomics which is associated with the concept of “Societal Metabolism” to be interfaced with “Urban Ecosystem Metabolism” analysis. The main goals which are behind the MuSIASEM approach keep clearly separated the descriptive from the normative aspect. It represents in an integrated way the relevant changes in the performance of an investigated system, using an open set of criteria and indicators which can be defined on different scales and in relation to different narratives¹⁴²⁷.

The MuSIASEM approach analyzes the metabolism of a society in regard to a dynamic budget in terms of “per hour of human activity”. Funds stand for the attributes used to define “*what the system is*” and flow coordinates correspond to “*what the system does*” interacting with its environment. The flow-fund representation is based on *extensive* (additive) variables which define the size of the compartment, and *intensive* variables (ratio) which represent the pace of metabolism. This allows to use the same assessment when referring to a hierarchical structure, i.e. to the whole society and to a given subsector (Giampietro et al. 2009). The total amount of what is consumed in terms of hour of human activity at *level n* (the whole urban system) has to be *congruent* with the flow in the compartment of production at the *sub-level n-1*. The allocation of funds and flows over different compartments across each hierarchical level is useful to establish a relation between the characteristics of the *metabolic rate* between and within compartments. At the level of individuals (*level n-3*) we observe the conversion of *endosomatic*¹⁴²⁸ energy into Human Activity (HA). At this level the population has to be divided in a set of type of individuals (*age class*). Each of this individual type distributes its own endowment of HA within a set of categories: Paid Work (PW), Physiological overhead (PO), Leisure Culture (LC). At this level, the congruence constraint is $HA_i = HA_{PW} + HA_{PO} + HA_{LC}$.

At the upper level (*level n-2*), the household level (HH), the focus moves on the conversion of *exosomatic*¹⁴²⁹ energy associated to categories of HA within the socioeconomic process, with

¹⁴²⁷ Obviously, this implies that MuSIASEM can provide only the analytical input within a process of integrated assessment.

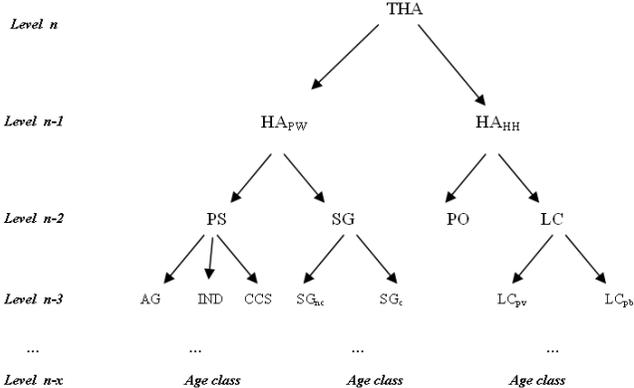

¹⁴²⁸ Information, energy and other material flows metabolized inside the human body for sustaining the physiological activity.

¹⁴²⁹ Information, energy and other material flows converted outside the human body in order to preserve the efficacy of human activity.

reference to the interaction of HH with the rest of the system. On the one hand it means that HH requires an amount of services and products in which working hours, provided by the PW, are embodied. On the other hand HH supplies hours of PW to the society by maintaining and reproducing workers. At the level of economic sectors (*level n-1*) it is necessary to observe the linkage between the PW sector (*Production*) and the HH sector (*Consumption*). The congruence fund constraint is: $THA = HA_{HH} + HA_{PW}$.

This paper aims to investigate the role played by the cultural sector in urban regeneration. From this point of view, we consider the seminal hierarchical structure (Giampietro et al. 2009), focusing the role that culture plays in the socioeconomic system (see fig. 1). Taking into account not only the total population, as it happens in per capita evaluations, but also the demographic structure, this approach allows to analyze the effect that any qualitative change in the cultural sector composition has on the urban socioeconomic system metabolism. In other words, the analysis investigates what happens in this sector in order to try to identify some of the mechanisms taking place at the age class level and vice versa. In this view, it is possible to analyze the socioeconomic characteristics of a culture-led regeneration of the urban system starting from analyzing how household members allocate their time in cultural and creative sector.

Fig.1: Hierarchical time use allocation in urban cultural-led regeneration
Fund category: Total Human Activities (THA)

HA_{PW} = Human Activities PW Sector; HA_{HH} = Human Activities HH Sector; PS= Productive Sector; AG= Agricultural Sector; IND= Industry; CCS= Cultural and Creative Sector; SG= Service and Government; SG_c = Service and Government in the Cultural sector; SG_i = Service and Government in other sectors; LC= Leisure Culture; LC_{pv} = Leisure Culture in Private configuration; LC_{pb} = Leisure Culture in public configuration.

4. Final remarks

Because of the lack of a full-fledged analysis of the deep causal links that make culture-led regeneration so important in the current scenario, it becomes difficult to assess what are the critical conditions that determine whether or not a given urban planning system may be successful. The MuSIASEM approach for the culture-led regeneration allows us to map the allocation of time over different sectors of human activities over different levels. Since our interest concerns the cultural sphere, we intend, in our future works, to effectively measure the hours of human activities spent in producing and consuming cultural and creative “goods” in particular cities of interest. Then we intend to use these data as the “fund category” necessary to construct “intensive variables”, such as income/hour, energy/hour, human capital/hour, etc. These intensive variables are to be used for assessing the contribution of culture-led processes to urban metabolism, through comparisons with other sectors of human activity. This approach could be suitable to evaluate cultural urban performances within the context of international competition deriving from globalization and European integration.

With regard to the feature of the culture that cannot be always consumed in a location distant from where it is produced, this approach is useful to analyze the spatial distribution of the cultural and creative activities within the city borders.

LA COMMUNICATION PUBLICITAIRE DANS LA COMMUNAUTÉ EUROPÉENNE: STRATÉGIE GLOBALE OU LOCALE?

Amălăncei Brîndușa-Mariana

Duhalm Simona

Université de Bacău, Faculté des Sciences Économiques, No. 8, Rue Spiru Haret, 600114 – Bacău, Roumanie, simonaduhalm@yahoo.com, 0742424479

The communication at the level of the European Community implies, on one hand, the observance of differences, and on the other hand, the existence of a minimum of common languages, of values, of representations and of shared interests. With signing The Unique Act, the European Community area seemed to fulfill, in the opinion of the supporters of the global marketing, all the necessary conditions for the success of this kind of marketing. But the European Economic Community comprises more cultures, 23 official languages, different legislations and regions with specific peculiarities of consumption. Therefore, the hegemony of an only global advertising communication or of a local advertising communication is not possible.

Mots-clés: globalisation, marque, marketing global, marketing local, culture pub

Cod JEL: M3

Quand on parle de l'Europe et de la communication, il faut essentiellement tenir compte, d'un côté, de l'importance des différences et, de l'autre côté, de la nécessité d'un minimum de langages communs, de symboles, de représentations, de valeurs partagées, de souvenirs, d'intérêts. D'ailleurs, on considère que l'Europe illustre «ce qui est l'enjeu par excellence de la communication, à savoir non pas la gestion des ressemblances, mais au contraire *l'organisation d'une cohabitation respectueuse des différences*. Cet enjeu est évidemment essentiel pour l'Europe qui construit ce projet volontariste: rapprocher des individus que tout sépare et qui ont commencé à coopérer par *le plus facile* – le commerce, l'économie, les intérêts financiers –, et qui aujourd'hui essayent de le faire du point de vue des valeurs. L'Europe est [...] l'exemple, en grandeur nature, de l'importance du respect des distances pour que le rapprochement, donc la communication, soit accepté»¹⁴³⁰.

De nos jours, on affirme d'une manière péremptoire que tout est communication, le terme en question perdant ainsi toute signification précise et désignant des réalités diverses. À ce sens, Philippe Breton amène en discussion, à titre d'exemple, les entreprises où l'«on parle de la *politique de communication* grâce à la quelle celles-ci [les entreprises] pourront *gérer leur image* et mieux contrôler leurs rapports avec l'environnement. La *communication interne* sert, quant à elle, à créer des liens au sein du personnel et à mieux promouvoir les rapports humains»¹⁴³¹. L'auteur mentionné est d'avis que l'on a très souvent tendance à associer, dans une perspective globalement publicitaire, la consommation des objets à un «mieux-être communicatif», mais ce mieux-être communicatif «semble plutôt avoir comme fonction d'éviter une perte que d'obtenir un gain. Il n'est pas un *mieux-être*, mais plutôt un *moins mal-être*»¹⁴³².

¹⁴³⁰ Wolton, D., *INTERNET ET APRÈS? Une théorie critique des nouveaux médias*, Flammarion, Paris, 2000, p. 164-165.

¹⁴³¹ Breton, Ph., *L'utopie de la communication. Le mythe du «village planétaire»*, La Découverte/Poche, Paris, 1997, p. 129.

¹⁴³² *Ibidem*, p. 96.

Le type de communication que les entreprises ou l'intermédiaire de prestataires spécialisés («les agences-conseils en communication») pratiquent directement, c'est *la communication lucrative*, une communication persuasive ayant comme objectif final l'accroissement des profits. On s'accorde à dire que toute communication lucrative vise à vendre un objet et à promouvoir en même temps les valeurs de l'entreprise, regroupant ainsi la communication commerciale et la communication institutionnelle. Ce regroupement constitue «le terme d'un long processus qui a vu les agences de publicité, les services de marketing et les établissements économiques devenir des *entreprises de communication*, c'est-à-dire des entreprises qui utilisent la communication dans le triple but d'améliorer leur fonctionnement interne, de développer leurs ventes et d'asseoir leur légitimité»¹⁴³³.

Quant à la communication lucrative européenne, il faut préciser qu'elle s'est confrontée au choc de la globalisation avant même l'avènement du Grand Marché. Le concept de *globalisation* a été «fabriqué» par les économistes devant la mondialisation des marchés et la concentration industrielle qui a eu comme conséquence la réduction du nombre de marques disponibles. Dans leur opinion, cette globalisation de l'économie mondiale impliquait l'adoption d'un *marketing global* – théorie au sujet de laquelle l'on écrit beaucoup dans les années '80 et dont les partisans considéraient, une fois *l'Acte unique* signé, que l'espace communautaire européen réunissait toutes les conditions nécessaires au succès d'un tel marketing, constituant «un ensemble culturel relativement homogène et un ensemble géographique bien délimité. De plus, de nombreuses firmes comme Head & Shoulders, Martini, Michelin, Pampers ou Rolex vendent déjà à travers l'ensemble de la Communauté des produits ayant les mêmes caractéristiques techniques, le même design, le même nom de marque, le même packaging et le même message publicitaire. Au niveau communautaire, le marketing global est déjà une réalité!»¹⁴³⁴.

Par contre, les adversaires sont d'avis que la Communauté Économique Européenne comprend des cultures, des langues officielles, des législations différentes et des régions possédant chacune des habitudes particulières de consommation. En outre, la majorité des multinationales recourent à une approche *locale*: «Par exemple, le lait corporel Nivea est plus liquide dans les pays du Sud que dans le Nord de l'Europe; le détergent Cif devient, suivant les pays: Viss, Jif ou Vif; et le spot pour la dentifrice Colgate varie d'un pays à l'autre: en Allemagne, il met en scène un dentiste, mais en Italie, il montre des enfants»¹⁴³⁵.

On a, donc, à faire, d'un côté, aux inévitables convergences économiques, soutenues par les adeptes du marketing global, et, de l'autre côté, aux irréductibles différences culturelles, défendues par les tenants du marketing local. Cependant, qu'il soit global ou local, le marketing a essentiellement comme but la maintenance de la croissance en créant de nouveaux marchés. D'ailleurs, certains auteurs soulignent l'idée qu'une corporation doit être compétitive n'importe où dans le monde et que ses clients savent généralement qu'il s'agit d'une compagnie globale bien que celle-ci recoure à une formule concurrentielle locale.

Par conséquent, les stratégies globales ne représentent pas de stratégies standard de marketing des produits reposant sur l'idée que le monde constitue un marché homogène sans frontières. Aussi, ne se résument-elles pas à une présence globale. Si une corporation développe dans un pays une activité tout à fait différente de l'activité exercée dans un autre pays, cela équivaut à la différence imposée par les relations avec les divers concurrents aux niveaux nationaux respectifs¹⁴³⁶. Les propos de Jacques Attali sont révélateurs à ce sens: «La mondialisation ne s'accompagnera pas d'une uniformisation. On passera au contraire de la globalisation du marché à un pluralisme du marché. Même mondiales, les firmes diversifieront leurs produits au gré de la culture de leurs clients et, dans certains cas, camoufleront même leur universalité derrière des confédérations

¹⁴³³ Dacheux, É., *Les stratégies de communication persuasive dans l'Union Européenne*, Éditions l'Harmattan, Paris, 1992, p. 109.

¹⁴³⁴ *Ibidem*, p. 123.

¹⁴³⁵ *Idem*.

¹⁴³⁶ Olivier, S., *Strategii de relații publice*, Polirom, Iași, 2009, p. 153.

d'entreprises locales, créant sans cesse de nouvelles diversités en métissant cultures et attentes»¹⁴³⁷.

En réalité, on peut constater que beaucoup de marques adaptent leur stratégie à la culture de chaque marché par l'intermédiaire d'une agence de publicité «locale», car, tout comme Marieke DeMooij disait, «les produits, c'est un marché global, mais les gens, c'est un marché local»¹⁴³⁸.

Il faut préciser que la signification du mot *global* est différente pour les spécialistes du marketing et pour les conseillers en communication: les premiers comprennent par *global* la finalité de leur stratégie, l'universalité, tandis que les seconds désignent par ce terme les moyens employés, la totalité des techniques de la communication. De cette façon, une agence de communication «globale» est une agence où l'on retrouve tous les secteurs d'activité de la communication lucrative, à savoir la communication corporate, la communication d'entreprise, la communication publicitaire, l'identité de la marque, l'identité du produit, le lobbying, le marketing opérationnel, le merchandising, les relations publiques. De toutes ces activités, l'unique à pouvoir être «globalisée» dans les années quatre-vingt, c'est la communication publicitaire.

Éric Dacheux précise que dans la communication publicitaire globale (le “global advertising”) c'est la marque qui compte au détriment du produit et que seulement une marque européenne ayant nécessairement partout le même mot et occupant sur tous les marchés la même position (à savoir un annonceur implanté dans tous les pays européens) peut reposer sur une communication européenne. Cependant, une telle marque ne réussit pas à communiquer d'emblée d'une manière uniforme dans les 27 États membres car il y a toutes sortes d'obstacles à surmonter.

Bien que les législations européennes restreignent la création publicitaire¹⁴³⁹, les législations concernant ce problème diffèrent encore d'un pays à l'autre, une approche «globale» devenant ainsi difficile. Aussi, les supports publicitaires (la presse, la télévision, l'affichage, etc.) auxquels l'on recourt principalement ne sont-ils pas les mêmes dans chaque État membre, l'inexistence d'un média paneuropéen performant constituant la source de ces différences. Les barrières linguistiques et socio-culturelles s'inscrivent également dans cette direction. La coexistence de 23 langues officielles pour 27 pays, en attendant davantage, illustre la difficulté majeure de la communication en Europe et l'entreprise délicate impliquée par la simple traduction d'un message. On connaît bien le cas de Martini Bianco qui a été obligé de renoncer à l'exportation en Italie de la création de son agence anglaise parce que la traduction du slogan *It's our thing* prenait la forme *Cosa nostra* – le non italien de la mafia. Quant aux barrières culturelles, Éric Dacheux nous offre l'exemple de Dim qui «a dû supprimer en Espagne un plan fixe de son spot paneuropéen pour Diam's, parce que ce plan, représentant un toréador affublé d'un masque de Minotaure, déclenchait l'ire de la gent masculine: en Espagne, un homme cornu est un homme cocu!»¹⁴⁴⁰.

En dépit de ces obstacles, l'élargissement des marchés dans les années '90 et la concentration industrielle favorisent l'apparition des marques internationales qui doivent avoir une personnalité cohérente au niveau mondial. Une communication publicitaire globale s'impose donc, se fondant sur l'idée d'une homogénéisation des pratiques culturelles, des goûts, des besoins, des cultures nationales, bref du consommateur global. D'ailleurs, c'est dès 1961 qu'E. Elinder remarque l'émergence de similarités entre les consommateurs européens qui rend possible et même

¹⁴³⁷ Attali, J., *Fraternités, une nouvelle utopie*, en Cossette, C., *La publicité, déchet culturel*, Les Éditions de l'IQRC, Québec, 2001, p. 121.

¹⁴³⁸ DeMooij, M., *Global Marketing and Advertising*, apud Cossette, C., *op. cit.*, p. 124.

¹⁴³⁹ La législation adoptée au niveau de la Communauté Européenne exerce une influence considérable sur la manière dont la publicité est réglementée dans chaque État membre. Cette législation garantit l'interdiction de la publicité trompeuse et l'existence dans tous les États membres des moyens nécessaires pour régler les problèmes qui pourraient surgir. En outre, certaines règles ont été établies au niveau communautaire en matière de publicité télévisée et de publicité pour les médicaments; <http://sos-net.eu.org/conso/guide2/publici.htm>.

¹⁴⁴⁰ Dacheux, É., *op. cit.*, p. 126.

souhaitable le développement de la publicité standardisée. Tout au long des années '90, le paysage européen est représenté par une mosaïque de marques hétérogènes telles Procter & Gamble, Unilever, Danone, Nestlé, etc.

Un autre argument en faveur de la globalisation de la communication publicitaire c'est l'existence de «cibles transnationales dont les ressemblances psychologiques seraient plus fortes que les différences culturelles», autrement dit «il y a plus de ressemblances entre un cadre de Hambourg et un cadre de Barcelone, qu'entre un chômeur allemand et le PDG de Mercedes»¹⁴⁴¹. Parmi les premières «global advertising» ayant à la base l'idée de l'existence de telles cibles on peut mentionner celle de Benetton dont le slogan *United Colors of Benetton* renvoie, d'un côté, aux couleurs des pulls Benetton et, de l'autre côté, à l'entente entre les peuples. Ce message publicitaire met l'accent sur le fait que tout le monde peut porter le produit fabriqué par l'entreprise Benetton, ce qui veut dire que tout le monde est en fait pareil. L'image des jeunes de tous les pays portant des pulls Benetton renforce cette idée.

Une typologie des «global advertising» européennes est réalisée par Éric Dacheux¹⁴⁴² qui fait la distinction entre les communications pour lesquelles l'Europe constitue le stade ultime de la globalisation et celle qui ont d'emblée une vocation mondiale, les deux types pouvant se diviser en deux:

- les campagnes *rigides* (qui sont exactement les mêmes dans tous les pays, cette «rigidité» s'expliquant soit par l'appel à des valeurs «universelles», telles la fraternité, pour Benetton, soit par le recours à des caractéristiques nationales que tous les pays apprécient, à savoir la mode française pour «Poison» de Dior);
- les campagnes *souples* (qui véhiculent, dans tous les pays visés, le même positionnement et la même promesse, mais en les traduisant dans la langue du pays; c'est le cas des marques Martini ou l'Oréal pour sa gamme de produits Vichy).

Les campagnes peuvent être également élaborées par un seul pays et ensuite internationalisées ou bien conçues, dès le départ, pour l'ensemble de l'Europe.

Cependant, de telles campagnes ne sont pas majoritaires. En outre, les obstacles à surmonter, que nous venons de mentionner, restent encore infranchissables, malgré tout effort. La diversité des législations concernant la publicité freine une législation unique, le décalage horaire permanent entre les pays européens rend impossible l'existence d'un média de masse, les différences de langue et de culture ne peuvent pas disparaître. Aussi, la quête d'authenticité, la sensibilité au prix invalident-elles la stratégie du tout-globalisé. Créer un véritable contact entraîne, comme Nicolas Riou l'a également noté dans son livre *Peur sur la pub*¹⁴⁴³, un langage commun partagé. Le propre de la publicité est de construire un imaginaire autour d'une marque, pour lui donner une dimension émotionnelle, une valeur ajoutée qui dépasse les éléments rationnels liés au produit. Une telle diversité rend pratiquement inconcevable la réussite d'une seule campagne au niveau global.

Le message global existe d'autant moins que la «culture pub» est, à son tour, essentiellement locale. Par exemple, les publicitaires allemands sont connus en général pour le sérieux et le caractère informatif de leurs spots, la publicité française recourt très souvent à l'érotisme, tandis que les messages publicitaires anglais sont en grande partie célèbres pour leur humour spécifiquement britannique. Ces différences au niveau des pratiques publicitaires expliquent pourquoi les goûts en matière de publicité sont très distincts.

Simplifier les différences culturelles des consommateurs et le message signifie pratiquement faire disparaître les services des entreprises de marketing et de publicité, respectivement la créativité de la communication publicitaire. De plus, la peur de se transformer en traducteurs locaux de

¹⁴⁴¹ Dacheux, É., *op. cit.*, p. 127.

¹⁴⁴² *Ibidem*, p. 128-129.

¹⁴⁴³ Riou, N., *Peur sur la pub*, Éditions Eyrolles, 2004.

campagnes globales si répandue dans les agences européennes a été nommée par les managers des réseaux mondiaux le «Syndrome NIH (Non Invented Here)»¹⁴⁴⁴.

Ces réticences face à la communication publicitaire globale sont autant de raisons pour adopter une approche locale au sein des agences européennes, que ce soit une campagne régionale d'une marque nationale, une campagne plurinationale d'une marque internationale ou bien une campagne nationale d'une marque internationale.

Selon un sondage réalisé par l'Institut CSA pour Coca-Cola et publié le 29 janvier 2010, dans le magazine «CB NEWS» en version on line¹⁴⁴⁵, 86 % des Européens se déclarent «plutôt heureux», la France ayant un niveau de bonheur plus élevé que la moyenne (87 %).

À la question «Parmi les marques suivantes, quelle est celle que vous associez le plus au bonheur?», c'est Disney en tête des réponses avec 14 %, suivi par Coca-Cola (10 %) et l'entreprise française Club Med (8 %). Viennent ensuite Google (7 %), Danone (6 %), Apple (5 %), Kinder et McDonald's (4 % chacun).

Une autre étude sur les «marques qui génèrent le plus de passion» vient d'être réalisée le 17 février 2010 par Panelteam¹⁴⁴⁶ auprès de 10 000 Européens. De grandes marques telles Apple, Sony, Coca-Cola, Samsung ou Adidas semblent être en tête du classement européen, mais d'autres, souvent locales, réussissent à s'imposer dans chaque pays. Ainsi, la marque préférée des Italiens est Bauli (alimentaire), suivie de Nutella, celle des Néerlandais est Duwe Egberts (café), les Allemands préfèrent Milka, les Scandinaves, Arla (produits laitiers), les Britanniques Cadbury, Marmite et Sainsbury (distribution) et les Français, «moins gourmands et plus pragmatiques», Sony, Adidas, Samsung, Google et Microsoft.

En guise de conclusion, on peut affirmer que la communication publicitaire dans la Communauté Européenne ne pourrait jamais être uniquement globale ou locale. Tout devient question d'équilibre entre le local et le global, le pragmatisme s'imposant comme nouveau mot d'ordre.

CULTURAL RESOURCES, HERITAGE AND THE TRAVEL AND TOURISM COMPETITIVENESS OF THE CENTRAL AND EASTERN EUROPEAN COUNTRIES

Bălan Diana

Academy of Economic Studies in Bucharest

Popescu Ioana Cecilia

Academy of Economic Studies in Bucharest

Vegheș Călin

Academy of Economic Studies in Bucharest

Competitiveness has become one of the common concepts employed in the recent years to approach and describe the sustainable development of the travel and tourism industry. As cultural resources represent one of the supporting pillars of the tourism's sustainable development, development of the cultural tourism could represent one of the directions to be followed in order to increase the competitiveness of the Central and Eastern European countries as tourism destinations. The paper assesses how important are and what is the contribution of the cultural resources and the heritage to the overall competitiveness of the travel and tourism industry and to its performances based on specific data referring to the Central and Eastern European countries.

Keywords: cultural resources, heritage, cultural tourism, competitiveness, Central and Eastern Europe

JEL Classification: L83, M31.

Introduction

The competitiveness of a tourism destination is a complex and relative concept, a part of this complexity being suggested by the definition given to the tourist destinations, seen as places or some form of actual or perceived boundary, such as physical boundaries of an island, political boundaries, or even market-created boundaries (Kotler, Bowen, and Markens, 2006). Competitiveness of tourism destinations and, generally, the overall competitiveness of the travel and tourism industry, became vital for their survival and growth in the international market.

Characteristics of a competitive tourist destination are of a very different nature and form a significantly diversified set of features. Among these are mentioned the ability to increase tourism expenditures, to increasingly attract visitors, to provide tourists with satisfying and memorable experiences in a profitable manner, to contribute to the enhancement of the well-being of destination residents and preservation of the natural resources for the future generations (Brent Richie and Crouch, 2003).

Seen from a macroeconomic perspective, tourism destination competitiveness has a support the three pillars of natural resources, climate and culture (Lumsdon, 1997). Kotler (2006) added other three factors: the existing infrastructure, political stability and currency fluctuation, mentioning also some factors that can decrease the competitiveness, such as violence, natural catastrophes, adverse environment factors and overcrowding. Ejarque has proposed (2005) a set of elements to be considered in analyzing the tourism destinations: the geographical location, environmental and physical conditions, demographical situation, existing tourist attractions, image perceived and image associated with the tourist destination, tourism resources (natural, cultural, activities, infrastructure and services).

Cultural resources have been identified a one of the significant factors, together with the natural beauty and climate, sport, recreation and education facilities, shopping and commercial facilities,

infrastructure, and the cost of living (Tang and Rochananond, 1990) in determining the attractiveness of a country as a tourist destination and, by extension, the competitiveness of the travel and tourism industry.

The content of the cultural resources is defined in a different manner by the authors approaching the subject. Ritchi and Zins (in Tang and Rochananond, 1990) have included (1978) among the cultural and social characteristics language, traditions, gastronomic practices, art, sculpture, music, architectural works, religion, education, dress, leisure behavior, history, museums, and festivals. According to the US Natural Resources Conservation Service, cultural resources are an evidence of the past human activity. These may include pioneer homes, buildings or old roads; structures with unique architecture; prehistoric village sites; historic or prehistoric artifacts or objects; rock inscription; human burial sites; earthworks, such as battlefield entrenchments, prehistoric canals, or mounds. Cultural resources could be tangible and intangible (McKercher, Ho, and du Cros, 2005): tangible resources range from single buildings to entire cities, including existing structures, modified facilities and purpose-built attractions, while intangible resources represent traditions and culture of communities – arts, performance, religion, traditional rites and rituals and the day-to-day activities.

The higher public interest in heritage and the perception of heritage as a mean to stimulate economic activities and development of the local communities and regions have increased the political focus on cultural heritage. Increasingly tourist demands for cultural experiences of various sorts as well as employing cultural heritage to attract tourists to various destinations (Bowitz and Ibenholt, 2009) have given an enhanced position to the cultural resources as a pillar of the travel and tourism competitiveness, respectively to the cultural tourism as a major activity within the industry.

Dallen has observed (1996) that cultural heritage is the essence of tourism in many destination areas worldwide, millions of other people engaging in international and domestic travel to experience heritage of general interest or even of a more personal nature. These phenomena allowed the introduction of the concept of heritage tourism defined as a subgroup of tourism, in which the main motivation for visiting a site is based on the place's heritage characteristics according to the tourists' perception of their own heritage (Poria, Butler, and Airey, 2001). More, the heritage tourism has been approached here as the final stage of the "heritagization" – the social process whose final outcome is the presentation and interpretation (rather than archiving or sustaining) of heritage or even demolishing (Poria and Ashworth, 2009).

Growth of the mass tourism is associated with serious damaging effects on physical and cultural environments: this should lead to a development of tourism capable of sustaining and enabling future generations to benefit from their heritage (Drost, 1996).

As the countries of the Central and Eastern Europe are not a uniform but diverse entities in terms of location, topography, climate, history, culture and economic development, each of these will have to identify its own competitive advantage (Hughes and Allen, 2005). Cultural resources and, within this category the heritage, could represent one of these advantages supporting their competitiveness as tourist destinations and the overall competitiveness of their tourism and travel industries.

Methodological Notes

The main objective to be reached through the present research approach referred to the assessment of the associations between the cultural resources, respectively the heritage, and the overall travel and tourism industry's competitiveness and performances in the case of the selected countries from the Central and Eastern Europe.

To conduct the assessment it was employed a set of data included in The Travel & Tourism Competitiveness Report 2009, issued by the World Economic Forum in Geneva, Switzerland. Ten countries of the Central and Eastern Europe have been selected based on the affiliation to the region and their status as members of the European Union: Bulgaria, Czech Republic, Estonia,

Hungary, Latvia, Lithuania, Poland, Romania, Slovakia, and Slovenia.

Variables of the research approach have been the following:

- overall travel and tourism competitiveness, as expressed by the specific index;
- performances of the travel and tourism industry and economy: GDP and travel and tourism industry and economy, employment in travel and tourism industry and economy, international visitor arrivals and international tourism receipts;
- number of the World Heritage sites, as a main factor describing the cultural resources competitiveness.

Pearson correlation coefficient has been employed to conduct the measurements and produce the aimed results.

Main Findings

With the exceptions Czech Republic and Poland, cultural resources do not appear as a supporting pillar for the travel and tourism competitiveness in the countries of the Central and Eastern Europe ($r = 0.18$). This may suggest not necessarily a lack of these resources but rather an insufficient or ineffective promotion and, generally, a less effective employment of these resources as critical drivers of their travel and tourism competitiveness.

Impact of the cultural resources on the competitiveness of the travel and tourism industry in the considered countries has been assessed considering the scores expressing the competitiveness of the cultural resources and the performances in terms of the gross domestic product and employment (for the industry and for the economy), international visitor arrivals and receipts at the level of the ten countries (see Table 1).

Measurement of the association between the indicators expressing the performances of the travel and tourism industry and economy and the scores expressing the competitiveness of the cultural resources in the considered countries shows strong relationships between these variables, in the cases of all the variables: the gross domestic product and travel and tourism economy ($r = 0.90$), gross domestic product and travel and tourism industry ($r = 0.85$) and employment and travel and tourism economy ($r = 0.77$), respectively a moderate relationship in the case of the employment and travel and tourism industry ($r = 0.57$).

Table 1. Cultural resources and travel and tourism industry, economy and performances (2009)

Country	TTC	CR	GDPi	EMPi	GDPe	EMPe	IVA	ITR
Czech Republic	4.86	5.41	3607	98.9	20664	5002	93363	6618
Estonia	4.83	2.26	620	17.3	2926	79	4304.8	1035
Slovenia	4.53	2.68	1380	32.8	6261	125	54439	2483
Hungary	4.45	3.92	3755	180.5	9275	261	39125	4728
Slovakia	4.34	2.69	1459	38	9402	223	32905	2013
Latvia	4.31	2.11	425	13.4	1803	56	4489	671
Lithuania	4.30	2.39	432	12.8	2156	63	4625	1153
Bulgaria	4.30	3.13	1478	89.2	5629	336	8204	3130
Poland	4.18	5.08	7157	265	32040	1100	58613	10627
Romania	4.04	2.85	3073	272.8	8289	544	5273	1464

Notes: TTC – Travel and Tourism Competitiveness index; CR – Cultural Resources; GDPi – GDP and travel and tourism industry (US\$ millions, 2009); EMPi – employment and travel and tourism industry (thousand jobs, 2009); GDPe – GDP and travel and tourism economy (US\$ millions, 2009); EMPe – employment and travel and tourism economy (thousand jobs, 2009); IVA – international visitor arrivals (thousands, 2009); ITR – international tourism receipts (US\$ millions, 2008); countries are ranked in the descending order of the TTC index.

Based on these results, it can be concluded that a more effective promotion and employment of the cultural resources available in the considered countries could determine a growth both in

terms of the gross domestic product generated by the travel and tourism industry and economy and the number of new direct or indirect workplaces created.

Association between the number of the international visitor arrivals and the international tourism receipts and the competitiveness of the cultural resources in the considered countries shows very strong relationships between these variables ($r = 0.83$, respectively $r = 0.92$). These results provide a supplementary support of the idea that specific efforts should be made by the considered countries to preserve, promote and employ their cultural resources.

According to the Travel and Tourism Competitiveness Report, number of UNESCO cultural World Heritage sites is one of the variables describing the content of the cultural resources pillar.

Table 2. Cultural resources, heritage and travel and tourism competitiveness in the Central and Eastern Europe

Country	TTC	CR	WHS	WHSs
Czech Republic	4.86	5.41	13	7.00
Estonia	4.83	2.26	4	2.85
Slovenia	4.53	2.68	0	1.00
Hungary	4.45	3.92	7	4.23
Slovakia	4.34	2.69	6	3.77
Latvia	4.31	2.11	3	2.38
Lithuania	4.30	2.39	6	3.77
Bulgaria	4.30	3.13	8	4.69
Poland	4.18	5.08	12	6.54
Romania	4.04	2.85	7	4.23

Notes: TTC – Travel and Tourism Competitiveness index; 14CR – Cultural Resources; WHS – number of World Heritage cultural sites; WHSs – corresponding scores for the World Heritage Sites determined based on the hard data; countries are ranked in the descending order of the TTC index.

The analysis of the relationships between the number of the World Heritage cultural sites and the macroeconomic performances of the travel and tourism industry in the considered countries, allow the observation of the following results:

- there is a strong correlation between the number of the World Heritage cultural sites and the gross domestic product generated at the level of the travel and tourism economy ($r = 0.77$) and industry ($r = 0.72$); registering an increased number of cultural sites on the list of the World Heritage sites, accompanied by an appropriate promotion, will contribute to the increase of the weight in the gross domestic product created by the travel and tourism industry;
- there is a moderate ($r = 0.57$), respectively a strong ($r = 0.77$) correlation between the number of the World Heritage cultural sites and the employment in the travel and tourism industry, respectively economy; again, an increased number of cultural sites registered in the World Heritage list, properly promoted and made available will contribute to the creation of new workplaces both direct, within the industry, and indirect in connected activities and industries;
- finally, there is a rather moderate correlation between the international visitor arrivals ($r = 0.49$), respectively a strong correlation between the international tourism receipts and the number of the registered World Heritage sites in the considered countries ($r = 0.76$); these results support the necessity to conduct marketing campaigns to promote them appropriately and to benefit from their extended cultural heritage.

Conclusions and Future Directions of Research

Cultural resources contribute, surprisingly, in a very poor measure to the overall competitiveness of the considered countries seen as travel and tourism destinations. Knowledge and capacities for

an effective employment of the cultural resources become essential for these countries in their attempts to transform these in critical drivers of their travel and tourism competitiveness.

Focus on particular capitalization of the existing cultural heritage appears to be critical as the relationships between the competitiveness of the cultural resources and the macroeconomic performances of the travel and tourism industry in the considered countries reveal a strong association. A more effective promotion and employment of the cultural resources would determine a growth in terms of the GDP generated and of the number of workplaces created by the travel and tourism industry of these countries. Taking advantage of the available cultural resources, inclusively through the development of the heritage tourism, should be reflected in the specific industry's performances as an increased competitiveness of these resources could determine significant increases in the number of the international visitor arrivals and of the international tourism receipts.

Further directions of research to be followed refer to the identification of a more adequate set of determinants of the cultural resources competitiveness to allow a better measurement of the cultural resources impact over the competitiveness of the travel and tourism industry and conducting a benchmarking analysis of the relationships between the cultural resources, heritage and the travel and tourism competitiveness industry in the considered countries and the most important world tourism destinations.

SPECIFIC ISSUES REGARDING THE PROCESS OF SELLING HIGH-TECH PRODUCTS

Bălășescu Simona

Transilvania University from Brasov

Faculty of Economic Sciences

Dovleac Lavinia

Transilvania University from Brasov

Faculty of Economic Sciences

Bălășescu Marius

High technology products are seen by the consumers as being complex and risky to buy and to use. The adoption process of this type of products has a slow rhythm. The producers have to make a lot of effort for convincing the consumers that these products represent the solution for their needs. The consumers' attitude towards new high-tech products is very reserved because they need a lot of information about the aspects they don't know for sure. Although they can access many information sources, it seems that face-to-face presentations give the best results. The possibility to ask questions and be cleared in the same time by a qualified person who knows the product is often preferred when someone wants to buy a high-tech product. That is why the managers from high – tech sector must pay attention at the important role of the sales force and especially the role of salesman. If he gains the trust of the potential consumer, the high-technology product is already half-bought.

Keywords: high technology, adoption process, selling process, consumer, adopters.

Cod JEL lucrare: M31

1. The first adopters of high - tech products

Consumer adoption of technology products continues to be a challenge for marketers. New products fail at a rate of between 33 percent and 90 percent, depending on the industry.¹⁴⁴⁷

Because the technology life-cycles are shorter and the market launch costs are rising, quick identification and successful attraction of that small part of the market willing to take the risk is essential to longer term success.

The process of predicting marketing reactions is complicated, particularly where the product is very different from its predecessors. Where the product is very new in the eyes of both the company and the consumers, marketers do not have the benefit of drawing clear analogies with similar products or past behaviors to determine the rate and manner with which it will diffuse through the market¹⁴⁴⁸.

The term “high-tech market” refers to newly established, rapidly growing markets, which are mainly driven by technological innovations. Since the major investments and marketing decisions

¹⁴⁴⁷ Peter, J.P., Donnelly, H.J.Jr. (2006), *A Preface to Marketing Management*, 10th edition, Boston: McGraw-Hill

¹⁴⁴⁸ McDonald, H., Corkindale, D., Sharp, B. (2003) *Behavioral versus demographic predictors of early adopters: a critical analysis and comparative test*, *Journal of Marketing Theory and Practice*, p.84 - 95

are typically made during the early years of a product's life cycle, sales forecasts are of special importance in the growth stage¹⁴⁴⁹. In this stage errors in sales projections can trigger serious consequences.

Marketing of high technology products and innovations is concerned about identifying the early adopters for these products.

Innovations are usually categorized into one of three classes¹⁴⁵⁰: *evolutionary or "continuous"* where there is any change in the technology or behavior by consumers; *"dynamic continuous"* where there is change in the technology but little change required in consumers' behavior to use the product; *radical or "discontinuous"* where consumers must change behavior.

The model introduced in 1971 by Everett Rogers, divide the adoption consumers into five groups on the basis of the relative timing of their adoption as Innovators, Early Adopters, Early Majority, Late Majority and Laggards.

Of the five groups, the **Innovators** have been the most heavily researched. According to Rogers, Innovators possess: higher education level, higher social status, higher income levels and they are more socially active. So this "cognitive consumer"¹⁴⁵¹ handles large quantities of information, analyses it in terms of their personal beliefs and experiences, and acts rationally within the bounds of their known information. Rogers describe the innovators as having "a desire for the rash, the daring and the risky"¹⁴⁵².

Moore characterized first purchasers of high technology radical innovations as being "techie"¹⁴⁵³. He claims they are people who seek out new things and they are tolerant of any teething problems, provided they are given the opportunity to help fix them.

2. Factors which affect sales in high-technology markets

Golder and Tellis found that the sales of an innovation start to climb rapidly when the price has become, on average, 63% of that at introduction to the market¹⁴⁵⁴.

There are identified five factors that can affect individual buying decisions and, therewith, aggregate sales: *Interpersonal Communication*

Because of the uncertainty inherent in new technologies, consumers are motivated to seek product-related information¹⁴⁵⁵.

Democratization of Innovation

High-tech-based products are often highly priced at the beginning of market penetration and then experience dramatic price decreases in subsequent periods. Some authors believe that the underlying process of market growth is not a diffusion of innovation, but actually a democratization of innovation.

Direct and Indirect Network Effects

Many high-tech products are subject to network effects. The value of such products increases, the more users adopt them. Direct network effects arise in a physical network, where the utility of a product rises directly with the number of adopters. Indirect network effects arise if the value

derived from a product depends on the availability of complementary products and services (e.g. DVD titles for DVD players, MP3 music files for MP3 players).

Forward-Looking Behavior

Forward-looking consumers try to optimize the timing of their purchase by balancing the increased expected utility of getting a better or cheaper product with the loss of utility due to a delayed purchase¹⁴⁵⁶.

Consumer and Firm Heterogeneity

The early market adopters want to gain a certain image by buying high – technology products.

But the mass market consumers are more utilitarian and primarily interested in the product's functionality. With regard to the firm heterogeneity, according to Srinivasan, Haunschild, and Grewal, many markets are characterized by a so-called dual-technology frontier, where the high-technology frontier represents innovations arising from technological opportunities, and the low-technology frontier represents innovations driven by user needs¹⁴⁵⁷.

3. Selling strategies for high tech products

Selling new products is a strategic choice of effort allocation between products; therefore, strategic decisions need to be made by many salespeople.¹⁴⁵⁸

To optimize product launch strategies, it is necessary for managers to understand the typical pattern of new product growth and, more importantly, the impact of a salesperson's characteristics on this growth pattern.

The managers' interest in sales forecasts is likely to diminish after the sales peak, that is, when the market matures and the high-tech product becomes a commodity.

Many consumers are overwhelmed by proliferation of technological advancements. Consumers are not always able to recognize the full advantages of technology innovations. Consumer technology products and services have shorter lifecycles and they are more complex. A salesperson can customize information about a new product or service to help facilitate customer understanding.

Personal selling is a "critically important element in the marketing mix of almost every industrial firm".¹⁴⁵⁹ The value of personal selling stems from the premise that salespeople can facilitate consumers' decision of adoption by implementing the appropriate selling tactics.

Selling tactics based on message adaptation

The selling process can be built having in the center of strategy the customer, the product or the competition.

The first approach, *customer-focused*, highlights a salesperson's attempt to link the benefits of the new product with the unique needs of customer. The customer-focused approach views customer's problems as unique and in need of customized responses¹⁴⁶⁰.

A second approach, *product-focused*, emphasizes the attributes and benefits of the innovative product being offered.

¹⁴⁶⁰ DeConnier, R.A., Jobber, D. (1993), *The Counselor Selling Method: Concepts and Constructs*, Journal of Personal Selling and Sales Management, 13, 39-59.

Product-focused tactics focus on a one-way communication that informs or educates the buyer. This selling strategy is aimed at the attributes and performance of the product. Such information may concern aspects of the core product (e.g., quality and satisfaction ratings; performance and safety specifications), peripheral benefits (e.g., warranties; financing options), price (e.g., this item has been discounted), retail outlet (e.g., good return policy), or manufacturer details (e.g., country of origin).

The third approach, *competitive focused*, relates similar customers and competitive products to the innovation.

Because the challenges are viewed as similar to others, the salesperson does not "engage in detailed diagnosis of the buyer's problem, but recommends a set of solutions that have proven successful in similar situations"¹⁴⁶¹.

When appears the intention to use the high-tech product?

In the literature it's presented a model which focuses on the attitudinal determinants of intention to use a specific technology or service.

The Technology Acceptance Model¹⁴⁶² consists of five concepts: perceived ease-of-use, perceived usefulness, attitudes towards use, intention to use, and actual use.

Perceived ease of-use is defined following Davis as "the degree to which a person believes that using a particular system would be free of effort." In essence, perceived ease-of-use reduces uncertainty about the cause-effect relationship involved in the innovations' capacity to solve an individual's problem.

Perceived usefulness is defined as "the degree to which a person believes that using a particular system would enhance his or her performance"¹⁴⁶³. In the context of consumer innovations, usefulness relates to compatibility with the existing values, past experiences, and needs of potential adopters.

Perceived expressiveness is defined as individuals' ability to express their emotions or identity.

Perceived enjoyment refers to "the extent to which the activity of using the computer (technology) is perceived to be enjoyable in its own right, apart from any performance consequences that may be anticipated"¹⁴⁶⁴.

Compared to perceived usefulness, perceived ease of use is more important in determining satisfaction in the consumption process. The ability of the new product to be understood in terms of how it is to be operated and the benefits that it offers have a considerable impact on consumer evaluation. By using the product focused approach, the salesperson encourages direct user-product interface to reduce consumer apprehension about product performance and safety¹⁴⁶⁵.

A customer-focused approach allows the salesperson to uncover latent motives by creating linkages with feelings associated with intrinsic motivation¹⁴⁶⁶ and/or peak experiences. The objective of the sales presentation is to show how the innovation can potentially fulfill unmet needs and to define what is possible and worth having in life (e.g. E-books allow intellectuals greater portability).

4. The importance of salesman in high-tech sector

The marketing literature on persuasion indicates that salespeople are viewed as a valuable source of information¹⁴⁶⁷. The influence from salespeople can therefore be used to reduce consumer's uncertainty and facilitate product adoption.

The literature on diffusion of innovation suggests that information about technological innovations can travel through a variety of communication sources to members of a social system¹⁴⁶⁸. That is, a salesperson can customize information about a new product/service to help facilitate customer understanding.

Studies indicate that where consumers are explicitly shown an innovation (e.g., by a friend or salesperson or at tradeshows), perceived compatibility or usefulness is likely to have an immediate effect. Therefore, consumers are able to acclimate and move through the process of mental adoption of the new product. Involvement is a key determinant of how information is processed and attitudes are changed.

During new product launches, salespeople need to understand the innovation and to memorize technological jargon before presenting the product to customers. The ability to process new information in due time represents an important attribute for a successful new product salesperson. Selling new products successfully also demands creativity, agility, energy, and innovation in approaching and persuading customers¹⁴⁶⁹.

It takes the determination and incessant effort of a salesperson to convince skeptical customers that a focal new product is indeed superior and that they should adjust their own behaviors and habits to adopt it¹⁴⁷⁰.

Work experience and salesperson age are both temporal variables¹⁴⁷¹. Learning theory suggests that work experience improves job performance through acquired knowledge and accumulated skills. Salespeople's experience is positively correlated with adaptive selling and performance¹⁴⁷². The explanation could be that experienced salespeople have encountered different types of customers, have been in a variety of selling situations, and have tried multiple selling strategies. Experienced sales people are typically good adaptors and adaptive selling has been proven to be conducive to generating sales.

Unlike work experience, an employee's age is viewed as a factor impeding job performance¹⁴⁷³. Many theorists contend that as people age, their mental and physical abilities decline, and, consequently, job performances will be hindered. Empirically, age has also been shown to be negatively related to ambition, aspirations, and motivation.

Relative to younger workers, older workers "are more reluctant to engage in new skills training and tend to prefer collaborative (versus competitive) tasks"¹⁴⁷⁴. Because understanding new

technology and maintaining high levels of energy are pivotal to new product success, younger salespeople have the advantage and are more likely to see early sales success than their older coworkers.

Although adults generally lose working memory, attention, and the ability to process novel information over their life span, they tend to accumulate occupational knowledge and job-related experience. Consequently, it is expected that the relationship between age and performance will vary among industries and job demands.

In several sales force management contexts, salespeople's self-set goals have been found to be positively related to sales performance¹⁴⁷⁵. After salespeople set targets, they tend to focus their efforts on these targets.

On one hand, age is an indicator of less energy and greater difficulty in learning new technology and new product features. On the other hand, sales experience accumulated over the years can be a strong advantage in tackling the challenges of selling new products.

Many researchers suggest that gender may influence salespeople's attitudes, motivations and outcomes.

5. Conclusions

The first 15 months after the launch is a critical period of new product success. Obtaining sales early and increasing the number of sales quickly is in the best interest of marketing and product managers, for whom the sales force should be a top ally with regard to achieving goals during this critical time frame.

The salesperson experience has a positive impact, whereas age has a negative impact on new product growth trajectory. Launching a new product involves tremendous uncertainty. Substantial time, energy and effort from salespeople are needed to ensure success.

In consumer markets, the challenge of salespeople is to understand how prospects perceive a new product and develop effective ways of positioning and communicating values associated with the new product.

When consumers first have direct experience and interface with a new technology, a sense of intense curiosity and anticipation can often occur. For example, in any Windows-based systems, software manufacturers are attempting to provide interfaces that are "fun," "cute," and tie into social functioning. This curiosity must be used appropriately by the salesman for presenting the product they sell. Starting from this consumer's attitude, the salesman can draw a selling speech, delivering to the consumer the necessary information.

THE SPECIFICITY OF CUSTOMER LOYALTY STRATEGIES USED IN THE TOURISM AND HOSPITALITY INDUSTRY

Băltescu Codruța Adina
Transilvania University of Brașov
Faculty of Economic Sciencies

Generally speaking, the development of companies marketing objectives has determined major changes into the marketing policies decisions. If several years ago most marketing strategies were oriented towards selecting new clients, creating new clients, increasing the attachment/loyalty of existing customers became lately a priority, but also a very difficult task. In the current context it is more and more difficult for a supplier to diversify his offer relative to the competition from the perspective of physical attributes, and the relationship marketing represents an efficient and necessary way to ensure the customers loyalty and to build a strong partnership with them. Within the article's content it has been included also an analysis of the ways of applying the loyalty strategies among the tourism service providers from Poiana Brașov resort.

Key words: customer satisfaction, relationship marketing, customer loyalty strategies.

The article's JEL code: M3

1. Introduction

A customer loyalty process comprises all measures taken by one company aimed to positively orient the behavioral intentions of current and future customers towards a bidder and/or his offer/services in order to obtain stabilization, respectively a development of the relations with such customers.¹⁴⁷⁶ In such context we approach a business philosophy relatively new, a strategic orientation which stresses the importance of keeping and improving the relations with the current customers, more likely than attracting new ones, respectively the *relationship marketing*.¹⁴⁷⁷ For ensuring the customers' loyalty, the satisfaction is an indispensable premise and for in order to obtain this desideratum achieving or surpassing the customers' expectations is crucial. Customers' loyalty represents a strategic commitment in the tourism industry.¹⁴⁷⁸ The satisfied customer who fails to return or to share his positive consumption experiences with others is valueless from the perspective of touristic organization, and, within this context, identifying the valuable customers which can be transformed into loyal customers represents an efficient measure in order to obtain competition advantages on the market. The research conducted showed the fact that 90% out of the satisfied customers switch the supplier, the connection between satisfaction and loyalty having the lowest intensity within the model of profitability of service provider companies.¹⁴⁷⁹

2. Relationship marketing strategies

The development of a strong and long-lasting relationship with the customers is based on several principles among which the most significant are the general feedback from the customer upon the company, the effective relationships built by the organization with its customers and the barriers

¹⁴⁷⁶ Bruhn, M., *Orientarea spre clienți-Temelia afacerii de succes*, Editura Economică, București, 2001, p.110

faced by the customer when he decides to break the relationship with the company. Those elements represent the basis for determining the strategies specific for the relationship marketing.¹⁴⁸⁰

1. *Quality-based services*. The strategies used to maintain a customer may provide sustainable success only by ensuring a strong basis for quality, offer value and consumer satisfaction. The organization's main interest shall consist of ensuring the offer competitiveness to respond to the customer's expectations, providing inferior services being impossible to be counteracted by such strategies.

2. *Supplier switching barriers*. The reference literature suggests the existence of a significant number of obstacles which influence the consumer's decision of leaving a supplier, facilitating this way his remembrance.¹⁴⁸¹ We take into consideration the *consumer's inertia* and correspondently, the expression of judgments like "it does not worth the effort" to change the supplier. The greater the efforts of breaking the relationship with the provider, the more stable the customer. *The costs associated with switching supplier* represent real reasons which determine the loyalty process. In this category are included both the nonmonetary (time, effort) and monetary costs and here we identify *initial costs, searching costs, learning costs and contractual costs*. Attracting new customers involves setting reduced costs, while their increase represents a strategy of maintaining the current customers.

3. *Monitoring and evaluating the relationship quality* represents another relationship marketing strategy. The abovementioned switching costs represent constraint measures to which companies often cannot give up.¹⁴⁸² The strategies which encourage the customers to maintain the relations with the supplier are focused on the types of connections which get consolidated in time with the supplier and those may be analyzed on four levels.¹⁴⁸³

The financial relations represent the basis of the relationship with the customer and they are mainly determined by the application of preferential tariffs. In this respect, the most common used instruments are the loyalty programs which allow the collection of points that may be transformed into high quality services, free services, reservations associated to the basic service, etc. In other situations, the customer receives the stability warranty of the negotiated price. These are strategies which need an increased attention paid by the organization whereas they may be easily copied by the competition and thus, they have short-term effects. Secondly, they are efficient only if they are very well structured and determine a real sales increase.

The social relations transform the consumer into a friend of which needs and desires are known in detail. Equally significant are also the social reports that get established between the customers of the same company which may become important elements for creating stable and long-lasting relationships. These are strategies harder to imitate, and their efficiency is proven through a combined application with the financial strategies.

The personalized relations determine two types of strategies: mass and individual personalization, both encouraging the close knowledge of each customer and the proposal of unique solutions adjusted to their needs.

The structural relations are the strategies hardest to imitate, comprising the application of all previously presented strategies and determining the customer's involvement into the service process.

¹⁴⁸³ Berry, Parasuraman,(1991), *Marketing Services*, quoted in Zeithaml, V.,A., Bitner, M.,J., Gremler, D.,D., *op.cit.*, p.196-201.

Ensuring the loyalty involves the operation of a *loyalty circle* which may be identified through the following three functions: process, value and communications.¹⁴⁸⁴ To be noted the fact that, throughout the entire process, there are points where the customer may leave the circle and, thus, the partnership with the supplier. The objective of tourism units, especially of hotels, consists in retaining the customer within the circle, performing in the same time in all three functions previously listed, this representing the key of success of the entire action. *The process* indicates “how the service functions”, and the customer’s feedback comprises all the moments of the service consumption, the interactions with the personnel representing intrinsic components of it. The second component, the creation of *value* comprises two parts, respectively *added value* and *straightening value*. The strategies that aim to ensure the *added value* start from the principle of offering to the customer a wide range of products/services in order to prevent his migration towards competition, in this respect being guaranteed *financial advantages* (low tariffs), *temporal advantages* (time savings), *functional advantages* (the product corresponds to the needs), *experimental advantages* (enhancing the experience by ensuring an increased comfort), *emotional advantages* (acknowledgment and positive experiences) and/or *social advantages* (favorable personal relations with the supplier). Value straightening strategies are meant to rectify the possible errors occurred within the supply process, the most frequent strategies used in this respect being the personnel empowerment to act according to the characteristics of each situation and providing warranties. The last component of the circle is the *communication*, embedding marketing specific actions like database, newsletters and general advertisements. Knowing the customers’ profiles is absolutely necessary in order to inform them upon the needed offers and, in the same time, it is necessary to avoid making promises impossible to keep.

4. *Customers’ claims settlement* represents a critical component within the loyalty policy. The performed analyses highlighted the extremely high percent of the unsatisfied customers, respectively 91%, who do not return to the same unit and, in the same time, the significant percentage, respectively 82% out of them, who change their minds when it comes to quickly settle the manifested dissatisfactions.¹⁴⁸⁵ Approaching these issues involves their settlement as quickly as possible, whereas any delay has negative effects, and also the implementation of an identification system of consumers’ dissatisfactions. Another major aspect is determined by the fact that a significant number of customers fails to manifest their dissatisfactions, the management board being responsible for encouraging the consumers to communicate the possible problems occurred. The methods used in this respect comprise the implementation of free phone lines, the personnel training in order to identify the unsatisfied consumers, the providing of warranties (their invocation represent the result of errors occurred within the supply process), etc.

Another way to raise the percentage of loyal customers consists in reducing the number of claims. In the centre of claims active management is placed the objective to react to the customers’ dissatisfaction in such way so that they should be eliminated and, after the conclusion of the specific processes, the customer’s satisfaction and loyalty should be rebuilt.¹⁴⁸⁶ On the other hand, reducing by half the number of claims determines the doubling of the average rate of one company’s development, and reducing with only 5% the expressed dissatisfactions may lead

¹⁴⁸⁴ Shoemaker, S., Lewis, R.,C., Yesawich., P.,C., *Marketing Leadership in Hospitality and Tourism – Strategies and Tactics for Competitive Advantage*, fourth edition, Pearson Prentice Hall, Upper Saddle River, New Jersey, 2007, p.101-102.

¹⁴⁸⁵ The Technical Research Programs Institute, quoted in Kotler, P., Bowen, J.,T., Makens, J.,C., *Marketing for Hospitality and Tourism*, fourth ed., Pearson Education International, Upper Saddle River, New Jersey, 2006, p. 402.

¹⁴⁸⁶ Bruhn, M., quoted work., p.161.

to a profit increase from 25 to 85%.¹⁴⁸⁷ The concept of zero defections successfully implemented within the production of material goods is not applicable in the field of services due to the intangibility features, the very different level of the expectations from each consumer and, as a consequence, the impossibility to standardize the supplies, etc. A more appropriate concept is that of zero desertions, of those customers who switch a supplier orienting towards the competition's offer.¹⁴⁸⁸ The desertions typology includes the customers migrations towards competitions due to the *price* (the competition's rate level is more advantageous, but, in general, the suppliers try to differentiate on market through the elements associated to the responsibility, trust conferred, empathy, tangible elements management, and the loyal clientage appreciate such characteristics without constantly hunting for "bargains"), *product* (the organization's offers are inferior qualitatively and the innovation decisions and continuous improvement of content and products/services characteristics represent key elements for having success on market), *general services* (untrained and uninformed staff with inappropriate attitude, unkept promises are also reasons that generate the customer's desertion), *market* (bankrupt or restructured organizations), *organizational elements* (change of supplier's trading policy).

The marketing instruments specific for building a strong relationship with the customer are generally focused on three aspects. The first aspect refers to providing of certain financial benefices, category which includes the loyalty programs of airline companies, hotels, etc. throughout which repetitive customers are rewarded. A second set of measures grants social benefices throughout actions of employees to know in detail the customer's needs and preferences in order to individualize and customize the offer. The third option is more complex and aims to consolidate structural relationships with valuable customers by granting both financial and social rewards (waiting rooms, phone lines, special check-in, check-out operations, etc.).

The ways of increasing the customers' loyalty represent the effective methods that are to be applied in order to transform the clientage into loyal customers. From this perspective, we may identify four different options, respectively the *emotional loyalty* which is achieved through the customer's satisfaction and represents the centre of any loyalty measures; the *economic conditioned loyalty*, case in which the customer would realize that switching the supplier would generate unnecessary additional costs (costs of time, information, new relationships initiation, etc.); the *contractual loyalty* which "links" the beneficiary with a producer, brand or trade unit through contract clauses (leasing clauses, for instance) and the *functional technical loyalty* which is possible when there is a certain functional dependence between the basic and the complementary service. The emotional loyalty is crucial in the hotel industry, the performed research proving different emotional attributes, in accordance with the comfort provided and the applied rate level. In case of budget hotels, valences such as comfort, offer content and practical elements are most frequently encountered, in case of medium comfort units we talk about comfort, ways to welcome and feeling of security, while for the luxury units the attention, the relaxation and the degree of sophistication represent the basis for transforming the clientage into loyal customers, the later registering the highest rates of return.¹⁴⁸⁹ Some studies have specified the importance of atmosphere, equipment and ambiance in general, as defining elements for the loyalty solidification, their frequent change generating new, interesting and pleasant experiences for the loyal customers. The contact personnel's training level and attitude are equally important,

¹⁴⁸⁹ Barsky, J., Nash, L., *Evoking Emotion: Affective Keys to Hotel Loyalty*, Cornell Hotel and Restaurant Administration Quarterly, Vol.43, 2002, p.39-46.

representing the crucial factors which influence the decision of returning to one hotel.¹⁴⁹⁰ In case of food units, the most significant attributes which converge towards a customer loyal behavior are the products quality, services and atmosphere. Other characteristics, among which we mention the unit's location, quality-price ratio, personnel's behavior, or other emotional attributes (the feeling of familiarity, pleasant memories) are also important when taking the decision to return, but they register secondary influences, their omission within the managerial process having negative consequences.¹⁴⁹¹

Related to the tourists' loyal behavior towards a certain holiday destination, several studies have proven the idea of habit, attachment, feeling of familiarity, doubled by the value perceived through the quality-price ratio, represent essential elements. In case of foreign tourists, the feeling of familiarity is most frequently encountered, being a significant measure of reducing the touristic consumption risks. Furthermore, the loyalty measures taken in the case of ski resorts constituted the subject of international research which highlighted the close relation between the annual number of travels towards such holiday destinations and the tourists' loyal behavior. It has been noticed the fact that providing ski and accommodation service packs at low prices, preferential subscriptions for cable transport, with additional restaurant services, represent measures which may substantially contribute to the increase of annual number of visits. The value perceived of the entire offer and the satisfaction represent essential loyalty attributes. Nourishment services provided through low rate coupons, accommodation services at lower prices for repeated visits, or free increased comfort services represent important measures in this direction as well.¹⁴⁹²

3. The features of loyalty strategies in Poiana Braşov resort

Poiana Braşov resort is located in the center of Romania, 12 Km away from Braşov, being situated at the foot of Postăvarul Mountain (1,030 m altitude), representing the most visited mountain resort in the country. Poiana Braşov is recognized for its characteristics which facilitate the winter sports practice, cable transport facilities and ski slopes being always available for all adventure lovers. The difference of altitude of almost 800 m is very appropriate for ski slopes arrangement (10 different slopes with various degrees of difficulty), slopes which are attended by eight cable transport facilities (two aerial lifts, a cable car line, five platter lifts). The most various ways of entertainment are playing tennis, football, basket, mini-golf, swimming, skating, equitation etc., fields, pools with sauna and a skating rink being especially arranged for this purpose.

The accommodation offer comprises a wide range of touristic structures, their total number being at this time of 36, out of which 15 hotels, 13 boarding houses, 6 touristic villas and 2 complexes of apartments. Related to comfort categories of accommodation units, 66.7% out of these offer a very high comfort degree, respectively four and five stars, the rest of 33.3% being included within the three stars category. The features of accommodation base determine us to state the fact that Poiana Braşov is the most luxurious mountain resort of Romania.

Analyzing the characteristics of tourism services provided by the accommodation units, we noted the lack, almost complete, of loyalty systems applied in the relationships with the tourist clientele. The sole hotel which announces the appliance of tactics specific for the relationship marketing, as a pioneer project, is "Acasă la Dracula" ("House of Dracula") hotel, a four stars hotel which launches the "House of Dracula" card, a customized prepaid card amounting 50 euro/year, valid for one year following its issuance. The benefits offered by the purchase of this card are the followings:

¹⁴⁹⁰ Skogland, I., Siguaw, J.,A., *Are Your Satisfied Customers Loyal?*, Cornell Hotel and Restaurant Administration Quarterly, Vol.45, No.3, 2004, p.221-231.

¹⁴⁹¹ Matilla, A.,S., *Emotional Bonding and Restaurant Loyalty*, Cornell Hotel and Restaurant Administration Quarterly, Vol.42, 2001, p. 73-79.

¹⁴⁹² Clark, J.,S., Maher, J.,K., *If you have their minds, will their bodies follow? Factors effecting customer loyalty in a ski resort setting*, Journal of Vacation Marketing, Vol.13, No.1, 2007, p.59-70.

- 10% discount applied to the standard rate;
- 15% discount at the food services of the “Castel” restaurant, applied to the menu prices, only for the kitchen products, drinks not included, applicable if the card's beneficiary is accompanied by maximum four guests;
- double room at the tariff of a single room, except for the weekends (applicable from Monday to Thursday);
- in case of repeated visits, starting from the second stay, the beneficiary has the possibility to be accommodated in the suite paying the rate of a double room, as permitted by the accommodation spaces;
- the bearers of the card benefit from *early check-in*, starting from 10:00 AM;
- the bearers of the card benefit from *late check-out*, being entitled to maintain the room until 6:00 PM (normally, an additional fee of 50% out of the room's rate is charged);
- free access at the hotel's Cardio Fitness Centre;
- free and secured parking space.

This loyalty offer is supplemented by that of 4 stars Miraj hotel, which provides the customers with a fifth free night stay if the visit covers four nights with half-board service.

In case of the other accommodation structures, the loyalty strategies do not represent a managerial strategic option, starting with the premise, as identified following the discussions with their managers and owners, that the best loyalty option currently considered is that of maintaining a high quality level of tourism services and a proper quality-price ratio. The resort food units are managed under the same principle related to the clientage loyalty problematic and the cable transport excludes such an option as there is well known the monopolistic position held by ANATELEFERIC company within the Poiana Braşov resort.

Without making any other comment, as considered useless, we can state that there is a lack of interest among the tourism service providers from Poiana Braşov in applying the processes specific for the relationship marketing, the implementation and use of certain loyalty strategies being an inexistent preoccupation.

5. Conclusions

The hotel industry cannot afford to neglect elements such as innovations and comfort which are intended to provide exquisite memories to the guests, and the continuous personnel training as well, so that they should be capable to respond to all customers needs. Within the current economic environment, renouncing to loyalty programs or reorienting the corresponding amounts towards other fields represents an incautious decision, with medium and long term negative effects.

AN OVERVIEW OF WHY SALES JOBS ARE SO REWARDING

Barin - Olariu Ioana

University "Vasile Alecsandri" of Bacau

Faculty of Economic Sciences

This article focuses on the process of selling and buying in the organizational marketplace. Many factors are driving the world of professional selling toward a relationship-based approach. This transformation has created a challenging, invigorating and rewarding environment in which to pursue a career in selling. Knowledge of the drivers of change in selling, the key success factors required in selling, the activities salespeople perform on the job, and the different kinds of selling jobs available go a long way toward helping a person make a decision if he or she might like to pursue selling as a career path. Successful salespeople always understand the roles that different individuals within the client company play in moving the relationship along, the buying decision process used by their client, and how their clients go about making different types of purchases and how those differences impact the salesperson's approach to the client.

Keywords: autonomy, sales activities, job variety, intrinsic rewards, extrinsic rewards

The article's JEL code: M310

1. Aspects of selling careers

For most professional salespeople, it is precisely the complexity and challenge of their jobs that motivate them to perform at a high level and provide a sense of satisfaction with their choice of careers. A number of satisfaction surveys over the years have found generally high levels of job satisfaction among professional salespeople across a broad cross section of firms and industries. Although these surveys did find some areas of dissatisfaction, that unhappiness tended to focus on the policies and actions of the salesperson's firm or sales manager, not on the nature of the sales job itself. Attractive aspects of selling careers include:

- § Autonomy or the freedom of action and opportunities for personal initiative.
- § Multifaceted and challenging activities as part of the job – sales activities.
- § Financial rewards.
- § Favorable working conditions, often via telecommuting with a virtual office, and with less minute-to-minute direct supervision than most other careers.
- § Excellent opportunities for career development and advancement.

2. High job autonomy

A common complaint among workers in many professions is that they are too closely supervised. They complain about the micromanagement of bosses and about rules and standard operating procedures that constrain their freedom to do their jobs as they see fit. Salespeople, on the other hand spend most of their time working directly with customers with no one around to supervise their every move. They are relatively free to organize their own time and to get the job done in their own way as long as they show good results.

The freedom of a selling career appeals to people who value their independence, who are confident they can cope with most situations they will encounter, and who like to show personal initiative in deciding how to get their job done. However, with this freedom come responsibilities and potential pressures. Salespeople are responsible for managing their existing customer relationships and developing new ones. Although no one closely supervises the salesperson's behavior, management usually keeps close tabs on the results of that behavior: sales volume, quota attainment, expenses, and the like. To be successful, salespeople must be able to manage themselves, to organize time wisely, and to make the right decisions about how to do the job.

3. Sales activities

Most people soon become bored doing routine tasks. Fortunately, boredom is seldom a problem among professional salespeople, as sales positions tend to be high in job variety. Each customer has different needs and problems for which the salesperson can work to develop unique solutions. Those problems are often anything but trivial, and a salesperson must display insight, creativity, and analytical skill to close a sale. Many sales consultants expect creative problem solving to become even more important to sales success in the future. It is difficult to specify the full range of activities in which salespeople engage because they can vary greatly across companies and types of sales jobs.

Sales jobs factors and selected associated activities

- *selling function*: plan selling activities; search out leads; call potential accounts; identify decision makers; prepare sales presentation; overcome objections; introduce new products; call new accounts;
- *working with others*: write up orders; expedite orders; handle back orders; handle shipping problems; find lost orders;
- *servicing the product*: learn about the product; test equipment; supervise installation; train customers; supervise repairs; perform maintenance;
- *managing information*: provide technical information; receive feedback; provide feedback; check with superiors;
- *servicing the account*: stock shelves; set up displays; take inventory for client; handle local advertising;
- *attending conferences and meetings*: attend sales conferences; attend regional sales meetings; work at client conferences; set up product exhibitions; attend periodic training sessions;
- *training and recruiting*: recruit new sales reps; train new salespeople; travel with trainees;
- *entertaining*: entertain clients; take clients to dinner; take clients out for drink; take clients out to lunch; throw parties for clients;
- *traveling*: travel out of town; spend nights on the road; travel in town;
- *distribution*: establish good relations with distributors; sell to distributors; handle credit; collect past due accounts.

One obvious conclusion is that a salesperson's job often involves a wide variety of activities beyond simply calling on customers, making sales presentations, and taking orders. While the first two factors are directly related to selling and order taking, factors 3 and 5 focus on activities involved in servicing customers after a sale is made. Similarly, factors 4, 6, and 7 incorporate a variety of administrative duties, including such things as collecting and communicating information about customers to sales and marketing executives in the company, attending periodic training sessions, and helping to recruit and develop new salespeople. Finally, some salespeople also expend a good deal of effort helping to build distribution channels and maintain reseller support (factor 10).

4. Opportunities for rewards

The internal and external environment is constantly changing. Salespeople must frequently adjust their sales presentations and other activities to shifts in economic and competitive conditions. For many people in the selling profession, variety and challenge are the most rewarding aspects of their jobs. Sales jobs offer great opportunity for developing a sense of accomplishment and opportunities for personal growth. These are important sources of intrinsic rewards and satisfaction - that is, rewards inherent to satisfaction derived from elements of the job or role itself, as opposed to extrinsic rewards, which are rewards bestowed on the salesperson by the company. Selling can be a very lucrative profession in terms of extrinsic rewards as well. More important, the growth of a salesperson's earnings - particularly, the earnings of someone receiving a large proportion of incentive pay - is determined largely by performance, and often no

arbitrary limits are placed on the maximum amount a salesperson can earn. Consequently, a salesperson's compensation can grow faster and reach higher levels than that of personnel in other departments at comparable levels in an organization.

5. Favorable working conditions

If the stereotypes of sales jobs addressed earlier were true, salespeople would be expected to travel extensively, live on big expense accounts, spend much of their time entertaining potential clients, and consequently have little time for home and family life. Such a situation represents a lack of balance between one's work life and family life such that work encroaching on family – *work-family conflict*. Some selling jobs require extensive travel, but the majority of salespeople can secure rewarding positions that allow them to be at home most every night. Indeed, with the increasing use of computer networks, e-mail, video conferencing, and the like, the trend for more than a decade has been for more and more salespeople to telecommute. That is, they work from a remote or virtual office such as out of the home and seldom even travel to their companies' offices.

For all the advantages and attractiveness of telecommuting to the salesperson, as well as the efficiencies and cost-saving aspects to the sales organization, operating out of a virtual office does create a challenge for keeping the sales force fully socialized to the culture of the organization.

6. Moving up in the organization

Given the wealth of knowledge about a firm's customers, competitors, and products - and the experience at building effective relationships - that a sales job can provide, it is not surprising that often CEOs come up through the sales ranks into the executive suite. Although salespeople are sometimes reluctant to give up their high-paying jobs to move into managerial positions, most firms recognize the importance of good managerial talent and reward it appropriately, particularly as a person reaches the top executive levels of the sales organization. Many managerial opportunities are available to successful salespeople at lower levels of the corporate hierarchy as well, most obviously in sales management, product or brand management, and general marketing management. A survey of human resource managers found that sales professionals are among the most sought-after employees.

Promoting top salespeople into management can sometimes cause problems. Successful selling often requires different personal skills and abilities than does successful management. No guarantee exists that a good salesperson will also be a good sales manager. Also, successful salespeople have been known to refuse promotion to managerial positions – because they enjoy selling, or they can make more money in sales than in management, or both. Finally, recent trends toward corporate downsizing, flatter organizational structures, and cross-functional selling teams have changed the number and nature of managerial opportunities available for successful salespeople. As noted earlier, the sales manager of the future is more likely to be a coach or team leader rather than an authority figure isolated in the upper reaches of a corporate hierarchy.

7. Types of selling jobs

Not every salesperson engages in all of the activities listed. Nor does every salesperson devote the same amount of time and effort to the same kinds of activities. The many different types of selling jobs involve widely different tasks and responsibilities, require different types of training and skills, and offer varying levels of compensation and opportunities for personal satisfaction and advancement. And, perhaps most important, different kinds of selling jobs bring different levels and types of opportunities for managing customer relationships. Two broad categories of selling are selling in *business-to-consumer markets* and selling in *business-to-business markets*.

Selling in Business-to-Consumer versus Business-to-Business Markets

In terms of sheer numbers, most salespeople are employed in various kinds of *retail selling*. These jobs involve selling goods and services to end-user consumers for their own personal use.

Thus salespeople here are referred to as selling in the **business-to-consumer (B2C) market**. However, a much greater amount of relationship selling is accounted for by the **business-to-business (B2B) market**, which used to be called industrial selling - the sale of goods and services to non-end-user consumers. Selling in business-to-business markets involves three types of customers:

1. *Sales to resellers*, as when a salesperson sells to a retail store, which in turn resells the goods to its customers.
2. *Sales to business users*, as when a salesperson sells materials or parts to a company, which uses them to produce another product.
3. *Sales to institutions*, as when a salesperson sells to a not-for-profit agency or a government agency.

In some instances, the key success factors and sales activities relevant to both B2C and B2B markets, and in managing the two types of sales forces, are very similar. Success in either type of selling requires interpersonal and communications skills, solid knowledge of the products being sold, an ability to discover the customer's needs and solve his or her problems, and the creativity necessary to show the customer how a particular product or service can help satisfy those needs and problems. Similarly, managers must recruit and train appropriate people for both types of sales jobs, provide them with objectives consistent with the firm's overall marketing or merchandising program, supervise them, motivate them, and evaluate their performance.

But B2C and B2B selling also differ in some important ways. Many of the goods and services sold by B2B salespeople are more expensive and technically complex than those in B2C. Similarly, B2B customers tend to be larger and to engage in extensive decision-making processes involving many people. Consequently, the key success factors and activities involved in selling to business buyers are often quite different from those in retail selling. Furthermore, the decisions made in effectively managing a B2B sales force are broader than those required for a B2C sales force.

Classifying types of B2B sales jobs

Even within the area of B2B selling, many different types of jobs exist requiring different skills. One of the most commonly used, and useful, classification systems for selling jobs is provided below. It identifies four types of B2B selling found across a variety of industries:

1. *Trade servicer*. The sales force's primary responsibility is to increase business from current and potential customers by providing them with merchandising and promotional assistance. The "trade" referred to in the label is the group of resellers such as retailers or distributors with whom this sales force does business.
2. *Missionary seller*. The sales force's primary job is to increase business from current and potential customers by providing them with product information and other personal selling assistance. Missionary salespeople often do not take orders from customers directly but persuade customers to buy their firm's product from distributors or other wholesale suppliers.
3. *Technical seller*. The sales force's primary responsibility is to increase business from current customers and potential customers by providing them with technical and engineering information and assistance. The trend nowadays is for most technical selling to be accomplished through cross-functional selling teams. This is because the complexity of many of the products and associated services involved in technical selling make it difficult for any one salesperson to master all aspects of this sale.
4. *New business seller*. The sales force's primary responsibility is to identify and obtain business from new customers. In relationship selling, this is analogous to a focus on securing and building the customer relationship.

Each type of sales job involves somewhat different activities. The differing nature of each also implies differences in key success factors.

DESIGN OF EFFECTIVE DISTRIBUTION CHANNELS

Barin – Olariu Ioana

University „Vasile Alecsandri” of Bacau

Faculty of Economic Sciences

Marketing managers have many decisions to make when designing effective channels to serve consumers. Decisions must be made whether to market directly to the consumer through company-owned or franchised stores or indirectly through combinations of intermediaries such as independent retailers, wholesalers, and agents. Decisions must be made whether to use store retailing, nonstore retailing, or some combination of the two. Decisions must be made about plant and warehouse locations, how products will be delivered to consumers, and who will perform what marketing functions within the channel. In some cases, manufacturers market products in their own stores, but most of them sell through independent retailers and retail chains.

Keywords: commodity, conditions, competition, costs, coverage, competence, control

The article’s JEL code: M310

Introduction

Selling through independent retailers can lead to a conflict in objectives for the two types of marketing institutions. That is, although *manufacturers* are concerned with developing consumer brand loyalty (commitment to and repeated purchase of their brands), *retailers* are concerned with developing consumer store loyalty (commitment to and repeated patronage of their stores). Trade promotions may influence retailers to put up special displays, give more shelf space to a brand, offer lower prices to consumers, and sponsor local advertising of the brand for the manufacturer.

This article highlights the fact that different members of a distribution channel may be concerned primarily with influencing different consumer behaviors. This is an important point; the role of retail management is often overlooked in discussions of marketing and consumer behavior. Retailers affect consumers most directly and perhaps most influentially, for many types of products and most services.

As with the other elements of the marketing mix, the starting point for designing effective channels is an analysis of consumer-product relationships. At least six basic questions must be considered:

- What is the potential annual market demand? That is, given a particular marketing strategy, how many consumers are likely to purchase the product, and how often?
- What is the long-run growth potential of the market?
- What is the geographic dispersion of the market?
- What are the most promising geographic markets to enter?
- Where and how do consumers purchase this and similar types of products?
- What is the likely impact of a particular channel system on consumers? That is, will the system influence consumer affect cognition, and behavior sufficiently to achieve marketing objectives?

Although these questions emphasize that consumers are the focal point in channel design, the answers require an analysis of a variety of other factors. These factors must be analyzed both in terms of their relationships with and impact on the consumer and in terms of their relationships with the other variables.

1. Commodity

Commodity means the nature of the product or service offered to the consumer. Different products and services vary in their tangibility, perishability, bulkiness, degree of standardization, amount of service required, and unit value. These factors influence whether it is effective to market the commodity directly to consumers or indirectly through a number of intermediaries.

Key consumer-related questions in considering the nature of the product or service are (1) what consequences or values the product or service provides the target market, (2) how much time and effort target-market consumers are willing to expend to shop for, locate, and purchase the product, and (3) how often target market consumers purchase the product. Thus, it is the *relationships* among consumers, the commodity, and the channel that are critical rather than analysis of these factors in isolation.

2. Conditions

Conditions refer to the current state of and expected changes in the economic, social, political, and legal environments in which the firm operates. This information is critical in channel design because channels typically involve long-term commitments by the firm that may be difficult to change. Situational analysis of the macroenvironment is critical in channel design to allow response to potential problems and to exploit opportunities.

3. Competition

The size, financial and marketing strengths, and market share of a firm's competitors are major concerns in designing effective marketing strategies. For channel decisions, a key issue is how major competitors distribute products and how their distribution system influences consumers. In some cases, emulating the channels of major competitors in the industry is the only feasible alternative. Many convenience goods require intensive distribution to all available retailers. In other cases, a competitive advantage can be obtained by selecting nontraditional channels.

4. Costs

Although channel strategies seek to provide form, time, place, and possession utilities to influence consumer affect, cognition, and behavior, these strategies are constrained by the cost of distribution. In general, a basic goal is to design a distribution system that facilitates exchanges between the firm and consumers, but does so in a cost-efficient manner. Distribution costs include transportation, order processing, cost of lost business, inventory carrying costs, and materials handling. Thus, costs can be viewed as a constraint on the firm's ability to distribute products and services and to serve and influence consumers. In general, firms seek distribution systems that minimize total distribution costs at a particular level of customer service.

5. Coverage

The term *coverage* has two separate meanings in channel strategy. First is the idea that seldom can every member of a selected target market receive sufficient marketing coverage to bring about an exchange. Because of cost considerations, even major consumer goods companies often cannot afford to distribute their products in outlets that do not serve a relatively large population. Second, coverage refers to the number of outlets in a particular geographic area in which the product or service will be sold. Distribution coverage can be viewed along a continuum ranging from intensive through selective to exclusive distribution. Intensive distribution involves marketing the product in as many outlets as available, selective distribution entails a more limited number, and exclusive distribution involves only one outlet in an area.

6. Competence

A frequently overlooked criterion in designing channels is the firm's *competence* to administer the channels and to perform channel tasks at all levels to ensure effective distribution to the consumer. Both financial strength and marketing skills are crucial, but many production-oriented

firms seriously underestimate the importance of marketing and overestimate their marketing abilities. Further, many manufacturers do not have a sufficiently large product line to develop their own retail stores. Finally, marketing skills effective for one market are not always transferable to other markets. Many global marketing efforts have failed because firms did not adapt their products and marketing strategies to foreign markets. Critics of marketing frequently point out that marketing intermediaries increase the cost of products because the profits these wholesalers and retailers make add to the cost of the product to the consumer. These critics generally do not understand that intermediaries are used because they can perform some marketing functions more efficiently and cheaply than the manufacturer can.

7. Control

An important managerial criterion in designing channels is the *degree of control* desired for effective marketing of the product to the consumer. In general, there is greater control in direct channels because no intermediaries are involved. Franchised channels also involve greater control than indirect channels because the franchiser typically places strong contractual constraints on the franchisee's operations. This control is quite important in delivering the major benefit of franchises to the consumer.

8. Characteristics of intermediaries

A final but extremely important consideration in designing distribution channels concerns the characteristics of the intermediaries that are available and willing to handle the manufacturer's product. If no acceptable intermediaries are available, the firm must market directly, encourage the development of intermediaries, or forgo entering a particular market.

In addition to such factors as the size, financial strength, and marketing skills of intermediaries, *consumer perceptions* of intermediaries can be crucial in channel strategy. Many consumers view discount stores as places to purchase good-quality merchandise but not necessarily prestige items. Manufacturers of prestige products may lower the image of their products by selling them in discount stores. Thus, manufacturers (and retailers) must consider the consumer-store relationships: the relationships among the store environment, consumer affect and cognition, and consumer behavior.

Most channel decisions are essentially strategic: inventories, sales forces, technology investments distributor support programs, and other channel activities involve large financial outlays.

The channel design process consists of four primary steps:

- identify and anticipate end user needs for an array of channel services;
- create a vision of an ideal channel that could provide customers with those services;
- evaluate current channels and all practicable options against this ideal system;
- implement the best practicable option and setup for ongoing channel management.

9. Relationships forms in channels

Channel members can apply their power not only to specific behaviors, but to the establishment of enduring structures for exchange. As a result, channel members interact to coordinate their work in four classes of exchange systems or vertical marketing systems: *transactional, administered, contractual and corporate*.

Transactional channels

In transactional channels the members trade at arm's length. Each firm operates on its own, no significant coordination with its channel partners.

Administered channels

Members of administered channels recognize their participation in a larger system, but they interact without a formal chain of command or a set of rules. Coordination results from an ad hoc division of labor and informal leadership. The leader has no legal legitimate base of power, but mobilizes social and economic resources to coordinate behaviors for competitiveness. The

use of promotional allowances and discounts to load resellers or blitz a market area is quite common but doesn't represent the systematic approach to lead or administer the entire channel.

Contractual channels

Contractual channels are tightly by formal procedures and pledges of ongoing exchange. More narrow in scope than these franchisee systems are authorized wholesalers and dealers.

Under these systems, resellers are allowed to promote that they are authorized by the manufacturer to carry a particular line. In return, the resellers agree to meet specified service standards.

Corporate channels

It is difficult to imagine total integration of all channel functions: delivery, selling, promoting, customer feedback, inventory, ordering, service, and so on. In corporate channels, there are high degrees of vertical integration in the sales and distribution functions. Ownership provides a significant measure of control over channel functions because one's own employees are generally more inclined to take direction than are associates of an independent organization. It can safeguard investments that have no use outside of the relationship. Corporate ownership provides a number of coordination advantages that arise from employees working in close proximity, using common communication standards, and following explicit procedures. Intermediaries can often perform activities cheaper and better than a vertically integrated firm.

Conclusion

Distribution channels are multiform systems at work in the flow of products from producer to user. Their purpose is to deliver needed services, spatial convenience, and time utility to customers. They represent a highly strategic decision arena in that they are expensive to establish, costly to coordinate, and difficult to adapt to new environments. Practically no firm can perform all the complex functions of sorting, assorting, transacting, risking, delivering, promoting, and servicing involved in providing sought channel outputs. Firms specialize in these functions and realize profits by performing them better and more efficiently than manufacturers, buyers, or others in the channel.

RELATIONS WITH THE PUBLIC VERSUS PUBLIC RELATIONS IN THE LOCAL PUBLIC ADMINISTRATION

Bențe Florina-Maria
University of Oradea
The Faculty of Economics

Concomitant with the evolution of society, public relations are socially expressed only together with the explicit articulation of public categories and public organizations, once the individual becomes a citizen whose satisfaction is at the core of the public system's preoccupations, ignoring times long gone when the ordinary citizen and the majority of the public administration representatives couldn't tell apart the concept of public relations from that of relations with the public.

Key words: *citizens, organizational culture, routine*
Cod JEL lucrare: M38

Organizations are blindly linked to very heterogeneous human groups and categories, to other organizations, cultural values, currents of ideas and, of course to politics. They need information on these social partners' expectations, their sympathy and adherence. They also need their messages to reach quickly to the public and be assessed by it. They are responsible for organizing the institutional communication and for building up the strategy and communication policies. Public relations are a filter of communication; they allow through and amplify the circulation of favourable messages, at the same time stopping or buffering the impact of unfavourable ones.¹⁴⁹³

Public relations are one of the methods by which the society adapts to changes and solves conflicts of attitudes, ideas, institutions and opposed persons¹⁴⁹⁴.

In the organization chart and factual relations with citizens, the local public administration institutions focused not too long ago only on the system "relations with the public". Although "relations with the public" concern only the direct communication with the immediate public (citizens, suppliers, visitors, members of subordinate institutions, etc.), getting in contact with at the desk, by phone or on the Internet. Again through "relations with the public" papers are filed for the recipient that is the public institution in discussion. Considering the complexity of local public administration functioning, the relations with the public represent only a component part of public relations.

The public institutions feel the need to communicate when good things happen to them. If they had a spectacular increase of budget incomes as compared to past years, or when they accomplished an elaborate project. Communication is associated with good news. But in times of crisis their tendency is to stay away, this proving to be a big mistake on their part. Public Relations may be regarded as "doctor of crises", the binder that keeps the public close to the organization even in moments not so good. Ignoring this aspect, institutions may fall into a dangerous trap considering the period of the present financial crisis, that of alienating citizens, up to the point of refusal to communicate. Such an attitude has a negative impact by perceiving the institution as not being transparent. Even during crises opportunities must be seized by adapting the communication strategy to the new context. Obviously, the resource of adaptation length lies in the people and their capacity to design and sustain a new mission of the organization, in consonance with the new extra-organizational tendencies. The support of the organizations'

¹⁴⁹³ Prutianu Ș., "Tratat de Comunicare și Negociere în afaceri", Polirom Publishing House, Iași, 2008, p. 282.

¹⁴⁹⁴ Grunig J. E., Hunt T, Managing Public Relations, Detriot, Rinehart and Winston, Philadelphia, 1984, p. 3.

adaptation is of communicational order. The adaptation strategy is, in essence, of communicational category. In this context, the organization's public categories establish and express themselves – the internal and external public, the latter comprising the local public (local community members the respective institution serves). Thus, internal communication becomes more visible than before, the reputation auditing being called for because the crisis is a moment of balance followed by long term decision making.

Even in the public institutions the organizational identity must be created hand in hand with the organizational culture. Swchwebig¹⁴⁹⁵ distinguishes the two concepts by placing culture at a behavioural level and identity at the level of the unconscious. In this perspective, one of the responsibilities of an organization's board is to create and maintain through a proper policy the process of identification with the organization. Partially, the identity is also built up from the relations with the environment and due to internal management. Another very similar concept and often mistaken with the above ones is the concept of organizational climate referring to the visible characteristics of the organizational "atmosphere", visible features for the outsiders even from the first contact with the public institution, for the employees being a rather hard to define ensemble but which may be part of the motivational factors. In the specialty literature the climate was defined as "a relatively lasting quality of the internal environment which is:

a) lived by its members;

b) influencing their behaviour;

c) described by a set of "organizational environment attributes". Thus, climate is a variable prone to creation or alteration in a shorter time as compared to the other two, whose design and management take much longer.¹⁴⁹⁶

The identity of an organization when it is well managed may be a very powerful mean of integrating more regulations and activities essential for the success of the organization. It may also furnish the visual cohesion necessary to secure the fact that all communication actions are coherent to one another and the result is an image compatible with the public institution's specificity. Through an efficient identity management an institution may build the understanding and trust for its diverse categories of public.

The effort of public relations communication create an important bond between the organization's strategy and personality, identity, culture, image and reputation, that is why various instruments are used for conveying identity and subsequently, assessment instruments to make sure that identity was properly communicated. The key to the differences between the types of organizational communication is the fact that it focuses on all public groups and has an internal dimension that contains communication with and among employees. A mission, vision and organizational philosophy related strategy develops, and the mission statement includes these values that couldn't have been extracted from the strategy. The mission statement may be used both for the internal and the external communication.

Public institutions also face communication problems due to the fact that the public system is a rigid one, with beaurocracy affecting all members and the performance of communication is also affected by the size of the institution – the bigger the institution (as number of employees) the harder is to obtain an efficient communication between all levels.

A large dimension public institution, rigid, with a rational organizational culture, tends to look to internal routine and less to non-routine, to improving both internal and external communication, with impact on the relations between the parties involved in the process of communication. Also, in an institution whose aim and organizational identity are misunderstood by all members, communication will suffer. In addition, beaurocracy itself affects the communication performance¹⁴⁹⁷. Organizational identity should be published in the largest sense possible because

¹⁴⁹⁵ Sfez, Lucien, Dictionnaire critique de la communication, PUF, Paris, 1993, p. 580.

¹⁴⁹⁶ Cismaru, D. M., Comunicarea internă în organizații, Tritonic Publishing House, Bucharest, 2008, p. 79.

¹⁴⁹⁷ Pandey Sanjay K, James L Garnett- *Exploring Public Sector Communication Performance: Testing a Model and Drawing Implications*, Rutgers University, Campus at Camden, 2006, p. 41.

the public categories are influenced in several different ways. Practically, the building of identity is the first major step in image building.

The organizational culture, meaning the common integrating culture that stimulates and reevaluates the members' potential, is the place where internal communication represents an important variable for the infusion of values and of the other elements of an organizational culture. It may be, at the same time, an instrument for the design and construction of a system of values which to stimulate performance and capacity to face the influences from outside. The culture of the organization may be seen as an expression of norms and values, representing that pattern of values and norms that distinguish an organization from the other, appointing to what is important for the respective organization¹⁴⁹⁸. Organizations must build themselves an organizational culture which emphasizes open and bi-directional communication with the aim of forming positive relations between employees which would lead to improving and/or building positive relations with the public categories outside the organization¹⁴⁹⁹.

Bluedorn explains that in order to understand and mostly to act in the sense of altering the organizational culture, the time factor must be taken into consideration. The author insists on the fact that the attempt to modify an institution's organizational culture, even of a department to a new creed or a new ideology, is one of the greatest challenges a manager may face; amid all the dimensions of the culture, the temporal one is the most difficult to alter because it stands for the foundation of any culture's values and creeds¹⁵⁰⁰.

Moreover, the public institutions where positive relations develop have as advantages, dedicated employees (public clerks that feel commitment towards the respective public institution) and employees developing positive relations both inside the organization and with the public categories outside the institution.¹⁵⁰¹

At the same time, the organizational perspective makes possible a relevant way to operationally define public information and organizational communication as a priority form of managerial communication. If in the public space public information is legitimated through the norm of social democratism, in the organizational space public information comes as a functional imperative. In other words, "organizational communication is the ensemble of structures and communication processes through which organizations adapt to the external environment changes". In conclusion, in the organizational space, the actors are the organizations themselves. Interests are of an adaptative order and the processes are of communicational nature. In this new context, a new sense and a new possible definition of the public relations become visible, according to the acception of SNSPA: "Public relations constitute an organizational communication strategy, through which organizations become communicant and the fluxes of communication between organizations and the internal and external public categories determining the adaptation of the organizations".

Public institutions must not overlook communication of public relations both due to lower costs and to the role public relations have in building the reputation and in times of crisis reputation is the most valuable asset of an organization. The spreading of its image among the large public depends on the way the public relations activity within the institution is organized, starting from the position of the department in the flow chart and continuing with human, material and financial resources allocated to that field and with the establishment of some strategies and public

relations campaigns in agreement with the specific and need of the institution. On the way these institutional level relations are managed, on the importance given by the board of the institution and by the entire personnel to this activity depends the draw-up and implementation of some efficient public relations and communication campaigns, and finally, the creation of a proper image of the institution in the eyes of its public categories. In addition, public relations are indispensable in changes. Any decision must have a related communication plan and crises, by definition, imply changes. As a matter of fact, in all public institutions, the focus of public relations communication will move on from informing to explaining, from “what” they do to “why” they do certain things (for example, organizing public meeting to discuss with the citizens about the streets that are going to be rehabilitated, why those and not others, etc.), perhaps not to the liking of their public and “how” do they prepare to meliorate the situation or maintain a positive direction. As general directions of strategy, public institutions must be more internal communication oriented, both with their own employees and with the unions, but also with the communication with the suppliers which due to the peculiar financial situation are not seldom paid with delay, with the ONG but also with the other public institutions they have relations with. Social normality expresses and results from a society’s capacity to assume and practice social norms, of democratic “norms” of social behaviour. The states of social abnormality are possible when in the social life either the tendencies of social “over-aggregation” manifests itself (through totalitarian type practices, of compressing the space of the individual life free existence), or the tendencies of social “under-aggregation” (by the dissolution of “social tissue” and of public authority, through social anarchy manifestations). It is a fact that, in both cases, the root of social abnormality is of a communicational structure and consists in a communication deficit or in a communication crisis. The communication crisis can only be surpassed (or foreseen) through an optimal public communication strategy. Or, this is exactly the essential role of public relations in the democratic societies, a role concentrated on generating communication fluxes between public institutions and citizens, so as the public institution to recognize and act for the real interests of the citizens and the citizens to gain confidence in the public institutions and clerks. In the above context, the following definition of public relations may be formulated: Public relations are a public communication strategy, through which the acknowledgment of the citizens’ interest and their faith in the public institutions are generated.

In this sense the “stake” of public relations is huge being directly linked to a society’s social health state and a society is healthy when citizens communicate freely with each other and with the public institutions.

The practician in public relations serves as intermediary between the organization he represents and all the public categories of that organization. As a consequence, the public relations practician has responsibilities towards the institution and the different public categories of the organization. He distributes information which gives the public categories the possibility to understand the policies of the institution. This implicit role includes the communicational aspect linked to the ascertaining and influencing the opinions of a group of persons.

As important function of the communication strategy public relations describe the followings¹⁵⁰²:

1. Anticipation, analyzing and interpretation of public opinion, of attitudes and elements that may have a positive or negative impact on the organization’s plans and operations.
2. Counselling the board, on every level, about the decisional politics, the course of events and communication, considering their public effect and the institution’s civil and social responsibilities.
3. Research, coordination and continuous evaluation through action and communication programs in order to obtain the information and support of the public, necessary elements for successfully achieving the objectives of the institution. These programs may include financial

¹⁵⁰² Newsom et al, 2000, apud R. Pricopie, *Relatii publice: evolutie si perspective*, Bucharest: Tritonic, 2005, p. 15.

and marketing techniques, funds raising and governmental relations, with the community and/or with the employees, as well as other types of programs.

4. Plan and implementation of the organizational efforts to influence or modify public policies.

5. Objectives establishing, scheduling, budgeting, recruitment and staff training, developing some activity spaces – in short, administrating the resources necessary for accomplishing the above.

6. Among the necessary knowledge in the public relations professional practice are listed: art of communication, psychology, social psychology, sociology, political sciences, economy, as well as the principles of management and ethics. Specific knowledge and technical abilities are necessary for: study of public opinion, analysis of public related issues, relations with the press, publications, video productions, special events, speeches and presentations. To aid the policies definition and implementation, the public relations practitioner uses a variety of professional communication abilities and has an integrating role, both inside the respective institution and between the organization and the outside space.

In order to realize an efficient communicational process both intra and inter-institutional, the following criteria must be fulfilled:

- **The credibility criterion** – trust and mutual support between administration and population are some desiderates that cannot be accomplished in a week or a month. These take time, are hard to build and are maintained by permanent efforts sustained by positive elements, performed by both parties involved in the communicational process.

- **The sensitivity criterion** – in the public relations work it is very important that orientation be both dependant on the wishes and expectations characteristic of the organization and on those of the partners. It is wrong to focus only on the own goals and development of own programs without considering their impact on the others. The reverse of the medal is not beneficial either, meaning to listen and act only dependant on the others. The public relations work must have as a result the fulfilment of own goals by not harming the discussion partner or any competitor whatsoever.

- **The realism criterion** – any system, through the work of public relations must very well acknowledge its potential, its strong points, as well as the weak ones. The system must lean on strong elements and it must avoid the alleged problems that weak elements should create. The weak elements once identified must constantly and permanently be enforced to become, in turn, strong points able to help the system. There are also cases when these weak elements take too much effort from the whole system to get strong, case in which they should be removed.¹⁵⁰³

For the good development of all the activities within an organization, the internal communication process must function impeccably. Inside any system where the intra-systemic communication flows in good and very good conditions, there is also a positive environment, aspect that has beneficial consequences on the involvement of its component elements in different actions, as well as on the accomplishment of the proposed targets. Each element of the system has a role of image multiplier. When an employee is satisfied with their working conditions (being met both their material and spiritual needs, of self-accomplishment), they will convey/disclose to other persons their experiences, passing on positive things in general, which brought them satisfaction within the system they work in. Czaplewski, B. Schneider and White & Paul present the relations inside the organization as directly responsible for the satisfaction experienced by the clients after coming into contact with the organization.¹⁵⁰⁴ The relation public – organization is given by the bond created between an organization and its public, which result from the behavioural

consequences (conduct) an organization has on its public, a repeated communication¹⁵⁰⁵ being also needed. We must not overlook the fact that in the case of relations from within the organization the situation is more delicate in the way that employees (as part of the organization) undergo an avalanche of contacts with the organization and when evaluating the quality of the relations, the criteria are different from person to person. Also, as towards the external public, the employees have the tendency to accentuate differently the dimensions and ways of establishing and maintaining the relations between employees. The relation employee – public mainly refers to the individual relational level developing between the employee and the external public. Analyzing this issue, Grunig and Huang¹⁵⁰⁶ identified trust, control reciprocity, satisfaction and commitment as dimensions of this relation.

The most important tactics public institutions under crisis may adopt are transparency and steadiness in communication in order to maintain the public's trust in the decisions taken and also in the fact that each decision follows primarily the interest of the citizen.

Due to the insecure situation generated by the existent crisis in Romania citizens find it more and more difficult to have trust: in the safety of the job, in the evolution of the economy and of the country's currency and in the public institutions, both central and local. Confidence is one of the poorest of resources from the highest political level down to the smallest economic transaction. At the same time, on a market governed by uncertainty confidence is the most precious resource an organization may own, that is why public institutions must rely more on strengthening the relations with the citizens through the system of public relations.

IMPLICATIONS OF CITIZEN PARTICIPATION IN LOCAL PUBLIC ADMINISTRATION UPON CITIZENS' SATISFACTION

Bențe Florina-Maria
University of Oradea
The Faculty of Economics

The satisfaction of citizens considering public services depends on the way the authorities identify and offer solutions to fulfil citizen's expectations, which are at least identical or even superior to the services offered in private domain. In addition, the worldwide governments are forced to adapt to the pressure exercised by the changes that appear in the demographic, technologic and economic environment, by the growing expectations of citizens and the necessity of lowering the taxes. As a consequence, the public system is starting to adopt the solutions that the citizens identified for the developing of the public policies, implying and making the community responsible in the act of governing.

Keywords: *social inclusion, exclusion, inequity*
Cod JEL lucrare: M38

The citizen participation is the process through which the preoccupations, needs and values of the citizens are incorporated in the decisional process of local public administration. There are two directions of communication (between citizens and administration), with the general purpose of making better decisions (local public administration) sustained by the citizens, on the basis of the attributes their satisfaction develops on.

Both Upson¹⁵⁰⁷ and Schachter plead for the implication of the citizens in the act of governing. The problem they notice is given by the difficulty of implication of the citizens in public affair problems. After Schachter, the indirect benefits associated with the involvement of citizens in the administrative act are: economical development, community reviving, perception of safeness, low mobility of the citizens with low salaries. Stone¹⁵⁰⁸ fights Schachter's ideas through the prism of plural wishes, expectations and opinions of citizens which mainly cannot be transform into efficient results for the governing act. Even though, Schachter himself admits the fact that the same project can be efficient or not, depending on what that community has been waiting for. In conclusion, it is difficult for the leaders of a community to decide which project should be implemented, because the results can be labelled as efficient or not depending on the subjective criteria each individual has. With such a big emphasis on the conformity of the administration's results to the citizens' expectations, Schachter misses the fact that the citizens' expectations can be unrealistic in what efficiency is concerned¹⁵⁰⁹.

Ebdon and Franklin¹⁵¹⁰ claim that the instruction of citizens with respect to fiscal aspects with which they operate in public system, helps them to separate the feasible projects from the unfeasible one. When Upson talks about the implication of citizens in problems of efficiency he distinguishes between "how" and "what" the public administration does. Upson argues that because this two situations interact with each other, the civil servants have to pay attention to

¹⁵¹⁰ Ebdon, Carol and Aimee L. Franklin, Citizen Participation in Budgeting Theory. Public Administration Review, 2006, 66(3) : 437-45

both aspects: “what administration does and how it does it”.¹⁵¹¹ By comparison, the hypothesis that Schachter supports relies more on “what” administration does and less on “how” it acts. Bothe¹⁵¹² says that it might be possible to obtain better results, if they first of all let citizens know about actions, functions and implications of the activities performed in those public institutions, and only later, after they developed their knowledge in the matter of public system, the citizens can understand “how” the administration works and based on this knowledge they can analyse if the projects they support bring realistic solutions.

The most influential theory that has dominated the research in the domain of social and political participation of the past years is Putnam’s theory on social capital, from 1993, which resumed from another perspective the theory on political culture developed by Almond and Verba. The social capital refers to the characteristics of society, trust, norms and networks of interpersonal relationships, which can better the society’s efficiency, by facilitating common actions. According to Putnam’s¹⁵¹³ theory a civic community (society) (which can be said to detain a social capital to a large extent) would be characterized by the following elements:

1. Civic employment: the citizens participate actively in the public domain, pursuing their interests in the broader context of society acknowledging at the same time, the interests of the others.
2. Political equality: the community is bounded through relationships of cooperation and reciprocity, not through relationships of authority and dependence. People are employed in the process of self-governing, following norms of reciprocity, in the perception of citizens one being able to find the growing satisfaction of the act of governance.
3. Solidarity, trust and tolerance: the citizens are active, equal and they help, respect, trust each other, even if they have different opinions, they are tolerant with their opponents.
4. Associations, which are, in fact, “social structures of cooperation”: the norms and values of civic community are incorporated in distinct social structures and practices.

Putnam’s research on the communities in Italy pointed out the tight connection between the type of community and the degree of social integration: the citizens from less civic communities in the south Italy feel, to a larger extent, alienated, exploited and powerless. The social networks based on trust have bigger chances to overpass the difficulties that come from non-fulfillment of common interests, as a result of opportunistic and isolated actions of the citizens that are not implicated in the mechanisms of collective actions.

Spontaneous cooperation of people is facilitated by social capital, but the production of the social capital is a cycle. In the participation process, people acquire new skills, greater confidence in each other, so that the provision of social capital is recharged. All the forms of social capital grow as they are used, and they decrease if not implemented.

Almon and Verba have considered that it is good to begin with the local community when it comes to participation, because the problems are easier to understand, the government organisms are less distant and the chances of efficient participation are bigger. It is only here that the citizen can develop a feeling of knowledge with respect to the social and political problems¹⁵¹⁴.

The citizens’ disinterest towards the involvement in the process of decision making and their distrust in their capacity of influencing the decisions of the authorities have as effect the emphasis of a dominant position of the public authorities in the structure of a participative administration. In this context, the role of local public authorities implies not only the acceptance

¹⁵¹¹ Upson, Lent D, Letters on Public Administration from Dean to His Graduates, Detroit: Citizens Research Council of Michigan, 1954, p.153

¹⁵¹² Bothe John, Governmental Efficiency in Our Time: Is the “What” Really More Important Than The “How”?, Public Administration Review, Sep/Oct 2007; 67; 5; ABI/INFORM Global, p.814

¹⁵¹³ Putnam Robert D, Making Democracy Work: Civic Traditions in Modern Italy, Princeton, NJ: Princeton University Press

¹⁵¹⁴ Almond G., Sidney V., *Cultura civică, Atitudini politice și democrație în cinci națiuni (Civic Culture, Political Attitudes and Democracy in Five Nations)*, Bucharest, Du Style Publishing House, 1996

of citizen's participation, but also the initiation of some measures for their effective implication in the decisional processes. The disinterest of public authorities considering citizen's participation seems to be a factor at least as important as the passivity of citizens, the relations between the mentioned dimensions being one of reciprocal causality¹⁵¹⁵.

Gretchen¹⁵¹⁶ reveals in his study the lack of an active implication and participation of the final beneficiaries (citizens), demonstrating that this way the structural and operational changes that demand implementation fail to produce the desired effect, or at least it takes longer than expected.

The citizen's participation in the process of making public decision includes not only the specific methods of implication at local level, but also ways of ensuring participation of the entire community in the process. The diversity management becomes an important part of the process of implication of the citizens in the public life.

Integration

"The opportunity of participating equally in the socio-economical life, without losing the distinctive identity (linguistic, cultural) and simultaneously, the contribution to the cultural heritage of society through individual distinctive elements...¹⁵¹⁷,"

If through integration the identity of a group is maintained, being identified modalities by which these would become a part of an entirety; the assimilation has, of course, a negative connotation due to the minorities' loss of identity and the adopting of the majority identity elements. The political integration based only on equality in rights as it derives from the citizenship won't grant equal opportunities and it won't prevent social conflicts either. The participation opportunity implies not only the participation but also its capacity of consolidation. Not to become a symbolic effort the comprehensive integration has to complete the political, socio-economic and cultural participation with the inclusion and consolidation of the capacity.

Social inclusion

The social inclusion is the process through which the persons with a higher risk of poorness and social exclusion gains access to the opportunities and resources needed in order to have a full participation to the normal life of the society they live in. The process implies an active participation in decision making which affects their lives and the guarantee of fundamental rights. Inclusion has an important role because the role of the state is to ensure security, order and prosperity. The state can accomplish this task only if it manages to integrate all the groups of society. The inclusion has an important role because:

- if a group feels rejected from the process of elaboration of policy and from the state's institutions, it will create its own separate institutions;
- the majority will see these institutions and the work agenda of that minority as a threat;
- this situation might generate conflict.

The inclusion implies the participation of minorities in the processes of elaboration of policy and the consolidation of their capacity, for a more efficient participation; it means acknowledgement and adaptation of minority groups. Thus, in what defining of community problems are concerned, the information has to include the definition of everyone's problems and needs, from the viewpoint of each, majority or minority. After the problem has been defined, they are prioritized and included in the work agenda. This process needs to be based on the participation of all the groups of community, reflecting the problems and the needs of the community in general and not only of a particular group. In what the participation of the minority to these processes is concerned, greater attention needs to be paid to the way the minorities are represented. The

¹⁵¹⁵ Comşa, Mircea et al. (2006) Evaluation of Law 52/2003 on decisional transparency in public administration, research report of Metro Media Transilvania, beneficiary InWent,p.35

¹⁵¹⁶ Gretchen K. . Managing the impersonal in a personalized public service. Public Administration and Development 23(2), 2003,pp. 197–209.

¹⁵¹⁷ United Nations Development Programme(2002).The Roma in Central and Eastern Europe.Avoiding the Dependency Trap. <http://roma.undp.sk/>

principle of the majority decision does not have to be determinant for the setting of priorities and of the agenda, neither in continuity in general, nor inside groups.

Thus, local policies need to be adapted to the diversity of the community and at the diversity within each group, as well. The participation of all the groups in the process of elaboration and implementation of local politics ensures their acceptance by the entire community, triggering a feeling of responsibility towards the results obtained. The responsibility of local authorities, in addition to the ensuring of participation of all those affected directly or indirectly by that policy, includes the development of complimentary structures of the policy, the creation of capacities and allocation of resources.

Exclusion and inequities

Social exclusion means limited or blocked access to social systems (labour market, political institutions, access to education, social services etc.). It is a process in which certain individuals are pushed to the margins of society and they are not allowed to fully participate, because of discrimination or due to poorness or lack of elementary competences.

It is important to emphasize that the inequities are characteristic to democracy not only at a level of representation, but also at the participation level: non-dominant ethnic groups, inferior in number or vulnerable ones could not only be neglected, but they also have less power to influence the rules, procedures and policies. If these are not taken into consideration or moderated by special procedures, they can cause later inequities.

On short term, the exclusion of a non-dominant group and of the preferences of this group from the political agenda might seem an efficient and effective solution, but on long term, the win-lose situation will become a loss-loss one as long as the social situation will get unbalanced. The restricted competition for power and resources and the exclusion of different groups from the decision making process sooner or later results in social conflicts, massive migration which effect the entire community, not only the group that is exposed to the exclusion. In such cases the risk of conflict is higher.

There are more values accepted in governing, such as equity, equal treatment, inclusion, social unity, participation. They all are meant to fight against the phenomenon of exclusion. Therefore, good governance is designed to reduce exclusion and promote inclusion, a fundamental principle of democratic states.

Marginalization

According to the Law concerning prevention and fight against social marginalization, social marginalization is defined by peripheral social position of isolation of individuals or groups with limited access to economic, political, educational and communication resources of community, it is manifested by the absence of minimum social conditions of life ¹⁵¹⁸. It is the result of multiple exclusion from different social systems and of segregation. It is a process of socio-economic degradation. It is the total failure of inclusion.

Segregation is illegal separation without consent or expressed desire of the segregated. It means isolation from society by denying access to major social, political or economic institutions. Segregation based on ethnic criteria can lead to both "vertical" and "horizontal" stratification, where different units are separated into their own structures and mutually incompatible.

To be fair, the state and its institutions must be neutral and must not favor one group over another. To ensure participation of all groups in local decision-making process there is a primary need for recognition and awareness of diversity as well as of the way in which the identities overlap and intersect.

Public participation is desirable when it is effective. The management of the participatory process primarily supposes a series of decisions and actions meant to make it possible:

- identifying the most appropriate form of participation for the desired goal, considering the nature of the problem, the size of the group involved;

¹⁵¹⁸ Law no.116 / 2002, art.3

- identification and clear communication of the objective of participation;
- invitations sent in time;
- providing necessary resources for the good development of the process: moderators, operating room, materials to present the problem, etc.

To get the desired result, participation must be first *inclusive*, i.e. the views of those directly and indirectly affected by the resulting public policy should be allowed to transpire. This is especially relevant where the community is distinct ethno-culturally.

Language barriers

Symbols, linguistic structures and rules make the coding mode of the message sent to the listener represent an important barrier in intercultural communication. Beyond the linguistic problem, the level of knowledge of communication language and the vocabulary which the participant has, make the message and its understanding difficult the way it was intended by the others. Ensuring communication in mother tongue is one of the ways of passing that barrier.

Anxiety

Coming into contact with members of other cultures makes them find out that other cultures have different values, that in the same situation the culture guides others differently. Interaction with a stranger is a challenge for any guide considering the behavior, the rules that were as clear as possible in the communication with a person of the same culture are lost, thus leading to anxiety - nervousness. Such an emotional reaction is normal when someone enters an environment that is unfamiliar, considering the fact that one cannot predict the behavior of others.

Stereotypes

Stereotypes are labels that are applied to individuals that are associated with a group of people and share one characteristic. They can be negative, and they function as mechanisms to discourage involvement in community life.

Cultural context

Communication must take into account the differences in codes of conduct and rules of communication that can differ according to culture / different ethnic group, age, social environment. These differences are relevant when they either discourage the participation due to the misunderstanding of the communication meaning and of behaviour, inability of expressing in the same way or have negative and offending effects that certain behaviours can inflict to the others.

However these communication barriers can be overcome. The Public Administration role in this process is to identify the differences among community members, to facilitate mutual understanding and communication between them, to mediate conflict situations.

To meet the needs of citizens, participation must be *transparent*, which is to rely on early communication of information necessary for participants to make decisions. The information must be communicated in a language accessible to a bigger part of the target group. Also, information should be distributed as widely as possible.

Participation should be facilitated in order to allow each participant to express their views, to ensure reaching a conclusion related to the objective of participation. The role of the facilitator or mediator is based on four principles:

- *separating people from their problems*: separation of subjective problems, caused by different perceptions and other inherent obstacles in communication between people, by objectives, by content;
- *focusing on interests beyond the positions of different parts*: finding the real problems, under apparent solutions or symptoms;
- *generating of multiple solutions before reaching an agreement*: identifying alternative solutions to the same problem, to identify the best alternatives or combination;
- *identifying objective criteria for the reached agreement*: objective evaluation of multiple options for taking any kind of decision, when determining priority issues or choosing the best solution from several alternatives.

The participation goal is to reach an agreement, a common understanding on solving a problem of the community or of a part of the community, thereby achieving a higher level of satisfaction of the community members.

The most effective methods of citizen involvement are the direct ones:

- *Regular meetings* between representatives of public authority with the public, both on specific areas of local public policies and with groups of citizens directly affected by specific policy measures (an effective method of citizen involvement is represented by the meetings organized by the local executive with the leaders of associations of owners in the community to identify together the ways of meeting the wishes of the citizens they represent).

- *Public hearings* - to identify problems of public policy brought by citizens.

- *Public debates* aiming to identify the alternatives of public policies approved by citizens and to select alternatives that are viable and/or the evaluation of the impact of implementation of various public policies (consulting citizens living on the streets included in the project of asphaltting and rehabilitation, aiming at surveying the riverants' opinion on the opportunity of the project implementation, on the method of further development of the road ditches, bridges etc.).

- Encouraging *the formation of citizen advisory committees* to identify solutions to the diverse problems of public policies at local level.

International experience shows that in the case of efficient and effective functioning of local authorities through active and direct involvement of citizens, the chances of the development of the town become bigger, but this has also a positive effect on decreasing the level of corruption at the level of local officials and clerks, all these reflecting a significant impact on citizens' satisfaction. Even if there is a legal framework in this regard and even if the transfer of power and financial funds is perfected, they should be supported by the knowledge of the citizens regarding this process and their commitment for local problems of public interest, too. But, the participation of citizens, more likely its effectiveness, is influenced by more factors such as: civic responsibility, knowledge related to the system, possibilities of participation, age as an indicator of political mobility and knowledge, occupation as time constraint, social integration as a network communication, income, education level, consumption of media.

In the case of services, implicitly those of local public administration, the client is part of the provision process. Therefore, there is a need to inform and educate him/her that his/her opinion counts, that depending on his/her options certain public services can develop and reorganize, that the benefits of active and inclusive involvement of citizens in the process of elaborating legislative acts and that of decision making are multiple. This involvement can be conceptualized as a form of partnership between authorities, public institutions and citizens to achieve common goals at the level of community. Citizen involvement is also a way of socialization, of making citizens responsible regarding community problems. Citizen involvement contributes to an atmosphere of cooperation and mutual support necessary for a balanced, sustainable and long-lasting development at local level.

Bacau health and wellness market has grown to embrace an array of products, including dietary supplements. As a typical “Plafar” store, Plafar DI offers a wide range of natural products, from teas, extracts and creams, to nutritional supplements, cosmetics and biological foods, most of them produced by local companies, as well as imported. Half of Romanian small and medium-sized firms are seriously and severely affected by the economic and financial crisis. Now, like thousand others small companies “Plafar DI”, from Bacau, should use an intelligent marketing positioning in order to survive the crisis.

cod JEL lucrare : M3

Keywords: brand positioning, SME, case study

1. Herbal medicines

Traditional medicine is the sum total of knowledge, skills and practices based on the theories, beliefs and experiences indigenous to different cultures that are used to maintain health, as well as to prevent, diagnose, improve or treat physical and mental illnesses.

Traditional medicine that has been adopted by other populations (outside its indigenous culture) is often termed alternative or complementary medicine.

Herbal medicines include herbs, herbal materials, herbal preparations, and finished herbal products that contain parts of plants or other plant materials as active ingredients¹⁵¹⁹.

Medicinal plants have played a key role in world health. Since its early beginnings human existence has been closely connected to the art of healing. Herbal drugs have been used since ancient times as medicines for the treatment of a range of diseases For a long time the main therapeutic arsenal of the human being were the plants as the most important and easy curative method. For ages the empirical medicine counted on the treasure of the nature, offered by the healing virtues of plants which have been, in their different forms, until the end of the XIX century and the beginning of the XX century, one of the weapons to fight against diseases

In spite of the great advances observed in modern medicine in recent decades, plants still make an important contribution to health care. It is estimated that about 25% of all modern medicines are directly or indirectly derived from higher plants. In some particular cases, such as antitumoral and antimicrobial drugs, about 60% of the medicines currently available on the market and most of those in the late stages of clinical trials are derived from natural products, mainly from higher plants¹⁵²⁰.

During the past decades, public interest in natural therapies, namely herbal medicine, has increased dramatically not only in developing countries but mainly in industrialized countries [reviewed in 1-3]. This has increased the international trade in herbal medicine enormously and

¹⁵¹⁹WHO, Fact sheet N°134, December 2008,

¹⁵²⁰ Calixto J.B., Efficacy, safety, quality control, marketing and regulatory guidelines for herbal medicines (phytotherapeutic agents), Brazilian Journal of Medical and Biological Research, February 2000, Volume 33(2), p. 179-189.

has attracted most of the pharmaceutical companies, including the multinationals. Until a few years ago, only small companies had interest in the marketing of herbal medicines. Currently, most large multinational companies are interested in producing and commercializing herbal drugs. “The green medicine” as it is called the production of different pharmaceutical products from plants, extracts or other pharmaceutical forms based on plants, generated the setting up of some small enterprises to harvest and render profitable, under a certain supervision, this activity. Consumers use herbal products as therapeutic agents for cure of diseases and pathological conditions, as prophylactic agents to prevent diseases over the long term, and as proactive agents to maintain health and wellness. Additional, herbs and phytomedicinals can be used as adjunct therapy, to support conventional pharmaceutical therapies¹⁵²¹.

2. Plafar – main source of herbal medicinal products in Romania

Macroeconomic and environmental factors, such as poverty, industrialization and hectic lifestyles, are transforming the diets of Romanian consumers and threatening to undermine healthy nutrition despite the improvements in the food chain. High deficiency rates of basic nutrients, such as calcium and other minerals, are shaping the popularity of dietary supplements in Romania. In contrast, developed economies in North America and Western Europe are “discovering” the benefits of supplements geared toward a specific health condition, such as joint disease or insomnia, or even toward improving beauty¹⁵²².

In Romania herbal medicinal products are traditionally sourced from “Plafar”. Plafar - is a famous Romanian brand with 80 years on the market a traditional brand with high customer awareness. Plafar become a generic name for a herbal products shop, like Xerox for photocopies, despite existence of the chain of “Societatea Nationala Plafar S.A.” markets and manufactures aromatic, herbal and medicinal plants a company who was founded in 1999 and is based in Bucuresti, Romania. A typical Plafar store offers a wide range of natural products, from teas, extracts and creams, to nutritional supplements, cosmetics and biological foods, most of them produced by local companies, as well as imported. It also sells bio foods, and specific books and magazines.

Last 10 years a large number of “Plafar” cover the supply for herbal products all over the country. Except the units of “Societatea Nationala Plafar S.A.” most stores are results of individual economic initiative, and practically are small companies.

3. General economic context for a small pharma business - Romania

Half of Romanian small and medium-sized firms are seriously and severely affected by the economic and financial crisis. In Romania small businesses do represent a high percentage of the total number of enterprises. Last year, the number of operational Romanian small and medium companies went down to some one million¹⁵²³.

During the early stage of the transition, small and medium enterprises (SMEs) began to grow dramatically, primarily because of the privatization of enterprises in trade and services. The majority of SMEs at that time specialized in trade.

A short review about “plafar” stores talks about 200 small stores¹⁵²⁴, but real number is bigger. Unfortunately statistics not cover real data about such kind of small business selling herbal products.

¹⁵²¹ Blumenthal M., *The Complete German Commission E Monographs: Therapeutic Guide to Herbal Medicines*, ed. American Botanical Council in cooperation with Integrative Medicine Communications, Austin, Tex, 1998, p.10.

¹⁵²³ Romanian Trade Registry’s National Office

¹⁵²⁴ Culita L., Do you remember Plafar tees?, *Business Magazine*, july 2009

Poor or less educated consumers use herbal products self-medicate with herbal preparations for preventive or therapeutic purposes instead pharmaceutical products, because of small costs or may assume that these products are safe because they are "natural". As a natural result, herbal products are strong attached to the pharma market. Romania lacks a regulatory system for herbal products. Although only limited research on herbs has been published all over the world. There are increasing discussions over the miraculous power of plants, over their properties, the fact that each of us should give more importance to nature

Some products cause adverse effects or have the potential to interact with prescription medications. Yet herbs contain hundreds of components, some of which can cause ill effects directly, while others can interact adversely with pharmaceutical agents.¹⁵²⁵ Few herbal drug manufactures can make claims of their product that have controlled double blind studies proving these claims.

According to market research firm Cegedim Romania in 2009 the domestic medicine market slowed down its growth rate measured in the national currency, by 13.1 %, and amounted to 8.1 billion Lei. In 2008, the medicine sector saw a 17.7 % increase, that is up to 7.16 billion lei. In Euros, the sales of medicines in Romania last year went down by 1.7% , reaching 1.9 billion Euros, as compared to the reported 6.8 % growth in 2008. Cegedim representatives estimate that this year medicine sales expressed in Euros will keep dropping by 2-3%, after the 1.7% decrease in 2009¹⁵²⁶.

Herbal products market is almost unknown in terms of data. Herbal products are included into a wide category: alimentary supplements, who, about specialists estimation¹⁵²⁷ is continual growth. There are some possible explanations for this fact:

- herbal supplements are more popular now than ever before. People are looking for new ways to improve their health, and they are turning to natural remedies rather than pharmaceutical drugs more and more.

- anecdotally, it is thought that herbal products and dietary supplements are popular as a result of a widespread belief that the preparations are natural and, therefore, safe.

- herbal products are affordable. Pharmaceutical products are often very expensive.

4. "Plafar" DI – positioning strategy

Plafar DI is a small and successful family business consists in 2 stores.

None of the owners has previous experience, training or even idea about business. They practiced an adapted training that qualifies each one of them directly operational for the job market (not academic or diploma).

Bacau health and wellness market has grown to embrace an array of products, including dietary supplements, fortified/functional foods and beverages, organic and naturally healthy food and beverages, and nutritional products targeted to specific health conditions and food allergies/intolerances. Plafar DI has understand early this situation and has opened a first store into the Central Place in Bacau – most visited area in town (year 2003).

The market they act – Bacau area¹⁵²⁸, is covered by almost 25 stores. The large majority of them are small companies which are active only in the area where they have been established. Only a mini-chain, from 4 pieces, seems to be a real competitor. Big, powerful player, with national coverage are less important (one single player) from local market. The tendency seems to be increasing competition.

¹⁵²⁵ Zink T., Chaffin J., Herbal 'Health' Products: What Family Physicians Need to Know, *American Family Physician Journal*, October 1998.

¹⁵²⁶ Mediafax announcement, Radio Romania International site, 21.04.2010,

<http://www.rri.ro/art.shtml?lang=1&sec=10&art=31789>

¹⁵²⁷ Dinu. D.I., Alimentary supplements market – 3 times smaller, *Pharma Business*, December 2008

¹⁵²⁸ Plafar DI estimations

From an economic perspective, however, a city (Bacău -175500 inhabitants¹⁵²⁹) does not represent a population within rigid geographical boundaries. To an economist or strategic planner, a city represents an area of dominant influence over markets in adjacent areas. This fact was very good understood and applied from Plafar DI, when opening a second store near to the bus terminal (year 2010).

Plafar “DI” has already experienced some of the problems of small and medium-sized enterprises have already been identified as: limited access to funds, credit markets freeze and a shortage of liquidities, a reduced European fund accessing capacity and high taxation. In order to survive this poor condition and succeed into a very competitive market, “Plafar” DI should develop an efficient and coherent positioning strategy.

This process involve selecting specific attributes with witch is desirable for the company to be associated. Knowing witch attributes, benefits and values consumer use within a given product category constitutes a grand start for brand assessment¹⁵³⁰. A brand position is how it is perceived in the mind of consumers relative to competitor brands (Stanton 1978).¹⁵³¹ An effective position can be defined as one that enables a brand or service to occupy a preferred and unique niche in a customer's mind that is also consistent with the overall marketing strategy¹⁵³²

“Plafar DI” has a relative easy mission because lack of management knowledge of their competitors. A good product policy, in terms of a wide range of products, and a large number of information provided to the consumer are determinant in gaining a significant position.

The information Plafar “DI” provide **is to educate their customers on the proper use of herbal drugs and help guide them towards healthy lifestyle** changes that provide a better sense of well being and overall improved health. Plafar “DI” personnel acts as the attentive sisterly figure who guides patients in selecting the appropriate herbal treatment regimen for their various conditions, respecting next rules:

- the vendor shall have a general knowledge of herbal products.
- the vendor shall have a current, reliable reference.
- the vendor shall be satisfied that the products are safe.
- when counseling, the vendor shall be satisfied that the product(s) will not interfere/interact with the patient’s possible disease state and/or other traditional medications.
- When counseling, the vendor shall be satisfied that the patient understands that the product is not to be used as an alternative to hi/her traditional therapy, unless so directed by his/her physician.
- When counseling, the vendor shall encourage the patient to inform his/her physician of the decision to try new therapy.
- The vendor shall recognize the need for intervention and/or referral to a physician.

The goal of an ad program should not be to communicate, but to occupy a "position" in the prospect's mind.

The main purpose of this process is that of promote a new image of “Plafar” DI, attracting many clients independent of living area, helpful for companies to consolidate their position on the market. Gaining customer loyalty becomes a key objective for “Plafar” DI who decide to adopt a relationship marketing perspective.

DISTRIBUTION OF BANKING PRODUCTS AND SERVICES.

Bulgărea Cătălin Nicolae
Universitatea Transilvania din Braşov
Facultatea de Stiinţe Economice

Starting with the '90s, retails banks have faced several challenges. One of them is how to efficiently deliver their products and services to the customers. In fact, the most important challenge of a bank is how to efficiently reach the customer, with the right product or service, at the right time. Today, they can choose between branches, contact centers, ATMs, online channels, portals and web banks. Multichannel banking is, therefore, more relevant than ever. Multichannel banking is more than just offering multiple channels, but offering integrated channels, with the optimal balance of services, prices and offer across channels. Banks should have the ability to deliver the right service at the right time in the right channel. The bank should define exactly how they are going to use each channels, which services and products in which channels, how to mix and integrate the channels and how to support the channels.

Keyword: banking, banking products and services, banking distribution channels, multichannel banking

Cod JEL lucrare: M31

Distribution in banking

A distribution channel is a route to the market for a supplier¹⁵³³. In the case of a bank, the distribution channel is the way the banking product or service takes from the bank to the customer. Most banks have multiple channels to serve their customers. Today, they can choose between branches, contact centers, ATMs and online channels, portals and web banks.

Types of distribution channels

1. Branches. These are the face of the bank and the place where the client meets the bank. The distribution is made by the traditional counter. The bank's president is far away and not always known to customers. However, the client manager is close, he advises, listens to the client, makes clients' financial life easier¹⁵³⁴. According to a survey carried out by Accenture in September 2008¹⁵³⁵, the branch is the most preferred channel for all the interactions that emotionally involve customers, such as buying complex products (76% preference) receiving financial advise (71%) and resolving an issue (59%). 73% of the customers visiting a branch say that they are looking for a personalized contact. In this respect, the branch is a distribution channel where the human factor plays a dominant role.

2. Specialized branches have been created as an alternative for the classic branches. These specialized branches are focused on a certain type of activity such as: operations for individuals, for small business or for corporate clients. Banks have opened such branches in supermarkets or malls. The main reason for establishing such branches was to have a close relationship with these corporate customers and to provide services of interests for their clients. Their primary activities are the consumer loans and basic operations for individuals (payments, foreign exchanges etc.). These branches are accessible all week long (even in Saturdays and Sundays) as long as the

¹⁵³³ Julian Dent – Distribution Channels. Understanding and Managing Channels to Market, Kogan Page, London, 2008.

¹⁵³⁴ EFMAG Magazine No. 220 July/August 2009, Branches- The Client comes for a service to satisfy his needs, http://www.efma.com/index.php/our_services/efmag/index/EN/1/74/220.

¹⁵³⁵ EFMAG Magazine No. 218 March/April 2009, Multichannel Distribution – The interconnected approach http://www.efma.com/index.php/our_services/efmag/index/EN/1/74/218.

supermarkets and malls are open. BRD-GSG, ING Bank were the first banks to open such branches in Romania.

3. In order to better serve certain ranges of clients, banks have also created **corporate branches** or **private banking branches**. These clients require more sophisticated products and services and high standards of quality. Therefore the staff employed in these branches should be seniors in terms of products knowledge and the quality of service delivery.

4. Among the specialized branches, we can also mention: the **mortgage branches** whose focus is on selling mortgage loans. Raiffeisen Bank created such a branch named „Raiffeisen – Casa Ta” as a result of the high demand for mortgage loans and the complexity of these products.

5. Self banking branches were first created by ING. These branches have two areas: one where the customers are served by bank employees (usually 3 or 4 persons) during the normal working hours and one where the customers can use self banking devices. These can be used all day long (24h/24, 7 days/7) and the access to this area is given to all the bank customers who have a debit card. Here, the clients can make deposits, payments, cash withdrawals, invoice payments, repayments of loans installments. BRD-GSG, RBS have also created such self banking branches.

6. Mobile branches were first used by Raiffeisen Banca pentru Locuitorii. The bank did not have a branch network and the products were delivered by the help of sales agents. The bank started a banking caravan which reached the most important cities in Romania. The aim of this caravan was to promote and to sell the bank's products. BRD-GSG has also created a flexible and movable branch. (BRD BLITZ) located mainly in rural areas. In this respect, the branch wanted to reach the rural population (neglected by all others banks). These branches had a rapid installation (2 weeks) and can be easily relocated to another place (if necessary). The opening hours were 2-3 days/week, 3-4 hours/day.

7. Banking cafes were first settled in Romania by Banca Transilvania. The banking cafe is the result of a partnership between a bank and a cafe. The branch that is located in a cafe can offer a full range of products and services (information point which offer leaflets, brochures with the bank's products and services to the existing and potential customers along with financial newspapers and magazines). This concept was later developed by ING, Volksbank, BRD. These banking cafes are in the major cities of Romania (where there is a large business community).

8. Direct mail is another distribution channel for banking products and services. In the same time, direct mail is also a promotional tool. The aim of delivering the banking products and services by mail can be, not only just simply informing the clients about a new product but also convincing the client to buy a certain product. The main advantage of delivering by mail is the fact that the bank can promote its products and services to a certain segment of clients. In this way, the bank can target a certain group of clients in order for the message and products to be tailored accordingly.

9. Automatic teller machines (ATMs) were first introduced in Romania in 1995 and they have evolved ever since. By the end of 2006, the number of ATMs overcame the number of branches. This fact is explained by the difference of operation costs involved by these two distribution channels. ATMs have been rapidly moving from just a cash-dispensing machine to a self-service banking channel. The driving forces of this movement are: firstly, the pursuit of operational efficiency and then, the battle for differentiation in the service being offered.

ATMs can increase the marketing potential by providing services to clients in others places than the bank branches. ATMs are an alternative for crowded desks in branches. Cash withdrawals were moved from the cash desks to the ATMs and this transfer is encouraged by most of the Romanian banks by lower fares for these services. This can reduce the waiting time in branches.

The numbers of ATMs users has increased in Romania. The clients appreciate the user-friendly feature of ATMs , the large number of operations that can be done through ATMs, the speed and the security of these devices and last but not least the theoretically unlimited availability of ATMs. Besides all these, all the transactions are automatic, which reduces the risk of human mistakes in transactions.

9. **EFTPOS (Electronic Funds Transfer at Point of Sale)** is a payment method that can be described as a distribution channel. EFTPOS is a system by which the clients pay the services they acquired just by using a bank card. This system is very used when shopping, travelling, buying tickets.

In a society where time is money, there has been a huge request from the customers for more accessible distribution channels. The computers and the mobile phones were the best choice. As a result the banks have made considerable investments in the development of services that are not based in the branch and which are accessible through the Internet or mobiles phones. The development of electronic distribution channels has resulted in the appearance of a new concept: **the virtual bank**. This is the bank where the contact can be reached by a large variety of distribution channels, but maintaining the same interface and having access to the same services. The client has the possibility of choosing from a large variety of channels: phone, ATM, POS, Internet. As a result,, a new form of banking has appeared. „Martini banking” which signifies the presence of the banking products and services „anywhere and any time”.

10. **Mobile banking** appeared in Romania in 2003. At the beginning, only some services were available: account balance, information about exchange rates etc. At present, all the banks provide mobile banking and the range of services provided is very wide: payments, direct debits, information about the nearest ATM/branch etc.

11. **Call centers** - Raiffeisen Bank was the first bank to start up a call center in Romania in 2004. Up until that moment, the only possibility to contact the bank by phone was through the branches' numbers. The only dedicated phone-line for a bank was the one related to card problems. The client used to pay the price of an ordinary phone call. By means of call centers, the contact with the bank was made through a toll-free phone-line which makes this distribution channel very accessible. Through call centers, all the information is received for free and one client can choose from a large range of services (information about accounts balance, payments, exchanges, applying for a credit etc.) The most important issue is to ensure the security of this service. The client is authenticated for each transaction by certain devices. Nowadays, the call centers are used as a marketing tool. Through it, the bank can start marketing researches, can sell products and services. As the mobile phone is an almost indispensable accessory, incomparably easier to handle than a computer, the phone banking is becoming a more advantageous alternative to Internet banking.

12. **Internet banking**. There is a debate about the impact of technology in services marketing, for example the Internet. The Internet-driven information revolution is widely seen to be transforming the way both business and consumer operate. This is particularly relevant in banking services, where transactions do not require interpersonal interaction. In such cases the Internet becomes a new distribution channel. However in other context the Internet is widely used as an information source or a promotional tool¹⁵³⁶. Internet banking was launched in Romania in 2003. At that time, the bank posted on the Internet information concerning only the bank and the range of products and services provided. Later on, the Internet became a distribution channel by providing an entire range of services: payments, information about account balances. The Internet facilitates payments for services (event the state taxes) by the help of virtual cards. The Internet is also a tool for acquiring new clients by online applications for different products. In terms of clients' preference, the internet is more preferable to other distribution channels by simplicity, availability and customization¹⁵³⁷. The only constraint is the fact that the Internet is not accessible to all the clients.

13. As banking market is highly competitive, the banks have looked for new formats to successfully develop market and deliver its services. Further promising approaches to distribution

can be found outside banking. In many sectors, a rapidly growing number of **franchise** systems works with self-employed entrepreneurs as franchisees, who sell the franchisor's products or services, benefiting from a standardized sales and marketing concept. In Romania, ING and Volksbank operate through franchises.

Besides, the banks started also to deliver through **sales agents**. The Romanian banks use this distribution channel for specialized services. Raiffeisen Bank, for example, have created teams of sales agents whose sales' focus is on credit cards and loans for SMEs.

According to Finalta/EFMA Multichannel Survey 2009¹⁵³⁸, the proportion of all retail banking sales made through each of the main distribution channels is shown in the following chart:

Source: Finalta/EFMA Multichannel Sales Productivity – November 2009

As we can see from this chart, there is a change on a year-to-year basis in direct channel sales. This is most due to the impact of information and communication technologies on banking. Sales is moving away from branches. Still, the branch remains the dominant channel by sales volume. While its contribution is expected to decline by 2012, banks still believe it will account for nearly two-thirds of sales. The share of retail banks sales from direct channels increased from 12,2 % in 2008 to 15,4 % in 2009. Bankers forecast rapid future growth, estimating that by 2012 direct channels sales will account for a third of all products sold, driven by a doubling of the Internet's sales contribution.

Conclusions

As we could see, most banks operate through various distribution channels. The expectation was that customers would eventually conduct most of their business online or by phone. However, current studies suggest that customers still prefer the branches. Over the last decade, banks have made considerable investments in the development of services that are not based in the branch. (this has led to a dramatic increase in the use of Internet and mobile banking, whilst the role of the ATM has also increased). Multichannel banking is, therefore, more relevant than ever. Multichannel banking is more than just offering multiple channels, but offering integrated channels, with the optimal balance of services, prices and offer across channels. Banks should have the ability to deliver the right service at the right time in the right channel. The bank should define exactly how they are going to use each channels, which services and products in which

¹⁵³⁸ Multichannel Sales Productivity 2009, EFMA/FINALTA Report, November 2009, http://www.efma.com/index.php/our_services/publications_studies_surveys/detail/EN/1/262/1-5I90X.

channels, how to mix and integrate the channels and how to support the channels. To do this, they need to understand customer behavior, channels performance and the channel's operating cost. However, managing and integrating the distribution channels within an increasingly complex and challenging operating environment has become very difficult.

The present study attempts to reveal the main market values that count for Romanian managers when adopting critical decision. We also want to evaluate if the main orientation of Romanian managers are through relational or transactional marketing. Another research objective was testing the correlation between organizational and demographic variable and the managers market values. The data is collected from a sample of 693 managers from different fields of activity. We cluster the 12 decisional market value in 5 categories. The main findings are: the most important decisional values is customer satisfaction while ethical consideration is neglected. There are present decisional values specific both to relational and transactional marketing orientation in the same company. The managers departments strongly influence the most important decisional market values of the managers.

Keywords: managerial market values, transactional marketing, relational marketing

JEL Classification: M11, M31

Introduction

C'est bien connu que dans les conditions d'une concurrence accrue, la survie et le développement des entreprises de n'est possible que les efforts soutenus des tous les employés de l'entreprise pour la fabrication de produits ou services qui pleinement satisfont les clients. Deshpande et Farley¹⁵⁴⁰ affirment que dans les pays émergents **l'orientation vers la clientèle est fortement corrélée à la performance des entreprises** (chiffre d'affaires et les bénéfices) en comparaison avec les pays développés où l'innovation a le plus important rôle. Le marché roumain est de plus en plus mature et les consommateurs sont plus exigeants et instruits, ainsi que les valeurs de marché des managers ont commencé lentement à se développer. Contrairement à la situation existant pendant le communisme, aujourd'hui n'est pas suffisant pur le manager de se concentrer sur leur produits, mais les services supplémentaires offerts sont importants aussi. Les managers roumains doivent comprendre que la source de revenu d'une entreprise reste à la clientèle.

De même manière, les bonnes relations avec les employés, les distributeurs, les fournisseurs et le publique de l'entreprise, un marketing éthique sont les clés qui assurent le succès à long terme de l'entreprise.

Dans cet article, nous avons examine les plus importantes valeurs concernant le marché dans le processus décisionnelle des managers roumains et les différences selon certaines caractéristiques démographiques et organisationnels. Nous avons recherché aussi si les managers du communisme et leurs valeurs de marché ont changé. D'autre part, nous avons trouvé si les valeurs dépendent du domaine d'activité du manager interrogé.

Pour faciliter l'existence durable d'une entreprise, quelques principes essentiels (valeurs) doit être partagé par les membres de l'organisation. Ils guident la conduite quotidienne des employés et représente la base de la culture organisationnelle.

Les conclusions d'une étude sur un échantillon d'entreprises du Transylvanie¹⁵⁴¹, un pourcentage de 78% employés a déclaré que leur entreprise a un ensemble de valeurs. Toutefois, l'étude révèle

¹⁵³⁹ Cette étude a été réalisée dans le cadre d'un contact de recherche PN II 186/2007, *Le leadership des entreprises roumaines: motivations, valeurs, styles*, financé par CNCIS-UEFISCSU (Unité d'Administration pour Financer l'Enseignement Supérieur et de la Recherche Scientifique Universitaire)

qu'un répondant sur cinq pense que les valeurs ne sont pas connues par les employés. En outre, 33% des répondants pensent que les employés ne croient pas à ces valeurs.

La valeur de marché des managers

L'évolution des valeurs de marché des managers est directement liée avec *les stratégies de marketing implémentées*.

En fonction de la relation entre les ressources des entreprises et la cible visée, la littérature¹⁵⁴² se réfère à l'existence de plusieurs étapes (à partir de l'orientation production, l'orientation produite, l'orientation vente).

Dans la littérature spécialisée et la pratique sont utilisés trois concepts: l'orientation marketing, l'orientation du marché et l'orientation client. Certains auteurs font une distinction claire entre ces termes et des autres les utilisent de façon interchangeable. Pendant les 2 derniers siècles, la stratégie de base est orientée à le réseau de clients, l'attachement à la clientèle rentable à long terme, correspondant à une vision intégrative sur le marketing. Le développement de stratégies de marketing ont suivi chronologiquement deux périodes: le développement extensif et cèle intensif. Une étude réalisée en 2009¹⁵⁴³ montre que *le marketing des entreprises roumain est également transactionnel et relationnel*. Dans la plupart des cas, le marketing transactionnel est accompagné par les pratiques de marketing relationnel qui ont besoin de technologie (marketing de base de données ou de e-marketing) et ils ont comme principal objectif d'attirer de nouveaux clients.

Compte tenu de ces considérations, les valeurs du marché que nous considérons ci-dessous sont les valeurs des managers sur **la satisfaction des clients, relations avec les employés, le publique de l'entreprise, les concurrents, les valeurs éthiques impliqués dans le développement des affaires et la performance de l'entreprise**.

Si les valeurs relatives à la performance des entreprises persistent, nous concluons que l'orientation vers le marketing transactionnel est présente. Toutefois si les autres valeurs emportent (la satisfaction du client, les relations avec les employés, le publique d'entreprise, les concurrents, les valeurs éthiques impliqués dans l'entreprise), la tendance est l'orientée vers le marketing relationnel, actuellement acquise dans les pays plus développés⁵.

Satisfaction de la clientèle

Les recherches effectuées sur les valeurs du marché des managers roumains montrent que la plupart des valeurs du marché formel ne sont pas appliquées dans la conduite des affaires. Une étude menée en 2001 sur le degré d'adoption de marketing par des entreprises locales¹⁵⁴⁴ a révélé que seulement 3% des entreprises étudiées ont une orientation vers le consommateur, et dans la plupart des compagnies roumaines, le marketing était seulement déclaratoire, et non pas opérationnelle. Une autre étude menée en 2007 sur un échantillon des hôpitaux roumains montre qu'ils ont partiellement l'orientation marketing, matérialisés dans les activités de marketing efficace qui semblent être exécuté sur une certaine stratégie. Cette perception des valeurs pragmatiques ont un support fragile idéologique, ce qui signifie marketing perçu n'est pas suffisamment. Cette constatation fait les auteurs d'examiner les résultats de la recherche avec prudence (les sujets étant assez déclaratives à remplir les questionnaires)¹⁵⁴⁵.

Relations avec les employés, distributeurs, fournisseurs, publique

En addition à l'importance accordée aux besoins des clients, les managers doivent développer un réseau des relations saines entre ses employés. Dans un tel contexte où l'énergie positive est

transmise par l'organisation résulte une augmentation de la productivité, la satisfaction et la créativité et, finalement, la satisfaction du client.

Une étude réalisée par *Hay et WorldatWork* sur un échantillon de 763 organisations dans 66 pays développés montre que 70% des managers ont augmenté l'importance des programmes de motivation pour les employés par rapport à d'autres programmes comme la satisfaction clients et l'innovation.¹⁵⁴⁶

Une autre étude réalisée dans les pays émergents montre que l'orientation vers le public, les employés et les concurrents ont un impact plus important sur le résultat financier et de marketing qu'uniquement l'orientation client. Dans ces pays, les relations avec les actionnaires, les fournisseurs, les distributeurs et les institutions de l'État en particulier, ont une plus grande importance que le prix ou les politiques de promotion.¹⁵⁴⁷

Relations avec les concurrents. Éthique

Les recherches montrent que la transition du communisme à une économie de marché a affecté les valeurs éthiques des managers en Europe de l'Est. Ici domine le scepticisme sur le rôle de l'éthique pour le développement des entreprises.¹⁵⁴⁸ En outre, les managers de ces pays face à la corruption bureaucratique et la plupart des jeunes ont une attitude négative envers le comportement éthique que les anciens managers.^{1549 1550}

En ce qui concerne l'éthique des managers roumain, selon une étude récente³, elle est *une valeur importante pour les managers de la Roumanie*. La plupart des répondants (82,8%) croient que l'éthique est une valeur dans leur propre organisation, mais n'est pas valorisée dans l'environnement des affaires en Roumanie (80,4%). En descendant la hiérarchie, l'importance de l'éthique dans leur propre organisation est plus faible. Ainsi, si 86% de directeurs général estime que l'éthique est évalué ayant une grande ou très grande valeur dans leur organisation, seulement 71% des autres managers partagent le même avis.

La méthodologie de recherche

Les objectifs de la recherche

1. Analyser les plus importantes valeurs de marché des managers roumaines pour prendre la décision et déterminer après leur orientation principale de marketing (transaction ou relationnelle);
2. Analyser la corrélation entre les valeurs de marché des managers roumains et les caractéristiques démographiques de l'organisation;
3. Évaluation la valeur de marché en fonction du département des managers roumains.

L'échantillon: Notre recherche est exploratoire, sur un échantillon de 94 organisations de trois domaines complexes de l'activité: l'exploitation minière et la foresterie, la fabrication et la construction, respectivement, les services. Les répondants sont 94 managers supérieurs (directeur général et entrepreneurs) et autre 599 managers (managers des directions ou de départements).

Les données ont été collectées à travers les 12 variables utilisés dans GLOBE III questionnaires (*Global Leadership and Organizational Behavior Effectiveness*). Les questionnaires demandent aux managers à évaluer l'importance qui doit être accordée à 17 valeurs fondamentales de

décision dans leur organisation. Nous avons choisi seulement ce question qui se réfèrent aux valeurs de marché déjà mentionné (12 valeurs): la satisfaction du client, relation avec les employés, le public, les aspects éthiques, mais aussi les problèmes de performance de l'entreprise (rentabilité, le volume des ventes).

Les questions ont la forme suivante: « *Quelle importance devraient avoir la satisfaction de la clientèle dans le processus décisionnel* ». L'importance de chaque valeur décisionnelle (variable) est mesurée sur une échelle de 7 points (1 = aucun, 4 = modéré, 7 = très important que tous les autres). Nous regroupons les questions relatives à une valeur et nous avons obtenu les déjà mentionné 5 catégories (*clusters*).

Nous avons comparé les valeurs obtenues et nous avons établi les corrélations (si elles existe) entre les 5 variables et le type de société (entrepreneurial / non-entrepreneurial), le département de travail et variables démographiques (sexe, âge, éducation).

L'analyse des données a été réalisée à l'aide de soft SPSS 17.

Les résultats

1. Les valeurs de marché des managers roumains important pendent le processus décisionnel

Les résultats de la recherche sont présentés dans les tableaux 1, 2 et 3.

Tableau 1. La moyenne des clusters

Variable	N	Min	Max	Moyenne	Std. D.
Satisfaction du consommateur	692	3.00	7.00	6.0564	.56656
Performance	686	3.00	7.00	5.5121	.78433
Employées	693	1.50	7.00	5.4387	.79571
Public	693	1.00	7.00	5.3218	1.0405
Éthique	693	1.75	7.00	4.6883	.91505

Tableau 2. Le plus important pourcentage dans l'échantillon

Variable	Freq.	%pour 7	% pour 6	% Cumul.
Satisfaction du consommateur	35	5,1	34,8	39,9
Performance	13	1,9	3,6	5,5
Employées	12	1,7	5,1	6,8
Public	31	4,5	47,6	52,1
Éthique	-	0	9,8	9,8

Le tableau 1 présente (ordonné par moyenne) les plus fréquentes valeurs de marche que les managers roumains prennent en compte pour décider.

Le plus important facteur dans la prise de décisions est la satisfaction des consommateurs (avec une moyenne de 6,05 sur 7 possibles). Dans l'ordre des résultats obtenu, la performance de l'organisation suit (avec une moyenne de 5,5), puis les relations avec les employés (5,5) et avec le public (5,6). De tous ces valeurs de marché, la performance de l'entreprise (profitabilité, le volume des ventes, le coût des produits ou services) suggérant une évolution vers le marketing transactionnelles plutôt que relationnel. La dernière place dans la hiérarchie est occupée des valeurs morales: la contribution au bien-être de la nation, de la communauté et environnement mais les considérations éthiques aussi (4,6).

En faisant une analyse *des plus importantes valeurs de marché des managers roumains* pour prendre les décisions (voir le tableau 2), nous constatons que la satisfaction du client est primordiale pour un pourcentage de seulement 5,1% des managers de l'échantillon. Un résultat surprenant est ce que *les relations avec le public de l'entreprise prennent une deuxième place* (4,5%). Ce résultat valide, pour la Roumanie aussi, la recherche déjà mentionnée, menée dans autres pays d'Europe de l'Est. En ce pays les relations avec les distributeurs, fournisseurs, gouvernement local sont plus importants que l'attention à la satisfaction de la clientèle par la valeur ajoutée.

Toutefois, à partir de la dimension culturelle de la société roumaine¹⁵⁵¹: *le collectivisme et la féminité*, ces valeurs représentent plutôt des prémisses pour l'orientation marketing relationnel,

¹⁵⁵¹ Luca, A. (2006), „România, eminentamente feminină”, *Revista de Marketing și comunicare în afaceri, Markmedia*, studiu efectuat de de *Gallup Organization România și Interact*, 08.01.2006

probablement pas pour des raisons de compétitivité sur le long terme. D'autre part, *l'orientation à court terme et le degré élevé de contrôle de l'incertitude* peut faire les managers à se concentrer sur la performance des organisations.

Analysant des valeurs de marché spécifique des managers roumain dans le processus décisionnel, nous concluons qu'il n'existe pas une tendance générale vers le marketing transactionnel ou relationnel, mais, selon le type d'organisation (entrepreneurial, non- entrepreneurial) **NOUS** pouvons élaborer des résultats. Les entrepreneurs considèrent les relations publiques, la performance et les relations avec les employés comme les valeurs les plus importantes pour prendre la décision, tandis que les managers non-entrepreneurs se concentrent plutôt sur l'éthique. La satisfaction des consommateurs est également importante pour les managers de ces deux types de sociétés.

2. Les corrélations entre les valeurs du marché et les variables démographiques et organisationnelles

Tableau 3. Les corrélations entre les valeurs du marché et de l'âge, sexe et de l'éducation formelle des managers roumains

Variable		L'éducation formelle	Sexe	âge
Satisfaction du consommateur	Pearson correlation	-.071	.052	-.041
	Sig. (2-tailed)	.085	.209	.318
	N	592	591	591
Performance	Pearson correlation	-.048	-.087*	-.023
	Sig. (2-tailed)	.246	.034	.575
	N	592	592	592
Employées	Pearson correlation	.062	-.025	-.011
	Sig. (2-tailed)	.133	.537	.781
	N	592	592	592
Public	Pearson correlation	.066	-.015	-.043
	Sig. (2-tailed)	.109	.716	.298
	N	592	592	592
Éthique	Pearson correlation	-.009	-.010	.088*
	Sig. (2-tailed)	.819	.816	.033
	N	592	592	592

L'analyse des corrélations bi variées présentées dans le tableau 3 montre qu'il n'y a *aucune corrélation significative* entre les valeurs du marché et les caractéristiques organisationnelles et démographiques. Il faut toutefois noter la *corrélations moyenne entre la responsabilité éthique et l'âge de manager, la performance de l'organisation et le sexe de manager et finalement, de la satisfaction du client et le nombre d'années d'éducation formelle de manager*. Ainsi, comme les managers sont plus âgés, les valeurs éthiques sont présentes. Ce résultat vient renforcer les conclusions de l'étude mentionnée, réalisée en Europe de l'Est : les managers de l'époque communiste ont une responsabilité éthique plus grande que leurs collègues plus jeunes, qui ont exercé leur poste de direction dans l'économie de marché.

Les hommes se focalisent principalement sur la performance dans la prise de décision. Étonnamment, la corrélation négative entre la satisfaction des consommateurs et le nombre moyen d'années d'éducation formelle des managers souligne le fait que les managers sont de plus en plus éduqués, la satisfaction du client n'est plus une valeur fondamentale. Ils valorisent, en principal, les relations avec le public pour consolider l'image favorable de l'entreprise et les relations avec les employés (probablement avec le but principal de diffuser l'attitude de marketing dans toute l'entreprise).

3. Les départements des managers influence leurs valeurs de marché?

Selon nos attentes, la satisfaction du client est la valeur la plus importante pour les responsables du marketing (42%), suivie de près par les managers administratifs. Simultanément, les relations avec le public d'entreprise et la responsabilité éthiques ne sont pas les plus importantes valeurs dans leur processus décisionnel. Les relations avec les employés sont les plus importantes valeurs par les managers financières (ou comptabilité) (7%) et celles concernant les relations avec le public sont importantes pour les managers impliquées dans la production (5,8%) et les managers administratifs (4,5%).

Directeurs de services administratifs et ceux des départements Ressources Humaines valorisent la performance pour prendre une décision (21,56%, 17,11%).

Les considérations éthiques sont les plus importants dans la prise de décision pour les managers de la production et des ressources humaines (4%).

Conclusion

En conclusion, dans le processus décisionnel, des managers roumains prennent en compte la satisfaction du client tandis que les considérations éthiques sont quasiment inexistantes. On peut dire que les managers roumains sont orientés également vers le marketing transactionnel (des valeurs concernant la performance de l'organisation) et de marketing relationnel (relation avec les consommateurs, le public, les employés).

Il existe une corrélation moyenne entre la performance et le sexe de manager, entre l'éthique et l'âge, et entre l'importance de la satisfaction de la clientèle et le nombre d'années d'éducation formelle des managers.

Le département des managers influence l'importance des valeurs du marché: les directeurs financiers, de production et la performance administrative sont également orientés vers la performance et vers les relations avec les employés et le public tandis que les managers de marketing tiennent compte principalement de la satisfaction des consommateurs.

Le fait que la satisfaction des clients occupe la première place dans la hiérarchie des valeurs de marché montre que, pendant les deux dernières décennies, les managers roumains se sont écoulés de l'orientation des produits vers la vente et puis vers l'orientation marketing.

Établir des limites concrètes entre le marketing transactionnel et relationnel c'est difficile parce que les deux tendances coexistent dans la même entreprise. Dans l'avenir, nous souhaitons élargir notre recherche, en clarifiant les valeurs transactionnelles et relationnelles et les pratiques des organisations roumaines.

1929, 1973, 2008: BRAND-RELATED ATTITUDES

Ichim Cosmin

Al. I. Cuza University, School of Doctoral Studies of Economics, Iași

This article focuses on the analysis and interpretation of the branding and promotion events that occurred during the so called, Great Depression (1929-1933) and the 1973-1974 Crisis, projected on the decision of the marketing and management specialists of our times. The economic manifestations, such as: the unemployment rate, the decrease of the purchasing power, the crediting related difficulties, etc., specific to all periods of recession, revolve around the consumer and the way he modifies his consumer behavior. The recommendations provided herein invite us to meditate upon the crises from the previous century and to take a critical look at various marketing related attitudes, such as the disregard for rebranding or brand creation and the diminution of the promotion budgets.

Key words: The Great Depression, 1973-1974 Crisis, Brand Strategies

The article's JEL code: M31

1. Introduction

In 1970, in his book entitled *Future Shock*, Alvin Toffler, in disagreement with the specialists of those times, who believed that science and technology were the main causes of the future product standardization, predicted that, with the passing of time, people would suffer because of a paralyzing excess of options, and not because a lack of products that one could choose from [14]. There are too many products, too many societies and too much *marketing noise* [15]. *Consumer Digest* magazine conducted a study which showed that a common family covers between 80 and 85% of its needs with the help of 150 products [16]. 150 brands – this is the new economy.

The brand has gained a crucial place in the history of marketing, for it has enabled us to make a distinction between various products and contributed to the creation of attitudes such as consumer trust and loyalty. Larry Light, a professional in the field of advertising, was interviewed by one of the editors of *The Journal of Advertising Research* about his predictions in relation to the development of marketing over the next three decades. Light's analysis proved to be very revealing: *The marketing battle will be a battle of brands, a competition for brand dominance. Businesses and investors will recognize brands as the company's most valuable assets* [4].

This paper presents the brand in two different hypostases (the 1929 and 1973 crises) and identifies a series of brand attitudes that may help marketers who see the brand as an efficient weapon for communicating with the consumer and adjusting to their new *consumption habits*.

I will position the brand in the two time periods discussed herein. This positioning will be strictly correlated with managerial behavior, for which purpose I will resort to case studies. Finally, I will try to give shape to a series of recommendations for the current crisis, which have as a starting point the analyzed cases.

2. The brands of 1929

The period 1922-1928 represented, for the American and European economies, a period of confidence and contentment with the outstanding results obtained, especially in industry. Economic development was accompanied by prosperity, salaries became bigger and bigger and unemployment almost disappeared. The crediting system facilitated the development of demand and, implicitly, of production. In his desire to increase productivity, imperatively necessary for augmenting demand, in his work entitled *Principles of Scientific Management*, 1911, [11] Frederick W. Taylor stimulated the trend of scientific management, which advocated for

production on assembly lines, with the strict timing of each operation. However, Taylorism enhanced fatigue and led to a decrease in the workers' technical creativity. The "robotizing" Taylorism was the source of the non-rationalization of consumer decisions.

Our consumer was more and more eager to consume, and, because of the normalization, and standardization principles applied to products and services, he would become loyal to the products he liked. Most marketing specialists argue that it is during this period that the packing and the brand start to act as information and pressure instruments on the buyer. They start to promote real or imaginary features of a given product or manufacturer [10]. The exodus of the population to the city, in search for better paid jobs, accelerated urbanization; electrical appliances and the radio become part of the life of ordinary people. Mass-media infiltrates in society via the radio, newspapers, the cinema and even television, leading to the diversification of the communication channels and thus laying the foundations for many of the marketing principles and practices.

In contradiction with all the above mentioned aspects, on October 29, 1929 (the so-called black Thursday) people witnessed the shock of the fall of the share prices at the New York Stock Exchange. The Wall Street Crash was followed by a wave of bankruptcies, account withdrawals and insolvencies. The purchasing power suddenly dropped, companies significantly reduced their activity, and some of them even closed for good. The unemployment rate reached unimaginable values; where the employers kept their employees, they had to reduce their salaries. The product abundance faced a lack of buyers. The poverty caused by the lack of employment and by the diminution of the salaries led to large scale social movements: strikes and demonstrations of the unemployed, hunger marches, actions of the veterans, farmers, etc. [1].

I will proceed to the analysis of some brand related events, in strict correlation with the economic and social context presented above.

Rebranding. In 1930, Pepsi underwent a rebranding process and invested significant amounts for the promotion of the new image [5], also supported by a new shape of the bottle. Coke Cola, its main competitor, invested primarily in repackaging and brought the six-pack on the market. Even if sales dropped, neither of these companies reduced promotion costs.

Reconstruction of the architecture of the brand portfolio. Ivory, the 99.44/100% pure floating soap and the first successful brand of Procter Gamble, resists the pressure of reducing promotion expenses and even manages to sponsor some of the first radio *soap operas*, The O'Neills. Procter Gamble launches, also in this period, the Camay soup, unfortunately in the shadow of the Ivory brand. The company envisages, for the first time in its history, the creation of a brand management team, in charge of a marketing program and of its coordination with sales and production. This was a crucial event in the history of branding [4].

Birth of a brand. In 1931, two years after he had lost his job with Steyr, because of the crisis, Ferdinand Porsche set up his own company, in Stuttgart. This would actually be the beginning of Porsche [6]. The first project dealt with the design of an average class car, but they subsequently returned to the idea of a popular car. Later, Ferdinand would manufacture a high speed vehicle that equaled the *Silver Arrows* during an age when German cars dominated Grand Prix races. A while later, Ferdinand faced new challenges: his car was supposed to carry two adults and three children at a speed of 100 km/h, to consume little fuel, not to have problems during the winter season and not to cost more than 990 Reich mark – a little more expensive than a motorcycle.

Innovation through creativity. Walt Disney stated: *I hope we never lose sight of one thing – it was all started by a mouse* [8]. Mickey Mouse is the name of the first cartoon to have managed to synchronize sounds and image. When the crisis was the primary concern of the entire population, and all the politicians were preoccupied with their anti-crisis programs, Disney launched their first color animated cartoons. Nowadays this is one of the most powerful media and entertainment company in the world.

Non-interruption of the scheduled launches. In 1932, Chrysler launched the Plymouth model and sent a message that was considered, at that time, unorthodoxly honest. The message incorporated

an image of Walter P. Chrysler, supporting his leg on the new Plymouth model, and the slogan: *Look at all Three!* [17]. Chrysler seemed to encourage the public to compare the new model with those of his competitors, Ford and General Motors, before making a decision. This kind of honesty led to record sales for the new model. Chevrolet also scheduled the launch of new models: Chevrolet AC (1929), AE Independence and ½ Ton Pickup (1930). In his turn, Ford did not stay behind and launched, during the depression, Ford Model A (1929), Ford V-8 Model 18 (1932) and 20 other models.

1929. The end of the second wave of company mergers and purchases. After Ford had managed to become a vertically integrated company, being, via the purchase of companies, its own producers of tires and car bodies, General Motors embraced the same type of attitude [12]; Colgate and Palmolive-Peet also decided to merge and to create the Colgate-Palmolive-Peet Company brand.

3. The brands of 1973

The Second World War, like the first one, gave birth to two highly significant periods in the economic history. First, there was the epoch of mass production from the 20s up to the Great Depression and then the period of the consumption society, from the 60s until the 1973 crisis.

In the beginning of the 60s, the Western World saw itself in a light of welfare and abundance. This period of time is characterized by the fact that most of the families earned more than the equivalent value of their psychological and biological costs. Also, just like in the 20s, the market offer increases, putting the companies in the position of studying the preferences, the wishes, the attitudes, the aspirations of the consumer. The return of the mass production, a sort of upgraded Taylorism and Fordism, is the start of a conflict with the limited character of the natural resources and with the possible degradation of the ecological environment.

The 70s were perhaps the worst decade for the economic performance of most industrialized countries since the Great Depression [7]. Although there was no severe economic depression, as witnessed in the 30s, economic growth rates were considerably lower than during the previous decades. As a result, the 70s adversely distinguished itself from the prosperous period between 1945 and 1973.

From an economic perspective, the 1970s were marked by the energy crisis which peaked in 1973. On the 16th of October 1973, The Organization of the Petroleum Exporting Countries (OPEC) announced a decision to raise the posted price of oil by 70%, to \$5.11 a barrel [18], a decision that had as background the end of Bretton Woods agreement and the war between Egypt, Syria and Israel (Yom Kippur War). In the 694 days between 11 January 1973 and 6 December 1974, the New York Stock Exchange's Dow Jones Industrial Average benchmark lost over 45% of its value, making it the seventh-worst bear market in the history of the index.

Again, I will proceed by analyzing some brand related events, in strict correlation with the economic and social context presented above.

Rebranding. In 1971 the Pepsi logo was slightly modified to a more rounded version which was used until 1991 [5]. This is the second time Pepsi uses rebranding to adapt to a new social and economical environment.

Reconstruction of the architecture of the brand portfolio. 1974 is a turning point for the successful Volkswagen brand: Beetle [6]. The increase in the design costs and a weaker dollar resulted in a bigger price (from 1893 dollars in 1970 to 3000 dollars in 1973) which was very not healthy for an economic alternative car. The magic of the brand also lost interest in the consumers' mind [4]. VW tried to transfer the Beetle capital to a new model called Rabbit, which distinguished itself through its simplicity and practical nature (the symbol of the brand was a cute running rabbit). 1974 is also the year of the birth of a myth called Golf [6].

Birth of a brand. In 1974, the term Duracell was formally introduced as a brand. It all began when breakthrough advertising was trying to develop the message that Duracell alkaline batteries lasted much longer than ordinary and inexpensive zinc carbon batteries. A small pink, fluffy

bunny was created, who, powered by Duracell batteries, was able to outlast all others in an array of colorful challenges [3]. The Duracell Bunny made his debut appearance in the US 35 years ago, in a commercial that included a group of drum-banging pink bunnies. The winner was the Duracell Drumming Bunny, the message was loud and clear - powered by the long-lasting Duracell battery, he's unstoppable.

Innovation. On September 25, 1928, Paul V. Galvin and his brother, Joseph, incorporated Motorola's founding company, Galvin Manufacturing Corporation, in Chicago, Illinois, USA. Having a large portfolio in the industry of communications, in 1973, Motorola demonstrated a prototype design for the DynaTAC portable radiotelephone, using cellular radio technology. In 1974, Motorola sold its television business to the Japan-based parent company, Panasonic, to concentrate on cellular radio technology [2].

Non-interruption of the scheduled launches. It was nothing scheduled in the motor industry. As in Western Europe, U.S. automakers were significantly impacted by the 1973 oil embargo and energy crisis. By 1971, the standard engine in a Chevrolet Caprice was a 400-cubic inch (6.5 liter) V8 with a big consumption figure. European and Japanese automakers began to export more compact cars into the US to meet the new demand. This forced the Big Three (General Motors, Ford, and Chrysler) to introduce smaller and fuel-efficient models for domestic sales [7]. The Chrysler Omni or Horizon, Ford Fiesta, Ford Fairmont, and the Chevrolet Chevette all had four-cylinder engines and room for at least four passengers by the late 70s. In the current crisis we find great interest in alternative power source motors such as: electric, hydrogen or solar ones.

The end of the third wave of company mergers and purchases. On the heels of post-World War II prosperity, a prolonged merger wave ensued. During this period, which is sometimes called the *conglomerate merger wave*, numerous established US companies embraced the diversified conglomerate paradigm. In addition, entirely new conglomerates were built from the ground, such as International Telephone & Telegraph (ITT), Ling – Temco - Voight (LTV), and Litton Industries. Diversification became widely accepted because management skills were assumed to be easily transferable among industries [12]. Brands begin to represent enormously valuable pieces of legal property that can influence consumer behavior, be bought and sold, and provide the security of sustained future revenues to their owner [9]. The merger wave gradually ended in the early 70s as the Dow Jones Industrial Average fell by more than a third (e.g. the largest conglomerates fell 86%, and computer and technology stocks fell 77%) and a worldwide energy crisis began. This led to tight money for merger activity and a devaluation of the US dollar [12]. The greatest merger, in time of the 73-74, is the one between Peugeot and Citroën (the birth of PSA).

4. Recommendations for the current crisis

The social and economic context specific to the period of the Great Depression and the 1973 crisis has many common aspects with the reactions to the current crises. Bankruptcies, account withdrawals, insolvencies and the decrease of the purchasing power characterize all analyzed periods. However, it is worth stressing the fact that our consumers did not reduce their expenses to zero; many of them started to thoroughly analyze what a brand really has to offer. They started to seek those products that bring more value to the earned money. The brands that succeeded in doing this, during the Great Depression and the one that took place in the 70s, gained loyalty, affection and long term trust.

The events which took place in the period 1929-1933 and 1973-1974 in association to the presented successful recipes represented the basis for the recommendations below.

Do not put an end to investments in advertising. The most intelligent decision made by the companies during the two periods was to invest in the promotion of their own brand. We must not lose sight of the fact that, by resorting to a new brand, we strive to gain loyalty, affection and trust. If we reduce the marketing budgets, the consumers will feel abandoned and will reorient towards the products of the competition. If all the players in your field give up promotion, it is

wise for you to be the only one that does not take such senseless measures. Thus, you will gain the long term loyalty of your customers.

Resort to advertising agencies or to specialists in the field. As the new consumer seeks to transform all purchases into a good deal, it is crucial for your sale process to achieve an efficient transformation of your message into perceived value. A flawed sale process will lead to wasted resources. Promotion campaigns, together with price decisions and promotion channels must be conceived in such a manner as to obtain the best possible results.

Rebranding. As we are dealing with a new type of consumer, with new consumer habits, we could try to adjust to this new reality by means of a new brand. It is absolutely necessary to question our consumer on the way he perceives our brand at present. Many of the current rebranding strategies focus on simplicity and clarity (e.g. the rebranding of Pepsi).

Reconstruction of the product portfolio. **Say no to price discounts**, focus on a new brand, and, implicitly, on a new product, depending on the positioning of the product in relation to its price. The *luxury industry* (or the industry of premium brands) has numerous rebranding opportunities; this is a strategic course, with beneficial effects as concerns the profit of a business, recommended for lowering a premium brand to an *upper-medium* or medium price level. It is worth mentioning that it is not advisable to return to high prices for the same brand. Consumers will focus on the *average price segment* and, consequently, this is where the battle between the producers will occur. The *low segment* does not have rebranding potential, since the consumers and the services in this segment are primarily motivated by the price and not by a potential emotional connection. **A new brand**, if it relies on innovation and on a potential need. We must keep in mind that recession comes with threats, as well as with opportunities. Ferdinand Porsche started his own business in 1929, when he became unemployed.

Cobranding (combination of the name of two or several brands), in case of takeovers or strategic alliances – this is the only solution for the brands subjected to mergers or acquisitions. Even if the Great Depression and the '73-'74 one represented the end of the second and the third wave in the history of mergers and acquisitions, the current crises showed us that some companies resorted to such strategies (see the cases of Caroli and Campofrio, which would become Caroli Foods Group, the taking over of Rompetrol by the Kazakhs and their desire to change the name of the fuel stations into *Litro, powered by Rompetrol*, the possible takeover of Zapp by Cosmote for the mobile Internet services owned by Zapp, the takeover of Volvo by Geely). Their decisions could not be more uninspired. The companies that resort to this type of strategies lose sight of the fact that this crisis will not last forever. For example, I wonder how Caroli and Campofrio will act when they see that the economic situation is back on the right track and they wish to be independent again. Acquisitions are recommended during this period, as they strengthen

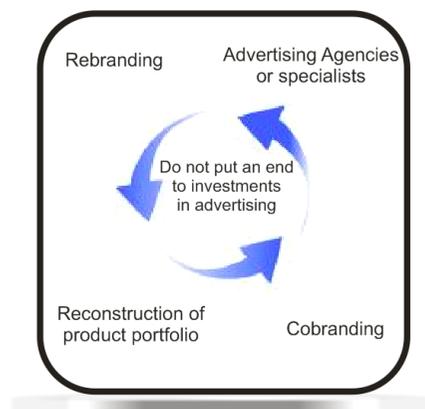

Figure. 1. Brand recommendations, suitable for times of recession

powerful companies and offer a chance to those that have not come with any solutions to the current crises. Anyhow, it is advisable to use cobranding in order to explain your customers what happened with their favorite brand and to aggressively promote the new identity.

Our recommendations are primarily oriented towards those managers who, so far, have not seen the brand as an efficient weapon for communicating with the consumer. I hope that this article will stir the interest of managers and determine them to thoroughly analyze this phenomenon.

5. Conclusions

The lessons learned by those who experienced the Great Depression and the '73-'74 crisis have already been successfully applied in the current economic and social environment. Nevertheless, this research has been limited by the historical positioning of marketing. We started from the premises that history repeats itself and that marketing is, after all, an ahistorical field [13]. Our recommendations are, however, purely subjective and strictly correlated to historical facts. They invite us to meditate upon the recessions from the past century and to take a critical look at attitudes such as the disregard for rebranding or brand creation and the diminution of the promotion budgets. We must keep in mind that recession comes with threats, as well as with opportunities.

FOCUS-GROUP AND ITS IMPACT IN THE QUESTIONNAIRE OF MARKETING RESEARCH ON THE ROMANIAN CAR MARKET

Cruceru Gheorghe

University Transilvania of Brasov, Faculty of Economics

Săvoiu Gheorghe

University of Pitești, Faculty of Economics

Manea Constantin

University of Pitești, Faculty of Letters

Designing a questionnaire is the most profound activity which makes an impact on a research in marketing. The investigation instrument finally determines the quality of this type of research. Never will a market research be able to exceed its questionnaire in point of quality. The present contribution succinctly itemizes a research project for the Romanian car market, emphasizing the importance of focus group, and appends, at the end, the concrete result, applied to the Romanian car market. The first part describes the hypotheses and sets out the objectives of the research, focusing on the market leader, i.e. Automobile Dacia Renault. The second section describes the practical process of designing the questionnaire, with a special stress laid on the impact of focus-group in the final version. The synthesis of focus group is materialized through a number of final remarks on the manner of concretely writing the questionnaire, which was put to practical use on the Romanian car market.

Key words: questionnaire, marketing research, car market, focus group.

JEL Code: M31

1. Introduction

The questionnaire is the most widely used instrument in marketing research, and it is on its quality that the success of such an undertaking depends. Half a century ago, C. A. Moser concluded that any enquiry cannot be better than its questionnaire. This fact hints to the special significance that has to be attached to its instrumental carrying out, i.e. to its materialization through a formalized set of questions, built in order to generate the data needed to achieve the objectives of a marketing research. A multiple-target marketing research can also have recourse to sets of questionnaires: in that situation, association with staggered / overlapping canvassing / poll becomes a methodological necessity. Whether one questionnaire or sets of questionnaires are used, their practical role remains to secure the *conversion of the objectives and hypotheses of a research into adequate questions*, which are then administered, and also getting veracious information from the responders.

2. Hypotheses and specific objectives as reflected in the questionnaire of marketing research in the car market

In general terms, the questionnaire allows to simultaneously achieving several objectives:

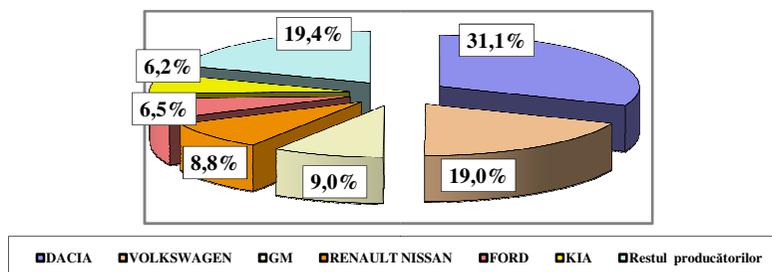

- *it contributes to shaping the structure of the interview*, by ensuring a logical succession of the questions;
- *it secures the standard format and lends uniformity to the manner in which factual information is recorded*, as well as the opinions and attitudes of the responders;
- *it motivates and coherently sustains the responders' cooperation* through the type of the questions used, through the manner the latter were formulated, and through their succession, and even through the general aspect of the questionnaire, in order that the final end of the interview is reached in the best conditions;
- *it serves as a data base concerning the research conducted*;
- *it facilitates scanning, processing and analyzing facts*, through its format, hierarchies and

logical correlations.

The present article tries to give solutions to a question of the type “What specific, fundamentally different aspects must a car market questionnaire respond to?” to begin with, this questionnaire will centre on the market leader, none other than Automobile Dacia Renault, as can be seen in the recently concluded picture of market structure for the year 2009.

The principal competitors on the Romanian car market having a quota above 5%

Graph no. 1.

Data source: www.drpciv.ro

The questionnaire will investigate the degree to which most of the owners of Dacia Renault cars know the market, and also the extent to which they are informed as to the car make they own. The other hypotheses, which concentrate the questionnaire on the detached market leader, namely Dacia Renault, could be detailed starting from the following noticeable facts:

- most of the car owners previously had at least one other car;
- most car owners consider that the cars correspond to their expectations;
- there are no differences between the appreciations of the leader made by male and female responders;
- a number of customers consider the optional equipment as insufficient;
- the majority of the customers prefer petrol / gas as an engine fuel;
- most of the customers are satisfied with the commercial distribution network;
- a relatively small number of car owners are dissatisfied with the servicing conditions.
- most customers consider that the export of components makes the prestige of the Dacia car make increase;
- most of the car owners consider that the *Dacia Asistență* car service is satisfactory.

These hypotheses are quantified, and can be statistically formulated in order to be tested by the agency of the questionnaire.

Consequently, a few approaches can be exemplified, which can contribute to stagger the scales of the various questions of the questionnaire, while ensuring the statistical testing of the hypotheses formulated (where, in the idiom of classical econometry, H_0 defines the null hypothesis and H_1 the alternative hypothesis).

Table no.1

Null hypothesis: H_0	Alternative hypothesis: H_1
1 customer out of 2 knows the performance of the car	H_1 average # 50%
1 customer out of 3 has already owned a car	H_1 average # 33%
2 customers out of 5 would have preferred a domestic car	H_1 average # 40%
1 customer out of 2 considers the price as accessible	H_1 average # 50%
1 customer out of 3 considers the domestic car as similar to an imported car	H_1 average # 33%
4 customers out of 5 considers that their income does not essentially influence their choice	H_1 average # 80%
3 customers out of 5 appreciate the quality/price ratio	H_1 average # 60%
9 customers out of 10 do not see any differences in appreciation between women and men	H_1 average # 90%
4 customers out of 5 consider that the car	H_1 average # 80%
7 customers out of 10 are satisfied with the commercial distribution network	H_1 average #70 %

Delineating and setting up the objectives of the marketing research is a complex process, and its structure in the car market is centred on specific targets, issues, and finally, on concrete objectives.

Setting up the objectives of the marketing research concerning the position of the Dacia Renault car on the Romanian market

Table no. 2

Aspects or targets to be quantified and made into a hierarchy	Problems that have to be answered through the research	The concrete and quantifiable objectives of the market investigator
1. Identifying the manner of purchasing of a Dacia Renault car	1. Which is the most frequent manner of purchasing the car? 2. Which is the most widely used source of funding?	1. Determining the modal value concerning the manner of purchasing a car. 2. Determining the prevalent funding source in purchasing.
2. Quantifying the degree of knowledge about the Dacia Renault car	1. To what extent are the car's variants known? 2. To what extent do the subjects detain information about the types of engines? 3. To what extent do the questioned people consider the car as being polluting? 4. To what extent does the inner space correspond to the expectations? 5. Do the buyers have any proposals for the improvement of the car?	1. Identification of the degree of knowing the car variants 2. Scaling the knowledge of the engine types 3. Scaling the opinions of the car's pollution degree 4. Scaling the opinions of the adequacy of the inner space as to the customers' expectations 5. Identifying the expected improvements.
3. Delimiting the adequacy of the distribution network to the expectations of the potential customers	1. Which is the coverage of the commercial distribution network? 2. Which is the owner's opinion concerning the quality of the services? 3. Which is the buyer's opinion concerning the purchase of a car?	1. Quantifying the coverage of the market by the distribution network 2. Scaling the car owners' opinion of the quality of the services 3. Scaling the buyers' opinion of buying a car
4. The degree of qualitative satisfaction of the demands of the customers through the manufacturer's network	1. Which is the buyer's opinion of the quality of the repair work and the service? 2. What do the customers think of the duration of the repairs? 3. Which is the customer's opinion of the veracity of the repair costs?	1. Scaling the buyers' opinion of the quality of the repair work and car servicing 2. Identification of the prevalent customer opinion of the duration of the repairs 3. Scaling the customers' opinion of the veracity of the repair costs.

3. The process of designing a questionnaire, and the impact of focus-group in the final writing

The stages of the practical design / planning of the questionnaire have been the following : specifying the information needed and the aspects/targets to be quantified and ordered hierarchically, setting up the solution of the stratified poll (strata / layers of customers as natural or legal entities), and the self-administered questionnaire with an anticipated rate of non-response, as a method of collecting data, elaborating the questions (content, type, quality order, pre-coding), using focus-group in a first pilot-analysis of the questionnaire, and the re-planning of its physical characteristics, endorsing the questionnaire by the beneficiary of the research, piloting, pre-testing and revising the questionnaire, as well as preparing the final variant and printing the questionnaire. The impact of the focus-group was bad far the most important factor of re-planning and final writing of the questionnaire, thus clearing most of the problems of writing and revising some peculiar aspects, derived from the specificity of the market. Four *sub-groups of experts* were used (each comprising on average 2-3 members), which appear in the following centralized table abbreviated as S.E. (1= quality/cost, 2 = technical, 3 = psychological = marketing).

Modeling focus-group of the final form concerning the Dacia Renault car in Romania

Table no. 1

Categories of themes	SE 1	SE 2	SE 3	SE 4
1. Knowledge or information possessed about cars generally				
1.1 Utility Car	Utility as to car price	Characteristics concerning the speed of traveling	Motion independence favorable limit-situations	It is useful mainly in work-related, and family holiday trips
1.2 The degree of hazard the car for drivers and pedestrians	None, if rules are observed	Any technical advance brings about hazards	Possibly, but compensated to a small extent by the advantages of use	Very little, or none
1.3 Major critical aspects in car	Assessed comfort/post ratio	Power of the engine and speed of travel	Robustness and endurance in time	Possibility of purchase
1.4. Competition with other solutions of transport	Convenient	Flexible and adapted technological evolutions	Fast and prompt	Modern and easy
2. Evaluation of the interest that the interviewed subjects had in the Dacia Renault cars				
2.1 Identification of information sources	Internet, SIAB, dealers, financial situations	Technical catalogues and specialized magazines (technical specifications)	Friends, acquaintances, colleagues, brochures, etc.	TV ads, internet, radio, car fairs
2.2 Variety of models	Complete assortment	Incomplete; off-road models are in order	Incomplete; a small-tank model would be useful	I think there are enough models
2.3 Diversity of optional equipment	An anti-theft device would be necessary	Parking sensors, side airbags and adjustable steering-wheel	Increased communication and entertainment comfort	Each model with a distinctive additional option
3. Identification of the knowledge and information they had about the quality of the Dacia Renault cars				
3.1 Types of known engines	Small engine = low consumption, plus diesel fuel	Out of the 6 engine variants, the GPL and K4M formulas are preferred	I prefer silent the engine formula (with no diesel fuel variant)	The engine formula should give an image of comfort and economizing
3.2 Fuel consumption	Minimal consumption = low travel costs	Consumption up to 6.5 liters / 100 km	I prefer a special efficiency to an apparent small consumption.	Higher consumption for a good image of its power
3.3 Inner space	Very roomy inside	Rather high, but passable	Generous to its owner	Very roomy for a family
3.4 Flaws noticed at the already manufactured models	Low stability at turn	The Diesel engine formula is far noisier	Visibility affected by the side pillars of the screen	3-4 years' use increase the noise of the car
3.5 Improvements expected the cars	Only in terms economicalness (of efficiency)	Adjustable suspension (load, and on road)	In terms of crash survivability	In terms of adaptation to the road network
3.6 Price, as an important factor in choosing a car	Acceptable and attractive, if compared to other cars	Factor ranking in second place, according to the technical quality	Price can raise problems, if continuing to go down	In point of image, a rise is needed, but not a really major one
4. Determining the buyers' attitude towards the quality of the distribution network:				
4.1 Distribution network A.Fortes and B.Weaknesses	A.Diversity B.Low coverage / high cost	A.Spatial coverage B. Relatively incomplete technical information	A.Close to the public B.Rather high degree of red-tape	Diversity and additional facilities .Interface /communication
4.2 Quality of staff in the distribution network	Training and qualification /cost	High technical abilities	Helpful and accessible	Not yet defined in the image of the brand
4.3 Favourite centers	AMAT	DAPEROM	Any	Delta Plus Trading
5. Determining the buyers' attitude towards the quality of the repair work, and servicing in general				
5.1 Distribution of repair centres	Sufficient proportion to the sales	Reasonable distance in proportion to the consumption	Covering in point of information	Prompt in point of image on an internal plane
5.2 Technical equipment	Efficiency as a ratio cost / profit	Upward trend as real technical solutions	It is permanently improving	Satisfactory
5.3 Satisfaction and insatisfactions in the process repairing and servicing	Costs/prices Quality in time	Promptness and duration in servicing Technical guaranty	Trust in point of impact Bureaucracy in unfolding	Average-level servicing Long waiting time
6. Identifying the profile of the Dacia Renault car buyer				
6.1 Social and demographic characteristics	State sector wage-earners, small wages in private companies	Prevailing: men having an average (minimal) technical training	Average age (30-40 years old) medium (high-school) and higher education	The modal buyer on the Romanian market
6.2 Profile of the Dacia car buyer	Economical, efficient, wishing to achieve	Energetic, on the move	Usually, a family man, equanimous, balanced	Quiet, calm, earnest, sociable.

The impact of the focus-group generated most of the issues conducive to the revising of the questionnaire. It was subsequently reevaluated in proportion to the optimization of the content and

the placement of the questions, and mainly to some essential desiderata of any marketing research, already designated, in practice, by the name of rules of structure-shaping and hierarchy-establishing, as in the classical example provided by the *5 x 20 rule* concerning the significance attributed to the first 20 seconds, 20 words, 20 gestures, 20 looks, and especially the first 20 questions, where what is more important for the research questionnaire will enter.

4. A final remark

On the stratified market of the Romanian cars, Pareto's famous law of the 20/80 ratio could be rephrased like this: a percentage of only 20% of the firms bring approximately 80% of the incomes. In the year 2009, on the Romanian market, only 6 manufacturing car companies held 80.6 % of the sales, while Automobile Dacia Renault represented the leader, which deserved a special research, it being the holder of over 31% of the whole market. The merit of the experts in the sub-groups whose opinions were tuned to account in the focus of the research is most probably special, and it becomes all the more pregnant after the final reading of the questionnaire. We believe that, very much like the Romanian market, pressed by the slow evolution of economy, it is to the experts in the first sub-group that we owe the closest investigation image shaped by the agency of questionnaires, through comparison with the car market under investigation.

Annex no 1

Final questionnaire

We are currently conducting a study that intends to identify the opinions and attitudes of the buyers of Dacia Renault cars, with respect to that firm's capacity as leader on the domestic car market. So, we ask you to be so kind as to answer the following questions. We assure you that your answers and identity are confidential.

1. What word comes to your mind when you think of the Dacia Renault cars?.....

2. You currently own a Dacia car. Which variant is it?.....

3. What was the reason you chose a Dacia car for?.....

4. Have you previously owned another car?

No	Yes. What make?
----	-----------------

5. How long have you had a Dacia car?

For 5 years	for 4 years	for 3 years	for 2 years	under 1 year
-------------	-------------	-------------	-------------	--------------

6. Have you paid all the car's price?

No (question 7 is continued)

Yes (you go on to question 8)

7. Have you paid the whole price so far?

No	Yes
----	-----

8. Did you borrow money to purchase the car?

No

Yes, from bank

Yes, from CAR (the Mutual Aid Fund)

Yes, from other people

Yes, from other sources (mention the source).....

9. In your opinion, the price of a Dacia car is:

very high	high	Middling	low	very low
-----------	------	----------	-----	----------

10. Do you think that the cars made by Dacia are up to your expectations?

wholly	to a high extent	Middling	to a low extent	at all
--------	------------------	----------	-----------------	--------

11. Do you consider that owning a Dacia car:

Confers a certain social status?

Gives the possibility of fast and secure travel?

Entails considerable costs?

Is an additional concern?

Is a necessity?

12. If you were to purchase one of the versions below, would you arrange them, marking one box according to your preference. Place at the top the choice that best matches your preferences.

	1	2	3	4	5	6
Logan Pick-up						
Logan coupé						
Logan MCV						
Logan Van						
Sandero						
Sandero Stepway						

13. Which do you think the main advantages of the Dacia car? Would you please enumerate and note the order of their importance, starting with 1 for the most important, then 2 for the next, etc.

Advantage	Importance
-----------	------------

14. Which do you think are the main disadvantages of the Dacia car? Would you please enumerate and note the order of their importance, starting with 1 for the most important, then 2 for the next, etc.

Disadvantage	Importance
--------------	------------

15. In general, what improvements do you think should be added to the Dacia cars.....?

16. What are your preferences concerning the engine?

Type of engine	Preference level					
	Very high	High	Middling	Little	Very little	No opinion
Petrol type K7J (1.4 MPI)						
Petrol type K7M (1.6 MPI)						
Petrol type K4M (1.616V)						
Petrol and LPG type K7M 718 MP						
Diesel type K9K (1.5 dCi 70CP)						
Diesel type K9K (1.5 dCi 85CP)						

17. What do you think a Dacia-Renault car is like?

18. The versions of the Dacia-Renault car have more facilities, out of which some are optional (air conditioning, electrically operated windows, ABS, aluminum rims, etc.). Do you consider these cover all the buyers' preferences?

- No (question 19 is continued)
- Yes (you go on to question 20)

19. What special facilities should be added?.....

20. Do you think the Dacia cars are adapted to the requirements of Romanian roads?

Totally agree	Agree	Neither nor	Disagree	Totally disagree
---------------	-------	-------------	----------	------------------

21. Do you feel secure inside a Dacia car?

Totally agree	Agree	Neither nor	Disagree	Totally disagree
---------------	-------	-------------	----------	------------------

the maintenance costs for a Dacia car are:

Very high	High	Moderate	Low	Very low
-----------	------	----------	-----	----------

23. Do you consider that the price of the spare parts is:

Very high	High	Moderate	Low	Very low
-----------	------	----------	-----	----------

24. SC Automobile Dacia SA has a vast distribution network. Do you think it is sufficiently developed?

- No (question 25 is continued)
- Yes (you go on to question 26)

25. What other areas should be covered?.....

26. Automobile Dacia has several distribution centres and showrooms staffed by qualified people. Would you say your opinion concerning the following statements:

Statement	Total agreement	Agreement	Neither-nor	Disagreement	Total disagreement
Purchasing a car is easy					
Exhibiting the models is up to expectations					
The staff is kind and helpful					
The staff is proficient					

27. The Dacia cars made at Mioveni are destined for both the domestic market, and export. Do you think that Dacia is praised on the foreign markets?

No		Yes	
----	--	-----	--

28. The Dacia models are also manufactured in Russia, Iran, Morocco, Brazil. Do you think the cars made at Dacia are:

Much better	Better	Same	A little worse	Much worse
-------------	--------	------	----------------	------------

29. Automobile Dacia is part of Renault Group. Do you think that the cars made at Mioveni, if compared with the similar Renault cars, are:

Much better	Better	Same	A little worse	Much worse
-------------	--------	------	----------------	------------

developed?

No (question 31 is continued)

Yes (you go on to question 32)

31. What other areas should be covered?.....

32. Have you had recourse to the Service Dacia network?

No		Yes	
----	--	-----	--

33. Starting from your own experience, would you say your opinion of the following statements:

Statement	Total agreement	Agreement	Neither-nor	Disagreement	Total disagreement
The quality of the work is at top level					
The equipment of the workshops is at a high technological level					
The duration of the repairs is short					
The costs of the repairs are calculated correctly					

34. The manufacturer gives 36 months' guarantee. Do you consider that period sufficient?

Yes		No	
-----	--	----	--

35. Do you think the variants of the Dacia car are sufficiently well known?

Yes		No	
-----	--	----	--

Characteristics	Extreme (1)	Foarte (2)	Suficient (3)	Nici/mici (4)	Suficient (5)	Foarte (6)	Extrem (7)	Characteristics
Non-polluting								Polluting
Spacious								Lacking room
Low consumption								High consumption
Modern design								Outmoded design
Close to the public								Distant from the public

22. In your opinion,

36. The information on the performance and technical data of the Dacia versions comes from many different sources. Grade each source, starting from 5 points – for the source that wholly identifies your option.

	5	4	3	2	1
Press materials					
Radio					
Television					
Brochures, folders					
Internet					
Other					

37. Dacia is manufactured in five versions. Do you think those cover all the buyers' expectations?

- No (is continued by question 38)
- Yes (you go to question 39)

38. What other versions do you think should be manufactured to cover the buyers' needs?.....

39. A general grade for the Dacia car should be:

1(min)	2	3	4	5	6	7	8	9	10(max)

40. Part of the components needed for making the Logan model in foreign works are made by Automobile Dacia, and exported to those destinations. Do you think that brings further prestige to the Dacia brand?

Totally agree	Agree	Neither-nor	Disagree	Totally disagree
---------------	-------	-------------	----------	------------------

41. The "Dacia Assistance" service is available on a 24h basis. Have you had recourse to the service?

No		Yes	
----	--	-----	--

42. Do you consider that service useful?

Totally agree	Agree	Neither-nor	Disagree	Totally disagree
---------------	-------	-------------	----------	------------------

43. If someone asked your opinion, would you recommend them to buy a car made by Dacia?

No		Yes	
----	--	-----	--

Questions for identifying the subjects of the interview

44. Sex:

Male		Female	
------	--	--------	--

45. Which is the most recent type of formal training you concluded?

- Elementary school
- Vocational school
- High school
- Post-high school training
- Higher education
- Post-graduate training.

46. Your occupation:

- Unskilled worker
- Skilled worker / craftsman
- Service operator / commercial worker
- Technician/foreman/primary school teacher/clerk
- Military /policeman/guard agent
- Businessman/Executive / Manager / Middle medical staff
- Specialist / high education staff
- Student Unemployed Pensioner
- Different. Which one?

47. Your monthly income in lei is comprised between:

600-1500	1501-2500	2501-3500	Over 3500
----------	-----------	-----------	-----------

48. Your age lies in the interval:

18-29 years	30-39 years	40-49 years	50-59 years	Over 60
----------------	----------------	----------------	----------------	---------

49. You live...

In a town		In the country	
-----------	--	----------------	--

Thank you for your cooperation

CRISIS IMAGE MANAGEMENT OF AN ORGANIZATION BY APPLYING APPROACHES PUBLIC RELATIONS

Duhalm Simona

*University "Vasile Alecsandri" of Bacău
Facultatea de Științe Economice*

Any organization may face crises that can affect its normal operation and at the same time can make in danger the reputation enjoyed by the public. These unpleasant events in the life of an organization can be predicted and prevented, but there are times when nothing is known about them before it happens. An effective solution to mitigate and eliminate the negative public reaction is to apply the approaches of public relations.

Keywords: public relations, crisis, communication, organization

Cod JEL: M3

Crisis can be defined as one major event, unpredictable, which may lead to adverse effects. These may affect the organization as a whole, or sector, employees, products, services, financial status and they reputation.

Crisis management is a very complex task involving both predictive capacity crisis, creation of scenarios for keeping control and solve their and the feedback when crisis appear. Their solution is achieved by identifying the causes, important activity for an organization, because researched as a crisis is likely to recur. This may damage the organization's image, and to lower the public credibility.

The purpose of public relations work consists of shaping and maintaining a positive image of organization both the target audience, and within society overall, in which it operates his activity.

Characteristics of the crisis:

- *insufficient information* (nobody knows the exact nature of the problem facing the organization);
- *rumors deteriorated by the appearance information;*
- *losing control of the situation* (the reality is reinterpreted and distorted);
- *panic* (is exacerbated by the absence of immediate solutions to it and have major effects especially the staff);
- *maximum visibility* (can provide the opportunity to restore balance quickly if there is an effective crisis management plan).

Causes of occurrence of image crisis:

- lack of concern of the organization to implement a well defined program of creating its own identity (name, atmosphere, events);
- organization unable to fully control the messages of public space;
- poor communication with the public;
- absence of specialized structures in image management.

Depending on the factors that lead to triggering a crisis in the organization, they can be **classified as:**

- cases (due to internal or external factors, cyclical immediate or structural);
- running time (sudden or slow);
- scale (superficial or deep);
- operating level (operational - affect current business; strategic - affects the development strategies; identity - affects the identity of the organization);

- consequences (affecting staff, customers, partners, public opinion, etc.).

Crisis management plan in an organization:

- identifying potential crisis: the major events (conflicts, accidents, etc..) occurred in the organization lately and predicting how they might affect the future organization;
- determining the target audience, location and its role according to their relevance;
- informing employees about the real situation facing the organization;
- setting people will deal with premiums answers to the press;
- choosing a competent spokesperson;
- develop standard press releases for confirming the events;
- drafting responses to questions that may arise frequently;
- establish channels of information dissemination: briefings, press conferences, radio and television appearances, letters, e-mail;
- establish a plan for the media: identifying contacts persons, phone numbers, providing technical facilities for journalists (faxes, phones, photocopies free, access to computers and the Internet network);
- keeping records of all calls made by mass-media and quickly responsibility to them;
- identify partners in crisis management: police, policemen, firemen, governmental structures, environmental groups, personalities of cultural and political life, humanitarian groups, voluntary associations;
- preparing portfolios press;
- media regularly informed through reliable messaging;
- testing crisis management plans through simulation spontaneous.

Public relations specialists have a key role in resolving a crisis when it mainly affects the organization's external public (consumers - the largest category of public, economic agents acting in the market - suppliers and intermediaries, financial institutions and of the power public, professional associations, etc.).

Public relations activities during the crisis within the organization:

- *Public relations specialist will decide whether they need to establish a press center. Press center will keep all visitors under control without disturbing dealing with the crisis. Depending major crisis to decide whether setting up a press center.*
- *Public relations specialist will maintain continuous contact with reporters, will ensure that they comply with locations that have been approved to visit and will provide as soon as possible all information it considers the company's interest.*
- *Public relations specialist will verify the declarations and together with a representative of management, will help in formulating responses to questions.*
- *Public relations specialist will be responsible for guiding reporters in areas of interest to the public.*
- *Public relations specialist will send information to the press and thus the public, only with the consent of the senior management.*
- *Public relations specialist will maintain close contact with media representatives. It may stay for information from the press and thus can stop the wave of false information.*
- *Public relations specialist will keep records of all the facts were made public and moments when they were made public. This avoids duplication of information and the emergence of conflicting reports.*

In a different vein, to address and remove the crisis, public relations professionals in an organization should implement the following:

- convene crisis management team and election spokesman;
- inform the public through the media;
- to set up a free telephone number that journalists can call 24 hours from 24 to find answers to their questions;
- to transmit information and have appearances on the news and the most powerful programs of TV channels;
- provide photos and videos about the work and conduct of business organization;
- selected photos to be published by the organization in major newspapers;
- make media reach in a short time from onset of the crisis, all the information needed to address issues raised.

In managing a crisis may occur a number of factors that disrupt or prevent proper conduct of this activity. Among these factors are found:

- size, scale and duration of the crisis may not be known at the outset;
- individuals or publics affected by the crisis can be difficult to identify;
- trigger crisis because it can be hard to identify;
- accurate and relevant information about the existence of a crisis are always sought by audiences, especially by those who are directly affected;
- development crisis are the effect of lowering the organization's credibility among audiences that relate;
- crisis produces a behavior governed by emotions for everyone connected with it.

An organization fails to maintain its image during a crisis depending on how they react and handle the situation or issue arising.

Importance for resolving crises is effective rapid decision and efficient communication. Experts in public relations tries to rebuild organization image. Because crises can change public opinion about the organization in a negative image, public relations experts most communicate with the public so organization to regain the place held in public opinion. Communication in such situations more clearly defines the identity and good faith of organization than does communication in positive situations or festive.

Communication with the media in crisis

Most people inform of the media about most the events, favorable or unfavorable, that occur at the level of an organization. Patrick Lagadec argues that the communication problems of an organization facing a crisis takes place on four levels:

- communication within the organization;
- communication with the public organization;
- crisis communication with stakeholders;
- communication with media.

In good times an organization, an imperfect presentation in the media did not immediately affect the functioning of the business organization, but in a time of crisis, any distortion of data related to the organization that will lead to increased status, and thus the loss of public confidence.

Immediately after the onset of the crisis, the move to implement the communication plan in crisis. Public relations specialists will assess the situation and will determine, depending on the magnitude of the event, the media communication techniques will be used.

Most important **communication techniques** used in stress conditions are:

- Press release - aims to inform journalists about the situation and the settlement decisions have been taken. It should contain: the presentation short, the event; specify how and to what extent the organization is responsible for crisis; name of solving the crisis management team; way is expected to solve the problem.
- Press conference - is an effective and rapid means of information and give answers to journalists questions, concerns or attacks from the press.
- Press pack - is one of the most important tools for communication with the media in crisis. This should include: a press release on the crisis, data about the organization, organization history, a list of crisis team members, photos of key team members.

Conclusions:

Crisis management can not be randomly. Rather, it relies on a correct assessment of the factors that cause such a situation, and the formulation of appropriate response strategies, strategies to be prepared and tested before the advent of crisis.

For specialists in public relations existence a major crisis test their ability to cope with a situation which, if not treated properly, can have unfavorable consequences for the organization. Effective crisis resolution image is influenced by how they are perceived crises and techniques and procedures implemented to address them. Some organizations openly communicate by passing difficulties, thereby demonstrating to the public interest, attracting the same time, his sympathy and understanding.

In combat unpleasant events triggered by a crisis, the organization should ensure a constant and consistent message to the press so as to be disposed of suspicions and rumors, to regain credibility and restore public trust.

DIRECT SALES IN THE CONTEXT OF ROMANIA'S UE INTEGRATION

Gherman Cristina

"Transilvania" University of Braşov

Faculty of Economic Sciences

More recently, direct sales business is stimulated by the difficult market conditions. While retailers hardly bear fixed costs such as rent, administrative costs and tend to raise prices, customers fall back to products offered by direct sale. In addition, labour market conditions made more and more Romanians (who were left without incomes) to move towards this system. On the other hand, the direct sales field doesn't concern only those who remained without a job, but rather those who want to round their incomes.

Keywords: direct sales, strategy, crisis, costs.

JEL code: M31

Introduction

Direct sales mean selling goods and services directly to consumers through an explanation and/or demonstration, at their home or in the others' house, at work or elsewhere, far from the retail sales location. In many countries the term of "home sale" is used instead of "direct sale".

Usually, direct sales companies operate in two modes:

- From person to person: usually a person who sells makes a presentation to the client and/or his family, after he set an appointment in advance in a certain place and at a certain time.

- Group sales: a customer invites his friends at home, where he makes a presentation for guests.

Direct selling can be defined as a form of communication from one person to another, in which a seller tries to convince potential buyers to buy the products and the services of his firm.¹⁵⁵²

It is therefore a process in which salesmen try to inform and persuade the customers to purchase a product or a service. Direct sales provide the fastest feedback of all promotional activities because of the direct negotiation.

The advantages of direct sales are:¹⁵⁵³

- the ensuring of a more effective individual communication, due to its high flexibility in the communication process, regarding the needs of individual consumers;

- the possibility of minimization of the promotional effort; in most cases sales staff effort materialized in an effective sale of goods or services;

- the ensuring of relevant marketing information for the company management.

Because the direct sales force is the largest expense in the marketing communications it needs proper management; it should have another type of management than other areas of promotion.¹⁵⁵⁴

Direct sales force management should consider the following requirements:¹⁵⁵⁵

- sets targets to be achieved in a given period, in a precise, measurable manner: the sales volume, the market share, the obtained profits etc.;

- determines the optimal sales force size and its correction in time;

- organizes sales staff training programs based on various categories of staff;

- motivates the sales staff in order to increase the efficiency of its business;

- controls and evaluates the performance of sales staff.

¹⁵⁵² Shimp T.A., Lozier M. W. – *"Promotion Management & Marketing Communications"*, Dryden Press, New York, 1996, p. 271.

¹⁵⁵³ Adăscăliței V. – *"Promotional Techniques. Fundamentals"*, "Transilvania" University of Braşov, 1994, p. 98.

¹⁵⁵⁴ Lefter C., Brătucu G. – *"Marketing"*, vol. II, "Transilvania" University of Braşov, 2000, p. 174.

¹⁵⁵⁵ Pride M. V., Ferrell C. O. – *"Marketing"*, 8th Edition, Houghton Mifflin, 1993, p. 550 – 558.

In many Western countries, through this type of sales, unlike the retail, the customer has a period of 7 days called "cool-of period". During this period, he has the opportunity to consider his decision and compare the quality and the price of goods or services provided by the sales people, having the right to cancel this agreement or to return the product purchased. This aspect makes the customer to have a high confidence in the method of direct selling. In addition, by extending the term of "cool off", by establishing the ethical principles that limit the actions of its members and through cooperation and continuous communication with Consumer Associations, direct sales companies protect the customers. Direct Selling is successfully used for many products: cosmetics, tools, home fitness products and dietary supplements, textiles, alcohol, jewelry etc.

Direct sales industry is rapidly growing as the preferred method of sale and purchase.

As a result of global development, in 1978 World Federation of Direct Selling Associations (World Federation of Direct Selling Association) was founded. The headquarter is in Washington DC, USA and its members are Direct Sales Associations from 52 countries representing a total of 1,300 companies worldwide.

Direct Selling is a proven practical method of purchase for millions of consumers worldwide. First, direct sales offers quality and diversified products to consumers while on the other hand they provides an opportunity to earn income for people from all social classes, without distinction of race, gender, religion, education or experience. Most of the people involved in direct selling business deals with only part-time and temporary.

A special study conducted in the U.S.A., to consider direct sales, shows that the 5 reasons to become a direct selling person are:

Table 1: 5 reasons to become a direct selling person

I like to test product	90.7%
I'm my own boss and I choose my work program	73.1%
I contribute to family income or I obtain additional income for me	63.7%
The more I work, the more I earn	54.3%
I like to sell	48.5%

Direct sales provide an opportunity of business for the person who sells, on the one hand, and offers quality, value, personal and practical service for the consumer, on the other hand. The practice of direct sales gives the opportunity of an extensive selection providing various products and services to customers, continuously increasing worldwide.

The evolution of direct sales in Romania in the period 1999 – 2009

At the end of 1990, after the fall of communist dictatorship, network marketing systems have emerged by entering the local market of individual life insurance agents from Austria (collaborators of Safe Invest Holding), as insurance brokers, in MLM system.

Poor economic conditions, lack of appropriate legislation, the reluctance of people to the responsibility of a business on their own, have greatly hampered the official start of such companies. For 4 to 5 years have entered the market, rather shy, collaborators from Italy, the Netherlands, Austria, Hungary, Germany and the U.S., which tried to build their own networks for various companies (Herbalife, Amway, etc.) distributing cosmetics, cleanliness products, nutrition and health maintenance products. Most of these activities took place at the boundary of law, because none of the supplying companies was registered in Romania.

In 1994 were recorded the first officially MLM companies in Romania (Safe Invest Romania, Romania Saveco, GWC), and several years later also appeared major network marketing companies (Oriflame, California Fitness, Amway, Golden NeoLife Diamonds, Carion, Forever Living Products, AVON, Eurolife etc.). Meanwhile, were set up some local MLM companies, which tried to imitate the success of the those well - known, but without notable results due to lack of capital and management

experience. If in 1998 the number of collaborators was estimated at about 60,000 at the end of 1999 there were approximately 125,000 people directly involved in the system. Only those active persons in the system were taken into account, then MLM distributors.

Currently, more than 10 Network Marketing companies try to develop their market in the context of an economy in full reform, always offering what no other industry in Romania can offer: jobs.

Each collaborator who entered the system had a major opportunity to become master of his own business, to have a secure job and earn money by honest means. Also it has to be noted the media indifference for the promotion of these systems, which can be explained by the ignorance of the truth about Network Marketing and the confusion generated by illegal pyramid selling (as the famous Caritas). If the above information is likely to be inaccurate, this is due to a false understanding of free market competition of the management teams of Network Marketing companies.

The last decade has shown a significant increase of population in Romania who was drawn to the idea of having its own direct sales business. The reason for this dramatic increase is not only the alternative to a job or an additional way of earnings, but the satisfaction of becoming an individual entrepreneur who wins on a profitable activity, in collaboration with partners in its network.

Most of the worldwide suppliers of consumer goods and services, now prefer to present their offer directly to consumers. Precisely this facility is a feature of the direct sales industry, so that over 70 companies are now operating in direct sales and MLM schemes in Romania. In Romania the turnover exceeded 270 million USD in 2007 and the number of the active distributors reached 300,000. These opportunities are designed to be embraced by men, women and families of any social class. One of the advantages of such opportunities is that personal commitment can be partially (outside office hours) or full, being fully flexible in terms of organizing working time. A day, a week or a whole month can be assigned to run an MLM business, according to the wish of every person to earn from the opportunity. The main statistics on the industry of direct sales and MLM systems in Romania refer to:¹⁵⁵⁶

- **Turnover** – in 2008 reached the value of € 300,041,307, an increase of 15% compared to 2007 when it reached € 275,285,253. According to the RODSA statistics (The Romanian Direct Selling Association) in 2009, turnover increased by 10% compared to 2008 due to current financial crisis. Cumulative 10 years, from 1999 to 2008, the turnover exceeded EUR 1.496 million.

Table 2: Turnover in the direct sales industry in Romania in the period 1999 – 2008 (mil. €)

	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008
Turnover	35,6	49,84	70,31	92,56	109,47	170	169	228	275, 28	300,04

(Source: <http://www.rodso.ro/rapoarte.htm>)

The range of products distributed in the direct sales industry and MLM systems in Romania in 2007:

- 3% – technical products, machinery, books, etc.;
- 9% – life insurance;
- 11% – household goods;
- 37% – cosmetics;
- 40% – nutritional supplements.

The structure of distributors and customers:

- 30% – active distributors;
- 70% – occasional customers and distributors.

Distributors work:

- 31% – full – time;
- 69% – in part (outside office – hours).

Working method:

- 61% – from person to person;
- 39% – group presentation.

The gender of the distributors who work on the Internet:

- female – 40%;
- male – 60%.

The age structure of distributors:

- 18 to 30 years: 37%;
- 31 to 40 years: 27%;
- 41 to 50 years: 24%;
- over 50 years: 12%.

Conclusions:

Direct selling industry has registered in 11 years of activity a spectacular growth. If in 1999 the total turnover in this sector just passed 35 million in 2009 - the peak year of economic crisis - companies

operating in multi-level-marketing had a total turnover of over 330 million. Between 1999 and 2009, the area has managed to make "the move" of over 1.8 billion euros. For these money work only 1,107 employees the rest of 350,000 being collaborators.

Last year, when the crisis has trampled on the local economy, the direct sales industry grew with 10% compared with 2008, reaching a total turnover that exceeded 330 million. This rising trend has a logical explanation, given that many Romanian have lost their jobs and were forced to look for a way of earnings. For them, the Multi-Level Marketing (MLM) system was a chance to make some revenue. In Romania today, where job hunting has become a real problem, many people had to look for opportunities of earnings. This was enough to increase the number of collaborators, which led to the increase of the turnover. According to data held by RODSA (Romanian Direct Selling Association), today this MLM system has a network of 350,000 direct distributors and more than one million consumers. Three quarters of those involved in this system made gains equal to the monthly minimum wage. There were also people who made performance, gaining \$ 15,000 each month.

The expansion of this type of services on the Romanian market made the major companies in the world to open offices here. If at first were few sellers "from door to door", the products distributed being designed especially for life insurance, now the range has extended, around 70 of such companies working in our country.

Turnover conducted by the industry shows that there is big money spinning: last year, the top three players - Avon, Oriflame and Amway - had total revenues of over 150 million. According to data from RODSA, Avon has managed to achieve in 2008 the performance of a net profit of 18,162,599 euros with only 311 employees, while Amway has reported a profit of 3,434,119 euros, the company's personnel plan showing only 38 work card employees. Ranked in the top three of the earnings achieved in 2008, Oriflame Company had a profit of 3,116,389 euros and a total of 127 workers.

With relatively small initial investment, direct sales companies have growing profits as more consumers turn to vendors for products to increase their income. Moreover, some of them created networks to grow their sales volume and thus increase revenues. There must be made the specification that the money is earned only when they sell products and not promises.

Another reason for the growth of this business is the improvement of legislation. As for Romania, even now the law is unclear, but becoming a European Union member has simplified things somewhat. For example, several years ago were banned the pyramid schemes. This is a good thing, because the MLM companies don't risk anymore to be associated with such practices.

The major problem of companies during the current period is the economic crisis, because it has a negative influence on all activities. The application of innovation in all areas, reducing costs and risks by contracting a franchise or improving the speed and the efficiency through direct sales are the most viable solutions.

The crisis is the forerunner of change.

NEW TRENDS IN THE ADVERTISING POLICY OF ROMANIAN AND UE COMPANIES

Gherman Cristina

"Transilvania" University of Braşov

Faculty of Economic Sciences

CEE Marketing Managers use the economic recession to reconsider its approach. A recent survey done among CEE marketing directors (Central and Eastern Europe) showed that recent economic pressure has not only cut short-term budget, but it shows that economic pressure has led to reassessment of their approach to marketing. The biggest challenge the marketers have to face in a recession is the budgetary constraints. In this context more and more managers are considering the integration and the development of direct marketing activities in their organizations.

Keywords: direct marketing, mobile marketing, sms promotion, campaign.

JEL code: M37

Introduction

Promotion seen as a key tool of the marketing mix includes a wide range of activities which has to be closely correlated with other elements of marketing mix, such as product, price and distribution. There is a great diversity of views regarding the criteria of structuring the promotional means, but it seems that the most suggestive and practical are those of referring to:¹⁵⁵⁷

- the intention of persuasion;
- the way of achieving the target goal.

Taking in consideration this point of view, some promotional means such as packaging, brand, price and the image of the point of sale are unpersuasive media; they belong to the other elements of the marketing mix.

In turn, persuasive means of communication can be classified according to the second criterion, namely how to achieve target goals in two big categories:

- means of direct communication (personal) – that means that rely on sales forces and other means of establishing direct relationships, specific direct, marketing with customers;
- indirect communication means (non-personal) – including advertising with its two forms (advertising and free advertising), public relations and sales promotion.

In another reference work in this field¹⁵⁵⁸, promotional methods and techniques are classified into two basic categories, namely:

1. promotional communication techniques, including: advertising, sales promotion, public relations, sales force and direct marketing;
2. continuous communication techniques, including: brand, design, packaging etc.

The strategic way in which they are combined by the firm, the various components of the promotion in order to achieve the given objectives generate the creation of "promotional mix". This, viewed from the perspective of various companies, is structured and sized differently, depending on the nature, extent and diversity of each promotional component. "The differences in the composition of the promotional mix are determined, in general, by the nature of products and services, by the profile of businesses (manufacturing, commercial, of services), by the characteristics and trends in markets where they operate, by the specific purchasing and consumption behaviours."¹⁵⁵⁹

Direct marketing – a specific way of making marketing

The biggest challenge the marketers have to face in a recession is the budgetary constraints.

A study made by Linea Directa Communications in 2009 shows that Romania is among the last states regarding the preference for direct marketing. These two trends, that of overcoming the importance of direct marketing over other marketing instruments and to ignore from the start that strategy, ranked Romania on the last place among European countries, the other countries investigated being Hungary, Poland, Czech Republic and Slovakia.

Most of the companies (in the study were considered only those companies which attained annual revenues of over one million euros) directs to the direct marketing activities a smaller percentage of 10% of marketing budget, the average of a marketing budget in Romania being at the most 250,000 euros. This is because direct marketing is not yet part of the organizational culture of most companies, although the effectiveness of direct marketing has been demonstrated for some time for other international business environments.

The current financial crisis could restore the direct marketing position in Romania by doubling its allocated share from an average of 4% to an average of 8% for 2010. One Hit Mail officials gave for comparison the Hungary, with an average of 12% allocated to direct marketing and the United States, where it exceeds 50% of a marketing budget. The highly personalized direct communication with the client, the pursuit of real and optimized database that can provide real and effective information to the organization, all these attributes or benefits of direct marketing will begin to gain ground in the old situation of world crisis in which the power of purchase is decimated, Romania not being an exception.

The impact of financial crisis on direct marketing practices

According to a survey made in the summer of 2009, in the CEE region, by Linea Directa Communications (part of Studio Moderna Group, one of the largest direct marketing, call – center and fast-growing company; the group covers 19 CEE markets and ensure the provision of services in 22 international languages), companies with small marketing budgets dominate the study, budgets under 250,000 euros being reported especially in Hungary (89.4%), Russia (88.6%) and Romania (85.4%).¹⁵⁶⁰ Budgets that exceed 1 million euros are in small percentages in the Czech Republic (5.4%), Slovakia (4.9%), Poland (4.5%) and Slovenia (4.3%).

In 2009, the biggest reductions of the marketing budgets were made in Russia (28.6%) and in Romania (22.7%), the companies reaching a 30% reduction of the budget. Similar budgets with those from 2008 were registered in Hungary (44.4%), Slovenia (43.9%) and Poland (43.4%). On the other hand, there are companies that have invested in marketing communication – Russia (19.6%), Poland (19.2%) or Slovenia (16.2%).

From 30 to 70% of this money is spent for internet promotion (banners, blogs, social networks etc.), catalogues, mass marketing (TV, newspapers, radio), and for organizing events and fairs. The smaller budgets (more than 30% of marketing budgets) are allocated for sending SMS for mobile marketing, telemarketing, direct mail and email.

The most used communication channels are the Internet (banners, blogs, social networks etc.), e-mail, distribution catalogues, fairs and events.

These data indicate that companies are focused on marketing activities that can be measured in order to become effective, but not too much. There are less popular channels, such as telemarketing, mobile marketing that are not used so much. The advantages of these channels consist not only in direct interaction with customers but also in the use of a wide range of services. Thus, telemarketing is an important tool not only for increasing sales but also for testing new offers and for market research in order to measure customer satisfaction. Telemarketing can be used also to generate sales opportunities,

¹⁵⁶⁰ <http://www.iaa.ro/Articole/Analize/Impactul-crizei-financiare-asupra-practicilor-de-marketing-in-europa-centrala-si-de-est/3153.html>

to establish business meetings or to provide customers with specific information about a particular product or service.

According to the survey, companies organize marketing campaigns in order to increase the number of customers, to increase their loyalty and to maximize the profit obtained from the existing customers through additional sales. Also, companies take into account the creation of databases, used later in their communication campaign, to create an awareness, but also for a brand or product repositioning.

For direct marketing companies, 2009 has meant the continuation of the collaboration started in previous years, but also the development of new projects with large and medium companies.

In the CEE region is increasingly speaking about the services outsourcing as a cost saving measure:

- *the Czech Republic recorded the highest percentage of companies that outsourced direct marketing activities (74.4%), followed by Poland (61.5%) and Romania (36.5%);*

- *84.8% of companies don't outsource services in Hungary, 74.6% from Slovakia, 68.6% from Slovenia and 46.7% from Russia these companies don't use the outsourcing of direct marketing activities because they have internal resources to do these operations or they can't afford them because they have low communication budgets; there are also companies that don't have enough information about outsourcing, about the meaning of this term (outsourcing) and its benefits.*

The most outsourced direct marketing activities are really the new communication channels such as Internet promotion (banners, Google Adwords, blogging, social networking), training events and fairs, as well as mass marketing (TV, Billboard newspapers), direct mailing and distribution catalogues.

The study was conducted in 7 countries: Czech Republic, Hungary, Poland, Romania, Russia, Slovenia and Slovakia. Managers from different industries such as IT, finance, FMCG, pharma, automotive, retail, telecommunications, tourism and utilities participated at this study.

The trends on the Romanian direct marketing market – SMS promotional campaigns

SMS promotional campaigns have stood in 2009 under the sign of the cost and resource efficiency. However, this kind of communication has grown not only in the number of new brands involved, but also in the value of prizes awarded, in the number of contributions and in terms of costs involved.

The reason for this increase was that in a year of crisis the actual results materialized in sales and their rapid and accurate quantification yielded a high return on investment. This is one conclusion of monitoring the SMS promotions market in 2009, by Voxline Communications Company, founded in 1998 with French capital, benefiting from the very beginning of technical support and Western European know – how in telecommunications services with value – added solutions and in the interactive services.

In over 10 years of activity on the Romanian market Voxline recorded numerous premiers of which three can be mentioned: in 2002 was the first alternative telecommunications operator which created services of SMS and voice mobile support; in 2004, the Voxline developed the application of the first mobile marketing campaign in Romania, for Chipita brand; in 2005 became the first operator of value added services which obtained ISO 9001:2000 certification issued by TUV Thuringen.

The services offered by Voxline Communications cover a wide range of mobile marketing applications (campaigns of sending and receiving SMS messages, mobile advergimes) call center (normal numbers and green numbers), Web applications (promotion sites, flash advergimes) micropayment services through mobile telephony and value added services (televotes, contests, digital content). Among the customers for which Voxline Communications has conducted campaigns over time are important players in the local market, such as Quadrant Amroq Beverages (Pepsi), Star Foods (Lays), JTI (Winston), Unilever (Dove, Cif & Domestos), Chipita Romania, URBB (Carlsberg, Tuborg), Western Union, Duracell, Braun, Dr. Oetker (Ristorante Pizza, Pudding) Fabryo (Savana), Wrigley, Charm, LG Prod 94 (Stalinskaya, Wembley), Porsche Romania.

One of the reasons for which the SMS promotions were increasing in 2009 is that the restriction of marketing and advertising budgets has led to concrete results orientation and Mobile Marketing remains one of the tools that offer the possibility of achieving the brands objectives having a personal character

and a multiple applicability and being on hand. Last year, the interest towards direct marketing activities increased a lot, being targeted especially to boost sales and the participation mechanisms via SMS have been very well received by buyers.

The evolution of SMS Promotions in 2009:

Communications Voxline monitored during 2009 over 60 marketing SMS campaigns, made by 35 companies, similar number with the promotions conducted in 2008.

In 2009 brands have invested increasingly more in the consumer viewing experience with the brand, adding dedicated websites to traditional SMS promotions. Thus, 55% of campaigns have been accompanied by such sites, on which the consumer behaviour didn't resume only to the registration; there were various ways of retaining the consumers on the sites, such as: games, auctions, user-generated content, RSS feeds from blogs etc. Most times, these additional activities were rewarded with additional prizes. However, the interest for the cost reduction determined 44% of promotions to use only the component registration via SMS. Some brands that used only the SMS channel for registration, had avoided the printing of unique codes on products, asking the customers to send the number of payment ticket or the brand's name, or the answer to a question. In 2009 the specialists observed the use of the same phone number for more simultaneous promotion of the same brand.

The year 2009 brought a real growth among campaigns conducted for food (both in number of campaigns and the number of companies), alcoholic beverages, as well as for cigarettes. However, collapse was observed in the number of companies in the electronics/appliances, cosmetics/detergents and construction domains. It was also noted the first campaign which offered the possibility of registration through mobile site and the fact that some brands have been returned to the classic coupon promotions or instead of participation through SMS, either as an alternative to registrations via SMS/Web/call centers. Although it was considered a year of crisis, there were companies that have developed sms promotions for the first time in 2009. These were: Albalact (Zuzu), AGRANA (Pearl), Macon Deva, SOLLERS PPD (J&B), Carolli Prod 2000 (Carolli), Nordic Import Export Co. (Rio Mare), Cotnari (Grasa Cotnari), United Euro Distributions (Murfatlar), Ringier (TvMania), the same number of new companies registered in the monitoring of 2008, year of growth. In terms of awards, in 2009 they exceeded the value registered in 2008, reaching the value of accumulated awards of approximately 25 million EUR (VAT included). In terms of traffic generated by the campaigns, it can be estimated a total of over 20 million SMS, the most numerous participations being on cigarettes and soft drinks.

The value of the sms promotions market, reported only to the number of sent messages, plus the average cost of making applications and the average cost of monthly subscription has exceeded in 2009 1 million euros, the highest annual amount recorded for such actions using mobile marketing.

Some companies which made SMS promotions for the first time in 2008, have repeated these promotions in 2009: Colgate - Palmolive, Petrom and Cris Tim. Poiana ("Choose Poiana!") was the promotion with more than one way of registration: SMS, Web, mail, e-mail. Murfatlar used the registration through call center, primarily for Romtelecom network users and other fixed networks. The company with most promotions (7) belonged to the Dr. Oetker brand. The brands with the biggest budget for awards were Murfatlar, Kent, Winston, Coca Cola and Pepsi (which, in total, have almost 50% of the prize budget).

Estimates for 2010:

In 2010 it is estimated that the brands known for their dynamism (Pepsi, Coca Cola, some brands of cigarettes, some alcohol brands) will continue to innovate the methods of registration to promotions, creating a bridge between the registration and the consumer experience with the on any channel. The year 2009 was distinguished by the introduction of new ways of registration, based on mobile phone:

the registration through a mobile site. It is estimated that in 2010 will be at least 5 brands that will also use this channel for registration to promotions.

INSURANCE CONSULTANTS ATTITUDE TOWARDS RELATIONSHIP MARKETING ELEMENTS

Grigoraş Elena

University Alexandru Ioan Cuza, Iaşi

Faculty of Economics and Business Administration

Stofor Ovidiu

University Alexandru Ioan Cuza, Iaşi

Faculty of Economics and Business Administration

This paper aims to investigate how the insurance consultants apply the relationship marketing specific elements in their relationship with customers. "How to establish and, especially, how to maintain the relationship between supplier and consumer of insurance services?" represents the investigated problem. Obstacles in attracting clients, in gaining and maintaining confidence, in communicating with them represent the grounds for that particular subject. It features an analysis of the relationship between supplier and consumer of insurance services.

Keywords: relationship marketing, insurance market, insurance sales agents

M31

1. Introduction

Because of the specific area of insurance products, which involve signing a contract for one year for non-life insurance and at least 5 years for life insurance, the relationship between insurance consultant and client is by definition a medium or long term one. Also, the fact that in insurance domain, the transaction is spread out in several stages, through the insurance premium which the customer must pay, makes it even more necessary to maintain and develop the relationship between the two sides. Customer confidence in the insurance consultant and also in the insurance company is important both before signing the contract, and especially after this stage of the relationship, as customer's money is at stake. Also, the impact of the current crisis on the insurance field is reflected in the relationship between insurance agent and his clients. Failure to pay premiums, trying to find different reasons and different staged accidents to get the compensation are elements that increase the difficulty of maintaining and developing relationships. Similarly, in a time of economical crisis, the consultant has developed a pushy attitude that creates a negative image among customers, leading to the emergence of another factor influencing the relationship.

2. Purpose and research objectives. Methodology

Performance of insurance consultant on the market depends on investments that he makes in customer relationship. Investments that the insurance agent must make to create, maintain and develop relationships with clients are of several types: the time to prepare for each phase of the sales process, training, time spent communicating with customers, all knowledge in this area.

But, whatever investment you make in different stages, they have no value if the consultants don't prove their involvement. It is the most important method by which they can win their customers.

The aim of this study was to analyze the relationship between agent and client in the insurance market, in terms of agents.

Study objectives were:

- identifying specific elements of the relationship between consultant and client in different stages of the sales process;
- identifying the role of obtaining customer confidence in the relationship between consultant and client;

- identifying the role of consultant involvement in the relationship between him and the customer. The method used to achieve these goals has been the investigation. Population considered for the investigation was the consultants of an insurance firm operating on the Romanian market. The instrument used was a questionnaire that the consultants had to complete before their meetings. The final sample consisted of 122 consultants. In terms of experience in insurance, 33.6% of consultants had experience of less than 10 months, 29.5% of them had experienced between 10 to 24 months and 36.9% of consultants had more than 24 months experience in insurance.

3. Results

3.1 Specific elements of the relationship between consultant and client

The results regarding the specific elements of the relationship between consultant and client are presented in the following tables. Each table presents the results obtain for one of the three categories of consultants in terms of their experience in insurance.

<i>Consultants with experience of less than 10 months in insurance</i>	
Need identification stage	- there is a higher proportion of consultants, respectively 75.6%, compared to 65.8% overall sample, that sustain they never decide what products to offer based on their beliefs, not on the client's needs.
Presentation of Solutions stage	- there is a higher proportion of consultants, respectively 36.6% versus 29.5% overall sample, that sustain they often attempt to influence a customer by information rather than by pressure; - there is a higher proportion of consultants, respectively 85.4% vs. 76% overall sample, that sustain they always give the product according to clients needs; - there is a higher proportion of consultants, namely 48.8% versus 40.5% overall sample, that sustain they rarely try to sell a customer everything they can to persuade, even if they believe that is more than a wise customer would buy; - there is a higher proportion of consultants , namely 17.1% versus 9.1% overall sample, that sustain they always describe a „pink picture” of the products to make them sound better.
Completion of sale stage	- there is a higher proportion of consultants, 51.2% versus 42.6% overall sample, that sustain they never prefer to sell as much, without considering the customer's satisfaction.
After-Sales Phase	- there is registered a larger proportion, 39% versus 23% overall sample, that sustain they always contact customers after signing a contract only for sending wishes for various occasions (birthdays, New Year).

<i>Consultants with insurance experience of 10 to 24 months</i>	
Need identification stage	- there is registered a larger proportion, 25% to 20.5% overall sample, that sustain they often identify their customers needs by asking questions; - there is a larger proportion, namely 16.7% versus 9.2% overall sample, that sustain they always decide what products to offer based on their beliefs, not on the client's needs.
Stage presentation solutions	- there is registered a larger proportion, 69.4% versus 62.3% overall sample, that sustain they never put pressure on a client to buy when they are not sure that the product is suitable for that client; - there is a larger proportion, respectively 69.4% versus 63.1% overall sample, that claim they always try to influence a customer by information rather than by pressure.

<i>Consultants with insurance experience of 10 to 24 months</i>	
After-Sales Phase	<ul style="list-style-type: none"> - there is registered a larger proportion, 13.9% versus 9.8% overall sample, that say they often prefer to sell as much, regardless of customer satisfaction; - there is registered a larger proportion, namely 63.9% versus 53.7 % overall sample, that say they rarely spend more time trying to convince a customer to buy than attempting to understand his needs.

<i>Consultants with more than 24 months experience in insurance</i>	
Need identification stage	- there is a higher proportion of consultants, 32.6% versus 20.8% overall sample, that say they rarely decide what products to offer based on their beliefs, not the client's needs.
Presentation of Solutions stage	<ul style="list-style-type: none"> - there is a higher proportion of consultants, 9.1% versus 4.1% overall sample, that sustain they never give to a customer the product according to its needs; - there is a higher proportion of consultants, namely 56.8% versus 45.5% overall sample, that say they never try to sell a customer all they can persuade, even if it considers that that's more than a wise customer would buy; - there is a higher proportion of consultants, 45.5% versus 38% overall sample, that sat they never describe a „pink picture” of the products to make them sound better.
After-Sales Phase	<ul style="list-style-type: none"> - there is registered a larger proportion of consultants, 24.4% versus 17.2% overall sample, that sustain they rarely contact the clients after signing the contract; - there is registered a larger proportion, namely 48.9% versus 36.9% overall sample, that sustain they often contact customers only after signing a contract for the transmission of greetings for various occasions (birthdays, New Year).

3.2 The role of trust and involvement

The results regarding the role of trust and involvement in the relationship between consultant and client are presented in the following tables. Each table presents the results obtain for one of the three categories of consultants in terms of their experience in insurance.

<i>Consultants with experience of less than 10 months in insurance</i>	
The role of customers confidence	<ul style="list-style-type: none"> - there is a greater proportion of consultants, namely 26.8% versus 14.9% overall sample, that sustain they are in agreement with the fact that customer confidence is very important until the contract is signed; - there is a greater proportion of consultants, 34.1% compared to 23.8% overall sample, that sustain they agree with the fact that presenting only the products advantages can make the client suspicious; - there is a greater proportion of consultants, 63.4% compared to 52.5% overall sample, that sustain they totally agree with the fact that calculating the solutions in front of the clients can make them have more confidence.
The role of consultant involvement	- there is a greater proportion of consultants, 39% respectively 30.3% overall sample, that sustain they agree with the fact that greater involvement on their part leads to a better relationship with the customer.

<i>Consultants with insurance experience of 10 to 24 months</i>
--

<i>Consultants with insurance experience of 10 to 24 months</i>	
The role of customers confidence	<ul style="list-style-type: none"> - there is a greater proportion, namely 19.4% versus 12.3% overall sample, that sustain they agree with the statement that earning customer confidence is the key to a good relationship with him; - there is a greater proportion of consultants, respectively 22.2% versus 13.2% overall sample, that declare to agree with the fact that in all actions they carry out the aim is to preserve their customers trust.
The role of consultant involvement	<ul style="list-style-type: none"> - there is a greater proportion, namely 41.7% versus 30.3% overall sample, that say they agree with the fact that greater involvement on their part leads to a better relationship with the client. - there is a greater proportion, namely 19.4% versus 13.1% overall sample, that declare to disagree with the fact that most times, too much involvement from their part gives the impression of aggression; - there is a greater proportion, namely 44.4% versus 28.7% overall sample, that sustain they agree with the fact that the use of computer applications during the meetings with the client would demonstrate a greater involvement from their part.

<i>Consultants with more than 24 months experience in insurance</i>	
The role of customers confidence	<ul style="list-style-type: none"> - there is a greater proportion, namely 88.9% versus 83.6% overall sample, that sustain they totally agree with the statement that earning customer confidence is the key to good relations with him; - there is a greater proportion, namely 86.7% versus 81.8% overall sample, that sustain they totally agree with the fact that in all actions they carry out the aim is to preserve their customers trust; - there is a higher proportion, respectively 56.8% versus 40.5% overall sample, that declare to totally disagree with the fact that customer confidence is very important until the contract is signed; - there is a greater proportion of consultants, namely 11.1% versus 4.9% overall sample, that sustain they totally disagree with the fact that the presenting only the benefits, without specifying customer requirements can awaken his suspicion; - there is a greater proportion, respectively 28.9% versus 23% overall sample, that declare to agree with the statement that calculating solutions in front of customers would increase their confidence.
The role of consultant involvement	<ul style="list-style-type: none"> - there is a greater proportion, namely 75.6% versus 64.8% overall sample, that sustain they totally agree with the fact that greater involvement on their part leads to a better relationship with the client; - there is a higher proportion, respectively 17.8% versus 11.5% overall sample, that sustain they totally disagree with the fact that most times, too much involvement from their part gives to the client the impression of aggression.

4. Conclusions

The first objective sought to obtain information on specific elements of the relationship between adviser and client, depending on the stage of the sales process. The results show that during the stage of identifying needs, most insurance consultants always identify customer needs by asking questions. Most consultants do not ever give products by their own beliefs, but based on customer's needs.

Regarding the stage of presentation of solutions, most consultants do not ever pressure the customer into buying the product. Most argue that consultants always provide the product according to customer needs and always try to influence a customer to buy based on the information and not by pressure.

Almost half of the consultants don't ever try to sell to a customer everything they can to persuade him to buy, even if they think it would be more than a wise customer would buy. Most consultants do not ever describe „in pink” products that sound better, or rarely do so.

Regarding post-sales, most consultants maintain contact with the customer after they sign the contract, but over half of them contact customers only to send "well wishes" on several occasions after signing contract.

The second objective sought to obtain information on the role of trust in the relationship with the client. Over 80% of insurance consultants consider winning the confidence of the client as a key element of establishing a good relationship with him. Therefore, most of them seek to maintain customer confidence throughout all actions that take place in relationship with them. Many consultants consider gaining customer trust as a condition for recommendation to other potential customers. But in terms of confidence importance during the sales process, more than half of consultants believe that customer confidence is only important to sign a contract.

Most consultants attach great importance to gain confidence through the methods of presenting solutions. They consider that presenting only the benefits, without specifying customer requirements, customer may arouse suspicion („too good to be true”). More than 70% of consultants argue that they would increase customer confidence if the solutions would be calculated in front of him.

The third objective sought to obtain information on the role of involvement. Regarding the consultant involvement in the relationship, most of them consider that a high involvement from their part leads to a better relationship with the client. However, just over half of them consider that, often, too much involvement from their part gives the impression of aggression. Computer software used during the meeting with the client is considered a demonstration of their involvement in the relationship. As regards to the involvement of clients more than 80% of consultants considered that their involvement is not sufficient for a good relationship with the client, but client's involvement is also needed.

In achieving these objectives limits have been identified also. One of these was the possibility that respondents had the impression to be evaluated when they received the questionnaire and the possibility that they had responded as they ought to, not like they act in reality. Another limit was realizing the investigation only in one insurance company; therefore the results are presented at company level and not at market level.

At this stage, attention was paid to consultants and their attitude towards relationship marketing. The next step is to realize this study in several insurance companies to reach the level of the insurance market. Also, the next step involves analyzing the applicability of relational marketing in terms of consumer insurance.

ADVERGAMES: CHARACTERISTICS, LIMITATIONS AND POTENTIAL

Călin Gurău

GSCM – Montpellier Business School

Advergaming represents a new advertising concept that uses Internet technology to implement viral marketing campaigns. Despite the potential of this interactive advertising method, very few academic studies have been initiated to investigate the characteristics of advergaming, and their influence on consumers' perceptions and behaviour. Using secondary data, this paper attempts to evaluate the characteristics of effective advergaming, and to analyse the effect of advergaming on players' perceptions and behaviour.

Keywords: online advertising, advergaming, effectiveness

Code JEL: M37 - Advertising

Introduction

Advergaming can be defined as online games that incorporate marketing content. Initially, many companies have placed their brands or logos in the virtual environment of computer games launched by specialised gaming firms. However, this form of advergaming is rather static and ineffective, since the player is concentrated on the task required by the game and might not acknowledge the brand image displayed in the background. This limitation has encouraged the firms to create their own advergaming, which are developed around a theme or a character directly related with their products and/or brands. In order to ensure a large diffusion of these games, they were made freely available on the Internet. The facilities offered by the Internet platform have increased the interactivity of the game, and have added a viral marketing dimension.

The interest in advergaming has substantially increased in the last 5 years, because of its perceived advantages (FreshGames, 2002; WebResource 2004):

- low-cost marketing in comparison with the traditional advertising channels, such as TV and radio;
- a captured audience that can transmit valuable personal information about their demographic profile, behaviour, needs, attitudes and preferences;
- customer retention: the average time spent in an advergaming is 7 to 30 minutes, which cannot be reached in the case of a classical TV advertisement.
- viral marketing – 81% of the players will email their friends to try a good game.

All these data demonstrate the huge potential of advergaming (Rodgers, 2004). However, despite the hype created by this new advertising method, most of the information describing or debating advergaming is professionally-oriented, often written in an advertising style (DeCollibus, 2002; Hartsock, 2004; Intrapromote, 2004). Very few academic studies have been initiated to investigate the characteristics of advergaming, and their influence on consumers' perceptions and behaviour (Hernandez, Chapa, Minor, Maldonado, & Barranzuela, 2004; Nelson, 2002).

Background

Studies conducted in the US have discovered that games are extremely popular among all categories of online users. A study conducted by Jupiter Media found that in December 2003, 84.6 million people visited online gaming sites (D5 Games, 2004). This number is projected to reach 104 million by 2007.

The preconception that only kids or teenagers are interested in interactive games is contradicted by the findings: in US 66% of the most frequent game players are over 18 years old, and 40% of them over 35 years old, with the average age of a player being 28 year old (D5 Games, 2004).

Another study conducted during December 2003 – January 2004 in the US, has identified the women over 40 years old as a major segment interested in online gaming (Arkadium, 2004). The female game-players over 40 spend the most hours per week playing games (9.1 hours or 41% of their online time in comparison with only 6.1 hours per week, or 26% of their online time for men). These women were also more likely to play online games every day than men or teens of either gender. The reasons for playing online games vary depending on the gender. The main reason of women is to relieve or eliminate stress, while the men are mainly attracted by the competitive factor of Internet gaming. The women prefer word and puzzle games, while men are more interested in sport, combat or casino games (Arkadium, 2004).

The placement of products or brand names in movies or TV shows is a relatively old technique, but the studies regarding their influence on consumer perceptions and behaviour are inconclusive (Gould, Pola, & Grabner-Krauter, 2000; Russell, 2002). The advergaming present a few distinct characteristics that can eventually enhance their marketing effect:

- the advergaming are selected by the player himself/herself, and are not forced upon an unwilling viewer;
- the player interacts with advergaming adopting an active stance, in comparison with the passive attitude of the TV audience;
- advergaming incite the players to share the gaming experience with their friends or family.

From a marketing point of view, the advergaming attempt to capture the attention of players, and then to transmit to them, in an indirect way, suggestions that aim to modify their perceptions regarding an enterprise, brand, or product. The psychological fundament of this process is the inducement and the use of the 'state of flow'. This concept is used by psychologists to describe a mental state in which the attention is highly concentrated on a specific process, the environmental information is screened out, and the person experiences a harmonious flow of its present experience (Csikszentmihalyi, 1991). The state of flow is known to create a state of well being, as well as increased perception and learning capacity. This state of flow can be induced by any activity that is very interesting for a person: watching a movie, reading a book, or playing a game. In fact, the ludic activity is considered as one of the best inducers of the flow state for children, and often also for adults.

The interaction with Internet applications can also induce the state of flow in specific circumstances (King, 2003), the most successful web sites offering interactive experiences, and not only content. The state of flow can be created online if the following essential conditions are combined: user motivation, user telepresence, and interactivity of the Internet application. On the other hand, the existence and the maintenance of the state of flow is a dynamic process, that depends on the relation between the capabilities of the user – or player in the case of an advergaming - and the level of difficulty proposed by the game. Figure 1 demonstrates the three possible scenarios of the interaction between an Internet user and an advergaming.

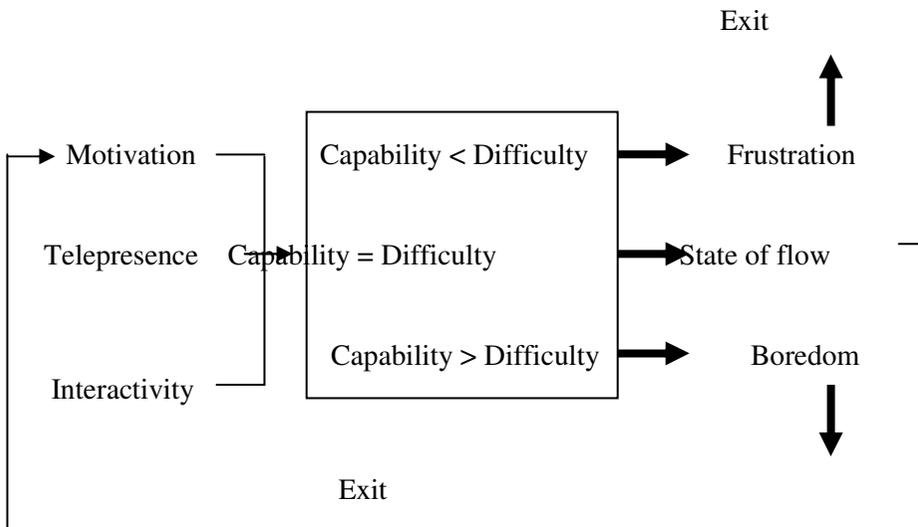

Figure 1. The inducement of the state of flow online

Once induced, the maintenance of the state of flow requires a constantly evolving challenge for the player, because his/her level of capability is likely to improve after playing the game a few times. This raises the problem of including in the advergame a progressive level of difficulty, that can represent a dynamic challenge for players.

If the features of the game are interesting enough and the playing experience provides satisfaction, the player will be inclined to send information about the available game to friends or relatives, participating directly to the spread of the advergames campaign. This action can be reinforced by creating complex games that require multiple participants.

As any other marketing communication tools, the advergame characteristics will have to correspond to: (1) the personality of the advertised brand, (2) the profile of the targeted audience, (3) the characteristics of the medium – in this case the Internet, (4) the strategic objectives of the communication campaign and (5) the corporate image of the company.

The difficulty to concomitantly evaluate these complex variables is probably the reason for a low rationalisation of the advergame development in the professional literature. The creation of an efficient advergame is still considered predominantly as a creative work, that it is difficult to describe in a formal, precise manner.

The characteristics of an efficient advergame

Considering the specific effect of advergames on online players, the following characteristics are considered necessary for an effective advergame:

1. accessibility: facility to identify the hyperlink between the firm/product site and the game, free access or required registration, specialised software required, downloading time;
2. difficulty of understanding: existence of explicit instructions/rules, and the facility of understanding these rules;
3. competitive level: number of players, the display of score lists, multiple level of difficulty;
4. relevance for the firm, brand or product: type of product advertised, type of game, advertising elements associated with the game;
5. capacity to induce and maintain the state of flow: multiple levels of difficulty, the possibility offered to players to choose a specific level of difficulty;
6. viral marketing: communication with friends and family members is encouraged.

An objective evaluation of the advergame relevance for the firm/brand/product advertised is difficult at this stage, because it is necessary to define a number of quantifiable criteria that can describe and assess the personality of a brand. The same type of problem is related with evaluating the capacity of the game to induce and maintain a state of flow. In this case, an experiential approach is more suitable, although the two variables defined for this characteristic are equally relevant, being derived from the relation between the capability of the online player, and the capacity of the advergame to propose an appropriate and dynamic level of challenge.

Socialization online sites have become important landmarks for people all around the world and of all ages, especially for youth. Users of such services can socialize with people they know or with unknown, people located in the vicinity or at different distances, even on different continents.

In other words, social online sites help people to interact with others of their kind, to know people who have the same passions as they have. The access to such sites is free and the members can build profiles (which include data on name, age, hobbies or favorite books and movies) and can share photos, music or videos with the others. A friend is, in the language of the socialization sites, any user who has a link to his/her profile page. Users can send messages or can leave comments on other profiles. In some cases, people who meet on such sites decide to meet also in the real life.

Keywords: internet, on-line, socialization sites, privacy

JEL code: L86

1. Developing online marketing through Web 2.0

During the current period of time there are organizing software and procedures that control the interpersonal exchange of information in socialization networking sites, text messaging, instant messaging, blogs, role-play online games and online education. All these applications can be grouped under the term "social media", a concept that describes the social interaction software based on Web 2.0 - seen more as a software platform, where the user controls / create his own data, information, usually offering them to others through collaborative tools.

Web 2.0 is nothing but the web today, which changes daily grows and includes services and people. The most important features are: achieving common networks (MySpace, Facebook and others), the presence of many small businesses, online search for partners, making new friends¹⁵⁶¹. Blogs, wikis, podcasts, and text comments are the most important forms through which the web content has evolved a lot. Basically, it has become accessible for anyone to reveal his thoughts on the Internet. Blogs have also spread to the companies and today there appeared not only the personal and business agendas but also the political blogs. On the list of news, the blog is one of them, other services addressed to the community occurring also: the sharing of images (Flickr), joint news pages (Digg), social networking market (iWiW, myVIP) and the list is constantly expanding. Moreover, there are discussions about the next generation of web - 3.0, already. It involves the transforming of the Web into a huge database, the artificial intelligence development and the creating of a new-human web, the creating of semantic networking computers connected to the Internet which can combine information based on logical connections¹⁵⁶².

¹⁵⁶¹ <http://aseweb20.wetpaint.com>

¹⁵⁶² <http://www.blogcity.ro>

Turning to the current stage, we can say that the single direction and traditional media was changed step by step as the result of some activities: in addition to horizontal, general search engines, there also appeared vertical search engines (engines specialized in certain areas search information), and Google has brought the both together (Universal Search).

A description of Web 2.0 might be the following¹⁵⁶³:

- includes a very wide range of applications and services using the web as a unitary organized platform for communication;
- is built on an architecture that encourages the active participation of users;
- allows easy interaction between users who have similar interests;
- enables users to generate content, share it with others, meaning a greater interactivity;
- facilitates the public access to databases;
- has the ability to connect various applications or services and to aggregate data from various sources - RSS, blogs;
- “talks” about: the socialization of information - a concept about applications and people, the emergence of collaborative tools like wikis, social networking platforms like MySpace, Hi5, LinkedIn and Second Life, blogs, data structures and communication documents, collections of bookmarks (like del.icio.us or digg), videos (YouTube) or images (flickr) etc.;
- syndication - RSS and tags structures: tree-classification removal and the application of labels, so that something is not strictly a descendant of another, but may belong to several categories;
- the improving of the users’ experience;
- democratization of content and distribution (user-created content and freely distributed);
- uses the power of Internet communities.

Video and Web 2.0 technologies help to improve collaboration between people and companies in the current context of increasing interactivity and globalization of labor. Most of the companies plan to prepare networks for implementation of video applications and innovative online collaboration. With the adoption of more wide-scale video and Web 2.0 technologies, companies are becoming increasingly interested in using video communications for the expansion of commercial activities, attracting more customers, improving collaboration between employees and implementation of environmental media.

Technologies such as blogs, wikis, telepresence and web conferencing, help companies to keep pace with the very dynamic changes in the field of IT applications and services. The main issue for investment in commercial video and Web 2.0 tools is to address growing customer demand for innovative products and services. Another factor considered for installing the video is, as pointed out above, the concern for the environmental issues.

In the current era of dynamic employees, informed and collaborative interaction characterized by increasing global importance, the horizontalizing of the organizational structures and interactivity, companies must use communication tools in an innovative way for increasing the degree of adaptability to dynamic change market.

Equally interesting is the fact that the U.S. companies which wish to use, in the next few years, videoconferencing technology are, in the same time, according to assessments of profitability during a fiscal year - companies with the greatest potential for development fast. Moreover, it is estimated that in the coming years, the fast-growing companies in Europe and in countries with emerging economies will implement Web 2.0 technology-based tools.

2. Concept and evolution of the socialization sites

Socialization networking sites are web-based services that allow individuals to construct a public or semi-public profile within a limited system, to devise a list of other users who are connected to their friends list and see what others in the system do. Nature and typology of these connections may vary from one site to another, but what makes the socialization sites unique is not that they allow individuals to know strangers, but that they allow users to compile and make public their network socialization (friends). The results may

¹⁵⁶³ idem

be the links between individuals which, in other circumstances, would not occur. Also, on many socialization sites, the participants are not looking, in particular, to become acquainted with others, but to connect with people they already know.

After recording on a socialization networking site, users are asked to identify those they are related to in the system. Labeling depends on the site: “friends”, “contacts”, “fans”, most socialization networking sites requiring bidirectional confirmation of friendship. Public display of friendship is a crucial component of these types of sites. Friends’ lists contain links to each profile, allowing users to navigate the network structure by clicking the lists of friends. Most sites offer users a social mechanism by which they can leave messages on friends’ profiles also. Moreover, these sites usually have a feature of “Private Messaging” similar to the webmail.

Experts believe that the history of these sites began with the advent SixDegrees.com. It was auto characterized as a means of knowledge and communication, but despite the success enjoyed (million users), it was closed in 2000. As its creators say, the time for such services hasn’t come yet¹⁵⁶⁴.

The next milestone was in 2002, Friendster - a site that initially proposed itself to help users to know, in the event of love affairs, their friends’ friends, who would be some more suitable pairs than the strangers. Friendster enjoyed a very big successful, quickly attracting hundreds of thousands of users, but technical problems, and the ease with which administrators were wiping fake accounts (for example, parodies of celebrities) led to a mass withdrawal of users. Friendster however remains very popular in countries like Philippines and Indonesia. Instead, former Friendster users have shifted to other similar services; MySpace is among the main beneficiaries.

On Hi5 (founded in 2002), users can create an online profile, which can show information such as interests, age and hometown and upload user pictures where other users can post (submit) comments. Hi5 also allows you to create personal photo albums and set up a music player in the profile.

In 2004, “The Facebook” was founded, originally as an academic network with the name “thefacebook.com” being later extended to companies like Apple and Microsoft¹⁵⁶⁵. In May 2007, Facebook launched a platform to interact with other websites. Likewise, there were released many applications by means of which users can send different messages. In a few months, after the launch of Facebook, there had been initiated an application against spam also.

The growing user-generated content sites focused on media sharing and have started to implement features of “social networking” becoming, in turn, socialization sites. There are Flickr (for photos), Last.FM (music listening), YouTube (video sharing) as examples¹⁵⁶⁶.

The idea of development of communication systems based on socialization sites is, also, operated by the U.S. emergency management (FEMA) which wants to use the Twitter microblog network sites or the Facebook socialization networking site in order to communicate in case of emergency (when the conventional communication networks will be broken), so that people can send information to the authorities, and may correspond better with those in areas at risk or already affected by various disasters or catastrophes¹⁵⁶⁷.

3. Extending socialization sites worldwide and in Romania

According to www.wall-street.ro the worldwide number of users of socialization networking sites has grown explosively in 2009, and their influence has been confirmed at every big event, benefiting from continuous Internet access through smart phones¹⁵⁶⁸. For example, Facebook announced in early April 2010, that he crossed the threshold of 400 million users, after six years of existence (a year ago with

¹⁵⁶⁴ Ana Soviany, www.revista22.ro, November 2008

¹⁵⁶⁵ <http://ro.wikipedia.org/wiki>

¹⁵⁶⁶ <http://aseweb20.wetpaint.com>

¹⁵⁶⁷ <http://neomania.ro>, November 2009

¹⁵⁶⁸ Cristina Negru, www.wall-street.ro, December 2009

record 200 million visitors), and Twitter has a number of users increased from 5.57 million in September 2008 to over 58 million people in early 2010¹⁵⁶⁹.

Moreover, Google recently competes with the social networks by adding to its email service, Gmail, functions that allow the users to change the status of their friends and share content online. These sites status updates may include content provided by the users' contacts on other Google sites, such as YouTube and Picasa. Currently, email service users can post short messages similar to those on Facebook or Twitter attached through Gmail's chat. Along with the status update feature sites, Gmail has a number of elements which together could provide an alternative to Facebook¹⁵⁷⁰.

In terms of age of users, according to a report by research company Pew Research Center released in autumn 2009¹⁵⁷¹, approximately three quarters (73%) of adolescents (12-17 years) and an almost equal number (72%) of young adults (18-29 years) use socialization networking sites like Facebook or MySpace. Among socialization networking sites, the study shows that Facebook is the leading destination for adults older than 18 years (73%). MySpace is on the second position with 48%, followed by LinkedIn, with 14%. The results also show that young people aged between 18 and 29 years use connectivity and mobile terminals, 66% of whom being users of laptops.

In our country, according to a November 2009 study by market research company Mercury Research, of the 44% of Internet users in urban areas, which states that are members of social networks, more than one third (36%) use Hi5. This is followed by Facebook with 16% and remotely Flixter (6%), LinkedIn (2%) and Twitter (2%)¹⁵⁷².

Young Internet users, aged between 18 and 24, are most active, both as membership in social networks and the frequency of access to personal accounts. Only 20% of young people between 18 and 24 have at least one account in socializing networks, the opposite being represented by the people over 45 years, 80% of them not belonging to any communities.

Unlike members of other social networks, Hi5 members are more open to new friends or groups, the average number of "friends" network being over 140, while 17% belong to a group of this network.

As frequency of access, over half of Hi5 and Facebook members access their personal account at least once a week, the young people being the most active numbers. For example, 70% of hi5 members aged between 18 and 24 connects at least once a week, unlike the third of those between 25 and 34 that connect with the same frequency. A similar situation is encountered on Facebook as well, where 74% of young people between 18 and 24 access their account at least once a week, unlike 45% people aged between 25 and 34 years.

4. European initiatives for the privacy on socialization networking sites

Sites for socialization networking are an emerging social and economic phenomenon, attracting 41.7 million users in Europe and changing the way we interact with others on the web. The using of socialization networks increased last year by 35% in Europe and is expected to increase by over 100% to 107.4 million users by 2012¹⁵⁷³.

According to an EU study, 50% of young Europeans internet broadcast personal information may remain permanently online and be viewed by anyone¹⁵⁷⁴. For the socialization networks to continue to grow young users must feel safe when expanding their networks or sharing any personal information but sometimes, they risk to be blackmailed and harassed. In most cases, the cause is the lack of information on the availability of personal data: users do not know who can see data on personal profiles published or how they may limit access.

¹⁵⁷⁴ www.euractiv.ro/uniunea-europeana/articles, February 2010

For this reason, the European Commission imposed the 23 companies that joined in 2009 to document “Principles for safer social networking” measures to ensure the protection of children using socialization sites in the network¹⁵⁷⁵. Their objective is to improve child safety and combat online harassment; so that most of the companies have given them the chance to protect themselves against risks by facilitating online transactions for changing privacy settings, blocking access to certain users or to delete comments and undesirable content.

The companies involved intend to limit these risks by¹⁵⁷⁶:

- providing a button to “report abuse” usable and accessible, enabling users to report any inappropriate contact or behavior of another user by the push of a button;
- ensuring that all profiles and online contact lists of the website users who are registered as minors are automatically set to "private." This will make it more difficult to contact the young person with bad intentions;
- ensuring that profiles of the users under 18 years can not be searched (on the Web sites or search engines);
- ensuring that the privacy options are clear and accessible at all times, so that users can easily realize whether everyone or only their friends can see what they post online;
- preventing minors from using their services. If a socialization networking site is addressed to the teenagers over 13 years, it would be difficult for anyone under that age to register on that site.

Earlier this year, the Commission published a report on the implementation of the “Principles for social networks more secure”¹⁵⁷⁷. The report concludes that, of the 23 sites, 19 offer safety advice and information specifically directed to children and/or adolescents. The report also shows that most companies give the children the opportunity to protect themselves against possible risks of being online and to use a safe approach to confidentiality.

However, the European Commission believes that there are more to be done in order to protect online privacy. Less than half of companies that manage social networking (40%) prepared profiles of users under 18 to be visible, by default, only to their friends and only one third of them have unmet requests for help from users.

Changes towards improving the use of socialization networking sites are taking place because of the initiative of independent organizations such as the Electronic Privacy Information Center, Electronic Frontier Foundation and American Civil Liberties Union as well¹⁵⁷⁸.

Also, companies like Facebook (one of the largest socialization networking sites) have implemented changes based on user settings, which cause the publication of more of their personal information. The effect was the one of making complaints by those organizations that have expressed their concern about the possibility of people to express their personal data or pictures without intending to do so. Although Facebook said it had changed the settings to help users be more precise about how and where their information is published, after complaints, the site’s officials said they would simplify the process of restriction of information for the friends list outwardly.

Conclusions:

Social networking sites which are addressed primarily at young audiences are well positioned in the Internet industry through the use of technologies that help companies keep pace with change very dynamic field of software and IT services. But, as many would benefit these means of communication, we can not overlook the risks, of which the largest is even endangering someone’s life.

Abstract: Nowadays company's profitability and viability depend considerably by the way that this company administrates its clients' satisfaction and especially dissatisfied experiences. The dissatisfied clients will tell to other clients about their negative experience, they will change their attitude about the product or service; they will register their complaint that will affect in a negative way the company's image and the company's products' perception. The authors of this article want to contribute to the improvement of the complaining behavior of the dissatisfied clients, considering the fact that in our country researchers in this area are modest. In this purpose it was developed a pilot survey which objectives were referring to building a socio-demographical profile of the consumer that register complaining.

Key words : Complaints, complaining behaviour, dissatisfaction, consumers' rights

JEL Classification : M31

Introduction

The management of consumers' complaints represents an important aspect of the marketing activity of any organization. A major difficulty that these companies might have consists in understanding the way in which their clients respond to dissatisfaction.

Exploratory research developed had as purpose the identification of some demographic variables that are influencing the complaining behavior, such as age, monthly income and the socio-professional category.

The assumptions from which this research starts consist in the fact that there are demographic differences among those who file a complaint and those who don't do this when they are dissatisfied with a product, service or commercial unit.

In Romania were conducted few studies concerning the consumers' complaints behaviour. Accordingly, the main purpose of this study consists in a better understanding of how dissatisfied consumers react. For this reason, the pilot survey carried out for gathering information has the character of an exploratory research, without any pretension of generalizing the results.

Literature review

Complaining behaviour occurs after the acquisition and consumption of a product or a service when the consumer is dissatisfied (Bearden & Teel 1983; Folkes, Koletsky and Graham 1987). According to the non-confirmation paradigm, developed by Oliver in 1980, a consumer will be dissatisfied when the perceived performance of the product is below his expectations formed before the purchase.

Jacoby and Jaccard (1981) define the complaining behaviour as being “an action made by an individual in order to communicate a negative aspect concerning a product or a service either to the producing or distributing company or to a third organization“.

Day et al. (1981) suggests in one of their studies that the consumer’s dissatisfaction may have important implications such as changing the attitude towards the brand or boycotting the selling points.

The complaints are a response to dissatisfaction and their attainment highly depends on the dissatisfaction’s intensity (Yi 1990). While the dissatisfaction is a mainly affective response, the complaining behaviour is a rather cognitive response. The factors influencing the complaints behaviour are closely related to the individual predisposition to complain, to the opportunity of filing a complaint, to the procedure of filing a complaint or the consumer’s lack of information.

The research conducted in the field highlighted the associations between the complaining behaviour on one hand, and the gender of the dissatisfied consumers who file complaints (Duhaime and Ash 1980), different personal and situational factors (Day 1984), the socio-professional category and the income (Jacoby and Jaccard 1981), the life style, the values and demographical characteristics (Morgansky and Buckley 1986), on the other hand.

With regard to consumer’s reaction to dissatisfaction, most research paid particular attention to the complaining behaviour as a consequence of his dissatisfaction (Andreassen 2001, Ved 1991). It is estimated that there are many types of consumer’s responses to dissatisfaction, namely: taking no action, changing the product / brand, switching the supplier, filing a complaint to the seller, producer or a third person/institution, telling other people about the product that dissatisfied him (Goodwin, Ross 1990).

The complaining behaviour, as a reaction to dissatisfaction, varies considerably from one consumer to another. Most often, consumers take no action in order to reduce or eliminate the problems encountered on the market. Day and Bodur showed that most of the dissatisfaction cases for which no action was taken occur in the case of perishable goods (49.6%), followed by durable goods (29.4%) and services (23.2 %).

The results of different studies have led to the conclusion that a large number of dissatisfied consumers do not file a complaint (Davidow, Dacin 1997, Jeffery ş.a. 1995, Valenzuela ş.a. 2002). This lack of action could have a negative impact for both marketers and consumers. First, by not expressing the dissatisfaction, the consumers are deprived of obtaining a recovery of this unpleasant experience for them. Second, the limited actions of the consumers do nothing but hide the problems of the market that the company should correct. Additionally, the company sees the consumer’s complaints as an important source of information for making some decisions about creating more competitive products.

There are studies that have attempted to establish profiles of the consumers who complain the dissatisfaction and have tried to find answers to questions like: “What types of consumers are willing to file complaints?”, “What are the differences between the consumers that file complaints and those who compliment?”, etc. (Cordoş 2003, Dong-Geun, 2003, Lau ş.a. 2001).

When establishing such profiles, the authors considered especially the demographic variables such as income, occupation, education, age, marital status, social integration, mobility, etc. According to Robinson and Berl, consumers who file complaints are generally young, have a relatively higher income and were not loyal to a brand even when they were satisfied. Also, it is appreciated that the complaints are filed only by those dissatisfied consumers who have enough resources to do this and have high expectations regarding their resolution.

Regarding the relationship between the complaints behavior and the product’s characteristics, some authors (Keng 1995) concluded that it is more likely to file a complaint for products that do not demonstrate their performance, and this may have a negative impact on the company’s image. It was also demonstrated that there is a direct link between the product’s price and the complaining behavior:

the higher the price for a product, the higher probability for a dissatisfied consumer to file a complaint (Keng ş.a. 1995).

In one of their studies, Gronhaug and Zaltman (1981) describe three patterns of the complaining behavior, called the resources, learning and personality patterns. The resources pattern takes into account the access to time, money and power as determinants of the complaining behavior; the learning model suggests that the complaints will be filled by experienced and better educated consumers as they know their rights better, regarding the personality model, the consumers who file complaints are more aggressive and more confident in themselves than those who do not file a complaint.

Research Methodology

A pilot survey was conducted in a shopping center, on a sample of 112 people, inhabitants of Alba Iulia. In the survey's questionnaire was included a "filter" question, placed at the beginning, which sought to exclude from the sample the ones who were not dissatisfied with the product or service: "Have you ever been dissatisfied with a product or service?" With the help of closed and mixed questions there were obtained information on the complaining behaviour of those included in the sample.

Research's hypotheses were formulated in this shape:

- (1) H_0 : statistically gender influences insignificant the measure in which the dissatisfied clients are register their complaints;
- (2) H_0 : statistically monthly income influences in a significant way the measure in which the dissatisfied clients are recording their complaints.

Results

Of the 112 questioned subjects, 6 persons (respectively 5,53%) said that they have never been dissatisfied with a purchased product or service.

Considering the dissatisfied clients, 70,80% had no ulterior action, and the difference of 29,20% recorded a complaint. It is important to underline that those consumers that recorded a complaint they are not doing this each time when they are unsatisfied, but they have done it at least one time.

As it can be observed from the table below (Table no. 1), among those that recorded a claim 62% are men, and among those that had no action 56% are women.

Table no. 1. Complaining behavior depending on investigated persons' gender

Investigated persons' gender	Complain	
	Yes	No
Women	38%	56%
Men	62%	44%
Total	100%	100%

Source: realized by author based on research data

Null hypothesis " H_0 : statistically gender influences insignificant the measure in which the dissatisfied clients are register their complaints " was verified using X^2 Test. For 1 degree of freedom and 0,05 significance level, the calculated value for X^2 (X^2 calculated = 2,623) was situated under the level of X^2 theoretic (X^2 theoretic = 3, 841), so the null hypothesis is accepted. In conclusion, statistically there are no significant differences between women and men regarding the complaining behavior.

From the data presented in the table bellow (Table no. 2) it can be observed that the ones that are not recording complaints are with modest monthly incomes (49,30% of all), while the dissatisfied consumers that are recording complaints have monthly income above the average (48,50% of all).

Null hypothesis “ H_0 : statistically monthly income influences in a significant way the measure in which the dissatisfied clients are recording their complaints” was verified using X^2 Test. The calculated value for X^2 was 16,87 and it is higher than the theoretical value of X^2 for 2 degrees of freedom and a 0,05 significance level. In conclusion the null hypothesis is not accepted, so the complaining behavior is significantly depending on the consumers’ monthly income.

Table no.2. Complaining behavior depending on the investigated subjects’ income category

Income category (personal, monthly average)	Complain	
	Yes	No
Bellow 1000 lei	19,3%	49,3%
1001-2000 lei	32,2%	37,3%
Above 2000 lei	48,5%	13,4%
Total	100%	100%

Source: realized by author based on research data

Private entrepreneurs, high education level persons and clerks that are recording their claims when they are dissatisfied in a bigger measure than the rest of the socio-professional categories. One possible explanation of this result could be that the persons that are included in these socio-professional categories know better their rights as consumers.

Considering the age, claiming behavior is specific to the people with the age bellow 40 years old. The dissatisfied consumers that have above 60 years are recording complaints in a small measure.

The lack of trust regarding the problem solving is the main raison for which the most of the investigated subjects are not recording complaints when they are dissatisfied. As well, the ones that are not recording complaints do not record them because of their lack of time (34,66%) or appreciate that the product represented for them a small importance (12%) (Figure no. 1).

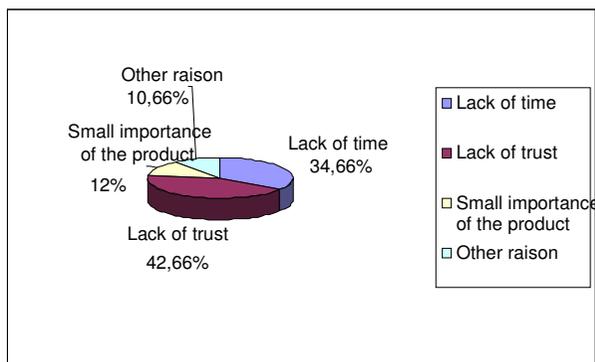

Figure no. 1. Weight of the persons that are not recording complaints depending on the reason for which they are not recording complaints

Source: realized by author based on research data

Among the subjects that had recorded the majority (45,33%) had addressed to the distributor/selling point from where they purchased the product related to which they were dissatisfied and the smaller part of them (20%) directly to the producer (Figure no. 3).

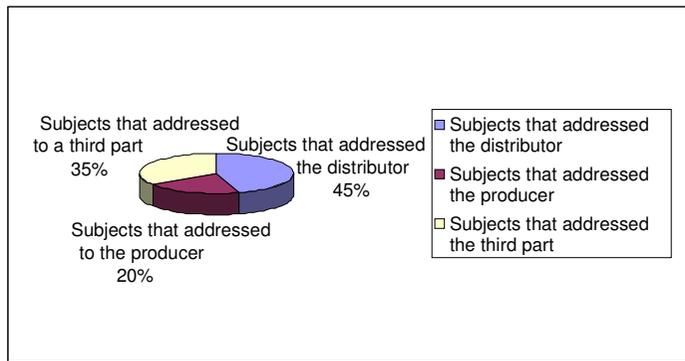

Figure no. 2. Weight of consumers that recorded complaints depending on the recording point
 Source: realized by author based on research data

From the total of 75 unsatisfied consumers that have recorded complaints, the biggest part of them registered their complains related to long term using products (respectively 50%) and for services (29%). In case of unsatisfied clients related to the perishable products, had been recorded complaints by 21% of the subjects investigated.

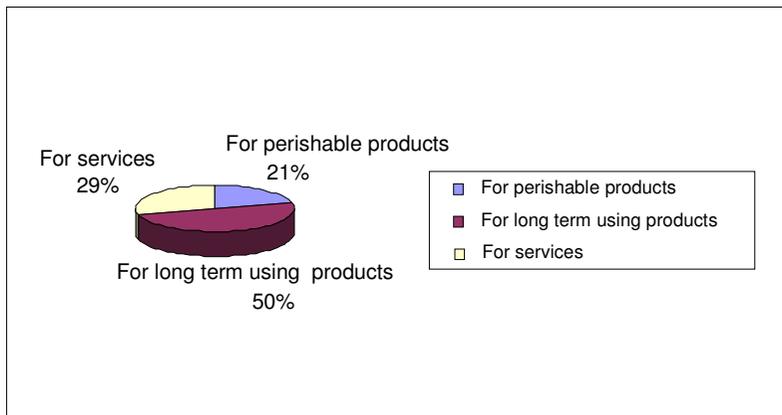

Figure no. 3. Weight of registered complaints depending on the products category
 Source: realized by author based on research data

The dissatisfied consumers that had recorded complaints and were solved (their number representing 43% of the total subjects that recorded complaints) intend in a big measure to repeat the purchase, while the ones that were dissatisfied and did not recorded their complaints do not intend to repeat the purchase.

Conclusions

The exploratory research developed allowed to made some conclusions.

First of all, complaining behavior is influenced by demographical variables like gender, monthly income, age and socio-professional category. Statistically there are not significant differences between the women’s complaining behavior and the men’s complaining behavior, but statistically there are significant differences between the complaining behaviors of the subjects belonging to different monthly income category.

The subjects that are recording their complaints when they are dissatisfied by a product or a services are usually young with high education level.

In the second place, the main raisons for which part of the dissatisfied consumers do not record their complaints is related to the lack of time and to the lack of trust that their problems will be solved.

In the third place, consumers recorded their complaints first at the selling point where they purchased the products and less to a third part.

Generally the complaints were made for long term using products and services and less for perishable products;

The dissatisfied consumers that recorded a complaint and this was solved are willing to repeat the purchase unlike the ones that were dissatisfied and did not had any action.

The conclusions resulting after the exploratory research are underlying the importance of future studies, especially due to the managerial implications of complaining behavior researches. In this way, the companies which want to increase the number of dissatisfied consumers who complain should facilitate this and also should assure them that their problems will be solved. Also, these companies should focus on dissatisfied consumers who complain to identify those socio-demographic characteristics that make them to have a positive attitude regarding complaining behavior.

Limits

The main limit of this study consists in that of the fact that the results cannot be generalized because the inquiry developed has the characteristics of the pilot survey and the sample is statistically unrepresentative.

Article focuses on identifying the marketing management concept specificity. The starting point was that of finding definitions that give us a clear idea about its features. Further, we identified opportunities to supplement these definitions in order to contribute to a better understanding of the concept.

Keywords: marketing management, definition, structural interface

M31

1.Premises

A question that has dominated and still dominates the marketing literature is linked to the extent that the marketing management concept is similar to marketing concept. Starting from the marketing concept as it has been defined along more than 70 years, many authors have attempted to provide relevant answers to this question by developing common approaches for identifying significant differences between the two concepts. To this end, the most prominent authors of the marketing literature, and not only focused their attention on the fundamentals of marketing concept in order to identify to what extent these fundamentals can be integrated in the specific framework of marketing management.

Interestingly, however, is to see if the definitions of marketing management somehow only replace the term of marketing with one of marketing management, content and significance of this latter concept overlapping with the specific marketing concept. From this perspective, examining a range of definitions of marketing management, we identified two lines of theorizing, which creates, in turn, opportunities for further development of analyzed field.

2.Marketing management – can we find uniformity?

Despite the many discrepancies on the demarcation of marketing management concept, literature does not abound in theoretical efforts. Thus, analyzing a total of 16 definitions of marketing management, we concluded that the definition of this concept either tends to overlap on known definitions on marketing, either to really describe a new concept.

In the first category of definitions of marketing management, are positioned those which are extremely close to the concept of marketing, thus is difficult, from our point of view, to refer to the existence of relevant elements of differentiation between the two concepts:

- *“process of achieving marketing objectives through the integration of the activities in the creation, promotion, pricing and distribution of products able to satisfy consumer needs, and through obtaining and using the best available information and engaging material, financial and human resources in an efficient and effective manner”¹⁵⁷⁹;*

¹⁵⁷⁹ Hass, R.W., Wotruba, TR., - *Marketing Management: Concepts, Practice and Cases*, Business Publications Inc, pp. 11, 1983.

- “marketing management seeks to provide an integrated and coordinated marketing mix by combining the 4P in a unified and satisfactory whole”¹⁵⁸⁰;
- “marketing management lies in setting marketing objectives - based on company resources and market opportunities -, planning and execution of the activities to ensure achieving the objectives. Based on these elements, marketing management satisfies consumer in an acceptable manner by society, concomitant with the profitable growth of the organization”¹⁵⁸¹;
- “that part of the organization responsible for formulating and implementing marketing programs to meet the needs of market segments and achieve organizational objectives”¹⁵⁸²;
- “marketing management is the process of environmental scanning, analysis of market opportunities, development and substantiation of marketing strategies and effective implementation and monitoring of marketing practices”¹⁵⁸³;
- “a specific organizational culture, a set of beliefs and shared values, centered around the importance of the consumer in the organization strategic and operational steps”¹⁵⁸⁴;
- “marketing management is the process of planning, organization, implementation and control of marketing activities to facilitate effective and efficient exchange”¹⁵⁸⁵;
- “marketing management is the process of analysis, planning, implementation, coordination and supervision of programs involving developing, pricing, promotion and distribution of products, services and ideas designed to create and maintain beneficial exchanges with market targets in order to achieve organizational objectives”¹⁵⁸⁶;
- “analysis, planning, implementation and monitoring of programs designed to create, build and maintain beneficial exchanges with target buyers in order to achieve organizational objectives”¹⁵⁸⁷;
- “planning of marketing activities, manage the implementation of marketing plans and operational control of these plans”¹⁵⁸⁸;
- “art and science to identify and maintain target markets, generate an increase in customers number by creating, communicating, and delivering superior value”¹⁵⁸⁹;
- “marketing management is the business function that identifies unmet needs and wants, defines and quantifies their magnitude and potential profitability, determine which market segments can be satisfied, decide on product, service and the best program to meet the chosen segments, and calls on the entire organization to serve consumer”¹⁵⁹⁰;

¹⁵⁹⁰ Kotler, Ph., - *Marketing Management: Analysis, planning, implementation and control*, New Jersey, Pearson Prentice Hall, 2004.

- *“the process of analysis, planning, implementation, coordination and supervision of programs involving the design of price, promotion and distribution of products, services and ideas designed to establish and maintain beneficial exchanges with target markets in order to achieve organizational objectives”*¹⁵⁹¹;

- *“development, implementation, and management of programs designed to generate implementation intentions”*¹⁵⁹².

As noted, most definitions of marketing management concept have common points: consumer orientation and develop profitable relationships with them, foundation and operational marketing mix as a medium of exchange relationship, involving all functional areas of the organization in customer relationship management as a means of achieving long term objectives of the organization - but the most important issues relate to mention of the four core activities - analyzing, planning, implementing and controlling marketing activities. Unfortunately, however, is difficult to identify those specific features that isolate the marketing management concept itself in relation to the marketing concept. Terms used in these definitions and significance of these terms do not lead to identifying a clear concept of marketing management. Rather it is an overlap of meanings, which creates the conditions for the occurrence of confusion between two terms.

It seems, however, that a number of other authors succeed, at least through the definitions, to create the conditions necessary to identify the specificity of the concept of marketing management.

Thus, two Australians, Miller and Layton offered a very succinct definition of marketing management, considering that this concept is essentially *“the vehicle used in business to enable the marketing concept”*¹⁵⁹³. Far from being exhaustive, the definition given by the two authors considers that marketing management is the manner of incorporation and implementation of marketing concept in practice, still not understanding very clearly what would be this vehicle. At the same time, however, the merit of this definition is that marketing management is not defined in relation to classical concepts associated with marketing, but placing it in a new level, thus preparing a new basis for a possible specific approaching of the concept.

In the same direction falls the definition offered by Stanton, whereby *“marketing management is the manner of implementing the concept of marketing in action, to increase consumer satisfaction and to maximize the profit”*¹⁵⁹⁴. And in terms of this definition, we can see that the concept of marketing management is not specifically defined in the context of traditional marketing elements, but again outsourced. Instead the concept of “vehicle”, used by Miller and Layton, we deal with the “manner of implementation”.

In 2003, Valerica Olteanu defined marketing management as a concept that *“deals with the processes and relationships generated by incorporating marketing, seen first as philosophy (optic, vision), run across your organization, and secondly as a set practical activities undertaken in the specific function”*¹⁵⁹⁵. The definition offered by the literature in Romania is that in consent with theories of marketing management which support the view that this is a process that is associated with the process of incorporation of marketing approach at the organizations level, focusing first on operational dimension - the marketing department, and second on strategic dimension and culture - at the corporate level. In our view, this definition is clearly showing key element of marketing management, namely the process of incorporation of marketing at the organizational level.

If some of the authors mentioned above have guessed, by definitions, that the concept of marketing management is “outside” marketing, the latter definition explicitly specifies the level or location where the marketing management process occurs. From this perspective, it seems logical to consider that

define and customize this concept is rather associated with the item of organizational structure, rather than the fundamental elements found in the definitions of marketing concept.

3.Our two theoretical hypotheses – marketing management as structural interface

Taking as a starting point made above details, we will try to issue a series of assumptions associated manner in which the concept of marketing management must be defined. These will constitute, in our view, some guidelines in identifying the features of the concept.

In the first phase to create the conceptual foundation of marketing management, we consider it to be associated with specific organizational structure of modern company and, of course, related to the trends for the organization of marketing activities.

From this perspective, it is known that modern organizational structure is composed of the following levels:

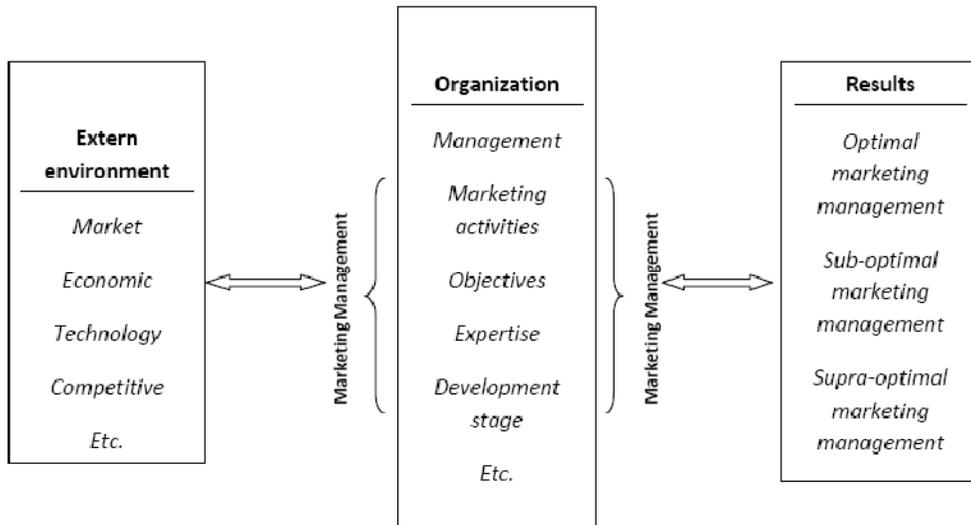

- the corporate, responsible for designing corporate strategic plan;
- the division responsible for plans relating to the allocation of funds for each business unit in its structure;
- the business unit responsible for developing the strategic plan needed to generate profitable results;
- the product level (product, brand), responsible for developing marketing plan for achieving the objectives on the targeted product market.

In this structural context, marketing management should be addressed, in our opinion, the manner in which marketing activities, the strategic and operational or tactical, are placed at these levels. There is also a logical, proven over time, that strategic and tactical activities of marketing have their place and role in all of these levels. For example, strategic steps are associated with higher organizational levels, while the operational or tactical ones are associated with lower organizational levels. Given these issues, we give a first hypothesis necessary in definition of marketing management:

H1 Marketing management, as a concept, is associated with how the marketing activities, both strategic and tactical ones, are placed at the four organizational levels: corporate, division, strategic unit, product / line / brand.

This first assumption is, however, generating other hypotheses. One aspect to be mentioned is related to the effectiveness of the structural placement. A good definition of any concept must ensure, in addition, possibilities for understanding it and putting it in practice. From this standpoint, it makes sense to intervene in the definition with more guiding elements which confer additional specificity. In other words, where exactly do we put marketing activities and what is their exact role in achieving maximum efficiency. The answer to this question is more complex, in our opinion. Modern marketing environment, with its unprecedented dynamism assumes no precise standards in conducting marketing activities, which are intended to safeguard the best results. Only if we look at the low rate of success of new products to market, we understand the difficulty of finding standard actions, and further the standards in structuring marketing activities. Therefore, we believe that marketing management as a concept, and as a system of positioning marketing activities to the external environment, will be also associated with a external context, and with a internal one. External context can be detailed by means of components, among which we mention: market conditions, competitive context, technological context, societal context etc. Internal context is associated with organizational realities, and may be further detailed as follows: overall management context, cultural background, stage of development of the organization, goals setting, expertise, etc. Given these clarifications, we believe that marketing management as a concept have to be implemented, further, in a broader context, namely the relationship environment-organization, being necessary to delineate its specifics, especially that associated with the conditions of efficiency and effectiveness. To be more explicit, we propose the following graphic expression of the relationship marketing management - organization - external environment.

Figure 1 Marketing management as structural interface

From the above figure we can see that marketing management can be considered a structural interface in relation organization - environment, that interface ensuring, with marketing activities, the success or failure. As a result, we propose the following hypothesis:

H2 Marketing management, as a concept, is associated with features of organization-environment relationship, being a structural interface of this relationship, still in the conditions of lack of guaranteed standards on how the process ensures efficiency in the external environment.

These two assumptions, far from being considered sufficient in the process of defining a concept, provides, in terms of authors, two key elements in understanding the significance of marketing management: strategic and tactical placement of activities in modern organizational structure and structural interface between the organization and environment. From this point, can be drawn, of course, a number of other questions: What is the placement of marketing activities in the organizational structure to ensure maximum economic efficiency?, what kind of relationship would be established between different hierarchical levels?, which means a optimal, over-optimal or sub-optimal marketing management? etc.

Conclusions

Motivation for this article was to identify the features of a concept that does not have a stand-alone place in marketing literature, and still wakes up some controversy. Studying a series of definitions of it, we concluded that there are real possibilities for supplementing them, giving dimensions of the concept that we have seemed obvious but which have not been explicitly mentioned. Thus, in addition to any theoretical valences of the two assumptions, which are a result of theoretical analysis, we believe these may be useful in future empirical approaches to study marketing management process.

Article examines changes in consumer behaviour occurred due to economic crisis. The article explores the changes that have occurred between late 2008 and early 2010 compared with the period from 2003 to 2008 and try to show new patterns developed by consumers arising from the crisis and developing in this context of ways of adapting for the Romanian retailers. The article also brings into attention strategies developed by shoppers for adapting to the crisis and opportunities for growing within the crisis context for the retail sector.

Keywords: Consumer behaviour, economic crises, retail, Consumers attitudes.

JEL Classification: M31.

Introduction

In 2008, Romanians state of mind could be characterized by effervescence, growth, more optimism, initiative, consumption. At present, we can speak of uncertainty, frustration, disorientation, vulnerability, stagnation, reserve, a wait-and-see attitude.

This psychological shock was largely generated by the “first-time” crisis, which took the Romanians by surprise, as they had no similar experience after 1990. The shock was even greater since the crisis followed a period of growth and enthusiasm, characterized by high consumption appetite. Moreover, the media “buzz” stimulated and maintained the “crisis psychosis”. Up until last year everything was going well: the economy was growing, laws had been passed that encouraged growth, and therefore, there was a basis, which, at present, is no longer available.

The experience of the crisis in Romania

The way Romanians experience and perceive the effects of the crisis is strongly influenced by the *line of business, the income level and age*.

On the one hand, regarding the *middle and upper income segments*, the effects of the crisis are felt much more on emotional level. The changes in the consumption and buying behaviour are not major yet and not strongly perceivable in concrete terms. Romanians are much more careful, aware, prepared to take measures. On the other hand, concerning the middle to low income segments, the crisis is quite strongly felt, including in the family budget, inducing major changes in the buying and consumption behavior. Their frame of mind could be described as including fear, insecurity, anxiety, stress, powerlessness

Employees in the *private sector* are more aware of and closer to the effects of the crisis, and sense greater psychological pressure and stronger adverse effects on their finances. *Government employees* are slightly more relaxed, on account of not being in close contact with clearly defined business indicators, hence not perceiving so strongly the impact of failure to achieve them, they don't feel

“directly” responsible for the effects of their work. Moreover, most of them don’t perceive clearly as yet the danger of bankruptcies or of dramatic salary cuts, staff cuts etc.

The crisis has provided *stagnation or reduction of income* (primarily bonuses, commissions that added to the family budget), *delayed salary payments*, *devaluation of the national currency in relation to the EUR and increase of prices* of many basic products (e.g. utilities, FMCG) and *lock-down of the loans market* (banks have stopped granting loans, the new loans are expensive and with rigid conditions). People work more for poorer results than last year and face expense cuts policy (phone calls, company car, other consumables) and staff restructuring.

Especially concerning the low income segment, difficulties in paying their debts of any kind have significantly grown (loan repayments, utility bills). Also, there have been an increase in loan repayment values. Daily basket is more expensive than last year. The crisis has blocked investments, as people have given up projects for which they required financing by the bank (purchase of a home / land / home renovation / buying a car etc.). They avoid to make plans - typical for Romanians is short term vision, “here and now”, which has become more apparent than in the previous years (they plan only from one month to the next). They envisage ADAPTING “ON THE FLY” to the new challenges, rather than planning and forecasting (on account of the uncertainty regarding the future). Moreover, there is increased pressure and stress at work *especially regarding the middle to upper income segment*.

Crisis perception

The presence of the crisis is a certainty for all, though the intensity with which its effects are felt differently between income categories, activity line and age. *Romanians with medium-high and high income* feel the crisis more on emotional level - “on the lookout”, more mindful of what happens with their money - rather than in their consumption behavior, while *the medium to low income segment* was visibly affected by the crisis, which has reduced their financial stability and the comfort of everyday life.

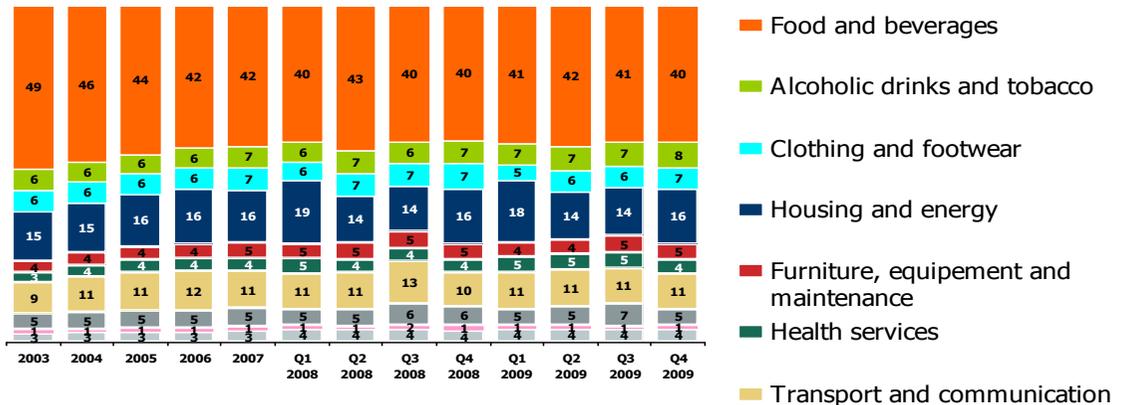

A significant part of the working people have had their financial situation affected by the crisis, primarily as a result of a drop in additional income (bonuses, commissions etc.) and secondarily due to delays in salary payments.

The consumers’ attitude regarding the evolution of the crisis vacillates between *uncertainty and skepticism*. Most romanians believe that the crisis will last more than 2 years. Within the next 6 month they don’t expect an improvement of their family’s financial situation, and hope that it won’t be worse than at present.

Whilst last year, without the crisis, *the main concerns* were to provide the required amounts of money for a decent living (meaning enhanced comfort) and to cover the inflation rate (which threatened their investments and earnings), this year the influence of the crisis on the quality of life is the main fear. The people’s fears are much more basic, they are related to the family’s stability and security: *impossibility to repay their debts and a drop in the quality of life, job loss, and price increase* (the reason for the first two fears).

In this context, *the need for security and control has become much stronger*. People are much more reluctant to take risks and the emotional connection with the family and the concern for their children have increased significantly.

Changes In Shopping Behavior

People are not very confident in the manufacturers' ability to adapt to the crisis without impacting the consumers negatively. Many Romanians believe that, on account of the crisis, the manufacturers will increase the prices of FMCG products. This perception (strengthened by concrete examples of price increases) explains why Romanians now *pay increased attention to the price when choosing the products as well as the shops*.

Whilst on account of the crisis *the interest for additional services provided by shops has dropped dramatically, the diversity of products is still a key selection criterion* (convenience and time saving are as important as the price), which justifies the consumers' choice for modern retail.

On declarative level, Romanians *are tempted by products in big packs* because they are more economical or have a better price. On the other hand, the crisis represents a growth opportunity for small packs because – whilst being more expensive – they enable better control of the budget, especially for middle to low segment.

The crisis has brought about a *more rigorous control of spontaneous shopping and diminished interest for "indulgence"*. Consequently, most Romanians stick to buying only the necessary products.

As the price has become more important, implicitly *promotions have a greater influence on the buying decision regarding everyday products*. Attractive promotions would determine many consumers to choose another product than their regular (switching behavior).

Consumers would be tempted to try *newly launched products*. On the other hand, as people have become more price sensitive and more open to promotions, a new product at an attractive price may become a tempting option especially for the medium to low segment.

In the first quarter of 2009, the *FMCG market increased by 18% in value*, driven by the growth of average price and higher quantities per trip. *Essential Food* products were the most influenced by the price increase, but with no negative impact towards household consumption – constant volume over the last period. *Supermarkets and Small Traditional Stores* seems to be the most affected – due to the fact that price became more important for consumers. Households living in Moldavia are more sensitive to the price growth, while families with children up to 14 years old don't modify their consumption behavior and constantly buy more volumes. *Basic Hygienic categories* were purchased more frequently but in higher quantities per trip – also due to increase preference for bigger economic packages.

Strategies for adapting to the crisis

Consumers' strategies for adapting to the crisis should be analyzed separately for low, middle and upper income categories.

- *Concerning middle to low and low income segments: the crisis has reduced their comfort and quality of life.* They try to cope with the crisis by adopting various strategies:

- Reduce the purchased quantities of products;
- The shopping list has become much more important, for better control of purchased products (they buy what they need and only as much as they need);
- They choose cheaper products within each category (milk);
- They change their consumption habits in order to save money (energy, laundry washing, cosmetics);
- They reduce the buying frequency or even eliminate completely some non-essential products;
- They pay more attention to the special offers presented in the hypermarkets' leaflets;
- Visits to shops are strictly functional (no leisure trips);
- Greater investments and durables - delayed projects.

- *Concerning middle to upper & upper income segments:*

- The consumption behavior has not changed significantly;
- The most affected areas are: savings (they cannot save as much money as they did last year) and holidays (they choose cheaper destinations);
- They try not to buy excessive quantities or to adjust the purchases to what they actually need but: they have not eliminated product categories and have not chosen cheaper products within each category, and the brand is still important.

Opportunities for growing within the crisis context

In the crisis context, *price has certainly become more important.* We may thus assume that modern retail, which offers good prices, will be the consumers' first choice. An *increased tendency to minimize risk* and *increased need for control* can be noticed, on the one hand, by choosing *small packs*, which enable a better budget management, and on the other, by *unconventional communication*, respectively, the increased importance of word of mouth or, in general, of messages that induce confidence and reduce uncertainty (e.g. testimonials).

Family, especially children, have become more important; children are priority no.1 and for them the parents are willing to invest even in times of crisis. Therefore, the *products for children* will be the last ones affected. Whilst the price of essential products has increased the most, the consumption of this category has been the least affected, and therefore, the *promotions for essential products* are the most attractive.

People from the medium to low and low segment are the most price sensitive. The strategies in this respect imply *undermining of brand loyalty* in the low segment, and, at the same time, *a new product with a good price* has good chances to win consumers. People with high income are still inertial in their consumption habits and then, their loyalty towards brands and products is less affected.

For the categories of products that are the first to be eliminated by the consumers in their efforts to reduce expenditures, it is necessary for the manufacturers to design strategies to prove to their consumers that they stand by them in these tough times. *The offers in the tourism sector* are an example of adaptation to crisis conditions. Their success is to be proven over the next months. Also, there is increased potential for *products that enable saving*, reduction of expenses related to utilities – e.g. detergent with increased washing power, hence requires less electricity.

Pastimes that require small investments, or in home entertainment, will grow. There is growth potential for *product categories for home entertaining* (snacks, beer), big packs for parties or picnics, etc. *In on trade* the budget allocated per visit will be reduced, resulting in the growth of budget products or brands. At the same time, the interest for *open air events* may increase, as an alternative to going to

bars, pubs or restaurants, which involve greater spending – e.g. beer festival, it is important for the producers to be there to have their products tried.

We can also mention that, on account of the crisis interest for social topics has been reduced significantly and therefore *CSR campaigns* will probably be less impacting and will attract attention to a lesser extent.

Conclusions

Romanians experience and perceive the effects of the crisis according to variables among which the income level is highly important. Romanian consumer behaviour has been analyzed accordingly. The crisis has reduced the comfort and quality of life of middle to low and low income segments, and thus they adapt using strategies like reduce the purchased quantities of products, they buy what they need and only as much as they need, they choose cheaper products within each category, etc. The consumption behavior has not changed significantly concerning middle to upper & upper income segments, the most affected areas being savings and holidays. Opportunities for growing within the crisis context should be based on the fact that In the crisis context, price has certainly become more important.

As main expectations regarding consumption over the next 6 months, we may assert that durables and car purchases have been the most affected in the first quarter of this year on account of reduced allocated budgets, while holidays, investments in leisure and clothing are the categories of purchases that will continue to be the most affected by the crisis. Utilities and food are the categories that are expected to grow the most.

MARKET ORIENTATION: A HOLISTIC APPROCH OF THE IMPLEMENTATION PROCESS

Pandelică Amalia
University of Pitesti
Faculty of Economics

Pandelică Ionuț
AGORA Univestity of Oradea

Jianu Eugenia

This paper is a conceptual one and is based on an extensive analyze of the literature in the field about market orientation during the last 20 years. The purpose of the paper is to highlight the way in which researchers' studies focused on different aspects of the concept during years and thus, to establish the stages that the analyzed concept underwent within its evolution. At the same time, we tried to synthesize the most important findings of the empirical researches on this subject since 1990 in order to emphasize what is market orientation. Therefore, the model of analysis is rather descriptive than normative, focusing on the most important findings of the empirical researches of the period we refer to. At the end of the paper, there is a presentation of a series of conclusions regarding the way in which the process of implementation of market orientation has to be approached taking in to account the new type of environment characterized by volatility and complexity.

Key words: market orientation, holistic approach, implementation process

JEL Code: M31, M14

Introduction

In marketing literature there is a large agreement about the roots of market orientation. Thus, it is considered that this concept has its origins in a managerial philosophy known as the concept of marketing.

The first who used the denomination "concept of marketing" was McKitterick (1959). During the same year, Felton described it as being the latest fashion in business. The definition of the concept of marketing evolved through the contribution of many researchers. Thus, Felton (1959) defined it as corporative declaration integrating the functions of marketing and harmonizing them with the other corporative functions for the purpose of achieving a basic goal – long-term profit. In 1972, McNamara placed the client in a central position defining the concept of marketing as a managerial philosophy client-oriented based. He acknowledged the important role of marketing in disseminating market information to all departments of the organization. In 1997, Kotler brought into attention competition in order to define the concept of marketing and he stated that the key of achieving the organizational goals consisted in being more efficient than the competitors regarding the functions of marketing and channeling them towards determining and satisfying consumers' desires. Since 1950, the concept of marketing has been praised, criticized, talked about and finally, as some specialists emphasize, rehabilitated under a new name: market orientation (Raaij, 2001).

From our research we identified the first use of the denomination of market orientation in 1988, in an article published in Harvard Business Review. But this denomination started to be used on a large scale beginning with 1990, after the publication of two important papers in *The Journal of Marketing*. These present the results of some researches made by two distinctive teams of researchers: Narver and Slater; Kohli and Jarowski. In one of these papers the term *market orientation* is used as implementation of the concept of marketing (Kohli and Jaworski, 1990). Thus, a new perspective over the concept of marketing has imposed which led to a new specialized body of literature around this perspective.

The methodology of research

In order to achieve the propose of our research, within the first stage, we identified and picked up over 60 articles published during 1990-2008, on market orientation topic.

Considering the great number of texts identified and chosen but also the diversity of research issues and perspectives, our approach may seem unrealistic and hard to accomplish. Still, our purpose is not to compare these works but to seize the manner in which they complete each other for the extension of market orientation concept.

In order to facilitate the process of analysis, we used classification. The texts were ranged according to the declared purpose of the research. This criterion was preferred because we considered that a classification according to the purpose of the research will allow us to notice if there is a concentration of the researches and if this exists to determine which are the stages of the concept during its evolution. The classes resulted are: Class A: The definition, the construct and the measurement of market orientation; Class B: The identification of the antecedents and consequences of the market orientation; class C: The implementation of the market orientation; Class D: Other purposes. The analysis of the texts was made for each class using hermeneutic spiral. Thus, the analysis started from a small number of works, relevant for the specialized body of literature and adding step by step other works with other points of view.

The establishment of the conceptual identity of market orientation

Since 1990 several perspectives of defining the market orientation concept were described: (1.) cultural perspective (Narver and Slater, 1990); (2.) behavioral perspective (Kohli and Jarwoski, 1990); (3.) strategic perspective (Rueckert, 1992); (4.) client orientation perspective (Deshpande, 1993; Day, 1994); (5.) strategic actions perspective (Lado, Olivares, and Riviera, 1998); (6.) value chain perspective (Baker, 1999; Simpson, 2001; Grunert, 2002). As the number of perspectives increased within the specialized literature, a great number of definitions occurred for this concept.

Market orientation is a business philosophy whose final purpose is to create the superior value for the client (Narver and Slater, 1990).

We use the term market orientation to illustrate the implementation of the concept of marketing within the organization (Kohli and Jaworsk, 1990).

Market orientation within a business unit is the degree at which the business unit gets and uses information about the clients, develops a strategy leading to the clients' needs and implements the strategy having thus, the capacity of responding to the clients' needs and desires (Rueckert, 1992).

Market orientation represents the implementation of a particular business philosophy – the concept of marketing (Deng and Dart, 1994).

Market orientation is a strategy leading to obtaining the durable competitive advantage (Rivera, 1995).

Considering the variety of definitions, researchers proposed various constructions of market orientation. Approaching market orientation from a cultural point of view, Narver and Slater (1990) identified three components of the concept: client orientation, competition orientation and inter-functional coordination. Client orientation is considered the basic component of the market orientation. The two researchers state that when consumers' needs are identified and understood superior value can be built, communicated and delivered. According to the second component, the organization must identify which are the strengths and weaknesses of the main competitors, the goals they pursue and what strategies they adopted in order to reach them.

Approaching the concept from a behavioral point of view, Kholi and Jawroski (1990) identified, in their turn, three components of the market orientation: gathering information about the consumers' needs, desires and demands and about other components of the environment in which the organization operates; the disseminating of information gathered to all functional departments within the organization; the response of the organization based on the information gathered.

In marketing literature, there have been proposed several scales of measurement for market orientation illustrating these constructions. Two of them were adopted and used by many other researchers:

MKTOR (Narver and Slater, 1990) and MARKOR (Jarowski Kohli and Kumar, 1993). In 1990, Narver and Slater presented MKTOR, a scale of measuring market orientation containing 15 items that reflected the three components of their construction: client orientation, competition orientation and interfunctional orientation. In 1993, Kahli, Jaworski and Kumar introduced a scale of alternative measuring MARKOR containing 20 items reflecting the three components proposed by these authors: gathering information from the market, dissemination of the market information within the organization, the response of the organization to market information. A consistent part of the works that followed during the years represented syntheses, extensions or rejections of the two scales of measurement.

In the first half of the '90s the researchers were concerned with finding answers to the following questions: What is market orientation? What are the constitutive elements of the concept? How can market orientation be measured?

The identification of the antecedents and the consequences of market orientation

The degree of market orientation depends on the presence or absence of some internal factors of the company, factors that have been labeled by specialized literature as antecedents of market orientation. Many researchers identified and tested empirically more categories of factors that can intensify or inhibit the development of market orientation within the organization.

In a comprehensive study Kirca, Jayachandran and Bearden (2005) showed that only interdepartmental connection and top management emphasis were significantly related to market orientation. Hammond, Webster and Harmon (2006), as well, thought that top management emphasis is directly related to market orientation stating that top management emphasis represents antecedents of market orientation playing a critical role in maintaining it within the organization. The importance of top management in attaining and maintaining a certain level of market orientation is confirmed in Day's study (1994), as well.

Top management risk aversion is another factor that may diminish market orientation. Thus, researchers demonstrated empirically that the higher the risk aversion, the lower the market orientation degree (Jaworski and Kohli, 1993; Van der Velden, 2004; Hafer and Gresham, 2008).

The connection between departments, the extension of formal and informal contacts between employees of various departments, intensifies market orientation as they lead to a better transmission of market information within the organization. Kohli and Jaworski (1990) emphasized that the low interest for other departments ideas and the lack of interdepartmental connection diminish the company's capacity for a proper response.

Formalization and centralization are organizational characteristics that inhibit market orientation. Thus, formalization involves the establishing of roles, procedures and authority through rules and reduces dissemination and usage of market information and accordingly, market orientation. Similarly, limited commissioning of the authority in decision-making process has a negative effect on market orientation (Matsuno and Ozsomer, 202).

A market-oriented payment system practice motivates those actions of the employees that increase market orientation. Market-oriented training determines employees' awareness for clients' needs and stimulates market orientation (Rueckert, 1992). Kica, Jayachandran and Bearden (2005) demonstrated that market orientation may be implemented successfully even in the case of centralized structures if there is a good interdepartment connection, there are suitable rewarding payment systems and market-oriented training programmers are developed stimulating, thus, those market orientation characteristic actions.

Kohli and Jaworski (1990) pointed out that market orientation generates a cost. Due to this reason, Day (1994) thinks it is essential that all consequences regarding market orientation, from top to bottom of the organization, be evaluated critically by the manager.

The relation between market orientation and organizational performance was explored within many researching studies, in different contexts and different methodologies. In 2002, Woller identified in a

study, 48 researches which analyzed the relation between market orientation and organizational performance measured as: profitability, sales, market share, innovation process success and pointed out that 44 of these concluded that there is positive relation between market orientation and organizational performance. Recent literature on market orientation suggests the fact that one of the keys for understanding this phenomenon is the positive effect that it has on the innovation process (Atuahene-Gima, 1995, 1996; Xuereb, 1997, Han, 1998, Hurley and Hult, 1998). Slater and Narver (1996) thought that innovation is the central competence for creating superior value that moulds the relation between market orientation and organizational performance. Quin (1986) appreciated that innovative businesses have a strong market orientation component. Going further, Narver and Slater (1996) said that innovation and the successful product is more likely to appear if the business is market oriented. Thus, there was empirically demonstrated that market orientation increases the company's ability to create and implement new ideas, products or processes (Hult and Ketchen, 2001) and the performance of the new products in terms of market share, sales, turnover and profitability (Im and Workman, 2004). According to our analysis, we recorded that during 1995-2005 although there were papers proposing new definitions, constructions and scales of measurement a great deal of researchers focused on finding reliable answers at the following questions: What are the stimulating or inhibiting factors for market orientation? What are the effects of market orientation? How does market orientation affect the organization?

The implementation process

Until 1995, the problem of implementation was approached only by few general studies, which did not provide a systematic model of implementation. Generally, the problem of implementation is seen as interventions recommended to practitioners willing to implement market orientation.

In 1998, Narver, Slater and Tietje, approaching market orientation as organizational learning, proposed two implementation strategies called: programmatic approach and market-back approach. In 1998, Lando, Olivares and Rivera thought that taking into account the promising results of their study, a future research direction would be the development of an intervention plan to grow company's market orientation. They suggest that market orientation measurement scale they developed should be used before (as a diagnosis instrument) and after (as an evaluation instrument) using the interventions. In 2003, Lichtenthal and Iyer approached the market orientation implementation process establishing the place and the role assigned to the marketing department within this process. In 2008, Ulrich and Smallwood described a series of steps that should be taken for the construction of a market orientation organizational culture from outside towards inside. Considering that the process of implementation of market orientation is a process of organizational change, in 2008, we proposed a methodological framework for implementing market orientation that comprises some stages the management should cover in order that the company could become more market-oriented. Without underestimating the importance of the proposed interventions, our analysis points out that the problem of implementation is still insufficiently discussed about in specialized literature. The questions of practitioners about how an organization can become more market oriented are questions for which market orientation theory provides only partial and variable answers.

A new perspective of approaching market orientation

As we emphasized during the past 20 years, researchers presented different perspectives of approaching market orientation. The great number of different perspectives conducted of a great number of definitions for this concept. Some researches consider that this suggest an unclear understanding of this phenomenon. For example, Dreher (1993) thinks that from a concept point of view, there is a certain ambiguity regarding the nature of market orientation phenomenon. Is it a business philosophy or a set of current activities? Is it an organizational culture or a behavioral set? Is it a competitive strategy or a set of managerial practices? Gabel (1995) as well, thinks that the field of the concept is not clearly and correctly confined. From our point of view, this debate regarding the definition of the market

orientation concept comes out of the fact that it was explored within the frame of other fields. We consider, also, that these perspectives are more complementary rather than divergent. ***This emphasizes the interdisciplinary and complex nature of the concept.*** Still, each perspective offers only partial and very different answers to managers' questions regarding the market orientation implementation process. For instance, Jaworski and Kohli (1993), presented the implementation process as a set of interventions within the organization which should increase the degree of market orientation: senior management stronger involvement, a better interdepartmental connection and a decrease of interdepartmental conflicts, reconfiguration of organizational systems (organizational structure, rewarding systems). On the other hand, Rueckert (1992) thought the following interventions: adapting the recruitment and selection systems, adapting the training systems, adapting rewording and compensation systems. In some ways these interventions are completing each other; still these don't provide a systematic model of market orientation implementation. For developing such a model researchers should adopt a holistic perspective: market orientation as a business model. Such a perspective will allow the development of the implementation model having in mind the entire organization. This is very important if we take into account the fact that the implementation process is actually a change process that unsure the transition of the organization from the usual way of doing business to a new logic of doing business (a new business model). In the process of implementation in some cases it could be major changes that will affect an important part of the organization as in some cases it could be some minor changes that will affect only some organizational variables.

Conclusions

Definitely, market orientation has represented one of the most important and exciting fields of research in the last 20 years. Since 1990 an entire specialized literature has evolved around two important works published in the *Journal of Marketing* by Narver and Slater; Kohli and Jaworski

Even if the researchers were concerned with the problem of concrete measures for implementing market orientation since the half of the '90s, the matter has not been enough exploited within specialized literature. We do not refer to the lack of propositions for interventions that should increase market orientation degree, but we refer to the lack of complete models that could provide managers answers to the following questions: Where do we start from? (The diagnosis of the company's present situation) – Where do we go to? (The establishment of the changes that should take place within the organization) – How do we get there? (The strategy of market orientation implementation and concrete actions programs) – Where did we get? (The evaluation of the implementation process).

We noticed that specialized literature provides a series of partial answers to these questions and the answers vary on a great extent. In conclusion, we think that at present, market orientation concept finds itself at the stage of implementation and that in the future, researchers should focus on the development of such models to assist the practicing specialists in market orientation implementation. Also, we consider that such models should be developed taking into account a holistic perspective of the organization: market orientation as a business model

EMAIL MARKETING CAMPAIGNS: THE EASIEST PATH FROM ORGANIZATIONS TO CONSUMERS – AN EXPLORATORY ASSESSMENT

Pantea Carmen

Academia de Studii Economice București, Facultatea de Administrarea Afacerilor (cu predare în limbi străine)

Pop Al. Nicolae

Academia de Studii Economice București, Facultatea de Marketing

The email is a valuable marketing tool for conveying short, simple messages that call for action on behalf of the recipient. Usually companies develop email marketing campaigns for attracting new customers, persuading the existing customers to buy again, encourage customer loyalty, announce or remind about special offers or events. For an email marketing campaign to be efficient, it is wanted a greater number of responses from those in the target.

The paper assesses in an exploratory manner the frequency in using the email accounts, the level of exposure to email marketing campaigns as well as the type of information wanted to be received by the Romanian users.

Keywords: email marketing, online marketing, Romanian consumer.

JEL Classification: M31

Introduction

Over the past few years, the tremendous technological development managed to break time and space barriers, but in the same time raise another one, very difficult to pass: the relationship one. The communication challenges rise at the very heart of what should actually represent a favorable relationship climate: living in a multicultural environment and following the globalization trends. The first that have to face it are the companies in their process of creating, developing and maintaining relationships with their “star” stakeholder: the customer (Pop, Petrescu, 2008).

The question is how to address effectively and efficiently customers belonging to different cultural backgrounds, looking for light-speed transactions, and respecting their privacy needs, while gathering valuable information and trying to keep in touch. The marketing tools that seem to have the best offer in terms of CRM are the online ones (Wang et. al, 2009). The reasons range from the low implementation costs when compared to other methods, to great accessibility opportunities, effective managing solutions and confidentiality tools such as online secured privacy policies.

As a consumer, surely no day goes without coming across to at least one of them. The most known are websites, e-mail marketing, blogs, RSS, forums, newsletters, instant messaging, social networks, search engines, etc. Used by companies, all these have in common one thing: creating and managing a relationship with both existing and potential customers (Vegheș, Pantea, 2009). The greatest advantage is that the Internet offers a relatively inexpensive ticket for a big entrance on a vast, continuously increasing market, while also giving a diversified choice of multimedia instruments that could be used in order to reach the audience (Pop, 2006).

In 2006, e-mail marketing won the first place for the most effective tool in increasing demand during holidays in retail business, according to WebTrends, leaving search engine marketing and search engine optimization on the second and, respectively third place. In addition, research shows that the tool is used by 80% of retailers regularly as the main customer relationship management instrument. As a result, investments in marketing for the holidays had their biggest increase in e-mail marketing with 52%, followed closely by 46% in search engine marketing and 38% in search engine optimization. However, the online glamour around some of the e-marketing tools is starting to fade away, as the media power slowly shifted from the company to the consumer, making room for more “pull” oriented

approaches, rather than “push” ones. This is one of the reasons why online banner ads experienced the greatest decrease in spending with 17% (Pantea, Vegheş, 2009).

Literature Review

The email represents the result of the natural evolution of the mailing. Email marketing is used in order to inform potential consumers and current clients by the use of the internet and it is the most popularly used element of the web (Gay, Charlesworth, Esen, 2007). The email or the electronic mail is one of the most efficient tools from the direct marketing’s arsenal on the internet, from the investment’s profitability point of view. The results regarded by an email marketing campaign is achieving sales from 5 to 15% of the cases, as compared with 0,5 to 2% in the case of the banners.

There are two forms of email communications:

Email communication initiated by the consumer: due to the presence on the companies’ websites of a contact page, the organizations offer their potential and / or current clients the opportunity to get in touch with them. The client sends an email where he explains the problems or complaints that he has concerning the product he has bought, or asks for details regarding a certain product. The company will answer also by email in the shortest time. The email is the cheapest web solution of the customer relationship management strategy (eCRM). Its main disadvantage is that it does not offer the opportunity to communicate with the client in real time.

An important aspect is related to the companies’ capacity to manage their clients’ replies to emails. It is imposed that when receiving the message, an email of confirmation to be sent immediately, and the clients’ requirements to be redirected to the responsible departments in the organization.

Email communication initiated by the company: the email is a valuable tool for sending short messages that call for action on behalf of the recipient. The companies usually develop email marketing campaigns with the purpose of maintaining current customers, build buyer’s loyalty, improve the relationship between the client and the seller, announce or remind the clients about different offers or special events they can attend. In order for such a campaign to be efficient, the messages should be addressed to a target, so that the rate of response is high. Usually there are inserted links to a “landing page” (a web page where it is driven the person who click on the link inserted in the email, which offers additional information concerning the products presented in the message). The email is the most spread internet application, which can be used strategically in direct marketing reasoning and in the bilateral communication with the target.

The main advantages of email communication are:

- the informational content and the relationship sender - recipient – the beneficiary can receive complex information (images, audio, video files or documents) rapidly and conveniently. He can read them whenever he wants, without incurring problems such as when using phone communication, where even though there is fast communication, there can be the case when the interlocutor can not talk at the moment of calling or does not understand well the message due to the circumstances he finds himself in. It can also be attached a short presentation movie where the product is presented and its features or there can be added representative pictures about the object of the direct email campaign;

- in most cases, the feedback is more consistent than phone calls or mailing, because the interlocutor can reply whenever he wants, however he wants and whatever he wants;

- probably the costs are the most important advantages to be taken into consideration, both by the organization and the beneficiary of the communication. They are lower then any other existing communication mean. That is why the beneficiary of the communication will have the reasoning to answer, since in most of the cases, he does not incur any additional costs;

- segmentation and targeting – both strategic components receive a special significance when using the email. Thus, the campaigns can be easily customized according to the consumers’ particularities;

- the results of an email marketing campaign can be easily measured with by using special software, which generate reports based on the number of emails opened by the recipients.

When implementing an email marketing campaign it is important to follow seven stages: determine the objectives of the campaign, develop the mailing list, the content, the landing page, test the content and the technology, send the emails and measure the results obtained (Charlesworth, 2009).

When the company inserts links to the landing page, the soft reports how many times those links were accessed. The main advantages of including links in the sent message are, on one hand the increase of traffic on the website, as well as the registered persons.

The electronic message should be developed starting from the current positioning of the organization (including its products / services / brands) and to materialize into an attractive offer for potential consumers (Vegheş, 2003).

The email is a valuable marketing tool for conveying short, simple messages that call for action on behalf of the recipient. Usually companies develop email marketing campaigns for attracting new customers, persuading the existing customers to buy again, encourage customer loyalty, announce or remind about special offers or events etc. For an email marketing campaign to be efficient, it is wanted a greater number of responses from those in the target.

The difference between the email marketing and newsletter is that the email marketing calls for immediate action from the recipient while the newsletters are meant to develop a long-term relationship between the sender and recipient. Newsletters are intended to offer the readers added value; they are more personal and informative.

The newsletter is a periodical message sent online to the company's database of subscribers who have previously agreed to receive it. It usually contains one or more of the following tools: an article / interview / editorial, case study, news, special offers / promotions, new projects / up-coming events, contests, polls or other resources.

When planning the online marketing strategy, the online marketing tools should not be treated separately. For instance, the newsletters sent by email can be promoted on the website and vice-versa. Combining different instruments offered by the internet in a single strategy can improve the rate of its success.

Methodological notes

The specific objectives to be reached through the present exploratory research approach referred to the main aspects concerning the email marketing campaigns and the use of this tool by the consumers: the frequency in using the email account, the level of exposure to receiving commercial messages and the type of information wanted to be received by the public. Questions concerning the email marketing campaigns had represented only a specialized part inside of a consistent questionnaire approaching all the tools consumers are exposed through the online marketing campaigns conducted on the market. Data have been collected online in February-April 2010.

The sample has included 153 respondents (65 male and 88 females), aged 18 to 29, from Bucharest. The focus was on this category, called in the marketing literature as the Generation Y, which is motivated by the significantly higher penetration and, respectively usage of the internet and, particularly of the email services.

Major findings of the research

Nowadays, the use of the email has become compulsory and the results of the survey come to attest the fact that each of the respondents owns at least one active email account (by an active email account it is understood that the respondent checks at least once a day that email account).

Most of the respondents have two active email accounts (45.1%), 23.5% of them own just one active email account, 20.9% check daily at least three email accounts, 11 of the respondents have four email accounts and 5 of the respondents have recognized they check more that five email account each day.

It is important to mention the fact that out of the investigated sample, 89.5% of the respondents have one up to three email accounts. Regarding the remaining percent, it should be mentioned that 6 males as

compared to 5 women own four email accounts, and 4 males as compared to just one woman have more than 5 email accounts to check daily (table 1).

Table 1. Number of active email accounts owned at the level of the investigated sample

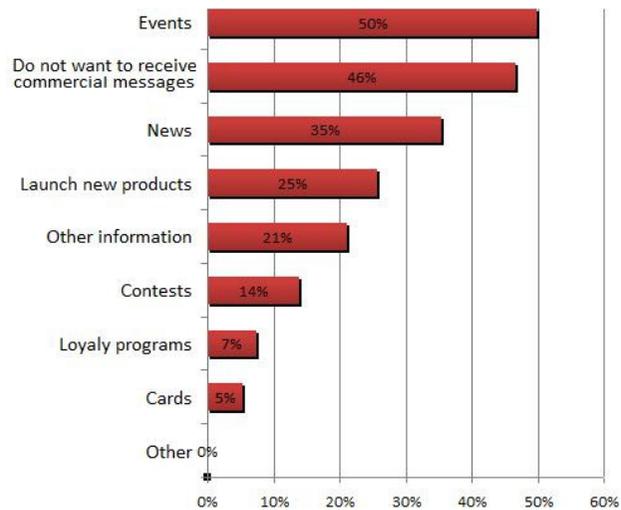

Number of active email accounts	Male	Women	Total
1	14	22	36
2	29	40	69
3	12	20	32
4	6	5	11
above 5	4	1	5
Total	65	88	153

Each day, 63.4% of the respondents receive one up to four commercial emails. These messages promote different products, services, brands or events; 9.15% of them receive five or six emails and only 5.88% receive more than seven commercial messages. However, surprisingly enough, 21.57% of the people interviewed, a number of 33 persons, stated that they do not receive any commercial messages (table 2).

Table 2. The average number of commercial messages received by email per day correlated to the number of active email accounts owned

Number of active email accounts	Average number of commercial messages received					
	none	1-2 emails	3-4 emails	5-6 emails	7-9 emails	more than 10 emails
1	14	14	7	0	0	1
2	13	32	13	5	2	4
3	1	10	13	7	1	0
4	4	2	3	1	1	0
more than 5	1	1	2	1	0	0
Total	33	59	38	14	4	5

In what concerns the information that the investigated sample would like to receive by email, daily, most of them mentioned that they would like to be kept updated to the events the companies are organizing (50%), to find out new things about the organizations (35%) and to know information about the new products that are ready to be launched on the market (25%). The consumers are also interested in the contests initiated by the companies (14%), their loyalty programs (7%) or are interested in receiving cards from the companies (5%), for different occasions. It is important to highlight that a number of 71 respondents (46% of the respondents), would not want to receive any commercial emails, fact that suggests that they prefer to search for the information they need to know and do not want to be disturbed with this type of emails.

Conclusions and Limits of the research

It is difficult to draw conclusions about the development and employment of the email marketing campaigns after an exploratory research approach conducted at the level of a rather specific group of consumers. The results of the study are significantly limited by the nature of the sample and this should be one of the further improvements to be made in terms of the research methodology. Another important limit of the study is represented by the orientation of the questions towards the obvious aspects of the existence and employment of the email marketing campaigns.

Still, there are several facts that have been observed based on the results provided by this exploratory approach:

- the majority of the respondents own and check daily two email accounts;
- more than 60% of the investigated sample receive daily one up to four commercial messages;
- the type of information considered to be of interest and wanted to be received by email by the Romanian 18-29 years old respondents are the organization's events, news related to the company, the launch of new products, other type of information, contests organized, details about the loyalty programs and different cards for different occasions;
- about half of the respondents do not prefer to receive commercial messages, but they want to search for the information they need themselves.

Further directions of research to be considered refer to the:

- expanding the dimension of the investigated population through getting out from Bucharest and covering the whole country (including the urban and rural areas), respectively through extending the demographic profile of the sample covering not only the group aged 18-29, but also consumers from other categories (at least members of the active population);
- increasing the complexity of the information generated through the research by introducing supplementary questions about the format of the message received by email, the elements that should be or not found in the commercial message or related to the amount of information that would convince the receiver to buy or contact the organization that developed the campaign.

This article is a result of the project **“Doctoral Program and PhD Students in the education research and innovation triangle”**. This project is co funded by European Social Fund through The Sectorial Operational Programme for Human Resources Development 2007-2013, coordinated by The Bucharest Academy of Economic Studies.

The purpose of this article is to highlight the importance of pricing strategy in the retail sector and the power of their influence on consumer behavior. Merchants should consider the price generates perceptions and can influence consumer behavior and buying customers. They must also understand how to participate in the price of consumer satisfaction.

Keywords: Consumer behaviour, price strategy, retail, price satisfaction, price fairness.

JEL Classification: M31.

Introduction

The competition in retail trade is a complex phenomenon. Retailers are running into competition using the whole arsenal of the marketing strategies at the level of marketing mix, tempting the customer with an attractive set of products, competitive prices, suitable places and a lot of other services and promotional activities.

Therefore, the companies choose the service stocks which helps at the maximization of profits, depending on the types of consumer, they expect to attempt and their rational belief, regarding the rival's actions. Price strategy in retail trade becomes a key element in this multi-dimensional package. Price becomes one of the most important elements of the retail marketing mix. Lately, the complexity and the speed with which the merchants develop raise the influence upon the final prices of the products that they have.

Traders usually use various pricing tools and promotion policies to attract new customers and increase customer loyalty. Surprising is that pricing strategies have proved to be a fruitful research area for marketers. Marketing scientists have offered both theoretical and empirical estimates showing that for all types of consumers different price policies are likely to attract.¹⁵⁹⁶ Although well known reasons why a consumer selects a store, we know relatively little about how retailers choose pricing strategies because of the complexity of such a decision should take into account both consumer preferences and current and anticipated actions of rivals.

Price strategy and retail performance

Price perception has a significant impact on consumer satisfaction¹⁵⁹⁷, which determines performance in retail sales and consumer loyalty. Different dimensions of price perception and potentially can lead to customer satisfaction in addition to simple product price level. In a retail context, additional dimensions

¹⁵⁹⁶ Rajiv Lal, Ram Rao,(1997) *Supermarket Competition: The Case of Every Day Low Pricing*, Marketing Science, 16, (1), 60-80.

¹⁵⁹⁷ Varki, S. and Colgate, M. (2001), *The role of price perceptions in an integrated model of behavioral intentions*, Journal of Service Research, 3(3), 232-240.

include, for example, value for money and price fairness, convenience and price perception and mental processing the price¹⁵⁹⁸.

However, not only generally important to explore the power relationship between these dimensions and satisfaction, optimal strategy, but it is essential to identify asymmetric effects in these relationships. For example, based on opponent-process theory assumes that some dimensions of price perception, such as price fairness, are mandatory requirements. If these demands are not met, customers will become very unhappy, however, their fulfillment will not actually increase satisfaction. In contrast, a good performance in other dimensions may not come by itself.

Underperformance in these dimensions could lead to dissatisfaction, but a good performance will increase satisfaction significantly. Low performance could not lead to dissatisfaction, but a good one rise notably the satisfaction. Knowing these asymmetric effects is extremely important because it helps retail managers to allocate resources to different performance dimensions. Retailers must be aware that price requirements must be met to a basic level and that their value must be fulfilled.

A modern price policy must protect consumer perception on choosing the best place to buy for their family. Consumers face prices that's hard to pay tend to buy elsewhere. Many consumers get confused by the pricing policy without having an understanding and only reacting to competition, prices or marginal goals. Even if some consumers are capable of saying why they are confused in retail trade environmental, the study done by the Wharton Business School indicates that consumers rely on three references points when they decide what they think is a fair retail price:

1. How much does the object cost in the past?
2. How much the rivals ask for same object?
3. Their perception about selling costs of the same objects

Considering other areas for business improvement, development and implementation of strategic pricing schemes can produce higher repercussions compared with the of loss control efforts. Teachers at Wharton, Z. John Zhang and Jagmohan S. Raju had made an important statistic in a recent research paper: a 1% reduction in fixed costs improves profitability by 2.3%; a 1% increase in volume will result in a 3.3% increase in profit; a 1% reduction in variable costs will prompt a 7.8% rise in profit; but a 1% hike in pricing can boost profitability by 11%.¹⁵⁹⁹

So far, satisfaction of the retail price has not been addressed in detail in the international marketing literature. Only a few researchers have discussed issues related to service satisfaction price.¹⁶⁰⁰ Therefore a satisfaction price definition has been derived for many common projections of client's contentment.

Price satisfaction: a definition

Therefore, a definition of price satisfaction is derived from the more common projections of customer satisfaction. Satisfaction seen in the context of retail sales is an emotional reaction to his or her individual evaluation of an overall set of experiments conducted by encouraging dealer. The satisfaction is "the function of knowledge and affect". By merging the two definitions, price satisfaction can be defined as an emotional reaction resulting from the interaction of cognitive and affective mental processes that are caused and enabled by specific experiences with different dimensions of price perception. After defining the satisfaction price it is necessary to clarify the relation between this and similar constructions latent variables, especially image price and attitude price. Price satisfaction is

¹⁵⁹⁸ Zielke, Stephan (2006): *Dimensionality and Impact of Retail Price Images*, Proceedings of the 35th EMAC Conference, European Marketing Academy (EMAC), Athens, Greece.

¹⁵⁹⁹ Raju, Jagmohan S. and Zhang, Z. John. (2003) "Choosing the Wrong Pricing Strategy Can Be a Costly Mistake." Knowledge@Wharton.

¹⁶⁰⁰ Matzler K., Renzl B. & Rothenberger S. (2006). *Measuring the Relative Importance of Service Dimensions in the Formation of Price Satisfaction and Service Satisfaction: A Case Study in the Hotel Industry*, Scandinavian Journal of Hospitality and Tourism, 6 (3), 179-196,

different from image price and attitude satisfaction price because the result is the peculiar shopping, buying or experiencing, which is not necessary to complain about an image or attitude.

However, different relationships exist between these structures. Satisfaction through a shopping trip may influence attitudes towards the store price image. But customers can derive the expected price, which is taken as a price comparison in the process of building the satisfaction.¹⁶⁰¹

In the literature, price perception is often measured in one dimension as an antecedent of overall satisfaction. However, research on retail price image illustrates the price perception by each customer sizes. It is therefore possible to treat these dimensions of price perception as antecedents of a single dimension of price satisfaction and overall satisfaction¹⁶⁰². Such multidimensional analysis is advantageous because it offers greater diagnostic potential for improvement if you have unsatisfied customers¹⁶⁰³.

In addition, customers often evaluate their satisfaction after shopping at an attributive level, a finding that also related to the price of satisfaction.

Consequently, the impact of different dimensions of perception of price satisfaction on price formation will be explored. International literature does not offer any tool for analyzing price retail satisfaction for a scale with more products. However, research on retail price image provides important suggestions on the dimensions of price perception are potentially relevant to price formation of satisfaction. Six dimensions of satisfaction can be derived from the image perceived in terms of consumer prices:

- Value for money is often defined as a result of price matching and quality evaluation. On a more abstract level, the result of a careful balancing trade between the utilities from product stores and stores duties. (“Reasonable prices”, ”offers good value for money”, “service or good for the price is economical”).

- The perception of price level (“low prices“). Of course, the perception of price level is somewhat correlated with value for money and some researchers even treat the perception of price as an indicator of value, “the general prices compared with competitors. However, in this study, value and price level are treated as different dimensions of price perception. A connoisseur can assess value for money in a wine shop as good, although he perceives as higher prices compared with those of supermarkets.

- Fairness price. How fair is a price or not? More precisely, price adjustment is perceived as fair? Most clients consider a price increase for snow shovels after a snowstorm, increasing the price of lamb meat and eggs in Easter or price increase during the holiday season as unfair , while price growth in wholesale trade to protect profit acceptable.

Consequently, customers can charge the same price, right or wrong, depending on the context.

- The price perceptibility is the ease with which prices are found in the store. It is strongly related to price labeling, which has a significant impact on customer satisfaction.

- The prices processability refers to the ease of processing the price, especially when comparing price with other products in the store. Shelf may have a strong influence on this dimension (eg, processability is supported if the marks are national private brands almost equivalent value for money).

- Special Offers relates to products offered at reduced prices temporarily. Special offers are important promoters of satisfaction. Customers wishing to receive information on these bids. Therefore, relevant advertising price is also a dimension of price perception.

Traditionally, the price is established depending on the cost of goods sold. Such a practice is no longer accepted in the current context of economy.

Thus, the retailers must take into consideration, in the formation of the price, other elements, such as the type of the commercialized goods, the store image, the consumer’s buying and consume behavior, the supplier’s price policy, the technical and functional quality and the legislation.

¹⁶⁰¹ Oliver, Richard L. 1980. *A Cognitive Model of the Antecedents and Consequences of Satisfaction Decisions*. Journal of Marketing Research 17 (9): 460-469.

¹⁶⁰³ Mittal, V., W. T. Ross, et al. (1998). *The Asymmetric Impact of Negative and Positive Attribute-Level Performance on Overall Satisfaction and Repurchase Intentions.*, Journal of Marketing 62(1), 33-47.

The commercialized goods, either alimentary or not, can be divided into four categories according to the effort consumers make in order to obtain them and according to the frequency in which they do it.¹⁶⁰⁴

There will be obtained categories, such as:

- a) Household goods;
- b) Tradable goods;
- c) Specialties
- d) Goods without interest on / Unwanted goods

Household goods are goods with a high buying frequency and for which the consumers make a minimum effort. Thanks to the frequency in which these products are found in the market and magazines, the consumer doesn't have to assign a very long period of time to purchase them.

The consumer is not involved too much in the search for price offers for this type of product, the price not being a very important element for them. Therefore, the price for these products is similar in all stores.

The negotiable goods are those goods for which the consumer has to compare price offers, taking into consideration the quality, the presentation of the product, the services attached to the product and also the assistance that is given through the acquisition. These products ask for a higher implication and effort from the consumer, being products that are purchased not so often and for which a higher price can be established.

The retailer must get involved into activities that can add value to these products, such as the packing or presentation mode, technical assistance etc to justify a higher price and to win the consumer.

The specialties are products for which the consumer is willing to make a higher effort in the search for it and also to pay a higher price. The price for these products isn't mainly important for the client, the retailer having more liberty in choosing the price, but has to choose wisely the products that he commercializes and to put effort in their sustain.

Unwanted goods are products whose existence is known or not, but consumers don't want to purchase. For these products, a sustained marketing effort is required, especially from the promotional part. The price established by the retailer must be attractive enough to push the product towards the consumer.

The image of the store influences directly the price asked by the retailers. The stores that want to transmit and maintain the image of a superior quality will practice higher prices that are meant to preserve the image and financially support it, the higher prices covering the costs for image investments.

The merchants who want to create an image of the small prices have to closely define their product categories and client flow to be able to maintain the profit margin.

The intensity of the competition is also another factor that influences the price strategy that retailers choose. When the competition is powerful, merchants only have a small liberty margin in the price establishment. Also, in the situation of a powerful competition, the retailer must perceive and understand quickly the changes made in the competitor's price strategies and react promptly.

The retailer establishes the price and depending on other objectives or strategies that he already has established. Thus, the price can support the company's image, can help at the entrance on new markets or reaching a target market share, the fast turnover of a category of products or the obtain of an established profit margin.

Legislation is a very important factor in the price establishment policy. The state can exert a powerful influence over the merchants through the ban of agreements over the price made by distributors, through the establishment of a minimum or maximum price for certain products, through the ban of loss sales, etc.

¹⁶⁰⁴ Vrânceanu, Diana Maria 2005 *Strategii de preț în comerțul cu amănuntul*, Revista de comerț, 6, (8), 21-28

This year it is being tried to introduce a code of good practices in the retail agroalimentary industry. Through the implementation of this code, in the product price there will be no longer included the 15 taxes imposed by the retailers, such as shelf tax. The Government hopes that in this way, the Romanian products will be more „present” in stores, and expects a decrease in prices between 20% and 30%.

Price strategies and price tactics

There are many outside influences that affect profitability and even survival of the retailer. Pricing correctly is a crucial step to achieve and maximize profit and to ensure consumer loyalty and repurchase. Many pricing strategies are used and each is based on a special set of circumstances and criteria. These are some of the more popular pricing strategies.

Strategies used by retailers depending on the price evolution:

- a) Fixed prices strategy for a long period of time that presumes the implementation on a long term of constant prices. This strategy bets on economies created through the simplification of product management and also the development of a tight connection with the consumers. But in the conditions of a powerful competition it is a strategy that is tough to support and imposes over the retailer the abnegation of some services offered at the sale's place, downsizing and the tough negotiation of contracts with the suppliers.
- b) Variable price strategy presumes the regular appeal to the sales promoting strategy through sales so that in short periods of time, the price is changed. The initially prices, before the discount are bigger than those established in the fixed prices strategy for a long period of time, but those obtained after the discount are smaller. Among the benefits of this strategy are: approach of different sectors of consumers, consumer's attracted with a grown sensitivity to price, the intensification of the in-store consumer flow and the consumer's loyalty strengthening.

Price strategies depending on the competition:

- a) The low price strategy is practiced by stores who don't have other advantages or competitive instruments apart from the other competitors, who don't offer post-sale services, who have a small range of sentiments, the accent being put on products with a high turnover.
- b) The same level prices with the competition strategy imply the practice of prices at a similar level with that of the competitors. The retailers who practice such a strategy are differenced from their competitors through the sentiments, in store and post-sale services.
- c) The high price strategy is practiced by the merchants when either there isn't a high competition or when they have powerful advantages over their competitors, such as a very good position, a high variety of sentiments, in store and post-sale services or a very good image. Such a strategy is adopted by merchants that aim the top of Maslow's pyramid towards the consumers who aren't so sensitive to price, but to quality, stile, prestige, self accomplishment.

Retailer's strategies depending on the structure of the assortments:

- a) The unitary price strategy. The retailer establishes a price for each product and next to it is being shown the price of a standard unit. This strategy can be used only for products that can be measured using standard measurement units.
- b) The brand level strategy. This strategy implies the establishment of prices at the level of each brand, the profit margin being established depending on the power of the brand and the contribution that that can bring to the profit.
- c) The product price-leveled strategy. This strategy implies the fact that the retailer has to establish a very low number of prices for the products from the same category and the classification of those below those prices. Thus, it can be established a price for a category that can cover the profit margin for all or two or three price levels depending on the quality and marginal cost of the products in that category.

Conclusions

Globalization and free development of economies and industries of all kinds enable new ways for retailers to develop, but born as many problems. Social pressures and new competition and extremely

sophisticated traders, are forcing merchants of any size to develop and to implement proactive pricing strategies.

As a mechanism, which generates strategies like the ones treated in this paper needs more than an organizational commitment and a purchase order, it needs a consultative approach to create a comprehensive pricing strategy made for the unique needs and objectives of each dealer.

Constant measurement should be in place with a long-term pricing strategy that incorporates feedbacks from the consumers. Over time, as you learn the system and exploit the opportunities to build an system that creates value for the customers and, consequently, satisfaction, profits will explode.

For understanding insurance services' consumer behavior, it is necessary to study the particularities of the decision-making process on the insurance market. This paper aims to present the main characteristics of the different stages of the decision-making process: from those that precede the purchase of insurance to the post purchase behavior.

Introduction

Dans le secteur des assurances les objectifs des sociétés d'assurance sont de maximiser les bénéfices de la société d'assurance et d'optimiser la qualité de la relation client pour déterminer les clients de rester fideles à la société d'assurance. Pour pouvoir réaliser ces objectifs les sociétés d'assurance doivent identifier les meilleurs marchés cible et découvrir des modèles de comportement des assurés. Pour cela s'impose l'étude du comportement du consommateur des services d'assurance.

L'étude du comportement du consommateur des services d'assurance c'est une démarche complexe qui suppose l'identification des caractéristiques particulières des assurés potentiels, l'étude des particularités des processus décisionnels d'achat pour les divers types d'assurances et l'étude des facteurs qui influencent le comportement du consommateur des services d'assurance.

Dans cette étude on fait une esquisse des principales caractéristiques du processus décisionnel d'achat sur le marché d'assurance et des facteurs qui l'influencent.

Les principales étapes du processus décisionnel d'achat pour les acheteurs individuels sont: la reconnaissance du problème, la recherche d'information, l'évaluation des alternatives, la décision d'achat et le comportement post-achat (voir la Figure 1).

¹⁶⁰⁵ This work was supported by CNCSIS – UEFISCSU, project number 915 / 2009 PNII – IDEI 1773/2008.

Figure 1. Les principales étapes du processus décisionnel d'achat pour les acheteurs individuels

1. L'apparition du besoin d'assurance

L'apparition du besoin de s'assurer et la reconnaissance de l'existence de ce besoin constituent le point de départ du processus décisionnel d'achat d'une police d'assurance.

Le besoin d'assurance se trouve parmi les besoins fondamentaux d'une personne, en se situant sur la deuxième position dans l'hierarchie des besoins d'Abraham Maslow, après les besoins physiologiques qui se trouvent sur le premier niveau et avant les besoins sociaux d'appartenance et d'amour (troisième niveau), les besoins de respect (quatrième niveau) et les besoins d'accomplissement du soi qui sont placés sur le dernier niveau de l'hierarchie (voir la Figure 2).

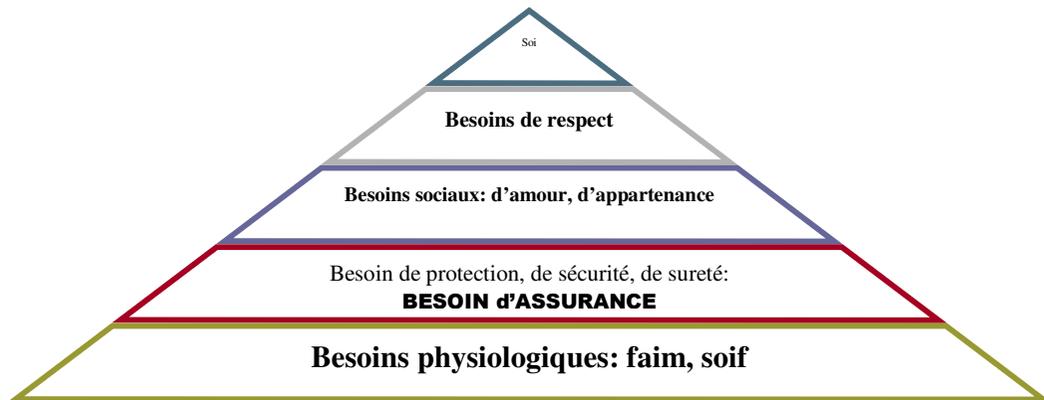

Figure 2. Le positionnement du besoin d'assurance dans l'hierarchie des besoins de Maslow

L'apparition du besoin peut être engendrée par des stimuli internes ou externes.

Il y a une grande diversité des stimuli externes qui agissent sur le potentiel assuré. Parmi les facteurs exogènes qui influencent le potentiel assuré on peut distinguer trois catégories importantes: (1) les facteurs du macro-environnement, (2) les facteurs liés à l'activité de marketing de la société d'assurance, (3) les facteurs exogènes liés aux particularités sociologiques des consommateurs des services d'assurance (voir la Figure 3).

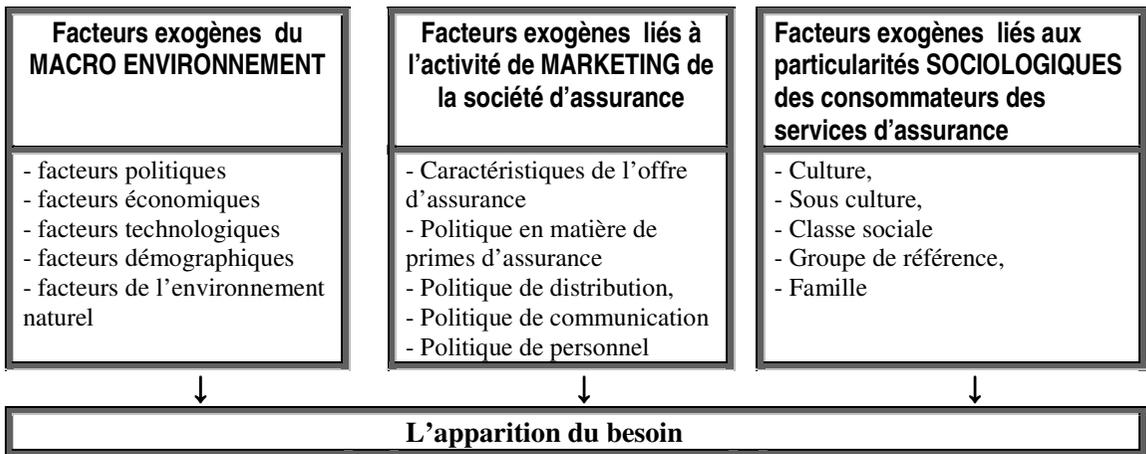

Figure 3. Facteurs externes qui influencent l'apparition du besoin d'acheter une assurance

Un rôle important dans l'apparition du besoin d'acheter une assurance est joué par les facteurs liés aux particularités personnelles du consommateur des services d'assurance: l'âge et l'étape du cycle de vie, l'occupation et la position économique. En Roumanie la demande d'assurance n'a pas un caractère uniforme, elle est concentrée dans les aires géographiques qui ont un potentiel économique élevé et dans les segments de population avec des revenus supérieurs à la moyenne. Dans la situation actuelle de crise économique les facteurs liés à la position économique du potentiel assuré sont d'autant plus importants.

Les actes du consommateur des services d'assurance sont influencés en grande mesure par une série des facteurs endogènes: la perception des assurés potentiels vis à vis les assurances et les sociétés d'assurance, le processus d'apprentissage (qui est basé sur l'expérience antérieure de l'assuré), les attitudes face aux assurances et aux sociétés d'assurance, les motivations et la personnalité du consommateur (voir la Figure 4).

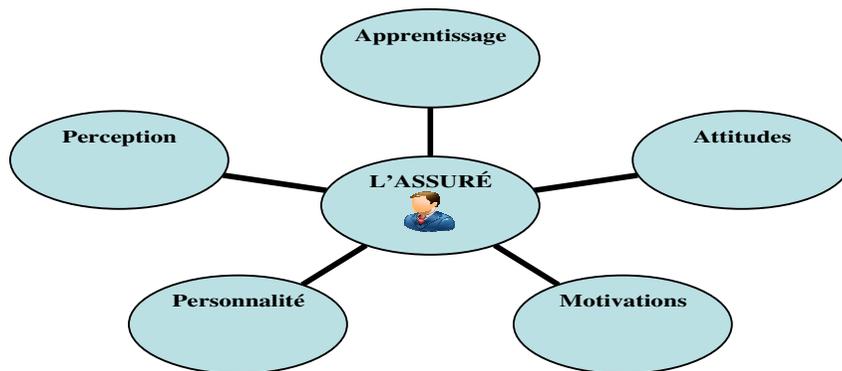

Figure 4. Facteurs endogènes qui influencent les actes du consommateur des services d'assurance

La reconnaissance du besoin de s'assurer peut être engendrée par plusieurs situations. Parmi les situations les plus fréquentes qui peuvent être rencontrés sur le marché des assurances on peut énumérer les suivantes:

- le besoin d'assurance peut apparaître comme besoin dérivé de l'acquisition d'un autre produit / service. Par exemple: l'acquisition d'une voiture peut conduire au besoin d'acheter une assurance RCA obligatoire ou CASCO, l'acquisition d'une maison/appartement peut déterminer une personne de

conclure un contrat d'assurance habitation et de s'assurer contre une série des risques : tremblement de terre, inondations, vol etc.

- le besoin de renouvellement d'un contrat d'assurance expiré. Par exemple une personne constate que son contrat d'assurance habitation est en train d'arriver à l'échéance et il décide de chercher des informations sur le marché pour pouvoir conclure une nouvelle assurance. Sur le marché des assurances l'achat répété est le résultat du processus d'apprentissage. La théorie de l'apprentissage instrumental nous montre que les personnes assurées apprennent à utiliser des comportements qui produisent des effets positifs et à éviter les comportements qui ont des résultats négatifs. Le conditionnement instrumental apparaît lorsqu'on donne une « motivation » suite de la réponse à un certain stimulus; cette motivation peut être positive ou négative. Par exemple, on a une motivation positive dans le cas d'une personne qui a une assurance CASCO et qui a reçu sans retards des dédommagements après un accident auto. Dans ce cas il est très probable que la personne renouvèlera son contrat d'assurance CASCO à la même société.

- le besoin d'assurance peut apparaître à l'aide de l'agent / courtier d'assurance. Souvent dans le cas des assurances de vie l'apparition du besoin est provoquée par les actes de l'intermédiaire.

- le besoin d'assurance peut apparaître à la suite de l'apparition des nouveaux risques.

- le besoin d'assurance peut apparaître à cause d'une offre vue sur l'Internet.

2. La recherche d'information en matière des assurances

La recherche d'information peut être accidentelle ou délibérée et l'accès aux informations peut être soit externe, soit interne. Les sources d'informations peuvent être classifiées en :

- sources liées à l'expérience propre: l'expérience obtenue à la suite de la relation antérieure avec la société d'assurance,

- sources personnelles (famille, collègues, amis etc.): les études ont montré que dans le cas des polices d'assurances les opinions des membres de famille, les opinions des leaders de groupes de référence jouent un rôle important dans la décision d'achat et dans le choix de la société d'assurance,

- sources commerciales - agents d'assurance, courtiers d'assurance, catalogues, brochures, sites Internet etc. et

- sources publiques - revues, journaux etc.

Le processus de recherche d'information est influencé par plusieurs facteurs: le risque perçu, l'implication du potentiel assuré, l'expertise du consommateur et les sources d'information.

Les potentiels assurés cherchent des informations concernant: les produits d'assurances existants sur le marché roumain, les risques assurés par ceux-ci, les primes à payer, le taux de dédommagement, la durée d'un contrat d'assurance et la réputation des sociétés d'assurances, leur compétence, leur crédibilité en utilisant des sources d'information commerciales (annonces publicitaires etc.) ou indépendantes (discussions avec les membres de la famille, avec les collègues etc.), standardisées ou personnalisées.

Une source importante d'information sur le marché d'assurance est l'agent d'assurance. L'agent d'assurance exerce son activité en vertu d'un mandat délivré par une société d'assurances. Les agents d'assurances analysent les risques de leurs clients, conseillent les clients sur les opportunités d'assurance, placent les risques auprès de leurs compagnies d'assurance, suivent la gestion des contrats et assistent leurs clients en cas de sinistre, de l'ouverture jusqu'à l'indemnisation.

Une autre source importante d'information sur le marché d'assurance est le courtier d'assurances qui exerce son activité en dehors de tout lien d'exclusivité contractuelle avec une ou plusieurs compagnies d'assurances et qui agit pour le compte de ses clients.

Une source moderne d'information qui est de plus en plus utilisée est l'Internet. En naviguant sur l'Internet le consommateur peut trouver facilement des informations concernant les types d'assurances et les offres des sociétés d'assurances.

À la suite de la recherche d'informations le consommateur établit un ensemble évoqué, qui inclut les alternatives prises en compte pour être évaluées. Il fait son choix en tenant compte de cet ensemble.

3. L'évaluation des alternatives

L'évaluation des alternatives dépend de l'expérience du consommateur. L'évaluation est réalisée en fonction des croyances et des attitudes de l'individu.

Elle est réalisée en fonction de certains attributs et de leur importance dans la décision d'achat.

Il y a trois étapes de l'évaluation des alternatives:

(1) le consommateur potentiel identifie les attributs (les critères) pris en considération pour évaluer les alternatives. Sur le marché des assurances il y a plusieurs critères qui sont importants dans la prise de la décision d'achat d'une police d'assurance. Les critères sont différents en fonction du type d'assurance. Parmi les critères utilisés on a: la notoriété de la société d'assurance, la réputation de la compagnie, la confiance inspirée par la société d'assurance, la qualité de la relation à long terme entre la société et l'assuré, le niveau de la prime d'assurance, la modalité de paiement de la prime, les facilités au paiement de la prime, la proximité du réseau de distribution des services d'assurance, l'amabilité du personnel, la compatibilité du potentiel assuré avec l'agent d'assurance etc.

(2) il détermine l'importance des attributs (des critères) et

(3) il établit un modèle d'évaluation. Il y a deux catégories de modèles d'évaluation: le modèle compensatoire linéaire de formation des attitudes et les modèles non compensatoires. Les principaux modèles non compensatoires sont: le modèle conjonctif, le modèle disjonctif et le modèle lexicographique.

Les études ont montré que facteur le plus important dans le choix de l'assurance obligatoire RCA est la prime d'assurance.

4. La décision

Il y a des facteurs qui peuvent influencer la décision: les attitudes d'autrui et les facteurs situationnels imprévus.

Le consommateur a trois décisions possibles :

(1) il prend la décision d'achat et il choisit le type d'assurance, la marque de la société d'assurance, le moment de l'achat, la prime à payer, les modalités de paiement etc.

(2) il décide de modifier la décision d'achat et dans ce cas on a un nouveau processus décisionnel ;

(3) il abandonne la décision d'achat. Ce choix dépend du risque perçu par le consommateur (risque fonctionnel, financier, social, psychologique etc.).

5. Le comportement post-achat

Si le consommateur décide d'acheter la police d'assurance l'étude du processus décisionnel d'achat ne s'arrête pas à la décision d'achat, mais il doit continuer parce que pour comprendre le comportement du consommateur il faut étudier la satisfaction ou l'insatisfaction du client de la société d'assurance et ses actions post-achat.

La satisfaction du consommateur dépend de la comparaison entre ses attentes et la performance perçue de la police d'assurance. Les attentes se forment en fonction des messages de la société d'assurance: si les performances du produit sont présentées dans une optique trop favorable, exagérée, alors il peut apparaître un écart. Le résultat probable est un client mécontent.

Une étude qualitative réalisée par interview semi-dirigé sur 59 personnes assurées dans les mois octobre et novembre 2009 a montré que la plupart des assurés sont satisfaits par leurs sociétés d'assurance et par les polices d'assurances achetées. Un nombre réduit des sujets interviewés se déclarent mécontents. Leurs insatisfactions portent sur: les retards dans le paiement des dédommagements, la manque d'initiative de la part des sociétés d'assurance, la perception qu'il n'y a pas une liaison étroite entre la prime payée et le risque couvert.

Les actions post-achat des assurés sont déterminées par le niveau de satisfaction. Le client content renouvelle sa police d'assurance et il conseillera à d'autres personnes de le faire elles aussi. Le client mécontent peut abandonner la société d'assurance ou il peut lui faire de la publicité négative.

Entre la satisfaction, la fidélisation de l'assuré et la rentabilité de la compagnie d'assurance il y a une étroite liaison et le rôle de l'activité de marketing est de créer une forte fidélité de la clientèle envers la compagnie d'assurance

ROMANIAN DEMOGRAPHIC FACTORS AND THE INVESTMENTS ON CAPITAL MARKET

Petric Ioana Ancuta

Babes-Bolyai University, Cluj-Napoca

Faculty of Economic Sciences and Business Administration

The growing interest for investments in capital markets creates the need for studies focused on monitoring and analysing demographic environment in which the investors operate. Its analysis may represent a starting point for finding out opportunities and threats brought by environment for the evolution of Financial Investment Services Companies in Romania. Our paper starts from the assumption that the behaviour of the investor in financial services is influenced by the demographic factors. We focus on some of them, in a descriptive manner. Specifically, they are: monthly net average incomes, gender, age, employment rate and education level of the population. This study also presents a short case of a Financial Investment Services Company named Target Capital.

Keywords: demographic environment, capital market, Financial Investments Company

JEL classification: G23

Capital market in Romania

At the present moment there are two market operators, authorized by the National Securities Commission in Romania: 1. the Bucharest Stock Exchange (BSE, www.bvb.ro) and Sibiu Monetary Financial and Commodities Exchange (Sibex; www.sibex.ro). The Bucharest Stock Exchange was re-established in 1995, with the state support, going through several transformations. It represents the platform of the regular market (issuers present on it are taken in account by Bloomberg in computing the Romanian stock market capitalization), regular market for the derivatives and Rasdaq market. There are 99 companies listed on the regular market and 1.447 companies on Rasdaq (Analysis report, Listing Sibex, 2010). Sibex was founded in 1994, based upon exclusively private initiative, as the most important regular market of financial derivative instruments (options, futures and CFD's). Starting with January 2010, Sibex operates as a regular market for the spot transactions, as well.

Based upon the regulations provided by Law 297 /2004, Financial Investment Services Companies were created, playing the intermediary role. At this moment, there are 69 of intermediaries in Romania, out of which 3 have their headquarters abroad (see <http://www.bvb.ro/intermediaries/ssifuri.aspx>).

If between 1995-1998, the number of intermediaries has increased, after 1998, market concentration took place, leading to a reduction in their number. Certainly, the number of intermediaries grows in the growing phases of business cycle, as the number of new companies listed on the stock market increase and decreases along with new law constraints regulating the capital market and the descending phases of business cycle.

Intermediaries that functioned until 2001, focused especially on selling stocks received by population through the mass privatization process. Now, their main operations concern the transaction on Bucharest Stock Exchange, and on Sibiu Monetary Financial and Commodities Exchange.

Trends in Romanian demographic environment

Capital market investments reflect the propensity of individuals/households towards saving. As known, saving behaviour changes during the life cycle of an individual. Typically, young people are incited towards consuming their income and investing especially in the development of human capital. The medium-aged have a saving and investment based behaviour (material goods, shares). The elder, usually, do not save nor invest after retirement. Exemption from this pattern is the people who accumulated considerable incomes, are familiar with financial investments and benefit from a secure retirement.

According to the data provided by the National Statistics Institute, at July 1st 2008, the Romanian population was 21,504,442, out of which 10,5 mil. (48,7%) male and 11,0 mil. (51,3%) female. Between 2005-2008, negative growth and population migration caused the decrease of population by almost 119,4 thousand. The age-structure of the population shows a specific demographic ageing process. reflected, especially by the decrease of birth rate. This led to an absolute and relative decrease of the young population (aged 0-14) and an increase of the elder population (60+). Compared to July 1st 2005, in 2008 the young population decreased from 15,6% to 15,2%, and the old population increased from 19,2% to 19,6%. Compared to the mid 2005, the adult population (aged 15-59) represents 65,2%, decreased by 52,1 thousand persons.

In the adult population, the age group 30-34 and 50-59 increased while the age groups 15-19, 25-29, 45-49 decreased. These evolutions outline the age and gender disproportions in the population structure. As a result, the main trend in Romanian population is ageing. (Romania in cifre, 2009)

For the Romanian stock market operators, the most interesting segment is the over 18 - employed one. Two are the main reasons: 1. The Romanian legislation doesn't allow people under 18 to trade shares on the market (than trough a legal representative), 2. The elementary logic shows that if one doesn't earn money, cannot invest. Assuming the employed population remained constant since 2007 (when it was 9,353,000), the number of investors on the stock market represents only 1,01% (94,511 accounts, according to the Investor Compensation Fund). A study performed by The Money Channel (Frenciu, 2007) concluded that the Romanian Stock market had a huge potential, because the investors in this market represented only 0,5% out of the entire population. This potential would be bigger if the stock market would consider not only the threats but also the opportunities brought by the changes in the population structure. Mainly it is about the fact that the elder consume less and, at least in Romania, try to leave an inheritance (why not, in shares) to the descendants. Of course there are other demographic trends, with potential effects on the stock market (increase of the education or women employment rate).

Theoretical approaches of the demographic environment impact on the stock market development

International field literature offers opinions on the way in which demographic factors affect the global economy (World Economic Outlook, 2004), and on wealth and gains from investments on capital market distribution (Gale/Pence, 2006).

The Romanian field literature rarely focuses on the impact of the demographic trends on the stock market, and when it does, it approaches these trends as a component of the consumer behaviour (Olteanu, Vlad, 2007).

This paper, from a descriptive perspective, we argue that consumer behaviour in financial investment is influenced by several demographic factors, such as: age group, gender, occupation, average monthly income.

Research methodology

In carrying out this work we used *secondary sources* of information: field books, articles published in newspapers and magazines, studies conducted by the National Institute of Statistics and data provided by Target Capital Investments Company. Should be mentioned the difficulties encountered due to the relatively small number of papers published on this subject, and constraints imposed by the owners of specific data (as, for instance, the value investors' portfolios.)

Preliminary findings

Table 1 data helps us understand that regions with a large number of Financial Investment Services Companies are characterized by higher monthly net average incomes. On the first place is Bucharest and Ilfov county with 1670 and 1492 Lei/month average net income. Cluj county ranks 4 with an average income of 1365, the remaining counties having at least one head quarter of an investment

company, are in the first part of the deck. According to National Institute of Statistics, population incomes increased steadily starting with 2003 until 2006, with permanent differences between those made by men (higher incomes) and women (see <http://www.insse.ro/cms/files/statistics/Statistics%202008/rom/21.htm> 20teritoriala%). This may be one explanation for the difference between accounts opened by men (56.56%) and, respectively, women (43.44%) in 2009 (according to Target Capital Investment Company).

Table 1. Top Romanian counties based on average monthly incomes (RON, 2006)

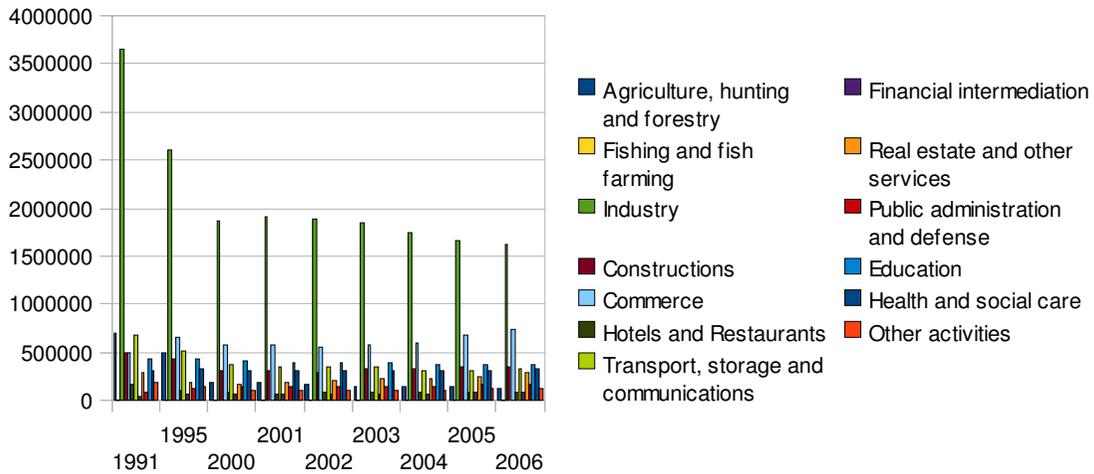

Crt. no.	Region	Average incomes	Crt. no.	Region	Average incomes	Crt. no.	Region	Average incomes
1	Bucuresti	1670	15	Prahova	1168	29	Braila	1002
2	Ilfov	1492	16	Galati	1156	30	Caras-Severin	1001
3	Sibiu	1365	17	Dolj	1156	31	Calarasi	1001
4	Cluj	1346	18	Buzau	1085	32	Ialomita	995
5	Gorj	1338	19	Tulcea	1076	33	Alba	995
6	Constanta	1224	20	Valcea	1057	34	Suceava	987
7	Iasi	1223	21	Bistrita-Nasaud	1055	35	Bihor	979
8	Timis	1222	22	Dambovita	1049	36	Vrancea	971
9	Olt	1218	23	Salaj	1046	37	Neamt	962
10	Mehedinti	1217	24	Arad	1037	38	Covasna	955
11	Brasov	1197	25	Hunedoara	1034	39	Maramures	926
12	Arges	1192	26	Mures	1023	40	Vaslui	925
13	Giurgiu	1185	27	Satu Mare	1014	41	Teleorman	917
14	Bacau	1185	28	Botosani	1003	42	Harghita	852

Note: Based on data provided by http://www.infoportal.ro/informatii_universitati.html

Most Financial Investment Services Companies headquarters are located in Bucharest (56.5%), Cluj - Napoca (7.25%), Ploiesti and Craiova (each with 4.35%), Targu Mures and Brasov (both 2.9%) and Arad, Constanta, Focsani, Galati, Miercurea Ciuc, Ramnicu Valcea, Satu Mare, Sibiu, Suceava and Timisoara (with 1.45% each; see <http://www.bvb.ro/Intermediaries/SSIFuri.aspx>).

Occupation rate of active population is another demographic factor influencing the volume and dynamics of capital market investments. The data on which we built Graph 1 allows us to conclude that along with increasing the employment rate in financial intermediaries and banking, increased the number of Financial Investment Services Companies, too.

Graph 1. Employed Civilian population, by sectors of national economy

Note: Based on data provided by INSSE ([http://www. Insse.ro/cms/files/statistics/statistics% 202008/rom/13.htm](http://www.Insse.ro/cms/files/statistics/statistics%202008/rom/13.htm) 20teritoriala%)

The data in Table 2 shows that in Romania 24 cities have universities, most of which are in Bucharest (36), followed by Iasi (10), Timisoara (9) and Cluj Napoca (4). Comparing this data with those representing the Financial Investment Services Companies numbers, we notice that 9 in the first 12 university centres have also investment intermediaries' headquarters, meaning that the education level is another factor that may influence the stock market.

Table 2. Academic centres in Romania

Cities	No. Of Universities	Cities	No. Of Universities
Bucuresti	36	Bacau	2
Iasi	10	Galati	2
Timisoara	9	Pitesti	2
Cluj-Napoca	8	Alba Iulia	1
Sibiu	5	Deva	1
Oradea	4	Petrosani	1
Targu-Mures	4	Ploiesti	1
Baia Mare	3	Resita	1
Brasov	3	Roman	1
Constanta	3	Suceava	1
Craiova	3	Targoviste	1
Arad	2	Targu Jiu	1

Note: According to data provided by http://www.infoportal.ro/informatii_universitati.html

Short case study

Target capital is a financial investments company with Romanian capital. It has been established in 1995, under the name Aura S.A. Since 2003, this company works under the name Target Capital. On 11.05.2009 the share capital was RON 2.5 million divided into 250,000 shares with a nominal value of RON 10 each. The company provides brokerage and consulting services specialized in capital markets, with offices in two other cities outside of Cluj. In January 2010, we performed a study on demographic characteristics of investors who have an open account at Target Capital. Table 3 and Table 4 summarize the results of it.

Table 3: Investors gender (Target Capital Financial Investments Company)

	Stock market investors (%)	
	2007	2008
Women	45.06	44.64
	43.44	
Men	54.94	55.36
	56.59	

Note: After processing the existing data in Target Capital Financial Investments Company

Table 4: Investors demographic characteristics (Target Capital Financial Investments Company, 2009)

	Age groups (%)		
	< 35 years	35-60 years	> 60 years
Women	7.03	6.93	7.58
	24.84	24.82	24.43
	13.2	12.89	11.3
Men	11.04	12.41	14.02
	29.59	29.23	30.06
	14.34	13.72	12.48

Note: After processing the existing data in the Target Capital Financial Investments Company

A conclusion is that women were more influenced by the economic crisis started in 2007, in terms of capital market investment. Their share fell with 1.62% during 2007-2009. In 2009, most of the investors on the capital market in Romania were men, older than 60 years.

Conclusion

Demographic trends impact the capital market activity volume and dynamics. This is why the stock exchange companies should be interested, through their marketing departments, in discovering the opportunities, but also the treats brought by these trends. On this basis, they could alter their offer portfolio, so that the various changes in the demographics can be granted.

THE ROLE OF MARKETING IN THE EDUCATION'S PROCESS

Magdalena Platis

University of Bucharest

Faculty of Business and Administration

Eleonora Gabriela Baban

University of Bucharest

Faculty of Business and Administration

Over time, marketing has become a propelling factor in any field of human activity, being also a primary tool in achieving the objectives of an organization. Identifying the main strategies in correlation with the marketing mix and its application on easy terms is a premise for each organization to achieve their targets. The essential objectives of the study are: 1). presenting the main functions of education, the role of marketing in education, 2) highlighting the main features of the education market in Romania; 3). presentation of the main strategies used by educational institutions in Romania; 4). application of marketing mix in education.

Keywords: marketing, marketing mix, education, strategy.

Cod JEL lucrare: M31

The functions and the role of educational marketing

Philip Kotler, regarded by many specialists in this field, “the father of modern marketing”, believes that, in general terms, marketing must be seen as “human activity orientated in the direction of satisfy the needs and wishes through exchange processes.”¹⁶⁰⁶ The single term, "marketing" means a combination of methods, techniques and tools which analyze the market, explores the market's factors in order to adapt supply and it can represents a new optic regarding the reality of life, the practice, is more precisely a new way of life. Based on the variety of definitions of marketing concept and extend it in areas of activity is emerging the concept of “non-profit marketing.” Non-profit marketing concerns different fields, so that, together with social marketing, green marketing, health marketing, cultural and sports marketing can be also the educational marketing. The educational marketing aims “the marketing application service”¹⁶⁰⁷ and enjoys the attention of regarding the individual training objectives.

The role of educational marketing is to:

- investigate the market, its definition and understanding and identifying potential consumers of goods and services;
- providing appropriate products and services to customer's needs at the time, place and right price;
- providing customers with optimal, quality and reputation educational services;
- attracting consumers by targeting their needs and aspirations intuition.

The educational marketing has several functions, namely:

- research of the market by trying to find the main consumers of education;
- marketing's policies linking the main requirements of the education market;
- adapting education's services to the needs, expectations and demands of consumers for products and educational services;
- promoting optimal efficient management, using materials and information resources in order to achieve the main objectives set.

The education market in Romania has the following characteristics:

¹⁶⁰⁶ vezi Philip Kotler, „Principles of Marketing”, Third Edition, Prentice Hall Inc. Englewood Cliffs, N.J. 1986, p.4.

¹⁶⁰⁷ A. Novak, „Marketingul educațional –Cercetări de marketing privind satisfacerea cererii de educație”, Teză de doctorat, ASE, București,p.20.

- Is a complex market which is facing two distinct segments, such as supply and demand.
- The offer is unique (a place in the classroom, a teacher, a certain hour of the day, etc.).
- The demand for products and educational services may be small or too high, or vary irregularly.
- Education-services market depends on the number of consumers of information, which may be, on the one hand, environmental agents in the economy, and secondly those who attend educational training.

Concrete marketing strategies for educational institutions

Strategy is a plan that an organization should use to successfully meet the objectives and proper use of elements of a marketing strategy enables long-term development of organization's business environment. A firm, and hence an educational institution can develop activities that take one or more of the following policy options¹⁶⁰⁸: it can penetrate existing markets with existing services, they can develop services through the introduction of services on existing markets, can expand the market by attracting new customer segments, or it can diversify their activity by offering new products in new markets.

The educational marketing mix

A reputed educational specialist, MJ Baker appreciated that the marketing mix "is one of the oldest and most useful marketing concepts"¹⁶⁰⁹. The concept of "marketing mix" occupies the central place in the concerns of an organization and it is able to successfully meet market objectives pursued. Marketing mix is an effective tool in guiding the work of an organization, more specifically, is the key "to open all the gates of success."

There is some controversy about the number of typical components that make up the marketing mix: product, price, promotion and placement. They are often called the four P, which correspond to the four C's customer: the call, its cost, convenience in purchasing and communication. Although interesting, these proposals come from prestigious personalities of the field: Valerie Zeithmal, Mary Jo Bitner, Adrian Payne, Christopher Lovelock, Peter Eiglier, etc. and they are not yet sufficiently convincing. They reflect the efforts by each author in part towards highlighting features of the area. Thus, for a better knowledge and understanding of marketing education we have used the model, "4P" because it gives the most important tool for marketing mix analysis in education.

Product policy

We all wonder about the product and try to find out what is a product. Ph. Kotler defines the product as, "something that can be offered to the market for attention, acquisition, use or consumption in order to satisfy a desire or a need"¹⁶¹⁰. This product category includes intangible items, services, people, places, organizations and ideas. Product policy in the field of education includes many actions and through them the educational institutions makes their goals, performs their activities that are based on choosing effective strategies used to adopt the necessary measures in education.

Defining educational product can be viewed from two viewpoints. First, the product can be represented by pupils or students who are actually "placed" to the traders on the labor market. Secondly, the product can be described as a wide range of services provided by schools, colleges or universities, to the pupils or students. The services provided are lectures, seminars, applied activities, specifically, may include all activities carried out by teachers in the education process.

In all the fields are new trends and changes occurring. And also can occur new knowledge in education, the new generations of students, emphasizing the idea that nothing disappears, everything turns and evolves. "The life" of a product in education is not limited, and it enriches and develops gradually. The consumers want products that can offer certain quality standards, which have an absolute or relative novelty, and which are performing. For this reason, the organizations should work towards continuous improvement of the product.

Price policy

¹⁶⁰⁸ Vezi Valerică Olteanu, „Marketingul serviciilor. Ediția aII-a”, Capitolul 6, p.159.

¹⁶⁰⁹ Vezi Michael J. Baker, „Marketing”, Ed. S.C. Știință și Tehnică S.A., București, 1996, p.64.

¹⁶¹⁰ Philip Kotler, „Principiile Marketingului”, Editura Teora, București, 1998, p.653.

In the economic literature, the price is the sum of all the values that “the consumers” offered in exchange to have or use the product or service.¹⁶¹¹ The price is a complex variable, and is influencing the variable of product, promotion and placement. In education "price" means the students or school fees that they must pay. According to the definition of DEX, the fee is the amount of money payable to an institution in exchange for services rendered or of certain rights. The issue of training fees in education services has led a number of concerns of specialists in the field.

In the literature review are outlined six steps, that should be should by covered by an educational institution when sets the fees:

- carefully determining market targets;
- to analyze the structure and dynamics of demand;
- to identify the costs and services;
- to identify and analyze major competitors' prices;
- to use a method for defining and determining the prices;
- establish the final price efficiently and correctly.

A series of internal and external factors, are guiding decisions of educational institutions in setting fees (tariffs). The key factors are: marketing objectives, marketing strategy, costs, organization-setting fees, demand, the prices and offers of competitors, economic conditions, legal framework, the government measures, etc.

The student is the one, who pays a fee in order to acquire knowledge and information provided by any educational institution. He changes the value (money) to another value (benefits of using the product). The claim, “Essential is the value, not the price” (Robert T. Lindgren), explains, metaphorically, that what is valuable is invaluable. The value is observed best in education. The school forms people with great potential, with special moral capacity. To pay a price for being a true man is impossible. Indeed, “Essential is the value, not the price.”

Distribution policy

In the field of education the distribution process refers to:

- the information offices, where the messages are received and where the student gets explicit information. These information offices are even the secretariats schools;
- placing graduates in enterprises. According to some polls, due to economic instability and weaknesses of the educational system, about 40% of graduates are intending to leave the country to achieve professional. Of course, immigration would bring them the salary that in Romania would probably never have.

Is urgently needed an in-depth reform of the entire education system. The Romanian education should be oriented towards the organization, a process that may trigger mechanisms such modern Romanian society to move towards modernization and a rising trend.

Promotion Policy

Promotion, as part of the marketing mix, expresses “the combination of action and media that attracts potential buyers to the selling points in order to meet their needs and desires and thus increasing the efficiency of economic activity of the producing company.”¹⁶¹² Promotion has a primary role, namely, in informing the market and the consumer. An effective promotion can create a prestigious image of the company in the minds of potential consumers. For this reason, to convince customers that the products or services offered by an organization are of a superior quality than the competitive products and services, are used promotional instruments in conjunction with an effective communication between manufacturer and customer.

In field of education are identified three major types of promotion:

- advertising, using television, radio, press;

¹⁶¹¹ Philip Kotler, „Principiile Marketingului”, Editura Teora, București, 1998, p. 773.

¹⁶¹² D. Patriche, „Marketing industrial”, Editura Expert, București, 1994, p.215.

-public relations: outdoor events, organizing exhibitions, symposiums, scientific communication sessions;

-A special place occupies the printed publicity like: brochures, letters, Christmas cards. There are also objects like: pens, pencils, bags, key rings, badges, garments which have printed the name and emblem of the educational institution.

To highlight the role of education in the life of a student from a Romanian University was made a questionnaire that was distributed to students of that institution.

Analysis and interpretation of questionnaire results led to the following conclusions:

-The image is formed and we can say it tends to be favorable. The students of this university appreciate the fact that the university's labs are equipped with powerful computers and they agree with the interior of the university.

-In this study, the activity of teachers is generally favorable. The University's professors show their interest in both the educational process and the students' problems.

-On classroom conduct, summarizes information received from students, is a clear fact that the documentation is determined to be favorable.

-Is very important the work of university teaching staff, and also the work of non-teaching staff. The university's information office, specifically the university secretariat provides clear and timely information required by students.

In the future, this university has to adopt a strategy to attract potential students. Students should be aware of the benefits brought by instruction and educational activities of university in their life.

"Everybody as "consumers" of science (or technical) should be aware not only with what is new and effective in this area, but also with what is valid and beneficial to a man"¹⁶¹³. The school of tomorrow doesn't want to be a school of intelligences, or technology. The future school will teach the pupil or the student how to cope with various demands of life. The teachers should continuously contribute to educating and training young generation in the spirit of passion for everything new and valuable in science, culture, education, technique.

Conclusion

Today marketing is often present around us. Throughout this paper we have tried to emphasize the main aspects that refer to the application of marketing in education, in relation to the marketing mix. Educational marketing mix is a combination of four variables (product, price, distribution and promotion) that are also presented in the paper, with clear connections highlighting the role of marketing in education. Using marketing mix elements can accurately determine and implement the main objectives of the organization. Location and function of each component in all marketing mix clearly stand out the main practical issues relating to educational marketing.

The education, seen as a complex way of actions made and applied in a continuous way by educational managers is focusing on modeling communication skills of the consumers of educational services, training and promoting them.

The quality of education depends to a large extent to the quality teaching education conditions, to the quality of teachers involved in this continuous and complex process like education.

Education's consumers are represented in education by students or pupils. They want to satisfy their various needs of knowledge, information, affirmation, and for that they must take part to the education process. The pupils or students motivated by the feeling of creativity are "buying" educational products offered by schools. The teachers wine the needs of pupils or students with information that are offered throw teaching.

An important aspect that must be mentioned is the one relating to marketing policy which has a decisive role in education. The marketing policy adopted in the general education system is trying to adapt education to the work of economic dynamism in the contemporary context. An education reform should

¹⁶¹³ vezi Constatntin Cucuș, „Pedagogie. Ediția aII-a revăzută și adăugită”, Editura Polirom, București, 2006, p. 215.

take into account both the requirements outlined as internal marketing as well as the external marketing in education.

Student-teacher relationship in the learning process is a prerequisite of interactive marketing education. The teachers who have teaching skills, pedagogical tact and the receptive, attentive students with a capacity to assimilate new and valuable knowledge are the two basic ingredients of educational marketing. The lack of education makes it impossible to conduct the process. In conclusion, the process of education should be regarded as an essential factor for economic and social development.

Within current economy context, complexities and particularities most companies are constantly seeking to maximize effectiveness and efficiency of their business. As sales force represents for most organizations their “spearheads” and direct contact with the market, its management can be a source for customer satisfaction and overall efficiency. Relationship marketing research with all its particularities and dimensions, if tailored appropriately can explicitly pinpoint major sources of customer satisfaction and dissatisfaction. Focus of contemporary relationship marketing is the customer viewed across lifetime as a profit source and partner rather than on short term for singular transactions. Research findings help the organization better manage its sales force and generate customer satisfaction, retention and loyalty and maximize profits while achieving superior efficiency.

Keywords: relationship marketing, sales management, customer satisfaction, research, efficiency.

Cod JEL article: M31

Introduction

Contemporary *relationship marketing* approach is in direct relation with *customer satisfaction*, in today's economy where most companies focus on building sustainable competitive advantages by developing close and cooperative relationships with a limited set of suppliers, customers and various channel members. Through these relationships firms create value by differentiating their offering and/or lowering their costs¹⁶¹⁴.

This new relationship marketing paradigm consists of placing emphasis of marketing activities on establishing, developing, and maintaining cooperative, long-term relationships¹⁶¹⁵ and thus using this approach to generate competitive advantage for the company. Relationship marketing has implications on all marketing activities from research, to marketing programs and campaigns and to selling activities, as Gummesson vividly describes new marketing concept consists of an *interaction of networks and relationships*¹⁶¹⁶. This paper focuses on its research implications vis-à-vis customer satisfaction in relationship with personal sales and sales force management.

Relationship research is a cardinal dimension for contemporary marketing and sales practice. It surveys behavior of all actors involved in the network which is established in the relationship marketing context. There is a major shift of this research approach where the emphasis moves from customer needs to relationship partner analysis.

1614 Berling, R., The Emerging Approach in Business Strategy: Building a Relationship Advantage, *BusinessHorizon* 36 (4), 1993, pp.16-27.

1615 Gummesson, E., Implementation Requires a Relationship Marketing Paradigm, *Journal of the Academy of Marketing Science*, 2 Summer, 1998, pp.242-249.

1616 Gummesson, E., *Implementation Requires a Relationship Marketing Paradigm*, *Journal of the Academy of Marketing Science*, 26 Summer, 1998, pp.242-249.

Firms' sales force play a key role in the formation of long term buyer-seller relationships. As the primary link between the buying and selling firms, they have a considerable influence on the buyer's perceptions. This perception of seller's reliability and its service offering value plays a key role influencing the buyer organization to continue business relationship. High-class performing sales force which have managed to establish and develop solid relationship with partners based on trust, support and mutuality are a source for long term value generation to their companies. There are researches today that show that buyers often have greater loyalty to salespeople than they have to their companies¹⁶¹⁷.

1. Managerial dimension of relationship marketing

The *management dimension* of relationship marketing, encloses a wide range of decisions that impacts the company and its customers. These relations can be structured according to their nature, as follows:¹⁶¹⁸

- a) relations regarding the contract: precontractual relations, contractual relations, and post contractual relations;
- b) relations vis-à-vis information demand and offer: available information for customers, information requested by customers;
- c) relations generated by the reaction of the customers towards the service offering: satisfaction; enthusiasm; complaint; and formal objections;
- d) relations generated by the multiplication effect of satisfied / unsatisfied customers on potential customers.

Decision making process has to be adapted to this kind of relationships in order to ensure continuity for the overall enterprise economic pursuit. If the first kind of relations (a) represents the *formal frame* of the cooperation and belongs to the tasks of the sales department, all other relations (b, c and d) are rather *informal* in their nature and are the responsibility of the marketing department.

2. Sales management. Relationship approach

Scholars as Wotruba¹⁶¹⁹ suggests that nature of personal selling, like the one of marketing, as described by distinguished professor Kotler, has evolved through the four different stages, namely: production, sales, marketing, and partnering. Each of these eras of sales has different objective, orientation, tasks and responsibilities for their salespeople ranging from transactions and short-term focus in production stage to relationships and long-term orientation in partnering stage. Consequently to each of these stage sales force fulfills different roles and pursues different activities that requires different skills, knowledge and abilities. Moreover the nature of sales management has evolved accordingly as reaction to the changing in nature of selling activities, market pressures and type of relationship among organizations. Focus of this paper is for partnering era of the personal sales and sales management stage corresponding to relationship marketing orientation.

Partnering salespeople work closely with their customers to create value, via tailored solutions that are profitable to both partners. Salespeople are engaging in relational exchanges on a day to day basis channeling additional consulting, support and information among partners. The objective of salespeople is to develop long-term relationship with the customers that imply commitment and aim to "increase the pie" rather than divide it. Sales force has to achieve a deep understanding of customer needs and particularities and to persuade them of their superior offering proposition. A crucial aspect of the partner relationship is played by trust and commitment developed by seller's sales reps, who are to

1617 Barton, A. W., Bradford, K. D., *Selling and Sales Management: A Relationship Marketing Perspective*, Journal of the Academy of Marketing Science, Spring, 1999, pp.241- 254.

1618 Pop, N. Al., Pelău, C., *Dimensions of relationship marketing in the Romanian banking sector. Case study: BRD Express*, Marketing Management, nr 4, Editura Economica, București, 2006.

develop it both internally within their own organization and externally with the buyer's organization, so as to openly exchange information and innovative solutions between two sides.

There are three major differences between partnering roles of sales people versus other roles¹⁶²⁰, as follows: (1) the focus on interpersonal communications- managing conflict versus influencing purchase decisions; (2) the salesperson's objective-building and maintaining the relationship with the customer versus maximizing short-term sales; and (3) the unit of analysis- the sales team versus the individual salesperson. Conflict is inherent to market interactions due to different objectives of the two actors, however the partner sales rep aims to manage the conflict so as to accrue benefits to the overall relationship and value it so as to strengthen overall relationship and increase commitment for both sides. Secondly, generating long term profits for both partners rather than pursue one time transaction has direct implications on sales management implemented by the seller company (way how sales agents and sales teams are recruited, evaluated and compensated). Lastly, it is important to emphasize the need for implementing sales team as these complex partnerships cannot be managed by individuals. Mostly are needed cross-functional sales team within their selling centers as corresponding to the cross-functional buying-teams in the buying centers of partner's company across different levels of management. As such, sales rep assigned to a customer will become *relationship manager* who is responsible to manage the activities of the entire sales team rather than personal activities and agenda.

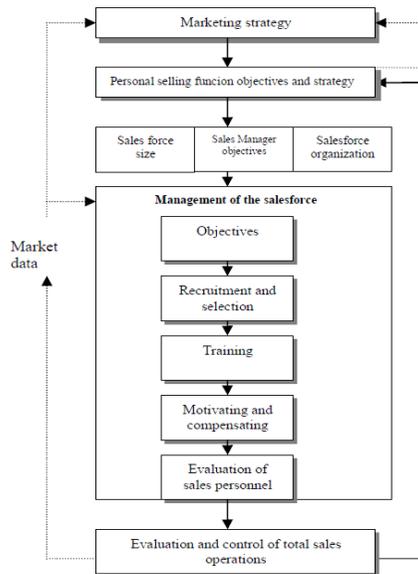

Figure 1, best describes direct relation between overall marketing strategy and sales function within an enterprise, marketing strategy providing objectives for sales and sales metrics. Some of the most common measures are percent of sales quota achieved, number of new customers, number of sales closings, average gross profit per customer, and sales expense to total sales.¹⁶²¹ Jobber illustrates how market data validated and refined are used in formulating overall marketing strategy initially and providing an evaluation and control support in the end analysis. All of the phases from setting the objectives, to hiring and recruitment, training, motivation and compensation and evaluations are being executed under the same umbrella.

Structure of the department and function is to be setted according the efforts employed for the relationship management with the customers. Within all functional departments there are created new jobs and new taks and different functions for each. Sales and marketing department, research personnel can be splitted, and customer databases competences are required for valuing marketing data and linking them with the sales policies implementation

A key position to be created in the relationship era is the *relationship manager*, who is to assign and deploy people and resources according to customers' importance for company (principal customer, permanent customer, occasional customer etc.). Duties and tasks of the salesforce (sales reps, service personnel, call centre officers), which is in permanent contact with the customers are permanent updated with the expectations of the different partners.

3. Case study: an international express logistics company on Romanian market

3.1. Relationship marketing research. Aims, instruments and primary findings

The main objective of the research was to measure the satisfaction of corporate clients (accounts that buy services for more than 100,000 EUR per year) of a multinational company that operates in more than 220 countries and territories on the Romanian market. Satisfaction related findings enable company to better manage its salesforce towards strengthening partnership with key accounts through superb salesforce design, high level of commitment and execution. Thus, using primary data and field research we have distributed a questionnaire to all 60 corporate clients (accounts that buy services for more than 100,000 EUR per year) of a major international express logistics company that operates in Romania. The rate response was a high of 88% due to excellent relationships that were built in time. Out of the 53 companies that have responded to the questionnaire, 30% are operating in the automotive industry, 9.4% in other production area and the rest in areas such as commerce, textile, software and electronics.

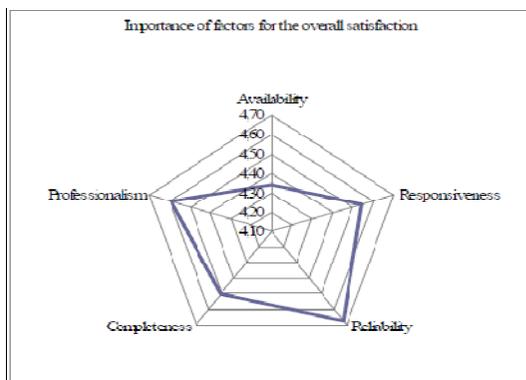

The questionnaire comprises of three sections. The first section is designed to collect firmographic data followed by the second, that addresses 37 important aspects of satisfaction using a 5 point Likert scale¹⁶²². The questionnaire ends with a section that is designed to measure the importance of several factors that influence the overall satisfaction of the client with the services received. The elements we identified to have an impact of the overall satisfaction are: availability (the degree to which the company can be accessed), responsiveness (the degree to which company staff reacts promptly and appropriately), reliability (the degree to which parcels are delivered without damage and on time),

¹⁶²² Malhotra, N., *Marketing Research*, 6 ed., Prentice Hall, Upper Saddle River, New Jersey, 2010, p. 390.

completeness (the degree to which all components of the service are finished) and professionalism (the degree to which carrier company uses suitable, professional behaviors, while working with me such as politeness, respect, consideration, truthfulness and friendliness).

The following chart is going to reveal relative importance of each of the 5 factors as perceived by customer, as follows:

Figure 2. Importance of factors for the overall satisfaction

Source: own research

It is worth underlying that after reliability, factors as professionalism and responsiveness are the among top three ones, which further enhances the relational view of partnership importance mediated though intelligent, innovative and salesforce which proves initiative. This finding becomes even more important in the light of service performance level findings which show that only a quarter (24%) of respondents considering the service offering very high, very few of them viewed it very low (4%), while most of them consider service rather average and/or superior, indicating a large potential pool for expanding relationships and mutual gains in the future.

Nevertheless, when questioned regarding overall interactions with the sales force and sales support of the researched company, major accounts were positive, 62% of them indicating that. Only 1,9% were negative about company staff exchanges and most of the exchanges being into the neutral and medium areas pointing towards future improvement potential.

3.2. Conclusions. Managerial implications and pursuits

Mostly, sales force has to initiate and encourage open dialogue and contact fostering the overall business relationship. A new set of policies and measures has to be implemented in this regard focusing on sales teams already existent, which is a major strength as underlined by literature for modern and innovative sales. Joint collaboration with financial and operation departments is to be further expanded in order to increase speed and professionalism for customers feedback and rate of solved calls, information requests, and complaints raised. Constant contact with the customer is to be maintained in different and diversers manners according to the situation and request: via direct contact and meeting, telesales, and web technologies (emails, CRM software) on a frequent basis.

Some of the research findings regarding key interactions topics further reveals that: 2/3 assert that staff is prompt and proffessional with feedback when asked about services and tariffs; customer claims management is viewed prompt and professional only by 40% of the questioned accounts; 44% views customer service as reliable and speedy, while relatively half of partners consider team's attitude and attention given to their issues as very positive and professional. These later findings additionally emphasize potential for relationship development and expansion with the existing large accounts. A key role for the sales force is to careffully listen major objections, complaints and even to stimulate customer to adress those openly as a source of continual improvement and trust development among the partners. The corporate accounts managers will act as a *relationship manager* and supervise

periodically service performance with operation department, financial terms with key customers and act as a liaison of the account and its staff to deliver outstanding performance and superior value every time.

Romanian logistics market is currently going through rapid changes as sales environment in general, thus as international experiences proves constant innovative solutions of individuals and teams are key for constant growth. Personal initiative is to be encouraged and appropriately compensated by management through intelligent periodical stimulus package.

A professional sales today has to be skilled and proficient in a very wide range of competencies native intelligence, creativity¹⁶²³ and relational capacities and traits being among most important ones. Such factors are to be considered both when management select and recruits new personal, and when stimulate and motivate existing one.

As shown by Magrath¹⁶²⁴ a key factor for the B2B market, is to constantly learn all aspects of customer operations in the light of partnership development. Most relevant aspects to be learned are those related to priorities, pressures and new and innovative ways that company salesforce can involve in solving customers problems related to logistics, shippings, operations and even non-direct related needs in a pro-actively manner. Today sales forces play a vital role because partnerships created are more solid and last longer if these professionals promote their solutions and attempt to match their offering to future customer needs and oftentimes buyers are more loyal to individual relationship manager than to the offering company, migrating after the professional.

THE COMPETITIVE POSITIONING OF THE SME'S ON THE MARKET

Pop (Bandi) Ramona
Universitatea Transilvania din Braşov
Facultatea de Stiinţe Economice

Having in view at the same time the possibilities identified for the development of the competitiveness of the Romanian SMEs in order to face the new challenges and the use of the opportunities to operate on the inner market as well as the one on the level of the European Union, the strategy has in view a series of measures and actions that are connected to a series of priorities. These priorities and related actions were established on basis of the present-day situation of the SMEs carried out by the ANIMMC. According to the position of the SMEs on the market, these can choose different types of marketing strategies with the aim of attaining in a certain period of time of the objectives established and at the same time their consolidation on the market.

Key-words: SME's, competitive, integration, marketing strategies.

Cod JEL lucrare: M31

Introduction

The market of the SMEs has a distinct and complex character. The objectives and motivations of the SMEs are significantly different from those of the large companies, their objective strategies ranging from their wish to develop till the simple ensuring of the incomes of stable cash-flow. Frequently, in the case of the SMEs, the need to solve current problems – solving clients' requests and maintaining competitiveness – shadows the strategic „image” perspective. The providers have to concentrate upon adapting their products and services to these special needs and to support the SMEs to identify their essential problems they have to cope with.

According to a study ordered by the Cisco Systems and carried out in the month of October 2005 by the marketstudy company Caleman parkes, because of the large number of competing companies¹⁶²⁵ – SMEs on the European market, it isn't surprising at all that these type of companies state as their prime priority the preserving of their competition position they presently hold.

Having in view that the problems of competitiveness are generated by the small enterprises as well as by the large ones, the lack of resources may seriously hinder the capacity of the SMEs to face the competitive pressures. The wish to counter and avoid competitiveness, is really to be considered the permanent reason of “insomnia” of the SMIs, being considered to be the main catalyst of investments in technologies in the present as well as in the near future.

One of the aspects of foremost importance for the SMEs is the choice of the products or services that may assure maximum commercial advantages.

1. The SME's in the present-day integrationist trend

The attentive analysis of the issues of the SME's in Romania in the preaccession period allows a series of conclusions of generalising character.

First of all we note the continuous fragileness of the positions of the SMEs on internal as well as on international level, compared to the large enterprises. The whole activity of the ANIMMC shows the process of improving awareness of some support measures for the SMEs, for there is the danger of their disloyal elimination from the market, this fact bringing about a very serious social and economic impact. The thorough and very diverse activity of the ANIMMC, activity that in fact is the result of the

¹⁶²⁵ Tehnologiile „fierbinţi” ajută IMM-urile din Europa să „conducă jocul” –CISCO 2005
http://www.cisco.com/web/RO/pdfs/imm/06_SMB_Technology_Byline.pdf

threats the SME's are confronted with, is, by itself, a measure of this reaction, of this threatening that makes it necessary.

Moreover, the activity of the Agency unfolds in the general framework of the Chart of Lisbon, therefore the problem of the SMEs is not a Romanian problem, but a European one, and what is more, we may state that it is a problem of the extension of the EU. Generalizing it is a problem of any integrationist phenomenon, and inclusively that of the process of globalization. The mechanisms by which the competitive position of the SMEs is continuously, systematically and objectively raised, in competition with the large enterprises, are the following:

- the scale economies. This refers to the well known phenomenon, but whose complex effects and dynamics for long periods are, probably scarcely studied, through which the mass product is competitively favoured in front of the product processed in small quantities.

As long as we discuss the theme of the scale economies only in the terms of the quantity and of the unit price, the phenomenon has a direct, mathematical explanation. Thus, the independent costs of the production volume (research-development, promotion, marketing) being the same, no matter of the quantity processed – the share of these costs in the unit price decreases as the production increases, because they are distributed at a larger number of products.

The approach may be extrapolated: a small or a middle size entrepreneur has generally the possibility to optimize his production by the short-term optimizing methods, by adapting the labour force to the fix existing capital. Even if he has the necessary knowledge for the procession optimizing for long-term, through establishing of the ideal relationship between the costs with the labour force and those with fixed capital, he usually doesn't have the necessary liquidities to make these procedures operational, especially from the point of view of enlarging the fixed capital and cannot obtain these liquidities but only through cost generating credits and supplementary risks.

From our notes it is clear that the scale effect may be extrapolated on-goingly to economic and extra-economic phenomena, deforming the competition equity as the result of the competition depends less and less on the relative merit of the competitors but more and more on the dimension of the resources they have at their disposal.

For example, one of the factors entirely associated with the initiative, that is, the risk, is also subject to a scale effect: the implication of the same volume of capital in an enterprise with the same risk factor may be discouraging for a small entrepreneur, who risks his entire capital into that enterprise, and the attraction for a large one, who risks only a small percentage out of his available capital.

We may also speak about a whole series of scale phenomena, economical or extra-economical, in which the size favours success: scale propriety, scale notoriety, scale net-work- communication a.s.o.. It is about situations in which the entity spoken about – propriety, notoriety, communication – has reached such dimensions that it self-generates and maintains itself without effort.

Scale phenomena and particularly scale economies should be regarded with discrimination from the perspective of competition and competitiveness. On the one hand, they normally represent the result of accumulating in time that had been generated by a superior competitiveness, under the conditions of a loyal competition. On the other hand, at the moment of analysis they decorrelate the economic result of labour and initiative, favouring the owner of large capital compared to the small and middle size entrepreneur.

- asymmetries – These can be material asymmetries- the bigger economic power of the enterprise, that makes it more attractive as a client, more feared of as a competitor a.s.o. – then the institutional asymmetries- the increased lobby capacity of the large companies etc – and maybe the most important ones the information asymmetries. All these systematically disfavour the SMEs in the so-called free competition on the market.

All these disfavour systematically the SMEs in competition with the large enterprises, leading to what we call perfect competition to naturally transform into monopolist competition, this later on into oligopoly competition and than into monopoly, that is – into the situation where there is no more

competition between the producers, but a competition between the unique producer and the consumer himself.

2. The market strategy of the enterprise

The necessity of adapting the company to the social-economic environment in which he unfolds his activity, represents an important condition for the development of an efficient activity.

This capacity of adaptation measured by the synergy of the enterprise depends on the material, human and financial power that it possesses as well as on the way it is carried out compared to the market. Every action of the enterprise finally is the result of the encounter between some needs of consume with the knowledge to satisfy them at the best-ever known level, thus, practically, out of the direct confrontation of the demand with the offer. In order to accomplish this aspect it is of outmost importance for the enterprise to carry out two very important things:

- to study and understand the market it acts on
- to adapt its activity in such a way that it can be able to put into value the best market offered opportunities (avoiding at the same time the possible dangers).

In order to carry out these things it is necessary to have a strategic vision over one's own activity, a vision that is more and more imposed by the new situations in which he develops his activity. It is about the analysis of evolution in time and space of the inner resources of the enterprise (organising, technical and human) as well as of the external ones to it (competition in the field of providers-suppliers and of the clients, the modification of technologies, the modification of the leadership a.s.o.) The identification and materialization of the major objectives of the enterprise, around a strategical vision, as well as the strengthening of the position on the market, the growth of the turnover, the improvement of the efficiency performances, a.s.o. - represent objectives of marketing policy of any economic organization.¹⁶²⁶

3. The importance of positioning as a strategical option

The positioning is a basic element of the strategic planning of marketing, because any decision referring to positioning has direct and immediate implications over the whole marketing mix and at foremost it represents a communication strategy.

Positioning is a competitive strategy that places it in the contextual frame of the international marketing essence. Positioning should be competitive because the firstmost requirement is the differentiation among competitors on basis of a competitive advantage. This advantage may be obtained to the extent in which the enterprise grants its clients a superior value compared to that of the competition.¹⁶²⁷

In order to properly solve the specific problems of each aspect of positionin on the target markets, the SMEs have to use the relevant criteria and variables step by step in several successive phases. For some of the SMEs the choice of position is relatively easy. Others may face difficulties and end up by being positioned on the same positions with other competitors. In such situations, the strategies have to identify and create a portfolio of competitive advantages attractive for the target market and later to communicate them and to let them be known in a convincing manner. From this point of view, that of competitiveness, the process of positioning includes three phases, respectively:

- the identification of the possible competitive advantages of the enterprise or brand (product).
- deciding over those that have to be stressed
- the concretization (exact stating) of the concept of positioning

These phases focused on the competitive differentiation may be included in a larger process that allows the highlighting of the aspects that facilitated the approach focused on the competitive advantage.

¹⁶²⁶ C. Florescu (coordonator), Op.cit., p.276, http://www.langhel.ase.ro/Cap_5.pdf

¹⁶²⁷ Victor, Danciu., Marketing strategic competitiv., Editura:economica-2004

Conclusions

According to the position of the SMEs on the market, these may express their option for different types of marketing strategies towards which they should face to. These marketing strategies have in view a wholeness of „long-term” actions that move human resources as well as financial, material ones of the SMEs in order to attain in a given period of time the traced objectives and implicitly their consolidation on the market. It is implemented with tactics, techniques and of a very well determined instrumentation.

The marketing strategies have a pronounced diversity and are classified according to multiple criteria. The applying of a strategic variant or another stays at the choice of the management team of the SMEs. It is important to express option for a proper “recipe” for the possibilities of the enterprise and of the given moment. Because the non-adequate application of a strategy may destroy the whole structure of the business built with toil and sacrifices, sometimes for whole long years.

The strategic axis of an enterprise can be modified from one phase to an other. But when the company takes action in a turbulent surrounding, where unforeseen events may happen which do not comply with the usual risk calculus, the strategic alternance becomes a common fact.

These strategies investigate and find the ways of placing the offer of the small and middle size enterprises, in accordance with the necessities, preferences and perceptions of the envisaged groups of clients, with the demands of the target market as a whole that also include the competitors with their resources, experience, the components and competitive advantages of the company which they use in order to take the selected position.

STUDY ON THE DYNAMICS OF FOOD CONTAMINATION IN INDUSTRIALIZED AREA

Popa Maria

University "1 Decembrie 1918" Alba Iulia, Faculty of Sciences

Glevitzky Mirel

DSV, Veterinary Health County Department Alba

Popa Dorin

University "1 Decembrie 1918" Alba Iulia, Faculty of Sciences

Tomescu Ada

University of Oradea, Faculty of Economics

The paper approaches the food contaminations with chemical substances in industrialised area (in an area intensely polluted with heavy metals). We firstly studied accumulation in several types of vegetable matter and secondly, the evolution in time of cations mentioned in the paper. As a work method, we used flame and graphite furnace atomic absorption spectrophotometry as well as stripping methods.

Keywords: food contamination, food safety, polluted area,

JEL cod: Q53

1. General aspects

Heavy metal pollution of the environment has lately been in the spotlight due to the extremely complex issues raised by this phenomenon, as most heavy metals are not soluble in water or if they are, the respective chemical species become compound with organic or inorganic binding agents, which radically influences their toxicity [1].

Inorganic noxious substances influence the growing and development of plants, the process of photosynthesis and the water absorption regime.

Physiological processes are ways of testing the interference pollution-normal development, preceding foliaceous symptomatology [2].

Soil charging with heavy metals led to their acidification and to the debasification of the absorbed complex. At the same time the degradation of organic matter quality occurs through an increase in the fulvic acid content (aggressive towards humic acids) and which, together with heavy metals, form compounds highly mobile and accessible to vegetation [3].

The global effect of the mentioned processes is the decrease of soil fertility and the worsening of nutrition conditions for plants. Consequently, mineral nutrition of plants becomes unbalanced. These nutrition unbalances are due to general unfavourable nutrition conditions (acid reaction, low content of phosphorous, calcium and magnesium) and to the passive absorption of polluting agents from air and soil, which are noxious to vegetal tissues. As a result, there is a slower growing process; vegetation withers sooner, fructification disappears thus leading to a production decrease [4].

The paper intends to approach this pollution aspect, respectively the contamination and dynamics of heavy metals in the vegetable matter from an industrial area. The research was conducted in the area of Zlatna, where heavy metals (Pb, Cd, Cu, Zn) are very active polluting agents, which in time have degraded agricultural and forest ecosystems, as a result of copper metallurgy from the ironworks of Ampelum Zlatna [5].

2. Experimental Part

Samples were gathered from four different areas and in several stages, taking into account the maturation degree of the studied plants, as follows:

Areas under study:

TA1 – Pătrânjeni, la 1 Km away from the polluting source, South, downstream of Ampoi river, air currents V→E (Calea Motilor Street);

TA2 - Valea Morilor (V. Morilor Street, 19), 1,5 Km away from the source, North, between two hills on the Valea Morilor river (affluent of Ampoi), favouring currents S →N;

TA3 – Stadionului Street (16), 2 km away from the source, upstream towards West, favouring iar currents E →V(obs. Samples were gathered from the confluence of rivers Valea Morilor and Ampoi);

TA4 –Tudor Vladimirescu Street (the Morarus), 500 m away from the source, favouring currents S→E

2.1. Method and equipment

In order to obtain exact results, comparable to those of the specialty literature, in determining metal cations from soil, water and vegetable matter samples, we aimed at studying and applying modern methods of analysis[6]. We took comparative measurements through the three methods: flame atomic absorption spectrophotometry, graphite furnace atomic absorption spectrophotometry[7] and accumulation-dissolution methods [8].

Vegetable Matter Processing in View of Determining Heavy Metals

Vegetable Matter Preparation in view of Mineralization

Analysed plants were gathered during the entire vegetation period, at certain time spans (in relation to the growing periods). The sample size was of approximately 500 g fresh material.

The material was ground and dried at the room temperature in appropriate conditions so that it should not become contaminated with other substances.

The sample was subsequently ground and passed through a sieve with a 1 mm whole dimension and stored in sealed and labelled plastic boxes till the moment of analysis (the same as with the soil).

Vegetable Matter Mineralization

Through this method we determine the Pb, Cd, Zn or Cu content from leaves, fruits (grapes, apples, etc), cereals (corn beans, wheat beans) etc.

Method principle: in order to determine the Pb, Cd, Zn or Cu content, the biological material underwent wet mineralization or calcination. In the obtained solution, heavy metals were dosed through atomic absorption spectrophotometry or through other methods [8].

a) Wet mineralization was performed using a mixture of nitric acid, perchloric acid and sulphuric acid.

The organic substance from the vegetable matter was oxidised at high temperature using a mixture of HNO₃:HClO₄: H₂SO₄ in proportion of 2:1:0,2 (volume)

We weighed 1 g of fine vegetable material ground in a pestle mortar to which, in a Berzelius glass, we added 5 ml of oxidating mixture: HNO₃:HClO₄:H₂SO₄ of proportion 2:1:0,2.

The sample was left to rest for 24 hours after which it was evaporated dry, on a sand bath.

The samples were cooled and mixed with 5ml HCl conc., to a dry evaporation (yellowish). The samples were placed in a 50 ml rated balloon flask with a solution of HCl 0,5 N (or with distilled water where we added 2 ml HCl conc.)

The elements from the obtained extract were dosed using the atomic absorption spectrophotometer.

b) Dry Mineralization (through calcination)

The organic substance from the vegetable material is oxidised by the air oxygen in calcination in an electric furnace at a constant temperature of 450⁰C. The obtained residue formed of oxides and carbonates becomes soluble with 2 ml HCl 6,5 N, is passed to a 50 ml rated balloon flask, the blue stripe is filtered through filter paper and the balloon flask is brought to a sign with distilled water. The elements from the obtained extract were dosed using atomic absorption spectrophotometry.

Mineralization through calcination has the advantage that it eliminates sample contamination by adding reagents. This method is recommended for the biological material that contains a high quantity of organic matter [9].

Observation

As, for comparison, we also used the graphite furnace atomic absorption spectrophotometric method, (GFAAS) samples were subsequently solubilized with HNO₃ 0,5 M in order to avoid heavy metal losses as metal chlorides in the graphite furnace [10], when HCl is used for solubilization.

The obtained extract is aspirated in AAS flame using a particular lamp for the dosed element. A blank sample (in order to verify the reagents' pureness) and a set of standards are prepared for each element under the same conditions.

3. Results and discussions

Results were registered on a period of 4 months encompassing all development phases of the studied plants. The analytical data on which we worked for Cu in vegetable matter are: spectral line $\lambda = 324, 7$; Φ (slit) = 0, 5; strength of current = 10mA; flame type air-acetylene; device sensitivity 0, 07 ppm.

The obtained results were compared to the maximum allowed limits, which must not exceed 10 ppm for vegetation.

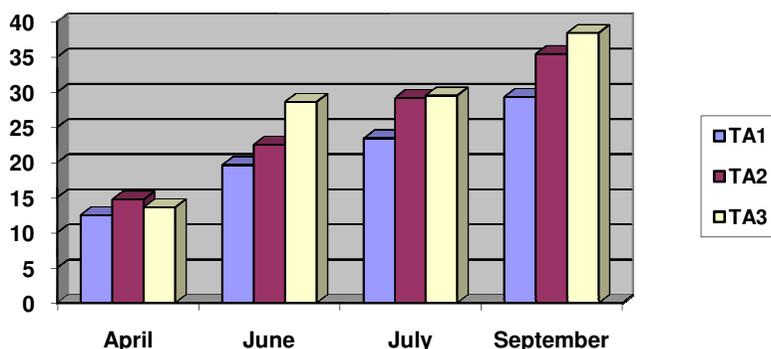

Fig.1. The dynamics of Cu²⁺ ion accumulation in spring onion (bulbs)

The evolution of cation content highlighted an increasing assimilation of the element studied, spaced out in different phases of vegetation, with extremely high values for the samples taken from the land TA2 , 1,5 km from the source, under the influence of currents S →N . High values can also be noted in the samples taken from land TA3, upstream towards West, air currents E →V, 2 km away from the source of pollution,.

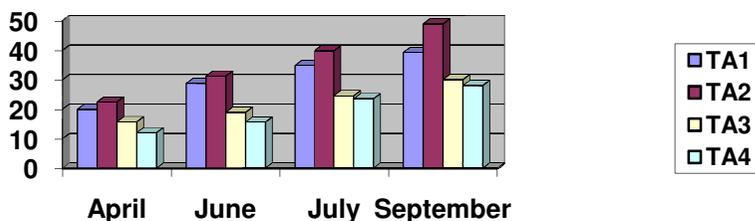

Fig. 2. The dynamics of Cu²⁺ accumulation in spring onion leaves

Green plants or their organs in photosynthetic activity accumulate larger quantities of heavy metals, which are better retained in leaves.

Besides the different accumulation in the plant's bulb or leaves, one can also notice an accumulation difference influenced by the soil of the agricultural land from where the samples were taken. The samples gathered from land TA2 registered the highest values.

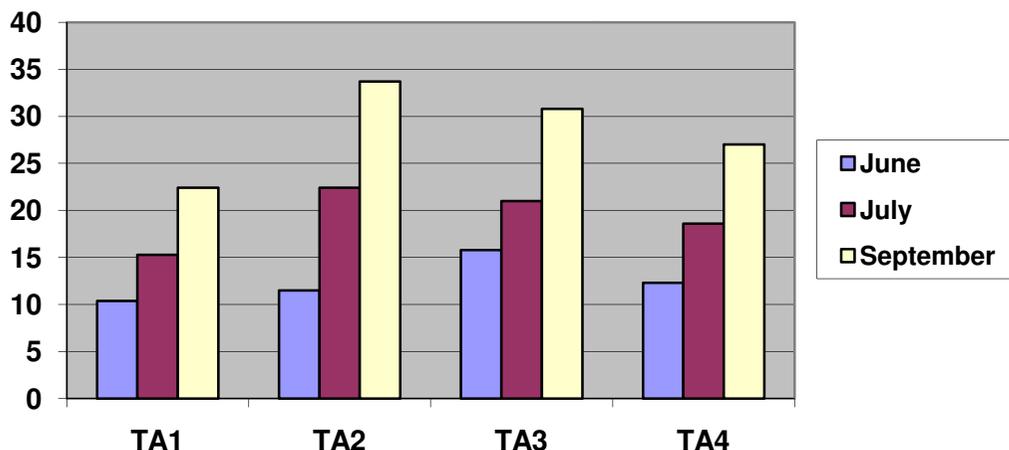

Fig. 3. The evolution of Cu²⁺ accumulation in the potatoes gathered from the four studied agricultural lands.

With potatoes, the accumulation dynamics was studied during a period of three months (June, July and September); the highest accumulation was registered in the first period of vegetation. Comparing the four agricultural lands, one can notice that the samples taken from the agricultural land TA2 registered the highest values for the copper.

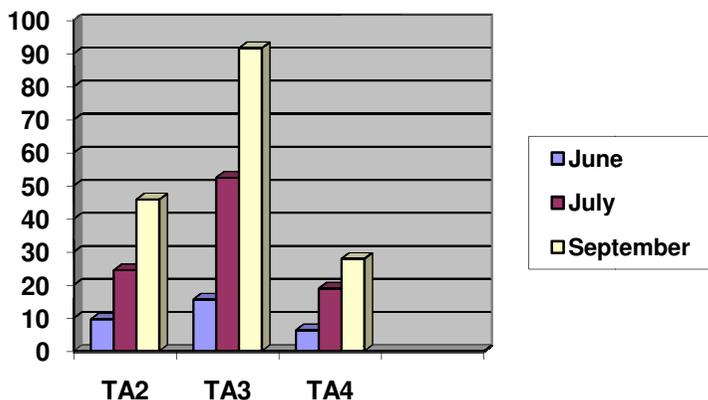

Fig. 4. The evolution of Cu²⁺ accumulation in the cabbage grown on three of the four agricultural lands studied

Of all studied vegetable matters, cabbage has the highest heavy metal accumulation potential. As it results from the presented diagrams, the most favourable area for copper accumulation is the agricultural land

TA3 located 2 km upstream from the source of pollution, favouring air currents E → V.

Conclusions

Compared to the MAL (maximum allowed limit), which is of 10 ppm, one can notice exceeding values, much above this limit, 4 times higher in the case of onion (bulbs), 5 times for onion leaves, 3 times for the potato and 9 times for the cabbage. The process of heavy metal accumulation in plants differs after the soil contamination level, the element's nature and the analysed vegetable species or organ; this phenomenon is intensified by excessive acidity and mobile aluminium accumulations [11].

Natural acidity activated by the effect of polluting emissions becomes phytotoxic as a result of excessive mobile aluminium solubilization, a disturbing element for the vegetation growing on these soils. Mobile aluminium is a toxic element, which limits agricultural production in all acid soils or in soils that have become acid through pollution. When soils become acid at the level of an intense acid reaction, this toxic effect of mobile Al must be removed through agrochemical processes. The mobile aluminium content from the soils under research is differentiated and put in connection to the reaction status, and thus to that of the H^+ ion activity.

BUILDING PATIENT LOYALTY USING ONLINE TOOLS

Adela Laura Popa

University of Oradea, Faculty of Economics

Anca Daniela Vlădoi

The Bucharest Academy of Economic Studies

The aim of the paper is to present the online tools used by private healthcare organizations in order to generate patient loyalty. The research emphasizes a comparative analyze between the Romanian and other European countries private healthcare organizations referring to online tools used by these organizations on their websites to generate patient loyalty.

Keywords: healthcare marketing, patient loyalty, online tools, relationship marketing

JEL: M31, I11,

Healthcare marketing saw from a relationship marketing approach

Even if it was not easily accepted in the field of healthcare services, the importance of marketing is more and more recognized nowadays by the organizations activating in the field. Due to ethical aspects involved in the healthcare delivery process, to the special characteristics of this market, the particular profile of the consumer of healthcare services and, also, probably because of the twisted understanding of the marketing role in the life of an organization, the marketing orientation of hospitals is no older than about two decades.

The deep analyze in the field of healthcare services emphasize not only its complexity, but also its interdisciplinary feature under many aspects, and also reveals a particular field of study with many particular features, we may call it a sensible field. Its complexity is discovered by the multitude of perspectives view it can be looked from. It is a place where many fields of interest are intersecting, both economic and social.

In order to achieve their objectives, the healthcare organizations should follow and adapt to uncontrollable factors, which are building actually the macroeconomic environment of the organization¹⁶²⁸:

- demographic environment: explosive increase in population at global level, segmentation by age, educational groups;
- economic environment: income distribution, savings, debt, possibilities to obtain the required resources regarding activity performance;
- ecological environment: high toxicity, noise pollution or pollution of the environment with toxic substances;
- technological environment: acceleration of pace of technological change, the infinity of innovation possibilities, the increasing number of technological regulations etc.;
- political environment: laws and regulations regarding the organization and distribution of medical care from one country to another and
- cultural environment: beliefs, values and behavior norms.

Besides these major factors, there are also forces that can be influenced by the organization and which are part of the marketing environment: customers, competitors, suppliers and communication channels.

¹⁶²⁸ Bratucu, G. (2003) Marketing sanitar, in Florescu C., Malcomete, P., Pop, N. Al. (coord), Dictionar explicativ de marketing, Ed. Economica, 2003, pp. 432-433

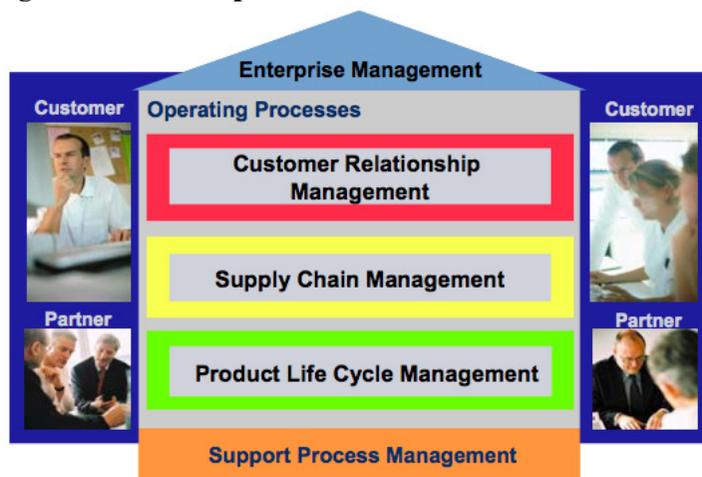

In Romania, the development of the healthcare services market after 1990 led to the growth of the marketing role into the life of healthcare organizations. The new perspective got after 1990 by Romanians leads to a new vision of the Romanian population regarding the healthcare services. Under the influence of major factors like liberalization, privatization and globalization, the healthcare services sector is involved in a process characterized by an accentuated dynamic. As results of this process, the competition has grown especially when talking about the private sector of healthcare services field, there are demographic and social changes at the population level, the technologic impact in the medical sector is huge, the new companies' perspective regarding the employees' healthcare led to a new kind of customer in this field – the organizations. (Rădulescu, 2008).

Customer relationship management is focused on the idea of situating the client in the center of the company's culture and activity (Țarcă, 2010). In such a context, the healthcare organizations are more and more concerned about finding efficient ways to keep the existing customers and to create and maintain their loyalty. This thing is possible only by developing long-term and mutual relationships between the organization and its clients, and this vision opens the perspective of approaching relationship marketing in a strategic manner.

Nowadays, a private hospital is a commercial enterprise which has to face fierce competition and in order to operate successfully on the market, its products and services should be perceived as a solution for the patient's problems and in return he is willing to pay for it. In general, we consider that a University Medical Center should be also an institute for research and development and should include training and specialization programs for resident doctors.

All the business operations are part of a life cycle which is made of several phases that are forming a process by repeating themselves. (Figure 1 – Customer Relationship Management is as integrated part of the CRM). The process of Customer Relationship Management consists of the following sub-processes: understanding the customer, selling to the customer and taking care of the customer, in short: Understand, Sell, Care. CRM is not about the disease process in the foreground, but especially about the well-being, the state of health of the patient, his/her relations with relatives and friends. This process will contribute more and more to the efficiency of the organisation. Factors as: customer service, a better productivity, cost savings, reduced medical errors, improved health outcomes are the main objectives of the private sector. These major objectors are better attained valuing CRM approach.

Figure 1. The organization of the processes in the Siemens Medical Solutions enterprise

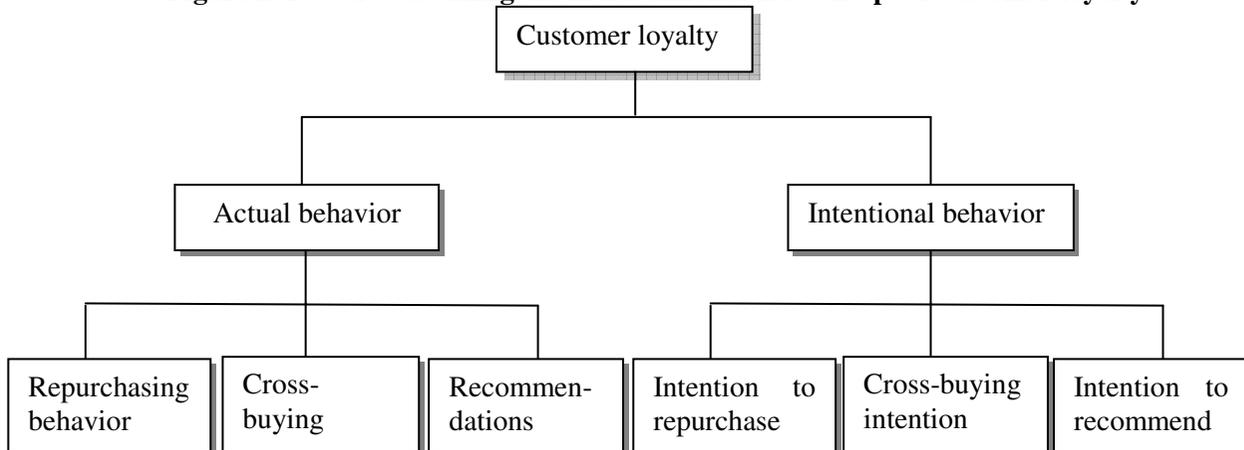

Source: Walter, J., Mang, H. – Medical Process Management, Siemens Healthcare Sector, Universität Erlangen-Nürnberg, 2008, p. 23

Customer satisfaction is a decisive factor that generates customer loyalty (Bruhn, 2001).

Customer loyalty is the sum of measures took by a company in order to influence in a positive way the behavioral intentions of its actual and potential customers regarding company's offer, aiming to create, establish and develop long-time relations with these customers (Diller, 1996, Meyer/Oeverman, 1998, Bruhn, 2001).

Also, it is generally recognized that the concept of customer loyalty implies two dimensions: the dimension of the actual behavior and the dimension of the intentional behavior (Meyer/Oevermann, 1995, Bruhn 2001). From this point of view, the concept of customer loyalty is a multi-dimensional one based on the variables presented in Figure 2 as factors sustaining this concept (Homburg/Bruhn, 1999, Bruhn, 2001).

Figure 2. Factors sustaining the multi-dimensional concept of customer loyalty

Source: Bruhn, M., *Orientarea spre clienți – temelia afacerii de succes*, Editura Economică, București, 2001, p. 109

Based on holism theory (Gk. Holas = whole), which says that the whole always has priority more than the total sum of individual parts, holistic marketing requires development and implementation of marketing programs, processes and measures with a wide spectrum and correlated with each other (Pop/Fotea/Mihoc/Pop 2009). The four pillars of the holistic marketing approach: relationship marketing, integrated marketing, omnipresent within the organization and socially responsible marketing (Kotler/Koller 2008) are reflected in a particular and very profound way in the healthcare marketing field.

Romanian private healthcare services – a statistic preview

According to the data revealed in a study made public by the Mednet Marketing Research Center, the market referring to the private healthcare services had a growth of 56% percents comparatively to the year 2008, targeting a value of 104 million Euros. Also, the same study revealed that the most important criteria used in the process of choosing a private medical clinic are:

- medical equipment;
- waiting time to get a consultation;
- availability of consultation;
- reputation of the medical staff;
- cost of the services;
- general appearance of the buildings and cabinets;
- reputation of the clinic.

Another study made public in 2010 by Companiesandmarkets.com says that the market of private healthcare services in Romania is characterized as with one of the faster development in the Center and Eastern European countries.

A quick analyze of the data included in Romania's statistical yearbook 2008 referring to the sanitary units shows that the number of the private sanitary units are increasing year by year starting with the year 2000 (Table 1).

Table 1: Number of sanitary units having private majority

<i>TYPE OF SANITARY UNITS</i>	2000	2001	2002	2003	2004	2005	2006	2007
<i>Hospitals</i>	3	4	5	5	9	11	17	22
<i>Hospital and specialized ambulatories</i>	-	-	-	-	-	4	5	9
<i>Polyclinics</i>	163	140	161	168	204	219	232	241
<i>Dispensaries</i>	-	-	-	-	-	1	1	2
<i>Health care centers</i>	-	-	-	-	-	1	1	1
<i>Balneary sanatoria</i>	-	-	-	-	-	1	1	1
<i>Diagnosis and curative centers</i>	-	-	-	-	-	15	19	20
<i>Health specialized centers</i>	46	60	87	113	112	131	115	130
<i>General practitioner offices</i>	4698	5220	5758	2483	1021	833	938	992
<i>Family doctors offices</i>	-	-	-	-	1875	2007	2065	2524
<i>Medical civil societies</i>						45	41	50
<i>Health specialized offices</i>	-	-	-	3962	4313	4577	5501	6937
<i>Total of the units mentioned above</i>	4910	5424	6011	6731	7534	7845	8936	10929

Source: Statistical yearbook of Romania, 2008

We excluded from this table the dentist offices, pharmacies and pharmaceutical point and some other units related with these and considered as not being relevant for our study.

As shown in the table above, the number of hospitals having private majority doubled in 2007 (22 hospitals) comparing with 2005 (11 hospitals). Also, for the type of units mentioned in this statistic, the number of total units increased in 2007 with about 39% comparing with the year 2005, and with about 22% comparing with the year 2006.

Research Methodology

Based on observation, in this research we investigated the websites of 10 private hospitals in Romania and 10 private hospitals located in other European countries, in order to underline the online tools the private hospitals use to generate patient loyalty. Also, we were interested to compare, from this point of view, the situation regarding the Romanian private hospitals' websites and those from the other countries. Individual private hospitals having active websites as of April 2010 were considered as the population for the study.

The framework of the research was designed based on the classification of customer loyalty tools in three categories: loyalty tools focused on interaction, loyalty tools focused on satisfaction and loyalty tools aiming to prevent customer migration (Homburg/Bruhn 1999, Bruhn 2001). We identified 22 tools used on hospitals' websites aiming to generate patients' loyalty.

The results of the study may be concluded as follows:

- in Romania there are no private university hospitals;
- the possibility of collecting data is mainly through recommendations made by family doctors, Customer Care Service (appointments, complaints), feedback (online form);
- in general, only few companies have a forum where customers can discuss their personal experiences; negative mouth-to-mouth propaganda;
- the price is an essential factor in taking a decision by Romanian customers. The price information is present on 8 of the 10 Romanian websites we analyzed, but only on one website of the 10 non-Romanian hospitals' websites;
- the foreign companies do not have a specialized department of Customer Complaint Management or, at least, it is not mentioned on their websites;
- only four of all analysed private companies have a research department and organize medical conferences;
- online appointment is made in the most of Romanian companies (but not in the foreign ones);
- the most used online loyalty tools focused on interaction are: developing products in collaboration with other institutions (networking), generating customers database using the webpage, and the presence on the website of the telephone numbers for special services;
- referring to the online loyalty tools focused on satisfaction, the most used are the section presenting advices and medical news, and the photos presenting the buildings and the cabinets. Most of the Romanian hospitals offer the possibility to make online appointments, but only one of the foreign hospitals' website we analyzed offers this possibility;
- Romanian hospitals use more online loyalty tools aiming to prevent customer migration than the foreign hospitals. Anyway, the most used tools in this category are those referring to the information about the medical equipments used and the information describing doctors' reputation;
- comparing the Romanian private hospitals with foreign ones it can be observed that later ones are oriented more to a wider range of patients, including the ones who are looking for methods of relaxation and maintenance of the state of health;
- in Romania, private hospitals are fulfilling the functions of the public ones offering sometimes high tech medical devices in order to perform accurate diagnosis, which because of the limited allocated budget by the state to the public sector (Romanian hospitals), these would not afford to acquire them;

DOES POSITIONING HAVE A PLACE IN THE MINDS OF OUR STUDENTS?

Popescu Andrei

*The Academy of Economic Studies Bucharest
Faculty of Marketing*

Brandabur Raluca Ecaterina

*The Academy of Economic Studies Bucharest
Faculty of Marketing*

Tatu Cristian Ionut

*The Academy of Economic Studies Bucharest
Faculty of Marketing*

Positioning is one of the most powerful marketing concepts. At the beginning, the meaning of positioning was rather limited, focusing on the concept of reputation. Then it became "the place a brand occupies in the mind of its target audience". Under this meaning, many companies have implemented the concept of positioning as a part of their everyday marketing activities. Nowadays, positioning is being used as a tool for explaining how consumers relate to foreign countries. The concept of positioning is simply too important to be ignored, but does it have a place in our students minds? This paper aims to determine whether we have an evolution or an involution in this matter.

Keywords: marketing, positioning, marketing research.

Cod JEL: M3

Conceptual framework

The concept of positioning is strongly linked with the process of trade. The exchange of goods and/or services between two or more merchants has taken place since the beginnings of civilization, as opposed to marketing which is considered to be a 20th century science. The explanation of this paradox is rather simple. Positioning was one of the marketing elements that had been used since the early days of trade. However, back then its meaning was rather limited, focusing on the concept of "reputation". All the merchants wanted to have a good reputation and to stand out with something: the best products, the widest range of goods, the most famous/important clients. Nevertheless, it's impossible to conclude that the ancient merchants were using the concept of positioning, as those actions were not part of a thoroughly planned and constantly implemented marketing activity.

Further on, at the beginning of the 20th century, marketing emerged as a science due to the accumulated social and economic progress generated by 19 centuries of turmoil. However, we can clearly conclude that this isn't the birthday of positioning. This concept is not typical of the first two stages in marketing's evolution, namely the orientation towards production (1900-1930) and the orientation towards sales (1930-1950). This is due to the fact that the concept of positioning cannot support a theory who's doesn't put the consumer on the first place. Therefore, the concept of positioning is typical of the orientation towards marketing (1950-1990), thus setting its birthday in the second half of the 20th century.

The word "positioning" was introduced by Jack Trout, an advertising executive, in his 1969 article published by "Industrial Marketing" and "Advertising Age". A few years later, in 1972, he teamed up with Al Ries, another advertising executive, in order to write an article called "Positioning cuts through chaos in marketplace", also published by "Advertising Age"¹⁶²⁹. This was only the beginning of their lifelong struggle aimed at establishing positioning as one of the most important concepts in marketing.

¹⁶²⁹ Enis, Ben, Cox, Keith - "Marketing classics: a selection of influential articles", Ed. Allyn and Bacon Inc., U.S.A., 1988, pages 410 & 420.

Their first struggle was about the meaning of positioning. Usually, when a new concept appears, there is more than one opinion about its content.

For instance, Alpert and Gatty considered that positioning is the differentiation of brands by studying the ways in which their consumers differ as well as how consumer perceptions of various brands differ¹⁶³⁰. Their approach is wrong because positioning is not presented as a process which unfurls in the mind of the consumer and its result is a classification of brands. Further on, Houston and Hanieski thought that positioning can be most easily described as a promotional strategy which attempts to place a brand along one or a number of dimensions relative to other brands in the same generic class. No matter what dimensions are employed, positioning is essentially a strategy used by the marketer in an attempt to find a niche for his brand¹⁶³¹. This is clearly a narrow definition concerning positioning. This concept has a strong influence on every P in the marketing mix, which means that it's much more than just a promotional strategy. Positioning is a key element not only when looking for a market niche, but especially when confronted with strong competition. From the management standpoint, Biggadike believed that positioning is a decision to serve a particular segment with a program tailored to those specific customer needs¹⁶³². Unfortunately, we can identify here a confusion between targeting and positioning.

Nevertheless, after a few decades of debate the Ries & Trout definition of positioning was unanimously accepted. The story goes like this: a company identifies a set of different needs in the marketplace, targets those needs that it can satisfy in a superior way, and then selects and communicates a position which is relevant, effective and consistent with the company's offering and image. Positioning is the act of designing the company's offering and image to occupy a distinctive place in the mind of the target market. The result of positioning is the successful creation of a "customer-focused value proposition", a cogent reason why the target market should consider buying the product¹⁶³³. If a company does a poor job of positioning, the unavoidable result will be a generalized confusion. On the other hand, if a company does an excellent job of positioning, then the rest of its marketing planning should come along smoothly.

Their second struggle was about implementing the concept of positioning in the daily business practices of every organization. This is yet to be realized. Nowadays, there are still organizations which go straight from identifying the need to marketing mix, without considering and choosing from the number of positioning alternatives. There is also the other side of the coin. There are already many organizations which use positioning as a weapon to undermine the competition and hypnotize the consumers. All the successes and failures that were recorded on the business stage can be easily explained using the positioning paradigm. Even the fact that many authors have written books about positioning using plenty of practical examples is, in my opinion, enough of a reason to be optimistic about the future of positioning. There is still work to be done in order to clarify the role and ease the implementation of positioning in every organization. There is also a need for improved marketing research methodology for positioning studies. A good progress in this area has been made by Marco Vriens and Frenkel Ter Hofstede¹⁶³⁴.

Nowadays, positioning is being used as a tool for explaining how consumers relate to foreign countries. Before even considering this, we must ask ourselves: is really positioning a concept that can be applied

¹⁶³⁰ Alpert, Lewis, Gatty, Ronald – "Product positioning by behavioral life-styles", published in "Journal of Marketing", U.S.A., 1969, page 65.

¹⁶³¹ Houston, Franklin S., Hanieski, John F. - "Pooled Marketing and Positioning", published in "Journal of Advertising", U.S.A., 1976, page 38.

¹⁶³² Biggadike, Ralph E. - "The contributions of Marketing to Strategic Management", published in "The Academy of Management Review", U.S.A., 1981, page 624.

¹⁶³³ Kotler, Philip, Keller, Kevin – "Marketing management", Pearson Prentice Hall, Upper Saddle River, New Jersey, 2006, page 310.

¹⁶³⁴ Vriens, Marco, Ter Hofstede, Frenkel - „Linking attributes, benefits, and consumer values", published in "Marketing Research", U.S.A., 2000, page 4-10.

to nations? Not only that the answer is yes, but it's very important for any country to make a coordinated effort regarding its position in the public's mind. The international image of a country is the central element which determines the position it occupies in the mind of the public. A country acquires a position in the mind of a person very much like any other product does. During its life, a person uses a multitude of sources in order to accumulate information about a country. Upon interpreting this information flow, a person builds and constantly updates the image of that country. This position is very important, as it will determine the person's future attitude towards that country and everything related to it¹⁶³⁵.

My research

We undertake this research for the second year in a row. One could ask which is the force that drive us to start this research series? The answer is quite simple: it is our opinion that the Marketing Faculty's syllabus should incorporate positioning and give it a place worthy of its importance. Unfortunately, at the moment positioning is barely mentioned throughout the core marketing courses. Our goal is to measure the results of this situation and to analyze them from a multiannual perspective. In order to guarantee the validity of our findings, we chose a full research. Thus, all the 3rd year students were asked to fill in a questionnaire concerning the positioning concept.

First of all, we wanted to see whether our students know the meaning of positioning or not. We're not doing that by accident. Previous research have shown a lack of knowledge on this matter. Besides that, if all the students would know what positioning means, there would be no need for further study regarding this concept. Thus, we discovered that only 23% of the students don't know the meaning of positioning. We believe this result to be encouraging, having in mind that an impressive 77% are familiar with the concept. We are further encouraged by the slight improvement of the results, when compared with the 2009 percentages. Still, the results show the need for an in depth study regarding positioning.

Second of all, we wanted to see whether our students know how to measure positioning or not. If a student knows what positioning means and how to measure it, there is no need to further study this concept. The results are surprising, to say the least. Thus, we discovered that 83% of the students are unaware of the fact that we can do this by using a positioning map. Is it possible for someone to know the meaning of a concept, without knowing how to measure it? We believe this is possible only when students receive less than the minimum amount of information about a concept. This paradox will be eliminated when students will undertake a thorough study concerning positioning. An additional concern is that the results are poorer than the 2009 percentages.

Third of all, we wanted to see whether the students know which is the positioning's place in the strategic marketing planning process or not. If a student knows what a concept means, how to measure it and where to insert it in the overall picture, there is no need to further study that concept. Unfortunately, the results are disastrous. Only 16% of the students know the correct answer to this question. Equally disastrous is the fact that the results are poorer than the 2009 percentages. This situation is a more than enough reason to accept the need for a distinct place for positioning in the marketing faculty's syllabus.

Last but not least, we wanted to see whether the students themselves perceive the need to further study the concept of positioning or not. When students receive less than the minimum amount of information about a concept, most of them become aware of their lack of knowledge. Thus, we discovered that only 5% of the students think they don't need further training on this subject. 44% of the students want to know more about positioning, by making it a chapter in the marketing introductory course. The rest of 51% believe that the presence of a "Positioning" course in the marketing faculty's syllabus is highly

¹⁶³⁵ Popescu, Andrei - "Re-positioning Russia towards the Eastern European countries", published in "Proceedings of the 6th International Interuniversity Scientific Conference: Russia and modern world, problems of political development", Russia, 2010, page 119.

desirable. We believe that these percentages speak for themselves. More than half of the students are aware of their lack of knowledge and are seeking additional training concerning positioning.

Based on this research, we conclude that students need to further study the concept of positioning. It is our belief that this need should be addressed sooner rather than later in order to fulfill our main objective of delivering skilled practitioners.

Université de Bacău, Faculté des Sciences Économiques

Romania's adherence to the European Union implied the previous and entire acceptance of the Community acquis in force on 31st of December 1999. Our country didn't request any period of transition or of derogation in this meaning, being among the first states from East Europe that regulated the audio-visual department, after the occidental model. In order to harmonize the Romanian legislation with the European standards, The National Council of the Audio-Visual Department adopted and transposed a whole range of acts and decisions that we will try to synthesize in our paper.

Mots-clés: acquis communautaire, réglementations sur l'audiovisuel, loi de la publicité, le Conseil National de l'Audiovisuel, transpositions des directives

Cod JEL: M3

L'Union Européenne a démontré pas mal de fois que la communication joue un rôle essentiel dans sa construction, bien que l'on revienne presque toujours au problème de vivre ensemble sans appartenir à la même culture. Cependant, on considère que cette culture représente le reflet fidèle de la personnalité de chaque individu, qui naît de l'enculturation, mais aussi de « l'acculturation », c'est-à-dire du contact avec les autres cultures. Malgré sa difficulté, la communication entre les représentants des cultures diverses aboutit souvent à l'émergence d'une réalité commune, la seule à pouvoir garantir la cohésion des sociétés pluriculturelles. Pareillement à ces sociétés, l'Union Européenne doit une certaine cohésion à ses habitants qui partagent une réalité commune par l'intermédiaire de la communication¹⁶³⁶.

Au niveau institutionnel, le développement de la politique de communication de l'Union, c'est une tâche de la Commission Européenne dont l'organe spécialisé, « La Direction générale audiovisuel, information, communication, culture » (DG X), met l'accent sur la distinction entre l'information et la communication. On a constaté quand même que la politique informative ne réussit pas à convaincre les Européens que les actions entreprises bénéficient à l'ensemble de la Communauté. Cet échec explique les raisons pour lesquelles l'information européenne a été confiée aux médias et la Commission a dû développer une communication audiovisuelle.

Les instruments de la politique audiovisuelle sont les documents adoptés en vertu de l'article 151(4) du *Traité instituant la Communauté Européenne* (1992). Ces instruments visent particulièrement les aspects culturels, afin de respecter et de promouvoir la diversité des cultures européennes.

Le poids de l'audiovisuel devient d'autant plus fort qu'il correspond à la fois à l'emploi d'une « stratégie d'image » et à la stratégie économique de la Communauté. Le secteur de l'audiovisuel combine, donc, de manière propre et unitaire, les aspects culturels, sociaux et économiques. Par conséquent, le point de départ de toute analyse de la politique générale applicable à l'audiovisuel doit être la reconnaissance du

¹⁶³⁶ Dacheux, É. – *Les stratégies de communication persuasive dans l'Union Européenne*, L'Harmattan, Paris, 1994, p. 72-73.

rôle important joué par ce secteur dans notre société, mais aussi le besoin d'assurer un équilibre entre le marché libre et la protection de l'intérêt général.

Le développement de la politique audiovisuelle de l'Union Européenne a deux objectifs fondamentaux¹⁶³⁷, qui sont poursuivis en prenant en considération la dimension culturelle du secteur audiovisuel:

- établir et assurer l'activité d'un espace européen authentique pour les services audiovisuels;
- consolider l'industrie des programmes européens.

L'action de l'Union Européenne dans le secteur audiovisuel repose pour l'essentiel sur deux piliers: un pilier législatif visant à organiser la circulation des émissions de télévision dans l'espace européen (**La Directive «Télévision sans Frontières»**) et un pilier financier consacré au soutien du secteur audiovisuel et conçu pour faciliter la circulation des créations européennes (**Le programme MEDIA**¹⁶³⁸) – deux modes d'action, normatif et incitatif, visant à défendre des créations cinématographique et audiovisuelle européennes ainsi que la promotion de la circulation de ces œuvres au sein de l'Union comme à l'extérieur. L'Union a su donc exercer une influence positive, aussi bien au niveau de l'encadrement que du développement. Instrument de référence en matière de réglementation de la télévision en Europe pendant plus de quinze ans, la *Directive TSF* a contribué à la diversité et à la croissance de ce secteur, en réconciliant à la fois objectifs culturels et économiques. Cependant, l'ère du numérique et de la convergence, mais aussi l'apparition des nouveaux services de médias audiovisuels ont imposé la redéfinition du cadre réglementaire européen. La nouvelle directive proposée, **«Services de médias audiovisuels»**, traduit *la nécessité d'étendre le champ d'application de la réglementation en vigueur à l'ensemble des services de contenu audiovisuel, indépendamment de la technologie ou de la plateforme de distribution utilisée*¹⁶³⁹.

Pour adhérer à l'Union Européenne, la Roumanie a entièrement accepté l'acquis communautaire en vigueur le 31 décembre 1999 et n'a sollicité aucune période de transition ou de dérogation, étant à même de mettre intégralement en pratique, à la date de son adhésion, cet acquis. En fait, la Roumanie a été parmi les premiers pays de l'Europe de l'Est à se doter d'une réglementation de l'audiovisuel et d'un organe de régulation modernes, selon le modèle occidental¹⁶⁴⁰.

En vue d'harmoniser la législation roumaine sur les règlements et les normes de l'Union Européenne, le Conseil National de l'Audiovisuel (CNA) a adopté et transposé toute une série d'actes et de décisions. Ce conseil représente l'autorité publique autonome et le garant de l'intérêt public dans le domaine de la communication audiovisuelle.

Dans le cadre institué par la Loi sur l'audiovisuel, le CNA assure *le respect de l'expression pluraliste d'idées et d'opinions dans les programmes transmis par les radiodiffuseurs situés sous la juridiction roumaine; le pluralisme des sources d'information et la libre concurrence dans le domaine de l'audiovisuel; un rapport d'équilibre entre les services nationaux de radiodiffusion et les services locaux, régionaux ou thématiques; la protection des mineurs; la défense de la dignité humaine; la*

*protection de la culture et de la langue roumaines, mais aussi de la culture et des langues des minorités nationales; la transparence des moyens de communication en masse dans le secteur audiovisuel*¹⁶⁴¹.

Dans ses rapports, la Commission Européenne mentionne les progrès enregistrés par la Roumanie, au cours des années, concernant le **Chapitre 20: «Culture et politiques audiovisuelles»**.

Quant aux politiques audiovisuelles, la Convention Européenne sur la Télévision Transfrontalière a été ratifiée et son Protocole d'amendement a été signé en février 2003. L'autorité de réglementation dans ce domaine, le CNA, a continué à adopter des décisions afin de mettre en pratique la Loi sur l'audiovisuel. Suite à l'adoption de cette loi en juillet 2002, la législation roumaine est en grande partie alignée sur l'acquis. Les amendements d'ordre techniques qui devraient être apportés à la Loi sur l'audiovisuel visent particulièrement la juridiction et les restrictions de retransmission.

La Roumanie a également continué à renforcer ses capacités administratives dans le domaine de l'audiovisuel pour assurer l'implémentation prévisible, transparente et efficiente du cadre législatif relatif aux politiques audiovisuelles.

La ratification de la Convention Européenne sur la Télévision Transfrontalière et l'adoption d'un nombre considérable de décisions en vertu de la Loi sur l'audiovisuel représentent des progrès importants enregistrés par la Roumanie dans le domaine de l'audiovisuel et mentionnés dans les différents rapports de pays.

La continuation de la transposition de la *Directive TSF* a été possible grâce aux décisions adoptées par le CNA, décisions concernant la liberté de retransmission, la publicité et le télé-achat, le droit à la réponse, la promotion des créations audiovisuelles et la délivrance de la licence audiovisuelle.

Suite à l'adoption de la Loi no. 504/2002 sur l'audiovisuel, à la promulgation par le Conseil de l'Europe de la Loi concernant la ratification de la Convention Européenne sur la Télévision Transfrontalière et au Protocole portant amendement à cette convention, la Roumanie accomplit les conditions prévues pour pouvoir participer au **Programme Media Plus** (2001-2005) – programme d'encouragement au développement, à la distribution et à la promotion des œuvres européennes.

Ce programme vise à améliorer la compétitivité dans l'industrie audiovisuelle européenne par une série de mesures se rapportant à la formation professionnelle, le développement de projets de production, la distribution et la promotion des productions cinématographiques et des programmes audio-visuels¹⁶⁴².

La position du CNA en tant qu'autorité indépendante a été renforcée aussi par le déroulement du **Projet PHARE RO 0107.02** (2002-2004): **«L'adoption et l'implémentation de l'acquis dans le domaine de l'audiovisuel – l'amélioration de l'élaboration des politiques et le développement des capacités administratives»**¹⁶⁴³, dont les objectifs concernent: l'élaboration et l'implémentation d'une politique de l'audiovisuel équilibrée et proportionnée afin d'assurer la libre compétition et le pluralisme; l'augmentation de la prise de conscience générale pour ce qui est de l'adoption et l'implémentation de l'acquis; une capacité administrative renforcée du CNA dans l'élaboration des projets législatifs et dans l'implémentation des politiques conformément au cadre législatif harmonisé de l'audiovisuel; la facilitation, pour les membres du Parlement, du gouvernement et pour les professionnels, de connaître et comprendre le contenu de l'acquis et des standards, des lignes directrices et des principes européens dans le domaine de l'audiovisuel; un plus grand nombre de connaissances au sein du grand public relativement aux conséquences de l'harmonisation de l'audiovisuel roumain sur les standards européens.

Les Rapports de contrôle et les Rapports d'évaluation confirment le fait que tous ces objectifs ont été atteints.

Vu le déroulement positif du projet Phare RO 0107.02, cofinancé par les subventions nationales, qui s'est déroulé de 2002 à 2004, et qui a notamment visé à apporter un soutien technique et matériel, le CNA a pu mener un second projet **Phare, PHARE 2004/016-772.03.15.01**, de 2007 à 2008, intégralement financé, cette fois-ci, par les fonds européens. Ce deuxième projet se proposait

¹⁶⁴¹ http://www.cna.ro/IMG/pdf/raport_cna_2004.pdf.

¹⁶⁴² <http://europa.eu/scadplus/leg/fr/lvb/l24224.htm>.

¹⁶⁴³ http://www.cna.ro/IMG/pdf/primul_pr_phare.pdf.

d'approfondir et d'élargir les compétences dans le secteur roumain de l'audiovisuel. L'objectif central était d'enrichir l'expérience et les connaissances des membres du CNA et du personnel spécialisé par l'acquis communautaire du secteur audiovisuel. Le programme englobait une analyse du marché de l'audiovisuel en Roumanie sous l'angle de quatre études spécifiques: le comportement, les habitudes et la satisfaction des auditeurs et téléspectateurs, l'influence de la télévision sur les enfants, l'impact de la publicité sur les enfants et l'impact des médias sur le comportement électoral du public. Les stages de formation continue proposés au personnel du CNA étaient consacrés aux thèmes de la protection des mineurs, du respect de la dignité humaine, de l'intérêt général, du pluralisme des médias et de la qualité de l'information.

Parallèlement, on envisageait des stages d'initiation informatiques et des cours d'anglais. Le programme comportait des voyages d'étude auprès des autorités de régulation d'autres Etats européens, des conférences et des ateliers. Au cours du projet, quatre bulletins d'information consacrés aux derniers développements internationaux dans le secteur de l'audiovisuel ont été publiés. A la fin du programme il y a eu une campagne médiatique pour la protection des mineurs dans le domaine de l'audiovisuel¹⁶⁴⁴.

On a pu constater que, entre le 15 janvier 2007 et le 14 février 2008, toutes les actions prévues dans ce projet se sont déroulées avec succès¹⁶⁴⁵.

La loi-cadre roumaine dans le domaine de l'audiovisuel a été révisée en octobre 2003. La révision a notamment permis de renforcer la position du CNA qui a porté le mandat de ses membres de 4 à 6 ans afin d'accroître son indépendance politique, mais elle a contribué aussi à clarifier les procédures de sanction et à introduire la possibilité d'actions plus nuancées et proportionnelles.

En 2004, les capacités administratives du CNA ont été accrues par une formation à la législation européenne et aux compétences techniques de contrôle.

En 2005, la Roumanie a, en grande partie, aligné sa législation sur l'acquis communautaire, en adoptant deux modifications qui restaient à apporter à la législation audiovisuelle au sujet de la compétence et de la liberté de réception. Néanmoins, le principe de non-discrimination basé sur la nationalité concernant la diffusion télévisuelle n'est pas respecté. Cela est dû à l'adoption d'une loi sur la cinématographie qui prévoit l'obligation, pour l'ensemble des organismes roumains de radiodiffusion télévisuelle, de réserver une part d'au moins 5 % du temps de diffusion aux films roumains¹⁶⁴⁶. Par conséquent, la Roumanie doit parfaire son alignement, tout en continuant à renforcer ses capacités administratives.

En décembre 2007, la Commission a présenté une révision de la Directive «Télévision sans Frontières», ayant pour principal objectif de moderniser les règles existantes de manière à tenir compte de l'évolution technologique et commerciale du secteur audiovisuel européen. La directive vise également à alléger les réglementations actuelles, surtout en matière de publicité, et distingue entre les services «linéaires» (télévision traditionnelle, Internet, téléphonie mobile) et «non linéaires» (télévision et informations à la demande)¹⁶⁴⁷.

Invités par la Commission à assouplir cette réglementation, les États membres de l'Union Européenne ont peu progressé dans l'adaptation de leur réglementation nationale. Le délai afin de finaliser la mise en place de ces changements a été établi à décembre 2009. On estime avoir alors un marché unique pour tous les services de médias audiovisuels en Europe.

La seule à pleinement avoir mis en œuvre les nouvelles dispositions européennes sur l'audiovisuel, entrées en vigueur le 19 décembre 2007, a été la Roumanie. Le 25 novembre 2008, elle a adopté un nouveau décret gouvernemental modifiant sa loi de 2002 sur l'audiovisuel dans le but d'y intégrer les dispositions de la nouvelle directive européenne. Cette réglementation offre aux producteurs et aux fournisseurs de programmes télévisés la possibilité d'avoir un accès plus facile à un financement provenant de nouvelles formes de publicité audiovisuelle, telles l'écran partagé ou le placement des

¹⁶⁴⁵ Ibidem.

¹⁶⁴⁶ <http://europa.eu/scadplus/leg/fr/lvb/e20108.htm>.

¹⁶⁴⁷ <http://europa.eu/scadplus/leg/fr/lvb/l24101.htm>.

produits, autorisé dans tous les programmes, excepté les journaux télévisés, les documentaires et les émissions télévisées. L'interruption plus facile des programmes de diffusion sera possible grâce à la suppression de la règle imposant les 20 minutes entre chaque coupure publicitaire. Cette réglementation se propose de renforcer le secteur européen de la télévision et de l'audiovisuel en créant des conditions de concurrence équitables pour les services de médias audiovisuels «sans frontières»¹⁶⁴⁸.

Les possibilités d'assouplissement proposées par la directive ont été entièrement exploitées par notre pays surtout concernant le placement des produits. Au moment de la notification officielle de ces modifications, la Commission vérifiera si la directive de 2007 a été complètement respectée en Roumanie.

Dans la reprise de l'acquis, le CNA doit veiller à ce que les décisions adoptées soient conformes aux progrès enregistrés au niveau européen. Il est nécessaire de continuer le renforcement de la capacité administrative du CNA afin d'assurer une implémentation prévisible, transparente et efficace du cadre de réglementation dans le domaine de la politique audiovisuelle.

En Roumanie, les actes normatifs qui règlementent les aspects concernant la publicité en général et la communication promotionnelle par l'intermédiaire de la télévision en particulier sont: la Loi sur la publicité et la Loi sur l'audiovisuel.

La loi no. 148/2000 sur la publicité, adoptée par le Sénat de la Roumanie le 29 juin 2000 et publiée dans le Moniteur Officiel no. 359 du 2 août 2000¹⁶⁴⁹, a comme but la protection des consommateurs de biens et de services, mais aussi des producteurs, des commerçants ou des personnes qui prestent des services. Les réglementations prévues dans le texte de cette loi s'appliquent au contenu des messages publicitaires indifféremment du moyen de communication. Quant à la publicité diffusée par voie de radio et télévision, les conditions y prévues sont complétées par la Loi sur l'audiovisuel.

La loi sur la publicité comprend quatre chapitres. **Le chapitre I** contient les dispositions générales concernant la publicité radio et télévisée, les définitions des termes de spécialité, les caractéristiques de la publicité et les interdictions la concernant. **Le chapitre II** traite de la publicité trompeuse et de la publicité comparative. **Le chapitre III** comprend les dispositions spéciales concernant certains produits (produits du tabac, boissons alcooliques, substances stupéfiantes et psychotropes, armes, explosifs et médicaments). **Le chapitre IV** précise les sanctions applicables en cas du non-respect de cette loi.

La loi no. 504/2002 sur l'audiovisuel, qui transpose dans notre législation les préventions de la *Directive «Télévision sans Frontières»*, a été adoptée le 27 juin 2002, modifiée et complétée par la **Loi no. 402** du 7 octobre 2003 et publiée dans le Moniteur Officiel no. 709 du 10 octobre 2003¹⁶⁵⁰. Structurée en huit chapitres, elle définit les termes de spécialité y utilisés et la qualité de radiodiffuseur, réglemente, d'un côté, la liberté de diffusion sur le territoire de la Roumanie des programmes télévisés et radiodiffusés des radiodiffuseurs qui sont sous la juridiction des États membres de l'Union Européenne, et, de l'autre côté, le droit de toute personne de libre réception des programmes de télévision (chapitre 1). La loi règlemente aussi le fonctionnement du Conseil National de l'Audiovisuel (membres, fonctions, attributions, etc.; chapitre 2), fixe le contenu de la communication audiovisuelle (réglementations concernant la transmission de la publicité et du télé-achat par l'intermédiaire de la télévision, la publicité pour certains produits tels les cigarettes, les médicaments et les boissons alcooliques, le temps de diffusion consacré à la publicité, etc.; chapitre 3), établit le régime juridique de la propriété dans le domaine de l'audiovisuel, mais aussi le fait que la mesure d'audience et de quotas sera réalisée conformément aux standards et à l'usage internationaux par des institutions spécialisées, désignées à la suite d'une mise aux enchères (chapitre 4), vise tous les aspects relatifs aux licences et aux autorisations du secteur audiovisuel – éléments constitutifs, temps consacré, situations où le CNA ou l'Autorité Nationale de Réglementation en Communications peut retirer la licence (chapitre 5), précise les limites du droit d'exclusivité (les trois derniers chapitres). Ainsi, en vertu de l'article 83, chaque personne a le droit de recevoir des informations, par voie audio ou audiovisuelle, relatives à tout

¹⁶⁴⁸ <http://www.welcomeurope.com/default.asp?id=1300&idnews=5125&MyPays=fr>.

¹⁶⁴⁹ <http://www.anpc.ro/anpcro/index.php>.

¹⁶⁵⁰ www.cna.ro/legislatie.html.

problème ou événement d'intérêt public, les contreventions et les sanctions applicables en cas de non-respect de cette loi, respectivement des dispositions transitoires et finales. La loi no. 504/2002 a été également complétée par la **Loi no. 116 du 19 mai 2008**, publiée dans le Moniteur Officiel no. 384 du 21 mai 2008.

A partir de 2000, le CNA a adopté également une série de décisions concernant la communication de marketing par l'intermédiaire de la télévision afin d'aligner la législation interne sur la législation européenne sur l'audiovisuel:

- la **Décision no. 65 du 23 mai 2000** relative aux normes obligatoires pour la publicité, le télé-achat et la sponsorisation dans le secteur de l'audiovisuel;

- la **Décision no. 21 du 28 janvier 2003** visant la publicité et le télé-achat pour les médicaments, les traitements médicaux, les suppléments nutritifs; la **Décision no. 22 du 28 janvier 2003** traitant des règles de la publicité et du télé-achat (publicité politique, publicité pour les bureaux des avocats et des notaires, publicité pour les boissons alcooliques et les aliments); la **Décision no. 36 du 13 février 2003** quant à l'intervalle horaire de diffusion télévisée de la publicité pour les boissons alcooliques distillées; la **Décision no. 38 du 18 février 2003** visant la publicité politique et la publicité relative à l'exercice de certaines professions. Le contenu des décisions no. 21, 22, 36 et 38 a été ultérieurement compris dans la **Décision no. 123 du 30 juin 2003**¹⁶⁵¹, modifiée et complétée par la **Décision no. 17 du 5 février 2004** concernant la diffusion de la publicité et le télé-achat, mais aussi la promotion des médicaments;

- la **Décision no. 187 du 3 avril 2006**, la plus récente décision du CNA, actualisée par les Décisions no. **335/2006**, **194/2007**, **516/2007**, **762/2007**, **1105/2007** et **50/2009**¹⁶⁵² et en vigueur à partir du 3 février 2009, contenant le code de réglementation du contenu de l'audiovisuel. Le 7^e titre de cette décision, *Sponsorisation, publicité, télé-achat*, concerne la publicité pour l'alcool, les aliments, les médicaments, la publicité politique, la publicité relative à l'exercice de certaines professions, les programmes de télé-achat.

En guise de conclusion, nous pouvons affirmer que la législation roumaine est, en grande partie, alignée sur l'acquis, même s'il reste encore des ajustements à faire quant à la Loi de l'audiovisuel et qu'il faut également assurer l'alignement sur l'acquis de toutes les décisions applicables à la loi. La Roumanie doit aussi respecter certaines dispositions législatives, réglementaires et administratives prévues dans **La Directive 2010/13/UE** du Parlement Européen et du Conseil **du 10 mars 2010**, relatives à la fourniture de services de médias audiovisuels (**Directive «Services de médias audiovisuels»**)¹⁶⁵³. Au plus tard le 19 décembre 2011, puis tous les trois ans, la Commission soumet au Parlement Européen, au Conseil et au Comité économique et social européen un rapport relatif à l'application de cette directive.

Communication is the key factor necessary to improve the relation between doctors and patients. The communication is the method used to transmit or collect information using different types of channels. The communication process should provide useful information for doctors and patients. In order to establish a good communication system, both parts must fulfil some obligations. The present paper presents direct communication methods and indirect methods of communication.

Keywords: communication, direct communication, indirect communication, doctors, patients

JEL codes: M 310;

Richard Weiner¹⁶⁵⁴ defines communication as “transmitting or exchanging information, signals, messages or data using different ways – verbal communication, written communication, or by telephone, radio or other channels, within a group or orientated to specific people or specific groups.” Communication is a process which involves the existence of two parts: the sender – the person who initializes the communication and the receiver - the person who receives the message. Between these two parts of the communication system we find the message, the channel, the codification, the decodification and the feedback.

The communication between doctors and patients must fulfil the following:

- doctors must establish a relationship based on trust;
- doctors must continuously provide information about the correct methods that can be accessed by the population in order to benefit from correct health care services;
- doctors must know and apply the rights and obligations provided by the status of the insured person;
- to inform the patient about the risks that the incorrect dosage of a treatment may involve;

The communication between doctors and patients has the following roles:

- exchanging of information;
- creating the bases of a relationship;
- building a relationship based on trust;
- maintaining the relationship for a long time period;

In order to establish a good communication system between doctors and patients, both parts must fulfil some obligations:

The doctor's obligations:

- the doctors must concentrate their full attention on the patients;
- confidentiality must be respected;
- permanent preoccupation with the patients;
- the doctors must treat their patients with respect;

¹⁶⁵⁴ Weiner, R., „Webster's new world dictionary of media and communications”, Editura Simon & Schuster Inc., New York, 1990, p.104.

The patient's obligations:

- the patients must establish a list of questions that they want to address to the doctors;
- when needed, the patients can assign a family member or a trustworthy person to; represent them in the discussions with the doctors;
- to keep an open dialog with the doctor;

Methods of communication

Direct communication – implies a direct dialog between two or more persons.

Types of direct communication:

1. Face to face communication occurs when the patient and the doctor are present in the same location, at the same time. This type of communication must be differentiated taking into account the different segments of patients. Taking into consideration the segmentation criteria based on the age of the patients we can identify the following:

- Children age between 3-10 years – must be considered as being the target segment to develop a good communication process. The health education must be presented as a story avoiding specialized terms and the results should be concluded with the help of a contest. For example, every child should have a table with daily hygiene rules in which he must mark with an X the respected tasks. Every week the doctors should check the accomplishment of those tasks.
- Children age between 10-14 years – the school doctor should organize and participate in open discussion in order to inform the children about the factors that causes the appearance of diseases and methods of prevention. When we talk about an epidemic, beside the explanation about the disease the doctor should display the methods of prevention of the disease in every classroom. The doctors should also initialize a contest in which to challenge the children to create prints about the disease and methods of prevention. The school doctor will select the most representative prints and will organize an exhibition in public places.
- Teenagers age between 15-19 years – the doctors should organize open discussions and project movies that explain the disease and also present the effects over the human body. When we talk about an epidemic the doctor could organize a forum of discussion on the web page of the high school, should transmit daily information about preventing the disease on the high school radio and should involve the teenagers in information campaigns about the epidemic among their young colleagues.
- Young population age between 20-35 years – the doctors should organize seminars on different themes in order to make them realize the risks of living a non-healthy life. For example, the school doctor should organize a seminary on the risks of consuming different types of drugs, alcohol and tobacco. Moreover, the doctors should create different accounts on socialization networks such as Facebook, Hi5 in order to communicate more easily with this segment of population. The doctors should additionally use e-mail communication in order to establish a meeting with the patients.
- Mature population and elderly population – the doctors should inform them about various modalities that they can use to reinforce their immune system, new methods of investigation and treatments discovered for each disease.

2. Communication by phone can be used for all types of patients and can occur when the doctor telephones the patient. This type of communication can be done in order to inform the patient about changes in the schedules. It can also appear when the doctor receives the blood results of a patient. When those indicate the appearance of a disease that requires immediate treatment or seeing a specialized doctor. In the case of communicating an incurable disease the doctor should contact a family member assigned by the patient to inform him about the disease and the proper method of informing the patient. For the segments between age 18-55, the doctor can modify the issues previously announced using the SMS service.

3. Communicating by mail can be used to inform the patients between 18-55 and can occur when the doctor announces the vaccination campaigns for babies, young children and the rest of population for

the prevention of new diseases. The doctors can send e-mails to patients in order to inform them about the opening of new medical clinics and services offered by those.

4. Communicating on an Internet forum. This type of communication can occur when the doctor creates a blog or an Internet page where the patients can address their questions. It is indicated for the doctor to have a schedule in which he will present the time and dates when he will be available for on-line communication.

Indirect communication is characterized by the possibility to send messages without a personal contact. The main forms of indirect communications are: printed media – newspapers, magazines; the broadcasting media – radio, television.

1. Communication using newspapers can be used when the doctors announce the vaccine campaigns for the patients. When a new disease appears, the newspaper can be used to inform the patients about the symptoms, effects over the human body and also about the methods of preventing it. The newspaper can even be used to inform the patients about the increasing of number of patients that have a contagious disease and the measures that must be taken. In the case of natural disasters that can influence the health status of the patients the doctors must communicate the measures that need to be taken into account.

2. Communication using specialized magazines in order to inform the patients about new discoveries in medical treatments and medical equipments.

3. Communication using radio and television as methods of sending the messages. The doctors must send messages in case of an epidemic explaining people the causes and effects of that epidemic and also the indicated medical measures that need to be taken into consideration. The doctors can participate in live transmissions on the radio or television where they can discuss current health issues.

Recommendations:

The health ministry must create a web page with the most competent specialized doctors for each medical domain. This page can be accessed by all patients from all over Romania. The site must provide a chat section and a forum where the patients can send analyses, X-rays, MRI analyses and treatments they themselves used in the process of treating a disease in order for the specialized doctors to get another confirmation about the diagnosis and the treatment. Also by using this site they must be able to obtain a medical appointment. This way, every patient will benefit from access to specialized doctors from every part of Romania.

The patients must be informed daily using the printed media and radio about the pharmacies that have the funds for compensated prescriptions.

The results of medical analyses and medical investigations must be delivered directly to the GPs (General Practitioners).

The patients must have the possibility to schedule to state clinics using the Internet site from where they can obtain the number of order.

If a person is medically insured and because of a lack of funds he/she has to pay for a medical analysis, he/she should benefit from a deduction to the sum paid for the medical insurance or the amount of money paid for that analysis must be returned to him.

Information campaigns about health issues conducted in schools should be conducted directly not by using only printed posters.

The communication campaigns using the Internet should increase the usage of Internet banners and interactive windows on the most accessed web sites.

ASPECTS REGARDING THE DIFFICULT PROCESS OF BUILDING A ROMANIAN TOURISM BRAND

Sasu Dinu Vlad

Universitatea din Oradea

Facultatea de Științe Economice

The image we have about a country has a huge impact on how we view it as a tourist destination, a place to invest in, or a place to buy the brands we love from. In today's globalised market the battle for tourism, exports, and inward investment is extremely intense as brands have become more and more the vehicles for communicating national identity.

Keywords: brand, tourism brand, image, country image, tourism.

M31 - Marketing

1. Defining the key concepts of the paper

As an introduction, the key concepts of the paper are briefly defined.

Brand

The American Marketing Association defines the term “brand” as followed: “A name, term, design, symbol, or any other feature that identifies one seller's good or service as distinct from those of other sellers. The legal term for brand is trademark. A brand may identify one item, a family of items, or all items of that seller. If used for the firm as a whole, the preferred term is trade name”.

We find it necessary to mention that the Romanian theoretical concepts of “brand” and “trademark” have spawned controversy, regarding the differences and similarities between the ways they are used. Most of the times the ones responsible for this “conceptual war” are the same unspecialized translators that also marked the beginning of yet another linguistic controversy between the terms “commercial” and “publicity”¹⁶⁵⁵. Without insisting on the issue, we would like to mention that the following paper considers the two theoretical concepts as being synonyms.

Country Brand

A **nation brand** or **country brand** is believed to be a country's identity that has been proactively distilled, interpreted, internalized and projected internationally in order to gain recognition and to construct a favorable national image. A country brand strategy therefore is a plan for defining the most realistic, most competitive and most compelling strategic vision for the country.

Country branding harmonizes national policies as varied as acts and policies of government, the values and behaviors of citizenry, education, culture, sports, health, taxation, public diplomacy, the look and feel of settlements, export and investment promotion, and infrastructure development.

Image¹⁶⁵⁶

In terms of marketing, an **image** is a mental representation, on an individual or group level, as a result of perceiving and organizing information about a product, person, group, organization, political party or country.

Country Image

¹⁶⁵⁵ Sasu D V. Diferențe și similitudini între marcă și brand in The Journal of the Faculty of Economics - Economic Science Series, TOM XIII, Oradea, 2004, p.332.

¹⁶⁵⁶ Bucur-Sabo M in Florescu C, Mălcomete P, Pop N A. Marketing – Dicționar explicativ, București, Ed. Economică, 2003, p.291.

There are many definitions surrounding this concept, but reviewing them we could say that “**country image**” represents a set of beliefs and perceptions that people have about a given country. Further on, we can make the assumption that country image is constituted of history, geography, art, music, citizens, events and a diverse package of variables and auxiliary factors.

2. Assessing the situation

We are witnessing a paradox. On one hand, Romania’s tourism potential indicates that it can compete with surrounding countries; therefore it has been chosen, by the government, as a strategic orientation for Romania’s Sustainable Development Strategy¹⁶⁵⁷, where the most important measures aim for sustainable capitalization of the cultural heritage and natural resources with tourism potential and also the improvement of tourist recreation and housing infrastructure. On the other hand, foreign tourism demand for Romania as a tourist destination is recording a downfall trend (not only compared to previous years, but also compared to other neighbourly countries – Annex 1) due to a complex number of factors ever so diverse. Curiously domestic tourism demand has had a constant accession in the last 6 years

Table 1: Arrival of tourists that check in at a hotel or similar establishment¹⁶⁵⁸

	Year	2003	2004	2005	2006	2007	2008
Number of tourists (x1000)	Non-residents	1.104	1.359	1.429	1.379	1.550	1.465
	Residents	3.951	4.279	4.375	4.836	5.420	5.659

Romania’s problem regarding tourism and the attempts to identify the main weaknesses in this field are not recent issues. The relative novelty for this subject is considering the lack and need of a strong tourism brand, part of a general country brand, as one of the main causes for Romania’s tourism problems.

Building a county brand, a tourism brand or a regional brand is a difficult task, but it is not impossible. Creating a brand involves developing a brand program, which underlies the brand identity and positioning. Thus the brand’s reason for being, its vision, core values, and know-how must be clearly defined, internalized and communicated. Country branding plans should exhibit the clear, simple, differentiating propositions often built around emotional qualities expressing some kind of superiority, which can be readily symbolized both verbally and visually. Therefore, in principle the product, service, corporate or country branding are the same. However, the methods differ.

As Simon Anholt, a reputable advisor for the British government, specializing in the field of nation branding, states on numerous articles on his personal web-site¹⁶⁵⁹, one of the most critical challenges facing nation branding is finding a strategy which is believable, relevant to the consumer audience, true to reality, and the aspirations of the country. The fact that products can be de-listed or modified, re-launched and re-positioned, or replaced by improved products is yet another difficulty encountered by country branding, one that product branding does not have to face. Countries, however, do not have many of these choices and their image problems may be founded in structural handicaps that take years to fix. For example, even The European Union finds it hard to build a coherent regional brand, as Wally Olins, also known as “The Branding Guru”, President of “Saffron Brand Consultants” states his opinion during an interview for IqAds: “Europe has not been able to build something like this [meaning a

¹⁶⁵⁷ “The National Strategy for Sustainable Development of Romania - Horizon 2013-2020-2030”, The Romanian Government, Ministry of Environment and Sustainable Development, The United Nations Program for Development, The National Center for Sustainable Development, 2008, p.116 at <http://strategia.ncsd.ro/>

¹⁶⁵⁸ <https://statistici.insse.ro/shop/>

¹⁶⁵⁹ <http://www.simonanholt.com>

regional brand] yet, but it will probably succeed in time. We can find models in the past. Going as far back in time as The Austrian Empire, The Austro-Hungarian Empire or if we take a look at the Ottoman Empire, [...], we will discover that it is possible for such an entity to exist, one that reunites different cultures and tongues, joint together by identity¹⁶⁶⁰.” Although exaggerating a bit, we can agree that there are inspirational resources for brand building that date as far back as the Old Continent goes.

As regarding tourist country brand, the recipe for success is out there. Here are a few examples of countries that have a strong tourist country brand:

Top 10 Country Brand Index¹⁶⁶¹ (CBI¹⁶⁶²) by FutureBrand

1.USA; 2.Canada; 3.Australia; 4.New Zealand; 5.France; 6.Italy; 7.Japan; 8.United Kingdom; 9.Germany; 10.Spain – Romania ranks number 81 in 102 countries.

Or countries that have active country branding programs: South Africa – Alive with possibility; Spain – San Siro; India – Incredible India; Thailand – Amazing Thailand; Malaysia – Truly Asia; Iceland – Iceland naturally; Egypt – Destination Egypt; Estonia – Positively Transforming.

Building a strong brand creates equity which is „a set of characteristics that make a brand seem different and better to both consumer and businesses¹⁶⁶³”. But in order to do that, „a branding program needs all its involved participants to take on the resulting responsibilities, in the same way if we are talking about a corporation, a church, a store or a country¹⁶⁶⁴”, and it also needs to be based on concrete and tangible characteristics.

Philip Kotler says that „in order to avoid the failure trap of an undifferentiated brand, marketers need to start from the belief that anything can be differentiated¹⁶⁶⁵”. So he frames 4 differentiation strategies:

1.Product, 2. Personnel, 3. Distribution channel and 4.Image differentiation.

When choosing image differentiation, one needs to take into consideration the fact that an image, in order to serve its goals has to be¹⁶⁶⁶: *1.Valid (anchored into reality), 2. Credible, 3.Simple, 4.Appealing, and 5. Distinctive.*

The questions for Romania are: “*What differentiates our country from all the other countries? And are those characteristics relevant enough to build a strong tourism brand?*”

3. Romania’s options and what is being done

Since Kotler encourages us to think that anything can be differentiated, maybe that’s where we have to start. Of course Romania can differentiate itself from other countries; we only have to choose the right way to do that and we cannot make the unpardonable mistake of trying to appeal to everyone. The answer to that is positioning, the process by which marketers try to create an image or identity in the minds of their target markets for their product, brand, or organization. The next logical step is to establish your target markets and focus on them. And that is yet another chapter at which Romania’s tourism fails, because it targets everyone. Romania wants to be “The land of choice”, but unfortunately not even we can say whose choice Romania is supposed to be.

When the target markets are set, one needs to bear in mind that advertising targets need to also be set. The advertising target has a wider range than the target market, and includes consumers, but also other

¹⁶⁶⁵Kotler P, Keller K L. Managementul Marketingului—ediția V, București, Ed. Teora, 2008, p.465.

¹⁶⁶⁶Kotler P, Haider H D, Rein I. Marketingul locurilor, București, Ed. Teora, 2001, p.159.

individuals that can influence the target market. In terms of volume, the advertising target is superior to the target market, unless a selective policy is established¹⁶⁶⁷.

After doing that, instead of trying to “*push*” new destinations, new offers, new experiences towards tourists, why not “*pull*” the tourists towards destinations that established themselves as attractive to foreigners. “New” is not always the best approach. The destinations foreign tourists are *already* interested in can become premises for building our tourism brand.

Table 2: Favorite Romanian destinations for foreign tourists

Country of origin	Favorite destinations
Japan	Maramureş County, the monasteries of Bucovina, Sighișoara, Braşov, Bucharest
USA	Transylvania’s medieval cities, Bucharest, the monasteries of Bucovina, traditional villages
Germany	The Black Sea shore, balneary resorts
Italy	Northern Moldavia, Bucovina, Bucharest, The Danube Delta, Prahova Valley
Sweden, Norway and Denmark	The Black Sea shore, balneary resorts
Poland	The Black Sea shore, skiing resorts, Bucovina
Hungary	The Black Sea shore
Holland and Israel	balneary resorts

Some of these destinations cannot compete with similar ones abroad. For example, if we are being practical about it, the Romanian Black Sea shore cannot compete with the beaches in Greece, nor can Prahova Valley compete with similar mountain resorts in Austria or Germany simply because nature is just different. *But* other destinations like Sighișoara, Bucovina, the old fortresses in The Orăştie Mountains, are a gold mine. According to Jean-Claude Baumgarten, president of the World Travel&Toursim Council, Romania has been gifted with a seventh of the worlds total cultural heritage¹⁶⁶⁸. Maybe, taking all this into consideration, we need to reassess our priorities.

The Ministry of Tourism has initiated a program called “Tourist in Romania”, promoting the destinations mentioned above, but the program only targets Romanian tourists. The <http://turistinromania.com> web-site is not even available in any foreign language and it is poorly designed, with scarce information.

Another issue revolves around the fact that not much has been done when it comes to finding the country an *up-to-date identity*. Romania’s country brand also depends on how the country is perceived in terms of its popular and high culture: ranging from films, TV, sport, and music to history, art and literature, even popular local products, and including not just elevated cultural achievements, but also popular celebrities. Romania’s identity and image hangs on the notable figures of the past, but these are not enough to be brand ambassadors in *today’s world*. Romanian “products”(including people) need to make their mark. Sadly, there are very few truly prominent people identifiable as Romanians and with whom outsiders can relate to.

A campaign that promotes our country as a tourist destination was launched following a collaboration protocol between the Ministry of Tourism and BRD Societe Generale. Headed by the key line “Romania.Land of Choice,” the campaign has at its forefront three Romanian sports legends- gymnast Nadia Comăneci, soccer player Gheorghe Hagi and tennisman Ilie Năstase. According to the Tourism Minister, the entire campaign will cost several million euros, of which 2 million euros will be used for

¹⁶⁶⁷ Marcenac L, Milon A, Saint Michel S H. Strategii publicitare, Bucureşti, Ed.Polirom, 2006, p. 86.

¹⁶⁶⁸ Sasu D V, Coita D C. Aspecte privind opţiunile strategice de dezvoltare turistică a României in The Journal of the Faculty of Economics - Economic Science Series, vol.1, TOM XV, Oradea, 2006, p. 963.

running the campaign on two popular international TV channels. She also made clear the distinction between this campaign and the country brand.

Previous branding campaigns have failed. This is actually not the first effort to brand Romania. In 2004, a campaign was made by Ogilvy&Mather, which required 1.7 million USD and which was called "Romania, simply surprising". It was cancelled three years later by Richard Batchelor, leader of the World Tourism Organization International Consultants team, because "it did not communicate Romania's essence to potential visitors."

A second failed attempt was a campaign initiated by the Ministry of External Affairs with the slogan "Fabulous Spirit" which cost 110,000 USD. The spokesman for the Ministry of External Affairs at that time said the reason for which previous efforts have failed was because building a branding strategy was one of the most difficult communication strategy projects. The brand strategy should convey that "Romania equals the most beautiful adventure in Europe". "The symbols and people used in it should be compatible and representative for this direction", said the spokesman.

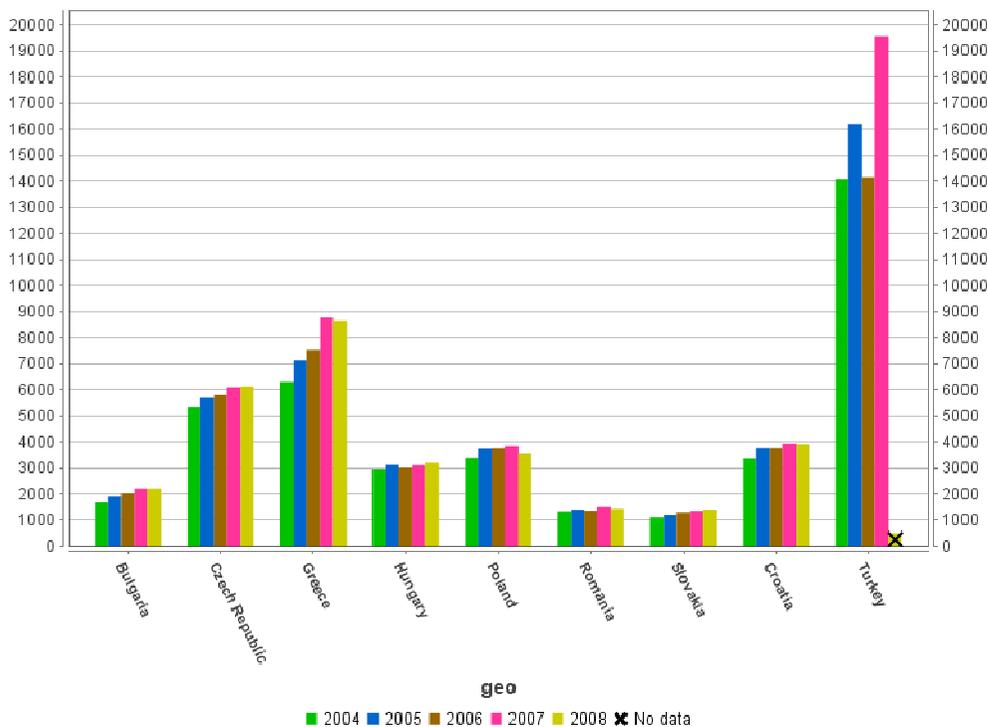

Regarding the process of Branding Romania, actions are being taken as we speak. An agency that will create the Romanian tourism brand will be selected by the Ministry of Tourism, following an international bid. Among the criteria that participants will have to meet is to have worked on at least one similar project. The creation of the brand will cost 2 million euros, while other 73 million euros, from European Union funds, will be used for implementing it.¹⁶⁶⁹

Only time will tell if Romania's Tourism Brand will become a successful story. But one thing is for sure, considerable efforts will be necessary in order to re-sketch our country image and build a solid, long-lasting, efficient brand.

In addition to traditional distribution methods (network of territorial units), to better meet market requirements in terms of speed and efficiency of services, banks have developed interactive electronic and computerized systems for clients: banking services via telephone, internet banking, network of automatic teller machines (ATMs), Electronic Funds Transfer at point of sale (EFTPOS). Automatic Teller Machines have become in recent years one of the common instruments through which banks offer the possibility of conducting routine operations such as: cash withdrawals, bill payments, transfer between accounts. This article presents the results obtained following a research that focused on determining the customers' degree of satisfaction with the distribution channels used by a Top Five Romanian Bank, in particular the ATMs distribution network.

Keywords: distribution channel, Automatic Teller Machines, satisfaction degree, bank

JEL Classification: M31, G29

Introduction

The distribution of banking services can be understood as the place and means by which the bank services are offered to customers.

In general, banks try to create a diversified distribution strategy in order to market their services range, offering customers several ways through which they can benefit from the bank services (a firm applies a diversified distribution strategy when making their products or services available through two or more distribution channels). The three main factors that led to the use of multiple distribution channels by banks are: major changes in the banking sector by growing competition and increasing pressure from competitors, changing customers preferences and the third factor, the difficulties encountered by banks in the attempt of differentiation by offer. As a result, the banks have then resorted to compete on price and now the emphasis is on differentiation by distribution channels used.

Distribution channels used by banks can be divided into two main groups: in the first category are included those channels which typically involves "personal contact with the consumer" - territorial units, and in the second category are included those "channels which may either interact directly with the consumer, by non-personal means, or operate through various intermediaries"¹⁶⁷⁰. Thus, in addition to traditional distribution methods (network of territorial units), to better meet market requirements in

¹⁶⁷⁰ Peter J. McGoldrick, Steven J. Greenland (1992), "Competition Between Banks and Building Societies in the Retailing of Financial Services", *British Journal of Management*, Vol. 3, No. 3, pp. 169 - 179

terms of speed and efficiency of services, banks have developed interactive electronic and computerized systems for clients: banking services via telephone, internet, network of automatic teller machines (ATMs), Electronic Funds Transfer at point of sale (EFTPOS).

Research objectives

The main objective of the research was to determine the contentment / satisfaction degree of respondents with distribution channels used by a top five Romanian Bank.

To achieve this, it was necessary to determine the most important factors that customers take into consideration in assessing the various distribution channels and determining how these factors are valued for channels of the analyzed bank¹⁶⁷¹.

The secondary objectives derived from the main objective have been structured as follows:
-identifying and measuring the satisfaction degree with the bank's territorial units;
-identifying and measuring service satisfaction with the Bank's Call Center services;
-identifying and measuring service satisfaction with the banks internet banking services;
-identifying and measuring satisfaction degree with the banks ATMs network.

In this article, only the results from the analysis of the fourth secondary objective are presented, because these are the most relevant for the article's topic.

Methodology

Data collection was carried out using punctual survey and the research instrument was the questionnaire.

Given the objectives of this study, the surveyed population was composed of banks' customers (customer = person who has at least one account with the considered bank), aged at least 18. The research was carried out during June-July of 2009, thus resulting in a sample composed of 515 persons, the margin of error being $\pm 5.2\%$, for a 0.95 probability.

Research results

Automatic Teller Machines have become in recent years one of the common instruments through which banks offer the possibility of conducting routine operations¹⁶⁷² (cash withdrawals, bill payments, transfer between accounts) which before the introduction of ATMs were carried out over the counter, with the help of bank staff.

The questions regarding this distribution channel were constructed so as to identify the main operations carried out by the bank's customers at ATMs and also the frequency with which they are conducted. Another aim was also to establish those factors that customers consider most important in assessing a distribution channel. A third goal was to identify how the bank's ATMs are perceived by its customers, to determine the satisfaction of respondents with the bank's ATMs and, not least, identifying the main reasons behind reduced customer satisfaction (if present)¹⁶⁷³.

The results presented in table 1 show that operations with the highest frequency conducted by most respondents are: cash withdrawal and card balance query.

¹⁶⁷¹ Wendy W.N. Wan, Chung-Leung Luk, Cheri W.C. Chow (2005), „Customers' adoption of banking channels in Hong Kong”, *International Journal of Bank Marketing*, Vol. 23, No. 3, pp. 255-272

¹⁶⁷² Luis M. Huete, Aleda V. Roth, (1988), „The Industrialisation and Span of Retail Banks' Delivery Systems”, *International Journal of Operations & Production Management*, Vol. 8, No. 3, pp.46-66

¹⁶⁷³ Robert Rugimbana, Philip Iversen (1994), „Perceived Attributes of ATMs and Their Marketing Implications”, *International Journal of Bank Marketing*, Vol. 12, No. 2, pp. 30-35

Table 1. Services structure according to the frequency of their request

		Frequency of the service use					
		Once a week or more often	Once every two weeks	Once a month	Once every 2-3 months	Less often	Total
Bill payments to utilities providers	Frequencies	14	29	65	10	15	133
	% of the persons requesting this service	10,5%	21,8%	48,9%	7,5%	11,3%	100,0%
Cash withdrawal	Frequencies	242	157	80	14	19	512
	% of the persons requesting this service	47,3%	30,7%	15,6%	2,7%	3,7%	100,0%
Card balance query	Frequencies	116	126	80	18	69	409
	% of the persons requesting this service	28,4%	30,8%	19,6%	4,4%	16,9%	100,0%
Changing the PIN Code	Frequencies	2	1	2	1	79	85
	% of the persons requesting this service	2,4%	1,2%	2,4%	1,2%	92,9%	100,0%

The higher percentages of customers who carry out these operations can be explained by the original purpose of this alternative distribution channel - cash withdrawal outside the bank's working hours. Another explanation is the low rate of POS payments (compared with the large number of people who withdraw cash from ATMs), and when such payments are made, the customer often wants to ensure for the accuracy of operation. This comes as a surprise because in general it is expected that these two percentages (99.42% for cash withdrawal and 79.42% for card balance query) are closer, considering that usually when cash withdrawal is performed, the customer also requests a receipt to be issued for the account balance. A possible explanation would be that the bank introduced since 2009 a fee for each card balance query. This prompted customers either to reduce the frequency of such operations, or to abandon the balance querying through this distribution channel in favor of internet banking (this channel does not charge any fee for checking the account balance).

Changing the PIN code at ATM is carried out less often than every 2-3 months by the majority (92.9%) of respondents. However, there are also customers who choose to change the PIN code more often, this being considered a protection measure against possible frauds.

The second aim is to investigate factors considered important by customers in assessing this distribution channel.

Initially, 8 factors of influence were taken into account, a number too large to be easily used in developing marketing strategies by the financial institution. Therefore, this number of factors was

reduced using principal components analysis¹⁶⁷⁴.

Applying this method has led to the formation of two components. The first one explains almost one third of the total variance, 32.095% and the second component 13.558%.

Table 2. The total variance explained using principal component analysis

Component	Initial eigenvalues			Extraction sums of squared loadings		
	Total	% of variance	Cumulative percentage	Total	% of variance	Cumulative percentage
1	2,568	32,095	32,095	2,568	32,095	32,095
2	1,085	13,558	45,653	1,085	13,558	45,653
3	0,856	10,700	56,353			
4	0,823	10,289	66,642			
5	0,747	9,339	75,981			
6	0,684	8,556	84,537			
7	0,652	8,146	92,683			
8	0,585	7,317	100,000			

The first component is a linear combination of 5 factors that customers consider important when assessing alternative distribution channel: *The variety of transactions*, a factor which has the highest loading - 0.647, *Operations rapidity*, the factor with the second highest loading - 0.635, *Ease of use*, *Clarity of instructions* and *The ATM network*.¹⁶⁷⁵

The second component is a linear combination of 3 factors considered to be important in assessing ATMs: *Costs of services*, loading - 0.599, *Service security*, loading - 0.564 and *Information provided related to promotional campaigns*, a factor with a smaller loading than the first two.

The first component is called *ATM*, because it contains factors that relate to the functional characteristics of this channel (technical features such as software that allows for quick and easy operations and logistical features – ATMs network).

The second component is called *Bank* because it contains factors that refer to the financial institution: costs of services or information, displayed on ATMs screens, about its offer.

Grouping eight factors into two components is very useful when the bank seeks to encourage the use of this distribution channel. The percentages of variance explained by each component indicates the issues on which the bank must primarily intervene and aspects through which the ATM distribution channels is evaluated by most respondents. In this case, the customers' emphasis more the ATM component, which means that the bank should try to focus mainly on messages relating to the factors included in this component.

After grouping the considered factors for the overall assessment of the distribution channel, an evaluation of the bank's ATMs was performed. Thus, respondents were asked to agree or disagree, on a 5-step scale where: 1 - totally disagree and 5 – totally agree, on statements about the bank's ATMs. Means are presented in table 3.

¹⁶⁷⁴ Mathew Joseph, George Stone, (2003), „An empirical evaluation of US bank customer perceptions of the impact of tehnology on service delivery in the banking sector”, International Journal of Retail & Distribution Management, Vol.31, No. 4, pp. 190-202

¹⁶⁷⁵ Kevin Curran, David King, (2008), „Investigating the human computer interaction problems with automated teller machine navigation menus”, Interactive Technology and Smart Education, Vol. 5, No. 1, pp. 59-79

Table 3. Means obtained for statements relating to the bank's ATMs

	Mean
<i>Ease of use</i>	4,72
<i>Service Security</i>	4,29
<i>The variety of transactions</i>	4,23
<i>Costs of services</i>	4,28
<i>ATMs network</i>	4,67
<i>Information provided related to promotional campaigns</i>	4,87
<i>Instructions clarity</i>	4,57
<i>Operations rapidity</i>	4,73

ATM Component - the lowest score was obtained for the statement: *Variety of transactions*. Thus, it is recommended that the bank should introduce new services for customers available through this channel.

Bank Component - the lowest means were obtained for *Cost of services* and *Service Security*. The low score for *cost of services* shows that some of the bank's customers consider the costs for operations performed through this distribution channel as being high. This perception requires further investigation because no additional costs are present other than the fee introduced since 2009.

Knowing what factors customers consider important when assessing a bank's ATMs and how the analyzed bank's ATMs are appreciated, it is also important to determine the customers satisfaction with this distribution channel (Customer were asked to express their level of satisfaction on a 5 points scale – 1=very dissatisfied and 5= very satisfied).Therefore the following hypothesis is formulated:

H₁: Customer satisfaction with the bank's ATMs is rather high.

Table 4. One-Sample T test results

T Test					
Test value = 4					
t	df	Sig. (2-tailed)	Mean difference	Mean	Std. error mean
24,200	514	0,000	0,569	4,57	0,024

Based on the results of the *One Sample T Test* (Sig. (2-

tailed) = 0.000 <0.05) the null hypothesis is rejected. In other words, the level of satisfaction is higher than the test value 4 (rather high). Indeed, the sample mean is 4.57, higher than the tested value.

Conclusion

To better meet customer expectations, it is essential that banks take into account both their expectations about the channel distribution mix (the channel mix should be established by customer requirements) and customer perception of the distribution channels. This will likely lead to an increase in sales and also to a more flexible offer matching different customer requirements.

Limitations and suggestions for future study

This research was carried out only in one city and therefore the sample might not be representative. It is recommended to extend this study in other areas of Romania, especially in the rural areas, where the population characteristics are different from those in the urban areas.

Future study is recommended in order to compare the results obtained periodically for a better understanding of consumer perceptions towards the bank's ATM network.

MARKETING PREDICTIONS IN ANTI-DRUG SOCIAL PROGRAMS: USE OF CAUSAL METHODS IN THE STUDY AND PREVENTION OF DRUG ABUSE

Corina Serban

*The Bucharest Academy of Economic Studies
Faculty of Marketing*

Drug use is one of the major challenges that today's society faces; its effects are felt at the level of various social, professional and age categories. Over 50 non-profit organizations are involved in the development of anti-drug social programs in Romania. Their role is to improve the degree of awareness of the target population concerning the risks associated with drug use, but also to steer consumers towards healthy areas, beneficial to their future. This paper aims to detail the issue of drug use in Romania, by making predictions based on the evolution of this phenomenon during the next five years. The obtained results have revealed the necessity to increase the number of programs preventing drug use, as well as the need to continue social programs that have proved effective in previous years.

Keywords: social marketing, non-profit organization, drug abuse, marketing forecast, drug use social program

JEL Classification: M31

Introduction

Over the past 10 years, social marketing has become an important area of analysis and research.¹⁶⁷⁶ The number of non-profit organizations that are currently carrying on social activities has increased considerably, and so has the efficiency of social programs undertaken. Nowadays, non-profit organizations are a means to sustain the solving of major society problems: drug use, smoking, cancer, road safety or sedentariness. Drug use is one of the most troublesome phenomenon that humanity faces. Preventing and limiting access to drugs is a necessity, both on behalf of the consumers, and for society in general. The article tries to provide an overview concerning the matter of drug use in Romania. By studying the connections between illicit drug addiction and various factors that influence the consumer decision process, this article wishes to extend research in this area, starting with the practical aspects. Thus, based on information provided by the *National Anti-Drug Agency* and the *General Inspectorate of Romanian Police* in the *National Report on the drug situation in 2009*, the article estimates the evolution of drug problems in Romania on a given period of five years. Causal prediction methods are used in the information analysis, and data evaluation is achieved based on the multi-factor regression model.

Trends concerning drug use in the society background

Drugs are a global problem causing major imbalances in the normal functioning of societies. According to the 2009 report of the European Monitoring Centre for Drugs and Drug Addiction regarding the drug use situation in Europe, about 13 million Europeans aged 15-64 have tried cocaine at least once, 74 million Europeans have tried cannabis at least once and 2.5% young Europeans use cannabis on a daily basis. These statistics become more alarming each year. Research shows that illicite drug abuse *in Romania* is lower than in other EU countries, but there is a growing trend for consumption in most of them.¹⁶⁷⁷ Most illicitly traded drugs in Romania are cannabis, heroin and ecstasy tablets, with cocaine ranking fourth place because it is a more expensive and harder to obtain drug. According to the Eurostat

¹⁶⁷⁶ Ranchodd, A. and Marandi, E., 2006, *Strategic Marketing in Practice*, Butterworth-Heineman, page 106.

¹⁶⁷⁷ European Monitoring Center for Drugs and Drug Addiction 2009, EMCDDA, accessed on the 17th of April 2010, www.emcdda.europa.eu.

report (Statistical Office of the European Communities) of 2008, the most widely consumed drug in Romania is *cannabis*. Most people begin using drugs at an early age of 15 to 19 years old - about 34% of the total in 2008. The next risk-subjected group is tat of 20 to 24 years, the age at which about one in four of them became drug users.¹⁶⁷⁸ According to research, the main drug consumers are young people in large cities. Bucharest still remains the most important center for drug trafficking and consumption in Romania, placed at the top of heroin consumption. The following districts are Timis and Cluj.

With regard to the evolution of treatment admissions, according to National Anti-Drug Agency (NAA) of 2009, the main drug for which assistance was requested remained heroin, both at the level of centers from the Ministry of Health network (66%) and, locally, at the level of prevention, evaluation and counseling drug centers (CPECA).

The prevalence of infectious diseases among drug injection users (DIUs) shows a worrying increase in the hepatitis C virus, the presence of antibodies (HCV) mounting to 72.59% in 2008, exceeding the European average value. Low levels of HIV prevalence (1.09%) can be explained by the decreased number of individuals who members of the DIUs community.

Number of drug consumption has reached 33 people in 2008, over 50% more than in 2007. Off the record, forensic sources said that their number ranges somewhere between 100 and 200 people each year.

Involving the National Anti-Drug Agency (NAA) in social programs

The National Anti-Drug Agency is the main institution involved in developing programs to prevent drug abuse in Romania. Established in December 2002 by the Romanian Government, the NAA is a public organization, under the coordination of The Ministry of Administration and Interior, whose main attribution is to *design general strategies to prevent drug use and traffic* in accordance with national anti-drug legislation in Romania. Also, the agency coordinates public authorities, state institutions and non-government organizations (NGOs) specializing in fighting drugs. NAA owns **47 assessment, drug prevention and counseling centers**, of which six are found in Bucharest, one for for each sector, and and 41 in the country - one for each district.

The National Anti-Drug Agency, along with the National Institute of Health Research and Development, are the main research institutions regarding drug traffic and consumption for these Romania. Together with the Ministry of Health, NAA is an important source of funding on such researches. The dissemination of information obtained from research is achieved by specialized websites and by holding national conferences.

According to the National Report on the drug situation in 2009, programs initiated by the NAA included the following areas: prevention in the domestic life, in the community and in recreational areas. Of these, the most important was the *"Fred goes Net - early intervention for drug users identified for the first time" project*. This project was initiated in Germany in 2002, Romania being one of the nine countries that took over, as pioneer partner, the project implementation. Another project was *"A one time means always!"* which was achieved in close collaboration with Rotary International. The project consisted in distributing information on DVD and CD-based information materials concerning drug prevention in recreational areas.

Non-profit organizations drug programs

One of the main tasks of the *National Anti-Drug Agency* is to coordinate the activities of non-profit organizations, so as to improve the efficiency of national anti-drug programs.¹⁶⁷⁹ The main purpose of these programs initiated by nonprofit organizations is to promote the rights of young people against drug abuse, by improving the degree of efficiency of the collaboration between specialized public institutions and family environment.

¹⁶⁷⁸ National Anti-Drug Agency, EMCDDA and General Inspectorate of Romanian Police, 2009, *National Report on the Drug Situation*, page 7.

¹⁶⁷⁹ Romanian Government 2005, *National Anti-drug Strategy 2005-2012*, Bucuresti, page 3.

One can notice ***a trend of increasing non-profit organizations' concern*** to increase the awareness of drug-consumption associated risks in society. Research conducted by them have provided valuable information on the prevalence of drug use among vulnerable groups. These projects were financed by international organizations such as *UNAIDS, UNICEF, UNODC* and the *Global Fund to Fight AIDS, Tuberculosis and Malaria*.

The more recent studies on traffic and drug consumption mentioned in the 2009 National Report emphasized aspects and concerning the consequences of drug use and the main ways of preventing it among youth.

The National Anti-Drug Agency has led and implemented many social programs in collaboration with non-profit organizations. The most important non-profit organization involved in drug prevention programs is ***“Save the Children”***. In the year 1998, “Save the Children” initiated the "Education towards Health" program, through which media drug campaigns were organized, aswell as youth interaction campaigns, courses and extra-curricular activities designed for scholars and students.¹⁶⁸⁰

Along with the ***National Anti-Drug Agency***, ***“Save the Children” organization*** has developed the following projects:

- the ***“Feel Free”*** campaign, in 2003, organized together with the Romanian Monitoring Centre for Drugs and Drug Addiction, which aimed to reduce the number of young drug users and to promote a healthy lifestyle.

- ***“The sea is our only addiction”*** campaign, in 2005 - a project initiated in partnership with the National Anti-Drug Agency, which takes place annually at the Black Sea seaside and is mainly intended to inform young people about the risks associated with drug use.

- The project ***“RIIA”*** – or Inter-Institutional Anti-Drug Network¹⁶⁸¹, in 2008 - project funded by the EU PHARE 2005 program, which took place between December 2007 - September 2008 and aimed to promote youth rights and protect them against drug abuse.

Other ***non-profit organizations that collaborated with the National Anti-Drug Agency*** in their programs were:

- ***International Drugs Brigade***, NAA's non-profit organization partner, which has developed the ***“Get him close to you”*** project in 2007. The campaign created public awareness about the fact that drug users' place is within society, together with their family, friends and colleagues.

- ***“Support for Life” Association***, through projects like: ***“Protego Project”*** in 2007 which aimed to inform parents about drug use among children, or the ***“Drug use and violence in schools”*** project in 2008, aswell as the ***“Choose Life”*** (2008 project).

- ***Rotary International Association*** through the ***“Friends, help children say YES to Life”*** in 2009, intended to prevent drug use among youth.

- ***Soul to Soul XXI Association***, in partnership with the Romanian Patriarchy and “Light” newspaper, which initiated the ***“The world of drugs is not my world”*** project in March 2010, whose main purpose was to increase readers' awareness of the inherent danger of drug consumption in society.

Studying issues of using and illicite drug trading in Romania

In studying the main issues of using and trading drugs in Romania, we examined correlations between these variables: **1) Number of persons detected as drug users:** dependent variable.

2) The quantities of drugs seized: independent variable. **3) Number of people caught red-handed:** independent variable. **4) Number of persons convicted for crimes:** independent variable.

Hypothesis: The number of persons detected as drug users directly depends on the quantities of drugs seized, the number of people caught red-handed and the number of persons convicted.

<i>Years</i>	<i>Evolution of the number of</i>	<i>Dynamic of drugs seized</i>	<i>Dynamic of the number of</i>	<i>Evolution of the number of</i>

	<i>persons detected as drug users</i>	<i>quantities (kg)</i>	<i>people caught red-handed</i>	<i>people convicted for drug offenses</i>
2001	2134	33.45	605	268
2002	1905	202.18	1035	432
2003	2070	320.70	1139	439
2004	1502	65.40	1219	508
2005	1538	285.07	1489	632
2006	1350	32.63	1921	659
2007	1891	129.90	1695	521
2008	1962	385.23	2158	454

Table 1. Aspects of drug use in Romania between 2001 and 2008,

Source: National Report on Drugs in 2009

Dependent Variable: PERSOANE_DEPISTATE				
Method: Least Squares				
Date: 04/17/10 Time: 14:09				
Sample: 2001 2008				
Included observations: 8				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	2664.313	222.8331	11.95654	0.0003
CANTITATI_CONFISCATE	0.692377	0.420726	1.645673	0.1752
PERSOANE_IN_FLAGRANT	0.049855	0.151774	0.328478	0.7590
PERSOANE_CONDAMNATE	-2.180175	0.588175	-3.706680	0.0207
R-squared	0.870531	Mean dependent var	1794.000	
Adjusted R-squared	0.773430	S.D. dependent var	290.2378	
S.E. of regression	138.1514	Akaike info criterion	13.00143	
Sum squared resid	76343.21	Schwarz criterion	13.04115	
Log likelihood	-48.00572	F-statistic	8.965178	
Durbin-Watson stat	2.600595	Prob(F-statistic)	0.030038	

Table 2. Multiple regression model characteristics

Model was considered valid because the probability associated with the Fisher test, Prob(F-statistic) was 0.03, a value less than 0.05. Since the regression line slope shows a negative sign (-2.18) it is safe to say that there is an inverse relationship between “persoane_depistate”(drug users) and “persoane_condamnatate” (persons convicted for drug offenses).

	<i>Persoane_ depistate</i>	<i>Cantitati_ confiscate</i>	<i>Persoane_ in_flagrant</i>	<i>Persoane_ condamnatate</i>
<i>Persoane_depistate</i>	1,00			
<i>Cantitati_confiscate</i>	0,33	1,00		
<i>Persoane_in_flagrant</i>	0,41	0,33	1,00	
<i>Persoane_condamnatate</i>	0,86	0,02	0,66	1,00

Table 3. Simple correlations between the variables considered

Because the correlations were too weak, most of them located below 0.5, we can say that there were no independent variables strongly correlated. Comparing t-Statistic values with t-theoretic (for 4 degrees

of freedom and a confidence level of 80%), we notice a low correlation between the dependent variable and the independent variables.

Prediction issues regarding the usage and traffic of drugs in Romania

Starting with National Report data on the drug situation in 2009, one has estimated the number of persons to be detected by drug use during 2009-2013.

Regression model obtained was considered valid because the value of Prob(F-statistic) was less than 0.05.

Dependent Variable: PERSOANE_DEPISTATE				
Method: Least Squares				
Date: 04/17/10 Time: 14:38				
Sample: 2001 2013				
Included observations: 13				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	2691.534	226.3018	11.89356	0.0000

PERSOANE_IN_FLAGRANT	0.252094	0.118024	2.135958	0.0614
PERSOANE_CONDAMNATE	-2.676599	0.532957	-5.022163	0.0007
R-squared	0.787692	Mean dependent var	1860.154	
Adjusted R-squared	0.716922	S.D. dependent var	265.5833	
S.E. of regression	141.3037	Akaike info criterion	12.98736	
Sum squared resid	179700.6	Schwarz criterion	13.16119	
Log likelihood	-80.41784	F-statistic	11.13040	
Durbin-Watson stat	2.824638	Prob(F-statistic)	0.002201	

Table 4. Features of multi-factor regression model after projection

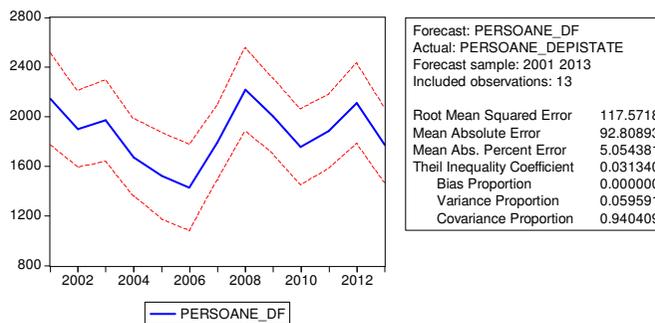

Chart 1. Predictions regarding the number of people detected as drug users during the period 2008-2013

The evolution of the number of persons detected as drug users in the next five years shows fluctuations, the values ranging between 1800 and 2200 people. Compared to the previous period, one can observe a slight increase concerning the number of people, which points, in a positive sense, to the development of ways to detect drug users on behalf of the authorities or, as a negative effect, points to an increasing number of persons using drugs.

Conclusions

Throughout this article, the author tried to present some of the aspects of drug issues in Romania. The main trends of drug use in Europe and in Romania were highlighted, as well as the connections between

The National Anti-Drug Agency and non-profit organizations, which were analyzed from the point of reducing the demand for narcotics. In the applied section of this paper, projections have shown that the number of tracked drug users will increase. This will cause many non-profit organizations to adopt a firmer position in communicating with vulnerable groups. The need to develop social programs is even greater, as the incidence of sexually transmitted infections and number of drug related crime are increasing. The main restrictions of this article relegate to the absence of data on drug users in Romania, NAA presenting only the evolution in the number of consumers discovered by treatment centers. Other restrictions concern the small number of research papers in this field, as well as the small scale of the implemented social programs, the majority of projects having a local character.

MARKETING COMMUNICATION IN ONLINE SOCIAL PROGRAMS: OHANIAN MODEL OF SOURCE CREDIBILITY

Corina Serban

*The Bucharest Academy of Economic Studies
The Faculty of Marketing*

The development of the Internet as a medium for interaction with customers has resulted in many changes regarding the promotion of organizations. Online marketing is nowadays used not only to sell a product on the market, but also requires ideas and behavioral change. Non-profit organizations active in online communication are based on the quality of their provided information. Credibility, attractiveness and usefulness are the key elements that provide effective online social programs. This paper aims to extend the scope of research in the field of social marketing by studying the Ohanian model in the online environment. The goal is to highlight the important theories and social models intrinsic to the online non-profit organizations' communication. The results show that the efficiency of social programs depends on the level of incorporated elements of social theories in the design, content and structure of the website.

Keywords: social marketing, Internet, Ohanian model, non-profit organizations (NGOs), online behaviour

JEL Classification: M31

Introduction

Social marketing is nowadays an important line of study concerning consumer behaviour in society. The complexity of social problems imposes the finding of quick solutions that meet the specific economic, cultural, historical and religious environment that is characteristic of a target population.¹⁶⁸² The emergence of the Internet as a dynamic, flexible and effective environment has opened up new opportunities for organizations to communicate and interact with consumers. Non-profit organizations (NGOs) have understood the advantages of the Internet and have adapted their programs to follow specific online communication. This paper aims to provide NGOs and practitioners in the field of online social marketing a valuable model to determine online consumer reaction, that model being the Ohanian model. Its three dimensions: credibility, attractiveness and expertise, are the basis to any communication, whether it is done online or offline. Starting with the Ohanian model, the article analyzes consumer perception towards currently undertaken online social programs. Thereby, consumer opinions on the quality of websites are studied and the relations between the considered variables and described. Furthermore, by using the model, it can be shown that the dimensions of online communication are not to be ignored, as they are in close relation with the support toward the target segments and with the influence of the individuals' behaviour in society.

The Ohanian Model

In the process of communication with target segments, an important role is played by the degree of persuasion inherent to the transmitted messages. The persuasiveness of a message depends on the considered characteristics of the source (Kelman, 1961). Credibility is a multidimensional concept, with particular impact on the consumer's attitudes, intentions and behaviour. Credibility is strongly linked to information, therefore it may be described as part of communication.¹⁶⁸³

¹⁶⁸² Ranchodd A. and Marandi E. 2006, *Strategic Marketing in Practice*, Butterworth-Heinemann, page 105

¹⁶⁸³ Eisend M. 2006, *Source Credibility Dimensions in Marketing, Communication – A Generalized Solution*, Journal of Empirical Generalisations in Marketing, 2006, page 3

The credibility source is the basis for credibility, being generally used to describe the positive influence of the communicated message on the receiver or transmitter (Ohanian, 1991). Researchers found that the degree of persuasiveness of a message largely depends on the credibility of the source (Petty and Cacioppo, 1986).

Based on the studies of, Desarbo, Likewise and Harshmann (1985), in 1990, Ohanian propounded three factors that contribute to the credibility of the source. The first of them is the **trust of the source**, or "the extent to which the audience perceives communication as valid" (Hovland, 1953). Ohanian describes the concept of **trust** as having dependent variables as "honesty", "addiction" and "sincerity" linked to it. Another factor, the **expertise**, expresses the ability of the source to be perceived as "qualified", "professional", "expert." The last factor, the **source attractiveness**, has the role of amplifying the message sent by features such as: beauty, elegance and style. Corresponding source attractiveness variables are: similitude - similarity between source and receiver of the message, familiarity - the near of the receiver and the source, and sympathy – the affectivity shown to the receptor (Erdogan, 1999).¹⁶⁸⁴ The figure below shows the credibility of the Ohanian model source (1990), including variables for every factor.

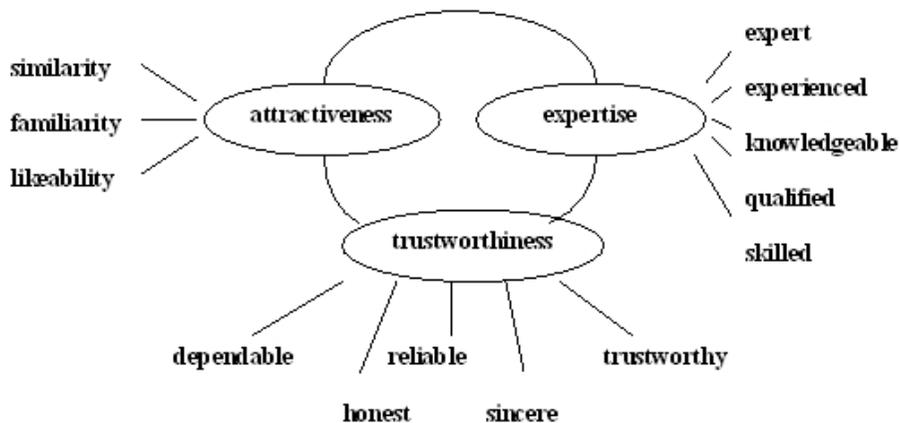

Figure 1. The Ohanian Model of Source Credibility
Source: Louise E Canning, celebrity endorsement in *Business Markets*, 2005

Credibility in social marketing programs

Although most social marketing programs, referred to as social programs, are based on solid research and involve strong national institutions such as public authorities, national agencies and NGOs, their online presence creates many problems related to fierce competition and low confidence. Using an aggressive means of communication and a hidden image, online organizations that promote unhealthy products and behaviours (cigarettes, alcohol, activities like gambling and bets) often win consumer confidence, adversely influencing their behaviour. In this context, the role of NGOs concerning the empowerment of social behaviour is extremely important and so is the need to gain credibility on behalf of the online consumer.

In what concerns social programs, online credibility can be gained in two ways: either by **using the human factor** and the social relationships between people, either by promoting a healthy lifestyle through **counteracting negative effects of risky products campaigns**.¹⁶⁸⁵ The first case, using the human factor, involves transmitting the message through a public office, a model in society. An example of an unprecedented social program was the "**Cherish Life**" campaign in 2007, when Andreea Marin, anchorwoman and UNICEF ambassador to Romania, has endorsed a national health system for

¹⁶⁸⁴ Canning L. 2006, *Celebrity endorsement in business markets*, 22nd IMP Conference, Italy

¹⁶⁸⁵ Cugelman B. 2009, *The psychology of Mass Interpersonal Behavioral Change Websites: a meta analysis*, Medicine 2.0 Conference, Canada

bone marrow transplant to leukaemia patients. The campaign won the Media Award next year, donations amounting to the equivalent of the annual budget of the Ministry of Health allocated for bone marrow transplants in Romania. Reducing the harm of unhealthy products campaigns was achieved through the *"I want fresh bread"* campaign in 2008. The project was initiated by three NGOs: CPA Romania (Consumer Protection Association), PRO ALIM SAN and Eurolink, and concerned these issues: non-specific legislation in connection to bread production, corruption and tax evasion, as well as the need to attract European funding. That campaign has raised a warning sign on the quality of the bread market and the increasing level of corruption currently existing in the industry.

Credibility is thus a multidimensional concept, which plays a decisive role in the impacts that social programs have on consumers. Credibility is easily influenced by media and social networks, therefore it is necessary to establish a relationship of trust and honesty with the consumers.

Study of the credibility of online social marketing programs

Purpose

The purpose of this research is to examine the extent to which the information on websites containing social organizations in Romania is considered trustworthy by consumers.

Objectives

Target goals: 1) determining the percentage of people who visit websites containing social programs, 2) determining the impact generated by each Ohanian model components (confidence, attractiveness and expertise) on consumers, 3) establishing relationships between respondent's demographic characteristics and their opinions on the analyzed problem.

Hypotheses

We defined the following hypotheses:

H1: The credibility of the source depends directly on trust.

H2: The credibility of the source depends directly on expertise.

H3: The credibility of the source depends directly on attractiveness.

Methods

In achieving the research, a questionnaire with questions based on the Ohanian model was used. The study was conducted online in March 2010-April 2010. To determine the number of people visiting websites containing social programs the following filter question was used: "Have you ever visited a site that promotes a social cause or one that fights problems such as smoking, maintaining health (fitness, diet), environmental issues (recycling), health problems (cancer, heart disease), education (education of the child), car accidents, etc.?" The questionnaire had 9 closed questions with multiple answers, arranged in a proportional scale.

Participants

A total of 76 persons were interviewed, of which 31 have not passed the filter question.

Respondents were aged between 18-30 years, with an average of 22 years' age. Respondents are singles (75%) residing outside Bucharest (78%) and are currently students or belong to academic environment (65%).

Data analysis and results

The data analysis program was conducted in Eviews' 4 software program. A multiple regression model was built containing these independent variables: trust, expertise and attractiveness, as well as a dependent variable- the credibility of source. Links between variables' intensities were measured using a proportional scale of 1 to 5, where 1 equalled very poor, and 5 - very strong.

Furthermore, simple correlations were examined between regression model variables.

	Credibility	Trust	Expertise	Attractiveness
Credibility	1,00			
Trust	0,13	1,00		
Expertise	0,08	0,08	1,00	
Attractiveness	0,47	0,46	0,16	1,00

Table 1. Simple correlations between source credibility, trust, expertise and attractiveness variables

Since the values obtained did not exceeded 0.5, it can be said that there were no independent variables that strongly correlated.

Dependent Variable: CREDIBILITY				
Method: Least Squares				
Date: 04/18/10 Time: 17:24				
Sample: 1 35				
Included observations: 35				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	4.252878	0.696682	6.104476	0.0000
TRUST	0.092813	0.142328	0.652108	0.5191
EXPERTISE	-0.016925	0.186495	-0.090750	0.9283
ATTRACTIVENESS	-0.458216	0.157376	-2.911589	0.0066
R-squared	0.234850	Mean dependent var	3.114286	
Adjusted R-squared	0.160803	S.D. dependent var	0.900047	
S.E. of regression	0.824512	Akaike info criterion	2.559161	
Sum squared resid	21.07443	Schwarz criterion	2.736915	
Log likelihood	-40.78531	F-statistic	3.171637	
Durbin-Watson stat	2.485058	Prob(F-statistic)	0.037960	

Table 2. Multiple regression model features with source credibility as dependent variable

Based on the information obtained in Table 2, we defined the following regression equation:

$$\text{Website Credibility} = 4.252 + (0.092 \times \text{trust}) - (0.016 \times \text{expertise}) - (0.458 \times \text{attractiveness})$$

The Student test was used to test significance of model parameters. Since probabilities were higher than 5% (except for attractiveness, prob = 0.0066), Wald test was used. Applying this test high values for Fisher test (F-statistic = 127.21) and Hi-square test (Chi-square = 508.84) and very low probabilities (Probability = 0.00) were obtained. We thus conclude that the parameters are significantly different from zero.

Checking the validity of proposed model

These hypotheses were tested:

1) Assumption of errors normality

The Jarque-Bera test coefficient is not significant ($0.63 > 0.05$), therefore null hypothesis is accepted, errors presenting a normal distribution.

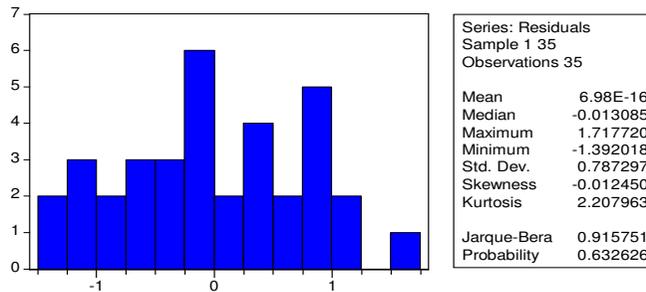

Figure 2. Normal distribution of errors

2) The hypothesis of autocorrelation errors

This can be verified by applying the Durbin-Watson test. Since the d calculated value is equal to 2.48, it can be said that errors do not show autocorrelation.

3) The hypothesis of homoscedasticity errors

The White test value ($R^2 = 7.504$) is higher than tabular value, that being safe to say because there is no heteroscedasticity between model errors.

White Heteroskedasticity Test:				
F-statistic	1.273711	Probability	0.301034	
Obs*R-squared	7.504555	Probability	0.276692	
Dependent Variable: RESID^2				
Method: Least Squares				
Date: 04/18/10 Time: 21:55				
Sample: 1 35				
Included observations: 35				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	2.074388	1.261281	1.644668	0.1112
INCREDERE	-0.363702	0.478665	-0.759826	0.4537
INCREDERE^2	0.029941	0.075102	0.398674	0.6932
EXPERTIZA	-0.186793	0.880436	-0.212159	0.8335
EXPERTIZA^2	0.054649	0.166036	0.329141	0.7445
ATTRACTIVITATE	-0.735444	0.509543	-1.443341	0.1600
ATTRACTIVITATE^2	0.161929	0.082723	1.957488	0.0603
R-squared	0.214416	Mean dependent var	0.602127	
Adjusted R-squared	0.046076	S.D. dependent var	0.671443	
S.E. of regression	0.655792	Akaike info criterion	2.170909	
Sum squared resid	12.04175	Schwarz criterion	2.481979	
Log likelihood	-30.99091	F-statistic	1.273711	
Durbin-Watson stat	2.096952	Prob(F-statistic)	0.301034	

Table 3. White test

4) The hypothesis of multi-collinear errors

Multi-collinearity points to the linear or nonlinear relationship between two independent variables of a model. Results of the correlation matrix showed a correlation between the nature of reverse credibility and trust, and between credibility and attractiveness.

	Credibility	Trust	Expertise	Attractiveness
Credibility	1.000000	-0.130893	0.081283	-0.473642
Trust	-0.130893	1.000000	0.080128	0.466027
Expertise	0.081283	0.080128	1.000000	-0.163013
Attractiveness	-0.473642	0.466027	-0.163013	1.000000

Table 4. Correlation matrix

From these assumptions, it is to conclude that the defined model is valid.

Conclusions

This article presented several theoretical and practical aspects related to source credibility in the online environment. Based on information obtained from research, a model of credibility in the online social programs was defined. Research results showed that the credibility of websites is quite low, average values of considered variables ranking around 3, a somewhat favourable opinion. This has confirmed the restricted nature of social online programs and their relatively low level of promotion. Some limitations of this paper were connected to the large number of people removed by filter question, the small number of researchers in the field and the sample consisting mainly of students.

ACCESSIBLE TOURISM – THE IGNORED OPPORTUNITY

Souca Maria Luiza

Babeş-Bolyai University Cluj Napoca, Faculty of Economics and Business Administration

To create a positive visitor experience, a key factor in obtaining economic benefits, the tourism industry must pay attention to all the elements that contribute to it, especially to accessibility. Visitor accessibility encompasses all tourism markets including seniors and people with disabilities, who have been defined through accessible tourism. This article offers a short presentation of the term accessible tourism, the existing research in the field and the main reasons why the worldwide tourism industry is seemingly unaware of this particular market.

Keywords: accessible tourism, disabilities, market potential, research

The article's JEL classification: M31

Introduction

There is a large and profitable market out there that the tourism industry has been largely ignoring for a long time. This market is as big as over 650 million people worldwide and it's estimated that by the end of 2020 it will reach an approximated 1.2 billion people (Darcy, 2008). It has a huge potential for growth and what's more, research shows its members are more easily converted into regular costumers and on average they spend more per trip than the usual tourist. So who is this market? They are the ones that "accessible tourism" – a rather new concept – primarily targets.

What is "accessible tourism"?

Definition

Accessible tourism enables people with access requirements including mobility, vision, hearing and cognitive dimensions of access, to function independently and with equity and dignity through the delivery of universally designed products, services and environments. This definition is inclusive of all people including those travelling with children in prams, people with disabilities and seniors.(Darcy and Dickson, 2009, p.34). Therefore it can be said that accessible tourism targets any segment of the market that prefers accessing a tourism experience with ease, whether is the seniors that may prefer walking up a gentle ramp than going up a large number of steep stairs or those with any type of disability, who will appreciate more tourism facilities with continuous pathways, tactile surfaces and clear and bright signage.

According to ENAT, the European Network for Accessible Tourism, accessible tourism includes:

- Barrier-free destinations:** infrastructures and facilities.
- Transport:** by air, land and sea, suitable for all users.
- High quality services:** delivered by trained staff.
- Activities, exhibits, attractions:** allowing participation in tourism by everyone.
- Marketing, booking systems, Web sites and services:** information accessible to all.

Situation Overview

Is the tourism industry worldwide adapted to the needs of those requiring accessible tourism? Despite the fact that modern society is increasingly aware of the need to integrate people with any type of disabilities the answer is a resounding "no". And while it can be argued that in order to function many tourism facilities comply with legislative requirements like accessible parking space and accessible toilets, clearly a step in the right direction, unfortunately that can't be called true accessible tourism as there are no further developments to include requirements like: professional staff capable of dealing

with accessibility issues, wheelchair accessible vehicles, adapted hotel rooms and many more. The reasons to that are numerous and stem from two directions:

-there is very little research that shows how the tourism industry can benefit from making changes in the tourism product development and delivery so that it can become more accessible. Only recently the European Union has commissioned research that shows insight into the complexities of accessible tourism (Buhalis et al., 2005) and in 2007 The UN Convention on the Rights of People with Disabilities and the International Day for People with Disabilities has internationally reinforced the language of disability thus helping define concepts like: accessible destination experiences, accessible tourism, access precincts, continuous (accessible) pathways and disability. Another important contributor to the accessible tourism research is the Australian Sustainable Tourism Cooperative Research Center which funded an Accessible Tourism Research Agenda that sought to create a sound research base on which the tourism industry and government marketing authorities can make more informed decisions. (Darcy, 2008)

-there is a perception that accessible tourism is “low yield” due to the stereotype that people with disabilities have significantly less disposable income and are more likely to be dependent on a pension. This argument has been used in the past as a deterrent to investment in accessible tourism and as long as there are too few case studies that can be given as examples of successful tourism enterprises offering accessible tourism experiences, it will continue to carry weight. Yet, according to the latest statistics the market for accessible tourism is continuously growing making it clear that to ignore its potential is to actually ignore fruitful business opportunities, a fact that several companies in Europe and US have counted on when designing offers clearly meant for this market niche. These pioneers can show through their example that accessible tourism can become a competitive edge, just like the case of Divi Hotels Resort on Bonaire Island, in the Caribbean Sea, which became “famous for being completely accessible”, their presentation brochures including images with the access ramp for those who need a wheelchair.

Market size and Economic value

In 1983 E. D Mills noted that “provisions for the disabled in any type of holiday situation can no longer be regarded as an optional extra” (Mills, 1983, p.81). Yet, several decades later researchers (Darcy, 2006) have noted that despite the large numbers of people with disabilities living independently, their growing financial wealth and their desire to travel, this segment continues to be largely ignored by the tourism industry worldwide.

What are the exact numbers? In Australia, for example, 20% of the population, or 4 million people, identify as having a disability. Of these people 520,000 have a mobility disability, 480,000 are blind or vision impaired, and 1 million are deaf or hearing impaired (Australian Bureau of Statistics, 2003). Still Darcy’s research (2008) estimates that in the 2003-2004 period the tourists with disabilities spent in Australia between \$8034.68 million and \$11980.272 million, contributed between \$ 3075.5243 million and \$4580.219 million to Tourism Gross Value Added (12.27%–15.60% of total tourism GVA), contributed between \$ 3885.168 million and \$5787.435 million to Tourism Gross Domestic Product (11.02%–16.41% of total) and sustained between 51 820 and 77 495 direct jobs in the tourism industry (11.6%–17.3% of direct tourism employment). And Australia is not an isolated case.

In the US alone there are more than 54 million people with disabilities, a market larger than that of African American or the Hispanics, representing almost 1 billion dollars in buying power (Kotler, 2009), while the European Union countries’ OSSATE research (Buhalis et al.,2005) estimates that tourists with disabilities contribute €80 billion to the economy using gross demand estimates. Globally there are over 650 million people with disabilities (Fujiura and Rutkowskikmitta, 2001; Mercer and MacDonald, 2007), equating to about 10% of humanity.

And this isn’t all of it. There is a direct link between aging and disability as a person is 14 times more likely to have a disability by the time they reach 65 years old than a four-year-old(Darcy, 2008), a trend shared by all western developed countries with a noticeable difference in Asian countries where the

ageing is occurring at a faster rate. (World Health Organization, 2007). What's more, this generation of seniors, unlike past generations of older people, is seeking an active and adventurous experience for their post work lives, and tourism is seen as an important component of their quest of life experiences. Yet, the tourism industry continues to ignore this market as shown by the results of a study involving senior travelers which has proven that despite the fact that seniors greatly value security and support elements in the bathrooms, visible signage in the halls, restaurants menus with big readable fonts and extra heating sources (more blankets available per bed), this type of information is not generally included in the advertising materials used by tourism enterprise, making it harder for them to choose old-age friendly destinations.(Howey et al., 1992).

Accessible tourism consumer behavior

People with disabilities are very appreciative of products that are adapted to their needs. According to Jim Tobias, the president of Inclusive Technologies, a consulting company specialized in "accessible products", "people with disabilities have the tendency to become **brand evangelists** for the brand they love; if usually a consumer would tell another 10 people about their favorite product, people with disabilities could tell 10 times more people." (Hsu, C.H.C., Powers, T., 2002).

This point of view is also shared by the Department for Culture, Media and Sport, DCMS for short, of the British Government, who has taken active steps for changing the British tourism industry in preparation for the Olympics and Paralympics Games of 2012. According to their statistics (DCMS, 2010), disabled people:

- **become regular clients** after finding a tourism facility that suits their needs;
- **tend to take longer holiday breaks** than the average – 4 days as opposed to the average length of stay of 3 days – therefore spending more money per trip (£216 as opposed to £197 overall);
- **tend not to travel alone**, as they are often accompanied by caregivers, family and friends: over 50% travel with a partner, 20 % with a child and between 21-25% with a companion.

Combining these behavior characteristics with the great potential for growth, presented in the chapter before, makes the market containing senior and persons with disabilities a very attractive one. That's why the mystery remains of why the tourism industry is still largely ignoring it. Fortunately, there are more and more case studies that show the fact that accessible tourism can be profitable: for example Holiday Inn and their specially targeted offer for hearing impaired people. According to their data the hearing impaired people segment includes from people with no hearing to people with different hearing problems, a number that in the US means 21 million persons. To approach this market Holiday Inn promoted their message through special magazines designed for those hearing impaired. And their strategy has paid off, in the first year after making the special offer Holiday Inn gained between 40000 to 50000 travelers staying the night, from this segment alone. (Hsu, C.H.C., Powers, T., 2002)

Conclusion

Is ignoring the opportunity presented by accessible tourism a mistake? One quick look at the facts should show that the obvious answer is "yes". The only fact that still remains uncertain is how the situation can be remediated. There are several things that can be done:

1. **Doing more research in the field.** While the statistics presented in this article are relevant to the developed western countries, there almost none regarding the situation in the developing countries, such as Romania, who could benefit very much from identifying a tourism niche. Unfortunately, in the case of Romania, there is also a lack of official information regarding the situation of disabled people: by 2003, there were 414.620 people with disabilities in the official statistics, or 1.97% of the population, far lower the average 10% for the EU countries, as estimated by UN statistics. (CNDR, 2004).
2. **Creating a business model** that can be successfully put into practice.
3. **Involving the tourism industry.** No matter how great the theoretical model is, until it's put into practice and it has proven its efficiency, it won't become a good argument. That's why tourism industry

needs to be involved in the research, and only by seeing actual numbers and successful case studies, they will change their attitude and give accessible tourism the place it rightfully deserves.

ETHICAL CONSUMERISM IN THE 21ST CENTURY

Ștefura Gabriela

Alexandru Ioan Cuza University from Iași, Faculty of Economics and Business Administration

In a world where the global economy has suffered a great deal of changes and has encountered many obstacles, consumers and companies seem less concerned about ethics in their behaviour.

Ethical consumerism regards issues as environmental friendly consumerism, fair-trade, morality and honesty. The paper presents a theoretical background of ethical behaviour from two perspectives, followed by factors of influence, typologies of consumers and causes of unethical behaviour, offering an up-to-date starting point for more thoroughgoing studies and some possible directions for further research.

Keywords: ethics, behaviour, consumer, unethical consumption

JEL: M31, M39

1. Introduction

An issue of great importance for the economic behaviour has been and still is the study of ethical consumption. In the speciality literature there are not many studies concerning this subject, but the interest increased in the last 10 to 15 years.

In order to be able to understand better the nature of this subject, it is important to start with the description of the concept and what are its meanings.

Firstly, “ethics” as a general term refers to a branch of philosophy which seeks to address questions about morality. It has been for centuries in the interest of philosophers the discussion regarding what is right and what is wrong and how we can live doing the right thing.

Secondly, a more general definition of ethical consumerism describes it as an intentional purchase of products and services that the consumer considers to be made ethically. Ethical consumerism can be practiced through “positive buying”.

Las but not least, among specialists there have been discrepancies regarding the meanings of “ethical consumption” and “ethics of consumption”¹⁶⁸⁶. The ethics of consumption mainly depicts a set of judgements over the morality of the entire provision system; the consumption is seen as the object of moral evaluation. In the case of ethical consumption, the consumption is now a medium for political and moral action. Although it may seem so, the meanings of the two concepts are not completely separate.

This paper’s main purpose is to build a theoretical frame of ethical behaviour among consumers, providing the description of its different meanings and, also, some directions for further research.

As the last couple of years have been a challenge from an economic perspective, ethical behaviour has begun to be more and more a problem which needs to be properly studied.

In the second part of this paper, the different views of ethical behaviour will be presented, along with the factors which influence this type of behaviour. The third part brings into discussion the typologies which can be found related to this behaviour and the main causes that determine an unethical behaviour (or simply being indifferent to it). Finally, the paper ends with conclusions and some further research directions.

¹⁶⁸⁶ Harrison R., Newholm T., Shaw D., *The Ethical Consumer*, Sage publications Ltd., London, 2005.

2. Ethical behaviour perceptions. Factors of influence

The concept of ethical behaviour has been approached in the speciality literature from two perspectives. The first one refers to ethical behaviour from an environmental approach. In many studies referrals to “green consumerism” are being made¹⁶⁸⁷. A green consumer is the one who avoids using products which pollute or is against animal cruelty, he/she purchases eco-friendly products, recycles etc.¹⁶⁸⁸.

Shaw and Shiu (2003) emphasize on the difference that must be made between green consumers and ethical consumers. The second category is obviously much more complex and includes the first one.

Ethical consumption has also been referred to as a behaviour which incorporates the principles of environmental friendly consumption and addresses issues regarding conscience and morality¹⁶⁸⁹.

In the opinion of Callen-Marchione and Ownbey (2008), ethical behaviour includes the purchase of eco products, the attitude towards counterfeited goods, how consumers react to companies which approach an unethical behaviour, honesty etc.

The second approach on ethical behaviour regards piracy, petty theft, shoplifting, unethical behaviour of employees etc. In this case, the morality and the honesty of individuals are put into question.

Shoham, Ruvio and Davidow (2008) emphasize on the matter of piracy (DVD's, music, software) and describe the phenomenon in three forms, as found in other researches:

- The assessment of software piracy, in the context of the innovation diffusion, accentuating the outcomes of piracy;
- The overall issue of purchasing counterfeited products;
- The identification of the ethical/moral issues which support the consumers' decision of buying counterfeited goods.

Coyle et. ali (2009) discuss about piracy in music. They think that the ability to distribute digitized music, the perception of an unfair treatment as long with the misunderstood expectations of buyers/sellers of music have created a favourable environment for music piracy.

Regarding the factors which influence the ethical behaviour or the attitude towards ethical consumption, previous researches have approached demographic, cultural and situational factors.

Babakus et. ali (2004) consider that a better comprehension of variations among consumers, regarding their beliefs on unethical behaviour, at a global level, could help in business development, but also in the propagation of public policies.

Many of the researchers think that age could influence the ethical behaviour. Babakus et. ali found out in their study that younger people are more tolerant when it comes to unethical behaviour.

Carrigan, Szmiging and Wright (2004) also sustain the idea that age is very important factor. The authors came to the conclusion that older people (50 and more) have higher morale and are more ethical when it comes to consumption. They think that the over 45 age segment is often underestimated, especially regarding subjects as novelty, technological innovation.

Older people are more predisposed to boycotting companies/brands which develop an unethical behaviour, but only in certain conditions. Carrigan, Szmiging and Wright conclude with the idea that their study cannot be generalised and that it can be approached only from an idiographic perspective.

Women were found to have a more positive attitude towards ethical behaviour¹⁶⁹⁰, but other authors think that the sex factor does not have an influence on ethical behaviour¹⁶⁹¹.

Income and education are positively correlated with ethical consumption¹⁶⁹².

¹⁶⁸⁷ In Carrigan M., Szmigin I., Wright J. (2004); Shaw D., Shiu E. (2003).

¹⁶⁸⁸ Apud Carrigan M., Szmigin I., Wright J., *Shopping for a better world? An interpretative study of the potential for ethical consumption within the older market*, Journal of Consumer Marketing, Emerald Group Publishing Ltd., vol. 21, no. 6, 2004, p. 401.

¹⁶⁸⁹ Idem.

¹⁶⁹⁰ In Babakus E., Cornwell T.B., Mitchell V., Schlegelmilch B. (2004); Starr A. Martha (2009).

¹⁶⁹¹ Carrigan M., Attalla A., *The myth of the ethical consumer-do ethics matter in purchase behaviour?*, Journal of Consumer Marketing, Emerald Group Publishing Ltd., vol. 18, no. 7, 2001, pp. 560-577.

Coyle et. ali (2009), in order to illustrate the way how people decide to purchase or pirate music, take in consideration three influencing constructs: attitudinal factors, demographic factors and purchasing/pirating behaviour. They came to the conclusion that younger men with lower incomes have more the tendency to pirate music. Also, they found that the legal/ethical factor has a great significance in describing the past behaviour and predicting the future one.

Starr (2009) found through her study that individuals who are influenced by politics, are more likely to have an ethical consumption behaviour, this suggesting a general influence of pro-active attitudes in the socio-political participation.

Ford, Nonis and Hudson affirm that values influence attitudes, attitudes influence behaviour, and behaviour has effects on culture, forming in this way a circular phenomenon. They think that the most frequent mistake made by marketers is that they fail to understand cultural differences. In their study, they measure six types of basic attitudes, with the help of six scales¹⁶⁹³:

- Theoretic;
- Economic;
- Aesthetic;
- Social;
- Politic;
- Religious.

The authors found a significant difference between the US and middle-eastern culture. The political dimension has the highest result in the case of the US culture, regarding ethical consumption. This dimension also influences the middle-eastern culture, along with the “social” attribute. The middle-eastern are seen as keen on social welfare and interaction between individuals.

Babakus et. ali (2004) also emphasize on cultural differences, trying to expand the research on the role of individual background variables, as determinants of unethical consumer perception. They underline the power of one nation to be different from others.

Egan and Taylor (2010) analyse the general personality traits that predict the attitude towards shoplifting and unethical behaviour. Predictors for this type of behaviour, according to their study, are lower IQ's and lower incomes, especially at young males. Their study also shows that between personality and unethical behaviour exists a significant relationship.

3. Behavioural typology. Causes for unethical consumption

Shaw and Shiu bring into discussion the fact that some researchers in ethical consumerism rely on the Theory of Reasoned Action/Theory of Planned Behaviour¹⁶⁹⁴. According to this theory, attitude and subjective norms (the individual's beliefs about what other people think related to his actions) determine the genesis of the behavioural intention and, in the end, the actual behaviour.

Shaw and Shiu tried to demonstrate that the behavioural intention of the individual has behind it a more complex structure of influences. They divided the “attitude” component into the *attitude of the individual towards difficulties* and the *attitude towards fair-trade*.

Subjective norms also have two components: *subjective norms-traditional*, which reflect the normative others from the traditional theory and *subjective norms-context*, that refer to groups associated to fair-trade.

The behavioural intention, in Shaw and Shiu's model, is primarily influenced by *behavioural control* and *internal reflection*. All the other components come to influence these two elements

¹⁶⁹⁴ Shaw D., Shiu E., *Ethics in consumer choice: a multivariate modeling approach*, European Journal of Marketing, Emerald Group Publishing Ltd., vol. 37, no. 10, 2003, pp. 1487.

Rawwas took in account Hofstede's classification of the dimensions which make societies different¹⁶⁹⁵: power distance, uncertainty avoidance, individualism and masculinity.

The author also uses in his study Hofstede's typology to categorize the different types of nationalities and their culture¹⁶⁹⁶:

- Functionalists (Nordics, Anglo-Saxons): people with high common-sense, with a well-developed sense of perceived risk; they have the tendency to be individualistic;
- Deferents (Latin nations, Mediterranean and Japan): the opposite of functionalists; are hard-working and obedient;
- Survivors (German): they weigh all possibilities and then they choose the one which can help them achieve their goal;
- Enthusiasts (Asian and African people): they listen to their superiors and are risk-tolerant.

He offers another typology, in order to complete the first one:

- Achievers (American business men, Anglo and some of the Asian): are aggressive and very competitive; their morality is variable;
- Absolutists (Latin Americans and Asian): are cooperant and are encouraged to take group decisions-collectivists;
- Situationists (some of the Latin, German and Japan): they accept a condition only if it brings safety and benefits;
- Conservationists (Indonesia, few of the Nordics and Africans): are preoccupied with society and environment.

The conclusions of Rawwas's study are that functionalists have a tendency of being more pragmatic, deferents have more stringent ethical values, absolutists can be idealistic and achievers more relativistic. Babakus et. ali, regarding the attitude towards unethical behaviour, have made a classification of the consumers, giving five different categories¹⁶⁹⁷:

- Puritans;
- Realists;
- Indifferent;
- Tolerant;
- Cynics.

The extremities are puritans and cynics and show the most clear segmentation. Puritans mostly young people (57%), mostly female (57%) and Anglo-Saxons. Cynics, although have a small overall percentage, include young people (89%), male (53%), the majority form the UK (73%).

In a study regarding similarities between the opinions towards ethical behaviour of countries from the North and South of the European Union, Polonsky et. ali remind about four categories of questionable behaviour¹⁶⁹⁸:

- People who actively benefit on the behalf of the retailer;
- People who passively benefit on the behalf of the retailer;
- Deceitful practices;
- No harm/no foul.

The first category is related to consumers who initiate this type of actions and who perceive the action as being illegal. In the second, the situations are determined by the seller's mistakes and the consumers don't do anything to correct them. The third category regards situations which are initiated by

consumers who do not see the act as being illegal. Finally, the last category describes the situations in which consumers think that no harm is done to the seller.

Regarding possible causes that determine people to engage or tolerate unethical behaviour, Carrigan and Attalla (2001) have identified the following:

- Poor quality of information; in order to maintain an ethical behaviour, people must be constantly informed;
- There are too little constraints for companies to behave in an ethical manner;
- The gap between attitude and behaviour;
- The lack of personal impact.

Callen-Marchione and Ownbey (2008) make a very interesting point by sustaining the idea that an unethical behaviour can determine supplementary costs for the consumers, as sellers increase prices to cover losses, an adverse shopping environment and many restrictive policies in stores.

4. Conclusions. Further research

Although ethical behaviour is presented from different views in the marketing literature, its importance remains the same. Ethical behaviour includes both consumers and companies behaviour and attitudes towards morality, honesty and environmental protection.

Ethical behaviour is seen from the environmental perspective (eco-buying, recycling, boycotting companies which have an unethical behaviour) and from the moral perspective (shoplifting, counterfeiting products, buying/selling pirated music, films and software).

This type of behaviour could not exist without the influence of such factors as: demographic factors (age, sex, education), cultural (the differences between nationalities) and situational factors.

Adopting a certain behaviour or simply having an opinion are not the only important elements. People are extremely diverse, but through some similar characteristics, different typologies have been conceived by specialists, in order to help international commerce and marketing.

Even though the causes that lead to unethical behaviour seem changeable, consumers along with companies put very little effort in making an importance change.

An interesting subject for further researches would be how countries from Europe differentiate from one another regarding ethical behaviour. For example, a study regarding the ethics in countries from Eastern Europe, especially in the economic crisis context, can be taken in account for the following researches.

SOME ASPECTS OF THE ROLE OF VISUAL IDENTITY IN THE SUCCESSFUL IMPLEMENTATION OF THE PROMOTIONAL STRATEGY

Teodora Tarcza
University of Oradea
Faculty of Economics

This paper wishes to emphasize the necessity and importance of the communicational capital of a business, in the midst of fierce competition and 'bombarding' of all clients with a great deal of data through classical methods of advertising. The overcrowding of media channels with information about different products, the excessive advertising through classical methods (e.g. TV, radio, media) has led to a negative attitude of potential clients towards such items. Hence, a boomerang effect has occurred as a result of the above-mentioned excess of advertising products and services. Furthermore, marketing specialists have come to the conclusion that the single promoting of a product through TV, radio, media will not make the consumer choose a certain product / service or a brand. But the integrated concept of communication will...

Keywords: communicational capital, promotional strategies, visual identity, identity manual

Code Jel:M31

1. Context

Given these circumstances, the question „Why to communicate ?” is considered out-of-date. The importance of communication between organizations and different categories of public was emphasized and demonstrated a long time ago. Nowadays, the real question, which is an issue for most marketers who understand the importance of communication is: „How to communicate ?”

Communication is closely linked to the marketing activity and, mainly, to the promotion concept. Not once or twice the two notions have been confused or dealt with as a single identity. There are authors who treat the concept communication – promotion as a whole – part type.

Philip Kotler, the famous American professor, defines marketing communication with the help of the total communicational mix of a company. According to him, it consists of „*a specific combination of advertising, distribution channel, sales promoting and public relations, which a business utilizes in order to meet its advertising and marketing goals.*”¹⁶⁹⁹

Corporate communication has *the mission of determining the position of a given company, of building itself an acknowledged personality and a distinct identity from its competitors?* Communication within a company defines its characteristics relative to other enterprises. This communication is of two different types:

- *external communication*, namely the relations of a business to the market, its business partners, distributors, banks, financial community, media, etc.,
- *internal communication*, which grows among the human resources department: employees, managers, share-holders, etc.

The marketing strategy is the path a company chooses to take in order to reach its marketing objectives.¹⁷⁰⁰ It is represented by the whole of the concrete objectives an organization is bound to reach in a given period of time, of the means and methods by which these objectives are practically made use of, in accordance with the tendencies and requirements of the throughput, which is measured with the help of economic indicators such as: stock market, sales, profit.

¹⁶⁹⁹ Kotler, Ph., Armstrong, G. – „Principiile Marketingului”, Ediția Europeană, Editura Teora, București, 2000.

¹⁷⁰⁰ Botezat, Elena- „Bazele marketingului”, Ed. Universității din Oradea, Oradea, 2006.

In the light of the current situation of the market, at a time when, for the majority of products and services, supply exceeds demand, it is a must for companies to communicate with their present or potential clients. Most companies have the tendency to approach promotional strategies such as „pull strategy” (sales promotions). Such strategies involve marketing activities, especially advertising and promoting on the consumer market, aimed at the final user and meant to make him / her ask intermediaries to provide additional products, and determine the latter to order those specific products from the producers.

As to the external communication, apart from promotional activities, one must take into account a series of supporting communicational elements, such as: brand, image, marking and packing of a product / service, employees’ attitude and behaviour, the aspect and the environment of workplaces (registered or head offices, shops, warehouses, etc.) All these elements have brought about the building up of communicational capital.

The communicational capital of an organization is the total amount information disseminated within and outside the company, to different categories of public.

Global image of a business results from the totality of its expressions: corporate (institutional), commercial (company reports about products or brands) and internal (communication with people from within).

There are two distinguishable types of marketing communication:

- promotional communication (namely, communication techniques used in an temporary advertising campaigns);
- continuous communication (around the clock communication with the target public).

Due to the large number of companies, marks, products lingering on the market and to their advertising campaigns, customers often feel confused or even have the tendency of ignoring and rejecting from the very beginning any new piece of information in the field. It is for this very reason that marketing specialists have started to become more and more aware of the importance of a continuous communication and to concentrate all their efforts in this direction.

2. Visual identity

In close relation to the concept of communicational capital, we may refer to the **visual communication** of a company. The succes on the market of any given company relies on the way in which it manages to distinguish itself from its competitors and to mark a particular spot in the mind of the target market. Hence, the creation and development of a suggestive and steadfast visual identity are essential. The instrument which deals with all the information about the **visual identity** of a business is the **identity manual**.

Talking about visual communication, Marie - Helene Westphalen mentions three elements:

- a) A logo and a system of visual identification (Logo or „specific mark” represents the association of a graphic image with its symbolism and colours).
- b) Visual communication applied to the product itself (industrial design and communication through package designs).
- c) Communication through environment or environmental design (devising work spaces, commercial and exhibition areas)¹⁷⁰¹.

Visual identity gives us information about the values and principles of a organization, about its quality and domain of activity. All these information are perceived in a matter of moments. The creation of a coherent and strong visual identity represents the turning point of a successful brand. Visual identity of good quality must accurately reflect the business and its founders, render credibility and trust to the brand customers.

Creating a visual identity is not an easy task. It has to follow a few basic steps:

- to reflect its domain of activity, its personality or a definite characteristic of the business;

¹⁷⁰¹ Westphalen, Marie- Helene- Comunicarea externă a firmei, Ed. C.H. Beck, București, 2008.

- to be able to hold good in the long run (altering its visual identity would result in a series of material and emotional costs) ;
- its logo must be clean-cut, easy to understand and to tell the story of the company;
- to be able to adapt itself to various graphic supports and to evolution, as well;
- its slogan has the purpose of deriving benefits for the client.

“On a competition market, where one must struggle with experienced companies and corporations, you must always be a step ahead. Unlike a few years ago, when only a few companies understood the importance of visual identity, at present it is absolutely necessary to understand and make a profit out of this issue”, thinks Georgiana Radu, managing partner and co-founder of full service [Brandaffair Advertising](#).¹⁷⁰²

Promotional communication

Freidmann Schulz von Thun, a German psychologist and specialist in communication sciences, has worked up a communication model which devises all messages in four groups: fact, self-revealing, relationship and appeal. This model can be applied to promotional communication as well. We may think that a piece of news is the promotional message.

a) The content of the promotional message: offers an answer to the question: „What do I give information about ?” A promotional message keeps us informed about a particular product / service, shop, special offer. Its content may be as well: „We have launched on the market the new product X”.

b) Self-revelation (self-exposure) is related to the information about the speaker, what s/he actually means through his / her words. In the case of the promotional message the company / organization who launches a product / service is the sender. We could say such things about the company: „Who are they ?”, „Have I heard about it or its products ?” „It tries to adapt itself to the customers’ needs”, „This company is struggling to develop itself”, „This service is useful to me”.

c) The relationship – the sender expresses what s/he thinks about the receiver and how s/he gets along with him / her. A certain company wants to sell its product / service to customers. Its target is to convince the receiver (potential clients) to make the decision of buying. In other words, the company wants to tell the receiver: „You need the product I am offering you”.

d) The appeal – the sender wants to influence the receiver, to cause a change in the latter’s attitude or behaviour. The companies which communicate have the desire to influence the buying or consumption behaviour of the target market (consumers) and cause changes in making decisions. In the case of the promotional message the appeal of the companies is as follows: „Buy! My product is the ideal solution for you!” „You must buy this product!”, „This is the product you have been looking for and we are offering it to you!”

For the consumer (i.e. the receiver of the promotional message), the task of receiving and proper understanding of a message with so many meanings is not at all an easy one, all the more so as s/he is daily confronted with tens or even hundreds of such challenges.

Each and every day, we all are subject to a series of messages, new pieces information, often very inconsistent. Because of this excess of messages we have the tendency to filter the information, consciously or not, in terms of their sender. Nothing new when it comes to promotional messages: we pay attention and receive only those messages that come from people we know, who have a certain identity and whom we trust.

Up to the present at the base of the pyramid of the promotional mix lied advertising, in which most part of the marketing budget used to be invested. Then, we had sales promotion and personal selling. Public relations used to play a minor part. However, things have taken a reversed turn lately. At present, many of the companies must be aware that, prior to investing money in advertising through the classical media means, they have to introduce themselves to the target public. But, in order to do so, they must be „someone”, they must have an identity of their own. Only after they become „someone” they will have

¹⁷⁰² http://antreprenor.money.ro/cum_se_construieste_identitatea_vizuala_a_unui_start_up-84084.html.

an identity clearly stated, only then they will be able to send promotional messages on the classical channels.

3. Identity manual

The identity manual is a tool of utmost importance for a company's identity and especially for a brand. It provides all the visual guidelines of the company and the rules for applying them, with both negative and positive examples.

The necessity of centralization of all the elements the visual identity of a company embodies has sprung from the idea that the people who have initially drawn it and taken care of it launch are not the only ones who are responsible for its promotion. It may happen that a customer changes his / her agency or that the agency itself externalizes its services and is bound, therefore, to send its coworkers the exact technical details of the customers' brand.

As a result, in the contents of an identity manual, there are enlisted such aspects as acceptable and unacceptable elements of a logo, multimedia, map colour guide, dress codes, formatting for stationery, acceptable and unacceptable photos. Through this instrument a company manages to implement and keep the consistency, unity and coherence of a brand, from its logo to leaflets, from its web sites to TV commercials.

Components of the identity manual:

1. Logo is the milestone, the basic element of the identity of any given company and, at the same time, the starting point of the creation of the brand, „its signature'. In order to get off on the right foot in creating an identity one must pay close attention to the logo, which must be, first of all, a suggestive symbol for the target of the company, unique and easy to identify. This logo consists of graphic symbols (images), texts (letters) and specific colours. The result of this association must be clear, concise, identifiable and recognizable. As well as the targets of a corporation it has to follow the KISS rule: Keep it short and simple!

When choosing a logo one must take heed to its flexibility, to the implementing possibilities on different promotional materials.

2. Business cards – bear business information about an individual and enhance interhuman relationships. By way of them people formally introduce themselves and make the premises of starting anew, rescheduling or developing of an established relationship. In order to fulfill their intermediary role, business cards must reflect in a sincere, clear and convincing way the image of the individual or the legal entity it represents.¹⁷⁰³ A business card must include:

- identity: name and surname
- job, professional degree, scientific titles
- company affiliation
- contact address: address, phone number, email, website.

In addition to these, one can include other pieces of information such as: personal information (phone and address), domain/s of activity of the corporation, services his / her company offers, features of the organization or institutio. It is not advisable to add other types of information. But, when it is absolutely necessary, one must make much of the established rules in the identity manual and of the open-minded nature of a business card. A lot of useless information might lead to the loss of essence of this instrument.

The design of a business card must be inspired, original, in perfect key with the organization personality, must stick to the requirements of the identity manual of the corporation, namely its logo, keeping to the approved space, utilization of the specific colour scheme of the brand, the ordering of materials in the space given, supporting typography and letter sizes, utilization of other graphic elements apart from a customized setting of the name.

The type of paper chosen for printing the card may give them a distinctive feature. In terms of the domain of activity of the organization, of its prestige and reputation, one can choose a common type of

¹⁷⁰³ Graur, Evelina – „Tehnici de comunicare”, Ed. Mediamira, Cluj-Napoca, 2001.

paper or stock, with or without a glossy coat. Business cards in a company may be different depending on whom they are imprinted for (e.g. managers, client service personnel, PR, etc.). They can be either in Romanian or another foreign language (e.g. English, French, German), but never in both languages on the same card.

3. Stationery: letterhead design, envelopes, portfolios, catalogues – are all important factors in communicating with business partners (clients, distributors, share-holders, financial distributors, governmental organisms). Using such tools is a proof of professionalism, coherence and unity of communication and helps in strengthening the brand.

4. Dress codes – a personalized attire supports both internal communication (employees feel they are members of the same family, building up a sense of affiliation and mutual respect) and external communication (clients associate the employee with the company s/he stands for). Moreover, a particular business attire is another form of promoting the image of the brand.

5. Promotional materials (pens, caps, T-shirts, keyrings, etc.) are offered on special occasions or events to coworkers. The right materials must be carefully chosen. They can have a big contribution to the image of the company. The quality of these products must reflect the image the company wants the others to picture. Furthermore, they must be carefully chosen when it comes to special days and events: Christian feasts, national celebrations (e.g. Women's Day, the 1st of May, the 9th of May, etc.), launch of a new product or the company's anniversary, signing of an important contract, the successful completion of a project, a press conference, etc. Special attention must be rendered both to the colour scheme of these materials (which must illustrate the brand) and to the personalization methods: imprinting, inscribing, engraving, etc., in perfect accordance with the 'flexibility' of the logo.

7. Cars imprinting - Similar to dress codes, it has two objectives: internal communication among employees and external communication, a form of promoting. The selection of the cars has an important contribution to the improvement of the brand image. The association of the company with the brand image of an acknowledged motor vehicle manufacturer will urge respect and will be a sign of security and financial performance. Likewise, the colours must assent to the brand colours or, at least, to allow the logo to be used in its simple form.

8. Website and CD presentations – Nowadays, the development of technology, of the communication system has led to an overall digitizing of the world (including the economic relations). The era of communication on the internet has brought about the development of many interhuman and business relationships. The selection of a particular product / service is usually preceded by a more or less comprehensive research on the company's website, on different search engines or chatting with former or potential clients interested in the same product / service. Thus, we can say that, unless we are on the Internet, we do not exist!

A website with the most important and viable information for the clients and business partners may lead to a better company image, may be a proof of professionalism and especially of being up-to-date with technical evolution.

The website graphics and design require knowledge and careful usage of the company's identity manual. Unpleasant situations might arise: e.g. the usage of another colour or image or font might create a sense of confusion in the client, who may not be able to recognize the brand s/he is looking for or even worse, mistake a particular brand for a similar one.

4. A model identity manual of a private kindergarten („Cheerful little angels”)

The launch onto the market of a private kindergarten requires a lot of research work and preparation, including the right choice of its name.

The services, as well as the products offered to the children, have names inspired from fairytales or little animals. The nouns usually are used as diminutives. Besides nouns, in the name of the company we might have a number which bears a certain meaning in our literature (2, 3, 5, 7), or an adjective (small, tiny, cheerful, strong, hardworking, happy).

The logo we choose for such a company is illustrative of the services we offer to the children, but those who are responsible for their buying are the parents (especially mothers). Hence, the new logo must be

attractive, as colourful and cheerful and playful and friendly as it can possibly be for the little ones, but, at the same time, it must give a sense of trust, security, reliability, care and affection to the buyers, namely to the parents.

The logo components: graphic elements: three little angels (two boys and a girl, the idea of friendship) and a little cloud (innocence, dreams, ideals, childhood games).

The text: the name of the company was carefully chosen. The font is cheerful, playful, and the size of the letters highlights it. This font type is not grave, austere or formal. It suggests security, reliability, a long term investment, though.

The colours: the background colour is light blue and white. The little angels and their dresses have various colours, in soft pastels to enrich the palette colours and to attract the children's attention.

Business cards design. We need only typical business cards (with information about the kindergarten and manager). The background is pale blue, the text is white to enhance a light, not at all crowded imagery. The logo is placed at the top right corner, according to the rules in the manual.

Stationery elements (leaflets, posters and flyers): in harmony with the business cards serve the purpose of drawing children's attention and provide additional information. For each and every child we have prepared personalized labels with their names which have been stuck unto the hall stands. The portfolios, envelopes, letterhead sheets of papers stand for professionalism towards our coworkers: distributors, financial institutions, governmental organisms, etc.

Dress code: within an educational institution a decent, but comfortable attire is a must. The teaching staff must be allowed flexibility when playing with children. Hereby, we have chosen comfortable cotton collar-embroidered shirts for the teachers and personalized, unicoloured logo-imprinted T-shirts for the children.

Custom - imprinted vehicle: in which the children are safely driven. Its design has drawn the attention and affection of both the children who see it every day and of potential clients (a personalized vehicle = a promotion vehicle). We have selected a light blue Mercedes Vito van, ideal for our logo.

Website: provides information for those interested in our offer service, photo galleries, contact details, etc. The parents of the children enlisted in our facility have the possibility of choosing the daily menu for their child and of watching their children through the video surveillance cameras installed in classes, bedrooms, dining halls, yard, etc.

5. Conclusion

The communicational capital, as well as the other types of capital (financial, technological, human) requires financial resources and time in order to continuously develop and improve. Drafting an identity manual is not a cheap financial investment. The bare concept may cost between 1.000- 5.000 EUR, plus the production and personalization costs. But such an investment is to be yearly made up for with every new client. The initial target, of 30 children at the beginning of the school year, has been exceeded. We have 42 children in three different age groups. Once the identity of the company is firmly stated, the manager can think of other effective methods of promoting the kindergarten services. Until then the gained trust and recommendations are the best method of promotion.

In conclusion, the relevance of the communicational capital for organizations may be expressed by their capacity of issuing and capitalizing this capital both on corporative and commercial level, in order to reach the marketing objectives of the organization.

The purpose of this paper is to examine the way in which Romanian monastic compounds promote their religious attraction and the degree of collaboration between monasteries and intermediaries in the religious tourism market. The study was carried on in more than 100 monasteries and showed the existence of significant differences regarding the promotion activities among monasteries because of the characteristics of the religious compounds. Moreover the results indicated there are opportunities to develop relationships and partnerships between monasteries and the other actors involved in organizing the travels with religious motivations.

Keywords: communication tools, distribution activities, religious sites, religious travel.

JEL classification: M 3.

1. Introduction

As in case of the other forms of tourism, the religious tourism should be seen into a competitive environment, in which the representatives of religious tourism supply try to attract and retain the customers or precisely try to attract a larger number of believers within sacred places. Although representatives of pilgrimage places say that we cannot speak about a competition among pilgrimage places from Romania, yet the number of visitors, the development, and the notoriety of these places vary greatly from one to other (Chiș and Țirca, 2009). Even if the religion or the religious needs are less important in a post-modern secular if not atheist society (Widenfeld and Ron, 2008) and the number of church attendants in Europe decreases (Nolan and Nolan, 1992), the number of visitors to religious sites is continuously increasing. Moreover religious tourism and/or pilgrimages are described as a new trend on travel market, a rapidly increasing segment (Country Brand Index, 2008).

This aspect is determined on one hand by consumer behavior, but in the same time can be a result of marketing and management instruments used by representatives of the religious attractions, even if they are not known under this name or they are not used for a commercial purpose.

Such example is the study of Pavicic et al. (2007) which presents many aspects related to management of communication and promotion to Marija Bistrica shrine.

The results of this study show that the main reason for the attraction of visitors to religious places is redemption and closeness to God; this is also the main goal when developing collaborative relationships with various intermediaries on the tourism market. Hereby we can speak about an attempt to adapt the religious tourism supply to consumers' needs, not in the sense of modifying the dogma or religious values, but using the specific communication tools and establishing partnerships between the actors in the religious tourism market. These aspects are brought up by Angheluță et al. (2009) which presents the utility of the market for religious organisations, in this case the Church.

3. Objectives and methodology

The present paper has two objectives: on the one hand to identify the medium used by the most important pilgrimage places from Romania to inform the public, and on the other hand to determine the collaborative relationships with intermediary agents in order to include religious attractions in tourism programs. In other words, we want to study two major activities of religious compounds which can greatly benefit from target audience-centred orientation: the communication - promotion and the delivery of religious tourism offerings.

The hypotheses considered in this study are:

- *Hypothesis #1: The communication tools used significantly differ because of the characteristics of the religious organizations.*
- *Hypothesis #2: The degree of collaboration between religious organizations and travel agents significantly differ because of the characteristics of the religious organizations.*

As three identification characteristics of monastery were taken into consideration (the type, the size and the Metropolis Church) *each hypothesis statement was divided in three, resulting six hypothesis.*

The research was carried on among the orthodox monastery in Romania, the major destinations for religious-based travels as pilgrimages and religious tourism. The *sampling unit* was the monastic compounds represented by abbot as manager of the monastery.

Due to the difficulty in contacting the abbots, the delicacy of the subject and the high geographic dispersion of monasteries, we chose *a mix sampling method*. The research was carried out through survey method, using the interview technique. *The questionnaire was the instrument of data gathering.*

The sample included 151 monasteries from 24 counties of whole Romanian Metropolis: the Metropolis of Cluj, Alba, Crişana and Maramureş 57.55%, the Metropolis of Muntenia and Dobrogea 2.88%, the Metropolis of Moldavia and Bucovina 15.11%, the Metropolis of Oltenia 7.19%, The Metropolis of Banat 10.79%, The Metropolis of Ardeal 6.47%. Regarding the type of monastery, 51.08% were monk monasteries and 48.92% were nun monasteries. Related to the size of monasteries in terms of numbers of inhabitants, the monasteries were divided into five categories from small monasteries (have no more than 5 inhabitants) to large monasteries (have more than 25 inhabitants).

4. Results

First, we tried to determine if the abbots think it is necessarily to carry on activities in order to attract people to monasteries, as a way to draw them closer them to God. We used a five-step scale from “certainly not” (value=-2) to “certainly yes” (value=+2). While this question may seem surprising, it is justified, because according to religious representatives’ statements based on orthodox dogma, people must visit the monasteries as their own choice, not because they are constraint or influenced. This is the reason the information tools used by orthodox monasteries don’t have invitations to visit them, only just schedules. Besides, the mission for many monasteries regarded the withdrawing from the world and solitude.

But, the answers pointed up that more than 50% from the abbots consider that monasteries should definitely attract people to them (“certainly yes”), however with the reason of drawing them closer to God. The mean is $M=0.91$ ($S.E=0.128$) (Table 1). *The abbots’ view significantly differs because of the type of monastery and the Metropolis Church.*

Table 1. The influence of monastery’s characteristics on abbots’ view regarding the necessity to attract people to monasteries

The view of abbots		Factors that influence abbots perception	
<i>Certainly not</i>	11.60%	Monastery size	$F=1.001$ ($p=0.421>0.05$)
<i>Probably not</i>	8.30%	Metropolis Church	$C=0.467$ ($df =20$; $p=0.028<0.05$)
<i>Indifferent</i>	5.00%	Monastery type	$C=0.300$ ($df =4$; $p=0.017<0.05$) $Z= -2.318$ ($p=0.020<0.05$)
<i>Probably yes</i>	24.80%		
<i>Certainly yes</i>	50.40%		

C= Pearson Correlation Coefficient; Z= Mann-Whitney Nonparametric Test; F=ANOVA test.

We tried to determine if there is an opportunity to develop promotion strategies for monastic compounds, to use religious tourism as a way to achieve the spiritual mission of the monasteries. As we can see, in most of cases the abbots' view allows such approach but it should take into consideration the characteristics of the monasteries.

Regarding the communication tools used by monasteries, the results indicated the monastery guides as being the most used (especially in monks monasteries), followed by the monastery flyers (Table 2). The main disadvantages of the brochures are the low market coverage and the reduced impact because usually, they can be found in monasteries.

Table 2. The influence of monastery's characteristics on the communication tools used by monastic compounds

The communication tools used by monasteries	The characteristics of monastery which influences the communication tools used
<i>Religious publications</i>	33.33% -
<i>Specialised broadcast stations</i>	38.21% -
<i>Travel guides of Romanian monasteries</i>	75.61% Monastery type: $C=0.258$ ($df=1$, $p=0.003<0.05$); $Z= -2.748$ ($p=0.006<0.05$).
<i>Monastery brochures</i>	36.58% Monastery size: $C=0.270$ ($df=1$, $p=0.002<0.05$); $Z= -3.084$ ($p=0.002<0.05$).
<i>Monastery flyers</i>	55.28% Monastery type: $F=2.351$ ($p=0.045<0.05$).
<i>Postcards</i>	35.77% Metropolis Church: $C=0.309$ ($df=5$, $p=0.028<0.05$).
<i>Monastery CDs</i>	17.07% Metropolis Church: $C=0.318$ ($df=5$, $p=0.018<0.05$). Monastery size: $C=0.325$ ($df=5$, $p=0.015<0.05$); $F=3.252$ ($p=0.009<0.05$).
<i>Monastery website</i>	24.39% Metropolis Church: $C=0.306$ ($df=5$, $p=0.029<0.05$).
<i>Metropolis websites</i>	37.39% -
<i>Tourist information websites</i>	25.20% -
<i>The travel agencies offerings</i>	10.56% Metropolis Church: $C=0.322$ ($df=5$, $p=0.018<0.05$).

C= Pearson Correlation Coefficient; Z= Mann-Whitney Nonparametric Test; F=ANOVA test.

Thus brochures are mostly used for the presentation of large monasteries, and the flyers for monks' monasteries. Postcards and CDs are means of promotion especially for the monasteries belonging to Moldavia and Bucovina Metropolis Church and Oltenia Metropolis Church. The monasteries from Moldavia and Bucovina Metropolis Church and Muntenia and Dobrodgea Metropolis Church are using their own website for communication, and those for Muntenia and Dobrudja Metropolis are using the Metropolis and Archbishoprics website. The last two Metropolis Churches mentioned and Vadului, Feleacului and Clujului Metropolis Church are the most often structures included in the travel agencies offers.

The communication tools with higher audience like specialised radio and television stations are used by 40% of monastic compounds. Almost 30% of monasteries are using their own website and almost 40% of monasteries are using Metropolis' website to deliver the information. Just 10.56% of monastic compounds use travel agencies and almost 25.20% of them use tourist information websites to give information. 10% of the abbots mention word of mouth advertising, and most probably the percent is higher, but we didn't included it within the predefined variables as we intend to determine just the impersonal communication tools. We consider that word of mouth advertising would be better identified if analysing the religious tourism demand.

The communication tools used by monasteries significantly differ because of the characteristics of the religious organizations, especially in case of the Metropolis of belonging, but in most situations there is medium relationship between variables.

Regarding the content of the message within information and/or presentation materials we tried to determine the explanation for the very beautiful pictures with monasteries using open ended questions: *We assume that the extraordinary content of the pictures and brochures is a way to attract the people to monasteries, being a promotion strategy.* The answers haven't confirmed entirely the hypothesis statement (Table 3).

Table 3. The reasons for the content of the presentation materials of the monasteries

The reasons for the content of the pictures of the monasteries		The characteristics of monastery which influence the abbots' opinions
<i>To attract people, promotion</i>	25.64%	The Metropolis Church: C=0.513 (<i>df</i> =20, <i>p</i> =0.005<0.05).
<i>It shows the "Gift of God"</i>	17.95%	
<i>It represents the beauty of the places</i>	41.88%	
<i>Is due to photographer skills</i>	7.69%	
<i>Others</i>	6.84%	

C= Pearson Correlation Coefficient.

Most of the abbots think the beauty of the pictures and brochures is given by the fact that they capture the loveliness of the surroundings. 25.64% of abbots think the content of the pictures is to promote, to attract people and almost 18% think the beauty of the pictures shows the work of God. The Metropolis of belonging influences greatly the answers of the abbots.

Next, we tried to determine the collaboration relationships between monasteries and organized groups of visitors, religious organisations or travel intermediaries. Hereby, in 60.3% of the cases to monasteries arrive organized groups of religious associations (ASCOR, Liga Studentească etc.), mainly young people, but sometimes come organized groups of pupils, elderly persons from asylums or even children. The question regarding the collaboration with members of religious organisations was meant to determine in the case of good cooperation, if it's possible to develop cooperation relations with non religious groups who want to visit the monastery. The results indicate the possibility to establish such relationships.

Just a small percent of monasteries appear in travel agencies offers (11.50%) and 15.70% cooperate with Pilgrimage Bureaus of Metropolis or Patriarchy. More than 70% of abbots received no proposals to introduce monasteries into tourism programs, and 6.60% refused such offers. For monasteries which cooperate with Travel agencies or Pilgrimage bureaus, the proposals came from travel organizers in 72.70% of cases and the rest from monasteries.

Table 4. The collaboration between monasteries and travel organisers

<i>Travel agencies</i>	4.10%
<i>Pilgrimage Bureaus of Metropolis or Patriarchy</i>	8.30%
<i>Travel agencies and pilgrimage bureaus</i>	7.40%
<i>Refused the collaboration offers</i>	6.60%
<i>Never received cooperation proposals</i>	73.60%

Testing the hypothesis shows there are no significant differences between the nature of the relationships and the characteristics of the monasteries therefore the *hypothesis #2 is not valid.*

Next, we tried to determine if such collaborative relationships with travel planners are possible from monastery abbots' view. All subjects answered to this question even if there are no contracts between monasteries and travel agencies or pilgrimage bureaus. To determine their view we used a five step

scale from “very detrimental” (value=-2) to “very beneficial” (value=+2). More than 60% of abbots consider that the collaboration relationships with travel organisers are “beneficial” or “very beneficial” and 30% of them indifferent, and none of them think such relationships as being “very detrimental”. Mean of the variable is 0.62 (*S.E*=0.062) (Table 5).

Table 5. Abbots’ view regarding the opportunity to develop relationships with travel organizers

The abbots’ view regarding the opportunity to develop relationships with travel organisers		The factors that influence abbots perception	
<i>Very detrimental</i>	0.00%	<i>Monastery size</i>	F=1.848 (<i>p</i> =0.110>0.05)
<i>detrimental</i>	6.10%	<i>Metropolis church</i>	C=0.329 (<i>df</i> =15; <i>p</i> =0.531>0.05)
<i>Indifferent</i>	30.40%	<i>Monastery type</i>	C=0.328 (<i>df</i> =3; <i>p</i>=0.003<0.05) Z= -3.659 (<i>p</i>=0.000<0.05)
<i>Beneficial</i>	59.10%		
<i>Very beneficial</i>	4.30%		

C = Pearson Correlation Coefficient; *Z* = Mann-Whitney Nonparametric Test; *F* = ANOVA test.

The tests show there are significant differences between abbots view regarding the opportunity to develop relationships with travel organisers, due to the type of monastery (more suitable for monks monasteries).

6. Conclusions

The current paper presents some aspects of the communication and delivering activities carried out by the monastic compounds from Romania, representing the main pilgrimage places for Romanian orthodox spirituality. *The novelty of this subject is very high in Romanian literature, because such research wasn’t carried out in our country until now.*

The results showed that communication activities are not very developed, using mainly the classical communication tools. *The most used tools to deliver information to target audience and believers are monasteries guides and brochures.* Just 25% of the religious compounds have their own website and 10% of them cooperate with travel agencies. *The communication tools used significantly differ because of the type and the size of monasteries and due to the Metropolis of belonging.* The aesthetic of the pictures from promotion materials is used in 25% of monasteries in order to attract visitors.

Regarding the cooperation with various intermediaries from tourism market, *more than 70% of the monastic compounds have no relationships with travels organizers, such as travel agencies or pilgrimage bureaus, although almost same percent of the abbots consider these relationships beneficial or very beneficial, and 60% of them receive organised groups of visitors, especially members of the religious organisations.*

Thereby, we can assume there *is a high potential of collaboration* between actors in the travel market and pilgrimage places, as well as an *obvious orientation of monasteries towards the usage of the most effective communication tools*, but only if the *main reason and the mission of the cooperation and communication activities is the religious experience of the traveller.*

THE FACTORS THAT INFLUENCE THE ROMANIAN BANKING MARKET DURING POST-ACCESSION PERIOD

Turkes (Vînt) Mirela Catalina
Transylvania University of Brasov
Faculty of Economic Sciences

In a developing economy, like the one of Romania, frequent changes take place in all areas, including the banking market. The Romanian banking environment is frequently influenced by various factors. The article shows the changes that have taken place in the Romanian banking market during the period 2007-2010 as a consequence of these factors. The research consisted in presenting the most important political, economical, social and technological factors which have influenced the banking market after Romania's integration to the European Union. Based on the analysis of these factors' influence, I have presented the developing manner of the Romanian banking market after joining the European Union, but also the problems faced in the context of the current global crisis.

Keywords: banking system, integration, financial indicator, bank marketing.

Code JEL: M31, G21

Introduction

The banking market in Romania is in a continuous movement since the environment is changing, the customers' needs and the competition are changing. Achieving success on an internal market which constantly changes its dimensions and internal structure, which improves its manner of carrying on its transactions, which uses the new technology in performing its operations, can only be made by adapting it to the external changes which represent its only viable alternative¹⁷⁰⁴.

Factors that influence the Romanian banking market

This environment in which the banks perform their activity is influenced by the following factors: political, social, technological and economical.

a) Political environment. The intervention of the politic in the banking activity is extremely detrimental because the political regime influenced the economical development, fluctuations based on governments being registered. During the period 1990-1996, Romania is facing both an economical and a political crisis caused by the politicizing of the positions in most of the government institutions. The banking sector was affected as well by this state of affairs, the government banks being divided between the political leaders as follows: BCR (Romanian Commercial Bank), CEC (Romanian Savings Bank) were administered by PNTCD (Christian-Democratic National Peasants' Party), Banca Agricola (Agricultural Bank) was given to PD (Democratic Party), etc.

The influence of the politic in the economical sector, and banking as well, has not been removed until today. By the agreement made with IMF (International Monetary Fund), Romania must receive almost 20 billion Euros, for a 2 year period. The biggest share of the money, meaning 12.9 billion Euros, must enter the foreign currency reserves of BNR (National Bank of Romania) in order to support the local currency (leu). The first part of 5 billion Euros entered the country in May 2009, and the average interest of the loan from IMF represented 3.5% per annum. From the European Union, Romania must receive 5 billion Euros (with an interest between 2 and 2.5%), a loan which firstly financed the budget

¹⁷⁰⁴ Constantin Rotaru, *Sistemul bancar românesc și integrarea europeană*, Ed. Expert, București, 2008, p.23.

deficit, and from the World Bank and from the European Bank for Reconstruction 2 more billion Euros intended for economy and banking system will come¹⁷⁰⁵.

At 1st of October 2009, Romania sinks into a new crisis, when the government coalition between the center-right party of president Traian Basescu (PD-L Democratic-Liberal Party) and the Social-Democratic Party (PSD) dissolves, causing an aggravation of the economical crisis.

After 6th of December 2009, the political crisis became even deeper when the final results of the presidential elections overturned the polls and brought out Traian Basescu as leader¹⁷⁰⁶.

The agitation in the Romanian political life determined a delay in the finalization of Romania evaluation process by IMF and implicitly a delay in granting the third part of 1.5 billion Euros, offered by IMF and the World Bank, following the delay of the government in the preparation of the consolidated budget for 2010. The banking system has also been affected by this crisis and the results did not delay in showing up: the number of credits granted to customers decreased, especially to SMEs (Small and Medium Enterprises), the number of bad debtors increased, etc.

b) Social environment. The social environment refers to *demographical, cultural and lifestyle changes*, the consumer *attitude and perception* changes. The banks must monitor the demographical tendencies, they must mark their probable impact and they must decide on the needed actions. The absence of the above could create problems for the banks.

The population number and structure of Romania has suffered major changes during the last 15 years.

During the period 2007-2009 the decreasing tendency of the population number continued, reaching from 21.53 million persons in 2007 to 21.49 million persons in 2008 (0.14% less than 2007) and to 21.45 million persons in 2009 (out of which 10.4 million men – 48.7% and 11.05 million women – 51.3%), considering the higher number of deaths compared to the number of newborns, according to the announcement of the National Statistics Institute (INS)¹⁷⁰⁷.

Therefore it can be said that the banks acting on the local banking market must consider the decrease of the young population number and the increase of the old population share when preparing its own strategies and the bank products and services as well, since in one way or another, this population represents the bank customers.

However, the *population attitudes and perceptions* did not change too much. Thus the population with the age over 46 continues to keep the savings at home, they prefer to pick up the money from the bank operator, they prefer to receive/send money by post-office and when applying for credits they prefer the credit cooperatives.

Unemployment rate. According to the latest data of the National Agency for Employment, the unemployment rate in December 2009 reached 7.8%, the total number of unemployed persons being of 683,123 persons, out of which 298,091 women. Romania is thus getting near the prognosis of IMF, who was estimating the number of unemployed persons at over one million persons for 2010. The effects of the current crisis have been felt by the local banking system not by wage reductions, but by the reduction of bonuses, benefits (which generally represent 15-25% of the yearly wage) and number of employees. Up to now, OTP Bank dismissed 5% of the employees and from Citibank around 100 persons were laid off. The number of unemployed persons coming from banking environment is over 7,000 persons¹⁷⁰⁸.

¹⁷⁰⁸ <http://www.banisiafaceri.ro/analize>.

Real net average earning. The real earnings of the Romanians started on a descendent path since April 2009, and in October they reached the value of 1,375 Ron. In October 2009, the index of the real earnings was of 99.3%, the equivalent of a decrease in the real average earnings of 0.7 percentage points. In the below figure, the evolution of the real earnings during the period February 2000 – October 2009 can be observed¹⁷⁰⁹.

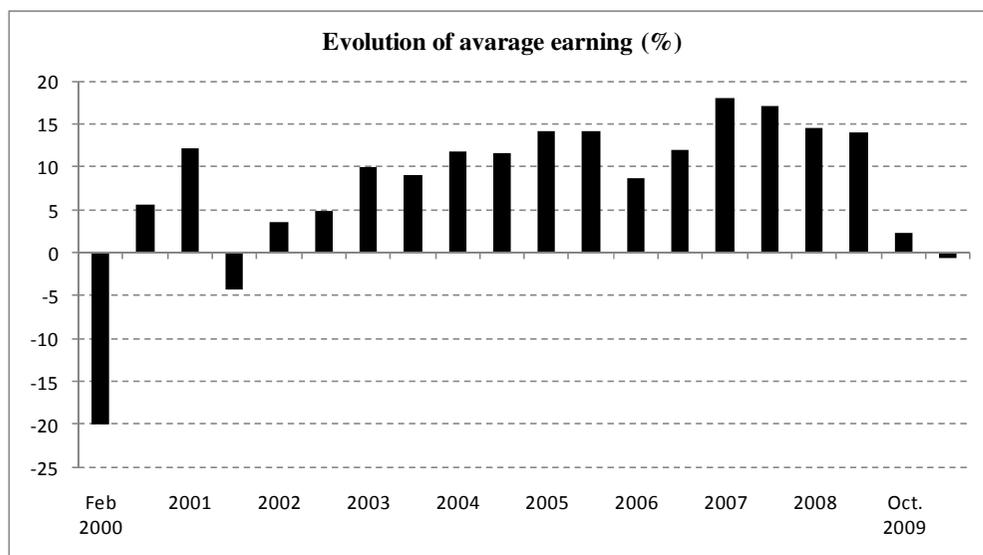

Fig. 1. Evolution of average earnings (%) during 2000-2009

Source: <http://www.insse.ro/cms/rw/pages/arhivaBuletine2009.ro.doc>.

The gross average earning in 2009 was of approximately 1,881 Ron¹⁷¹⁰. During the last years, the bank employees have been among the best-paid in the economy sector, according to the data provided by the National Statistics Institute, which indicates a gross average earning of 5,983 Ron (1,503 Euro) in the banking sector, almost three times higher than the average earning for the whole economy of 1,881 Ron, followed by the one of the employees in the pharmaceutical sector (918 Euro) and IT sector (880 Euro), according to Paywell study performed by PricewaterhouseCoopers (PwC).

Nevertheless, the earnings average has been “pulled down” by the entrance of a great many new employees into the system, since the earnings for the entry-level positions from the banking sector are not very high. However, during the last years, the earning increases have not been spectacular in banks: 10% in 2007, 9% in 2008 and 5% in 2009 considering that the market increased with 12-15%.

Consumption prices. The average increase of the prices per total in 2009 compared to 2008 determined based on CPI (Consumer Price Index), but also the one determined based on the harmonized index of consumer prices (HICP) was of 5.6%. Comparing 2009 with 2008, the highest increase of the consumer price index has been registered in services (8.97%), followed by non-food items (6.22%) and food items (3.25%)¹⁷¹¹. Under these conditions, the situation deterioration of the persons distributing over 80% of their income to cover the basic needs is natural. The living standard constantly decreasing, the

¹⁷¹⁰ <http://www.insse.ro/cms/files/statistici/comunicate/castiguri/a09/cs12r09.pdf>.

¹⁷¹¹ <http://www.insse.ro/cms/files/statistici/comunicate/ipc/a09/ipc12r09.pdf>.

population's trust in banks and national currency is diminished, this being reflected in the structure of banking products inquiry.

c) Technological environment. In the development of the market economy, the banks are the biggest users of information technology (IT). It influences the offer of banking services as well as the efficiency of the banking processes. In the technology world, fast developments have occurred, new hardware and software products have been released, the operations which were manually performed are now computerized, the information systems being introduced at a large scale.

The technology had a deep impact on the sector of banking services in Romania as well. The increase of the competition, the more and more sophisticated inquiries from customers and a larger range of products will benefit from an improved technology. An example is given by the new technology for chip card reading, which was introduced in December 2009 by Citibank and BRD banks, while most of the POS systems on the Romanian banking market operate by magnetic stripe reading only¹⁷¹².

d) Economical environment. The second year of Romania's participation to EU mechanisms has been marked by a series of events, both external and internal, which have complicated the mission of the authorities to ensure macro-economical stability.

Internationally, the turbulences triggered in the summer of 2007 by the high risk mortgage loans (*subprime*) transformed during 2008 into the most severe international economical crisis since the Great Depression of 1929-1933. The crisis mainly affected the countries with high external deficits, including Romania. Internally, the economical aspect has been complicated by the parliamentary elections in November which have caused an unprecedented relaxation of the income and fiscal-budgetary policies¹⁷¹³.

The budget deficit reached the highest level of the last decade (5.4% of GDP), the expansion of the government sector cancelling almost integrally the external adjusting effort undertaken by the private sector and thus contributing to maintaining the current account deficit to a level perceived by the foreign investors as being much too high (7.4% of GDP in 2009). This evolution manifested itself in all emerging countries of EU, but in different proportions (Table 1).

Table 1. Evolution of current account deficits in emerging EU

	<i>percent of GDP</i>							
	<i>BZ</i>	<i>CZ</i>	<i>EE</i>	<i>LV</i>	<i>LI</i>	<i>HU</i>	<i>PL</i>	<i>RO</i>
Average 2002-2006	-9,0	-4,4	-12,2	-12,5	-7,4	-7,8	-2,4	-6,3
2007	-22,5	-1,5	-18,3	-22,5	-15,1	-6,2	-5,1	-13,5
2008	-24,8	-3,1	-9,1	-13,6	-12,2	-8,4	-5,3	-12,3
2009	-18,8	-3,2	-1,1	-1,5	-1,9	-5,0	-4,7	-7,4
2010	-17,2	-3,3	-3,1	-1,9	-0,7	-4,8	-3,7	-6,1

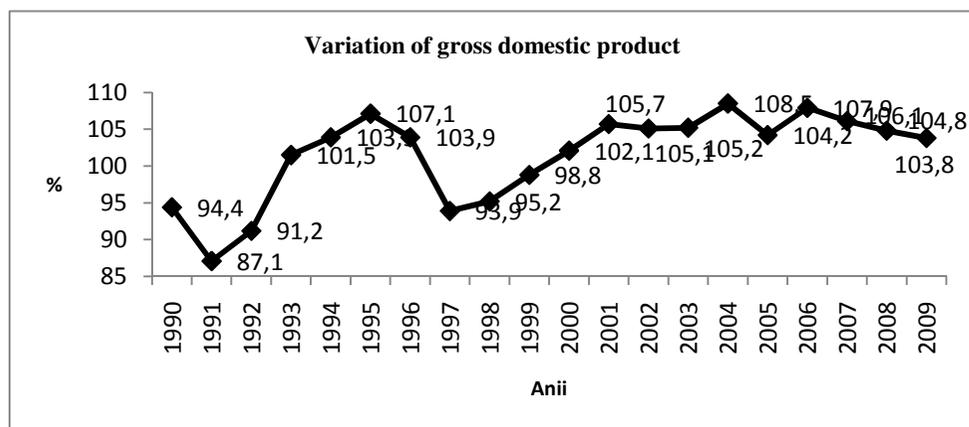

Source: <http://www.insse.ro/cms/rw/pages/arhivaBuletine2009.ro.doc>.

The correction of the current account deficit brings two important challenges: financial situation deterioration of the companies, especially those with import-export activity and the risk for the adjustment to take place especially by diminishing the investments.

¹⁷¹² <http://www.zf.ro/banci-si-asigurari/citibank-isi-securizeaza-cardurile-de-credit-cu-cipuri-5317658>.

After a decline period (1997-2001) of the *Gross Domestic Product (GDP)*, the economical growth re-launched starting with 2002. The growth has been determined significantly by the increase of the activity volume in the field of banking services, constructions and industry.¹⁷¹⁴

Source: http://www.insse.ro/cms/rw/resource/rom_cifre_2009_ro.pdf

Considering that the financial intermediation is still at a low level and taking into account the share of the bank assets in GDP compared to other countries in EU, the Romanian market potential remains high. Besides, the last years have been marked by a pronounced stimulation of bank activity and an increased competitiveness, the share of the banking system assets rising to 50.1% of GDP at the end of 2006, to 60.9% in 2007 and 62.4% in 2008.

Investments. At the end of 2007, the investments made in the national economy registered a remarkable increase of 151.7% compared to 2000. In 2009, on the main activities of the national economy, a higher concentration of the investment funds took place in the industry sector, including electrical and thermal energy, natural gas and water (40.6%), and in the services sector (44.1%). The foreign investments in Romania have reached a record level of 9 billion Euros in 2008.

In the banking system, after years in which the crediting achieved record levels, the moment of the payment has arrived and the authorities reached the point of borrowing from the International Monetary Fund (IMF) in order to cover the financial gaps, in the context of the financial corporations stopping the capital flows to Romania.

The analysts believe that the high external vulnerabilities of Romania, so negative in the context of the current financial and economical crisis, as well as the economical disarticulation by the unsolvable disequilibrium between consumption and production, is first of all the deed of the foreign banks and not the foreign investments.

In conclusion, among the changes that took place on the Romanian banking market after joining EU we can mention the following: the banks continued to improve the technology for a large range of products, they renewed their customer database and they used more aggressive strategies for customer segmentation and for the promotion of their own banking products; the decrease in the living standard diminished the trust of the population in banks and national currency, this being reflected in the decrease of the inquiry for banking products; the economical and political crisis in the Romanian economy materialized by the decrease in the number of loans granted to the population and especially to SMEs, as well as the increase in the number of bad debtors; the number of unemployed persons at national level increased, a relatively small part coming from banking environment; the gross average earnings of the Romanians increased while the earnings in banks remained relatively constant; the global economical crisis and the internal elections caused a relaxation of the income and fiscal-budgetary policies; in 2009 the highest budget deficit in the last decade was registered (5.4% of GDP)

¹⁷¹⁴ <http://www.insse.ro/cms/rw/forum/post535.ro.do>.

which contributed to maintaining the current account deficit at 7.4% of GDP, thus causing the decrease of the foreign entrepreneurs' interest in investments on the banking market and other fields of economy as well; the volume of foreign investments decreased and the authorities had to borrow from IMF in order to cover the financial gaps in the economy.

CONCEPT AND EVOLUTION OF BANK MARKETING

Turkes (Vînt) Mirela Catalina
Transylvania University of Brasov
Faculty of Economic Sciences

The bank marketing, a specialized field of the marketing, has emerged following the extensive development of the general marketing and following the appearance, separation and development of services marketing. The article shows the appearance, development and delimitation of the bank marketing concept following the increase of the financial-banking sector in all world countries due to the appearance of new competitors and the competition intensification. The research consisted in presenting the evolution stages of the bank marketing and the manner in which the concept has been approached and perceived, in time, by various Romanian and foreign specialists. Through analysis, I have shown the importance of including the bank marketing concept into the assembly of tactical and strategic decisions of the banking companies.

Keywords: marketing, bank marketing, concept, evolution.

Code JEL: M31, G21

Introduction

Following the extensive development of the marketing field, the consumer-goods marketing and the services marketing have resulted. The services marketing, as a distinct field, is characterized by a peculiar content where elements can be found similar to material goods (properly adapted) and other elements common to all services. It developed in two ways: one approaching the sector as a whole and another one specific to various categories of services, which underlies the appearance of some of its branches: *bank marketing*, *tourism marketing*, etc.

The marketing-specific applications within the activities performed by the banking institutions that offer their products and services, realized in the banking sector, to companies or organizations, government, other financial institutions and population as well, designate the *bank marketing*.

Bank marketing concept

The bank marketing is a specialized field of the marketing and it has emerged following the extensive development of the general marketing and following the appearance, development, separation, delimitation, deepening and specialization of services marketing. The bank marketing concept evolved following the significant increase in the developed countries of the financial sector and implicitly the banking sector due to the appearance of new competitors, the market overcapacity and the competition intensification.

*The bank marketing is "the marketing that applies in the *universal banks'* field (commercial banks as: savings and cooperative banks) and in the *specialized banks'* field (actual credit institutions, investment companies, etc.). Besides the insurance companies and savings institutions for constructions, the banks are the most important offerers on the market of financial services. Today, on the market of bank services, there is a powerful competition, the transparency is more pronounced and the customers have become more critical and less fastidious, being better informed about the monetary and financial issues, but also better advised for this purpose. Therefore, many banks admitted the need to develop and implement professional and efficient *bank marketing* in the relationship with their own private customers".*

In the specialty literature, the *bank marketing* is also called marketing for *services* or for immaterial goods. Compared to other services, the banking products are distinguished by the fact that they are *complex and abstract*. Most of the customers do not easily understand what the financial services

consist in, what benefit they bring and how they can be distinguished from one another. To this we can add the fact that the benefit of a banking service, for example a consultancy for the acquisition of a mortgage loan, for the placement of some shares or a funding for the execution of a construction, is exposed to an *external insecurity*, more than the other goods. The factors that influence these situations are the following: the evolution of national and world economy and the evolution of banking, monetary and capital markets. The exogenous insecurity and the immateriality generate a very high *qualitative insecurity* of the banking products for customers. Most of the banking products are mainly *integrating*, meaning that the customer takes part, more or less actively, in their realization.

For banking services, the specialist Kaas K.P. emphasizes the importance of the customers giving some information about the standard financial *data* (income and patrimony), about their financial *objectives* for life planning, about their attitude towards *risk*, about the intended period of the commitment, etc. in interaction with the bank employees. The immateriality and the abstractization of the banking services lead to the fact that, compared to the offerers of material goods; it is more difficult for a bank to create lasting competition advantages. The innovating products, for example a special savings contract or a chip card, cannot be protected against the competition by patents or property know-how. A bank can create competition advantages by a *high quality of the services, customer orientation and customer loyalty development*. To that effect, resources are needed which, on short term, are not available to all competitors. Examples to that effect are the customers carefully chosen, formed and motivated to serve the customers in an exceptional manner and also the information systems which allow the bank to optimally adapt its services to customer needs and restrictions¹⁷¹⁵.

The contemporary specialty literature shows numerous definitions of the *bank marketing*, more or less different, on the one hand due to the development level of the banking market and of the economy in the author's origin country and on the other hand due to the viewpoint in which the concept has been approached and perceived.

The English specialists C. Ennew, T. Watkins and M. Wright, in their writing "Marketing Financial Services", considered that the *bank marketing concept* implies "*the achievement of the bank objectives by establishing the needs and wishes of the target customers and the supply of the needed satisfaction in a more efficient manner than their competitors*"¹⁷¹⁶.

Another Belgian specialist Claessens R., in his writing "Marketing of retail banking products" stated that "*The banks should identify the future needs and wishes of the customers and should use their own services and distribution channels in order to efficiently develop the integrated marketing concept on long term*"¹⁷¹⁷.

In a brief formulation, the Romanian specialist Ionescu Lucian, in his writing "Bank marketing elements" states that the *bank marketing* represents "*the management of the processes leading to the satisfaction of the customer financial needs, in a manner profitable to the bank*"¹⁷¹⁸.

Another Romanian specialist, Dedu V. considered that "*the bank marketing refers to the actions taken through banks in order to satisfy the customer needs – private and companies*"¹⁷¹⁹

The specialist Odobescu E., in his writing "Modern bank marketing", stated that "*the adaptation of the bank marketing concept, as an assembly of strategic and tactical decisions adopted in the management process and the bank existence, implies the consideration of the following elements: satisfaction of customer needs, increasing the bank profitability, employees' involvement thus ensuring the cost*

control and the income maximization, social responsibility, the bank needing to have a responsible behavior"¹⁷²⁰.

The bank marketing considers that the bank institutions must involve themselves to a great extent in the complex study of the customers (income level, lifestyle, financial situations, market positions, market shares, etc), they must try to influence their behavior and to keep a permanent and efficient communication in order to know better their preferences and demands, offering to them new and diversified products, constantly improved in quality, using a highly qualified personnel and in the same time efficiently using their own resources, thus ensuring their profitability increase.

Bank marketing evolution

The stages of the bank marketing evolution are the following:

-*during the 70s*, many banks did not use the marketing in their activity, their management being market-oriented. Once the competition intensified, some of the banks have started to use the marketing, launching some extremely expensive advertising campaigns. The banks were counting on the fact that they could fool the customers by various promotional activities, by which they could hide the negative aspects related to their own banking services. The first failures of the advertising campaigns proved to the banks that on the one hand these campaigns could ruin them, and on the other hand that the main problem did not consist in attracting new customers, but in keeping them. During this period, the advertisement was the most important marketing activity performed by the banks;

-*during the 80s*, the banks developed programs to support the business, they promoted the bank marketing on a large scale, engaging all its constituent aspects: establishing and organizing the offer of products/services to satisfy the existing needs; promoting and orientating the products/services towards responding to the considered requirements of the business. It is a time when the banks no longer accentuate the trade, the short term sale of banking products, their volume increase; instead they focus on the perennial value of the customer, pursuing the winning of new customers.

-*during the 90s*, the banks focused their efforts in order to create some superior banking products/services, on the one hand following the assurance of the customer needs' satisfaction, and on the other hand establishing lasting relationships with them. During this period, the financial sector and implicitly the banking sector experiences a significant growth in the developed countries.

-*during the 21st century*, the banks act in a dynamic environment, where the market and the other factors (components of the political, economical, social, juridical, cultural, demographical and technological environment) frequently raise problems, forcing them to additional efforts or offering them opportunities that need to be fructified as well as possible; they need to integrate their current actions to their long term objectives which were previously determined by the bank marketing policy. Adapting the banking institution's activity to the environment requires a continuous tracking of the structural quantity and quality changes which the environment registers or will register¹⁷²¹.

In conclusion, in order to successfully achieve the purpose of the marketing process, *the banks* should:

-perform analyses in order to know the bank customers to the highest possible extent, so that the offered banking products/services match their needs and the sale is ensured. That is why the bank needs to involve as actively as possible in their customers' activities, by financial and logistical support, specialty consultancy and assistance.

-perform studies, systematical analyses of the financial market identifying the profitable markets, the new capital flows on the financial markets, the new agencies, intermediaries and entrepreneurs (sellers) acting on these markets, their operations and performances.

-define and apply their strategies in their relation with the market, efficiently using their own resources in order to create new banking products/services and to diversify them according to the consumers' wishes and expectations.

¹⁷²¹ Dedu V.: *Gestiune bancară*, Ed. Didactică și Pedagogică, București, 1999, p.9.

- try to obtain a lasting competition advantage by promoting high quality products/services, by customer orientation and by customer loyalty development.
- establish clear communication strategies for the customers, shareholders and employees.
- influence the customers' behavior since the profitability ratio of the banks is connected to their customers' profitability.
- determine certain specific indicators with the help of the financial – banking marketing, such as liquidity, solvency, interest rate and amount, the size of the production and investment expenditure estimates (especially within the credit banking product), bank capital adequacy ratio, the quality of credits portfolio by which to eliminate or to reduce the financial risk and to increase the profitability.

ATTITUDES OF THE CONSUMERS REGARDING THE PROCESSING AND EMPLOYMENT OF THEIR PERSONAL DATA

Vegheş Călin

Academy of Economic Studies in Bucharest

Bălan Diana

Academy of Economic Studies in Bucharest

Rusescu Marius

Academy of Economic Studies in Bucharest

The concept of privacy, seen in connection with the consumer's private space, and defined in terms of the specific personal data has gained an increasing importance, as a result of the organizations' extended attempts, within their marketing efforts, to capture, process and use the consumers' personal data.

Paper explores the attitudes of the consumers regarding their personal data in terms of their disclosure, previous agreement consumers should grant to the companies or public institutions (authorities) processing them, employment, registration and processing by the companies, and buying products and/or services as a result of a direct approach.

Keywords: privacy, consumer private space, personal data

JEL Classification: M31

Introduction

The end of the 19th century has brought the first formal attempts to conceptualize privacy. In 1887, the Pacific Railway Commission has found that “of all the rights of the citizen, few are of greater importance or more essential to his peace and happiness than the right of personal security, and that involves, not merely protection of his person from assault, but exemption of his private affairs, books, and papers, from the inspection and scrutiny of others” (Langenderfer and Cook, 2007). Three years later, Louis Brandies, in the article “The Right to Privacy”, has approached and explained the individual’s “right to be left alone” as a response to the loss of privacy experienced during that times (Wirtz, Lwin, and Williams, 2007).

In spite of their historical roots, privacy laws could being traced as far back as 1361 – when the Justices of the Peace Act in England provided protection from peeping Toms and eavesdroppers (Henderson and Snyder, 1999), the attempts to define *privacy* were rather difficult due to the wide number of related interests such as the personal information control, reproductive autonomy, access to places and bodies, secrecy, and personal development (Kemp and Moore, 2007). Many definitions given have tried to explain the content of privacy considering the right to be let alone, limited access to the self, secrecy, control of personal information, personhood and intimacy (Solove, 2002). Misspecification, cultural and historical biases, and their value-driven appearance altered more or less the content of all these definitions (Kasper, 2005).

Considering the information perspective, privacy is an ambiguous term and consumers may have different privacy thresholds depending on internal or external factors associated mainly to the context of the data collection process (Long, Hogg, Hartley and Angold, 1999). In the information age, due to the many invading ways, mainly through the internet, the consumer privacy has become a luxury to maintain (Pan and Zinkhan, 2006). Frauds, identity thefts and deceptive consumer surveys made consumers more discrete and sensitive to the need of protecting their privacy (Pitta, Franzak, and Laric,

2003). That is why the answer, provided more than a decade ago, by Scott McNealy, Sun Microsystems CEO, when questioned about the potential privacy breaches of new networking technology, will remain extremely accurate and actual: “You have zero privacy anyway, get over it” (Kasper, 2005).

From a *marketing perspective*, definition of privacy should focus on the personal data and information regarding the consumers. In this respect, privacy has been defined as the claim of individuals, groups or institutions to determine for themselves when, how, and to what extent information about them is communicated to others (Westin, 1968). Definition proposed by Schoeman adapted the content of privacy at individual level presenting it as a claim, entitlement or right of an individual to determine what information about himself (or herself) may be communicated to others; the measure of control an individual has over information about himself, intimacies of personal identity, or who has sensory access to him; and a state or condition of limited access to a person, information about him, intimacies of personal identity (Jóri, 2007).

Privacy must be seen in connection with the particular area where its content is applied. The above definitions imply the existence of a *consumer's private space* defined through and including an amount of information referring to the demographic, psychographic and behavioral characteristics of the individuals (*personal data*), and the rights the consumer should have to disclose or not, respectively to have this information protected through the appropriate laws and means (Veghes, 2009).

Analyzing the evolution of the definitions given to the personal data in the 1998-2008 decade, Grant (2009) has concluded that the content of the personal data, representing the central issue in the data protection, is still under debate. Still, there is a strong need for identification and definition of this data as consumers are more and more approached through direct marketing campaigns by the different organizations. Although most of the consumers have realized that participating in direct marketing is a necessary part of being in a consumer society, they are concerned about the unauthorized use or the misuse of their personal data and information, mainly in the forms of sale of their data without permission, unsolicited contact by businesses, the feeling that businesses know too much about their personal information, and the accuracy of data retained in databases (Pope and Lowen, 2009).

Methodological Notes

Data expressing the attitude of the consumers regarding their personal data have been obtained within a research approach with a larger overall scope, of assessing the exposure, attitude, current and future behavior of the consumers in connection with the direct marketing efforts of the organizations.

Data have been collected in January 2010 using a sample including 78 Romanian consumers from the Capital and other cities, aged 18 to 30, with higher education, which have been asked about:

- the attitude toward communicating their personal data to the companies or public institutions (authorities) the consumers are getting in touch with;
- the previous agreement the companies or public institutions (authorities) should obtain from the consumers before they will disclose their personal data;
- the consumers' attitudes regarding employment, registration and processing of their personal data by the companies providing different products and services;
- buying products and/or services from the companies approaching the consumers by mail, mobile phone, telephone or Internet.

Main Findings

All the direct marketing approaches employed by the organizations present in the market to provide various products and/or services aim to capture data about the consumers to be processed and later used in the future campaigns. That is why the investigated consumers have been asked to express their attitude regarding the potential reserves they may have to communicate (disclose) their personal data to the companies and public institutions (authorities) when getting in touch with them. Results obtained (see Tables 1 and 2) indicate that, overall, consumers are rather reserved in disclosing their personal data to the organizations attempting to approach them in a direct and interactive manner. This reserved

attitude tends to be more consistent in the case of the companies than in that of the public institutions (authorities): 60.2 % of the respondents would not, or rather not, communicate their personal data to the companies, while 46.2 % of them would not, or rather not, communicate this data to the public institutions (authorities).

Table 1. Attitude of the consumers toward communicating their personal data to companies

Data_firms					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	yes	7	9.0	9.0	9.0
	rather yes	24	30.8	30.8	39.7
	rather no	31	39.7	39.7	79.5
	no	16	20.5	20.5	100.0
	Total	78	100.0	100.0	

Table 2. Attitude of the consumers toward communicating their personal data to public institutions (authorities)

Data_public					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	yes	7	9.0	9.0	9.0
	rather yes	34	43.6	43.6	52.6
	rather no	28	35.9	35.9	88.5
	no	8	10.3	10.3	98.7
	don't know	1	1.3	1.3	100.0
Total		78	100.0	100.0	

A part of this attitude can be explained through the risks the consumers perceive and associate with the communication and, mostly, the consequent inappropriate employment of their personal data. The most important threats in this respect are the exposure to the potential abuses of the private companies, respectively the frauds respondents may suffer as consumers of the different products and services. By comparison, potential abuses of the public institutions (authorities) were mentioned by slightly more than a half of the respondents and the gap between the percentages associated to the abuses potentially committed by the companies, respectively public institutions (authorities), reveal that consumers tend to trust more the public entities and to fear more the private ones.

Having the right to agree or disagree in disclosing the personal data to the organizations (companies and/or public institutions or authorities) aiming to capture, process, and employ them is one of the most important mechanisms the consumers may use to defend their privacy and private space. That is why the investigated consumers have been asked to express their attitude regarding the agreement the companies and the public institutions (authorities) should ask before capturing their personal data. Results obtained (see Tables 3 and 4) indicate that, overall, consumers consider this agreement they could grant as mandatory before any attempt from the part of the companies and public institutions (authorities) to obtain their personal data.

Table 3. Attitudes of the consumers toward having the right to agree to disclose their personal data to companies

Agree_firms					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	yes	64	82.1	82.1	82.1
	rather yes	14	17.9	17.9	100.0
	Total	78	100.0	100.0	

Table 4. Attitudes of the consumers toward having the right to agree to disclose their personal data to public institutions (authorities)

Agree_public

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	yes	53	67.9	67.9	67.9
	rather yes	21	26.9	26.9	94.9
	rather no	3	3.8	3.8	98.7
	don't know	1	1.3	1.3	100.0
	Total	78	100.0	100.0	

The attitude of the respondents in terms of the agreement they should grant the companies and public institutions (authorities) confirm the higher confidence the consumers tend to have in the public entities: while there are respondents not demanding to be asked about disclosing their personal data to the public entities, all of them agreed (or rather agreed), that private entities should ask for an agreement in order to process the consumers' personal data.

The investigated consumers' attitude regarding what happens with their personal data after being captured by the companies represented a third objective of this research approach. More than a half of the respondents agreed, or rather agreed, that companies should not register their personal data when they buy products and/or services from them (see Table 5). Still, the fact that a part of the respondents appear less or not-at-all affected in this respect may suggest that a proper processing environment would make them more confident and open toward disclosing their personal data to the companies.

Table 5. Consumers' attitude toward their personal data registration by the companies

DataSave_Firms

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	yes	21	26.9	26.9	26.9
	rather yes	24	30.8	30.8	57.7
	rather no	19	24.4	24.4	82.1
	no	10	12.8	12.8	94.9
	don't know	4	5.1	5.1	100.0
	Total	78	100.0	100.0	

Processing of the consumers' personal data is perceived in a similar manner by the respondents: more than a half of them agree or tend to agree that companies should not process their data although a situation like this would be a rather less probable: the companies have captured the personal data of the consumers specifically to know better their demographics, psychographics and behavioral characteristics, to profile them and to use this information in planning more effective direct marketing campaigns targeting them. A possible interpretation of the respondents' attitude in this respect may consist in a certain expectation that their personal data will not be processed at all or, when processed, this will be done in a way that does not affect their private space or do not expose their private lives.

Table 6. Consumers' attitude toward their personal data processing by the companies

DataProce_Firms

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	yes	22	28.2	28.2	28.2
	rather yes	22	28.2	28.2	56.4
	rather no	19	24.4	24.4	80.8
	no	13	16.7	16.7	97.4
	don't know	2	2.6	2.6	100.0
	Total	78	100.0	100.0	

Employment of the consumers' personal data by the companies to promote their products and/or

services through direct marketing campaigns is perceived in a rather unfavorable and reserved manner by the respondents: almost three quarters of them agree or tend to agree that companies should not employ their to support marketing campaigns aiming to promote products and/or services. The percentages corresponding to the consumers not (or rather not) having a problem in disclosing their personal data to allow companies to conduct later direct marketing campaigns support the rather overall reserved attitude of the respondents regarding the processing of their personal data. It is important to observe that all these reserves are determined not necessarily only by the fears the consumers may have regarding the risks associated with an inappropriate processing and employment of their personal data: the unclear definition of the personal data and the relative consumer knowledge on how this data should and could be protected contribute to this overall reserved attitude.

Table 7. Consumers' attitude toward their personal data employment by the companies

		DataUse_Firms			
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	yes	44	56.4	56.4	56.4
	rather yes	13	16.7	16.7	73.1
	rather no	11	14.1	14.1	87.2
	no	9	11.5	11.5	98.7
	don't know	1	1.3	1.3	100.0
Total		78	100.0	100.0	

Buying products/services from the companies approaching consumers in a direct and interactive manner, based, of course, on the personal data captured and processed has represented another objective of the research approach. As the results presented in the Table 8 suggest, the most important conclusions that can be drawn state that:

- consumers are (or rather are) reserved to buy products and/or services after they have been approached directly by the supplying companies, specific weights of the consumers not having reserves in this respect varying between 14.1 and 20.5 %;
- consumers tend to consider buying of the products and/or services when the distance between them and the companies approaching them is higher and to remain so. Thus, respondents have appeared to be more open (or rather open) to buy after being approached on the Internet (57.7 %) and by mail (50.0 %), respectively less open (or not open) to buy when approached in a more personal manner, over the telephone (38.5 %) or the mobile phone (35.9 %).

Keeping the distance is one of the safest strategies the consumers seem to employ in protecting, not necessarily their personal data but their private space from the its invasions conducted by the different companies present in the market.

Table 8. Consumers' attitudes toward buying products/services after being directly approached by the companies (percentages, n=78)

I would have no reserves to buy... from the companies approaching me by...	Mail	Phone	Mobile phone	Internet
Yes	19.2	16.7	14.1	20.5

Limits of the research

The research approach has been conducted under the context created by the existence of the limits related to the set of the variables considered to define and measure the attitude of the consumers regarding the processing of their personal data (these variables should be extended for the further research to be conducted), and the sample and the sampling procedure used (further research should be conducted using a sample covering also the rural areas and having a representative structure in terms of demographics such as education and income).

Conclusions and main implications

Findings of the research show that the attitude of the consumers toward the processing their personal data is a rather reserved one. Consumers are not so willing to disclose personal data and are concerned for the risks they should face when this data is employed in an inappropriate manner. Although seem to agree the receiving of personalized marketing information, the consumers tend to avoid engaging in interactive relationships with the organizations approaching them and prefer to defend their private space keeping the distance.

The currently unclear definition of the personal data leads to an uncertain delimitation of the private space of the consumer, which may represent a source of abuses of both the companies and public institutions (authorities) over their consumers and citizens: that is why a better legal environment regulating the capturing, processing, administration and employment of the personal data is more than necessary in order to allow consumers to take a real and effective control over the collection, processing, administration and employment of their personal data.

Une question qui a dominé et domine encore la littérature de spécialité porte sur la manière dont le concept de management du marketing ressemble-t-il à celui de marketing. À partir du concept de marketing tel que l'on a défini sur plus de 50 ans d'existence, nombreux auteurs ont essayé d'en offrir des réponses pertinentes, développant des démarches dont le but représente l'identification des points communs et des différences significatives entre les deux concepts. À cet égard, la plupart des auteurs les plus renommés de la littérature marketing, et pas seulement, ont concentré leur attention sur les fondements de la notion de marketing pour déterminer dans quelle mesure on peut les intégrer et mettre en œuvre dans un contexte spécifique de management du marketing.

1. Une analyse des ressemblances et des différences entre marketing et management du marketing

Un premier élément analysé par une large catégorie d'auteurs porte sur l'éloquence et la rélevance de la théorie des 4P proposée par McCarthy, dans le développement du concept de management du marketing. Les opinions concernant cet aspect sont partagées: d'un côté il ya les partisans de la théorie des 4P, qui considèrent que *„la théorie est toujours la base des décisions, même dans le contexte du marketing management”*¹⁷²², et d'un autre côté se trouvent les critiques véhémentes qui proposent *„de repenser et de restructurer le système de fondements dans l'approche spécifique du management du marketing”*¹⁷²³.

Des arguments soutenant la rélevance des 4P dans le contexte spécifique du management du marketing sont fournis par de nombreux auteurs tels Foxall (1981) qui affirme que *„la responsabilité de base du management du marketing dans différentes situations où se manifeste la demande consiste dans l'utilisation des 4P.. dans une combinaison équilibrée”*¹⁷²⁴; selon Anderson et Taylor (1995), *„la théorie proposée par McCarthy est mal comprise parce que 1. les critiques ne comprennent pas pleinement les*

¹⁷²²Vignoli, C., Davies, B.J. – *The marketing mix redefined and mapped*, Management Decision, vol. 32, issue.8, pp.11-16, 1994.

¹⁷²³Bruner, G.C., - *The marketing mix: a retrospection and evaluation*, Journal of Marketing Education, vol.10, spring, pp. 29-33, 1988.

¹⁷²⁴Foxall, G., - *Strategic marketing management*, Wiley, New York, 1981.

4P dans le contexte pratique des managers et 2. la théorie de McCarthy est remarquable face aux problèmes de la pratique”¹⁷²⁵; Vignoli et Davies (1994); Kotler (1997).

D’autre part on trouve des travaux qui critiquent et remettent en cause l’utilisation de la théorie des 4P qui, au-delà de la nécessité de la redéfinition et d’achèvement exigée par le contexte spécifique du management du marketing, mentionnent les arguments suivants:

- la théorie des 4P relève un développement inadéquat pour le management du marketing, n’étant qu’une liste sans fondements théoriques¹⁷²⁶;

- la théorie des 4P n’est pas intégrée formellement dans le paradigme de l’échange, car il n’y a pas d’indications sur l’existence des composantes de ce processus¹⁷²⁷;

- la focalisation de la théorie des 4P sur les biens de consommation montrent une vision de l’orientation vers la production ou ventes qu’une orientation réelle des ventes à la commercialisation, le vendeur est actif, tandis que l’acheteur ou consommateur sont passifs”¹⁷²⁸;

- les 4P ne surprennent pas toutes les activités spécifiques pour le management du marketing¹⁷²⁹;

- la théorie proposée par McCarthy ignore les démarches spécifiques du marketing stratégique¹⁷³⁰;

- la théorie des 4P est centrée seulement sur l’étape de l’acquisition du processus de consommation¹⁷³¹;

- les composants de la théorie proposée par McCarthy sont incompatibles avec le paradigme du marketing relationnel¹⁷³²;

- la théorie des 4P est dépassée de point de vue conceptuel¹⁷³³.

Bagozzi est celui qui souligne que le management du marketing n’est pas synonyme avec le marketing, en soutenant, en 1986, que „le management du marketing représente le lien central entre le marketing placé au niveau sociétal et la consommation quotidienne du grand public”¹⁷³⁴. Cette différence est soulignée aussi par Houston (1992) qui soutenait „qu’il faut opérer une distinction nette entre les termes de marketing et management du marketing”.

Dans la même direction, en 1989, Foxall soutenait que le marketing est le point de départ pour la fondementation et l’opérationnalisation du management du marketing, considérant que „l’expérience théorique et pratique du concept de marketing ... offre le support de la distinction entre le marketing, qui surprend un set des fonctions de gestion ... et le management du marketing en tant que manière dont ces fonctions sont accomplies”.

Il faut mentionner, dans cette étape de l’analyse, les théories de Kotler (2000) et Boyd (1998) qui considèrent que „le management du marketing est, essentiellement, le management de la demande”¹⁷³⁵.

Dans la même lignée on pourrait mentionner les théories, beaucoup plus permissives en ce qui concerne la définition des deux concepts, proposées par Dixon și Wilkinson (1989), qui soutiennent que „le

2. Nouvelles théories dans la définition du concept et du processus de management du marketing

Compte tenu de la différence entre les deux concepts mentionnés dans la littérature par divers auteurs, les critiques remettent en question la théorie des 4P, apportant un nouveau concept - la **Théorie des 8D** et les piliers du processus de gestion du marketing (Day et Montgomery 1999, Mickael R. Hyman). Pratiquement, les auteurs cités ont essayé, à travers la *Théorie des 8D*, d'identifier les questions auxquelles répondra le management du marketing¹⁷³⁷ dans le cadre de la structure remplacera la théorie des 4P ainsi:

- **Design:** *Comment les organisations pourraient traduire les besoins et les préférences des consommateurs dans les produits (biens, services, idées) qui ils veulent, qu'ils achètent et les utilisent?*

- **Demande:** *Qu'est ce que rend le consommateur une partie d'un échange avec les organisations présentes sur un marché?*

- **Didactique:** *Comment les organisations peuvent informer les stakeholders – particulièrement des cibles visés - sur les produits et d'autres informations spécifiques pour les activités déroulées?*

- **Distribution:** *Comment les organisations peuvent distribuer des produits pour les consommateurs?*

- **Devoir:** *Quels sont les droits et obligations des parties prenantes impliquées dans une organisation?*

- **Direction:** *Quelle est l'histoire et l'évolution de l'organisation et les produits commercialisés?*

- **Quotidien:** *Quels sont les éléments de définition de l'organisation liés à la culture, la vision et la mission de l'organisation?*

- **Dialectique:** *Quelles stratégies de marketing peut et doit suivre l'organisation?*

Les premiers 5D de la théorie mentionnent explicitement des éléments de l'éthique et la responsabilité sociale dans le marketing, la notion de devoir étant, probablement, la plus complète, y compris les composants allant de l'environnement politique et naturel, de la consommation et le marketing vert.

D'autre part, les dernières 3D traitent explicitement 1. le marketing stratégique, qui est extrêmement important pour le management du marketing, 2. la recherche de marketing et 3. la pratique de marketing.

Par la reconnaissance formelle de l'importance de l'historique, la composante **direction** fournit les coordonnées pour la compréhension des actions de marketing et des résultats enregistrés dans le passé. Le **quotidien** reconnaît l'importance de comprendre et de déterminer, au niveau d'une organisation, de certaines cultures, de visions et missions courantes et le **dialectique** souligne la dimension stratégique par ses composantes: la planification stratégique, les avantages concurrentiels durables, l'analyse SWOT et l'audit de marketing.

Ce qu'il faut souligner, c'est que les partisans de cette théorie affirment que „*les 8D sont applicables aussi bien dans des domaines spécifiques qui visent les organisations à but lucratif et au niveau des organisations sans but lucratif*”¹⁷³⁸.

Mais les partisans de la théorie de McCarthy critiquent la tentative de remplacer les 4P aux 8D, remettant en question ses limites évidentes qui, d'ailleurs, sont mentionnées et argumentées par ses partisans - la **théorie des 8D ne tient pas compte de l'importance du micro-environnement de marketing**. À cet égard, Monye (1995) affirme que la théorie des 8D justifie la négligence du macro-environnement de marketing, étant circonscrite au management du marketing et non au marketing, le concept étant discuté dans le contexte des marchés internationaux: „*si le management du marketing*

¹⁷³⁶Dixon, D.F., Wilkinson, I.F., - *An alternative paradigm for marketing theory*, European Journal of Marketing, vol. 23, issue. 8, pp. 59-69, 1989.

dans un environnement international est une discipline distincte, il est possible que la théorie des 8D ne puisse pas bien saisir ses composants."¹⁷³⁹.

Malgré ses limites évidentes et de l'acceptation à petite échelle dans la littérature et la pratique de spécialité, les 8D ont le mérite de développer un certain nombre d'éléments considérés comme essentiels pour différencier les deux théories:

- elle est plus explicite, au moins sur la dimension stratégique, et synthétise les 40 ans de théorie et de pratique dans le management du marketing;
- le courant du management du marketing tel que décrit dans la littérature;
- est-ce compatible avec le partenariat entre le consommateur et l'organisation (orientation marketing cohérente et le paradigme du marketing relationnel), traduit avec succès les besoins et les préférences des consommateurs concernant des produits désirés et sollicités;
- elle surprend la totalité des activités du management du marketing; s'adresse à toutes les étapes de la consommation - l'achat, la consommation, de post-consommation;
- met l'accent sur la communication marketing intégrée au détriment de la publicité et à la promotion des ventes, comme des actions isolées.

3. La rélevance des concepts d'échange et marché dans le concept et processus de management du marketing

Un autre aspect spécifique du marketing, à faire l'analyse dans la démarche d'établissement les différences entre les deux concepts est celui de l'échange. En partant de la prémisse, lancée par divers auteurs, que „*les besoins de consommation facilitent l'échange*” est l'expression à définir le concept de marketing, Hunt (1983) soutient, quant à la notion d'échange, qui ne figure pas explicitement dans de nombreuses théories de la littérature, qu'on ne peut pas la considérer l'un des fondements de cette science.

Pour étayer sa théorie, l'auteur propose quatre composantes, considérée comme le fondement de base en marketing comme une science: 1. le comportement des consommateurs; 2. Le comportement des organisations; 3. le contexte institutionnel; 4. Les conséquences sur la société la société générées par les trois premiers éléments. En outre, sur la base de ce qu'on a mentionné, Hunt propose un guide de recherche pour identifier les questions de recherche auxquelles le marketing essaie d'apporter des réponses. Par exemple, dans le cas du comportement du consommateur, les questions indiquent, à l'opinion de l'auteur, „*la manière dont le consommateur agit, ses motivations, le moment et le lieu du déroulement de l'action.*”¹⁷⁴⁰.

Hunt insiste sur l'analyse du concept d'échange, de déterminer dans quelle mesure celui-ci peut constituer un fondement du concept de management du marketing. Considérant que l'échange n'est pas un concept de base en marketing et que le management du marketing est un sous-domaine du marketing, il conclut que „*l'échange n'est pas un fondement du management du marketing ... et d'ailleurs il ne peut pas lui fournir une série de questions similaires à celles liées au marketing*”¹⁷⁴¹.

Au cours des trois dernières décennies du XXe siècle, cependant, de nombreux auteurs ont critiqué la théorie de Hunt, affirmant que „*l'échange définit le domaine du marketing*”(Bagozzi 1975, Dobscha et Foxman 1998, Ferrell et Lucas 1987, Kotler 1972) et en ont apporté des arguments :

- dans la littérature de spécialité, le marketing n'est pas défini dans le paradigme de l'échange, mais cela ne veut pas dire que l'échange n'en est impliqué: présent dans toutes les définitions de marketing, l'échange est effectivement compris et intégrés dans le modèle stratégique des 4¹⁷⁴².

¹⁷³⁹Monye, S.O., - *Research note: international marketing management: a separate academic discipline?*, International Marketing Review, vol. 12, issue 3, pp. 5-14, 1995.

¹⁷⁴⁰Hunt, S., - *General theories and the fundamental explananda of marketing*, Journal of Marketing , vol. 47, pp.9-17, 1983.

¹⁷⁴¹Hunt, S., - *Modern marketing theory: critical issues in the philosophy of marketing science*, South-Western Publishing, Cincinnati, 1991

¹⁷⁴²Keith, R.J. - *The marketing revolution*, Journal of Marketing, vol. 24, january, pp. 35-38, 1960.

- une recherche menée par Ferrell et Lucas en 1987 sur les définitions du marketing à partir de 1970 relève que le terme d'échange est implicite, les 7 sur 27 des théories tenant compte de la notion de théorie de l'échange d'une manière implicite;

- en outre, un certain nombre d'auteurs font référence, comme argument, à la situation similaire constatée à propos du concept de *marché*. Ainsi, Hyman et Tansey (1992) ont constaté que bien que le concept de marché est un élément clé de la théorie du marketing, seulement 9 des 125 définitions du concept¹⁷⁴³ entre 1970 et 1990 en offrent une mention. De toute évidence, l'absence de la notion de marché n'est pas considérée comme une omission ou la marque d'un faible niveau de son importance, mais elle est implicite au-delà des composants qu'elle incombe.

En ce qui concerne la définition du management du marketing, la littérature est dominée par deux tendances: d'une part, dans la littérature européenne, on trouve des conceptualisations qui définissent le management du marketing comme un moyen d'assimiler et de mettre en œuvre le marketing au niveau des organisations sur les trois dimensions - la *culture organisationnelle* (mentalité), la *dimension stratégique* et la *dimension opérationnelle* et d'autre part de trouver des définitions spécifiques de la littérature américaine, qui réduit la notion à un ensemble d'activités tactiques, localisé au niveau fonctionnel de la structure organisationnelle.

La plupart des définitions de la notion de management du marketing ont en commun *l'orientation client, le développement des relations rentables avec eux, de fonder et rendre opérationnel le mix de marketing* en tant que support de la relation d'échange, *impliquer tous les domaines fonctionnels d'une organisation pour gérer les relations avec les clients* comme un moyen d'atteindre des objectifs à long terme de l'organisation -, mais les aspects les plus importants sont liés à mentionner les quatre secteurs d'activité de base - *l'analyse, la planification, la mise en œuvre et le contrôle des activités marketing*.

4. Conclusions

Après cette brève analyse, il est conclu que la théorie 4P et les concepts d'échange et de marché sont des éléments fondamentaux du concept de gestion du marketing, explicitement ou implicitement mentionnés. En outre, la façon d'aborder le processus de management du marketing révèle les théories conformément auxquelles les deux concepts (marketing et management du marketing) ne sont pas similaires, sans promouvoir l'idée du remplacement de la théorie des 4P .

Le **marketing** est une vision intégrative et une séquence cohérente d'activités, stratégiques et tactiques, orientées vers la maximisation de satisfaction et de l'efficacité des intervenants en fournissant une valeur supérieure par rapport à la concurrence, tandis que le **management du marketing** peut être considéré comme un „véhicule utilisé dans l'entreprise afin de permettre l'activation du concept de marketing", ou comme „la façon de mettre en œuvre le concept de marketing visant à accroître la satisfaction des consommateurs et de maximiser les profits."¹⁷⁴⁴.

Developing an information system integration strategy, at enterprise level is one of the most difficult issues that the information systems managers must solve, within the present conditions. When settling the integration strategy, two aspects must mainly be taken into account: assuring a complete integration solution of the information systems and building an integration infrastructure of the applications.

The present paper aims at presenting few aspects regarding the integration of the information systems at organizational level and describing a specifically developed IBM architecture.

information systems integration, software modelling, Model Driven Architecture (MDA), Model Driven Development (MDD)

M15

1. The necessity to integrate the present information systems

The success of the business depends, mostly, on the quality and quantity of the information that it relies on. The internet is a new form of environment, which modifies both the nature of the business and the market, transforming the relations between the two. Technically, all long-term business in the real world is nowadays actively present on Web. Many of them have entirely transferred their operations on Internet. The information systems have become more and more complex; therefore it is compulsory to integrate them within the already existing software applications and to adjust them to the new actual conditions. The IT solutions were rapidly created, the attention of the software producers focusing on the development of high quality instruments for the integration of the information systems. Therefore, presently, in most of the companies, the process of developing the software solutions is no longer a unique process, based on costs, but it became a part of the company global strategy, also requiring the integration of the existing applications.

A viable solution for integrating the information systems within an environment which is continually developing must be based on the informational architecture at enterprise level, or most of the time, department level. This is how the information system integration can be accomplished, not only at technical infrastructure level, but also at the level of business concept, which are more stable in time [1].

OMG Group (Object Management Group) has been pursuing, for 12 years, the integration of the new developed applications, within the already implemented ones. Taking into account the dynamic transformation of the IT technologies, the growing demand of soft application integration, the new information online systems and new e-business patterns, a new standard based on integration and interoperability is required. Presently there are several operation systems, different programming languages, multiple networks architectures, which are rapidly developing and in order to keep up with them, they must resort to the modeling process and the increase of the abstracting degree within the software development process.

Each system was based exclusively on accomplishing the functions it was designed for. Nowadays, when transferring data from one system to another, the users have to re-enter the data or to manually transfer the information.

2. Integration solutions

One of the used solutions was settling some connections between some specific systems, which prove to be connected. This connection though, cannot be easily achieved and maintained for a great number of systems, at enterprise level. The purpose of the integration is to make these systems work within one single logic system. The integration of the applications within different departments or enterprises can be achieved on three directions: vertical, horizontal, mixed.

The vertical integration consists in accomplishing adaptive services that would connect the present applications and existing data, with new applications, new platforms or services; for instance, connecting an existing insurance system, to Web services.

The horizontal integration consists in building adaptive services that would connect already existing applications and data among them. For instance, integrating an on-line acquire system, with an accounting system. The integration can be achieved by using application integration instruments at enterprise level. (Enterprise Application Integration – EAI)

The mixed integration consists in integrating both existing and new applications.

The integration consists in integrating the applications and also data, by using adequate security standards and methods.

The integration of data represents the integration at the level of database, either by migration of the data from one system to another, or by creating common data warehouses which would be used by several systems. The integration consists in extraction, transportation, transformation and validation of the data from the source systems and loading the data in the destination systems or data common warehouses.

The integration of applications represents a strategic approach in order to unify several systems, at the level of both services and data. The user's way of interacting with the systems and the integrated application is important in this case. These architectures also include Web parts, the Internet access being already well known, they contain connections with the data warehouses and relations with other enterprises.

3. Software modeling – integration technology focused on models

Presently, most of the software developers are facing the problem of integrating a great number of software applications, written in different programming languages. These applications are designed to run on different software platforms, operating systems, to use different databases, being adapted to different network protocols or middleware platforms. This is the reason why OMG Group has been trying to simplify the issue of applications integration, by developing the new MDA architecture – based on patterns - and which lays the foundation of UML language.

By modeling the information systems, the software developers can create the system models before engaging additional resources; they can design software applications starting from requests and can apply the iterative development, where the obtained models have a high abstracting level. Modeling complex software applications implies therefore a number of benefits, but it only represents a part of the software development and integration process. The models oriented approach of the software development process was possible due to adopting some standards such as UML language, models representation language. Considering that the applications development process has become more and more complex, the solution based on increasing its abstracting level was compulsory.

4. Model Driven Architecture (MDA) – the methodology of modern software applications integration and interoperability

The new MDA approach is focused on integrating the software applications belonging to the beneficiary companies; by using the UML, the soft developers can model interface and connections between applications, irrespective of the software/hardware platform, programming language or

network type. The new MDA approach is based on the UML language and works at a high abstracting level, in order to provide a universal valid software applications integration mode.

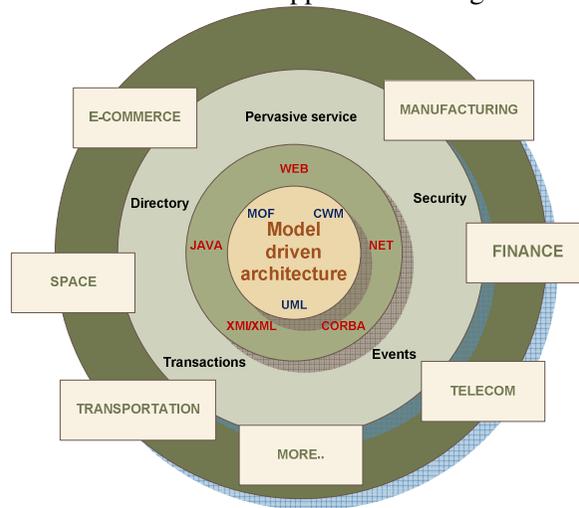

Figure 1. Model Driven Architecture [2]

This architecture can be graphically represented by a number of concentric circles (figure 1), in the middle of which lay the UML language and the MOF models (Meta-Object Facility). The purpose is creating a central, fully integrated model, based on which different applicants would be generated, in different programming languages, in order to run on different hardware or software platforms. It can be therefore obtained the integration of all software applications already existing in the beneficiary company and the clients and the fulfillment of the demands regarding the simplification of the developed IT system infrastructure. The MDA is not just another CASE instrument of generating a complete application, starting from the UML diagrams, but it consists in generating complete connections, for integrating software applications through UML diagrams. It is like a UML integration model, at high level, that could generate: connection bridges, protocols, relations, etc., necessary for the integration of a new application, with the already implemented, inherited ones.

The ideas laying the foundations of this new challenge are the following:

- Software solutions at a company level are considered a collection of incapsulated services communicating through their own interfaces;
- Reiteration of the approach way takes place at all levels, during the entire software project, starting with modeling the business environment, the business processes and ending with the implementation.

Therefore, the MDA architecture separates the functional demands of the system, from the implementation method, resulting thus an independent architecture of programming language, hard/soft platform or IT producers [3]. The MDA architecture can be applied during the entire process of development of the IT systems, using open standards. It allows the modeling of the IT systems, based on the functions starting from programming languages, hard/soft platforms, IT technologies, and this means that a system created through the MDA approach can be modified or extended at any time, without modifying the core infrastructure. The MDA approach facilitates the integration process, decreases the information systems development time and preserves the company's resources, enabling the accomplishing of a greater number of IT solutions without the increase of the necessary time or of the number of people involved.

The MDA architecture has three views (figure 2):

- *Computation Independent Viewpoint – CIV* – which separates the logical modeling of the IT system from the implementation specifications;

-*Platform Independent Viewpoint – PIV* – which focuses on the operation modeling of the system, without detailing the implementation specifications;

-*Platform Specific Viewpoint – PSV* – which contains the implementation specifications (hardware platform, software platform, middleware products, used IT technologies).

The true value of the MDA approach consists in the fact that the CIM view can become PIM and the latter one can become the PSV view, which can be directly translated into a source code. Its key-elements are the mapping between the three views and the software instruments allowing these mappings.

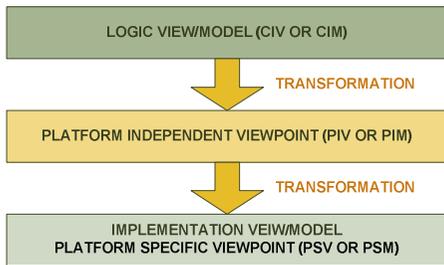

Fig.2. Views of the Model Driven Architecture (MDA) approach [4]

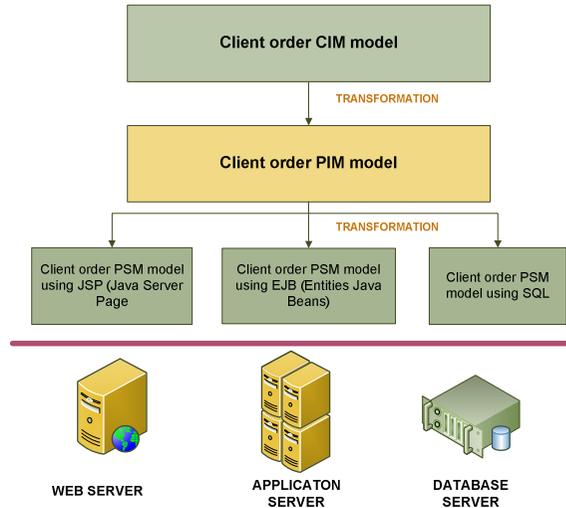

Fig.3. Transformation of CIM-PIM-PSV for the clients' orders

If integrating the clients' orders sent via Internet, within a company's information system, is being considered an issue, the CIM view shall consist in UML diagrams at a conceptual level that will show what the information system will specifically do; the PIM view is next and it describes its functions and structure through detailed UML diagrams and finally comes the PSV view, actually several such views (figure 3).

The company applications are focusing, more and more towards clients, products and services, dealing with the daily specific transactions. Considering that the business regulations are rapidly changing in a modern business environment, the information systems must be updated mostly by incorporating the new IT technologies. The MDA approach [5] is suitable for such applications, due to the benefits: portability, interoperability towards the platform, productivity, quality, fast process of developing the software applications, of integrating the modern IT technologies and the independence towards the imposed hard/soft platform, the decrease of costs and time connected to the software development process.

5. Soft instruments used with the MDA methodology

Once the new MDA standard was introduced, a new implementation instruments market was created. Considering that the MDA approach is based on the separation of the information system architecture in three different models (CIM, PIM and PSV), the chosen instruments must put up with the same separation, and not only the generating of source-code from UML diagrams [6].

The Model Driven Development (MDD) is a new method of designing the information systems and is applicable with the MDA methodology, which allows the building of an ensemble of models of the system to be analyzed and of the new system, based on which other models or the system's source-code

are being generated. Practically, everything focuses on transforming the models of the system to be achieved, and generating the source-code. This method needs an integrated development environment (IDE) that would support: UML language, patterns, transformation of UML models and source-code generation. Rational Software Architect (RSA) is such an integrated instrument for designing and developing information systems.

By going from analyzing to designing, for instance, the analyses model becomes a design model, the documentation connected to different models is created (e.g. the instrument Rational Software Architect's Report Generator or IBM Rational SoDA - IBM Rational Software Documentation Automation), the testing models are obtained (by applying JUnit), the building and development of scripts, the application of patterns.

The next image shows how an actual problem becomes the adequate IT solution, by applying the MDD method. (figure 4).

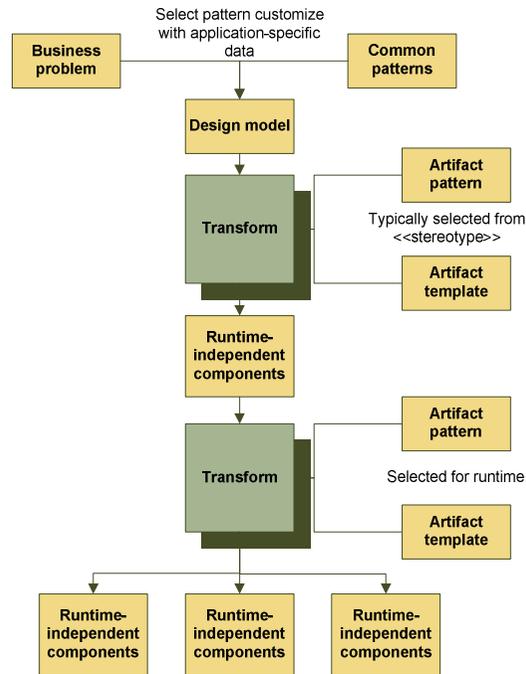

Figure 4 MDD method for transforming an actual problem, into an IT solution [7]

Starting from the clear separation between the logic models and the implementation ones, we can actually speak about a layered modeling technique, which allows the achieving of the analysis, design, and implementation model. The three models can be defined as follows: *the analysis model*—contains the utilization cases, *the design model* – includes the architecture of the system to be achieved, independently from implementation specifications, *the implementation model* – contains the implementation specifications.

Just as the architecture of a system is traditionally defined by 4+1 different perspectives (the centrally located utilization cases view, the logic view, the implementation view, the distribution and exploitation view), the *utilization cases view*, in MDD method, is also centrally located, alongside with the *implementation view*, which fits the structuring of the programs forming the system in components, *the logic view*, which describes the functional requirements of the system, *the distribution view*, which defines the space aspect of the system (hardware equipments, network nodes) and the *operational view* or the processes' one, which fits the structure of exploiting the programs and executable components. By viewing the utilization cases, the connections users-services and services-IT technologies are being accomplished.

Image 5 reveals the connection between the business processes sphere and the sphere of the IT technologies, achieved by services modeling. The beneficiaries look at the information system through the logic view and the utilization cases, while the IT specialists build and maintain the abstracting level between services and implementation IT technologies, through the implementation and distribution views [8].

The MDD method allows the logical modeling of the software applications integration, independently from the IT technologies used for their implementation [9].

Components specific to the patterns applying come in addition to the architecture of the RSA integrated environment (figure 6). We can notice the presence of a functional asset repository, obtained starting from models, applying patterns and eventually transformations, their saving into this repository, followed by their re-utilization, taking into account the demands [10].

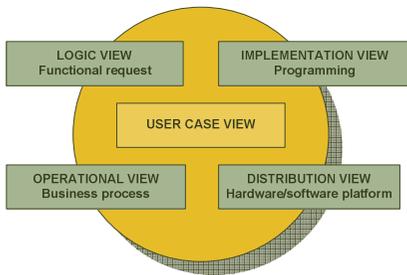

Figure 5 perspectives 4+1 of the IT system architecture in MDD method

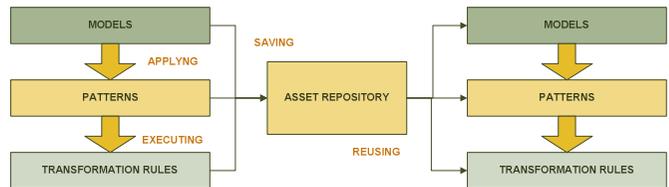

Figure 6 The components of RSA environment, specific to patterns appliance [11]

6. Conclusions:

The integration of the applications/IT systems represents a very up-to-date and complex issue, becoming a part of the global management strategy of an organization [12]. Within this context, the IT specialists are becoming more and more involved with the management process, they explore and offer solutions of software applications development and integration, the flux of the resulted data and processes providing a strategic advantage for the enterprises: the possibility to carry on a business in real time, in an environment based on events, with decreased response time, re-using the IT components under optimal conditions. This is why new specific IT techniques and technologies and new adequate Case instruments emerge. Some of these issues have been analyzed by authors and solutions have been suggested within a research project called Development and Implementation of the Integrated Management System (DI-IMS).

DATA WAREHOUSE AND DATA MINING - DATABASES NEXT STEP

Burtescu Emil

University of Pitesti, Faculty of Economics Sciences

Burtescu Claudia

University of Pitesti, Faculty of Economics Sciences

Data Warehouses and Data Mining are indispensable and inseparable parts for modern organization. Organizations will create data warehouses in order for them to be used by business executives to take important decisions. And as data volume is very large, and a simple filtration of data is not enough in taking decisions, Data Mining techniques will be called on. What must an organization do to implement a Data Warehouse and a Data Mining? Is this investment profitable (especially in the conditions of economic crisis)? In the followings we will try to answer these questions.

Keywords: database, data warehouse, data mining, decision, implementing, investment.

JEL code: M15

Data warehouse

The data warehouse concept has its origins in the early 60's when following the collaboration between a group of companies and a university in the United States were introduced new terms such as *dimensions* and *facts*.

The role of Data Warehouse was obviously marked by the year 2000 once with the advent of applications accessible to all consumers.

Data Warehouse represents in fact a response to the developers of IT society dynamics.

There are two premises that led to the emergence of data warehousing:

1. Economic premises.
2. Technological advances.

The premises are in close relationship with economic and market dynamics, namely:

- Globalization of trade.
- The dramatic sharpening of competition.
- Spectacular shortening of products' cycle of life due to technologic dynamics.
- Imposing of extremely high quality requirements.

The economic premises are:

- The increase of computing power;
- Low prices.

Given the above, we can draw the following conclusions:

- Informatics systems exist;
- data can be accessed from anywhere;
- the need for information is acute;
- great computing power;
- large and cheap storage capacity;
- available software tools.

So there we have all the premises for implementing a Data Warehouse. Data Warehouse is a collection of designed data for the fundamentals of management decision. Data Warehouse contains a great variety of data that present a coherent image of business conditions of a company at one point in time.

A Data Warehouse like system is used to monitor the activity of organizations by generating reports in standard formats for analyzing issues related to the work in the organization and based on this analysis taking coordination decisions is made.

In a Data Warehouse Data Mining operations are particularly made. One can say that Data Mining instruments use raw materials supplied by the Data Warehouse.

Basic features of a Data Warehouse are:

1. It is focused on daily operations and transactions. It focuses on the data used in the analysis on which decisions are taken.
2. The basic operation is to add data. The data is not deleted and not at all overwritten. A log of data is maintained.
3. The system is integrated. Data is collected from different places (operating systems, databases, files etc.), is transformed by bringing the data to the representation format from the Data Warehouse and centralized in the system.
4. The integration of data represents the most important issue in the construction of a Data Warehouse. The necessary costs for creating and maintaining a Data Warehouse are divided equally into the following categories:
 - Required hardware systems and data storage systems.
 - Software needed for extraction, processing, storing and analyzing data.
 - Professional services.

Building a Data Warehouse is a complex work and it is addressed particularly to experienced professionals.

A Data Warehouse is made out of the following levels with their own structure and functionality:

1. The level of data sources

The level of data sources refers to any information, usually electronic, that must be collected and stored in the Data Warehouse. It uses as data sources: mainframe databases (DB2, IBMS, VSAM, ISAM, Ababas etc); client-server databases (Oracle, Informix); small databases, from PC's (MS Access); spreadsheets and other types of files.

2. The level of data processing

This level deals with bringing the collected data to a standard form. The transformation consists in bringing them to the internal format of the Data Warehouse. Special applications are used such as ETL (Extract, Transform and Load).

Data transformation may require operations of "cleaning" data (accuracy, consistency, totals, subtotals etc).

3. Data Warehouse level

Data Warehouse level is actually dealing with data storage. For storage relational databases are used. Data is retained for determined periods of time.

4. Reporting level

The level of reporting is the one that does the analysis and generates reports for monitoring the organization's activity. The generating of reports can be done using specific tools: Business intelligence tools; Executive information systems; Enterprise Information Systems; OLAP; Data Mining and KDD (Knowledge Discovery in Databases), that uses statistic analysis techniques, "form" recognition to discover correlations, rules, knowledge etc.

5. Metadata level

Metadata includes administration information of the Data Warehouse (date of last update, number of connected users etc.)

6. Operations level

This level has as main purpose loading data in the Data Warehouse, but also manipulating and extraction of data. The second purpose is represented by the user management, security, capacity but other administration functions as well.

Three types for the implementation of a Data Warehouse are known: **analytical, for standardization of reports and for homogenization and consolidation of data.**

Analytical. This is very complex and requires a lot of attention from design to implementation. It is mainly addressed to the analysts who can interpret the data.

For standardization of reports. These are the most common types known on the market (80%) because they are easy to interpret. Because of the fact that they are based on developing standard reports, these have appeared long before Data Warehouse.

For homogenization and consolidation of data. These are the most complex and combine multiple sources of information in order to fit the data.

Typically Data Warehouses double their size the first 12 up to 18 months.

Data Mining

Another very powerful tool, along with the Data Warehouse, that is available to assist organizations as support to taking decisions is represented by Data Mining techniques.

Data Mining is a “deeper search” in the source data. The source data means both the data from the Data Warehouse but also other data categories. Data Mining, also known as “knowledge discovery in large databases” is a modern and powerful IT instrument that can be used to extract useful information but still unknown.

Data Mining in many cases involves data analysis in large data deposits - Data Warehouse.

Data Mining is the process of extraction knowledge from databases (Data Warehouse), knowledge that was previously unknown valid and in the same time operational.

By unknown knowledge we understand extraction of new knowledge that are unanticipated and sometimes even surprising. Extracted knowledge must be translated and applied in reality. Also they must be made operational and obtained in a short time.

Data Mining differs from other data processing for data analysis, such as data query, reports, OLAP etc. Information obtained through Data Mining techniques can be predictive or descriptive. Predictive information is used to describe an event, such as the possibility of fraud.

Using Data Warehouses and data extraction from warehouses using Data Mining techniques will give the organizations that use them a clear advantage over the competition.

Implementing Data Mining techniques, also as in the case of Data Warehouse, must be done by specialists in order for the results to be the ones expected.

The areas where Data Mining is used are multiple. They are used especially in the following directions:

- sales analysis and establishing customer behavior;
- research (medical research);
- fraud, electronic fraud and (cyber) terrorism ;
- risk analysis.

Data Mining tools use technologies of Artificial Intelligence (AI) to process and extract data.

Lately, Artificial Intelligence solutions are more and more present in the offers of the companies who offer data analysis software for business activities, thereby we have the Business Intelligence (BI) concept.

Using a Business Intelligence solution is suitable both for the management departments and for the other departments. Each department can use specific capabilities of a Business Intelligence solution.

The benefits are:

- Financial departments will use Business Intelligence to analyze data and generate reports, financial statistics and to take important financial decisions based on the information.
- Operations department can anticipate requests, estimate stocks and can make the production process more efficient.
- Marketing and sales department can analyze the response to promotions and marketing campaigns, can estimate sales and the analysis of market behaviour.
- Freeing IT departments from tasks.

Components of Business Intelligence solution are: Windows Server 200X, SQL Server 2000 Analysis Services, Microsoft SQL Server Accelerator for Business Intelligence, Project Server 2000, SharePoint Portal Server, Data Analyzer, Map Point and connection customers.

Implementing the system

To design and implement a Data Warehouse and Data Mining it is necessary to go through some stages. We will discuss about Data Warehouse, understanding the existence of Data Mining.

There is no strict methodology to design and implement a Data Warehouse. In the following we will define the important stages without concentrating ourselves on technical elements.

Stage 1. Implementation decision

The first question one has to answer when someone wants to implement a Data Warehouse is: "Do I really need this?". The answer can be multiple some of them being clear and others ambiguous. Ten years ago probably, especially in our country the answer would have been: "No". A great part of the decision would have been taken due to the ignorance of the used terms- Data Warehouse and Data Mining. Nowadays the answer must be emphatically "Yes". A decisive argument in the foundation of the response is given by the sharpening of the competition on the market. Companies are forced to explore a huge volume of data in a very short time in order to take a decision. A second argument is given by the companies that study the IT market.

Gartner Groups Inc. was making in 2009 the following predictions for the upcoming years:

- by 2012, due to the lack of information, processes and tools, more than 35% from the total of 5000 companies worldwide will have problems in taking optimal decisions for the company's activities.
- by the year 2012 the companies will allocate 40% of the budget for Business Intelligence.
- in the late 2010, 20% of the organizations will rule analytical software applications as a Business Intelligence component.
- by 2012, one third of the analytical applications will be delivered through Web applications (web application hybrid).

Stage 2. The analysis of the existing economic system

At this stage a strategic analysis referring to the company's assets and the ways of achieving these objectives, and also an analysis of the existing informational system must be done. From the existing economic system we will retrieve data which consequently we will use to help management factors in taking a quick and correct decision. If the collected data is not correct and the decision will be incorrect - *garbage in garbage out*. In many cases, from personal findings the managers expect certain errors to be corrected by the IT personnel.

Stage 3. Analysis of the existing IT system

At this stage 2 things must be established:

- if the existing IT infrastructure can be used (at least partially to reduce costs) to implement Data Warehouse and Data Mining;
- whether the organization has a well defined and formalized security policy (in conjunction with step 3).

Hardware components that will form a new architecture cost one third of the total cost so I have to see if I can lower this cost. Ideal would be to find as many solutions to reduce initial costs, by relocating the existing computer systems, following that these to be replaced by the ones initially indicated. We should not exaggerate, an equipment with minor problems will create big problems in such a system.

In a Data Warehouse the important data about the organization is stored in one place. This involves increased risks for the organization. Building a Data Warehouse must be done very carefully because having all the data of a company focused in one single point data security problems might appear.

The steps that follow are much more complex gaining technical meanings.

Stage 4. Data Warehouse architecture design

Taking as starting point the existing architecture we can define the future architecture. The new architecture must be designed in such way that it will have as little impact as possible on the existing system but a further development to be allowed [3]. We define physical and logical configurations, the data, the necessary applications and financial and architectural support are designed. Basically the main components must be designed: the data stores, ETL (Extract, Transform and Load) system and the front-end applications.

Stage 5. Selection of the technological solution

At this stage we will identify the implementation tools for data and applications, and the tools needed for technical and architectural support. Selecting these tools must take into account the structure and the complexity of the Data Warehouse. According to their function, these tools can be classified into the following categories: Transforming and extracting time, data cleaning, data loading and refreshing, data access, security providing, version control and configuration management, database management, data backup and recovery, disaster recovery, performance monitoring, data modeling, metadata management [3].

Stage 6. Development

At this stage the elements designed in the data stores are designed, ETL system (including data quality system and metadata) and the front-end applications.

We define the detail level of design for every operation that has as purpose data extraction.

Stage 7. Testing and implementation

At this stage, all designed and built elements are put together forming a system, and are tested and implemented thereafter.

Stage 8. Operation and maintenance

This is actually the last stage, with equal duration of the Data Warehouse life. It involves using Data Warehouse for the purposes for which it was designed and also for periodical application on Data Warehouse of some test and maintenance operations, evaluation and security assessment. All these stages are done one at a time, when one is finished the other starts- waterfall methodology.

Ways of implementation

To be able to define a strategic plan for initial implementation and further development it is necessary to know the financial resources, time and specialists of the company. In the case of financial resources an implementation at a lower level for the Data Warehouse and Data Mining must be done. Depending on the time available one can choose for the application development his own personnel or can choose the COTS products (Commercial On The Shelf). This option must be put together with the level of the company's specialists. If the training of the specialists is high, then the implementation can be done, but otherwise this operation must be outsourced, with the problems that can appear starting from this point. Creating and developing a Data Warehouse can be done starting from the following three stages:

1. Implementation from scratch.
2. Improving the existing system.
3. Converting an older system.

Implementation from scratch has the advantage that I do not need an audit of what we have in the organization but it implies higher costs. For operating safely it is advised to start from scratch. Instead upgrading the existing databases or hardware and software will reduce costs, but will also create "fear" in later use. If something goes wrong later, then I would probably ask myself: "Why haven't I changed the ... too?". With a limited budget I will probably be forced to use open-source applications.

With a budget that is over the calculated average we will have a new and reliable system, with increased computing power. It would be best to have all the amount of money in order to make all the assembly powerful.

An option to reduce costs would be outsourcing certain services. Outsourcing any service must be done by weighing three factors: money, performance and security. With less money I can get more performance but I need to share data with an outsourced organization.

Return on investment

For this we have to answer the question: "How do we measure success?". Displaying new results will be a gained point in understanding the necessity of building and exploiting the Data Warehouse and Data Mining.

Time factor will also be essential. Making a report in a very short time will put another brick in the building of the system.

But most important is the fact that all the system can be used in assisting decisions, this time disposing the results of a large data volume, so with a higher precision.

Finally, an analysis with the specialists in the company or outside the company will highlight the benefits of using Data Warehouse and Data Mining.

The most important thing is represented by the acknowledgement of resources owner over the necessity of this type of investment.

There are Data Warehouses consisting of databases containing between one and several tens of terabytes. Creating such a warehouse costs million dollars. What organization would invest so much money without obtaining profit?

Conclusions

For the medium and large organizations with a very good computer system, implementing a Data Warehouse and of course a Data Mining are absolutely necessary.

Even if it seems an easy task at first sight, implementing a Data Warehouse proves to be a challenge for the specialists. Lately, more and more commercial applications come with Data Warehouse facilities implemented. Very often, the organization implements a Data Warehouse and thinks the issue is solved. But things are not as easy as they seem. Probably many companies have specialists who can read a standard report given by a Data Mining tools on a Data Warehouse. But how many companies have analysts who can read and interpret an analytical report or a report for homogenizing and consolidating data? This is where things get complicated. The decision personnel must be assisted by persons who are capable to interpret the data, which consequently will be used in the decision process.

Finally, after the system will be used in assisting the first decisions, the benefits of using a Data Warehouse and Data Mining system will be seen.

IT SOLUTION FOR PROCUREMENT MANAGEMENT FROM RESEARCH CENTERS

Răduț Carmen

Universitatea "Constantin Brâncoveanu" Pitești, Facultatea Management Marketing în Afaceri Economice Rm. Vâlcea

Abstract: The paper proposes a study and analysis of the management of procurement of goods (products, services) by research centers and laboratories in a university. The stated goal is the computerization of work related to directions and research centers. The module is designed to be integrated into an existing platform. Modeling obtained highlights the main activities to be supported for this type of activity, possible problems that may arise and solutions proposed.

Keywords: modeling, acquisition, conceptual model, relational modeling, research center

Cod JEL: C61 - Optimization Techniques; Programming Models; Dynamic Analysis, C67 - Input-Output Models, C81 - Methodology for Collecting, Estimating, and Organizing Microeconomic Data.

1. Introduction

In the current direction "Knowledge Economy" is driven and academic research is creating opportunities that should not be ignored. But research can only take place in a suitable well, receiving support. Given the flow of requests for goods (physical products or services), it must follow the work in this direction and efficiency of purchasing. For example, aggregating more supply can reduce the purchase price (aggregation), in other cases, redundancy can be eliminated. The paper proposes a conceptual model how to take over the prosecution of such applications for purchase. The result is meant to be a module can be integrated into various platforms.

2. Analysis requirements.

Requirements resulting from the analysis following actors: the beneficiary, buying office, administrative service. Beneficiary (or research center research laboratory, CCLC) an application for purchase of property / assets (a good will mean both an object and a service – e.g. a subscription, a connection to a database) the University Registry. Beneficiary is a project coordinator and has justified the acquisition, the value estimate, technical specifications of the property / goods purchased CPV code, approval of university management (vice-rector Scientific), addressed the funding sources.

Purchasing office collects applications, preparing specifications according to technical specifications supplied by the customer, get management approval to auction the University, organizing and conducting the auction, decided the contract of acquisition. Part of the legal requirements, establish procurement office annual procurement plan (PAA). PAA is updated with approved purchases occurred during the year and of course included in PAA.

Administrative Service: receiving property or assets acquired and taught him the beneficiary, the property is taken from storage provider subordinated Supply Service. Then compile the property or assets purchased with service accounting and financial service to inform the final invoice. An action / activity CCLC is located in one of the states:

- *Recorded* - the application is taken to purchase office and found that the conditions for commencement of business acquisition.
- *Validated* - has signed the purchase agreement.
- *Purchased* - the asset (property) has been received (received in full) of administrative services.
- *Completed* - property (goods were taken by the applicant (research center, research laboratory, etc.).

The application is maintained by the office of acquiring acquisition activity recorded in the database and validates the contract of acquisition. Administrative service acquisition points with good acceptance (of goods in full). This alert occurs when the property registration (property) in management. The applicant indicates completion of the action when he takes the endowment asset management (property).

IT solution for managing this activity includes:

- Ensure staff web server that hosts the application.
- Annual maintenance of the database: The database contains information on outstanding data, be deleted from the closed end of a cycle (calendar year).
- Ensuring access to application.

The application is distributed, information is provided by the office of procurement and administrative service by filling out forms online (Internet / Intranet). Tables resulting from the modeling are:

- DirectieCercetare
- Proiect
- Entitate
- TipEntitate
- DirectieCercetare_Entitate
- Proiect_Entitate
- Proiect_DirectieCercetare
- Achizitie
- Furnizor
- Achizitie_Proiect
- Achizitie_Entitate
- Achizitie_DirectieCercetare

Tables have the following meanings:

- DirectieCercetare - For now DirectieCercetare entitatea shape as synonymous with research center. Project - research project is intended to make purchases.
- Entitate - defines entities such faculty, department, laboratory with hierarchical relations (eg, a chair is a faculty).
- TipEntitate - defines the types of entities: faculty, department and laboratory.
- DirectieCercetare_Entitate - directions for research, retains entities (faculties, departments, laboratories) to whom they are subordinate. An entity can contain multiple lines of research, a research direction can be contained by several entities.
- Proiect_Entitate - some projects are initiated by a particular entity. Table Proiect_Entitate Note that such projects were initiated by the entity. A project can be put in contact with several entities, one entity may initiate more projects.
- Proiect_DirectieCercetare - some projects are initiated in a research direction. Table Proiect_DirectieCercetare Note that such projects were initiated by the direction of research. A project may be placed in the line of inquiry, a research direction may initiate more projects.
- Achizitie - Note data acquisition (tender).
- Furnizor - maintain data about suppliers.
- Achizitie_Proiect, Achizitie_Entitate, Achizitie_DirectieCercetare - these tables as part of a store go towards the purchase of the 3 types of beneficiaries. Sum of quantities of the three tables above must be equal to the number of items ordered in the acquisition.

Information expected to be received by the scheme are: the list of beneficiaries, providers list, the recipient of an acquisition situation, queries / reports.
Diagram links between tables is presented in Figure 1.

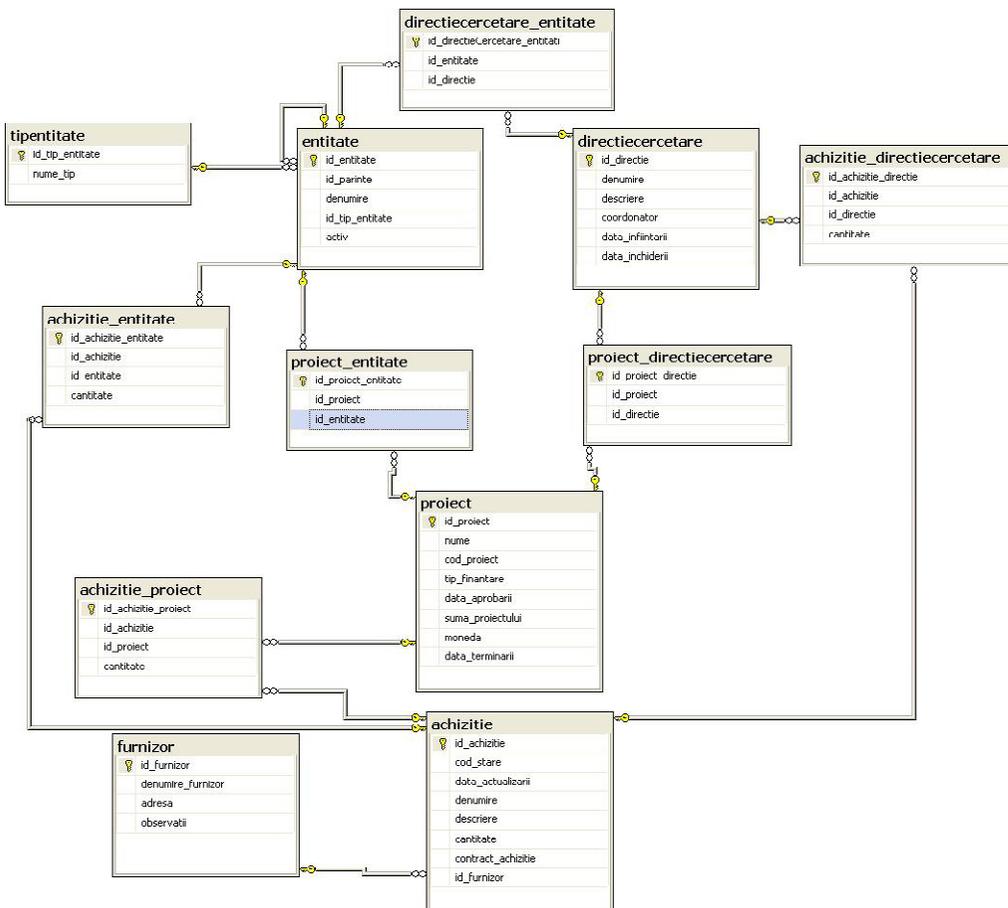

Figure 1. Diagram links between tables

3. Solution approached.

A problem arises in modeling the relational form of technical specifications, they can be extremely heterogeneous, with specific types of associated values. A solution to this problem is modeling the Entity-Attribute-Value, known as Object-Attribute-Value. This type of modeling can continue to use a traditional relational DBMS. Modeling involves storing a registration form has three columns: entity - a foreign key to a table containing the entity name for specifying the attribute and associated value attribute is a foreign key to one table with definitions of attributes - it contains at least the name and key attribute, possibly description, unit of measurement, permissible values, etc.. The third column is the current attribute value.

Other issues that need to be addressed are: data security, logging into the system allowing only certain users (authentication) and implementing a scheme to control access to web pages (authorization). Addressing these requirements is specifically covered platform on implementation. A complete solution is based on operating system facilities, the specific security settings that operate the network and the application-level security.

4. Conclusions.

Creating a system that would meet the proposed goal was to determine the requirements and determine the flow of actors and events. For persistent fever relational data modeling can be complemented in this case, the EAV model, the situation required some technical features related goods. Such modeling could also be useful if others modeled (projects, suppliers) are attached to features that are not found for all instances.

Also how the results should have an external security (data security, authentication, authorization). They are most often presented as the best practices, patterns and programming interfaces - API's - to be integrated into the host system.

The present article concerns present status of implementation in Romania and Europe of eCall service and the proposed business models regarding eCall function implementation in Romania. eCall system is used for reliable transmission in case of crash between In Vehicle System and Public Service Answering Point, via the voice channel of cellular and Public Switched Telephone Network (PSTN). eCall service could be initiated automatically or manual the driver. All data presented in this article are part of researches made by authors in the Sectorial Contract Implementation study regarding eCall system, having as partners ITS Romania and Electronic Solution, with the Romanian Ministry of Communication and Information Technology as beneficiary.

Road safety, information technology, communication, ecall, emergency call center.

M15

1 Introduction

1.1 Road fatalities

Since 2004, European Commission has developed an integrated plan named e-Safety, as primary pillar on Intelligent Car Solution i2010 initiative. Its objective is connected with vehicle safety, keeping in mind the excessive number of road accidents. This plan follows all phases regarding vehicle safety as *exposure, crash avoidance, injury reduction* and *post-crash* situations.

The issue of road safety, including all phases: information, support, intervention, crash and post-crash, is very severe, because of its repercussions in population health and death causes. First, we must see any effort of saving lives or limiting and preventing injuries from humanitarian reasons, where a life lost is not measured in financial terms for the family members. The second point of view, an accident has as result time of work incapacity, expenditures with treating injuries and so on. From World Health Organization published statistics we emphasize that road accidents are in 2004 estimated as 2,2 percent of death causes, being the ninth as percent and for 2030 to 3,6 percent of total deaths, rising on fifth place as cause of death, being estimated on 2,4 million fatalities around the world ([1]). In the same report is clearly revealed the connection between funds invested in prevention policies and number of accident, the cost of road traffic injury being estimated at 518 billion USD world-wide, for countries with poor economic settings, losses being bigger than fund invested in development of prevention measures. In Europe road traffic injury fatality rates (per 100 000 population) is 12,9 with 19,3 rate for middle-income countries (e.g. Romania), being lower for high-income states (7,9) and even for low-income countries (12,2).

For Romania, reported road traffic fatalities (2007) is 2712 (86 percent males, 14 percent females) and non-fatal road traffic injuries (2007) 29832, with total registered vehicles 4,6 million (2008). In 2008, from Romanian Police data are registered 10472 severe road accidents with 2999 fatalities, 9260

persons with severe injuries and other 3125 persons injured (non-severe), with 23,7 percent increase for number of severe road accidents compared with the year 2007. The same report also emphasize the increasing of road accident without injuries with 16,3 percent comparing with 2007 (full data [2]). As primary conclusion, for Romania, with 6150USD/habitant income (in 2007), estimated as being middle comparatively with other countries, with 81693 km (2008) of national roads the road safety became a serious issue.

1.2 Implementing IT technologies in safety measures

Starting from this situation where both humanitarian and economic reasons are important, on 2004 a number of discussions were held between the Commission for the European Communities (CEC), the automotive industry, the telecommunication industry and European Telecommunications Standards Institute (ETSI) regarding the development of various safety systems, covering all phases mentioned above on European level, called e-Safety [3]. This initiative has promote the concept of Intelligent Transport Systems (ITS) [4], where new and advanced information and communication technologies (ICTs) is incorporated on-board in order to help preventing or avoiding traffic accidents, limiting the accidents consequences, provide real-time information for drivers about local traffic, optimizing the cruise by avoiding road congestion roads, assistance in post-crash situations [5]. To a better understanding, we emphasize the phase of intervention and related technologies. First phase is *Information* with related technologies: *Dynamic traffic management, Extended environmental information, Real time traffic information* and *SpeedAlert*. Second phase, *Support*, with *Adaptive Head Lights, Blind spot monitoring, Extended environmental information, Lane departure warning, Local danger warning* and *Obstacle and collision avoidance*, followed by *Intervention* phase with *Electronic stability control, Lane keeping assistant* and *Longitudinal support and collision warning, Crush* with *Obstacle and collision warning* and *Post-crash* with *e-Call* technology. Most of these technologies are implemented by i2010 Intelligent Car initiative. As part of this initiative, eCall is defined as a specific item in the scope of the e-Safety initiative. eCall is seen as an extensio of current E112 capabilities, enabling the automatically transfer of eCall data between the Vehicle and the Public Safety Answering Points (PSAPs) in case of crush, supposing that the passengers are wounded or unaware to make the call to 112. This should rely on existing E 112 network architecture.

2. 112 and eCall Function Insertion Status

Part of e-Safety plan is to extend 112 Emergency Call Center capabilities with eCall function insertion, to enable the transferring of eCall data between the vehicle and the Public Safety Answering Points (PSAPs), relying on existing 112 network architecture.

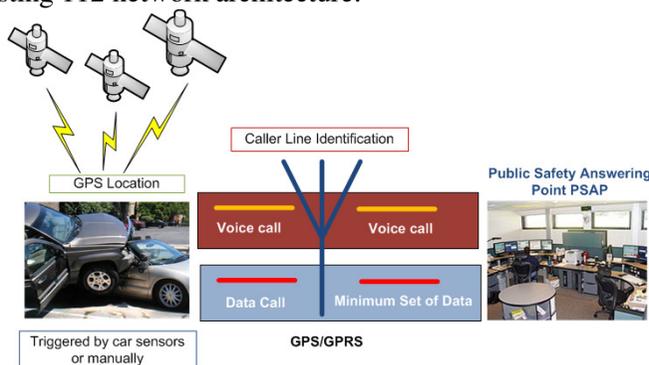

Figure 1 eCall system service chain

As it shown in Figure 1, eCall system use existing E112 networks to communicate between a vehicle and a public emergency service center, providing reliable full-duplex data communications between IVS and PSAP in addition to emergency voice call (E112) via the cellular network, and can be initiated either automatically or manually. If an accident occurs, the device will call the emergency services and

will communicate the exact location of the vehicle. Thus, emergency response time will be reducing, and the wounded will be treated more quickly and more lives will be saved. Advanced communication and information technologies have great potential to improve safety on roads.

The eCall objective is to reduce the number of roadway fatalities by minimizing the response time when an accident has occurred, being estimated by EC on 2500 person each year as fatalities because of non-intervention or long intervention time.

Location-enhanced emergency calls like in-vehicle e-Call have their primary benefit to society of saving lives and in offering an increased sense of security. eCall is a combination of an In Vehicle System (IVS), a device with a GSM cell phone and GPS location capability, and a corresponding infrastructure of PSAPs [6].

Under the Action Plan, automobile manufacturers and technology companies to be as up in late 2005 to agree on standards and technical specifications necessary to complete the tests, because in 2010 a part of new vehicles are equipped with this technology, as European Commission has announced, major implementation phase being expected to 2020. Main advantage of eCall implementation is that 112 intervention procedures are set in all European countries, with few exceptions.

In Romania, the 112 has one PSAP to each county, organized under Special Telecommunication Service, who is developing the modules needed to introduce the new service. What is missing is the Memorandum of Understanding between national MNOs and STS and as a result one of next possibilities of implementation:

- Mandatory for new cars, that having a result a critical mass of vehicle in 2020;
- Mandatory for cars insurance (CASCO or RCA), where the insurance company will install eCall IVS to prevent thefts to finance damages from unreal accidents, critical mass of vehicle being expected immediately (with limitation of car age caused by lack of sensors);
- Optional for car insurance, with discount insurance (20 percent in France), with the same idea of preventing thefts.

3. Business models for eCall function insertion

To establish the possible business model we have to define the cost and incomes for the eCall service. Basic, are two models for implementing eCall service. First, one is based on private PSAP, the Minimum Set of Data [7] being received by a PSAP [8], managed by insurance companies or car manufacturers. After receiving data about the crush, the PSAP operator decides if a live is putted in danger situation. In this case, the operator, accordingly with the Law No. 160/2008 regarding the implementation of the Single National Emergency Call System (SNECS), transfers the call to Special Telecommunications Service, who is the unique administrator. STS, announce, depending on the crush details and severity, the competent authorities such Ambulance, Police or Emergency Situation Inspectorate (Fire/Rescue). Accordingly with the procedure, those authorities must close the emergency case (after it is solved) and report to PSAP. The closing data are reported from STS to private PSAP, who initiate the procedure. The private PSAP could make capital out of selling diverse reports to third parties (insurance companies, transportation companies etc.). The information flow is presented in figure 2. The second is based entirely on existing SNECS managed by STS. In this case, SNECS receive MSD [9] resulted from car accident, announce the competent authorities, close the emergency case and could sell various reports to third parties. The question is what solution could provide an efficient business models. It is expected that all the cost involved by implementation, operation and maintaining.

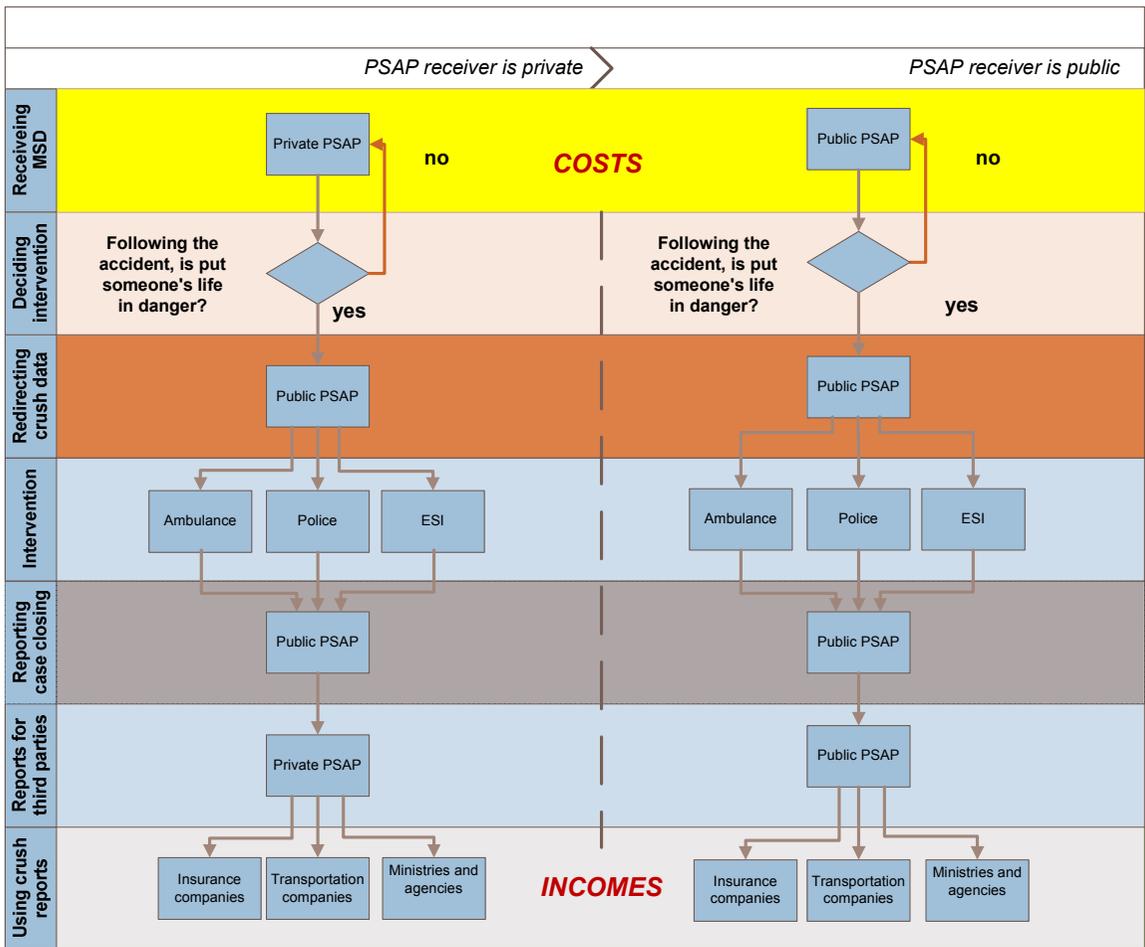

Figure 2 Comparatively information flow for eCall business models

If private PSAP is put on target, the cost of implementation are very high because, none of Romanian companies from assurance or transportation field, accordingly with our study, based on questionnaire in December 2009- February 2010 [10], is not interested in develop their own PSAP. So, if any private company intent to develop such PSAP it is need to:

- Connect to all PSTN, to receive a digital compressed data under the form of MSD,
- Extract from MSD the VIN code and connect to Romanian Automobile Registry database to establish vehicle manufacturer, type, color,
- Decide, after a voice call or other procedural step if is an emergency life situation. Must have its own call center,
- Collect closing data from STS and prepare reports for third parties.

In public PSAP case, all those operations are currently covered in classic 112 emergency life situations. What must be developed is:

- Prepare the system for MSD receiving, supposing additional software module developing to existent system,
- Complete hardware infrastructure with servers for switching and recording data and additional voice calls,
- Testing entire chain service and also the crossing border situations,
- Develop special procedure for eCall.

Now, Romania is part of FP7 initiative named eCall National Projects, European Commission providing 50% of implementation and testing costs. The project will start in January 2011, having a

three years durations and one million euro total budget for Romania. The project consortium bring together ITS - Romania, STS, RNADCR, UTI, Romanian-American University and El- Sol. The first conclusion is that because of lack of interest of assurance and transportation companies, first implementation will be with a single public PSAP managed by STS.

The second issue is the In Vehicle System, supposing that every car to be equipped with a device capable to transmit the MSD with GPS position and VIN code and support a voice call. In this case, based also on the same questionnaire, the assurance companies are not interested to support entirely or a part of implementation cost, evaluated between 50 and 150 euro/car. Therefore, the implementation situation could be as follow:

- For old vehicles by owner request, if the vehicle already has the sensors for triggering the call in crush situations,
- Mandatory for new car produced in Romania from 2013,
- Mandatory for new cars registered in Romania from 2020.

In the plan presented, we expect to reach 30% of registered vehicle until 2018, and 45% in 2020, based on actual and presumed vehicle replenishment rate in period 2010-2020 and predicted number of vehicles. The operation and maintenance for 112e service will be sustained financial by government budget with co-financing from selling reports for third parties. Car owner will pay IVS on vehicle purchasing time.

4. Conclusions and Future Works

In order to make the reporting of an accident more simple and to give the emergency call operator more information about the accident the European Commission launched a communication telling the EU Member States to implement the single European emergency call number 112, which has been follow by all EU Member States. In addition the European Communication launched a recommendation about the enhanced E112 number, with also provides the location when an emergency call initiated from a cellular phone. From the network operators and service provider's perspective they are developing different systems for all vehicles manufactures, which is making the system expensive and not able to work across the different EU Member States. Another conclusion is that if there should be a Pan-European eCall system, the vehicle manufactures or the network providers cannot develop these themselves. It is very important to include the public eCall MSD signaling system should be based on a in-band modem/signaling application eCall In-band Modem.

The present article presents the research made in Sectorial Contract Implementation study regarding eCall system, Romanian Ministry of Communication and Information Technology. The eCall system utilizes existing E112 networks to communicate between a vehicle and a public emergency service center. The authors are direct implicated though its partner ITS Romania, which have signed the European Commission MoU regarding eCall. Therefore, what we claim in this article is the general plan of implementation for Romanian of eCall technology, as the result of Sectorial Contract *Implementation study regarding eCall system*, being now on third phase, project-having deadline in September 2010. To conclude, we propose an architecture with a single PSAP managed by STS and calendar to impose IVS on new car. In 2020 we expect a 45% coverage of the service. Next, for future work, we will participate to eCall implementation, as a part of FP7 already constituted consortium.

SOME ASPECTS CONCERNING THE CORRELATION BETWEEN ICT AND INNOVATION IN EUROPE

Crișan Daniela Alexandra

Preda Ana-Maria

Coculescu Cristina

Altăr-Samuel Adam Nelu

Romanian-American University, Bucharest, Romania

In the context of the entire world's efforts to start recovering from one of the worst economic crisis, finding the main drivers of growth is increasingly important. The European Commission's new proposal – "Europe 2020" – states innovation as one of these main drivers, and promotes the development of a smart economy based on knowledge and innovation. But how innovation can be fostered? The present study focuses on the relationship between innovation and Information and Communications Technology (ICT), a supporting pillar of the "smart economy". This relationship has been studied at country level using two composite indicators: one for ICT – the "Networked Readiness Index" (NRI) published by World Economic Forum – and another for Innovation – the "Summary Innovation Index" (SII) from the European Innovation Scoreboard (EIS). The results represent a first step towards finding the best driving factors that can stimulate innovation.

Keywords: *Innovation, ICT, SII, NRI, correlation*

JEL classification: O11

1. Introduction

Innovation and ICT, as main drivers of competitiveness and sustainable growth, enable the reducing of the digital, economic, and social divides within each country, and among countries.

A recent analysis made by the European Commission (European Commission, 2010) shows that even before the global economic crisis, Europe was not progressing fast enough relative to the rest of the world, and the productivity gap has widened over the last decade. This was due to many factors, including the insufficient use of ICT, the lower level of investment in R&D and innovation, the "reluctance in some parts of our societies to embrace innovation" etc. Thus, the importance of *the dynamic relationship between "the use of ICT" and "innovation"* is becoming more and more politically recognized.

But how does ICT connect with innovation? This research study – which was partially supported by the National Council for Scientific Research in Higher Education (CNCSIS) under the Project NPRDI - II, Contract No. 91-071/2007: "Innovation and competitiveness – the fundamental drivers of economic and social progress of Romania" – investigates the following aspects:

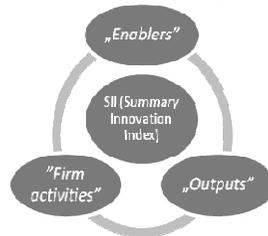

- the existence of a correlation between ICT and Innovation for 32 European countries in 2009; a cross-sectional regression analysis on the relationship between two composite indicators has been used: the Summary Innovation Index (SII) for Innovation, and the Networked Readiness Index (NRI) for ICT;
- the existence of a connection in time, related to different clusters of innovation, between SII and NRI; a dynamic regression analysis for the data of 27 European countries over six years (2004-2009) has been used;
- the relationship between NRI and SII for Romania during 2004-2009.

2. Composite Indicators - measures of ICT and Innovation performance

2.1. The Summary Innovation Index

SII (Summary Innovation Index) is a composite index that measures the overall innovation performance at national level. It was created at the request of the European Council in Lisbon in 2000 and since then has been assessed and published annually in the European Innovation Scoreboard (EIS). According to the methodology used since 2008, SII summarizes 7 innovation dimensions grouped into 3 main blocks: "Enablers", "Firm activities" and "Outputs". Each one of the innovation dimensions contains several indicators leading to a total of 29 indicators (EIS, 2009).

Fig. 1. The structure of the Summary Innovation Index (SII)

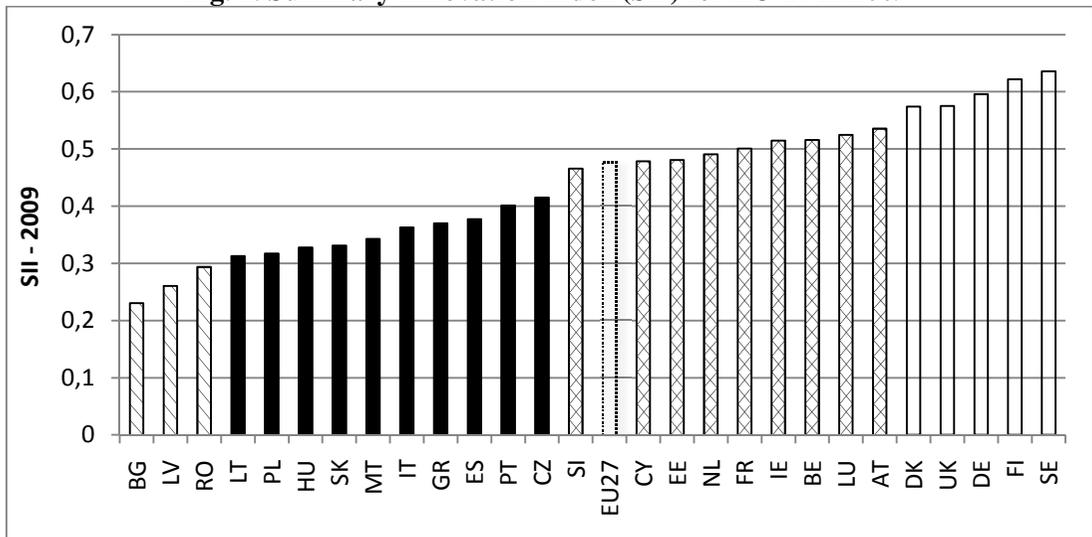

Based on a statistical cluster analysis of the SII scores over a five-year period, the EU Member States are divided into four groups:

- *Innovation leaders*, including countries with innovation performance well above that of the EU average;
- *Innovation followers*, including countries with innovation performance below those of the innovation leaders but close to or above that of the EU average;
- *Moderate innovators*, including countries with innovation performance below that of the EU average;
- *Catching up countries*, where the innovation performance is well below the EU average.

Figure 2 shows the four groups (clusters) according to EIS 2009 (with the most innovative country in the right side and the less innovative one to the left).

Fig. 2. Summary Innovation Index (SII) for EU-27 in 2009

Source: (EIS, 2010)

The *Innovation Leaders* are Sweden, Finland, Germany, the UK and Denmark. The group of the *Innovation followers* includes the following nine countries: Austria, Luxembourg, Belgium, Ireland, France, Netherland, Estonia, Cyprus and Slovenia. The *Moderate innovators* are: Czech Republic, Portugal, Spain, Greece, Italy, Malta, Slovakia, Hungary, Poland and Lithuania, whereas Romania, Latvia and Bulgaria are regarded as *Catching up countries*.

2.2. The Networked Readiness Index (NRI)

The Networked Readiness Index has been published annually, since 2001, in *The Global Information Technology Report* produced by World Economic Forum, in collaboration with INSEAD. The index is a composite of 3 components (fig.3):

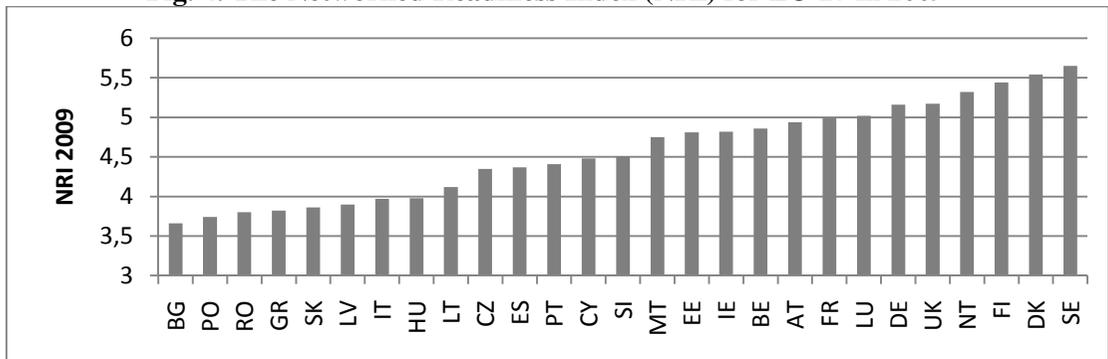

- the *environment* for ICT offered by a given country;
- the *readiness* of the economy's key stakeholders (individuals, businesses, and governments) to use ICT;
- the *usage* of ICT among these stakeholders.

Fig. 3. The structure of the Networked Readiness Index (NRI)

Each of the NRI components contains 3 sub-indexes ("pillars") composed of variables, the total number of variables included in NRI being of 68 (WEF, 2010).

Fig. 4. The Networked Readiness Index (NRI) for EU-27 in 2009

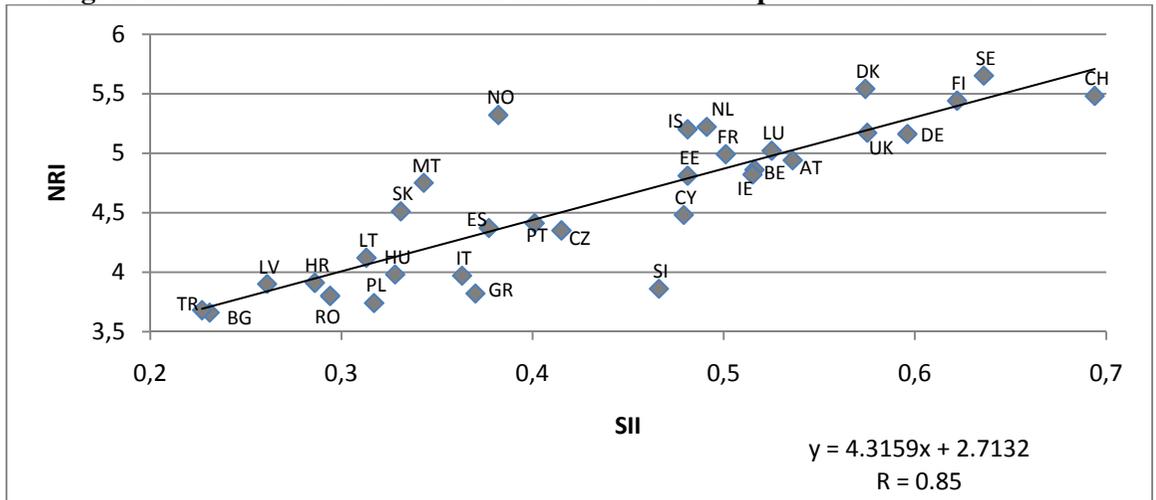

Source:(WEF, 2010)

3. Econometric tests

3.1. The correlation between NRI and SII for 32 European countries in 2009

To get an overview of the degree of correlation between ICT and Innovation at EU level, a cross-sectional analysis of NRI and SII in 2009 for 32 European countries has been achieved. The results of the statistical tests performed are listed in Annex, Table 1.

Fig. 4. The correlation between NRI and SII for 32 European countries in 2009

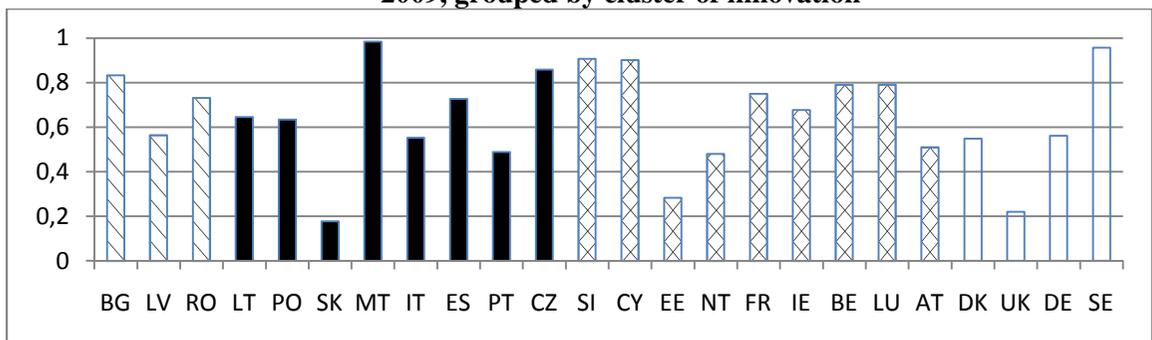

As shown in figure 4 there is a strong correlation between NRI and the innovation index (SII), the regression coefficient having a value of 0.85. In the right-upper corner, countries which are "leaders" in innovation also have the highest values for NRI. In the second group of countries, the "followers in innovation", the low performance in ICT opening of Slovenia and Cyprus must be noted. The "moderates" in innovation are spread in the lower left corner, registering a wide range of NRI values, from 4.75 for Malta to 3.74 for Poland. The "catching-up in innovation", Romania, Latvia and Bulgaria, have also wide spread NRI-SII values: Romania (3.8, 0.294), Latvia (3.9, 0.261) and Bulgaria (3.66, 0.231).

3.2. The correlation between NRI and SII for 24 countries from European Union, during 2004-2009

Using a linear (unifactorial) regression analysis, the relationship between NRI and SII for 24 EU countries over a period of six years (2004-2009) has been studied. The results obtained are presented in Annex, Table 2. Figure 5 shows the correlation degree for each of the 24 states, grouped by innovation cluster. The "leaders in innovation" (cluster 1) appear on the right, and those who are "catching up in innovation" (cluster 4) appear at the left.

Fig. 5. The correlation degree between NRI and SII for 24 UE countries during the period 2004-2009, grouped by cluster of innovation

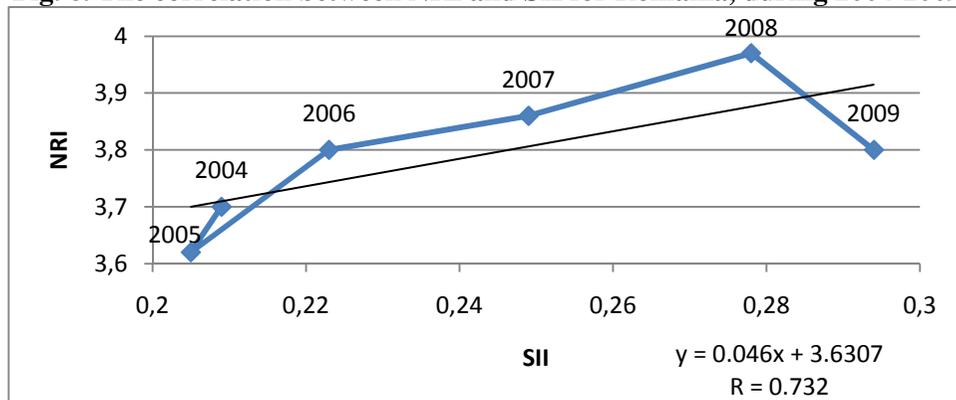

All clusters in innovation have similar properties, namely they are composed by countries where the correlation between NRI and SII is relevant, and countries for which this correlation is not significant. For "innovation leaders", Sweden is the only country for which there is a strong correlation between NRI and SII. In the "followers in innovation" cluster, there are strong correlations recorded for Cyprus and Slovenia, and significant correlations for Luxembourg, Belgium, Ireland and France. Similar results can be observed in the case of

"moderates in innovation". Among "catching-up in innovation", just for Romania and Bulgaria the connection between the two indicators is significant.

3.3. The correlation between NRI and SII for Romania during 2004-2009

For Romania, the correlation between the two composite indices over the period 2004-2009 is illustrated in figure 6.

Fig. 6. The correlation between NRI and SII for Romania, during 2004-2009

Statistical analysis of the correlation is shown in detail in Annex, Table 3. The 0.732 value of the correlation coefficient for Romania confirms that there is a relationship between ICT and innovation. To be noted the regress registered in Romania in 2005 over the previous year. In 2009, although the degree of innovation has increased significantly, from 0.278 in 2008 to 0.294, a regression in terms of opening for ICT can also be noted.

4. Conclusions

The study shows, through the econometric tests performed, that there are significant correlations between NRI and SII:

- at the European level - proved by the transverse analysis corresponding to year 2009 and the dynamic analysis for the period 2004-2009;
- at the national level – proved by the dynamic analysis for Romania in the period 2004-2009.

The results represent a first step towards finding the best driving factors that can stimulate innovation and increase its efficiency.

OPTIMIZATION OF DISTRIBUTED QUERY USED IN SYNCHRONIZING DATA BETWEEN TABLES WITH DIFFERENT STRUCTURE

Horia Demian

Str. Universitatii nr 1

Faculty of Economics

University of Oradea

Replication can be used to improve local database performance and to improve the availability of applications. An application can access a local database rather than a central database from another site, which minimize network traffic, locking escalation at the central database and achieve maximum performance for current insert, delete or update operations. The application can continue to function if the central database is down, or cannot be contacted due to a communication problem, power or hardware failure. This paper is focused on presenting a synchronization process between a central Microsoft SQL Server database and many remote sites databases. One possible problem in replication can appear when the two databases have different organization of tables and structures.

Keywords: replication, data synchronization, openquery, linked server, parameterized query, uniqueidentifier, SQL Server

In this paper we will focus on the problem of synchronizing data between a central database and many client databases, when the client and the server databases have different organization of tables and structures. All the client databases are identical, this means that have the same number of tables, the tables have the same structure, but the records are different. This model can be used to improve local database performance and availability of applications at the clients, because we access the local database rather than a central database. Other benefits are the minimization of network traffic between the client and the central location, the minimization of locking at the central database, the maximization of up time because we does not need a permanent communication channel between the clients and the central location and also the minimization of costs.

The architecture of the network

The network consists of one Central Server on which we have the central database and many client servers, each of them with its own database used in the local area for storage the local transactions, like in figure 1. Between the client servers and the central server communications channels had been made by using VPN (Virtual Private Network). This communication channels are most of the time down, and from time to time get connected.

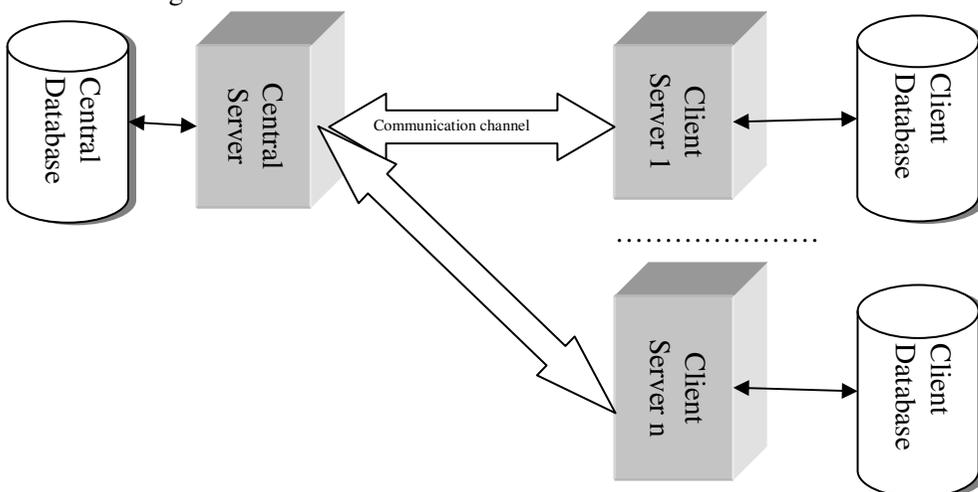

Figure 1. The architecture of the network

If we want to synchronize the information from client database with the server, we have to open first the communication channel and after that to synchronize the data. Microsoft SQL Server offers a mechanism of defining linked servers which can be used to run distributed query against multiple server. Our scenario consists of a one way data transfer from Central Database to the Client Database. We have to obtain new or modified data from the Central Database using inner join operations between TableA and TableB and to copy these data in TableC from Client Database. The fields used for filtering are of uniqueidentifier data type.

We want to obtain the best performance for our process of synchronizing the data.

One syntax for doing this operation is:

```

Select A.somefields, B.somefields
  From CentralServer.CentralDatabase.dbo.TableA A
  Inner Join CentralServer.CentralDatabase.dbo.TableB B
  On A.idProduct = B.idProduct
  And B.FilteringField = @SomeValue
Where not exists (Select * from TableC C
                  Where C.idProduct = A.idProduct )
    
```

In our studying case TableA contains 1915 records, TableB contains 7341 records and TableC contains 1664 records. We obtain 243 new records which have to be copied in TableC. In our test environment this query takes about 47 seconds. The explanation for this bad performance are given to us by the following sentence “Queries involving the following are never delegated to a provider and are always evaluated locally: bit, uniqueidentifier” (Microsoft), which means that the records are taken from the Central Database to the client, and all operations are done at the client. For a poor connection we lose precious time with data transportation.

	Rows	Executes	StmtText	PhysicalOp	LogicalOp	Argument
1	243	1	select P.codprodus from . . .C...	NULL	NULL	NULL
2	243	1	--Hash Match(Right Anti Semi Joi...	Hash Match	Right Anti Semi Join	HASH: ([p...
3	1664	1	--Index Scan(OBJECT: ([vanza...	Index Scan	Index Scan	OBJECT: (
4	1907	1	--Merge Join(Inner Join, ME...	Merge Join	Inner Join	MERGE: ([
5	1915	1	--Remote Query(SOURCE:...	Remote Query	Remote Query	SOURCE: ([
6	1907	1	--Filter(WHERE: ([` \...	Filter	Filter	WHERE: ([
7	7341	1	--Remote Query(SO...	Remote Query	Remote Query	SOURCE: ([

Figure 2. Execution plan

The execution plan demonstrates that two remote query are executed against the linked server for bringing locally data from TableA and also from TableB, and only after that the inner join operation are executed at the client site. From this execution plan we understand that 1915 +7341 records are moving from central database to the client site.

One thing we have to optimize is that of forcing to execute inner join operation at the Central Server site. This can be done if we define a view in the CentralDatabase or if we use OPENQUERY syntax to send queries which will be executed at the central database.

```

Select *
  from OPENQUERY(CentralServer,'Select A.somefields, B.somefields
  from CentralDatabase.dbo.TableA A
  inner join CentralDatabase.dbo.TableB B
  on A.idProduct = B.idProduct') As R
where R.FilteringField = @SomeValue
and not exists (Select * from TableC C
                Where C.idProduct = A.idProduct )
    
```

Because OPENQUERY does not accept variables for its arguments, we have to write filtering condition outside. The execution plan demonstrate us that only 7341 records are coming from the central database which resulted in better performance, which means 43 seconds.

	Rows	Executes	StmtText	PhysicalOp	Argument
1	243	1	Select * from OPENQUERY(, '...'	NULL	NULL
2	243	1	--Hash Match(Right Anti Semi Joi...	Hash Match	HASH: ([p2
3	1664	1	--Index Scan(OBJECT: ([vanza...	Index Scan	OBJECT: ([
4	1907	1	--Filter(WHERE: ([A].[idGest...	Filter	WHERE: ([A
5	7341	1	--Remote Scan(SOURCE: (...	Remote Scan	SOURCE: (D

Figure 3. Execution plan

The next big thing to optimize is that of execution of filtering condition at the central database to obtain only 1907 records instead of 7341. If we know exactly the value used for filtering we can write in the OPENQUERY the filtering condition.

```
Select *
from OPENQUERY(CentralServer,'Select A.somefields, B.somefields
from CentralDatabase.dbo.TableA A
inner join CentralDatabase.dbo.TableB B
on A.idProduct = B.idProduct
and A.FilteringField =VALUE
') As R
```

```
where
not exists (Select * from TableC C
Where C.idProduct = A.idProduct )
```

The time needed for executing this query was 7 seconds, and the execution plan can be analyze from the figure 4.

	Rows	Executes	StmtText	PhysicalOp	Argument
1	243	1	Select * from OPENQUERY(, '...'	NULL	NULL
2	243	1	--Hash Match(Right Anti Semi Joi...	Hash Match	HASH: ([I
3	1664	1	--Index Scan(OBJECT: ([vanza...	Index Scan	OBJECT:
4	1907	1	--Remote Scan(SOURCE: (DOUAR...	Remote Scan	SOURCE:

Figure 4. Execution plan

As we can see only 1907 records came from the central database, which is an explanation for our best results until now.

Because OPENQUERY does not accept variables for its argument, we can construct the sting dynamically and executes after that like in the following example:

```
DECLARE @SQLSTMT nCHAR(4000)
DECLARE @SOMEVALUE uniqueidentifier
--we can put here a code for initializing the value of our variables
SET @SOMEVALUE = '341FE6DA-D431-4D72-93F0-E20B2CDB1767'

SET @SQLSTMT =N' Select * '
+'from OPENQUERY ( CENTRALSERVER, "Select A.somefields, B.somefields '
+' from CentralDatabase.dbo.TableA A'
+' inner join CentralDatabase.dbo.TableB B '
```

```

+' on A.idProduct = B.idProduct '
+' and B.FilteringField = ""'+cast(@idSomeValue as char(36))+""'" As A '
+' where not exists ( select * from TableC C '
+' where C.idProduct = A.idProduct) '

```

```
EXECUTE SP_EXECUTESQL @SQLSTMT
```

The execution plan for this command can be viewed in the following figure, and we can see the same results as in the last example. The execution of the Join operation and the filtering occurs on the central server. We achieve the same results.

	Rows	Executes	StmtText	PhysicalOp	Argument
1	243	1	Select * from OPENQUERY(, 's...	NULL	NULL
2	243	1	--Hash Match(Right Anti Semi Joi...	Hash Match	HASH: ([p
3	1664	1	--Index Scan(OBJECT: ([vanza...	Index Scan	OBJECT: (
4	1907	1	--Remote Scan(SOURCE: (DOUAR...	Remote Scan	SOURCE: (

Figure 5. Execution plan for dynamic query

The speed is well for the preceding examples, but we can improve performance, if we can rewrite the query without making reference to a table from the client site.

To do this we have to know for every records from the central site for every records involved in the query, the date when the record was added or modified. This date has to be copied to the client site.

```

DECLARE @SQLSTMT          nCHAR(4000)
DECLARE @SOMEVALUE        uniqueidentifier
DECLARE @DATA              datetime

```

```
SET @SOMEVALUE = '391FE6DA-D431-4D72-93F0-E20B2CDB1767'
```

```
SELECT @DATA =MAX(DATA)
FROM TABLEC
```

```

SET @SQLSTMT =N' Select * '
+'from OPENQUERY ( CENTRALSERVER, "Select A.somefields, B.somefields '
+' from CentralDatabase.dbo.TableA A'
+' inner join CentralDatabase.dbo.TableB B '
+' on A.idProduct = B.idProduct '
+' and B.FilteringField = ""'+cast(@SomeValue as char(36))+""'"
+' and P.Dataoperarii >=""'+cast(@data as char(20))+""'"
+') As A '

```

```
EXECUTE SP_EXECUTESQL @SQLSTMT
```

We obtain 1 seconds for 243 records, the best results.

	Rows	Executes	StmtText	PhysicalOp	d
1	243	1	Select * from OPENQUERY(, '....	NULL	
2	243	1	--Remote Scan(SOURCE: (_ ...),...	Remote Scan	

Figure 6. Execution plan on the linked server

Another benefit of dynamically creation of sql commands consist of construction of a mechanism for calling function from linked server, like we can see in the following example:

```
DECLARE @SQLSTMT          nCHAR(4000)
DECLARE @idParameter      uniqueidentifier
--we can put here a code for initializing the value of our variables
SET @ idParameter = '6EDAE050-F5EA-4B1C-823B-28B8F599FDC9'

SET @SQLSTMT =N' Select * '
    +'from OPENQUERY(DOUAROTI,"select * '
    +' from DataBase.dbo.FunctionName( ""'+cast(@idParameter as char(36))+""") ' ) '
--we used only apostrophes

EXECUTE SP_EXECUTESQL @SQLSTMT
```

Conclusion:

1. Even if OPENQUERY does not accept variables for its argument we can build dynamically the command and executed against the linked server.
2. For better performance we have to limit the number of records which are transported from one server to other.
3. It's better to force the execution of JOIN operation at the sites where the tables are located, if we need better performance
4. Using OPENQUERY we can call function from the linked server, which can used variables.
5. The best results can be achieved if all operations will be executed on the central server.

A SUPPLIER SELECTION MODEL FOR SOFTWARE DEVELOPMENT OUTSOURCING

Zoltán Alpár Fekete

Babeş-Bolyai University, Faculty of Economics and Business Administration

Lucian-Viorel Hancu

SoftProEuro srl

This paper presents a multi-criteria decision making model used for supplier selection for software development outsourcing on e-marketplaces. This model can be used in auctions. The supplier selection process becomes complex and difficult on last twenty years since the Internet plays an important role in business management. Companies have to concentrate their efforts on their core activities and the others activities should be realized by outsourcing. They can achieve significant cost reduction by using e-marketplaces in their purchase process and by using decision support systems on supplier selection. In the literature were proposed many approaches for supplier evaluation and selection process. The performance of potential suppliers is evaluated using multi criteria decision making methods rather than considering a single factor cost.

Keywords: Supplier evaluation, Supplier selection, Multi-criteria decision making, E-marketplace, Software development outsourcing

JEL: P13, L81

1. Introduction

Today, outsourcing is considered a competitive strategy to improve the competitiveness of an organization. There are many barriers which can affect the success of a software development outsourcing. Some research suggests that most outsourced development projects do not succeed. The primary cause is the lack of customer preparation about the selection criteria and other important factors which have to take into account in the supplier selection process.

Identifying, gathering, and analyzing the appropriate information to aide in the selection of a qualified supplier is essential in properly preparing to outsource, and critical to outsourcing success. With appropriate supplier selection the company can achieve significant cost reduction and can increase its productivity. The potential benefits that come from outsourcing create a new demand and a successful market that have 10.000 suppliers in 175 countries. Many organizations have failed on her outsourcing action because of improper preparation and consideration. A study showed that 45% of the companies engaged into an outsourcing project would classify their project as a success.

In this paper we review some important aspects of supplier selection from the literature than we will propose a conceptual model for supplier selection on software development outsourcing which can be used on e-marketplace.

2. Literature review

Supplier evaluation and selection problem has been studied extensively. We can mention three important literature reviews – Weber at al. (1991), L. De Boer at al. (2001), W. Ho at al. (2010) – in which the authors present the main criteria's and methods utilized in supplier evaluation and selection. Weber (1991) based its review on Dickson 23 supplier evaluation criteria. Dickson (1966) concludes that the major supplier selection criteria proposed in the most researches are quality delivery, net price, geographical location, production facilities and capacity. W. Ho (2010) analyzed papers from 2000-2008 periods and found that nowadays in the literature numerous individual and integrated approaches were proposed to solve the supplier selection problem. They are capable to handle multiple quantitative and qualitative factors. They find that the most important individual approach is DEA and the most popular integrated approach is AHP-GP. H. Shyur and H. Shih (2006) present an effective model for supplier selection using ANP and modified TOPSIS techniques. They observe also that most popular

criterion used for evaluating the performance of suppliers is quality, followed by delivery, price or cost, and so on.

Degraeve et al. (2000) analyses the supplier selection models proposed in the literature from a total cost of ownership perspective. He concluded that all mathematical programming models perform better than the rating models because they approach the problem in a more objective way by optimizing an explicitly stated objective function.

Several studies have been conducted on the process of outsourcing dealing with different aspects of this matter. Smith et al. (1996) have presented a framework that addresses issues that arise in the context of the offshore outsourcing of software development. The proposed framework links projects and sites, including environmental aspects. Krause et al. (1998) have developed a process model for supplier development based on an exploratory study.

Regarding the supplier selection on outsourcing problem little research has been found in the literature. Almeida (2001) has studied the maintenance contract selection problem based on a multicriteria model, which uses contributions from multiattribute utility theory (MAUT). Dulmin and Mininno (2003) have presented a multicriteria decision aid method, to approach a suppliers selection model, which is applied in the context of the rail transportation. Valluri and Croson (2005) have studied the performance of a supplier selection model, which displays a reward and punishment profile under incomplete information. Their study is based on outsourcing of tangible products and is not adequate for service outsourcing.

3. Supplier selection criteria for software development outsourcing

The process of e-procurement using an e-marketplace can be illustrated with the following figure.

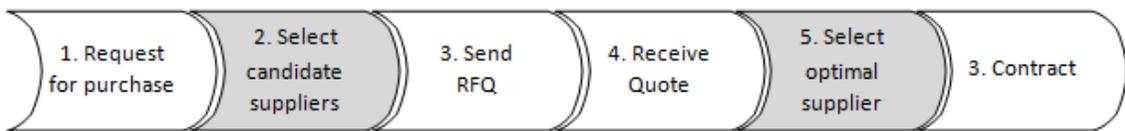

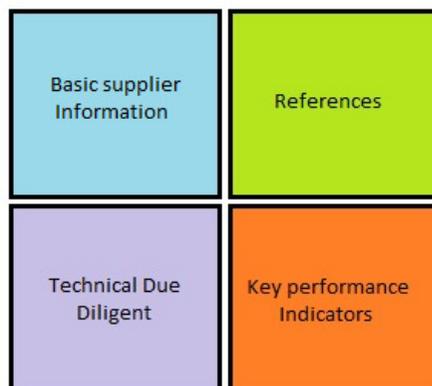

Figure 1. E-procurement process

The supplier selection process starts with potential supplier selection. In this first step the client company has to isolate a handful of potential suppliers from a field of thousands. There is necessary an assistant tool which help the client in what information to look for, how to get the information, how to assess the information to locate those suppliers that best suited for the task. The information need to be evaluated by the client can be group in 4 categories.

3.1. Basic vendor information

The basic supplier information group is necessary for having an elementary insight about de supplier background and capabilities. A list of basic information is presented in Table 1.

Figure 2: Vendor selection information grouping

Basic Supplier information	
Location	Country and city of suppliers
Year founded	Year when the supplier start its activities.
Number of Technical Resources	Number of development, testing and management resources that supplier employs.
Average rate	Average hourly/monthly rate of a developer, tester, and project manager.
Technical Capabilities	Technical skill set (development languages, databases)
Applications Previously Developed	Types of applications developed for their clients (document management, business intelligence, etc.)
Major Clients	Most important clients
List of Certifications	CMM, ISO, etc.

Table 1: Basic information about the supplier

3.2. References

The reference information is almost always positive; otherwise the supplier wouldn't provide the reference. This reference information represents the best objective information that the supplier can provide. By measuring the degree of praise offered by de reference can give some inspection to the general capabilities of the potential supplier. Basing the buying decision on only this information would be a mistake. What works for one organization may not work for another. This is why different business models, experiences, and available resources of each organization interested in outsourcing will play a major role in the execution of the outsourcing initiative.

3.3. Technical Due diligence

This group of information involves a detailed discussion with some of the supplier's technical resources. Topic of discussion should include: Development process, development tools, project management, and technical skills/certification. The technical resources provided by the vendor to answer a potential client's due diligent questions are the best resources that a supplier has to offer. The information gained during due diligent may be not shows clearly the actual technical expertise that you can expect on your project. Technical due diligent indicates generally the supplier capabilities.

3.4. Performance indicators

The performance indicators are the best information based on the client can select a well qualified software development outsourcing supplier. This information offer de specific and objective insight about the performance of potential supplier. The key performance indicators group contains the most important information on the supplier selection process. Until recently this type of information was impossible to be collected. But this thing was changed and there are new way to gather this type of information.

Key performance indicators	
On-Time Delivery	Indication of the supplier's ability to deliver the specified work on schedule. Calculated via client feedback.
On-Budget	Indication of the supplier's ability to deliver the specified work within budget. Calculated via client feedback.
Quality	An acceptable level of quality can differ from client to client. This KPI provides an indication of the supplier's ability to deliver on an agreed upon level of quality. This measurement is calculated via a combination of client feedback.
Productivity	An indication of the supplier's speed, responsiveness, and related effectiveness. Calculated via client feedback
Client Satisfaction	The level of satisfaction with the supplier. Calculated via client satisfaction surveys.
Ability to Manage Change	Most projects have some element of change that is required as the project progresses. This is an indication of the supplier's ability to plan, prepare, and respond to the inevitable change requests. Calculated via client feedback.

Table 2: Key performance indicators

4. Supplier selection model on the e-marketplace

The supplier selection model in software development outsourcing utilizes the six criteria described in Table 2: on-time delivery, on-budget, quality, productivity, client satisfaction, ability to manage changes. As a supplier evaluation method we will use the Multi Attribute Utility Theory (MAUT). “MAUT allows the decision-maker to quantify and aggregate multiple objectives even when these objectives are composed of conflicting attributes. The decision-makers preferences are modeled in order to obtain a multi attribute utility function, for instance $U(c_i, t_i, d_i)$. This function aggregates utility functions for all criteria or attributes. That is an analytical function is obtained which combines all criteria through a synthesis function. Each particular analytical form for this function has preferential independence conditions to be evaluated, in order to guarantee that the decision maker’s preferences are associated to the basic axioms of the theory” Teixeira, (2007). According to this MAUT the utility of a supplier can be calculated with the formula:

$$U(s) = \sum w_i f_i(x_i)$$

$U(s)$: supplier utility

x_i : criteria(attribute)

w_i : importance of attribute x_i , represented by a numeric value

f_i : utility function applied to attribute x_i

On the marketplace clients when registries sign a contract agreement and take the obligation that they will give feedback about every selected and contracted supplier. The feedback is to rate in a 1(very dissatisfied) to 4 (very satisfied) scale of the supplier’s performance. The evaluation of each supplier will be calculated as the average of the individual evaluations gave by the clients.

For the utility function we will use the linear function having the formula $u=ax+b$.

The weights are given by the client depending which is the most important selection criteria in its case. The weights are introduced by a specific form on the e-marketplace interface. The suppliers will be ranked according to their calculated utility from the bigger utility value to the smallest.

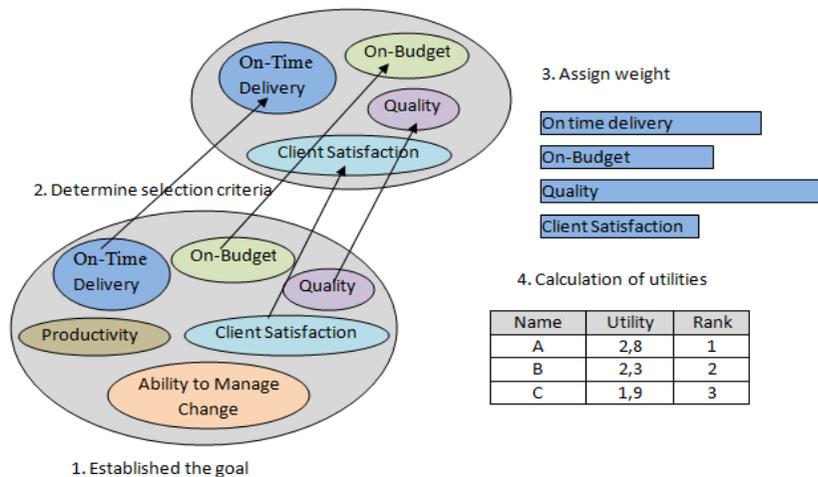

Figure 3: Supplier selection process model

4.1. Example of the utilization of the supplier evaluation model:

1. Establish the goal: A typography company wants to outsource the development of software for supporting different form types used in business as invoice, delivery note, bill, etc.

The company makes a search on the e-marketplace based on basic supplier information presented in Table 1. Based on the basic supplier information and references the company chose the potential suppliers.

2. Criteria selection: The client company considers that for his case on-time delivery, on-budget, quality, productivity and client satisfaction are the key factors.

3. Assign weight: On-Time Delivery – 20%, On-Budget -20%, Quality – 30%, Productivity – 15%, Client Satisfaction – 15%.

4. Calculation of utilities: Supplier A – $U(s)=2,81$. (Table 3)

5. Ranking the suppliers bases on the utility value

In this example the supplier selection model for software development outsourcing indicate supplier B having the biggest utility value (3.54, bigger than A’s utility – 2.8, D’s utility – 2.2 and C’s utility – 1.98).

Criteria/Clients evaluation	Client ₁	Client ₂	Client ₃	Client ₄	Eval/Criteria	Weight	
On-Time Delivery	2	3	4	3	3	20,00%	
On-Budget	4	3	4	4	3,75	20,00%	
Quality	2	1	3	2	2	30,00%	
Productivity	3	4	2	3	3	15,00%	
Client Satisfaction	2	3	3	3	2,75	15,00%	
Ability to Manage Change	1	2	3	4	2,5		
U(s): Supplier A	2,81						100,00%

Table 3: Calculation of Supplier A utility value

5. Conclusions and future work

In this article we have presented a model of supplier evaluation and selection for software development outsourcing in e-marketplace. We have detailed the information group that are necessary to take proper supplier selection decision. We presented also the supplier evaluation criteria specifically for software development outsourcing. We proposed a supplier evaluation method based MAUT theory. Finally we presented an example of using the proposed model.

As future work we propose to evaluate the possibility of using alternative methods and criteria for supplier selection. For example we can use the ELECTRE method for supplier evaluation in our model. We can include other supplier selection criteria like: performance history, warranties and claim policies. The evaluation and complaints received from clients in supplier evaluation enhance the collaborative nature of supplier selection model for e-marketplace presented.

The technologies supporting future business must be intuitive from a user standpoint, flexible from design standpoint and highly productive. As an answer to many requirements, analysts recommend the inclusion of SOA and ESB in the IT management strategies, since these tend to become mainstream, overcoming their abstract vision status in the last decade. In this paper, we provide a study regarding the attitude of companies from north-western Romania with respect to this transition and the SOA&ESB models. Our analysis targets attributes such as: level of understanding, knowledge and concern in adopting such technologies, the management involvement in the company IT strategy, the added value of the new technologies and risk factors for the migration towards an SOA&ESB architecture.

Keywords: integration, enterprise applications, web applications, SOA, ESB, framework

Cod JEL: M15

1. Introduction

The role of IT has been changing significantly in the last decade. Far from being just a background element or a system acknowledged for logistics support only, the IT environment has become an engine for the business, an element with direct impact upon improving business results and indicators such as customer satisfaction and revenues. The majority of systems have developed gradually, with multiple technologies and vendors, and in time they have become too complicated and inflexible, big resource consumers and difficult to change. [site1,2006]. In the 90's many firms from Romania acquired software solutions which worked very well individually but had an application scope of high specificity. Gradually these applications generated a discontinuity in processes (information islands), it became increasingly difficult to exchange data between them, information was redundant and burdened the company resources. This could only be compensated by „manual intervention” on data (even screen scraping), which led to data isolation and inconsistency. Thus, the need for integrating legacy systems in an system of high interoperability prevailed, an integration which acts on two levels: the infrastructure integration and the applications integration. It was supposed, and in time it actually proved to be real, that the IT integration determines both the corresponding business performances and the access to the methodologies recommended by the international good practice rules for maintenance. All ensure dependence and continuity, the safety and the effectiveness of data processing and stocking in efficient conditions. The strategic planning, a feature of performant management, is extended in this way to the level of the IT department. „System integration” refers to the functional integration, which includes two aspects: the infrastructure integration and the integration at the level of the application. The infrastructure integration determines a distributed IT system, with a certain number of interconnected locations collaborating in real time, ensuring a corresponding data flow in the system

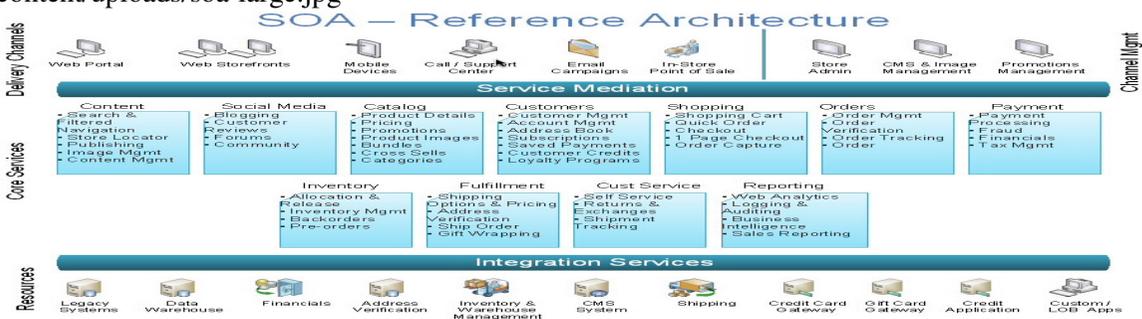

and having a security framework in place. Integration at the level of the application means that for all the data processing requirements of a firm, the number of independent applications should be minimized, both a company level and within departments and units of the organization [site1, 2006]. The integration at both levels is also known as Enterprise Application Integration. The first solution which worked relatively well with two applications was found under the name of Point-to-Point integration, well supported by Java technology. For a larger number of applications, the integration would become too complex. Moreover, there were problems in the case that one or several integrated applications were changed. Middleware-based integration is the solution that solved the integration of several applications considering that it introduces an architecture oriented towards the maintenance of the system, which allows to change certain applications more easily, without affecting the others, due to high modularity and base code refactoring [site1,2006]. SOA is based on middleware between the operation systems and the applications which ensure the integration. According to [Vasile,2005] „SOA is a model through which businesses are seen as a set of services which interact, an approach which uses open standards for making the operations of a company more efficient, more flexible and more collaborative”. In this paper we make a study with the purpose of monitoring the attitude of the companies from North-West Romania towards integration through SOA and ESB.

2. Related works on SOA&ESB

Why is there a need for SOA? According to [Rangu, 2006] the fundamental reason is to be able to answer the changing and unpredictable needs determined by the market demands, the clients and the increase in the number of distribution channels. The term SOA was introduced by Yefim Natis in a research paper from 1994: SOA is a software architecture which starts from an interface definition and builds a whole topology of the application as an interface topology, interface implementation and interface calls. [Petcu,2009] The SOA principles [Frasinaru,2010] are not technology-dependant, but rather define an abstract architectural vision:

Encapsulation	Abstractionization	Contract
Autonomy	No state	Loose coupling
Granularity	Re-use	Composition
Communication	(Self) description	Discovery
Standardization	Integration	Interoperability

SOA uses the service as a reusable component [Petcu,2009]: the services have a higher granularity than the components; the communication between services and with the clients is made on the basis of well-defined interfaces. The SOA general design in according to [http://www.getelastic.com/wp-content/uploads/soa-large.jpg

According to [Frasinaru,2010] and [ERL, 2009], SOA is an architectural solution for exhibiting and accessing the applications under the form of services (such as web services); it involves an infrastructure for communication and service management, the ESB (Enterprise Service Bus), a specialized language for composing the simple functionalities into complex ones, which will model the economic processes (such as BPEL). Other definitions state: - “service oriented architecture (SOA) is an approach to have software resources in an enterprise available and discoverable on network as well defined services. Each service would achieve a predefined business objective and perform discrete units of work. The services are independent and do not depend on the context or state of the other services.

They work within distributed systems architecture” [Anurag, 2008]; - “earlier SOA used COM or ORB based on CORBA specifications and recent SOA stress on web services using standard description (WSDL), discovery (UDDI) and messaging (SOAP). Service oriented architecture may or may not use web services but web services provide a simple way towards service oriented architecture albeit with the age old security and reliability limitations” [Anurag, 2008]; - “enterprise service bus (ESB) is an infrastructure to facilitate SOA. Technically ESB is a messaging backbone which does protocol conversion, message format transformation, routing, accept and deliver messages from various services and application which are linked to ESB” [Anurag, 2008]; - according to Gartner Group’s definition, the new application integration middleware is: „a new architecture that exploits Web services, messaging middleware, intelligent routing and transformation. ESBs act as a lightweight, ubiquitous integration backbone through which software services and application components flow“. [site,2006]

Some advantages of SOA we can sum up are, as follows [site,2006]: it covers the integration of applications, an essential requirement under the circumstances of very rapid development of instruments such as the CRM or BPM etc; it provides efficiency through flexibility, automation and the integration of the business processes; it ensures cost reduction through re-using what was developed before and not through re-inventing for each new product or distribution channel; it decreases the time-to-market and time-to-yes by standardization and re-use of previously developed services; it simplifies the IT infrastructure and complexity in the company, the possibility to apply well-fundamented architectural principles; it supports business innovation and the competitive advantage [Rangu,2006]; it is agile - the significant improvement of the answer times to the business changes - the systems are projected as parted and autonomous services which behave independently as the “black box” type; it supports the implementation of new business processes or modified ones at a high level of independence from the particular IT systems; - it helps the business owners to have an active and direct role in designing the IT systems or at least the business processes supported by the IT systems. The modern software products which implement the SOA architecture provide the necessary functionality to a business-agile firm by implementing an ESB line. The ESB approach is to transform the robust messaging infrastructure in a platform for the development of the applications which interact through service-type interfaces. The working and management method based on the tools contained in the SOA/ESB software products transforms the IT infrastructure so that it could be used both by IT administrators, programmers and by the business people. [Lupu,2006]

In terms of technology, a project based on SOA principles is preferable to be implemented either on a Microsoft platform or on an IBM platform, these being the most popular. The Microsoft SOA platform represents a technology portfolio which offers capabilities such as:

- service exhibition (from the business point of view it means to allow the participation/re-use of services and from the technical point of view to adapt the services and to develop the end points or facades);
- connectivity between services;
- a message exchange system between services, preserves the abstraction of service implementation and a loose coupling, but also a naming, organization and mediation system for services;
- the service composition. Assembling new solutions, with minimum code: composite application or service orchestration or process composition, business ones etc.;
- the service consumption (the interaction with the users through a minimum number of interfaces);
- the service administration, service management and governance [site2,2006].

The SOA in the IBM mainframes provides a lot of advantages. We can use the old mainframes systems for getting data and integrating them in the new applications which use newer technologies, such as Java, XML and web services. Also, besides the possibility of integrating with new applications using state of the art technologies, the use of SOA permits a cost reduction as well and avoiding the implementation of more complex systems. Through a mere application and a web service, the existing data can be taken without problems and their usage will lead to an extension of their utilization mode. Thus, the SOA integration on the IBM mainframes and the use of new technologies (Java, XML, web

services) bring about new benefits: the extension of the applicability of current data in the IBM mainframes by cost reduction, as well as avoiding the development of more complex applications which would involve an infrastructure that would be more difficult to use and maintain. [site2,2006]. Thus, SOA is implemented by using a variety of technologies [Petcu,2009]: Distributed objects CORBA, J2EE, COM/DCOM; Message-oriented middleware (MOM); WebSphere MQ, Tibco Rendezvous; MonitorsCICS, IMS, Encinia, Tuxedo; Platforms B2B as well as ebXML, RosettaNet; Web services

3. The SOA market in the northwestern Romania

The West development region, called shortly the West region, is one of the 8 development regions from Romania. From the point of view of neighborhood, the North-West region has a strategic geographical position, close to the European markets and it is characterized by a relatively good accessibility by air or land. The following were settled as priority supporting sectors at the region level, meant to ensure competitive advantage in the national and global competition: IT&C, higher education and research, tourism, agriculture, foods industry, consumption goods (furniture and clothes), the machine and equipment industry, banking activity. Among the factors that contributed to the introduction of the concept in the Romanian business environment we mention: - previous implementations of ERP, BPM, CRM, SCM; - the appearance of multinational companies (for example, Italian, German, Finnish even American companies); - the involvement of the software vendors who support the promotion of architecture through their products; - the statistics given to the public linked to the expansion of the SOA concept.

Concerning the ERP, this is often considered as backbone for many producers' activities, as well as a basis for performant management. The ERP systems based on SOA allow clients to model and manipulate the system in such a way as to adjust it more easily to their own needs. This thing helps them obtain maximum flexibility of their business, generate innovation and react promptly to different changes, without modifying the basic business processes. The SOA benefits include also a decrease in the demands of IT resources at the end user, for the integration and personalization of the systems, and the reduction of the maintenance requirements. Some of the statistics from the national literature which influenced, as we believe, the attempt to analyze and even to adopt the SOA &ESB concept are:

- the Forrester Research study published in August 2004 which shows that 25% of the interviewed companies gave up the EAI platforms opting for an ESB solution [site1,2006];
- according to Gartner Group, 75% of the companies' projects were supposed to be based on SOA in 2008;
- according to Gartner „SOA will be used in more than 50% of the new operational applications and the processes projected for business in 2007 and in more than 80% of such programs until 2010” [site3,2007];
- the IBM specialists predicted the use of SOA in more than 80% of the business applications and processes before 2010.

The first attempt to implement SOA in Romania was linked to the banking activity, more exactly in 2003 a collaboration between Iiruc Service and Raiffeisen Bank România. Other attempts followed. If we group on categories the potential SOA&ESB clients we can identify: banks and financial institutions; IT&C companies (Nokia); big corporations in the real estate field and in tourism, respectively industries which already run systems such as ERP, CRM, etc. The analysis we are undertaking refers to such aspects as: the understanding, knowledge and interest level in adopting these new technologies; the involvement of the management in the firm's IT strategy: the business value of the new technologies, the risk factors in the migration from a closed architecture to SOA&ESB, etc. We applied 500 questionnaires among the decision factors and the IT specialists from companies belonging to the north-west business region. We obtained 427 answers which could be processed. Through the questions from the questionnaire we tried to analyze the following aspects: the understanding, knowledge and interest level in adopting these new technologies; the involvement of the management in the IT strategy of the firm; the business value of the new technologies, the risk factors in the migration

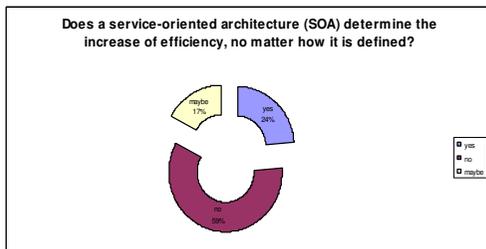

from a closed architecture to SOA&ESB. The questions were grouped in 3 big classes: A. questions referring to the respondent's profile and to the firm he/she is coming from: age, sex, college graduated, other studies, professional activity, research activity, company type, (SMBs, or corporations), the company profile (IT&C, higher education and research, tourism, agriculture, foods and consumption goods industry (furniture, clothes), machine and equipments industry, banking activity), number of employees, the county they are coming from; B. questions about competence in IT&C; C. questions which define understanding and the will to progress. It provided the following definition: SOA is the composition of services, an architectural approach which allows IT to be agile and to answer the changing needs of business. In the following paragraph we are going to detail some conclusions linked to class C, the will to know and the interest in promoting new technologies.

To the question: „Is there a business model respectively an IT model in the company you work for?“, 35% answered YES, 42% answered NO and the others said they were not interested. Out of those who answered YES a number of 67% were in leading positions and the others were ordinary employees.

To the question „Which ERP system is there in the firm you are currently working for?“ 56% were able to name the ERP, 23% do not know that the integrated application is called ERP and 21% were not interested by the fact that it was an integrated application, they knew that it was an application they can work in.

To the question „Does the modernization of the company's business environment depend on the IT&C modernization?“ 58 % answered YES while 25% said maybe and 17% said NO, the business environment in Romania being determined mostly by politics and current regulations.

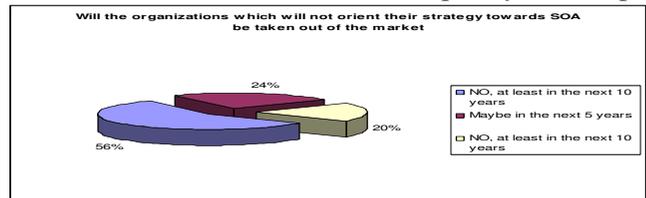

To the question: „Does a service-oriented architecture (SOA) determine the increase of efficiency, no matter how it is defined?“ 24% answered YES, 59% answered NO, and 17% think that the term efficiency must be modulated.

To the question "Will the organizations which will not orient their strategy towards SOA be taken out of the market?" 56% answered NO, at least in the next 10 years, 24% answered maybe in the next 5 years and the rest said NO because they consider this is a slogan with no real basis, based on a buzzword.

Our observations show that the frequency of companies

that have already implemented or try to implement the new models is low, less than 10% of the business environment in north-western Romania, but there are perspectives for a potential growth.

4. Conclusions

Regarding the questionnaire we applied there were certain difficulties in gathering data, as the concept of SOA is not really familiar to managers and is considered to be a technical issue rather than a strategic management approach. We realized that it is hard to define in universally accepted indicators the benefits of SOA. [ERL, 2005]. One of the problems the organizations under our scrutiny are facing is that the majority of IT departments would rather use legacy hardware and software than being the promoter of an IT approach strategically linked to improving business results. This can be noticed even though the IT managers admit the importance of aligning the IT efforts to the business objectives. On the other hand, the IT departments have the tendency to manage their resources and tasks like islands, each with their own agenda and priorities, consuming redundant efforts and wasted time. Another remark is that at the moment of the study there was a segmentation of the integrated software solution market and there are players with experience in this area, with a correct and acknowledged positioning, but at the same time we can still find a serious growth potential, due to the maturity and development process many companies from Romania are going through. SOA, composite applications, EAI and

related-products do not define a mature market in the north-west region of Romania. Above all we have to understand the benefits of using composite applications both on an operational and on a strategic level, and its implications on the general informational system of a company. SOA is not a product to buy and install. Besides adopting new technologies, it imposes changes in the people's behavior. All these involve costs which cannot be justified only based on technical specifications. In the absence of specific business requirements that SOA would respond to directly it is difficult to "sell" (and be convinced to buy) SOA. We conclude that the area submitted to the analysis from the point of view of IT&C technologies is characterized by three aspects: quite a big and very dynamic market, talented human resource with good technical skills and clearly belonging to the European priorities. As a final conclusion, the integration of management applications continues to represent a challenge for Romanian specialists and a necessity for companies, providing benefits from various points of view: management, system design, maintenance cost.

IT&C POLICIES AND STRATEGIES OF THE MODERN ROMANIAN SOCIETY

Mareş Valerica

Economic Studies Academy of Bucharest, Romania

Faculty of Accounting and Management Information Systems

Mareş Marius Daniel

Spiru Haret University, Bucharest, Romania

Faculty of Management, Finance and Accounting

Technology has become more and more global and access to advanced technologies is vital for gaining and maintaining a durable competitive advantage under the conditions of economic globalization. Globalization and opening of large research and development centres by the large companies in areas with a major human potential, in which the operating costs are low, imply an exchange of specialized information with global distribution, access to specific applications and big data traffic generators. In the same time they imply the existence of IT&C infrastructure, as well as the availability of human resources experienced in using the new technologies. Electronic communications have a significant impact over cultural activities as well as on recreative ones, by offering a high accessibility, changing the consumer behaviour as well as offering access to a large number of options.

Keywords: universal service, national strategy, interactivity of the on-line environment, durable competitive advantage, on-line public services dedicated

Jel classification: M15, O17

Introduction

The technological progress has an important role in keeping a good position on the market, as well as for an optimum choice of the production partners or providers as well as the permanent documentation, which implies direct contacts with competitors, providers, research centres, universities, participation to scientific events, subscription to specialized publications, specialized data banks, etc. As for the Romanian business environment – which suffers from the technological gap with the developed countries – technological development appears to be a stringent necessity, which can be satisfied through education (favoured by the ever increasing spread of the technology in the society and by the ever increasing relevance of the literature in the field) and through foreign investments, which allow a continuous impulse for the Romanian partner to develop personnel training, to stimulate the creative activity and to facilitate the innovations process).

Strategies for developing technologies

Technologies can be considered a key factor of the gaps that separate different countries from the socio-economic level point of view. The technological factor plays an essential role in explaining the domination that a country experts on the others. If a country is the first to have industries capable of ensuring it a dominant position, it automatically benefits from an asset that the other don't have, and the others can only copy, in their development, the nation with a dominant position and to adapt to it.

As an answer to the challenges of globalization, a set of development strategies have appeared lately, as:

-the strategy of internationalization – whose managerial alternatives can envisage

-export – as a way to minimize the risk related to investments and testing the acceptability of a product;

-licence – an understanding through which a company gives the right to produce/sell a product of its own to another company;

-acquisition – *strategy through which is followed keeping the control in a country or obtaining a synergy by adding complementary competences;*

-joint venture – *way to avoid socio-political risks and to obtain access to a new market;*

-key operations – *suppose achieving a contract that implies creating an operation facility in a country which could be paid for;*

-production partnerships – *strategy through which is tried to obtain an advantage by combining some components/subcomponents created in different countries;*

-greenfield development – *alternative to an acquisition, with the advantage that starting a contract allows choosing the best alternative in the given moment.*

-re-centring strategy – adopted by many of the large companies in the process of adapting to the international economic conjecture, to increased competition, as well as to the profound technological transformations, this strategy consists in the orientation to outsourcing peripheral activities, and concentrating over one or a couple of activities for which companies consider they have the most performing potential.

-techno polls technology – complex strategy, through which is attempted to efficiently answer the ample and heterogeneous mutations which occur at world system, macro system and micro system levels, through a techno- industrial concentration which ensure achieving a close contact between research and industry, university and companies, by reuniting small areas, relatively little developed, by strong research networks, units for preparing the high level specialists and a nucleus of innovative industry, to which is associated an adequate socio-cultural climate, ready to ensure a rapid economic development based on a sustained technical-scientific progress.

The strategies of transnational societies cover a variety of forms, depending on the degree of integration desired under the new concurrential conditions. The informational society is integrating objectives for a durable development, based on social justice and equality of chances, ecological protection, freedom, cultural diversity and innovative development, restructuring the industry and the business environment.

The role of IT&C in the modern society

The contribution of IT&C to economic growth depends on the development of the information technology and communications sector, as well as on the degree of its use in the economy. The progress of Romania in the field of informational society, its future opportunities are far from being satisfied.

A relevant indicator of the situation of the informational society in Romania is the level of expenses in the IT field in the year 2009, which has been of approximately 2% of GDP. The analysis of performances in the field of informational society shows that Romania registered progresses in the field of informatization of education and public administration, but has not been able to cover enough of the enterprise sector in developing its IT&C. When it comes to PCs and the degree of penetration of them one can see an ascendant evolution due to competition on the market and introducing on a large scale the systems of consumer loans, which include loans for buying IT&C goods, offered to private persons, as well as the governmental program for subsidizing computer acquisition.

The successful implementation of communication technologies has tangible effects in increasing the degree of innovation by offering the opportunity to virtually aggregate the best resources and ideas from around the world. The free circulation of information and the increased interactivity lead to increasing the number of new solutions and products.

In the same times, new doors to knowledge in universities and the possibility of development and intensification of the university research programs by uniting efforts between researchers from different centres from Romania and intensifying cooperation in international projects (e-working), facilitating and accelerating the access to new information. In the same time, while communication performance increases, it triggers an increase in the interactivity of the on-line environment by attracting new users, giving the possibility of a rapid dissemination of the content, communications being a vector for

promoting cultural values and diversity inside Romania. Thus, informatics databases can be developed (**e-tourism, e-culture**) which can help develop the cultural digital content, including touristy information by introducing the necessary information for promoting national landmarks, by contributing to promoting the Romanian values as well as increasing the number of tourists.

The public administration is a provider of public information, services as tax collecting, education and health, all of which are of a major importance for the citizens. The development by the public administration of those electronic services that are covering the citizen's needs, for making the service less time consuming, when he pays the local and administrative taxes, sends requests and receives answers in electronic format and displaying the useful information for obtaining emits and authorizations (**e-governing** and **e-administration**) as well as improving the efficiency of the public health services by creating national databases regarding the health of the patients in hospitals and at the level of family doctors(**e-health**) and for developing telemedicine services that lead to improving the condition of people with heart disease, diabetic and other diseases, as well as of the handicapped people.

For private companies, broadband represents a facilitator of the **e-business application and practices**, by creating new business opportunities and helping companies to obtain increases in productivity based on an improvement of the access to information and transactions. For companies, as well as for employees, broadband communications have the role to diminish the importance of location by allowing establishing new headquarters in small towns, in rural or isolated areas, as well as facilitating tele-working. Romanian companies have developed the electronic commerce which can bring important advantages in the sense of significantly reducing transaction costs and intensifying the speed of interaction with business partners. Broadband communications allowed a revolutionary change of business processes, contributing to an increase of competitiveness of the Romanian companies in the Central and Eastern Europe region, as well as at global level, by facilitating the internationalization of the local companies, decentralizing functions of enterprises, such as production and marketing, etc.

For small rural or isolated communities, developing communications can favour the economic and social integration by facilitating access to new, superior goods and services, as well as opportunities of participation to the digital economy or to the informational society. For the average consumer, services, such as **e-education**, tele-working etc, have benefices effects that are concretized in an increased access to interactive content, various equipment interconnection, with or without a communication basis or personalizing consume.

Thought the pilot project edonatii.mcti.ro (**e-donations**) functional all over the country, it is permitted to private or juridical persons to donate IT equipment to people who don't have computer access. It is offered free technical support and portal hosting, ensuring the security and the integrity of the public information.

Each offering or requesting person should open an account on the site www.e-donatii.ro. The request for creating an account contains data regarding the user such as username, password, name and surname, e-mail address.

In case the solicitor belongs to the defavorized communities or ONGs with charitable or ecologic profile, there are also required the age, address, education level and the income level on family member. The solicitor will publish on site the equipment request which consists in the parameters of the wanted computer and the motivation of the request. A similar procedure has to be followed by the offering person.

The site automatically produces an encounter between a request and an offer, generating the automatic expedition towards the 2 parties of a report that contains their contact data.

By studying the flow of processes in time I noticed that there are requests and offers and that the displayed identification data seem to be elements of a test. We consider the utility of popularizing the existence of these forms of help but in the same time of reuse of the functional equipments belonging to

citizens and economic agents, and the efforts made in this sense should be accomplished by the local public administration authorities.

Communitarian cohesion policies

Modernizing the society and developing European economic competitiveness generated by the process of aging of the European population, is going to be based on using electronic services and equipment which will help creating an informational society. Through these directions is aimed at stimulating an increase in the degree of economic competitiveness in the EU.

In the context created by the general objective, that is promoting economic and social progress in a balanced and achievable way is done through enforcing the economic and social cohesion. Without neglecting the decisive and dominant role of the pre-adhesion funds, the implications of the absorption of the funds allocated to communitarian programs are strategic for Romania, first of all for supporting the economic convergence with the European Union, as well as for evaluating the success of the integration, based on comparisons and competition with the other member states.

In 2010 it was planned to accomplish the migration of electronic public services at the level of the Unique Access Point through using unique databases by ensuring interoperability at European level by implementing security standards for informatics systems.

In June 2009 the Ministry of Communications and Informational Security, as unique public authority for organizing and coordinating at national level the implementation of programs and projects for e-governing and e-administration, has proposed a national strategy that is following a unique vision for creating a coherent and integrated national system for online public services dedicated to citizens and to the business environment. The national strategy is accompanied by an action plan that should lead in a short time to orienting the whole public sector towards the informational society, to the society based on knowledge, whose main action instrument being the e-governing system

The basic goal is the creation of a society which would allow the access of all citizens, by increasing the capacity of using the services of the informational society, reforming the operational models at the level of the public administrations and increasing the operational efficiency by an adequate use of IT&C, respectively by increasing competitiveness at the business level by using advanced informational technologies and implicating all decedent factors, from the central and local public administration, as well as organizations that belong to the business environment as well as scientific and professional associations.

E-Romania represents a unitary vision of a coherent and integrated national system for online public services dedicated to citizens, the business environment and the central and local administration.

The interoperability of the systems will allow the local authorities to develop at various levels, as digital city or district, to implement its own services at regional, district or town level

The need to decentralize which represents a priority direction for action will allow e-government at local level, achieved according to the needs and specific requirements of each public local authority to be integrated in the central e-government system.

The essential element is represented by promoting public trust in the services and the importance of the informational society, in parallel with reforming the structures and operational models, introducing the model of *Digital Town* or *Digital District* by identifying, auditing and developing public services, corroborated with their translation and transporting in digital format, and promoting these practices at the level of local public authorities and at the business level.

Maximizing the quality of the public services is achieved by:

- offering services in a unitary and friendly way by interoperability, at the highest level of possible trust;
- permanent availability of services to all users, the access being ensured throughout the country or outside it;
- accessing information and services through a central, integrated access point;
- achieving a rate of service adoption similar to the one at the European level, the consequence being a degree of client satisfaction at the level of the European average;

-the integrated use of the system of electronic public acquisitions.

The service e-Romania, through its fundamental component e-governing, is based on generally valid principles, of service integrity, which supposes reprojecting the way in which various governmental agents cooperate for providing a service. The unitary framework of approach, formulating a vision but also the explicit description of the structural components: organizational, e-service, application, infrastructure.

Centring on the citizen's needs and the needs of the business environment that is the orientation on added value of the e-governing services provided by the public administration have to satisfy the needs of its users, with private individuals or companies. The accessibility and the transparency through which the information processes and electronic services are provided by the public administration have to be accessible and transparent to all categories of clients, including the disadvantaged groups, in an intelligible form adapted to them, through traditional as well as through electronic means.

The reuse and the efficiency of the e-governing solutions and of the information/data at the level of the public administration it's the goal of avoiding project duplication with similar objectives in different public institutions and eliminating the redundancy in the information requested to citizens and the business environment

Through standardization and system interoperability, by using new technologies, open standards and architectures, which are scalable and flexible, in order to ensure interoperability between the e-governance application, as well as at national and European level.

E-Romania will cover areas of interest, general interest information, as the historic and geographic ones, the culture of our country, detailed information concerning a district, town or at the level at the associated territorial portals (figure 1).

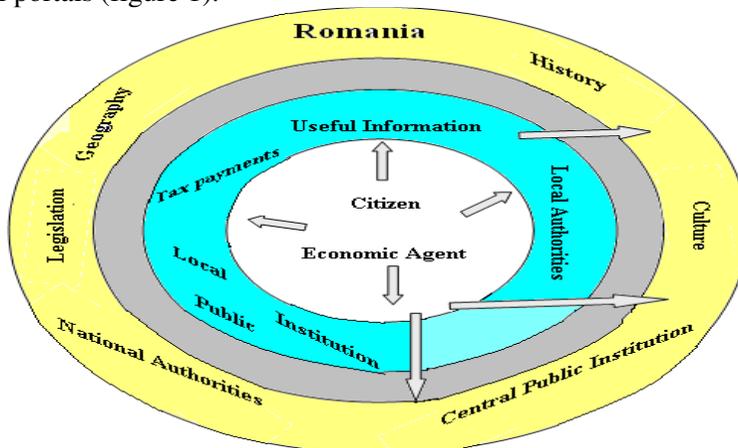

Figure 1 Areas of E-Romania

Each citizen, irrespective of where he lives, in Romania or abroad, each company and governmental user, will have the possibility of gathering information, to access the public services or to solve online any administrative problem, in the quickest and most favourable way.

Providing high quality governmental and administrative e-services to citizens, companies and users from the central or local administration, increasing the efficiency of the public sector, reducing costs, simplifying operations, a consistent increase in the number of users, are the main goals of the strategy and the goals program, the e-governance system being the main pillar of the informational society and one of the main pillars of the society based on knowledge.

The access to a set of minimum services of electronic communications is considered a fundamental right of the citizens, essential for his integration in the community and in the informational society. The electronic communication services are an essential instrument for providing to the public of all the types of information, goods and services, to the public administration (social services, for example education or health) as well as to the private sector (the services of the informational society).

In the same time the policy and strategy concerning the **universal service in the field of electronic communications** is aiming on the long run to provide access to the public telephone network through fix points in each house. On the short term the goal is providing access to isolated rural communities to the public telephone network in a fix point, for certain defavorized categories of users. One can notice that the installation and the interoperability through telecasters represent one of the most efficient means to prevent the phenomenon of social exclusion. The low of the universal service comes with the solution of proposing one or more universal service providers, to which will be imposed the obligation to offer one or more services from the area of the universal service, in some areas or on the whole territory of Romania.

Conclusions

1. The convergence phenomenon, which appeared due to new technologies, ensures a maximum choice possibility for the final users, among several providers and ensures a maximum of benefits from the services available at a certain price level, becoming essential instruments for directly increasing the degree of satisfaction.
2. Romania has set strategic objectives in the IT&C sector, with a clear orientation towards a competition profile, by developing offers for an access infrastructure for users on the background of a continuously increasing request, fed by an increase in the buying power and by the increasingly sophisticated consumes preferences of Romanian users.
3. In order to accelerate the transition to an Informational Society and an Economy Based on Knowledge, it is aimed at increasing the efficiency of the informatics systems through which are offered public electronic services, implicitly by a more efficient use of public funds, increasing the security of informatics systems of the local and central administration, the multiple reuse of resources offered through informatics systems, the improvement of the cooperation between the institutions of the public administration, increasing the comfort of the citizen and facilitating the cooperation at European and international level.

PARTICULARITIES AND TENDENCIES IN IT

Mareş Marius Daniel

Spiru Haret University, Bucharest, Romania

Faculty of Management, Finance and Accounting

Mareş Valerica

Economic Studies Academy of Bucharest, Romania

Faculty of Accounting and Management Information Systems

In the current global economic environment, competition is becoming acute and complex, and rapid technological changes are shortening product lifecycles and the capacity of a company to generate new goods and services, or to improve them and distribute them as quickly as possible to markets. Changes of technological nature have been so rapid lately that one can talk of a new technological revolution – if we take into account the „waves” of technological development which are based on the spectacular progresses in informatics, telecommunications, robotics, fiber optics, fine chemical products and in aerospace industry.

Keywords: technological revolution, strategic management, formalized knowledge, inovational potential, organizational culture, analysis of the value chain

Jel classification: M15, M54, O17

Introduction

The term technology has different meanings and definitions:

- assembly of processes, methods and scientific methods applied for obtaining a product or service;
- assembly of knowledge regarding the method, the way, the experience of producing a product, creating a factory etc, together with the technique and the working facilities;
- combination between a certain technique and the knowledge necessary for using it (in which knowledge has the dominant role related to the working facilities), technology plays an essential role in the economic development of a country, determining not only an increase in production dimensions but also in its quality. In an increasingly concurential environment, technology appears to be a key element in obtaining international competitiveness for countries;
- structured assembly of the processes, methods and operations used in order to produce or commercialize a certain product or for creating a process; organized and formalized knowledge of techniques (assembly of procedures for creating a product) a pluridimensional package structured on knowledge that can be exploited from an economical point of view. In its composition we find material elements (materials, machinery), informational elements (knowing the procedures, experiences or individual or collective habits) or operational (production functions, coordination);
- at company level, technology appears as an operator that represents using resources, structures (production structures and how to manage them and the company in general), know-hows and human relationships in the process of work and not only that, for achieving objectives.

The most common way of approaching notions of technology is based on separating the notion related to defining technology as a scientific means of research or defining it as a procedure, method or process. This delimitation can be considered just partial because, even when the notion of technology is attributed to processes and procedures, they're not accompanied by the knowledge related to it. This results in the definition given by the Economic Commission for Europe, according to which the technology consists in „concretely applying scientific knowledge and techniques in the conception, development and fabrication of a product”.

The impossibility of separating scientific knowledge and techniques from the used methods, procedures and techniques becomes even more evident when the concept is had into account, that is technology is

seen as a system. Regarded as a system, technology covers, as invariable elements, scientific knowledge, technical knowledge incorporated in procedures, materials, equipment and specific informational systems (plans, programs, various documentation). Under this vision, the technology concept is not referring only to product processing, but it becomes a complex activity of a company, where it takes a number of forms: research technology, design technology, information technology, leadership and organization technology, fabrication technologies, distribution and sales technology, etc.

The place of IT in the modern company

Under the impact of scientific and technologic progress, but also under the profound and accelerated mutations to which are exposed the global economy and the national economies, the company will be the stage of fundamental changes that will affect its leadership, functionality and integration in the society as a whole:

- increasing dimensional, structural and functional flexibility
- geographical dispersion of the activities of the company
- adopting suitable dimensions for competitiveness
- harmonizing standardization with flexibility
- extending informatization
- increasing the role of intellectual technologies in the management and functioning of a company
- increasing the creative potential
- increasing the managerial ability to anticipate environment change
- increased concern for saving and a superior valorification of resources
- increased concern for environment protection
- increased professionalization of the management

On the other side, the future *characteristics of the environment* – due to general causes (such as the technico-scientific progress, the progress of society in general, perfecting economic mechanisms) or the reaction of companies that pollute the environment and are trying to adapt to its evolution, by influencing it, on their turn, in a significant way – with a major impact on the strategic management of the company will be:

- development of the knowledge society
- amplification of the inovational potential
- intensification of the entrepreneurial spirit
- increasing internationalization and globalization of the markets
- intensification of the cooperation between companies
- acceleration and deepening of changes

The metric force is the acerb struggle for increasing competitively and efficiency in the context of globalization of the economy and in this context a significant contribution was brought by the managerial revolution in IT.

In order to see the place and the role of the informatics systems in the informational management of an informatized economic organization, one starts from the structured organizational scheme on levels of management and on management domains (functions) of the organization (Figure 1).

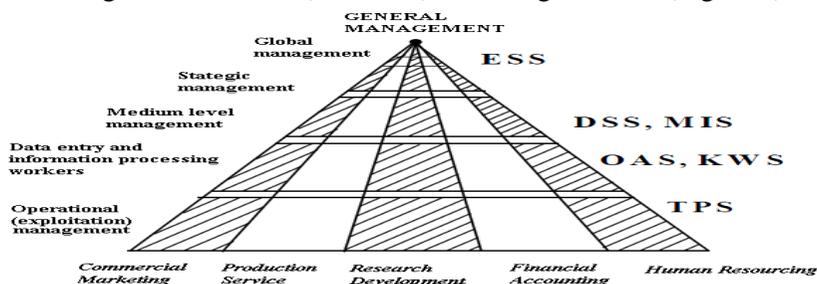

Figure 1 Level and domanins management

The categories of informational systems correspond to each layer of organizational management:

-at the level of **strategic management** – informatics systems for assisting the executive, (ESS Executive Support Systems) serve the strategic management level and are aimed at assisting decision taking not structured on elements of great synthesis, graphical presentations and advanced communications. ESS are used by general managers, address unstructured decisions and more, they create the general working and communication environment, dealing less with specific, detailed applications, necessary for the economic organization.

-for the medium level management: MIS (**M**anagement **I**nformation **S**ystems) and informatics **D**ecision **S**upport **S**ystems (DSS). MIS serve the medium management layer of the economic organization, providing managers with reports, online access to results and older records. MIS also serve the strategic management layer, by supporting the planning, control and decision taking functions through routine resumes and reports of unforeseeable situations. Normally MIS can be accessed by managers who are interested in weekly, monthly or annual results obtained by the economic organization. The IT for assisting DSS at the medium management layer, combines data and sophisticated analytical methods for helping semistructured and unstructured decisions. Although DSS uses mainly data and information coming from TPS and MIS, it often receives data and information from external sources, as for example market values of certain products or services.

-at the layer of the data and information entry workers, the knowledge informatics system is called **K**nowledge **W**ork **S**ystem (KWS) and the informatics system for the automatization of desk office, also called **O**ffice **A**utomation **S**ystem (OAS).

-at the operational management layer (exploitation) – informatics systems for processing transactions, also called **T**ransaction **P**rocessing **S**ystems (TPS).

These informatics systems are designed to incorporate, in general, data about external events as, for example, new elements about market competitors, but also receive internal data from MIS and DSS. ESS filters, compresses and follow critical data, while having an accent on shortening execution time for activities and reducing the necessary effort for obtaining useful and relevant information for the whole organizational management.

Organization management through IT

Organizations are formal entities tied with rules and procedures that have to be followed. They can also be seen as social structures, because they represent a collection of social elements. The technical definition is focused on influences that technological modifications (thus also the information and communication technologies IT&C) have on the environment in which the inputs are transformed in outputs.

In the case of behavioral definition, building or reconstructing the informatics system of an organization supposes much more than a new configuration of the workstations or a new informatics application. Organizations, in general, can have different structures - entrepreneurial, bureaucratic, bureaucratic machine with subdivisions, professional bureaucratic machine and adhocratic.

Organizations with an *entrepreneurial structure* are of a smaller dimension, usually small companies with simple structures, led by an entrepreneur.

Bureaucratic organizations are formal organizations, of medium size, with a clear division of labor, with pre-established procedures and rules and an impartial process of decision taking, where employees are promoted based on their technical qualification and their professionalism. This type of organization has the following characteristics of the management: a centralized management team, a centralized management process and a centralized decision making process.

Bureaucratic machine organizations with division's combines multiple bureaucratic machines, each achieving distinct products and services, led from a central general headquarter.

Professional bureaucratic machine organizations are based on knowledge, and the products and services depend on the knowledge of the specialists. This type of organization is dominated by department chiefs with a low central authority.

Adhocracies are act of God organizations created to solve emergency situations and which have to respond to rapid changes of the socio-economic environment. This type of organization is composed by a large number of specialists organized in multidisciplinary teams, it functions for a short period of time and have a weakly represented central management.

All organizations develop standard working procedures, policies and cultures. Standard procedures are precise rules, procedures and practices developed by the organization in order to answer to almost all possible future situations.

Organizational policies take into account the fact that people in organizations occupy different positions have different specialties, preoccupations and perspectives. Thus they represent various points of view about distributing resources, the way of rewarding work results and sanctioning ways. These different points of view affect managers as well as employees and are materialized in the existence of disputes and of a competition inside the organization.

Virtually all informatics systems that bring significant changes to the goals of the organization, in the work procedures, in productivity and personnel will raise a problem to organizational policies and in the organizational culture.

Economic organizations, according to the evolution of the socio-economic environment, are subject to several challenges related to: frequent internal reorganizations required by the evolution of the socio-economic environment; the increase in operational risks and in the direct requirements and in those related to the procedural environment; integrating all management activities of interhuman relationships, including clients: ensuring the efficiency of the organizational activities and their correlation to the evolution of the business environment and the tendencies of the modern man to use products and services suitable to his lifestyle; gaining new clients by using the economic-financial analysis and the marketing analysis.

Any economic organization functions based on 4 categories of resources: human, material, financial and informational. In the last years, the degree of informational resources used in the organization increased considerably together with the progresses of the Informational Technology and Communications (IT&C), so that currently one can say that this category of resources of the organization has become a success factor and an important vector in the overall directions of evolution specific to the informational society and the knowledge society.

The integrated informatics system of the economic organization is subject to a continuous modernization and consolidation in order to be ready to achieve continuity, coherence, opportunity, confidentiality and the security of data, information and knowledge, of all processes and transactions.

The knowledge society, through both its components, informational and durability, have a global character and is a factor of globalization, representing a new stage in the culture, in which the most important will be the culture of knowledge, which implies all forms of knowledge, including artistically, literary and personal knowledge etc. Two large classes of vectors of the knowledge society have been defined

- technological vectors;
- functional vectors.

A vector of the knowledge society represents an instrument that transforms the informational society in a society of knowledge

The category of technological vectors of the knowledge society comprises

- internet development;
- e-music and e-books technology;
- intelligent agents, which represent expert systems (from the domain of artificial intelligence), used, for example, for Data Mining or even for formal knowledge discoveries;
- intelligent environment for man's life and activity;
- nanoelectronics;

The category of functional vectors of the knowledge society comprises:

- management of the moral use of knowledge at global level;

- organizational knowledge management;
- health, physical education and sport at social and individual level;
- enhancing existential knowledge;
- implementing an education system based on methods of the informational and knowledge society (e-learning, e-library, on-line learning);
- protecting the environment and ensuring a durable society;
- generating new technological knowledge;
- developing a culture of knowledge and innovation etc.

Elements from the informational sector that's evolution affect overall the society and the businesses, and the progress of informational resources of the economic organization, in particular, are:

- enhancing knowledge in informatics for managers and a growing number of employees
- developing telecommunications through fiber optic, satellites, computer networks and global communications and databases;
- developing and proliferating personal computers; the manager and the employee have personal computers at work and at home, connected to a central computer, to a databases and to other personal computers;
- computers are perceived and used as "analytical thinkers" (analogous to the function performed by the left hemisphere of the human brain);
- creating a common front against infractionality in the computer domain (against informatics criminality);
- using laser devices for writing and reading information from various supports in various encodings;
- human-computer communication through voice;
- the evolution of technologies in the field of producing electronic micro-chips which led to decreasing power consumption

The image of this manager who is, for example, in an international meeting, anywhere in the world of the informational society is associated with a mobile phone of the last generation and with a laptop permanently connected to the organizational network of the country it represents. The manager has on his laptop all kinds of information about competitors, about the up to date legislation in the concerned fields in the form of databases which can be exploited through specific instruments.

Directions in the evolution of the IT management

The main directions in which can be anticipated the evolution of the IT management are:

- the emergence of a new type of management, based on information;
- harmonization of the managerial priorities with the level of profitability of the company;
- developing new systematic approaches;
- developing the situational perspective;
- perfecting strategic learning for modeling strategic behaviors;
- intensification of the development of the multiple capabilities of the company;
- increasing the range of strategic variables to be taken into account;
- developing new basic managerial principles;
- establishing an optimum level of complexity of the activity of the company;
- increasing organizational flexibility.

Understanding the connection between the competences (resources) of the organization and its competitive position is based on knowing the way in which the activities of the company generate added value, the link being theoretized in what is called **the analysis of the value chain**, which starts with the identification of the activities that are creating value. Thus the activities of an organization can be split into two large categories:

- primary activities** – grouped into 5 main areas:
 - internal logistic – receiving, storing and distributing inputs activity;
 - production (operations) – the activity of transforming inputs in a final product;

- external logistic – the activity of collecting, storing and distributing;
- marketing and sales – generate means through which the consumer can be told about the existence of the product and through which it can be procured;
- service – improving and maintaining the value of the product through repair, installation, preparing the auxiliary personel etc.
- support activities** – are related to primary activities and are grouped into 4 main areas:
 - procurement – the process of acquiring the resources for the primary activities;
 - technology development – know-how related to product (research, design), process or particular resource;
 - human resource management – recruiting, training and motivating the personel of the organization;
 - infrastructure – planning, financing, quality control systems, and elements of organizational culture.

Conclusions

1. The management of an economic organization strongly implies knowledge and using the informational resources of the organization which, in the modern approach, imply managing these resources in an integrated informatics system (organizational structure) of the economic organization, a system conceived and used from a business perspective.
2. For using these informational resources, the manager has the duty to learn the general IT&C concepts and principles for creating dedicated informatics systems, as well as of informatics instruments which can assist the managerial process and the managerial decision.
3. By using the IT&C the efficiency of the organizational activities increases significantly, together with the alignment to similar practices at global level.

THE IMPORTANCE OF THE IMPLEMENTATION OF INTEGRATED INFORMATION SYSTEMS IN THE RESTRUCTURING AND EUROPEAN INTEGRATION PROCESS OF ORGANIZATIONS

Moisuc Diana-Aderina

“Babes-Bolyai” University of Cluj Napoca

Faculty of Economics and Business Administration

Șteliac Nela

“Babes-Bolyai” University of Cluj Napoca

Faculty of Economics and Business Administration

Many of the organizations that are part of the public and private domain in Romania have reached the stage in which the existing information systems can no longer comply with the requests of users. Therefore, we are compelled by necessity to use integrated information systems which should be able to control all kinds of data and to allow access to them, to ensure the coherence and consistency of the stored information. Managers must be aware of the importance of the implementation of integrated information systems in the background restructuring of the organization, which can thus become consistent and competitive with the European Union one, so the integration process becomes a real and possible one.

Keywords: integrated information systems, ERP (Enterprise Resource Planning), CRM (Customer Relationship Management), SCM (Supply Chain Management)

JEL Classification: M15, O30, O32

1. Introduction

The economic, social and political environment in which the management decisions are currently made is characterized by a sustained and pronounced dynamics. In this respect, many changes are made in the way the competition is evolving on the market, in the legislative framework, in the way in which the enterprises function and organize, in the industrial and data processing technologies. All these processes lead to an increasing pressure over the managers and to new requirements compared to the way in which the decisions are elaborated and adopted, because the success of an enterprise in a competitive economy depends entirely on the quality of the decisions made by its managers.

Making a decision implies more and more the necessity of having a large package of information as well as an entire process of analyzing and synthesizing it. This ability to collect, process and analyze the necessary information in order to make a decision has long exceeded the human limits, as one must use the highest information technologies to support the decision in its making process. The information technology is nowadays a dominant one as well as a welfare source.

Right now many organizations in the public and private domain in Romania have reached the stage in which the existing applications can no longer comply with the requests of users.

We are compelled by necessity to use integrated information systems (integrated unitary systems in which the management positions, the ones of supporting the management decisions as well as the ones of controlling the activities and processing the transactions between different subsystems should be integrated). Part of the Romanian organizational environments has joined the integration game, as the implementation of integrated information systems means performance, efficiency and business control. The other ones are still hesitating, as they consider the integration a difficult step, a very difficult decision and, most of all, investment to make.

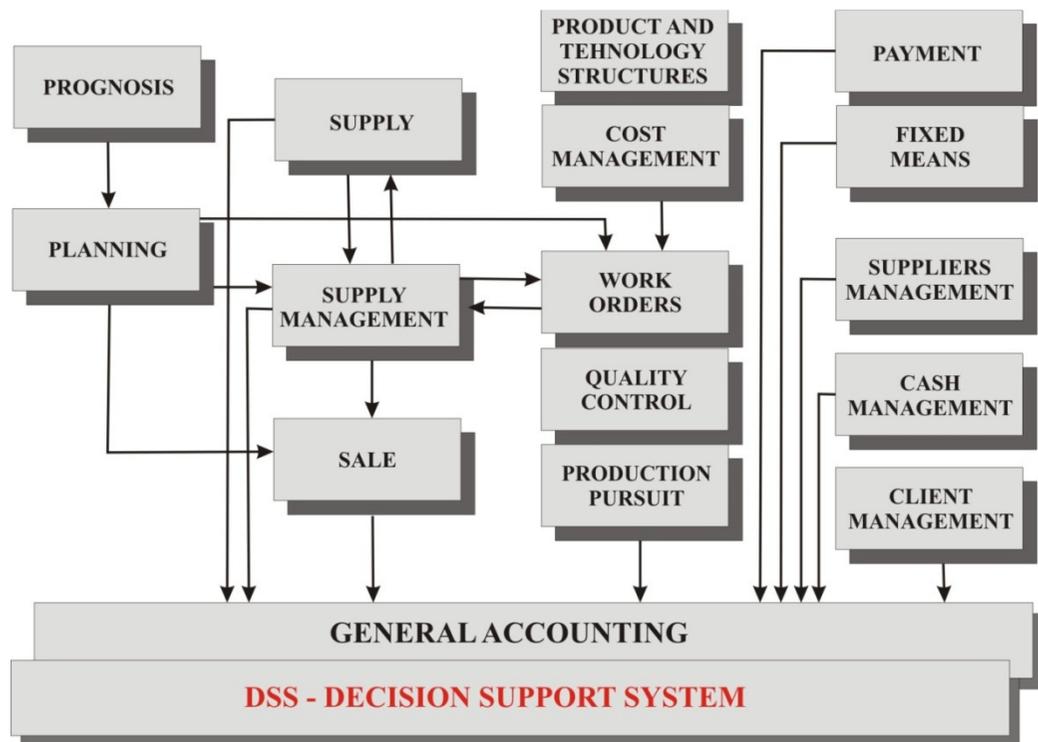

Figure 1. The functional architecture of an integrated system¹⁷⁴⁵

„In order to justify the investment in an integrated system we can take into consideration the following benefits:

- cost reduction by efficient resource planning (energy, water, prime matters, labor force, time) and by avoiding penalty charges (payment delays, violation of the terms of agreement);
- quality information and avoiding operations and data redundancy (single database);
- risk prevention and control;
- anticipation of legal requirements and the facilitation of the their compliance;
- the improvement of the company image and credibility on the market (by product certification);
- the improvement of the internal and external communication, decrease in the response time due to reports and ad-hoc information provided by the system;
- technological openness – (the system architecture allows the integration of new types of e-business applications).¹⁷⁴⁶

Information integration must be regarded as a continuous process and a long-term strategic investment, since its benefits appear not immediately, but with time. It may be considered as a form of “life insurance” for the company’s information system.

The approach to integration must be realistic and take into consideration two major alternatives:

- internal integration – focuses on the intra-corporate economic processes, covered by **ERP** application suites (Enterprise Resource Planning);
- external integration - combines the services of several suppliers in order to support the extended operations management, information exchange, coordination and cooperation throughout the extended value chain (expansion of the traditional ERP applications by means of “newer” **CRM** - Customer Relationship Management, **SCM** - Supply Chain Management).

¹⁷⁴⁵ Rusu, L. și colab, (2005), Sisteme integrate și sisteme ERP, Editura Risoprint, p.106

¹⁷⁴⁶ Jones, M., Zound, R., *ERP Usage in Practice: An Empirical Investigation*, Information Resources Management Journal, January-march 2006, p. 23-42

2. ERP (Enterprise Resource Planning) Systems

Defining ERP systems

An ERP is a complex multimodular software application which integrates the economic processes of the companies in order to optimize and increase their efficiency.

From the functionality point of view, an ERP software covers the following domains of interest of a business: production planning; acquisition management and supply management; interaction with the suppliers; customer relationship management; order pursuit; financial management; human resources management.

An ERP system achieves the information integration used by the functions and departments of a company, framing them in a single and coherent system.

The benefits of an ERP system:

An ERP software offers a series of advantages for the financial management, as it is able to present any time a general view of the company in what concerns the financial status of the treasury, sales, debtors and creditors, current contracts.

According to a survey carried out in Great Britain among the organizations that have implemented ERP applications, we can point out the following aspects:

- the organizations have gradually invested human resources, money and technology in order to develop their own ERP systems and in the current financial climate they are trying to consolidate and maximize the results of these investments;
- not all the companies have equally prospered as a consequence of their investments, as many of the organizations have achieved considerably larger benefits using the ERP systems than the others. Among the difficulties encountered we mention: the systems haven't been perfectly set; not all the functionalities of the system have been activated and therefore their efficiency was reduced; the companies haven't ensured and maintained the correct functioning of the system;
- in Fig.no.2 is rendered the share of the factors that have influenced the motivation of the organizations in choosing an ERP solution:

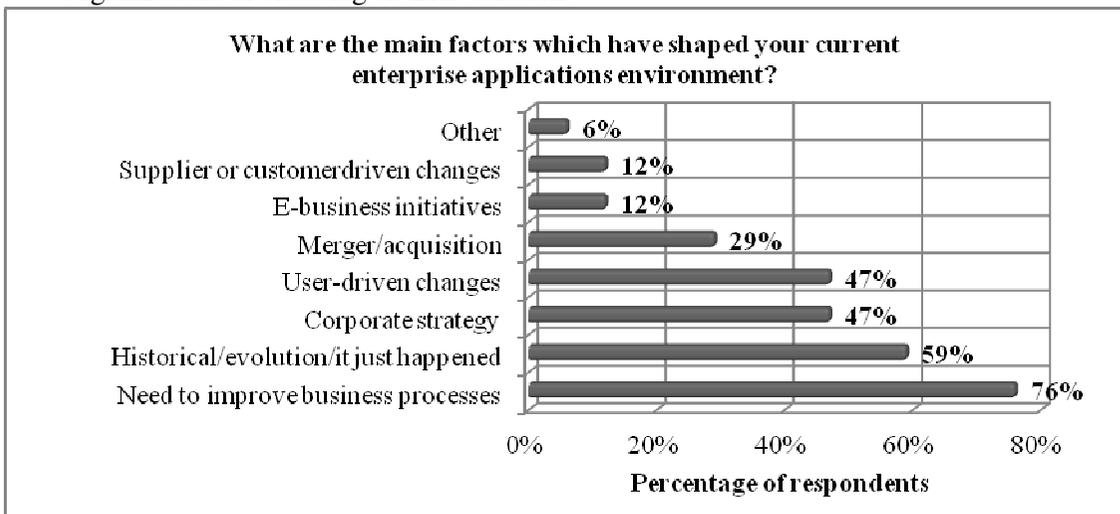

Figure 2. Key drivers for enterprise systems¹⁷⁴⁷

- there are contradictory opinions among the respondents as regarding how easy it is to modify the ERP solutions in order to produce changes in the business processes:

¹⁷⁴⁷ http://www.conspectus.com/2009/october/downloads/Conspectus_ERPSolutions_October09.pdf

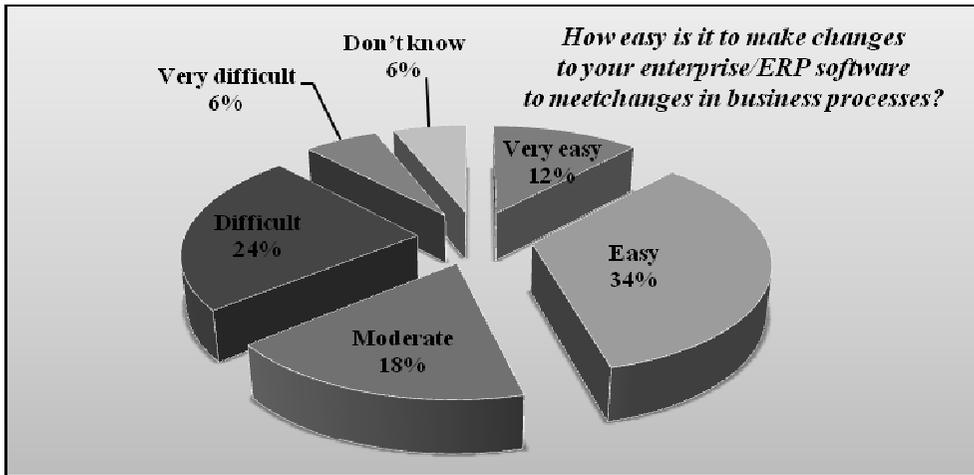

Figure 3. Flexibility of the software¹⁷⁴⁸

2. CRM (Customer Relationship Management) systems

CRM: definition and functionality

"CRM is a complex system that provides a means to improve the experience of a particular client so as he should remain a trusty one; it provides both technological and functional means, in order to identify, attract and keep clients; it provides a single image of the client inside the entire organization." (Paul Greenberg – English analyst).

"CRM extends the sales document from a confidential one, issued by a salesman, to a continuous one that involves the entire staff of a company. It is the art/science of collecting and using the information about the client to strengthen his loyalty and increase his long-term value." (Larry Tuck – American analyst).

"CRM means an integrated approach of the processes of identification, attracting and keeping the clients of an organization." (Siebel Systems).

The advantages given by CRM compared to the traditional marketing are:

- reducing advertising costs;
- focusing the company's policy on the clients' needs;
- quick ascertaining of the efficiency of a campaign;
- the possibility to compete with the main contestants not only on a price level but also through the provided services;
- avoiding extra expenses that are assumed to be made by the less profitable clients and redirecting the resources towards the high profitable ones;
- surpassing the delays arising from the development and marketing of a product (it optimizes the marketing course);
- optimizing the trade channels and the contact with the clients.

So, placing the client in the centre of the organizations' concern in order to suggest to him the most appropriate products and services is the aim of this new generation of information tools in the Customer Relationship Management category.

According to the surveys carried out in Great Britain among the organizations that have already implemented a CRM System, we can point out the following aspects:

- the companies that provide good services and manage to understand their clients' requirements are those that, generally speaking, can survive and prosper on a long time;

¹⁷⁴⁸ http://www.conspectus.com/2009/october/downloads/Conspectus_ERPSolutions_October09.pdf

- in the past, successful companies used to search for their clients instinctively. Nowadays we have to use the CRM systems, but we have to understand very well the fact that a CRM application only provides the process automation of the client relationship management. A company uses the CRM in order to supervise and keep information regarding to its current and future clients. It's not enough to install a CRM system in order to develop and ensure a complete environment for client services. The success doesn't depend entirely on the implementation of the system. A philosophy and a clear strategy for client relationship management have to be developed. O society has to provide a formative support climate and an accurate business environment for the employees in order to completely take advantage of the information systems;
- many organizations have implemented a CRM integrated system to help elaborate a client relationship management strategy. The surveys have pointed out how important these strategies are as opposed to three years before:

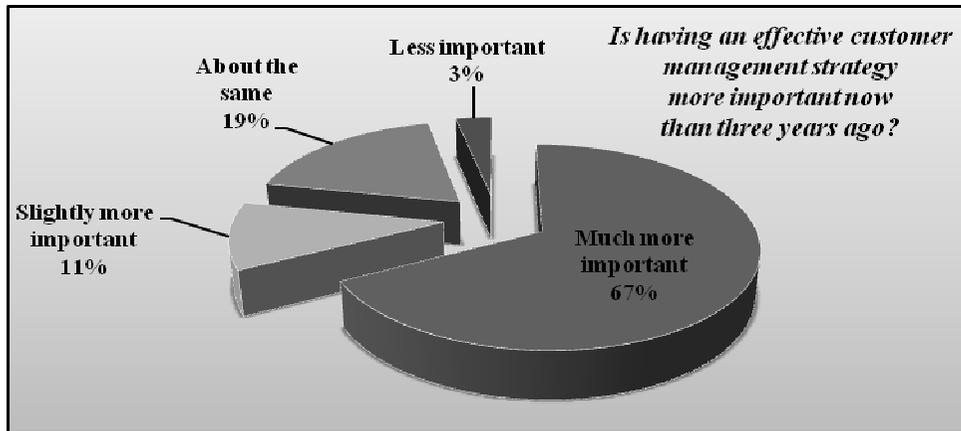

Figure 4. Importance of customer strategy¹⁷⁴⁹

3. SCM (Supply Chain Management) systems

SCM: definition and functionality

The Supply Chain Management is a term encountered in the Romanian literature under the name of supply-sales chain management or distribution chain management and it basically refers to optimizing and automating all the economic processes that take place at a level of an enterprise, starting with materials and raw material supply and ending with the production, transportation and distribution processes of the end products.

"The easiest way the supply-sales chain is defined is as an "umbrella" process under which the products are created and delivered to the clients."¹⁷⁵⁰ The efficient distribution chain management secures the necessary amount of goods and services where they are needed, at the right time, in the solicited quantity and at the best price.

The chain management allows the administration of the expanded processes of the enterprise, integrates both the internal and external processes, secures flexibility and transparency in the development of a business from the raw materials that are necessary to the production supply stage to the delivery towards the end consumer.

The web expansion as a means for the economic transactions to take place and to develop a business-to-business communication, together with the development of new web based SCM technologies, achieve the transition from linear interactions to the network model. We are now talking about the interdependent distribution networks. The enterprises are heading for real time operating by dividing the information and interconnecting the processes with the ones of the business partners.

¹⁷⁴⁹ http://www.conspectus.com/2009/june/downloads/Conspectus_CRM_June09.pdf

¹⁷⁵⁰ Meșniță, G., *Introducere în afaceri electronice*, Editura Junimea, Iași, 2002

According to the surveys carried out in Great Britain we can point out the following aspects:

- the British companies continue to invest in SCM technology, in spite of the uneven results and, sometimes, despite the current economic recession;
- a particular aspect for present-day organizations is to ensure the supply chain. They are designed to support the global business strategy, both in terms of management and marketing aims support and also of financial performances;
- the surveys show to what extent the SCM systems support the entire strategy of the organization:

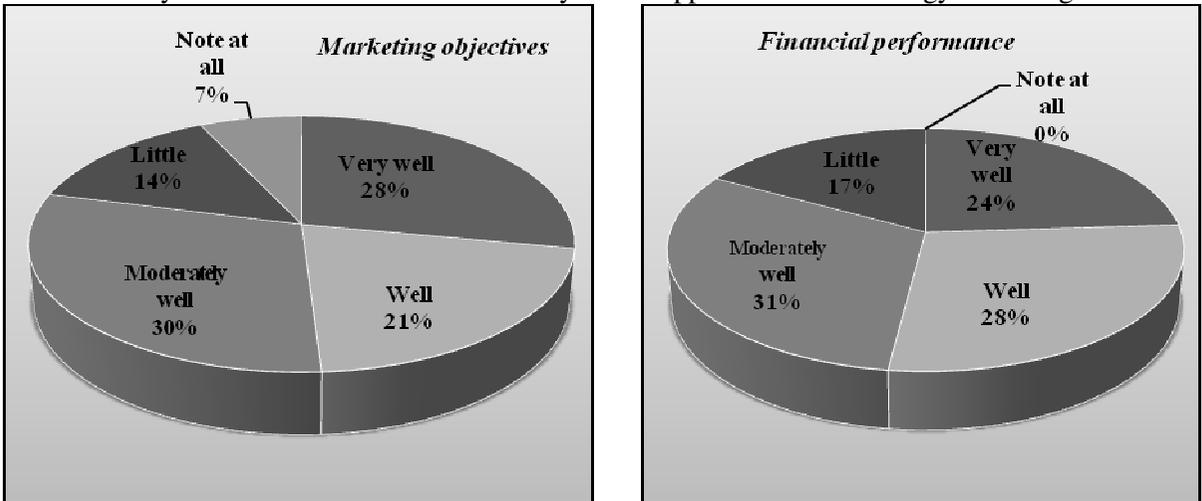

Figure 5. How well do your supply chain operations support the overall strategy of the business?¹⁷⁵¹

Conclusions

The passing to the appliance of some restructuring and changed modern methods and to real-time distributed processing of the information using new approaches like: ERP-Enterprise Resource Planning, CRM-Customer Relationship Management, SCM-Supply Chain Management, is a fact both in the private and public domain, which has to be treated accordingly.

In Romania there already exist a whole series of integrated information systems implementations provided by well-known companies such as: SAP, ORACLE, SIVICO (the first place in providing ERPs in Romania).

The rising number of integrated systems implementation confirms the fact that managers (in public and private domain) are aware of the importance of this solution in the background restructuring of the organization which can become thus compatible and competitive with those of the European Union. Therefore, the integration process becomes a real and possible one.

Nowadays, the most systems on the Internet are using databases. These databases are relational and normalized. Although the tables of the relational model itself does not have a behaviour in context object, though the diagrams uses different methods. In this article we focus on the database modeling for a virtual store using UML (Unified Modeling Language).

Keywords: Database, Virtual store, UML, Business model

Cod JEL: C88, M15

1. Introduction

For representating and modeling of databases are used several types of diagrams. In the relational world the instructions are not procedural type, still they are result oriented. In the implementation, many times we have to combine programming object to relational databases. UML is a language for visualization, specification, construction and documentation of models. There are no official UML diagrams for modeling data, but we have a scoring system and a data modeling system used and accepted by many CASE tools. The scoring used for data modeling in UML class diagrams comes from other scoring systems used the classical model (entity-relationship).

2. Modeling and database design

2.1. The database modeling

The database modeling is based more on logical and physical models of databases. A logical model of a database consists of entities, attributes and contains relations between entities that may be required or not (Naiburg E. J., Maksimchuk R. A, 2003).

The logic model is a standardized model, which is 3 normal form (3NF). May contain several elements, which is next to the database, but it does not contain any specific software management system or a database.

In this case, it is not important the important optimization factor, neither the application where the database will be managed. In the center is the building of the model. De-normalization process begins with the physical database model. The group of developers try to optimize the model and seek its implementation.

2.2 The database design

Until the modeling is focused on presenting a database, it contains the entire design process starting with specification, continuing with business modeling, logical analysis, the physical structure of the database to its implementation and installation.

For example, in the database design in physical modeling there are already set tables, columns and in modeling addition and hardware and the database system structure.

The Database Design includes (Song E., Yin S., Ray I., 2007): the requirements for modeling, the business processes (which may be today or in future), the business activities, the logical models, the physical database model, the links between database and application, developing of the system. After

the design, it comes the implementation itself, which can be done individually or in most cases the group.

2.3 UML diagrams for database design

There are many types of UML diagrams that help designer databases in their work. These diagrams can be used for meeting requirements for representation of installation, etc. The most important UML diagrams are as follows (Marcos E., Vela B., Cavero J. M., 2001):

Diagram	Description
Use Case	Use Case shows the behavior of the system or a part of the system and a description of a set of action sequences.
Interactions	Sequence or collaboration diagrams, which represent the interaction of objects in the system.
Activity	Activity diagram is a flow chart of activities that have control flow between activities. It is used to model dynamic aspects of the system and requires a process modeling step.
Statechart	Statechart diagram presents the dynamic of the system state or system objects.
Class	The logical model for the system class.
Database	Database shapes including the database modeling structure and constraints.
Component	The diagram of components shows the dependencies between various software components that comprise a computer system. These dependencies are static or dynamic. The software component has a model with a well defined interface.
Deployment	The deployment diagrams present operating configuration of runtime processing elements and components, processes and objects containing them.

Table 1 UML diagrams for database design

3. Business modeling for database design

The understanding the functioning of a company and its work it is not an easy problem. It is important to understand what business do they do, what information exists, who are business partners, etc. The current activity is not only important but also the firm's future perspectives. Most of the companies, firms have a standard representation of activities, especially their modeling tools (Avornicului C., Avornicului M., 2010).

We need the following information to create a correct model:

- How do the employees see business?
- What is their opinion to advance the company?
- What does not the company do well?
- What does each individual do?

3.1. The Business Modeling

The first step is the gathering information and the modeling descriptions. We must have an overall idea about the business, only to read only the words themselves.

We always start with the use case diagrams. A business use case diagram represents the most important functions of a business. In the modeling business is very important to identify and shape the roles of coming into contact with the business.

Business model should include views of interior and exterior views to suggest the most important moments of the business. The use case diagrams and use case actors may contain links. Actor can be anyone and anything that comes into contact with the system. It is important to note that one person can play multiple roles and a role can be characterized more people. The actor can be defined as a set of roles which the user uses when interacting with the use cases. It can be a human role, device or any other system hardware. The use case it may be a number of activities that may be useful for players. They involve the interaction between actors and system. In the business modeling, working groups are not only important but also the way they operate. The working mode is the activity diagram. This is a flow chart presenting the control flows between activities. It is used for modeling the dynamic aspects of the system and it requires a process modeling step. Activity diagrams returns to specific use case. Activity diagrams have several purposes (Song E., Yin S., Ray I., 2007):

- understanding the current business;
- understanding and designing of changes;
- discovery of redundancy in the business;
- discovery of the delays in business;
- revealing those activities that affect business;

3.2 Nowadays business model

By understanding the functioning of today's business systems, we can understand their operation. In this step, it helps to identify the business models having activities that are repeated, they are redundant. If we look at the whole business, we must understand the processes, systems, software, hardware etc. currently there. The essence consists not only in understanding the current business but also in revealing future prospects.

4. Case Study: Creating a database for a virtual store

In this part we deal with database design for a virtual store in Târnăveni, Mures county. The company is dealing with buying and selling computer parts.

A person can see components existing categories to rank and order them online on the Internet. To order our products, the person must register on the site. Insert an email address and password that is stored in databases. A person can order more products. Products will be sent by post or by Cargus (courier) and payment is made on receipt of goods. The administrator can introduce new products that can modify existing information products.

Project purpose:

- reduce human error;
- increase efficiency;
- national coverage (the Internet);

The emphasis is on quality of service and not on human resources management, the bill payment or other processes.

4.1. Business model use case

First part of business modeling is the use business model. It reflects the views of the outside and their contact with services. The outside actors are the business actors. After negotiating with the company, the first step is to identify business actors (Song E., Yin S., Ray I., 2007).

This is a very simple model and it shows us which business actor belongs to which use case. These actors do not relate to all who come into contact with services. For example, Ms. Florica involved in the cleaning company will not be considered in this model, although it contributes indirectly to the company's reputation.

During discussions, new players may appear coming in contact with the company, such as carriers, insurance companies and other corporate stakeholders. Of course, we have many sites use case, but they

must be verified, it will remain only those that are important in terms of business. Figure 1 shows a business use case possible.

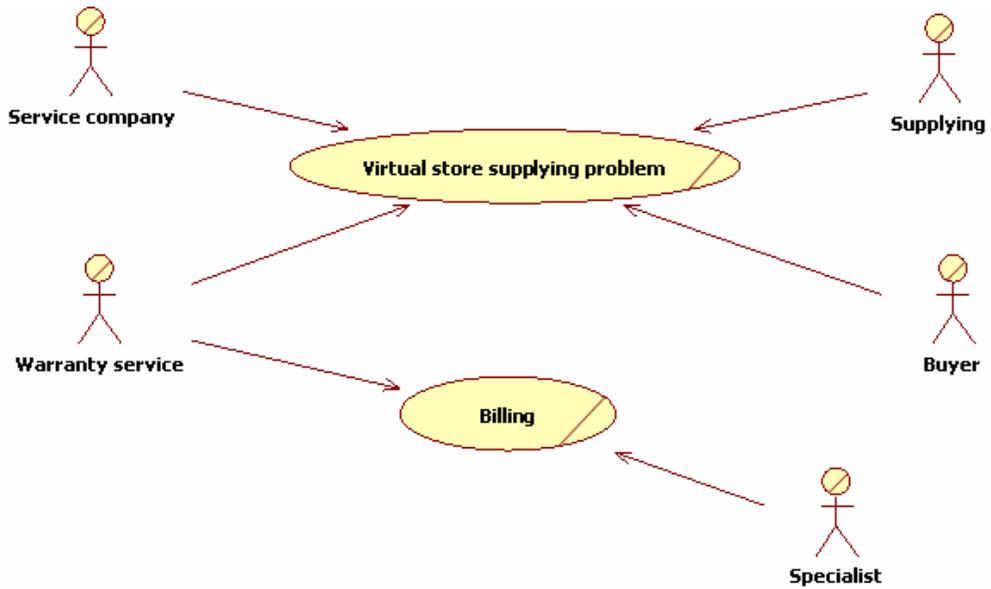

Figure 1 Business model use case

Improving of use case model can be done through a business model for each process. The charts shows business activities and have people who belong to departments.

In a business it is extremely important to look at things in terms of business actors. Because of this, the activity diagrams do not contain internal business functions. Business process ends when the players transfer the business management within the system (records manager – business worker) (Avornicului C., Avornicului M., 2010).

4.2. The design database using UML

In that part we design the model database. StarUML CASE tool is used. In the first phase of building the necessary classes. Figure 2 contains the necessary classes.

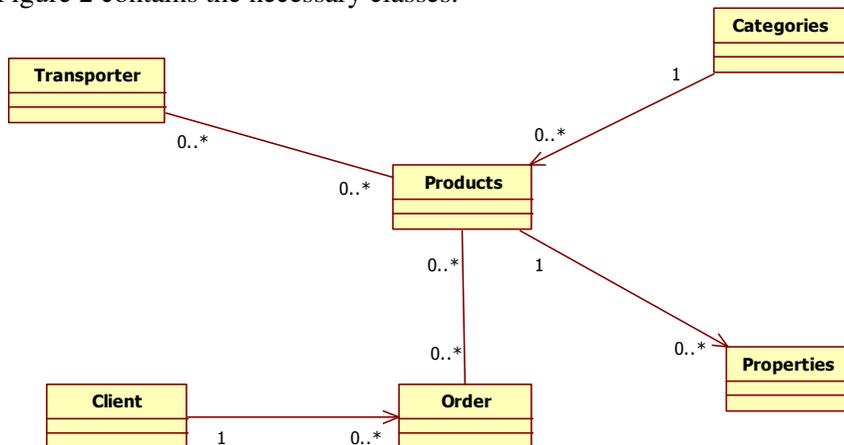

Figure 2 Class diagram for the shop

The following chart contains tables with all attributes.

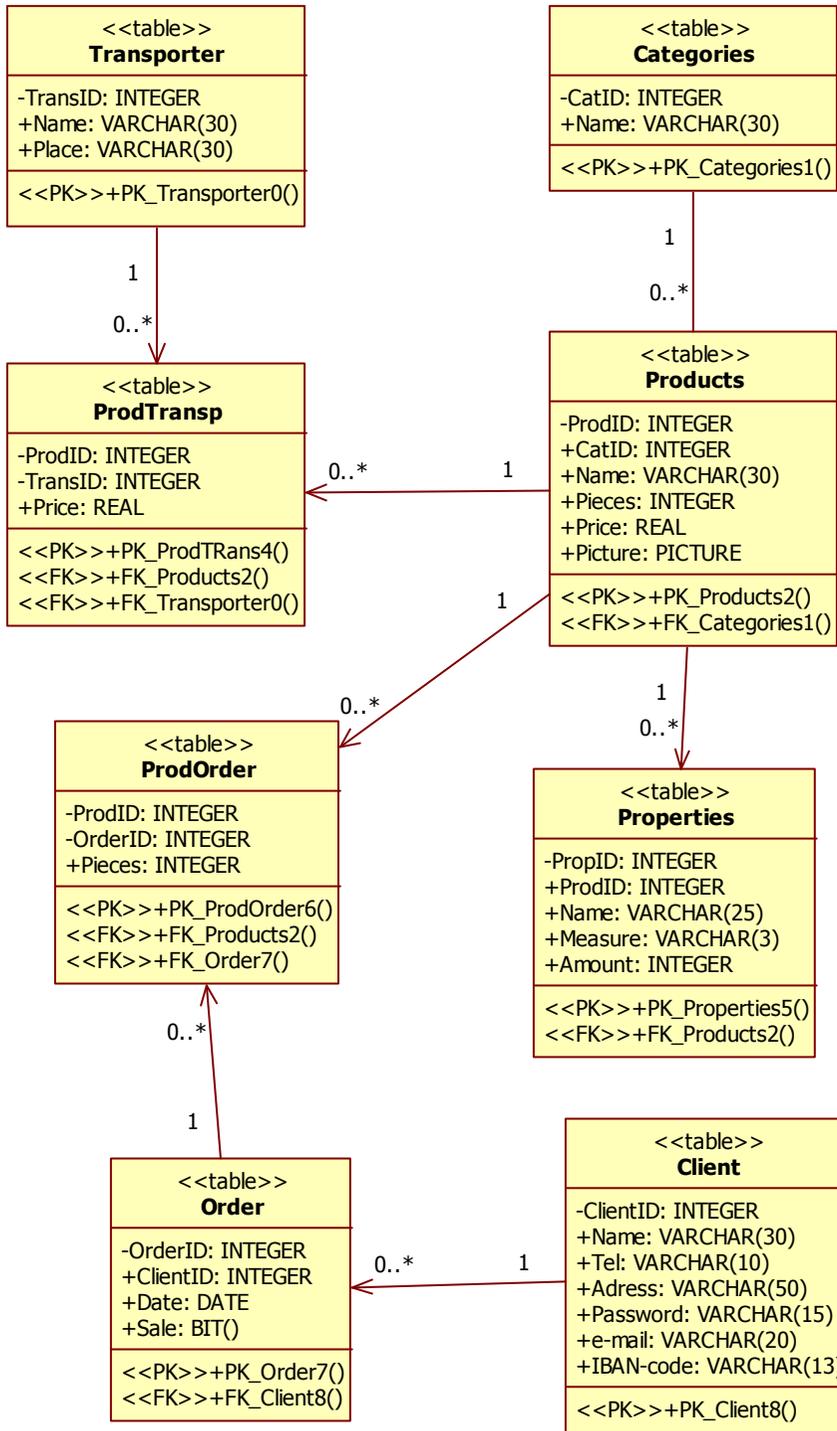

Figure 3 Tables with attributes for virtual store

The database will be implemented in MS SQL Server, Oracle, etc.

5. Conclusions

Even if in UML there are no diagrams for modeling data, we have a scoring system and a modeling data used these are supported by many CASE tools. The scoring used for data modeling in UML class diagrams comes from other scoring systems used the classical model (entity-relationship). Using UML diagrams, we can easily achieve a database that can be used in a virtual store. This paper presents such a database, which is used successfully in a virtual store.

A STUDY ON THE STAGE OF E-LEARNING DEVELOPMENT IN ROMANIA

Preda Ana-Maria

Stănică Justina Lavinia

Crișan Daniela Alexandra

Romanian-American University, Bucharest, Romania

This paper evaluates the stage of development of the e-learning system in Romania compared to other EU Member States, in the perspective of the newly proposed Europe 2020 strategy for a “smart, sustainable and inclusive growth”. Official statistics are essential in order to monitor these comparisons. Although Romania’s analyzed indicators are not at the level of other EU countries, a modest but increasing uptake of e-Learning services over the past few years can be observed. However, Romania still has major shortcomings in the field of e-Learning, our country being placed at the lower end of the EU-27 ranking in almost all statistics. As an EU Member State since 2007, Romania has to reduce its gap in the shortest possible time. The first steps were taken through implementing e-Learning projects and defining the barriers that stand in the way of an information society for everyone.

Keywords: e-Learning, indicators, education policies, strategies, initiatives

JEL classification: D83

1. Introduction

In the European Union (EU) e-Learning is considered an important progress in the educational and training systems, in the perspective of reaching the strategic objective assumed for the Union by the European Commission (EC) at Lisbon in March 2000, to become “*the most competitive and dynamic knowledge-based economy in the world by 2010*”. The spread of the Internet and new information and communication technologies (ICT) over the last decade, has allowed European citizens to gain access to incredibly many and varied information and information resources. Successfully using this potential in education is more a strategic and organizational problem than a technological one. The introduction of ICT should be accompanied by substantial restructuring in education. New ICT technologies allow every citizen to be (re)qualified or able to develop new skills at any age and any level of training, which means that the employment opportunities will increase and the competitiveness of European companies will enhance. In addition, this will promote the social inclusion, will increase the civic activity and will ensure the personal development.

2. EU political actions for e-Learning: a short history

The European Commission’s first initiative in the field of e-Learning was in 2000, in order to implement the *eEurope* Action Plan (Lisbon Strategy, 2000) in education. The initiative entitled “*Designing tomorrow education*” [12] set out the principles, objectives and directions for action in e-Learning, to adapt the European educational systems to the knowledge-based economy and digital culture. The *e-Learning Action Plan* (2001-2004) and *e-Learning Programme* (2004-2006) established the priority areas that should channel the efforts in modernizing education and training systems in Europe. In 2001, the EU initiative “*Making the European Area of Life Long Learning become a reality*” stipulated that each Member State should adapt its educational and training system to the requirements of the current modern environment, removing barriers between different educational systems of Europe and giving citizens a chance to develop new ICT skills. Life Long Learning is one of the basic principles governing the European policies in education and training, essential not only for the competitiveness and the employment degree, but also for social inclusion, personal development and civic activism.

A new strategic framework, the “*i2010: a European Information Society for growth and employment*” [10], proposed by the EC in 2005, promoted an open and competitive digital economy, and stressed the role of ICT to improve social inclusion and quality of life. The i2010 Action line “*Inclusion, public services and a better quality of life*” supported the development of e-Learning in all EU countries in a positive manner by promoting technologies that underpin e-Learning strategies.

The *Lifelong Learning Programme 2007–2013* [8] defined the strategic actions to allow EU to achieve the Lisbon goal of becoming the most advanced knowledge economy. This programme’s main objective is to sustain the economic development through lifelong learning and to turn the European educational systems into a world quality reference.

The Adult Learning Action Plan “*It is always a good time to learn*” [7] was adopted by the Commission in 2007, and reinforced by the Conclusions of the Council in 2008. This Action Plan had defined five actions that Member States should implement in order to increase the quality and participation in adult learning.

In May 2009, the European Council signed a new strategic framework for European cooperation in education and training – “*Education and Training 2020*” (ET 2020) – which provides common strategic objectives for Member States, including a set of principles for achieving these objectives, as well as common working methods with priority areas for each periodic work cycle [3]. The ET 2020 has the following four strategic objectives:

- *Making lifelong learning and mobility a reality*: More actions are necessary for increasing the lifelong learning quality and attractiveness, also through the use of new learning technologies. Mobility of students and teachers is an important way of promoting lifelong learning and of improving people adaptability, and thus must be increased.

- *Improving the quality and efficiency of education and training*: The EU economic success depends on quality education and training systems, which can enhance employability. High quality can only be obtained through an efficient use of both public and private resources, in implementing the best policies and practices in education and training.

- *Promoting equity, social cohesion and active citizenship*: The education and training systems should be made accessible to all learners, including those with special needs, so that all people could complete their education.

- *Enhancing creativity and innovation, including entrepreneurship, at all levels of education and training*: Creativity and innovation play an important role in enterprise development, enhancing the EU ability to compete internationally.

To reach the above objectives, a more intense European cooperation in education and training is necessary, which should produce visible results. In order to evaluate the overall progress in achieving the objectives under this framework, the Member States established five benchmarks: “adult participation in lifelong learning”, “low achievers in basic skills”, “tertiary level attainment”, “early leavers from education and training”, and “early childhood education”. The strategic framework ET 2020, along with the initiative “*New Skills for New Jobs*” adopted in December 2008, play a key role in addressing the priorities of the Europe 2020 strategy [1] launched as a proposal in March 2010, in which education is one of the five measurable EU targets for 2020. The *Europe 2020* strategy is taking into consideration the accomplishments and failures of the Lisbon Strategy, and is intended to prepare the EU economy for the next decade.

3. E-Learning Initiatives in Romania

In order to introduce ICT in the educational system, the technologically advanced countries constantly pursue the socio-economical competitiveness rules, providing impressive funds for the appropriate training of human resources, and taking decisions for the following decades based on rigorous studies. In the last decade, the field of e-Learning has begun to develop also in Romania, now existing more functional projects. Under the perspective of developing the information society in Romania, it became obvious the need to adopt a national strategy to support the expansion of electronic communications.

Under these circumstances, the Romanian Ministry of Communications and Information Society (MCSI) adopted in 2009 a *Strategic Plan for 2010-2013* [4] that set out the actions and programs for developing an efficient information society and knowledge economy. Through this strategic plan, MCSI has established the following directions of activity:

- *Electronic Communications* – financed through the budgetary program *The Development of Electronic Communications and Related Areas*, including two sub-programmes: *The National Communications Infrastructure* and *The Sectoral Plan for Research and Development (R&D) in Communications*. These sub-programs attempt to encourage investments in infrastructure, promote innovation and ensure effective management of limited resources, as well as, improve the capacity of R&D systems to support future policy documents, strategies and regulations developed by MCSI.

- *Information Society* – financed by two programs: *The Development of the Information Society* and *The Knowledge-Based Economy*. The first program is structured into three sub-programmes – *Romania's transition to electronic government – e-Government Program*, *e-Europe* and *The Sectoral Plan for R&D in Information Technology* – and aims to ensure an integrated approach according to the European policies, to modernize public administration by managing and promoting information and public services using electronic means, to develop the IT research-innovation sector, and to implement the specific technologies in central and local administration and business environment. The *Knowledge-Based Economy* program contributes to computer skills improvement and facilitates access to modern ICT for citizens in disadvantaged communities.

- *Structural Funds Management* – financed by the program *Access to Technical Assistance by OIPSI for the Efficient Management of the Structural Funds Allocated to Axis III SOP IEC*. The program is trying to achieve a high degree of absorption of structural funds allocated to SOP IEC and an efficient use of interventions.

- *MCSI Administrative Capacity* – financed through the budgetary program *Advanced Institutional Management*, which aims to mobilize the available resources for developing a competitive, knowledge-based information society, promoting ICT services and increasing citizens' comfort.

One of the MCSI most recent projects is "*The implementation of an e-learning system for public administration training to support the development of information society*", developed by the National Agency of Civil Servants (NACS) and MCSI (the financial agreement was signed in March 2010) for an implementation period of 24 months[5]. The total value of this project is 13 million lei: 8.9 million lei allocated by the European Regional Development Fund (Sectoral Operational Programme "Increase of Economic Competitiveness", Priority Axis III – ICT for Private and Public Sectors), 2 million lei representing the national co-financing, and 2.1 million lei VAT. The overall goal of the project is to increase the NACS training offer through the use of ICT. The technical objectives refer to the development of software applications that will allow the implementation of a complete e-learning system (online training and testing, homeworks, automated reports on learner participation and results) and the development of an online software for registration for the various training programs of the NACS portfolio. In the 2 years period, the project aims to obtain an increase of 20% in the number of civil servants trained by NACS using electronic means, and an increase of 20% in the NACS training capacity by developing a greater number of online courses.

4. Measuring the development of e-Learning in Romania

There are rather few studies on the evolution of e-Learning at country level. The most known are the Australian researchers studies – the Flexible Learning Advisory Group (FLAG) – that have developed a benchmarking system of 12 indicators assessing the degree of use, the effect and the impact of using e-Learning in professional and technical education.

However, there are many sources where e-Learning indicators can be found: the Canadian Internet Project: Canada Online, the Canadian Internet Use Survey, the studies prepared by Empirica (Empirica 2007), the eUSER survey (eUSER 2005), EUROSTAT statistics; International Telecommunication Union (ITU) statistics etc.

4.1. ICT development indicators

Even though there are few studies concerning the e-Learning development in Romania, we can start by referring to some international statistics, observing, for example, the country's degree of informatization. One indicator describing this is "the number of Internet users per 100 inhabitants".

Table 1. Internet usage statistics for Romania

Year	Internet Users	Population	Penetration (% pop.)	Statistics Source
2000	800,000	22,217,700	3.6	International Telecommunication Union
2001	1,012,000	22,000,000	4.6	Ministry of Communications and Information Technology
2002	3,520,000	22,000,000	16.0	Ministry of Communications and Information Technology
2004	4,000,000	21,377,426	18.7	International Telecommunication Union
2006	4,940,000	21,154,226	23.4	Computer Industry Almanac
2007	7,000,000	22,276,056	31.4	Internet World Stats
2009	7,430,000	22,215,421	33.4	Internet World Stats

Table 2. Internet usage statistics for Romania and EU-27 (2009)

Internet Usage	Population (2009)	Internet Users	Penetration (% Pop)	Usage Growth (2009/2000)
Romania	22,246,862	7,430,000	33.4%	82.8%
EU-27	489,601,562	311,953,600	63.5%	238.9%

Source: Internet World Stats [6]

Despite the substantial increase in the number of Internet users during 2000-2009 (828% growth rate), Romania is situated behind most EU Member States, ranking 26 out of the 27 EU states, according to the Internet World Stats.

In order to evaluate the information society development, the International Telecommunication Union introduced in March 2009 another indicator: the ICT Development Index (IDI). This is a compound indicator made up of three sub-indices (including 11 indicators): ICT access sub-index (measuring the ICT infrastructure and access), ICT use sub-index (evaluating the ICT use and intensity of use) and ICT skills sub-index (assessing the capacity to use ICTs effectively). The 2010 ITU report [2] presents the results of the IDI indicator for 159 countries and a comparison of the 2002, 2007 and 2008 IDI values for 39 European Countries.

Table 3. IDI changes 2002-2008

Country	IDI 2002	IDI 2007	IDI 2008	IDI change 2002-2008
Romania	2.46	4.11	4.73	2.27
EU-27	4.18	5.78	6.22	2.04
Europe	4.06	5.50	5.92	1.86
World	2.42	3.32	3.58	1.16

Source: International Telecommunication Union [2]

In the 2008 IDI scale Romania has moved up 16 places since 2002, to rank 44, but it is still the last among the EU-27 Member States. Romania improved its IDI index mainly due to the ICT access sub-index (growing from 2.40 in 2002 to 5.30 in 2008). Also it had gained over one point on the ICT skills sub-index (from 7.16 in 2002 to 8.37 in 2008), being among the top ten countries worldwide that most increased this sub-index.

4.2. e-Learning development indicators

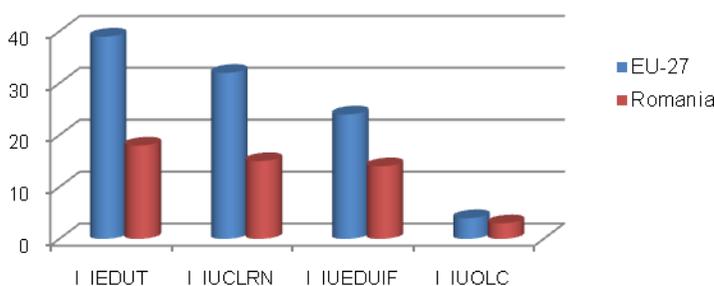

More accurate indicators for assessing the e-Learning development in Romania can be obtained from Eurostat statistics, the website having a section dedicated to Information Society. There are a number of indicators that can give an insight about the population interest towards online education and training, such as: percentage of individuals using the Internet for consultation with the purpose of learning; percentage of individuals who have used Internet for training and education; percentage of individuals using the Internet for seeking information about education, training or course offers; percentage of individuals who have used Internet for doing an online course (of any subject).

Table 4. e-Learning indicators

e-Learning indicators (% of individuals)		2007	2008	2009
Individuals who have used Internet, in the last 3 months, for training and education (I_IEDUT)	Romania	12	16	18
	EU-27	30	33	39
Individuals using the Internet for seeking information with the purpose of learning, within the last three months before the survey (I_IUCLRN)	Romania	8	11	15
	EU-27	23	26	32
Individuals who have used Internet, in the last 3 months, for looking for information about education, training or course offers (I_IUEDUIF)	Romania	8	11	14
	EU-27	19	21	24
Individuals using the Internet for doing an online course, within the last three months before the survey (I_IUOLC)	Romania	1	1	3
	EU-27	3	3	4

Source: Eurostat

The values of these indicators show a modest but increasing uptake of e-Learning services over the past few years, but Romania is still at the lower end of the European ranking, having indices that are about half that of the EU-27 averages.

Figure 1. e-Learning indicators for Romania 2009

The situation is even worse for the lifelong learning indicator, taking into consideration that the value of this index for Romania is more than 6 times lower than the EU-27 mean and about 20 times lower than the top EU-27 countries (Sweden – 32.4 and Denmark – 30.2). In the analyzed 2003-2008 period,

Romania recorded little or no progress in improving this extremely low level of participation. The lifelong learning indicator refers to persons (aged 25 to 64) who have received education or training within the last four weeks preceding the survey.

Table 5. Lifelong learning indicator

Lifelong Learning indicator	2003	2004	2005	2006	2007	2008
Romania	1.1	1.4	1.6	1.3	1.3	1.5
EU-27	8.5	9.3	9.8	9.7	9.5	9.5

Source: Eurostat

The most interesting results came from the commercial sector. According to another indicator offered by Eurostat – “the percentage of enterprises using e-Learning applications for training and education of employees” – Romania is situated among the leading European countries, obtaining values above the EU-27 average. This outcome has been achieved due to the strong competition in the Romanian market, which forced the companies to acknowledge the benefits and advantages offered by e-Learning in training their employees and to invest more in their professional development.

Table 6. Enterprise e-Learning indicator

Enterprises using e-Learning applications for training and education of employees	2004	2005	2006	2007	2008	2009
Romania	30	NA	32	42	41	47
EU-27	20	21	21	23	24	24

Source: Eurostat

Even though for this field Romania obtained a remarkable result, the significant differences between our country and other EU-27 Member States regarding the e-Learning development, cannot be ignored. The reasons are complex, such as the lack of adequate infrastructure and the reduced number of offers in the field of education. Ensuring the availability of educational services and resources on the Internet, and increasing Internet use and computers endowment in educational institutions will certainly lead to a workforce that is better prepared, more flexible and more suited to market requirements, having positive effects on labor productivity and competitiveness. This kind of educational system will probably support the lifelong learning, this field being, for the moment, at a very low level in Romania.

5. Conclusions

e-Learning tends to become a regular presence in education and training systems, and Europe is making progresses in this area. Since the adoption of e-Learning Initiative in May 2000 and the Action Plan in March 2001, interest in the use of technology in education continued to grow. The objective of improving the quality of training and access to education is a foundation stone for building the new knowledge-based society in Europe. Indeed, e-Learning is viewed as a catalyst for the fundamental changes necessary for the transition to the new economy, and at the same time as a tool for achieving the European objectives for social inclusion, differences eradication, and intercultural dialogue.

Regarding the e-Learning development in Romania, even if the indicators are not at the level of other EU countries, one can observe that the situation has improved and electronic training begins to be used increasingly often. However, given that one of the objectives of the European Union is to create an information society for all by 2010, Romania, as a Member State, must align to this requirement. The first steps were taken through implementing e-Learning projects and defining the barriers that stand in the way of an information society for everyone. In the Romanian educational system – rather conservative – changes occur gradually and it takes a long time until the innovations (especially quite radical, such as those generated by the introduction of ICT) are assimilated.

DATA MINING FOR BUSINESS INTELLIGENCE

Soavă Georgeta

University of Craiova, Faculty of Economics and Business Administration

Raduteanu Mircea Alexandru

University of Craiova, Faculty of Economics and Business Administration

Business Intelligence (BI) solutions have for many years been a hot topic among companies due to their optimization and decision making capabilities in business processes. Data Mining offers a variety of advanced data processing techniques that may beneficially be applied for BI purposes. This process is far from simple and often requires customization of the DM algorithm with respect to a given BI purpose. The comprehensive process of applying BI for a business problem is referred to as the Knowledge Discovery in Databases (KDD) process and is vital for successful DM implementations with BI in mind. In this project the emphasis is on developing a number of advanced DM solutions with respect to desired data processing applications chosen in collaboration with the project partner, gatetrade.net. In the project, gatetrade.net is the primary data supplier.

Keywords: Business Intelligence, Data Mining, Knowledge Discovery in Databases,

Cod JEL :M15.

1. Introduction

Many present Business Intelligence analysis solutions are manually operated making it both time consuming and difficult for users to extract useful information from a multidimensional set of data. By applying advanced Data Mining algorithms for BI it is possible to automate this analysis process, thus making the algorithms able to extract patterns and other important information from the data set. The process of applying DM for BI purposes (referred to as the Knowledge Discovery in Databases process) is the main subject in this project. The data analyzed in the project is provided by gatetrade.net who is keen on exploring the various advanced data processing possibilities of their data.

2. Business Intelligence

Business Intelligence (BI) refers to computer-based techniques used in spotting, digging-out, and analyzing business data, such as sales revenue by products or departments or associated costs and incomes.

BI technologies provide historical, current, and predictive views of business operations. Common functions of Business Intelligence technologies are reporting, online analytical processing, analytics, data mining, business performance management, benchmarking, text mining, and predictive analytics.

Business Intelligence often aims to support better business decision-making.[2] Thus a BI system can be called a decision support system (DSS).[3] Though the term business intelligence is often used as a synonym for competitive intelligence, because they both support decision making, BI uses technologies, processes, and applications to analyze mostly internal, structured data and business processes while competitive intelligence, is done by gathering, analyzing and disseminating information with or without support from technology and applications, and focuses on all-source information and data (unstructured or structured), mostly external to, but also internal to a company, to support decision making.

Business intelligence is a decision support tool used to capture, report, and analyze a subset of organizational data without affecting operational systems. The software provides essential business visibility to help clients' businesses grow by giving them the information they need about product, sales, and customer behavior. It allows clients to look at their businesses in different ways, and helps them to understand the core issues so they can take action to improve performance.

Key Business Intelligence Features: facilitate corporate decision making initiatives; meet compliance and governance standards (i.e. SOX, HIPAA); align business processes with information systems; maximize sales and customer service initiatives; attain return on investment (ROI) on planning initiatives (i.e., product distribution).

BI can help you compete more effectively with your bigger competitors by enabling you to make better and faster decisions. It can extend and strengthen the functionality of your existing enterprise resource planning (ERP) and customer relationship management (CRM) systems. It can help put the past into useful perspective while allowing you to effectively plan for the future. Business intelligence is information about a company's past performance that is used to help predict the company's future performance. It can reveal emerging trends from which the company might profit. Data mining allows users to sift through the enormous amount of information available in data warehouses; it is from this sifting process that business intelligence gems may be found.

3. Knowledge Discovery in Databases

A popular term in the world of intelligent data processing is Knowledge Discovery in Databases (KDD). Fayyad [4] defines KDD as "the nontrivial process of identifying valid, novel, potentially useful, and ultimately understandable patterns in data". Understanding the difference between Knowledge Discovery in Databases and Business Intelligence (and Data Mining) is important for this project and should therefore be elaborated on.

The terms Knowledge Discovery in Databases and Data Mining are often believed to have the same meaning. However, this is not the fact! While Data Mining is the name of a group of intelligent BI methods the term KDD describes the entire process of extracting information from a data warehouse. Moreover, the Data Mining task is part of the KDD process and according to Fayyad the KDD process can be divided into the following steps (once the wanted goals of the process has been decided on).

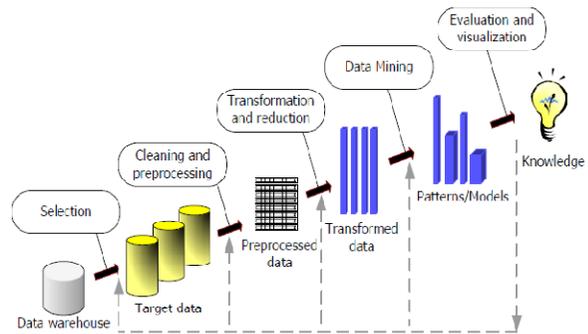

Fig.1. Fayyad's KDD process.

1. Selecting target data from a data warehouse - A data warehouse often contains many databases which each contain large amounts of data. To save resources only relevant target data should be selected from the data warehouse.
2. Cleaning and preprocessing the target data - The raw data is often in an unwanted format and may contain noise and missing data fields. Strategies for handling these factors should be decided on.
3. Transformation and reduction of the preprocessed data - In this step, useful features to represent the data depending on the goal in a given task should be found. Further, dimensionality reduction/transformation can reduce the effective number a variables in consideration.
4. Applying Data Mining to the transformed data - Once the data has been transformed, a proper Data Mining technique should be applied in order to intelligently process the data for patterns and other information.
5. Evaluation/visualization of Data Mining results - The results of the Data Mining step are not always easy to interpret. Using visualization in the evaluation process can therefore be of great advantage. All of the steps in the KDD process are essential to ensure useful models/patterns are extracted from a given data set. Solely applying Data Mining methods to data sets regardless of the other KDD steps often results in discovery of misleading models/patterns and is therefore a risky activity. As shown in figure 1, the KDD process is iteratively involving

numerous steps with many decisions made by the user. Finally, if useful knowledge is extracted in the KDD process this should be implemented in the respective company's business model in order to optimize important factors such as turnover and profit.

4. Data Mining

The most challenging step of the Knowledge Discovery in Databases process (figure 1) is probably performing the actual Data Mining. As mentioned earlier, Data Mining is the task of extracting patterns and other interesting relations from large volumes of data. This nontrivial task is accomplished by the use of complex algorithms in a (semi-)automatic manner.

Data mining is the process of extracting patterns from data. Data mining is becoming an increasingly important tool to transform this data into information. It is commonly used in a wide range of profiling practices, such as marketing, surveillance, fraud detection and scientific discovery.

Data mining can be used to uncover patterns in data but is often carried out only on samples of data. The mining process will be ineffective if the samples are not a good representation of the larger body of data. Data mining cannot discover patterns that may be present in the larger body of data if those patterns are not present in the sample being "mined". Inability to find patterns may become a cause for some disputes between customers and service providers. Therefore data mining is not foolproof but may be useful if sufficiently representative data samples are collected. The discovery of a particular pattern in a particular set of data does not necessarily mean that a pattern is found elsewhere in the larger data from which that sample was drawn. An important part of the process is the verification and validation of patterns on other samples of data.

Data mining commonly involves four classes of tasks:

- **classification** - arranges the data into predefined groups. For example, an email program might attempt to classify an email as legitimate or spam. Common algorithms include decision tree learning, nearest neighbor, naive Bayesian classification and neural networks;
- **clustering** - is like classification but the groups are not predefined, so the algorithm will try to group similar items together;
- **regression** - attempts to find a function which models the data with the least error;
- **association rule learning** - searches for relationships between variables. For example a supermarket might gather data on customer purchasing habits. Using association rule learning, the supermarket can determine which products are frequently bought together and use this information for marketing purposes. This is sometimes referred to as market basket analysis.

Data mining in customer relationship management applications can contribute significantly to the bottom line. Rather than randomly contacting a prospect or customer through a call center or sending mail, a company can concentrate its efforts on prospects that are predicted to have a high likelihood of responding to an offer. More sophisticated methods may be used to optimise resources across campaigns so that one may predict which channel and which offer an individual is most likely to respond to — across all potential offers. Additionally, sophisticated applications could be used to automate the mailing. Once the results from data mining (potential prospect/customer and channel/offer) are determined, this "sophisticated application" can either automatically send an e-mail or regular mail. Finally, in cases where many people will take an action without an offer, uplift modeling can be used to determine which people will have the greatest increase in responding if given an offer. Data clustering can also be used to automatically discover the segments or groups within a customer data set.

Businesses employing data mining may see a return on investment, but also they recognise that the number of predictive models can quickly become very large. Rather than one model to predict which customers will churn, a business could build a separate model for each region and customer type. Then instead of sending an offer to all people that are likely to churn, it may only want to send offers to customers that will likely take to offer. And finally, it may also want to determine which customers are going to be profitable over a window of time and only send the offers to those that are likely to be

profitable. In order to maintain this quantity of models, they need to manage model versions and move to automated data mining.

Another example of data mining, often called the market basket analysis, relates to its use in retail sales. If a clothing store records the purchases of customers, a data-mining system could identify those customers who favour silk shirts over cotton ones. Although some explanations of relationships may be difficult, taking advantage of it is easier. The example deals with association rules within transaction-based data. Not all data are transaction based and logical or inexact rules may also be present within a database. In a manufacturing application, an inexact rule may state that 73% of products which have a specific defect or problem will develop a secondary problem within the next six months.

Market basket analysis has also been used to identify the purchase patterns of the Alpha consumer. Alpha Consumers are people that play a key roles in connecting with the concept behind a product, then adopting that product, and finally validating it for the rest of society. Analyzing the data collected on these type of users has allowed companies to predict future buying trends and forecast supply demands.

Data Mining is a highly effective tool in the catalog marketing industry. Catalogers have a rich history of customer transactions on millions of customers dating back several years. Data mining tools can identify patterns among customers and help identify the most likely customers to respond to upcoming mailing campaigns.

5. gatetrade.net company profile and

It makes good sense to use Fayyad's KDD process [4] in the complex task of exploring gatetrade.net data and extracting useful information from it. Before the different steps of the KDD process are carried out in chapter 5, it is important to have clear goals and intentions of what the applied Data Mining should accomplish with respect to the gatetrade.net data. A short profile of gatetrade.net and its business areas is also relevant.

5.1 gatetrade.net Profile

gatetrade.net is a 100% Danish owned company that is leading in its field of business in Denmark with more than 1500 customers [5]. gatetrade.net specializes in e-trade solutions which basically make e-trading easier and cheaper for buyers and suppliers with typical commodities such as different office supplies and services. The e-trading is taking place on multiple systems [6] and two of these are of interest in the KDD analysis.

- **gatetrade.net - marketplace** : the marketplace system offers a complete basic e-trade solution to companies of all sizes and the ability to fully integrate with prior commerce systems should that be the case. Marketplace is solely web based which makes it easy to generate and handle invoices. By further offering updated supplier catalogues and administration of suppliers price and framework agreements, Marketplace constitutes a cost efficient solution. In order to use Marketplace every buyer and supplier must pay a periodic subscription fee which amount depends on the buyer/supplier's size/usage. Moreover, suppliers must additionally pay a given percentage of their turnover.

gatetrade.net - eProcurement: besides offering a complete basic e-trade solution the eProcurement system also supports full integration with most accounting systems. Moreover, eProcurement is fully integrated with Marketplace allowing the buyer to do trading through Marketplace and benefit from its advantages. eProcurement thereby provides a broader and more complete e-trade solution compared to Marketplace.

5.2 Goals of the KDD process

Fayyad's [4] KDD process requires predefined goals/objectives before any of its steps can be carried out. A list of prioritized goals for BI solutions has therefore been made in collaboration with gatetrade.net. Time-wise, the list should reflect goals that are realistic to complete within the period during which the project is done. This limitation is necessary due to the countless

possibilities/applications of Data Mining and other Business Intelligence methods as mentioned earlier on.

1. Examine transactions that are not made through the Marketplace and the possible reasons for this.
2. Analysis of buyers' use of suppliers in Marketplace. Examine if the number of suppliers of a given buyer can be reduced in order to obtain lower prices for the buyer.
3. Analysis/profiling of monthly buyer/supplier development for Marketplace/eProcurement.
4. Analysis of lost suppliers in Marketplace.
5. Examine in Marketplace if trade is canalized through top buyers in a given company leaving a number of inactive buyers.
6. Examine the possibility of recommending relevant products to buyers in Marketplace.

5.3 Extraction of proper data from gatetrade.net data depot

Locating relevant data from the gatetrade.net data depot should be done with respect to the list of data processing goals. The gatetrade.net data depot holds several databases for both the Marketplace and the eProcurement system. Marketplace data is available from the 15 month period, January 2009 - March 2010 while eProcurement data is available from the 7 month period, September 2009 - March 2010. The structures of the main databases available for both Marketplace and eProcurement are exclusively of a transactional character as order information are continuously being stored in these. Each new order is for both systems stored as an order header (containing various details of buyer, buyer's company, supplier, etc.) and a number of order lines (one line per different product in the order). It should be stressed that although the eProcurement system names its contents "invoice" these are in this project referred to as orders similar to the orders in the Marketplace system. For each order this project operates with three main players - the buyer in the order, the buyer's company and finally the supplier of the product(s) in the order.

The following sections illustrate from which databases data for this project was gathered along with a short description of the data. All gatetrade.net data were extracted in Excel format directly from the data depots.

- Marketplace databases

Data from the Marketplace system was collected from two primary databases in the gatetrade.net data depot. The first database contains order headers (POM_ORDER_HEADERS) while the second stores order lines (POM_ORDER_LINES). The common attribute ORDER_NUMBER binds headers and lines to specific orders. Moreover, POM_ORDER_HEADERS numbered 150.000 + order headers and POM_ORDER_LINES numbered 400.000+ order lines for the given time period. Database relations are illustrated figure 2.

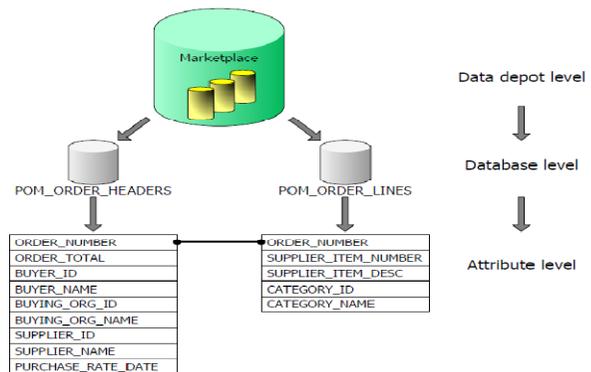

Fig. 2. Overview of extracted Marketplace databases and attributes.

Attribute descriptions of databases POM_ORDER_HEADERS and POM_ORDER_LINES attribute descriptions are found in table 1 and 2 respectively.

Table1. POM_ORDER_HEADERS

Attribute	Description
ORDER_NUMBER	ID number of order
ORDER_TOTAL	Total of order
BUYER_ID	ID of buyer
BUYER_NAME	Name of buyer
BUYER_ORG_ID	ID of buyer's company
BUYER_ORG_NAME	Name of buyer's company
SUPPLIER_ID	ID of supplier
SUPPLIER_NAME	Name of supplier
PURCHASE_RATE_DATE	Date of order

Table 2. POM_ORDER_LINES

Attribute	Description
ORDER_NUMBER	ID number of order
SUPPLIER_ITEM_NUMBER	Supplier's ID of a given product
SUPPLIER_ITEM_DESC	Supplier's description of a given product
CATEGORY_ID	ID of product category
CATEGORY_NAME	Name of product category

- eProcurement databases

Similar to Marketplace, orders from the eProcurement system are collected to two main databases in the gatetrade.net data depot. The first database contains order headers (eProc_INVOICE) while the second stores order lines (eProc_INVOICELINE). The common attribute pkid/invoice_id binds headers and lines to specific orders. Further on, information on eProcurement buyers, companies and suppliers are provided by three smaller databases (eProc_USER, Proc_COMPANY and eProc_SUPPLIERS). Moreover, eProc_INVOICE numbered 65.000+ order headers and eProc_INVOICELINE

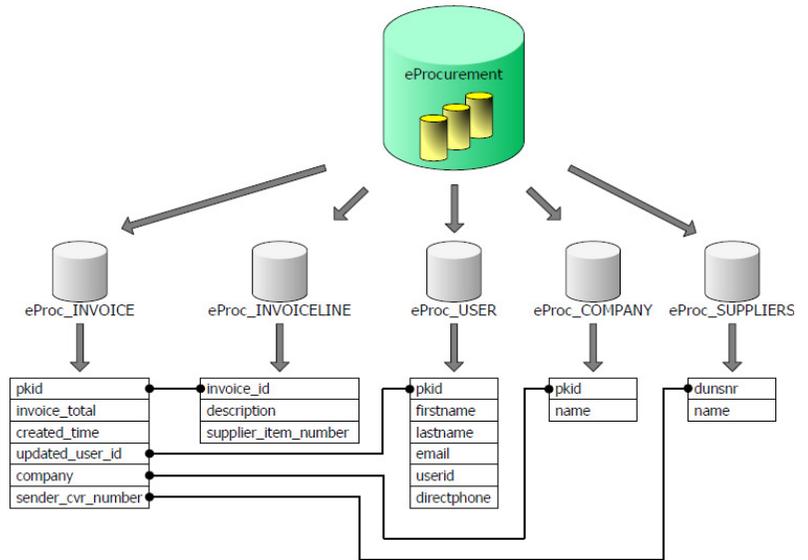

Fig. 3. Overview of extracted Marketplace DB and attributes

numbered 350.000+ order lines for the given time period. All database relations are illustrated in figure 3. Attribute descriptions of databases eProc_INVOICE and eProc_INVOICELINE attribute descriptions are found in table 3 and 4 respectively.

Table 4. eProc_INVOICE

Attribute	Description
pkid	ID of order
invoice_total	Total of order
created_time	Date of order
updated_user_id	ID of buyer
company	ID of company
sender_cvr_number	CVR number of supplier

Table 5: eProc_INVOICELINE

Attribute	Description
invoice_id	ID of order
description	Buyer's description of a given product
supplier_item_number	Supplier's ID of a given product

Among the specialized analysis tools, spreadsheet applications are the most accessible. In addition, techniques and tools for organizing, processing and presentation of basic data, such as strengthening multiple lists, filtering, running sum, pivot tables they offer, largely satisfy the needs of organization and data analysis activities in the field of economics. For this reason we conducted a study in which we sought to obtain information on how these applications are used in the economic field.

Keywords: data analysis, worksheet, economic analysis activity, working reports

JEL codes: C80, M21

1. Introduction

Economic activity involves many decision situations. Their complexity involve organizing, processing and analyzing of a large volume of information. [4] Because of the software tools, more diverse and better, information can be organized and processed quickly, accurately and in depth. For the same amount of data processed a larger volume of complex and diverse information can be achieved, allowing to get a more complete picture of the decision analysis situation. [2]

In the data analysis activity traditional methods and software tools can be used, such as: dispersion analysis software, multi-factor techniques, regression analysis software, data-series analysis software is useful in data-series analysis in their trend format, seasonality and of the other dynamic series components.

But where would be a more complex economic analysis, viewing the information in the form of diagrams is necessary to use specialized software tools for analysis, such as spreadsheet applications, multidimensional analysis tools, data mining applications. [1]

Among the specialized analysis tools, spreadsheet applications are the most accessible, regarding the price. In addition, techniques and tools for organizing, processing and presentation of basic data, such as strengthening multiple lists, filtering, running sum, pivot tables they offer, largely satisfy the needs of organization and data analysis activities in the field of economics. [3] For this reason we conducted a study in which we sought to obtain information on how these applications are used in the economic field.

2. Data analysis and interpretation

The study was conducted with the help of the masters in economics students from the University of Oradea. The specializations covering the activities of marketing, management and accounting were

taken into account. The most of the master degree students, both first and second year, have a job in state institutions and private companies in the western part of the country, being involved in economic activities. Thus they can provide valuable information on how spreadsheet software are used in business, the importance that managers attaches to improve the knowledge for their employees in using these applications.

Economic activities involving the subjects were grouped as follows:

- Management activities;
- Marketing activities;
- Accounting activities.

The sample chosen for study is representative because of the large number of institutions and companies in which students work. The table below presents the number of institutions and companies considered:

Investigated domain	Number of students	Number of institutions	Number of companies	Institution and companies
Management	150	27	104	131
Marketing	150	11	123	134
Accounting	150	24	106	130
Total	450	36	298	334

From the table above one can see that the subjects who participated in the study came from 36 institutions and 298 private or state companies.

To collect the necessary information a questionnaire was compiled, which was served with either students or was sent by email. Questionnaires were completed by almost all students entered in their possession. Therefore, the total of 450 questionnaires distributed, 446 were completed, returned and used for analysis, resulting in a response rate of 99.11%.

Response rate is very high compared to the situation in which questionnaires were sent for completion to persons who are not involved in an continuous learning activity. This conclusion has been driven during previous studies in which questionnaires were sent only by e-mail to people working in the economic field, without involving students. Response rate in those cases ranged between 50% - 60%.

The questions were grouped as follows:

- Questions related to the activity field of the subjects (management, marketing, accounting) and their studies.
- Questions related to the number of employees of the institution or company, the share in the total number of the company's employees of the people working in the activity field of the respondent.
- Questions related to the graduated domain, informatics studies attended, software application known.
- Questions related to the complexity of the reports they manage.
- Questions related to the activity of the economic data analysis.
- Questions related to the software applications they use in their activity.
- Questions related to the spreadsheet solutions used: the complexity of the processed data, instruments for data management, data processing and data analysis.

Collected data showed that:

- % of the subjects use spreadsheet solutions in data management, data processing and data analysis activity.
- % of the subject do not use spreadsheet solutions. Examples for this situation:
 - Subjects employed in a small business private company (under 10 employees). These companies usually use software only for accounting activities. Data analysis is reduced only to compare levels at different period of time (usually the current and previous month) for management decisions. For example current month's sales are compared to those of the

previous month, the result being used to make a decision regarding the level of the next month's supply.

- Subjects that works as accountants. They use only accounting software to generate accounting reports.

- Subjects which use other software applications in data analysis, such as: data-mining specialized software, database software which include data mining instruments.

- % of the subjects which do not use spreadsheet solutions works as accountants. In most cases, they use specialized software to generate specific (desired) reports based on the software's graphic user interface- GUI (menus, commands, and so on). Data analysis and processing is made by other employees of the company.

- % of the subjects use "working reports" type software, created inside company or institution. This is the case of the employees working in a company or institution with specialized workers, employed to create personalized software.

- % of the subjects uses Microsoft Excel ® as spreadsheet solution. In most cases spreadsheets are used only for simple calculus, such as summation. Using the results, a person can make a decision, usually regarding what to do next month, based on the current month data, compared to the data acquired in the previous month. In other cases are used instruments for organizing, statistic processing and simple analysis of the data offered by the spreadsheet software: multiple lists consolidation, summation, filtering, subtotals, pivot tables, trend diagrams and relations, alternative comparison for optimum decisions.

-The most people using spreadsheet applications or type of work reports, ie 47.80%, works in managerial domain. Short distance behind, with a percentage of 42.65% is the marketing domain. The accounting domain is the worst, those who use spreadsheet applications or type of work reports representing only 9.55%.

Results are synthesized in the table below:

Software used \ Field of activity	N	A	B	C	D	E
Management	%	78 52,00	3 2,00	11 7,34	38 25,33	20 13,33
Marketing	%	67 45,27	6 4,05	14 9,47	29 19,59	32 21,62
Accounting	%	19 12,84	-	4 2,70	3 2,02	122 82,44
Total	%	164 36,77	9 2,02	29 6,50	70 15,70	174 39,01

A - Microsoft Excel

B - Other spreadsheet applications

C - "Working reports" type software applications realized inside the respondent's institution or company

D - Bought "working reports" type software applications

E - Do not use neither spreadsheet application nor "working reports" type software

It appears that 39.24% of the respondents used in their work spreadsheet applications and 36.77% of them use Microsoft Excel ®. Using mainly of Microsoft Excel ® can be explained as follows:

- Institutions and companies largely use the Microsoft Office software package, which includes the Excel spreadsheet application.

- The economic students, have in their syllabus, information on how to use this application

- Possibility of obtaining certification by ECDL accredited test centers in some schools in Oradea and in several localities of Bihor county and the Faculty of Economics, certification that entitles their owners to the use of Microsoft Excel.

3. Conclusions

Most of the University of Oradea students in master's cycle in the economy domain, are employed in state institutions or private companies, being involved in economic activities. They use pretty much in their activities of management and marketing, spreadsheet applications, or “working reports” type software. The survey found that 60.99% of the respondents use such applications.

Among those who know and use spreadsheet applications for drawing up the reports necessary for carrying out the work, 94.80% use the Microsoft Excel. This is due, on the one hand, to the fact that institutions and firms use mainly Microsoft Office software package, and secondly, that economic graduates know how to use Microsoft Excel application from school.

European Union enlargement, the existence of new needs and demands, requires the development of innovation and quality of public administration, which means improving public services in the global economy as a requirement of competitiveness.

The European Union hopes to achieve the major objectives in what concerns the electronic government by 2010; actions necessary to achieve them are adopting solutions based on information and communication technologies in the Romanian public administration, aimed at developing modern public services. This paper presents some best experiences of e-governance in Romania and the results of e-governance in Gorj County, and the degree of implementation and use by citizens.

Keywords: electronic government, information technology and communications, public services.

Cod JEL: O34, M15, L86

1. Development of e-Government services in the current European context

The existence of efficient and innovating public administrations is essential in a global and competitive Europe. Government is the key element for the management and putting the potential of the public sector to good use.

The electronic governance is the acceptance of general Government use of IT applications and other information technologies based on the Internet, combined with processes that implement these technologies to improve access and delivery of government information and services to the public, or to other agencies and government entities. This brings improvements in the workings of government that result in increased effectiveness, efficiency and service quality.

In general, the administrations of most developed cities make use of initiatives and programs at national and international level in order to achieve and develop an environment for e-government services in the city. Their policy is focused on developing several types of services and the establishment of a wide range of services (for citizens and businesses).

Strategy shift to e-government transformation and modernization of government is imposed by information technology and communications. Digital Governance refers to the web infrastructure to provide online services. According to an analysis of websites of major cities, which took into account five variables (security and confidentiality, can / utilization, content, type of online services offered,

answer citizens and ensuring their participation through websites), increase participation is a key to the e-government strategies¹⁷⁵².

Providing information and knowledge needed in the sector was a priority for governments from the beginning. They must be integrated through interactive tools that allow, for example, involving people in defining and evaluating public policies. The most important electronic governance models focus on user involvement and citizens on the one hand, and the services provided to users in urban areas, on the other.

E-Government services involve the public sector to the challenges and requirements of the new economy. Therefore, accelerating the implementation of electronic government is important in order to innovate and modernize public services¹⁷⁵³.

Throughout the world, governments are showing interest in new technologies and electronic services of the future, allowing the implementation of electronic government, but must not forget that this involves major changes in public institutions and facilities.

Internet is easy to use and involves low cost of use, this making it a digital instrument that anyone can use. This is why the Internet is now an opportunity for the Board to serve citizen information technology intensively. Internet access isn't the only element that influences the level of development of applications for electronic government. The use of this application depends also on *education* and on *the change of mentality*, and the success of implementing these applications determines the acceptance and the impact they have in modern society. Not so long ago, citizens perceived public service negatively, being most often displeased of their quality. The level of satisfaction of the citizens is tied to their expectations regarding public service.

The European Union has identified five priorities or **major objectives regarding e-government for 2010**, which are¹⁷⁵⁴:

- ***Efficiency and efficacy***, which implies an important contribution of e-government services to the increase of satisfaction, transparency and responsibility, to the reduction of bureaucracy and to the increase of efficiency by the year 2010.

- ***Implementing key services, with major impact on the citizens and on the business environment***, so, by the year 2010, public acquisitions will be 100% available online. The achievement of this objective also involves the future cooperation for the development of online services that have strong impact on the citizens.

- ***Offering services for all citizens***, which means stimulating the inclusion through e-government, so all citizens will benefit from secure, innovative and easy to use services by 2010.

- ***The introduction of identification keys, which allow authenticated access to public services, based on laws concerning the protection of data***. This allows citizens and the business environment to benefit of authenticated convenient access by 2010, secure and interoperable to public services from Europe (for example, eIDM, and the management of electronic identification for interoperable access to public services).

- ***Strengthening the participation of citizens to the process of government and the democratic adoption of decisions***, by promoting public debate and the participation to the process of making decisions in a democratic way.

The i2010 plan for e-government – „Accelerating e-government in Europe for everyone's benefit”¹⁷⁵⁵ has as main goals accelerating the process of obtaining attainable advantages for all citizens and for the

business environment; the assurance that national e-government does not lead to new barriers on the unique market because of fragmentation and lack of interoperability; expanding the advantages for the European Union through large scale economies that can be obtained in member states and cooperation in order to find solutions to common problems that appear in Europe; ensuring the cooperation of all European Union stakeholders in planning and providing e-government services. For the development of electronic government services concentrated actions are necessary, like:

- establishing a common guide, approved by member countries that will align the development of electronic government with the accessibility of electronic communication;
- advancing specifications for strategies of providing services that will allow access to e-government services through varied channels like digital television, fixed and mobile telephony and other interactive environments;
- establishing a common measurement of the impact of e-government services;
- exploiting the mechanism that ensures long term financial and operational durability for infrastructure and electronic services;
- accelerating the establishment of common specifications for public acquisitions in the European Union and launching pilot programs in this area;
- testing instruments based on information technology and communications that facilitates the transparency and involvement of the public in adopting decisions and also backing exchange of experience;
- establishing an advanced form of electronic democracy, etc.

The actions presented above and announced through i2010 were introduced in the period 2006 – 2010 and will need the cooperation of all stakeholders in order to develop electronic government in the European Union.

2. Integrated development and implementation of online public services in the Gorj County Council

Objective of the project concept development and implementation of electronic administration in the Gorj County Council, focuses on quality growth and development of electronic public services for the benefit of citizens, providing online public services to citizens / public administration at a level of sophistication environment and efficient activities of the County Council, using specific information technology by implementing new work flows, related to e-administration services.

The project will have the main results and increase satisfaction in Gorj County citizens through: transparency in providing information and electronic public services, equal access for all citizens, and better information and service them through public service available "on line" simplify, accelerate and strategic management of economic processes to be conducted on the basis of solutions, ensuring the security of transactions in a centralized, 24 hour availability of services 24, 7 days a week, in a solution integrated, consistent, easily integrated with other systems and easy to manage. Also, another significant result pursued by the project is the efficient activities of the Gorj County Council, using specific means of ICT, by: improving the quality of the administrative act and change deep relationship between public administration and citizen, increase efficiency of public administration, elimination bureaucracy and increase the quality of public services, creating a centralized system for routing administrative documents (administrative forms), ensuring the security of transactions in a centralized, retraining public servants, raise their professional standard.

3. The overall system architecture

In defining the architecture that will support the Information System Development and increased efficiency of electronic public services to citizens and businesses in Gorj country, were taken of the following general features of the system:

- Availability: Availability of IT& C depends largely on the care with which it was designed, the discipline with which it is operated, the rigor with which it was tested and optimization to over exploitation. Key availability is found in insulation capacity of that "single point of failure" existing in the individual components of the system (equipment and / or applications), thereby maximizing its uptime. Techniques and technologies to increase the availability of time are: to ensure redundancy (multiple-way communication between server and client) in the communications, and using technologies like clustering to services.
- Data security: risk management by ensuring adequate protection of networks and systems should ensure confidentiality and integrity of information circulating through the system, is an important goal in designing any system IT & C The only solution for doing so in a consistent manner is strict observance of a policy in the organization, named "defense-in-depth".
- Defense-in-depth multi-level security defines bidirectional, organized in areas of security, which ensures the compartmentalization system so that if one part of it is compromised by a potential attack, it can not compromise the other compartments.
- Scalability: scalability is the ability of a system to cope with an ascending continuous charging, without decreasing performance. In general, the major components of a system architecture that is subject to scalability are: topologies and network systems, application servers, infrastructure services, infrastructure management components and subsystems responsible for storing data.
- Safety in operation: is based on the repetitiveness with which architecture has been implemented successfully as standard system architecture. Reliability of operation may directly affect the system availability at the macro level and indirectly, the degree of success that can be achieved in areas such as security, scalability, and performance management capacity. Safety in operation is addressed to several levels (layers) and is especially critical for solution scalability and performance of individual applications.
- Standardization: implementation of infrastructure components, standardized by well-known architectural elements, creates predictable and reliable systems to exploit. Standardization creates a solid foundation for growth management system, ensuring integration of processes / applications and technologies within the organization.

The system should not allow the loss of data, in this sense is necessary to restore capabilities in case of accidents and ways to prevent them. Also, system architecture will be a component of security infrastructure that does not allow unauthorized access to data. The information and communication system will be arranged on two levels:

- Level of infrastructure: including all subsystems necessary for the functioning and security specific applications. This level contains the following subsystems:
 - Subsystem Hardware.
 - Communications Subsystem.
 - Subsystem Software Basic.
 - Security Subsystem.
- The level of specific applications: includes all the subsystems that support the activities of carrying on specific activities management. This level contains the following subsystems operating on different applications within each organization in part:
 - Economic Management Subsystem.
 - Subsystem HR and payroll.
 - Subsystem local taxes.
 - Subsystem "Marital status".
 - Subsystem "Agricultural Register".

- Subsystems necessary to complete the electronic services delivery system:
 - Subsystem Design and simulation work processes.
- Subsystem document management and workflow (including electronic registry).
- Project Management Subsystem.
- Subsystem external portal (the management of electronic identity for citizens enrolled in the system and operators).
- Public area of the portal institution with the functions of advertising and promotion of information of general interest.
- Component type discussion forum - which will be held on various issues - instead of being extracted information on the areas of interest to citizens for the development of new services coming to meet local community needs.
- Component type probe public opinion on the subject of attention of public opinion about various aspects of community life to find solutions closest to the characteristics of the local community.
- Subsystem management relationship with citizens and businesses.
- Implementation of computer application project specific indicators.
- Business Intelligence Subsystem.
- Subsystem Management Application.

Principle of the computer system architecture and communications for “Integrated development of online public services in Gorj” can be represented as follows:

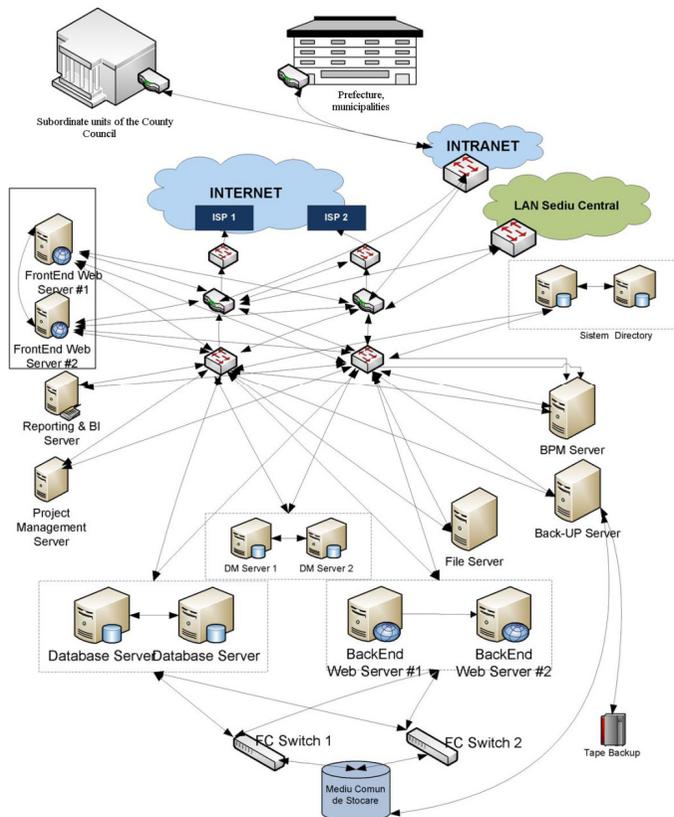

Fig. 1 County computer system architecture: Online public services

To achieve system and the Communications Council, have been taken into account these technical possibilities of designing the architecture: a centralized system, this calls for a single Data-Center, centrally, and connecting all secondary locations via VPN network , the centralized database management requires a single point, making data transfer is vertical; due to the necessity of obtaining and processing data in real time, seen fit to implement a system to connect all users to a central system. Of course, such architecture requires a communication system adequate to ensure access any information from the system operator, with reasonable response times.

4. Conclusions

In the macroeconomic context of Romania in the last few years, the IT&C sector has grown in importance, becoming a valuable instrument and important element of success, capable of generating economic growth, promoting education and, last but not least, offering real support to democracy. In this context, the initiatives of e-government of creating an electronic infrastructure that will bond educational institutions, governmental agencies, and public sectors to private sectors have formed the premise for the development of the IT&C sector.

New information technologies and communication has favored gathering, analyzing and access to information, leading to more efficient activities, a better act of decision and more transparent public and local institutions in their relationship with the citizen, who has a right for free access to information.

The Romanian strategy for e-Government is tied to the growth of the entire sector of information technology and communications and it concentrates on the government's effort to implement those electronic services that have high economic and social potential. Only through actions of developing modern electronic services can e-Government ensures transparency and institutional credibility and reduce costs necessary for managerial process in public services. In this context, the main objectives for e-Government are the use IT instruments in the sector of public administration in order to make day to day activities more efficient, the presence of public administrations on the Internet, providing more accessible information to citizens and companies, the growth of utility and usage of interactive services for citizens and companies and last but not least changing the experience of e-Government nationwide.

The achievement of these goals is not possible if a strong partnership between all sides involved (public authority, public administration and civil society), that leads to creating intelligent public services based on new information technology and communications, does not exist.

The development of public services bring benefit both in the public and private sectors, translated into economic growth, a favorable environment for investments and better use of public resource, including Structural and Cohesion Funds.
