CONTINUING INTERNATIONAL TRADE LIBERALIZATION IN THE FINANCIAL CRISIS CONTEXT

Berinde Mihai

University of Oradea, Economic Sciences Department

This research paper is based on an assessment of the effects of the recent financial crisis on the international trade and the way states and international organizations acted in this context. The importance of this research topic consists in identifying the way the international trade liberalization process has been affected by the financial crisis and the way anti-crisis measures deviated from the basic rules agreed under the aegis of WTO/GATT.

The intended purpose of the paper is to conduct a substantive assessment of undertaken actions by the various states aimed to mitigate crisis impact on anti-dumping investigations and measures. Precisely, it was assayed whether the international financial crisis has been an opportunity for WTO member states to plainly intervene in the economy and give up the commitments they made in the context of multilateral commercial negotiations. Considering the international, regional and national effects of the crisis the topic has been copiously elaborated on by economics literature. A number of anti-crisis measures were presented encouraging massive intervention in the economy, as well as actions, particularly of International Organizations according to which measures could be taken without deviating from globally agreed mechanisms and principles. In order to be able to find out which of these two options prevailed in actions undertaken by the states the types of international, regional or national anti-crisis measures were selected. Positions voiced by the World Trade Organization, United Nations Conference on Trade and Development (UNCTAD), European Union are rendered.

To answer the question about the way it has been responded in order to mitigate crisis effects, adopted anti-crisis measures were inventoried and their deviation from international rules was assessed.

One of the indicators used in the assessment of anti-crisis measures is the progress of the anti-dumping investigations and measures notified to WTO in the past 9 years for which data were available (2003-2009). The relevance of this period lies in the fact that it includes 5 pre-crisis years and 2 years when it was strongly evident.

It was found that the number of anti-crisis investigations and measures has not seen significant increases during the crisis period. Moreover, it has been found that states have shown a certain amount of flexibility in construing application of certain international principles rather than relinquishing them.

It is thereby demonstrated that the international trade liberalization process continues without major disruptions by the financial crisis. This gives confidence to states and business environment with respect to predictability of international trade developments.

The paper has significant added value brought about by both literature processing and interpretation and the author's experience in international trade negotiations. The very election of the indicator pertaining to anti-dumping investigations and measures was based

on the fact that changing trade defence mechanisms into protectionist mechanisms often stands for prevailing immediate crisis resolution.

Keywords: financial crisis, anti-dumping investigations and measures, trade liberalization, state aid, preferential trade systems

Code JEL: F13, F15

I. Introduction

The topic of this paper is directly related to the financial crisis effects on international trade liberalization. It aims to identify the way anti-crisis measures affected international trade negotiations in view of trade liberalization, successful performance of preferential trade systems, as well as negotiation and implementation of regional integration agreements.

Trade liberalization has seen various approaches. In many instances it has been regarded as detrimental to economic development, protectionist theories attempting to maintain the need to increase borderline protection by various tariff, non-tariff or para-tariff measures resulting in reduced cooperation and isolation of protected economies. In these circumstances, international trade liberalization has been accepted as a solution to encourage economic development.

Right after the Second World War, international trade liberalization panned out and the General Agreement on Tariffs and Trade (GATT) was negotiated in order to serve as a general framework for the liberalization process.

At the time, the matter of creating the World Trade Organization was brought up for discussion as a third pillar of the world economy along with the International Monetary Fund and the International Bank for Reconstruction and Development. Failure to fully understand the liberalization process as well as the absence from negotiations of some important states did not enable creation of this organization. Participating countries did not forsake the idea of creating such an organization and eventually, it was established under the Marrakech Agreement signed upon the finalization of multilateral trade negotiations within Uruguay Round. On this occasion, multilateral agreements were also renegotiated and complemented which allow member states to intervene in parallel with the liberalization process, by trade defence measures, based on well established internationally agreed rules (agreements concerning anti-dumping measures, compensatory taxes, safeguard measures, and restrictive measures by reason of major imbalances in the balance of payments).

Hence, it ensues that the liberalization process cannot and should not be seen as being apt to exclude its regulation. These are two processes going ahead together and ensure beneficial effects for economic development. International trade liberalization deepened via the multilateral negotiation rounds amongst which Uruguay Round has been the most complex and important.

Another means of trade liberalization consists in the international application of customs preference systems apt to increase commercial competitiveness of products coming from developing countries in the world market. Thus, the General Preference System (GSP) was defined which provides facilities for developing countries in their relations with developed countries. Likewise, developing countries defined the General System of Trade Preferences (GSTP) and the Protocol of 16 (P-16) which should enable trade liberalization among these countries. Aware of the need to deepen the liberalization process, GATT contracting parties accepting defining in article XXIV of GATT the possibility to negotiate regional integration agreements and requirements they have to meet in order to be internationally recognized.

These agreements proliferated over the past decades, while contributing significantly in trade liberalization.

During the period when the financial crisis worsened, a number of protectionist theories emerged aimed at resorting to trade defence measures more frequently. There were other theories which maintained giving up during this period any trade defence measures that might adversely affect international trade. Practice has demonstrated that effects of the financial crisis cannot be stopped by measures which deviate from multilaterally negotiated rules.

II. Literature review

Albeit the crisis was active only three years ago, economics literature attached major importance to this phenomenon given its implications on world economy. In this context papers published under the aegis of OECD, IMF, World Bank and European Commission are relevant. Moreover, the way anti-dumping investigations and measures in international trade were or were not encouraged by the crisis occurrence is tackled in various papers and periodical reports published by WTO/GATT.

Once the crisis has settled into, its effects were analyzed by all international and regional organizations, and by each individual state, as well.

Thus, at international level the three organizations that form the world economy pillars approached the crisis from various perspectives, i.e.

- World Trade Organization (WTO) and UNCTAD focused their efforts on inventorying all anti-crisis measures adopted in the various countries and on assessing crisis impact on the international trade.

- International Monetary Fund (IMF) and World Bank were more interested in the effects of the financial crisis and measures which might be taken in the banking sector in order to straighten out the situation.

At regional level, several „actors” (EU, EFTA, MERCOSUR) were involved in adopting measures seen as required and timely in addressing the problems created by the crisis.

At the same time, states got greater freedom to act, within their competencies, for the adoption of measures which should support national economies. Due to such increased freedom, the risk inherently arised that states invoke the crisis so as to adopt measures that wouldn't have been allowed in normal circumstances due to their categorization as prohibited protectionist measures.

It becomes increasingly obvious that one cannot consider addressing the crisis if globalization and regionalization elements in the world economy are ignored. An individual solution cannot exist in the context of crisis extension at international level.

III. Research methodology

Research started from the assessment of the way the financial crisis affected the economic sector resulting in: direct investments reduction due to lower profit rates in the circumstances of higher credit costs, shrunk international market due to high commercial credit costs, reduced trade financing possibilities required to guarantee export credits and for measures apt to ensure promotion of exports; potential increased trade defence measures.

The reason of this approach is determined by the wish to find positive responses which, by the various anti-crisis measures, the states gave to the need to mitigate their impact on their economies.

The specific element of the research in this paper consists in assessing the profile of the number of anti-dumping investigations and measures notified by WTO/GATT member states. Thus, a period of 5 pre-crisis years (2003 – 2007) and 2 years of active crisis (2008 – 2009) have been considered. In the absence of final data for the full year 2010, first quarter data have been projected over the whole year so that a complete picture of the crisis effects on trade defence measures should exist.

The relevance of this assessment consists in the fact that it provides a clear picture of the way states acted in the crisis period and of whether they turned anti-dumping measures from the trade defence category into excessive protection ones.

IV. Research results

Based on the two research aspects described in the previous chapter, key results are given below. Hence, in the context of anti-crisis measures the European Union has not deviated from international principles, acting in such a manner that:

a) funds allocated by states for banks and companies should be treated as state aid whom the applicable rules in this area should be applied. However, flexibility is accepted in applying such rules (reduction of state aid authorization period from 90 days to 24 hours; time limited state aids granted by reason of economic crisis, correct sizing of state aids and their periodical monitoring followed by stoppage when crisis factors are no longer active; granted state aids should not deviate from community principles and should be associated with restructuring and viability processes, as well as technology modernization programs).

b) export subsidizing measures should not represent deviations from principles set out within WTO;

c) import surtax introduction or higher customs duties should be linked with WTO accepted circumstances.

It can easily be noticed that these measures do not stand for a deviation from international rules and do not encourage primary protectionism by plain administrative interventions in the economy.

Furthermore, the World Trade Organization sent out several messages concerning anti-crisis measures, such as:

a) the need to inventory all commercial character measures adopted by contracting parties and candidate states;

b) substantiation of anti-crisis measures in consideration of mechanisms and legal instruments agreed multilaterally;

c) avoid that adopted anti-crisis measures should represent more or less disguised forms of increasing protectionism.

These messages are based on the fact that trade liberalization is not the root of problems created by the current crisis but rather a solution for them.

Data processed by the author with respect to anti-dumping investigations and measures revealed the followings:

A. Anti-dumping investigations opened by GATT Contracting Parties:

a) The average annual number of anti-dumping investigations in 2003-2009 is in the range of over 200 cases. Although data are available only for 2010 first quarter, by way of projections one can assume that there will be no significant deviations for this year either. Thence, it has been found that no major changes existed at the level of investigations during the active crisis years against pre-crisis years;

b) Main countries which opened most anti-dumping investigations during the active crisis period were: India (86), Argentina (47), USA (36), EU (34), China (31), Turkey and Pakistan (29);

c) Among countries undergoing anti-dumping investigations in 2008 and 2009 the followings stand out: China (153), USA (22), Thailand (21), Brazil (14) and EU (10);

Sectors undergoing anti-dumping investigations during 2008-2009 were: metals and metal articles (110); petrochemicals (81); textiles and textile articles (59); resins, plastics and rubber materials (52); electrical machinery and equipment (37)

B. With respect to actually adopted anti-dumping measures:

a) The average annual number of adopted measures during 2004-2009 ranges between 138-159 cases.

b) By projecting data available for 6 months in 2010 the number of adopted measures will not be significantly different for 2010;

c) Main countries which adopted anti-dumping measures during 2008-2009 were: India (61), USA (38), Brazil (27), EU (24), Argentina (21), Turkey (20);

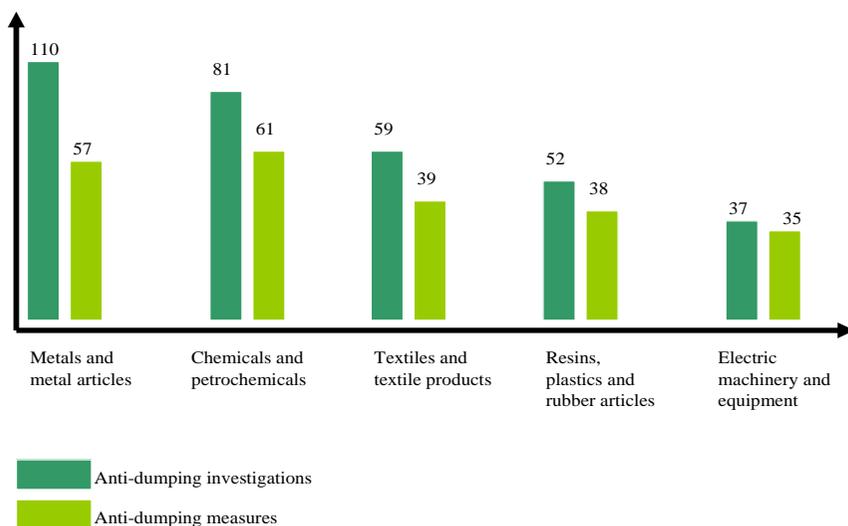

d) Among countries undergoing anti-dumping measures during 2009-2009 are: China (108), South Korea (15), Thailand (14), Indonesia (13), USA (12) and India (10);

e) Key product groups covered by anti-dumping measures during 2008-2009 were: Chemicals and petrochemicals (61), metals and metal articles (57), textiles and textile products (39), resins, plastics and rubber articles (38), electric machinery and equipment (35).

It is most obvious that during the crisis period we do not see any upsurge in anti-dumping investigations and adopted measures. It was therefore preferred to continue trade liberalization and avoid primary protectionism involving relinquishment of rules required for the normal development of the liberalization process.

Below is a diagram of the key groups of goods undergoing anti-dumping investigations and measures adopted during 2008-2009:

Diagram 1. Profile of anti-dumping investigations and measures by groups of products (2008-2009)

Source: WTO data processed by the author

From the diagram above it results that key sectors exposed to both anti-dumping investigations and measures are the same, while the crisis did not have any role in stimulating such measures in other areas than the ones considered as sensitive.

V. Conclusions

Since international trade was no root of the financial crisis but rather a solution to mitigate its impact on world economy, this paper highlights the following factual aspects:

- trade liberalization in observance of requirements set out in GATT/WTO has not been essentially affected by the crisis. Thus, Uruguay Round resulted objectives have not been jeopardized or abandoned, customs preference systems have not undergone changes and neither have they been relinquished, while internationally negotiated regional integration agreements continued to exist and operate in normal conditions;
- the international financial crisis has not determined the European Union and the other Contracting Parties to give up their own rules in the matter of state aid but rather a more flexible attitude was noted which resulted in reduced authorization aid request examination periods which were sufficiently important during this period, particularly to the benefit of the banking system. Moreover, objectives and aid granting requirements have not seen any changes determined by the crisis;
- multilaterally set out rules in the matter of anti-dumping investigations and measures continued to be enforced without easier access of the same, nor turning them into protectionist measures. We do not see any massive increase of cases where it would have been resorted to such investigations nor any dramatic changes concerning affected economic sectors by anti-dumping investigations and measures. It is evident that Contracting Parties took WTO messages into consideration to the effect that in adopting crisis effects containment measures those measures that do not deviate from multilaterally agreed principles and rules should be selected. It is also evident that it has been preferred to continue international trade liberalization and by no means use plain administrative interventions in the economy and excessive primary protection of the same.
- the crisis has not significantly affected products considered as sensitive from the perspective of anti-dumping investigations and measures.

PREDICTABLE TRENDS OF EU TARIFF POLICY IN GLOBALIZATION'S CONTEXT

Caba Ștefan

University of Oradea Faculty of Economics

Căuș Vasile-Aurel

University of Oradea Faculty of Economics

This paper consists of information regarding current situation of international trade relations, in particular those pertaining to EU, concerning to preferential trade agreements, the trend towards globalization and custom policies. The importance of this document is given by the identification of strategy trends in respect to EU tariff policy in the context of changes at commercial exchange level, as a consequence of international trade globalization's trend. The tariff policy, as a component of the trade one, represents a factor which influences companies' behavior and, consequently the structure of import-export interstates relations. Specialty literature has lately identified a less natural phenomenon: starting with adoption by WTO states members of some measures and principles that emphasize the trade globalization tendency, a significant number of preferential agreements were settled in the meanwhile, many of them being bilateral, fact at least at first view is opposite to globalization phenomenon. The causes of this phenomenon have not been yet completely identified by economic analysts, so that these preferential trade agreements can be translated as a an impediment in the way of globalization and, on the contrary an intermediate phase and an accelerator of global extension trade exchange phenomenon. The present work ideas are based on analysis by bibliographic guide that link to historical GATT/WTO and principles which sustain its operation and to dynamic of international trade. Also, there have been studied data related to strategies of trade policy adopted by EU. The results consist of information about tariff policy elements adopted or forecasted by EU in general strategic context of participation to international trade. Particularly, it is emphasized the new competencies that must be achieved by custom personnel because of changes in trade exchanges. The main idea is represented by the necessity of custom authorities responsibility transfer toward new fields which do not represent traditional activities.

Keywords: *international trade, globalization, regionalization, tariff policies, trade policies.*

JEL Classification: *F13, F15*

I. Introduction

The last decades have emphasized, voluntarily or not, the increase of globalization process. If for phenomenon such as global warming there is identified an usual and unanimous reaction, concerning for instance trade globalization the opinions and actions are varied. One of the biggest international organizations, the trade one, in both its stages during the time (GATT or WTO) has been developing the globalization idea. At the same time, individual reactions of states were different. As a consequence, an explosion of preferential trade agreements has occurred in the last 20 years. Besides, an increase of bilateral agreements has been noted. This situation automatically generates the next question: is it

about a resistance to economic globalization phenomenon or it is an intermediated, preparatory phase? The answer it is not simple and is beyond the scope of this paper. What we want is to skim the current state in the hope that our notes can contribute to find the answer to the question previously mentioned. For the beginning we will talk about WTO evolution in order to identify its policy trend. After we shall analyze the last years of EU trade policy trend in order to identify its position to trade globalization, and finally we will try to forecast its tariff policy trend in the mentioned context.

2. GATT- WTO- Short History

Since its establishment in 1947, GATT has expressed partners' desire to reach the free trade state. This idea is emphasized by the decrease of duty tax in each round (see table 1). In the meanwhile, these decreases facilitate the geographic expansion of commercial relations; in other words the door towards globalization is open. One of the major factors which encourage trade globalization phenomenon is expenses decrease, which allows goods to have competitive prices around the world (close to production cost); duty tax decrease is part of this process, as well.

Table 1. GATT/WTO rounds

Year	Place	Subject covered	Countries	Average tariff reduction for industrial goods (per cent)
1947	Geneva	Tariffs	23	19
1949	Annecy	Tariffs	13	2
1951	Torquay	Tariffs	38	3
1956	Geneva	Tariffs	26	2
1960-1961	Geneva (Dillon Round)	Tariffs	26	7
1964-1967	Geneva (Kennedy Round)	Tariffs and anti-dumping measures	62	35
1973-1979	Geneva (Tokyo Round)	Tariffs, non-tariff measures, "framework" agreements	102	34
1986-1994	Geneva (Uruguay Round)	Tariffs, non-tariff measures, rules services, intellectual property, dispute settlement, textiles, agriculture, creation of WTO, etc	123	40
2001-20??	Runda Doha	Tariffs, non-tariff measures, rules, services agriculture, DS, trade and environment (certain aspects)	150	?

Source: Proksch, M. (2007)

The year 1994, when the Uruguay Round negotiations were concluded establishes the formal framework of WTO foundation. So, in 1995 was born one of the biggest international institutions. A short review of principles which sustain WTO's operation will allow us to demonstrate that one of the main objectives is international trade globalization.

Some of the principles that govern WTO are (Proksch 2007: 7-13):

- a) Universality- WTO rules are applicable to all members.
- b) Opening- there is no restrictions regarding the access within organization.
- c) Regulations- WTO establishes international trade development rules.
- d) Nondiscrimination- is the main principle of the WTO and is implemented by two means: most favored nation clause and the national treatment.
- e) Liberalization- WTO sustains the idea of duty tax reduction and the exclusion of quantitative limitations
- f) Predictability- once determined, duty tax cannot be increased anymore.
- g) Transparency- is a principle that increases WTO's credibility.

Obviously the principles mentioned do not offer but an overall image of WTO operations. However, this image is enough to emphasize the idea previously expressed: explicit or implicit WTO sustains trade globalization. Universality, opening, nondiscrimination, liberalization, and transparency are principles that support directly the globalization, while regulation and predictability indirectly support the global trade.

Nevertheless, the last two decades data highlight a strange aspect: an explosion of regional trade agreements and more an explosion of bilateral ones. This fact is more disputed as these agreements are generally against the rules established by GATT; exceptions are bi or multilateral agreements, which settle zero duty taxes and consequently support trade liberalization.

III. EU and WTO

EU has extended its intern efforts internationally, where it is recognized as an active supporter of GATT/WTO negotiation rounds. This multilateral framework has allowed EU to prepare the way to reach ambitious goals; high practical importance has the perspective of trade liberalization, reconnection to business environment trust at one critical moment in world economy development, and refreshment of multilateral commercial system, as well.

All these EU actions are part of the WTO states member effort to advance the way of trade exchange liberalization. However, as we mentioned, the last period was marked by an important increase in preferential trade agreements (as seen in the following graphics).

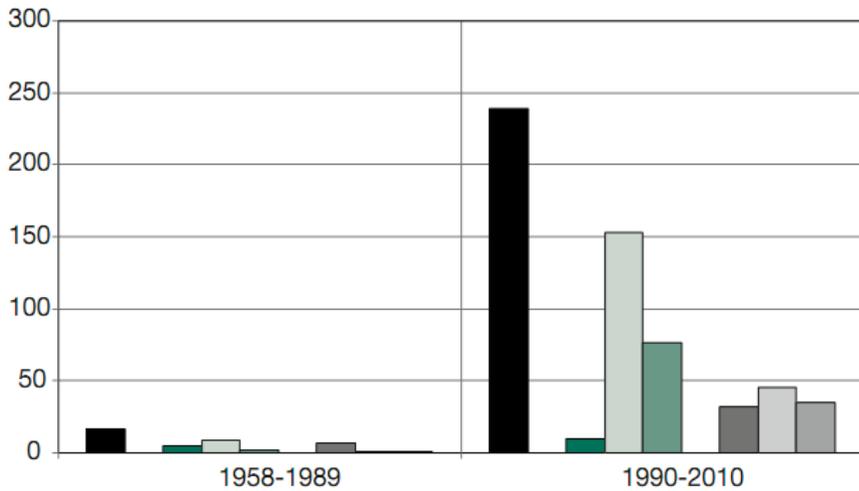

Figure 1. Preferential Trade Agreements 1958-2010

■ - Total, ■ - Customs Union, ■ - Free Trade Area, ■ - Services integration
 ■ - EU, ■ - North America, ■ - Asia - Pacific

Source: Koopmann, G. și Wilhelm, M. (2010)

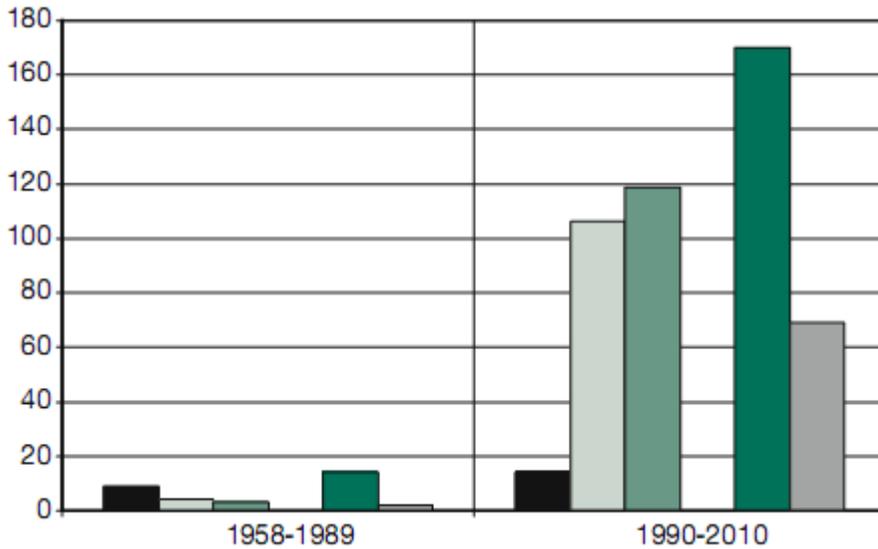

Figure 2. Preferential Trade Agreements by Geography

■ - North-North, ■ - North-South, ■ - South-South
 ■ - Regional, ■ - Cross-regional

Source: Koopmann, G. și Wilhelm, M. (2010)

A first glance over the two graphics leads us to the conclusion that most of the preferential trade agreements are regional that create free trade zone. This fact sustains the idea that many states support trade liberalization, but in the meantime, it considers that there are states which cannot face the competition generated by a trade completely free. In our opinion there is a struggle for “pole position” in the perspective of continuous deregulations

of commercial exchanges. As more states tend to reach developed state status, the area of free trade zone expands. These areas along with custom unions eliminate inside the protection tariff measures and create a competitive system based on competitiveness. In the perspective of generalization of such system, the position in trade exchange standing can influence the economy of a state.

That's why the trade and tariff policies of each state or interstate structure represent in this phase, a very important element.

VI. EU tariff policy forecasts

EU has built a mechanism of trade policy well articulated whose main features are:

- member states have agreed on transfer responsibilities in respect to duty tax assessment and trade policy management at EU level and to Community decisions' enforcement;
- member states continue to pay a major role in situations regarding economic and social difficulties caused directly by the trade nature;
- trade liberalization for industrial goods run continuously, as can be seen from preferential agreement for products and geographic areas;

This policy stipulates both offensive and defensive instruments. EU has 3 instruments to protect commercial interest of European manufacturers: anti-dumping, anti-subsidy and safeguarding measures. These instruments can be used by compliance with strict procedures established by EU Commission.

EU is one of the most important economic zones in the world and represents the most important actor in international trade with goods. EU economical success would not be possible without the existence of unique internal market, defined by four free movements: of goods, of persons, of services, and of capital.

Community Constitutional treaties do not define custom union, but they emphasize its main elements. In 2001 European Commission published The Strategy for Custom Union, which reiterates challenges the Community must face on a short term and proposes solid actions for Custom Union development and functioning.

The proposed strategy of Commission indicates five major fields of action:

- the simplification and rationalization of legislation,
- the improvement of custom's examination,
- provide better services to businessmen community
- the improvement of professional formation and
- the improvement of international cooperation in custom area

European Commission sustains practical implementation of the Strategy regarding Custom Union using the program "Custode 2013" (continuation of "Custode 2000" and "Custode 2007" programs initiated by Decision no. 210/97).

V. Conclusions

The continuing liberalization of international trade – fact that may conduct to the decrease, even to cancellation of duty taxes' role, WTO principles that do not accept non-tariff protections – only in justified cases, international trade trend toward globalization and new coming challenges in front of custom authorities (related to environment, health, terrorism) have imposed changes of tariff policy strategies.

In respect to EU there was identified the intention of developing complementary capacities of custom personnel to face these new challenges. The continuous simplification and

decrease of custom tariffs transfers the responsibilities of custom officers for environmental protection and citizens' health. Another activity area, which is relatively new, is related to intellectual protection. At the same time, the terrorist phenomenon does not have to be neglected – it represents an issue for custom authorities.

All aspects previously mentioned are, or should be, part of tariff policy strategy adopted by EU.

THE RISKS OF A TOO QUICK EURO ADOPTION BY THE EU MEMBER STATES. THE CASE OF PORTUGAL

Cristian Ștefan Ovidiu
Babeș-Bolyai University
Faculty of Economics and Business Administration

In this article we present the risks faced by the new countries that have joined the European Union, and which also desire to adopt the euro currency as quickly as possible. We will analyze the existing literature regarding the ways these risks manifest themselves, depending on the economic conditions present in these countries. The risks are mostly caused by an incomplete fulfillment of the optimum currency area conditions, especially the ones regarding the synchronization of the business cycles, the existence of mitigation mechanisms in the case of asymmetric shocks, and to a lesser extent, the insufficient flexibility of the European labor markets. In addition, because there are different economic conditions between the countries that plan on introducing the euro currency and the ones that already had, mostly related to a lower economic development and lower prices, there are specific risks that affect the former countries. Moreover, the benefits of entering the EMU – greater monetary stability, reduced transaction costs, lower exchange rate volatility and a decrease of the interest rates – can in some specific cases become also costs. In order to quantify all these elements, we have constructed a case study of Portugal, which has entered the EMU in the first wave. We have determined that Portugal's experience after the euro introduction was a negative one, when compared with the previous period, because the convergence process did not actually happened, as expected. Not only that, but the economic differences between Portugal and the other EMU countries deepened, and the country's fiscal situation also deteriorated badly in all these years, up to the point where Portugal was forced to ask for external help. The case of Portugal is very important for the countries that are eager to adopt the common currency without first achieving a sustainable economic development, through increasing labor productivity and exports. It shows that fulfilling the nominal criteria and entering EMU must not be a declared goal, but just the last measure implemented after reducing the economic disparities and reaching a balanced economic development. Based on the existing realities from the Central and Eastern European states, different scenarios can be constructed that will take into account the way these risks influence the future economic environment, should these states were to decide accelerating the common currency adoption process.

1. Introduction

There are undeniable benefits of adopting the common currency, and the most important of these are a greater monetary stability, reduced transaction costs, decreased exchange rate volatility and lower interest rates. Still, it must be mentioned that these benefits are effective only if the Economic and Monetary Union functions as it was intended to, without major economic turmoil – a detail that a few years ago was not even mentioned, but which recently has surfaced. Moreover, these benefits are not unidirectional, but have a hidden side, in some specific cases being able to become substantial costs.

Adopting the euro by a newly European Union member state would generate a climate of monetary stability. The experience demonstrated that the less developed European countries are exposed to a higher risk posed by massive external capital flows, or even speculative attacks against their own currency, perceived as being more vulnerable. Because the market expects that the economic development will accelerate following the start of the euro currency adoption process, or because of the existing investment opportunities in these countries, investment capital searching bigger returns will enter, quickly affecting the exchange rate. The massive capital inflows can also unexpectedly exit, if the economic growth is not on target, if the fiscal situation is not stable or if it finds better investment/speculative opportunities in other countries (Janackova and Borek 2004). Being part of a much more solid monetary structure built around the common currency would eliminate an important part of the monetary instability risk. Still, we must mention that this benefit is valid only when the euro currency is not affected internationally by global events that could erode its own stability.

Reducing the transaction costs is another benefit of adopting the euro currency. This benefit is especially visible in the trading sector among the Economic and Monetary Union member states, which use the same currency in their transactions. These countries experienced a fast increase of their trade after the launch of the EMU (Barr 2003). This advantage takes place just in the case of open economies, which are capable of exporting on the European market competitive products, in great quantities.

A third important benefit of adopting the common currency would be the decrease of the exchange rate. This would in turn eliminate the inherent higher exchange rate fluctuations experienced in relation with the country's external partners. Lowering the exchange rate volatility implies the reduction of costs incurred for protecting against these undesirable events. Moreover, if the volatility of the exchange rate diminishes, the risks experienced by the foreign investment projects are also lower, which in turn stimulate a more active investment environment, with immediate effects on the economic growth and the convergence process. Unfortunately giving up the ability to use this monetary intervention instrument has also negative consequences, because when economic imbalances appear, the adjustment costs can be higher by using other methods.

A last major benefit of adopting the euro currency is the rapid reduction of the interest rates, with positive consequences upon the economy. This interest rates reduction is mainly determined by a lower monetary risk, an element that is always incorporated in the interest's nominal rate. A quick lowering of the interest rates can have negative consequences also, when it is accompanied by a relaxation of the credit standards, which determined in the new euro zone member states an increase in consumption and a decrease in savings, having as a final result an unsustainable increase in the households' level of debt (Fagan and Gaspar 2007).

2. The risks of a too quick adoption of the euro currency by the new EU member states

A too quick adoption of the euro currency by the new EU member states has major risks, especially if the economies of these states are not well developed. There are risks that derive from the theory of the optimum currency areas, as well as specific risks caused by an insufficient economic development or induced by the economic convergence process. Often the costs generated by these risks are very high, being sometimes able to surpass the advantages of adopting the common currency.

One of the basic conditions stipulated by the theory of optimum currency areas for a smooth functioning of a monetary union is the synchronization of the business cycles. Unfortunately even the countries that already take part in the Economic and Monetary Union do not meet this condition. There is a core in the euro zone that acts as a single economic entity, but there are also countries whose economies are far from being synchronized with this core. For example, the member countries that in the '70 had high levels of GDP/capita – Germany, France, Belgium, the Netherlands and Luxembourg – also exhibited highly synchronized business cycles, and entering the Economic and Monetary Union did not influence them in any significant way (Giannone, Lenza and Reichlin 2009). On the other hand, the states that in the '70 had relatively lower levels of GDP/capita – Spain, Italy, Portugal, Ireland, Greece – their business cycles were not correlated with the business cycles of the countries from the first category, and moreover, even after the introduction of the euro currency, this variability persisted, together with the increased volatility of their business cycles. Even more, before their accession in the European Union, the business cycles of the East European member states were not synchronized with the business cycles of the big euro zone countries, not synchronized with the business cycles of the countries situated at the periphery of the euro zone (Greece, Portugal, Ireland) and not even synchronized among themselves (Süppel 2003). It is very important that the harmonization takes place between the business cycles belonging to the euro zone countries and those of the acceding EMU countries, otherwise the common monetary policy of the Central European Bank would induce long term unbalances in the economies that do not fluctuate in the same manner.

Another aspect mentioned by the theory of the optimum currency areas is the existence of mitigation mechanisms for the asymmetric shocks, which affect just a country or a small group of countries. Because the common monetary policy can not solve specific problems that appear in a certain state, it is imperative that there exists price and wage flexibility, backed by a high labor and capital mobility, in order to successfully respond to these type of shocks. In the European Union the labor market rules used to be quite rigid (Silva 2004), containing many barriers for the quick wage adjustment, and on top of that, for the newly entered member states, there are restrictive regulations regarding their labor mobility internationally. Moreover, it has been determined that the countries that joined the European Union in 2004 are more influenced by asymmetric shocks (Ramos 2004), compared with the rest of the countries that are already in the euro zone.

Besides these general risks that derive from the theory of optimum currency areas, there are specific risks that result from a lower level of economic development and lower prices, which exist in the new member states that in the future will also enter the euro zone. Entering the Economic and Monetary Union and having their products compete with the ones produced in the euro zone would cause a rapid increase in prices, if the production

technology increases also. If the labor productivity increases at the same speed as the increase in prices, the conditions of a durable convergence are met, without experiencing major disturbances along the way. This is the successful way of increasing the real convergence that happened in the vast majority of the states that introduced the euro currency: a rapid increase of labor productivity and a remarkable export performance (Kolasa 2010). Still, this process is likely to be a long one, which will continue way after the introduction of the common currency in these countries. Therefore, reducing the economic disparities will probably determine a higher level of inflation in these particular states, which will likely persist for a long time. If this will influence the level of the harmonized index of consumer price (HICP) from the euro zone, a too strict monetary policy implemented by the European Central Bank would slow this process of reducing the economic disparities, with negative consequences upon the states that started the economic convergence process. Therefore, a too quick adoption of the euro currency can be sub optimal for the less developed states that have entered the European Union (Rostowski 2003), because the European Central Bank will never target the acceleration of economic convergence among euro countries, but a strict inflationary level of under 2%.

3. The case of Portugal

At the beginning of the '80, Portugal had a precarious economic condition, caused mainly by the 1975 revolution, the losing of its colonies and the second oil shock. The budgetary deficits often surpassed 12%, and the current account deficits 10%. This was an unsustainable situation, and indeed, between 1980 and 1987 the Portuguese escudo depreciated by 60%, wiping the current account deficit (Blanchard and Giavazzi 2002). After this stabilization took place, Portugal embarked on an accelerated process of economic development, which saw its GDP grow at a yearly average of 5.1% during 1985-91. During 1992-95 this growth slowed at an average of 1.5% yearly, but then again Portugal gained traction during 1996-2001, with an average yearly GDP growth of 3.5%. The average yearly inflation dropped from 14% during 1985-91 to 7% during 1992-95, stabilizing to 3.5% between 1996-2001. The labor market also improved, the unemployment decreasing from 7% in 1995-96 to 4% in 2000-2001.

After the start of the euro adoption process and the move towards the fulfillment of the Maastricht criteria, Portugal experienced a substantial reduction of its interest rates. This was caused by the previous economic performance and by the market perception that the euro adoption process will be a successful one. This nominal – as well as real – interest rate reduction, coupled with the liberalization of the financial sector and increased competition, determined an increase in the volume of loans, especially household loans, which in the end translated into an increase of internal demand. The process of credit acceleration peaked just before the euro introduction, when the annual increase in the volume of loans was 28.6% in real terms, and the short term (3 months) real interest rate was 0% (Brzoza-Brzezina 2005). Coupled with the wage increases, particularly in the public sector, all fueled the illusory expectations that the incomes will keep rising indefinitely in the future.

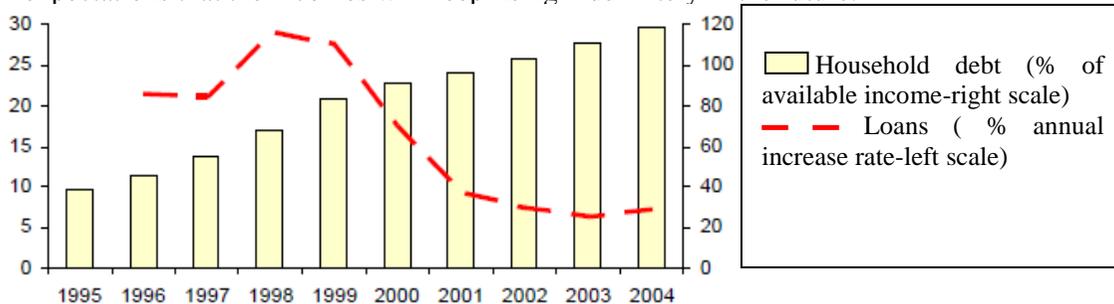

Figure 1. The increase of household loans and debt

Source: European Commission

Before entering the Economic and Monetary Union, Portugal managed to considerably reduce the budgetary deficit, from 7.7% of GDP in 1993 to 2.7% of GDP in 1999 (Abreu 2006). This was not based on a stricter fiscal policy – which in that period was expansionistic – but rather on a powerful economic development and low interest rates, which in turn determined lower costs for interest rate payments incurred by the Portuguese state. Unfortunately the structural reforms implemented towards increasing internal production were insufficient. However, with the national debt not surpassing the 60% limit, Portugal managed to successfully meet all the other nominal convergence criteria.

After entering the Economic and Monetary Union, it was discovered that some sectors, especially the textile and footwear industries, which held important shares in the Portuguese economy, were not prepared for the increased competition environment that followed. As a result they lost important market share, the export for these categories of merchandises falling from 2/3 of total exports in 1995-96 to 1/3 in 2004-2005 (Abreu 2006). Thus the Portuguese economy was forced to reorient to the constructions and services sectors, which in 2002 were already representing 76.7% of the total value added in the whole economy. Consequently the rising internal demand shifted towards foreign goods, the value of imports in this segments rising rapidly. In the end the current account deficit increased again, surpassing the 10% of GDP in 2000 and remaining at a high level ever since.

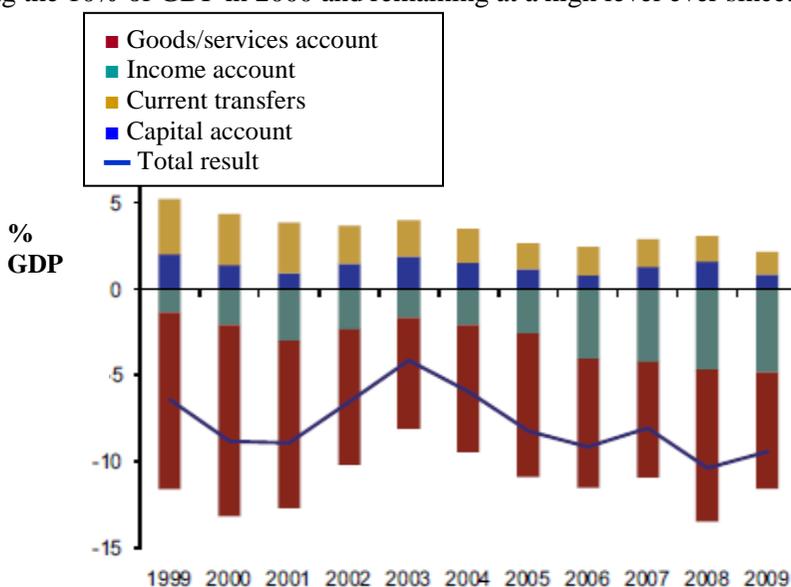

Figure 2. Portugal's current and capital accounts, 1999-2009

Source: Portugal National Bank

In the following years after Portugal entered the Economic and Monetary Union, the speed of economic growth decreased. Moreover, due to insufficient structural reforms, the country kept losing market share, while the salaries were increasing at a faster rate than the ones from the euro zone, mostly because the unemployment was low and there was a high pressure for constant wage growing. The process of credit expansion continued, coupled with the rapid decrease of the saving rates, which resulted in an increase of the debt burden of the households, which in 2004 reached 118% of disposable income, a level surpassed in the euro zone only in the Netherlands (Cardoso 2005). It was becoming more and more clear that the high consumption levels could not be sustained by the available incomes, especially in an environment of slower productivity gains and diminished market share. At the macroeconomic level the situation became dire in time, the main fiscal indicators experiencing deterioration, mostly determined by the higher sums that had to be allocated to finance the constant current account deficits.

Table 1. The evolution of Portugal's main financial indicators (percent of GDP)

	2005	2006	2007	2008	2009
Budgetary deficit	6,1	3,9	2,6	2,8	9,4
Public debt	63,6	64,7	63,6	66,3	76,8

Source: Portugal National Bank

4. Conclusions

Portugal's experience after entering the Economic and Monetary Union is not a positive one. The expected economic convergence never took place, the post adoption low growth rates deepening the existing economic disparities with the euro zone, which in 2009 were calculated to be 4% bigger than the level experienced before the euro adoption, in 1998. At the end of 2010 the economy of Portugal was in a dire condition, having a high level of public and private debt, a significant commercial deficit, and a small GDP growth rate, of 1.4%, after a drop of 2.5% in 2009 (Banco de Portugal 2010). These weaknesses were observed before the economic crisis, but after the onsets of its effects, they become more evident, and the ensuing austerity measures could not reverse this trend. The interest rates of the Portuguese bonds increased dramatically, fueled by the successive downgrades operated by the rating agencies. In April 2011 Portugal, after Greece and Ireland, asked for external help in order to be able to honor its financial obligations and thus to avoid the restructuring of its debt.

Recent years have seen profound changes in country risk and its components, in the context of crises multiplication and diversification; the sovereign risk, a main country risk component, has undergone important changes, mainly given by mutations in its determining factors; the economy of "indebtedness" represents a reality of the recent years.

In this context, our paper aims to capture new issues related to sovereign risk and its manifestations, and to bring to the fore a number of relevant indicators concerning the indebtedness problems. Currently, the increasing sovereign obligations, the Greece 2010 episode and the real sovereign debt crisis testify the important implications that the national economic policy decisions have on entire nations. In general, the countries with servicing difficulties present a total external or public debt that overcomes the average of the emerging states; however, we can not accurately identify a threshold beyond which we can say that a state is overly indebted. Therefore, questions such as “Starting from what point is a state overly indebted?” or “What is the cause of the excessive debts of a state?” are fully justified and the answer or answers deserve being sought.

Studies on the relationship between various economic variables and the countries ability to deal with external debt problems are present in the country risk literature since the 1970s; beginning with authors such as Frank and Cline (1971), which gave priority to external debt service indicators such as Exports, Imports / GDP, Imports / Reserves, and continuing with other specialists, among whom we mention Saini and Bates (1978), Abassi and Tafler (1982), Haque, Brewer and Rivoli (1990), North (2001) Bouchet (2003), Meunier (2005), Longueville (2010) and many others, many ratios and indicators were carefully analyzed.

In our short study, we also present a number of recent aspects concerning sovereign risk, and we analyze some relevant indicators, using statistical data, for four countries: Romania, Greece, Hungary and Bulgaria. We underline the fact that, even if sovereign risk indicators are in the good intervals, the crisis risk remains present, especially because of the liquidity issues. For us, this brief paper opens the way for a much broader study, which aims to develop a model of sovereign risk analysis, the dependent variable, the probability of default, being explained by the evolution of the selected relevant indicators.

Keywords: sovereign risk, external debt, sovereign crisis, external debt indicators, thresholds.

JEL Classifications: F3 (F31, F34).

I. Sovereign risk as a component of Country risk

The study of country risk has become increasingly important towards the end of the 20th century, prompting interest from both the academic and the professional sphere (banks, multinational companies, insurance companies, etc.), financial markets also becoming more sensitive to the information on country risk. Of course, this increase in importance is not accidental, as it could be attributed to the multiplication of risks, their increasingly frequent and intense occurrence, but also to the mutations of the political and economic international environment. In a general manner, we can define country risk as *a compound risk, representing all elements emanating from a state's environment and which are able to affect a banking institution, an industrial or financial investor, an exporter and generally any foreign trader performing an operation in that country – political, commercial, financial and specific natural risks.*

Country risk is often seen as *a tool used to assist the decision making process* (Meunier 2005: 16); the results of the studies related to this type of risk should be immediately usable by bankers, investors or exporters; from this perspective, it is situated at the confluence of the business world and the economic science. Sovereign and transfer risks are two classic forms of risk manifestation for an agent (bank, investor) who is conducting economic and financial operations in a foreign country. About the sovereign risk, identified as the “probability of default on sovereign external debt” (Heffernan 1986: 7), we can state that:

- *it covers only the loans given to foreign governments (or guaranteed by them), loans that compound that country's foreign debt; it may affect both public and private legal subjects;*
- *this type of risk arises from the likelihood that at some point the government of the debtor country could not or would be unwilling to repay its external debt, the forms of manifestation being represented by the risk of rescheduling, of renegotiation or of repudiation of the foreign debt;*

- *there is a lack of legal approach; countries don't go bankrupt; despite waves of sovereign defaults and restructurings, the statement is still true at its core, the reason for this is to be found in the concept of sovereignty* (Andritzky 2006: 15).

In this brief study, we intend to capture new issues related to sovereign risk and its manifestations, and to bring to the fore a number of relevant indicators in relation to the indebtedness issues. The probability of crisis remains difficult to quantify, but the key challenge is, for both academics and managers, to create a system of early warning indicators that highlight the macro and microeconomic fragilities of the states with risk of default. Evolution of certain values will be presented in the case of Romania and other countries in the region, some remarks being made on this occasion.

II. Brief overview of some recent issues concerning the sovereign debt. The indebtedness of an economy

Recent years have seen profound changes in country risk and its components, in the context of crises multiplication and diversification; in turn, sovereign risk has undergone important changes, mainly given by mutations in its determining factors. A distinction can be made among countries with strong currencies (EUR, USD, GBP, etc.), on one hand, and states with weaker currencies, on the other hand:

Table 1 – Specificities of sovereign risk according to the concerned states

	Countries with strong currencies (developed ones)	States with weak currencies (generally developing countries)
Public debt/GDP	- the progressive increase in the share of public debt to GDP after 2008;	- maintaining a relatively constant level of public debt to GDP;
The dynamics of public debt/solvency crisis risk/default risk	<ul style="list-style-type: none"> - moderate risk/easy refinancing (even in the case of a high debt), strong currency, <i>real vaccine which immunizes states with default risk</i>; - positive feedback from the rating agencies; - the distinction between sovereign risk in foreign currency and sovereign risk in local currency disappears; - sovereign risk related to foreign currency debt, quasi -inexistent; - refinancing risk is lower and does not imply solvency risk; - besides the domestic financial market, central banks can provide the necessary funding; in the euro zone, government bonds are often purchased by commercial banks; in the U.S.A., Asian central banks currently buy treasury bills; - solvency depends directly on the central bank's monetary policy (interest rate guidelines, required reserves, mechanisms of action). 	<ul style="list-style-type: none"> - high risk, especially when public debt to GDP evolves (1-3 points per year), based on average values (40-60% of GDP); - average or negative assessments from rating agencies; - the distinction between debt in foreign currency and the one in local currency can be operated; - the analysis of debt sustainability is achieved through budgetary balances and current balances, external liquidity and vulnerability to exogenous shocks analysis; - the risk of default, solvency and liquidity are closely related; - the importance of the good faith, of the willingness to pay; - degradation of solvency hinders refinancing difficulties and, as a consequence, liquidity crises; - the assessment of sovereign risk is influenced by the indebtedness of the private sector.

Source: processed after Guy Longueville and Eric Vergnaud, 2010.

A country with a particular situation is Greece; until about two years ago, the Greek state was part of a group of countries characterized by the degradation of public sector solvency, in the absence of liquidity constraints. A year later, the rising of public debt to GDP has been dramatic, and the negative perceptions of solvency in the various markets has generated significant difficulties in financing and refinancing, boosted by speculative attacks. Solvency degradation can be attributed to the effects of the economic crisis on the budget balance, the lack of reliable measures for the purposes of recovery of public finances, the presence of some irregularities discovered late, in the context of a public accounting opacity of the Greek state (Longueville 2010: 11). Also, the evaluations provided by the rating agencies have contributed to the increase of the difficulties in refinancing, their procyclical effect being evident.

Among the factors that increase the country risk and its sovereign component, a state's indebtedness appears to us as having a particular importance. The situation recorded in South America in the mid 1980s, influencing the development and manifestation of the

modern country risk, showed the world that a sovereign state can reach a point where it is no longer able to pay a debt in a foreign currency.

In general, the countries with payment difficulties present a total external or public debt over the average of the emerging nations (Meunier 2005: 23); however, we can not accurately identify a threshold beyond which we can say that a state is overly indebted. Therefore, questions such as *Starting from what point is a state overly indebted?* or *What is the source of overly indebtedness of a state?* are fully justified and the answer or answers deserve being sought.

Whichever method is used in the study of country risk – rating systems, analytical techniques such as reports, econometric techniques, etc. – some indicators are irreplaceable (as inputs), holding a special relevance when it comes to the global risk assessment specific to an economy.

In the following table we present, without claim of completeness, few variables/indicators that have already become classics, whose observation is relevant in the context of analysing a state from the perspective of the country/sovereign risk:

Table 2 – Different indicators of the sovereign risk according literature

Variable or indicator	Characteristics and significance
GDP/capita, GNP/capita	<ul style="list-style-type: none"> - genuine indicators of the wealth of a state; - allow the classification of the states according to their wealth; a small value, for example, points to a poor state, with probable difficulties in meeting its obligations to the outside and, consequently, a high country risk.
External debt/capita	- quantify the level of indebtedness, but also the ability to contract new loans safely.
External Debt/GDP	- specific indicator of the indebtedness of a state.
Imports/GNP	- measures the relative size of imports and is an indicator of the degree in which the trend of the national income is affected by a potential decision to reduce import due to the difficulties in managing debt.
Growth rate of exports	- exports can be seen as the cheapest source of foreign currency, countries with favorable trend in exports comprising good solvency premises.
Interest paid/debt service	- measures the cost of debt and the repayment ability of a state.
Inflation rate	- the inflation rate is an indicator of economic performance, in close conjunction with the monetary policy. The inflationary phenomenon involves reducing the real value of a state's income and causes a depreciation of the currency, reducing a country's ability to repay its debt.
Foreign direct investment/capita, foreign direct investment/GNP	- most theorists consider that a significant concentration of foreign firms in one country may be positively correlated with the risk of expropriation, because governments could consider this fact as an obstacle to economic efficiency of a state, foreign companies appropriating on the other hand a too large fraction of the profits made.

Source: processed after Bouchet, Clark, Gros Lambert 2003, Hurson, Doumpos, Ricci-Xella, Zopounidis 2006, Meunier, Sollogoub 2005, Nagy 1984, and personal considerations.

Of course, we can bring to the fore many more variables and indicators that are important when we study an economy in terms of the emanated risk. But what we want to emphasize here is that the evolutions of the variables and those of the indicators are currently taking place very rapidly, which requires a continuous analysis of the dynamics. Studies on the relationship between various economic variables and the countries ability to deal with external debt problems are present in the literature since the 1970s; from authors such as Frank and Cline (1971), which gave priority to external debt service indicators such as Exports, Imports / GDP, Imports / Reserves, and continuing with other specialists, among whom we mention Saini and Bates (1978), Abassi and Tafler (1982), Haque, Brewer and

Rivoli (1990), North (2001) Bouchet (2003), Meunier (2005), Longueville (2010), were carefully analyzed the *variables that form the backbone of the economic and financial aspects of country risk analysis* (Bouchet, Clark, Gros Lambert 2003: 42).

Several elements are relevant when we propose an analysis of sovereign debt; first, *solvency and liquidity*, and, secondly, *external debt sustainability* (Meunier and Sollogoub 2005: 29). As regards solvency, the essence of the analysis consists in reporting the debt stock to the wealth of a state. Sustainability requires a more nuanced and dynamic analysis; in this context, the evolution of external debt relative to the evolution of global wealth is particularly important.

Liquidity refers to cash issues, relevant being the limit – the maximum level of debt – to which a state is able to repay; the elements to be compared are, of course, available liquidity and the amount refunded. When we try sizing the "safe" external debt, it seems useful to relate it to the state's assets, translated mainly by GDP. From the perspective of this reporting of external debt, to assets (GDP) or income (exports), the thresholds most often mentioned in the literature are 50% and 150%. The issue of the alert thresholds is extremely complex and, although they are widely used in the study of country risk, we believe that they do not offer a high degree of reliability. The diversity of the developing states, the extremely fast evolution of economic climate, the lack of a permanent correlation between the level of debt and the probability of entry in the default, require addressing risk from case to case.

III. Case study – a glimpse on the indicators of four countries

We will continue by presenting the evolution of some indicators and ratios that we consider relevant for sovereign risk analysis, for the following countries: Romania, Greece – the well-known example of sovereign debt problem, Bulgaria and Hungary.

		2001	2002	2003	2004	2005	2006	2007	2008	2009
Romania	GDP/Capita Th. USD	3,81	4,12	4,35	4,73	4,95	5,34	5,69	6,12	5,70
	GDP growth	5,7	5,1	5,2	8,4	4,2	7,9	6	9,4	-8,5
	Inflation r. %	34,45	22,48	15,37	11,85	8,99	6,59	4,83	4,84	5,58

Table 3 – Sovereign risk ratios and indicators (Romania, Greece, Bulgaria, Hungary)
Source: World Bank, 2011

Analyzing the situation in terms of the established warning thresholds, a number of remarks can be made; in the case of the total external debt to GDP ratio, the evolution in Romania in the period 2001-2009 was an upward one, the critical threshold of 50% being exceeded in 2008 (52 %). In 2010, the indicator reaches 75%, and we can already speak of a over-indebtedness issue. Inflation rate, although rising, does not reach the benchmark value of 10.5%, overcome by countries in crisis such as Turkey in 2000, Indonesia in 2002 or Brazil in 2003. Meanwhile, total external debt to exports is growing significantly, exceeding the alert threshold of 150% in 2007. In the case of the sovereign debt crises of the 1990s (Argentina, Brazil, Ecuador, Uruguay, etc..) the level of this indicator reached values above 250%. Romania's liquidity reserves, in months of imports, however, kept a high level, the benchmark of three months being significantly exceeded. Moreover, it can be stated that these reserves could even be resized, creating positive effects in other areas.

For Greece, the issues related to the debts size are accompanied by an extremely low level of reserves, which entitles us to talk about liquidity risk. One of the specific problems of the Greek state, unlike other countries examined, is the impossibility of implementation of its own monetary policy.

Hungary, after some problems related to the external debt in the mid-1990s (total external debt to exports of 250% in 1994), managed to bring under control the evolution of its indicators (91% in 1997 and, during 2000, values under 200%); in the same time, inflation rate is relatively low.

A higher level of external debt to GDP stands for Bulgaria, but the reserves are high enough to dissipate the liquidity risk. Also, the inflation rate is well below the alert threshold.

Liquidity risk appears as an extremely important one, and this because a number of seizures recorded in the last period were stimulated by it, even without indebtedness; the crises without over-indebtedness (Mexico, 1994, Turkey, 2000, etc.) have multiplied, making predictions more and more difficult: *pure liquidity crises occur at total external debt to GDP ratios of less than 45%* (Manasse and Roubini 2005: 57).

IV. Short conclusion and further researches

The *economy of indebtedness* is a reality of the recent years. Over-liquidity facilitated credits, the selection of borrowers being more and more permissive. In this context, the country risk analyst is increasingly concerned about sovereign crisis and its consequences; he raises the natural question, appealing to economic history: *What are the states that have*

recently experienced a sovereign crisis? The answer will be surprising, inducing the idea of a reduced probability of default of the states. What the answer to that question hides is the fact that a significant number of states have avoided collapse thanks to the International Monetary Fund, or as a result of debt restructuring. Beyond liquidity risk, with the highest visibility, a number of other fragilities are particularly noteworthy: the current account deficit, the existence of an overvalued currency, the excessive government deficit, the high governmental debt, the difficult political situation, etc.

In Europe, many countries are facing problems due to high sovereign debt. Not only Greece, but also Spain, Portugal, Ireland or Italy represent well-known cases. Among the causes, we can mention the lack of controlling government deficits, the recession effects, the public accounting opacity, or the inability to use independent monetary policies.

In order to study the default probability for a given state, it is extremely important to take in consideration the economic fragility. A sovereign risk analysis is advised to include *a 360 degree review of the economy, including the banking system, political stability, monetary policy, and the current regime* (Andritzky 2006: 71). Finally, we add that, in addition to the specific vulnerabilities of an economy, we are also interested in the state's willingness to pay. Even today, not all countries are of *market-friendly* type, some continuing to compare the gains and the losses obtained for the fulfillment of international obligations, namely repudiation of foreign debt.

This short paper opens the way for a broader study that we will propose, and which aims to develop a model of sovereign risk analysis, the dependent variable, the probability of default, being explained by the evolution of the selected relevant indicators.

SHORT REVIEW ON EUROPEAN TURISM IN 2010 THROUGH THE INFLUENCE OF THE FINANCIAL CRISIS

Marinoiu Ana-Maria

*Academy of Economic Studies Bucharest
Faculty of International Business*

Viciu (Cărăgin) Andreea Raluca

*Academy of Economic Studies Bucharest
Faculty of International Business*

The aim of the present research paper is to present a short review on the European tourism in 2010 through the influence of the financial crisis. The importance of the paper resides in the presentation of the impact that the economic downturn had on the European tourism, taking a closer look also in the investment in hotel industry in 2010. The paper's objectives took into consideration the current situation and by proposing the rural tourism as an alternative we offer a solution in order to minimise its effects on this specific activity sector. The subject has not been extensively debated in the specialized literature even though it represents a current issue both regarding the private business environment as well as the main national and international bodies that regulate the tourism industry. The research methodology consists in a SWOT analysis through which we prove the rural and ecotourism to be a viable solution in order to minimise the downturn of the industry for countries in CEE. The added value of the paper consists in the analysis of a subject that is too little taken into consideration and of big importance for the companies acting in this specific domain.

Key words: european tourism, financial crisis, rural tourism, ecotourism

JEL codes: L83, M16, R19, Q01

1.Introduction - International tourism in 2010 and the financial crisis

After a few years of healthy growth, the year 2009 represented a turning point for the european tourism, the hotel and leisure industry due to events such as government down-comes, the credits crisis and the increase in unemployment which lead the national economies into recession, leaving fewer money available for leisure trips and other forms of leisure.

Meantime, the corporations have implemented cost cutting measures including the amount of air travels for their employees and decreases up to elimination the group meetings in famous brand hotels and resorts. In spite of the turmoil registered in the period 2009-2010 the european tourism has recovered spectacularly, even if the effects of the financial crisis have still been felt through the shortening of the traveling time and the reducement of the allocated budget.

The decreasing of the revenues has led to the lowering of the tourist consumption by shifting the demand towards similar tourist destinations in terms of motivation but different regarding the price level. According to the European Travel Monitor the number of out bond trips made by Europeans rose by 1% in the period January-August of last year, while the

hotel occupancy degree has fallen by 2%, due to the lowering of the spendings by 3%. According to the same source's forecast 2011 will register a rise in the outbound tourism compared to the period mentioned above. The short-term travel to the European region have stagnated and the long term ones have risen by about 3%, this phenomenon being explained on the basis of one of the tourism demand determinants: the distance of travel.

The latest information on tourism development in 2010 shows that 2011 will be a fruitful one for the whole sector, but the trend, although increasing, in terms of value shows that the performances from 2008 will not be achieved just yet. The signals remain positive due to the massive growth of liquidity resulted from the closure of the last financial year. The existing liquidity will allow future investments. At the macroeconomic level the indicators show positive trends and the economies of emerging countries are becoming stronger. Taking into account the risk of indebtedness that still hangs on the economies of the EU (after the failure of Greece and Ireland, suspicions are hanging over Portugal and Spain), The European Travel Commission has predicted for 2012 an overnight increase in visitors by about 4% in the European Union.

2.Literature review

The subject has not been extensively debated by the specialized literature even though it represents a current issue both regarding the private business environment as well as the main national and international bodies that regulate the tourism industry.

We must take into consideration the effects of the economic crisis may have on short term (eg. changes in consumer behavior regarding tourism), but also, most important the long term changes. Therefore, "the macroeconomic environment as sketched by international financial and other institutions can be useful in providing the necessary background information to understand how tourism industries can react to these challenging times and to consequently perform short- and mid-term projections." (Papatheodorou, A., Rosselló, J. and Xiao, H. 2010: 41)

Even though the world economy has faced a series of economic crisis, however, the specialised literature has mostly analyzed the financial and monetary implications and has focused less on their influence on the tourist flows. After a short period of time following the break of the financial Asian crisis a series of specialised books and articles have appeared regarding this subject but the approach from the tourist point of view has been long expected (Pine, R., Chan, A. and Leung, P. 1998: 252-256.), (Leiper, N. and Hing, N. 1998: 245-251), (Prideaux, B. and Kim, SM. 1999: 523-532).

As a consequence, the causes and implications of the crisis for Asia as a whole and for individual countries have been widely discussed from an economic perspective but the impacts on tourism are relatively under-researched. The academist (Igor Mladenović 2009: 51-58) was a pioneer that addressed the impact of the current global economic crisis, driven by the real estate and banking crisis in the United States of America on tourism in the Balkan countries. We can also identify impact studies and reports on tourism conducted by authorized institutions of the European Commission (European Travel Commission 2010) or belonging to consulting firms such as Ernst & Young (2009) that have analyzed the trend of tourist flows in the period 2008-2011.

3. Financial crisis and the investments in hotel industry in 2010

The global financial crisis is bound to exert a major impact on the development for countries, affecting different international resource streams such as: private capital flows such as FDI, portfolio flows and international lendings, official flows such as: the financial development institutions, the financial development transfers, the capital transfers and current transfers such as: assistance and official development payments. For the European region, the crisis was most visible in January 2009 when retail sales, excluding cars and construction, have decreased by 3.5%. Tourism Economics, a company owned by Oxford Economics stated in their newspaper „The Financial Crisis and the implications on European tourism" for the European Transport Commission that the consumption is declining both in 2009 and in 2010 by 1.7% and respectively 0.1%”.

Almost all the European countries in the Euro zone have introduced tax incentives to support the domestic demand. The combined sizing of these sums amounted to about 1% of the gross domestic product. However it was unlikely that these measures would produce a major increase in domestic demand for goods and services before the end of the year and their effect was negligible. The tax incentives and the normal operation of automatic stabilisation caused a significant deterioration in the governmental fiscal balance so that in the Euro zone the fiscal deficit reached 4.3% of the gross domestic product in 2009 being projected to increase by 5% in 2010.

The responses of the tourism sector opposite to the financial crisis are the reactions of the government due to the existence of certain promotional campaigns as well as the response of the private sector to the performed actions. National tourism offices in all countries have suffered as the level of promotional funds decreased with the devaluation of local currencies.

Noting the earlier responses to the crisis offered by both the private and the public sectors as well as the individuals it is noticeable that the short-term strategic plans have assumed a higher level of importance than the long-term considerations. Individual consumer responses are the most visible and can be measured by the decline of tourist activity, both locally and internationally. The uncertainty about employment and worries about the ability to meet future financial obligations can be the primary reasons that explain the reduction in tourism activity. (Mladenovic 2009: 52).

Governments often exert a negative impact on tourism withdrawing funds during some austerity campaigns and giving in to the temptation to raise taxes. The analysis of the responses to the crisis offered by both the public and the private sectors indicates that there are some key strategies for maintaining tourism at a limited level. Firstly we have ensured the political stability. In fact, the past experience has shown us that governments have been installed through a peaceful transfer of power from previous administrations.

A second successful strategy is the reassessment of promotional priorities to increase tourism in countries that have not been affected by the crisis (Mladenovic 2009: 56). The success of this strategy was visible in the case of Australia, Korea and Thailand. Under this strategy there is the need for governments to maintain or increase expenditures. There is also a corresponding need for the private sector to increase the level of promotion both through collaboration in national campaigns as well as through individual actions with foreign distributors.

In conclusion, we can say that, in accordance with all these experiences, the European tourism industry is facing significant challenges. That is, with the reduction of capital

inflows in European countries due to the crisis in the countries of origin of capital, the exchange rate regimes have become more vulnerable.

The financial crisis has driven more than ever to the reduction of credits for projects of new hotels and 2009 has registred very few investment projects in this area. The refinancing strategies, which are usually available for real estate companies, have often been used for other purposes than for hotels - the property is in most cases difficult to reconvert or relocate while for most companies these factors are not tied to the company's success. The restructuring strategies have therefore been focused on optimizing the existing properties rather than on rescue plans in the area of major pipeline development. The remedies must be designed to stabilize the situation of long-term revenues for the owners.

It is likely that in future the low-budget and the 3-4 star accommodations be promoted, especially in areas where previously there were gaps such as in India as well as before large events like the Olympic Games in London and Sochi.

According to the report done by BNP Paribas Real Estate the investments in the hotel industry began to grow in 2010, they recorded a total volume of 6.6 billion euros in the five countries analyzed (France, Spain, Italy, Great Britain and Germany) an increase of approximately 110% compared to 2009 when they recorded a 3.1 billion euro volume.

The investment volume in tourism in the EU increased in 2010, but has not yet reached its peak from 2006 (20 billion euros) being marked by two major transactions: the acquisition of the group Norgani by the group Pandox and the single asset transaction of Grosvenor House. Grosvenor House in London was bought by Sahara India Pariwar, belonging to the Royal Bank of Scotland for a price of 550 million euros, about 1.1 million per room. Last year there were 80 transactions, totaling 589 hotels, 60,000 rooms.

Geographically speaking, Britain has remained the most active investor on the European hotel market with a total volume of 1.9 billion euros, followed by Scandinavia (1.2 billion euros), France (772 million euros), Spain (680 million euros) and Germany (200 million euros)".

4. Research methodology

Given the present situation of the industry we propose a SWOT analysis on the tourist market from CEE as research methodology in order to identify some niche tourist products and to propose them to the bidders in the private sector.

SWOT analysis

STRENGTHS	WEAKNESSES
<ul style="list-style-type: none"> - the variety and diversity of the tourist resources, both natural and anthropogenic; - the geographical diversity: mountains, hills, plains and sea; -the diversity of the tourism potential: protected areas, national parks, caves, hunting and fishing, unpolluted areas, culture, etc. -increasing the interest in agro-tourism -the existence of cultural and historical relics in the region -the vast majority of countries in the Central and Eastern Europe as members of the EU develop 	<ul style="list-style-type: none"> - the lack of local infrastructure that hampers the access for tourists (poorly developed road infrastructure, airports that need massive investment in order to upgrade the technology, the obsolete rail infrastructure) -the inadequacy of the tourist offer to the consumer requirements, especially the poor quality of accommodation and restoration. -the lack of tourist information and promotional materials of the touristic offer; -the lack of qualified personnel in the tourism services;

regional plans for sustainable tourism development -good conservation of inherited traditions and customs	-the low information and promotion of tourism jobs available; -the cultural rigidity -the lack of local capital -the delays in private funding of tourism utilities -the existence of large accommodation units with poor architecture
OPPORTUNITES	THREATS
-the increase in the number of visitors in the region due to the free movement of persons -the need to conserve and protect nature through an organized tourism sector that respects sustainable development (eco-tourism) -Creating economic and social complementarities on the terms of industrial regress and agriculture stagnation; -Ecological reconstruction through tourism of habitats, affected by other forms of economic exploitation like mining or agriculture -accessing ERDF European funds in order to realise the regional specialization in tourism; -the involvement of the local population in the development of rural tourism by preserving the traditions and customs; -the possibility of exploiting the natural potential in order to achieve a kind of eco tourism. -the discovery of alternative sources of fuel and energy and their ability to capitalize them in the touristic sector -the emergence and development of private property as well as other mechanisms (eg concession) of ownership of movable assets -the entrance of the main integrated hotel chains on the market -the openness to new sources of financing of the touristic sector (credit, leasing)	- strong competition -the negative image of tourism generated by the communist period -the deterioration of tourist resources due to inadequate exploitation and development of other forms of competitive economic capitalization (industry, agriculture) -the reduced competitiveness of the inbound tourism offer compared with the outbond offer -the low regulatory legislation.

Given the SWOT analysis carried out above we propose two types of “niche “ tourism in order to overcome the financial crisis in the Central and Eastern Europe area : the rural tourism and the ecotourism.

Rural tourism is a "form of tourism that includes any tourist activity organized and led in rural areas by the local population, harnessing the local tourism resources (natural, cultural, historical, human) as well as the facilities, tourist establishments, including hostels and agro farms"(WTO). The specific features of rural tourism are: location in rural areas, touristic functional design of the construction, open space, contact with nature, tradition, organization and traditional practices, traditional character - gentle growth, organic as compared with the family, diversity and forms of presentation. According to (Page and Getz 1997: 3) rural tourism is much more than “countryside”. The impact of rural tourism is social and also cultural, not only economical. Butler and Clark, 1992 cited by (Page and

Getz 1997: 12) consider that the impact of rural tourism on development of the respective area is to be analyzed in relation to “income leakage, multipliers, labor issues, the limited number of entrepreneurs in rural areas, the proposition that tourism should be a supplement to rather than the mainstay of rural economies”.

In order to better understand the term of ecotourism one must first define the following concepts: responsible tourism, green tourism, geotourism. "The responsible tourism" is the fact that all those involved in tourism activity, tourists and service providers must adopt a responsible attitude towards tourist destination. "Green tourism" is often used as a non-academic version of sustainable tourism and "Geotourism" is the form of tourism that supports or enhances the geophysical characteristics of a space - the environment, culture, aesthetics, heritage and population welfare.

A tourism project or product must meet four criteria (to be held in the natural and cultural spaces, to encourage the involvement of local labor, to involve conservation measures and to support local welfare.) in order for it to be an authentic ecotourism product. Of course, we cannot say that tourist services which do not include all four components always have a low quality, just say that it is not an ecotourism activity. We propose to include these types of tourism in the offer of countries of CEE due to the poor local and international development and due to the great potential that it presents. The choice made is based also on financial and technical reasons given the present market funding sources (public sources: money from the EBRD and non-refundable funds: ERDF and private sources: capital contribution, loans or leasing).

5. Conclusions

1. *As it is well known there are two categories of factors that motivate tourist demand: endogenous factors (motivation, income and free time) and exogenous factors.* People travel because they are: activated as a result of the action of internal factors (push factors) and attracted as a result of external factors, dependent on the destination features (pull factors). Traditionally, activation factors explain the desire to go on holiday, while the attractiveness factors explain the choice of destination. The activation factors are: socio-psychological reasons, explain the desire to go on holiday, their action - refers to any destination on the tourist market and the attractiveness factors: motivations determined by a particular destination, explain the choice of a destination; their action - refers to a specific destination on the tourist market. That being said, it is observed that in 2010 in tourism the predominated type of factors in choosing a tourist destination were the pull factors.

2. *Considering the touristic offer and also the touristic potential of the European countries we have identified the following potential niche market from which we have chosen to detail only two elements: rural tourism and ecotourism.*

3. *The major obstacle in the way of the development of the hotel industry from Europe versus the opportunities*

It has become increasingly obvious that fact that the region of Europe especially CEE represents a very attractive location for the international hotel chains, not only for the luxury sector but also for the middle section or the budget section. However, foreign companies look with skepticism onto this market mainly due to the following factors: political instability, lack of local capital, uncertainty of the property right and lack of infrastructure (here we refer to Central and Eastern Europe). In terms of **political stability**, there are signs that the established democratic regime is respected and it acts according to the criterion of

freedom of decision. What remained to be done now is to carry out awareness campaigns for possible investors about the real state of the new democratic states. Regarding the second barrier, **the eradication of corruption** is much more difficult to fulfill. Two international chains such as Accor and Bass have made ambitious investments in the region, their success being a starting point for their competitors. **The lack of local capital** cannot be changed overnight, although there are positive signs from the creation of institutions that could help local investors in the hotel industry. For example, the countries that have recently joined the EU, as is the case of Romania, have benefited from the help of the EU pre-accession and structural funds meant for the reconstruction and elimination of disparities compared to the other members of the Union. Regarding **the ambiguity of property** it exists in many new countries that have joined the European Union. **The infrastructure** has also benefited from the European Union funds (ISPA and Transport SOP) with which there have been rehabilitated whole kilometers of rail and road infrastructure. A still weak point of this problem is the motorway network that is still underdeveloped in the region.

All these barriers identified in this study must be removed in order to ensure the continuity and sustainability of the hotel business. The present work provides a remarkable contribution to the literature in this field. It may be one of the few sources of information on the influence of the present financial crisis on tourism, especially on the hotel industry and a starting point for potential investors in the tourism sector in Central and Eastern Europe. There are presented two niche tourism products: rural tourism and ecotourism through whose regulation and practice there will be an increase in the number of inbound visitors but especially outbound ones in the analyzed region. One must keep in mind that the two products mentioned above represent a priority of the European Commission in order to realise a sustainable tourism and to accomplish the objectives of the legislative package on climate change due to pollution.

The economic crisis creates a series of consequences such as loss of jobs, reducing wages, insecurity of the population, reducing standard of living, material hardships, low self-confidence and hope for the better, illnesses, altered human relationships, social protests, ever greater scale strikes, in other words, deterioration of the economic environment.

This paper aims to identify possible solutions to improve the effects of the crisis on the quality of life, based on figures from surveys conducted by research firms and the possible correlations to be made between these dates, without attempting to consider that these solutions are unique or the best. The main indicators considered for identifying the negative aspects of the crisis among the population are: the evolution of unemployment, changes in gross domestic product or wage developments in the economy and the share of expenditure linked to the basic needs out of the income earned. Regarding the possible solutions to reduce the population crisis, they are closely related to the credit and monetary policy, and also to the budgetary policy.

Under the impact of the economic crisis, the business environment in Romania has suffered. Sub impactul crizei economice, mediul de afaceri din Romania a avut de suferit. Since most investments in 2008 were of foreign origin, the fact that this crisis has affected Romania as well did not surprise anyone. Nowadays Romania's business climate is characterized by lack of direct foreign investments and self funding sources whereas the population declares itself in a large proportion –more than 50% - to be affected by the crisis (1).

Effects of the crisis can also be observed in the evolution of consumers' behavior who fearing layoffs and declining revenue, not only turned to buying the same products or to purchase cheaper products, but also to reducing the amount of the purchased products. The quality of social life is essential and strongly related to stimulating economic activity. Satisfaction felt by the consumer will determine the level of consumption and will influence and ultimately decide the supply level. An adequate economic policy in Romania to restore the balance between supply and demand in the market may induce a state of economic recovery. This should be the objective of anti-crisis policies.

Keywords: crisis, quality of life, unemployment rate, gross domestic product, wages rate, social conditions of life, economic environment

JEL: F41, F41, J17

1. The quality of life in the current crisis

The direct impact of the crisis on the population leads to altered social conditions of life. A social indicator for the economic crisis assessment is the *evolution of the unemployment rate*. Given the systemic nature of the global economy, the problems the U.S. economy was confronted with were felt and widespread in Europe and, of course, on other continents as well. If in 2007, the improvement of the economic conditions, those of the labour market included, resulted in an employment rate of the labour force at European level of 68% and a decrease in the unemployment rate up to 7% unemployment rate, in 2009 the unemployment rate increased by 2.2 percent, reaching 11% in 2010, and the employment rate decreased by 2.5% in the EU.

Another relevant indicator is *the evolution of the gross domestic product*. In 2009 as compared to the year 2008, the GDP decreased by 4.1% for the euro area and by 4.3% on average for the 27 European countries.

Inevitably, the economic crisis effects were felt in Romania as well. Studies have shown that, given the global recession, the number of bankruptcy cases has increased significantly up to the half of the year 2009. In Romania, for instance, the number of bankruptcies increased by 27% during 2008-2009, although 2008 had been a record year in this respect - for companies in Romania bankruptcies nearly doubled in 2008 compared to 2007 and most of them were in the trade. Moreover, there are a number of sectors affected strongly by bankruptcy: trade, distribution, wood and wood products manufacture (412 cases), transport (causes: the increase of fuel prices, which led to the insolvency of small carriers) construction, textile, manufacturing, hospitality sector (causes: poor competitiveness, lack of qualified personnel, poor management strategy) the catering and automotive industry, the areas with the lowest risk, where they recorded the fewest cases of insolvency, are producing and supplying electricity and heat, water and gas, metallurgy, financial intermediation, telecommunications and IT. For example, in Romania since 2008, the number of payments made under conditions of insolvency has increased the production twice and three times that of wholesale and retail trade, construction and only in the construction industry were recorded 10 or more payments in circumstances of insolvency.

In Romania, the crisis in the construction sector has caused problems to companies in the wood industry, leading to lower orders and financial difficulties among companies in the forest administration. The annual review of working time evolution also revealed that the length of the workweek reflected a clear distinction among the 27: only 13 of the EU countries had working weeks longer than the EU average. The longer working week was recorded in Romania, where full time employees were working, on average, about 41.8 hours a week.

Regarding *the evolution of wages* between 2008 and 2007, all EU countries have recorded increases in average wages agreed in collective agreements. However, the surge in inflation rate has reduced the wages rise set in the collective agreements, from 3.6% in 2007 to 1.3% in 2008 in real terms. In countries where real wages have still continued to grow (and for Romania), increases were much lower in 2008 than in 2007.

It is obvious that there are differences and similarities between Member States in Europe. Yet the satisfaction levels vary significantly among social groups: people with higher incomes, better health status, secure jobs and higher levels of education are generally more satisfied with their lives. Although Bulgaria and Romania have a similar GDP per capita, the level of satisfaction in Romania is much higher than in Bulgaria. Consequently, there is no proportional relationship between national income and level of satisfaction. 70% of EU

citizens have a dwelling, and nearly half of them hold it definitively, without any mortgage or loan. The proportion of people with home ownership is much higher in countries of Central and Eastern Europe where, on average, 74% of citizens have total ownership of the housing, the highest proportion being recorded in Romania (87%) -this high percentage of ownership does not translate into a higher quality of housing.

The recession of 2008 has fundamentally changed the living conditions of many European citizens, causing for Romania a decline of the possibilities to provide the basic needs: adequate warming of the house, an annual holiday, new furniture to replace old furniture, a meal that includes meat, chicken or fish every other day, new clothes and means of taking care of guests at home a meal that includes meat, chicken or fish every other day, new clothes and means of taking care of guests at home - from 30% in 2007 to 26% in 2009, significant differences being perceived throughout the country as well: 25% of the poorest people lack four of six items, while a percentage of 25% of the wealthiest citizens t lack only one element. In Turkey, the Former Yugoslav Republic of Macedonia, Bulgaria, Romania, Hungary, Lithuania, Slovakia and Latvia, 25% of the richest people suffer from many shortcomings than the poorest 25% in Denmark, Sweden, Luxembourg and the Netherlands.

There is an obvious downward trend in Europe from 2007 to 2009 in nearly all states regarding the satisfaction with the level of living. In Romania, this trend is sudden, the largest decline in satisfaction with the level of living were recorded among people of 65 or more who have suffered the greatest decrease in quality of life in general as a result of the fall in the purchasing power of pensions.

Regarding the evolution of the number of jobs, it is shown in the following table (*table no. 1*):

Table no. 1 Jobs lost and created by sectors in 2009-2010

Fields of activity	Nr. jobs lost / created
Automobile production	-70377
Financial intermediation	-57417
Public administration and defence	-46802
Trade	-44621
Machinery and equipment production	-42545
Post and telecommunications	-35452
Metallurgy	-23770
Road transport	-22712
Electric equipment production	-21358
Food and drink production	-20466
Financial intermediation	6215
Computer and related activities	6470
Coal Mining	7650
Other economic activities	8592
Post and telecommunications	8860
Electricity, gas and hot water supply	11510
Automobile production	12744
Public administration and defence	13999

Hotels and restaurants	22220
Retail	47157

Source: adapted from <http://www.eurofound.europa.eu/pubdocs/2010/16/ro/1/EF1016RO.pdf>.

The Romanian economy has lost more than 370,000 jobs over the last year. *In late 2009, the number of employees had fallen from 4.73 million jobs to 4.36 million. 40% of the jobs lost in 2009 belonged to the construction and industry field.* At the end of 2009, the number of employees fell from 4.73 million jobs to 4.36 million. 40% of the jobs lost in 2009 and belonged to the construction industry. After 2005, over a third of the new jobs have been created by the state, and personnel costs incurred by public money have doubled the budget. The fact is that the missing 370,000 jobs by the end of 2009 equal the number of jobs created in five years of economic boom.

2. Anti-crisis solutions:

There are a number of protectionist measures to be found in the specialized literature meant to diminish the effects of the crisis. -

In his book *Après la démocratie*, Emmanuel Todd (2), considers that when confronted with the "brutality" of the crisis and of the unemployment rise, more and more people were in favour of the strengthening of protectionist measures, starting with a form of "European protectionism "done in the name of" a necessary correspondence between economic and social spaces. " This solution is proposed taking into account the fact that rising wages will encourage consumers to absorb more of the market offered, resulting therefore in real possibilities of production relaunching.

Michel Aglietta (3) believes that, given the current crisis, the adoption of protectionist measures could be a factor that deepens the crisis and brings along the risk of damaging relations between states, this claim is based on the fact that a concerted international action is absolutely necessary for successful implementation of existing measures to halt the crisis. Even if the European protectionism helped the economies of European countries in fighting against the international market, there are factors that hinder the adoption and implementation of protectionist measures in the EU domestic policy, factors resulting from the differences between the economic development of EU countries.

Michel Aglietta believes that Europe has been profoundly affected during this period of crisis (4) because of the absence of a robust and well-based industrial policy, and also due to the promotion of a clear policy against competition coming from outside the EU. In this context, the research and development policies remain the national ones, generating an unnecessary competition between companies from different EU countries, a process also exacerbated by political sensitivities between countries; EU holds its own responsibility because it supported the fight for the dominant position in the EU through protectionist measures against other areas, America, Asia, this European protectionism preventing firms from moving towards the development of extra-European activities. -

Referring to the book written by Emmanuel Todd, Daniel Bensaïd asks in his article "Keynes et après? (5) "to protect? whom and against whom? If Europe started by adopting social measures of convergence in terms of jobs, income, social protection, labour rights, harmonization of taxation, then Europe might legitimize the adoption of protective measures and not the interests of selfish industrialists and those in the financial environment whom it favours." Europe could help the developed countries in supporting the joint development

through agreements with less developed countries in terms of migration, technical cooperation, fair trade. Without these measures, he believes, the protectionism of the rich would have negative consequences upon these developing countries as main effects.

One of the measures put forward in order to reduce the impact of the crises upon the European Union countries, is a European economic recovery plan (6), which has proposed to come not only with supporting solutions for EU countries, but also practical help in this regard.

Thus, the plan devised at the European level aims at using all available means and instruments of action at EU and national level; it is a plan meant ultimately to lead to economic growth and creating jobs by means of the objectives to promote economic recovery and that lead, ultimately, to economic growth and creating jobs.

The strategic objectives of the Recovery Plan were:

- stimulate demand and consumer confidence;
- harmonization of market conditions with the requirements in terms of competitiveness by stimulating economic growth and new jobs;
- stimulate economic activity without affecting the environment security.

To achieve these objectives, there were proposed concrete measures that can be implemented in the economies of EU countries with the aid provided by EU institutions.

The monetary and credit policy - is vital when in crisis and must be managed carefully by the bank that carries it out - the European Central Bank ECB. In this respect, the ECB has created a drop in euro zone interest rates to stabilize the markets by lending money to supply banks with cash to help their clients. Similarly, the European Investment Bank EIB will increase by about 15 billion its annual interventions in the EU countries' economies by providing loans to positively influence and lead these national economy out of recession whereas the European Bank for Reconstruction and Development will help the new Member States with 500 million per year to get out of recession and to start the economic recovery.

Budget policy – within the national budgets for 2009, and then for 2010 there were measures to be taken requiring an amount of approx. 170 billion or 1.2% of GDP at EU level so as to produce positive effects, and, if possible, long term ones: to boost purchasing power of consumers by improving the functionality of market adoption of emergency measures to strengthen the link between wage-fixing mechanism and the evolution of productivity, employment policy supporting and facilitating labour market transitions, reducing administrative costs.

For blurring effects of the crisis on global business environment, the Government Strategy for improving the business environment 2010-2011 proposes a number of measures to be implemented with minimal cost: restoring flows of foreign capital, promoting responsible business conduct, reduce trade costs and providing national consulting firms to solve the crisis.

The government provides a series of actions aimed at:

- improving the dialogue by creating public-private consultations designed to ensure greater transparency in the regulations;
- supporting the business environment by encouraging freelance professions;
- developing the cooperation with specialized departments of the central government institutions.

The EU has published recommendations in individual reports on each Member State to achieve the objectives of the annual package "Lisbon". These recommendations have as a

major priority the protection of the European citizens regarding the consequences of the financial crisis and the implementation of several policies such as integration, retraining, valuation of professional competencies, especially in what the licensed unemployed workers are concerned.

Conclusions:

Many economists, coming from different socio-cultural spaces, aim at finding further reforms for getting out the crisis. Their dilemma lies in the fact that I cannot answer exactly to what extent the preservation of capitalist structures, as they were promoted through the writings of the interwar reformers can still be possible under current conditions. For Romania, the confidence in overcoming the crisis is still, the lowest in Europe. However, the direction is positive: in 2011 the population confidence index measured by the Consumer Confidence Barometer for the European Commission has recorded an average increase compared to the average of the year 2010, reaching -46 to -54, showing the Romanians more optimistic especially at the beginning of the year.

COMMON AGRICULTURAL POLICY FROM HEALTH CHECK DECISIONS TO THE POST-2013 REFORM

Niculescu Oana Marilena

Academy of Economic Studies, Bucharest, Faculty of International Business

The paper proposed for being presented belongs to the field research “International Affairs and European Integration”. The paper entitled “Common Agricultural Policy from Health Check decisions to the post-2013 reform” aims to analyze the Common Agricultural Policy (CAP) from the Health Check adoption in November 2008 to a new reform post-2013. The objectives of the paper are the presentation of the Health Check with its advantages and disadvantages as well as the analysis of the opportunity of a new European policy and its reforming having in view that the analysis of Health Check condition was considered a compromise.

The paper is related to the internal and international research consisting in several books, studies, documents that analyze the particularities of the most debated, controversial and reformed EU policy. A personal study is represented by the first report within the PhD paper called “The reform of CAP and its implications for Romania’s agriculture”(coordinator prof. Gheorghe Hurduzeu PhD, Academy of Economic Studies Bucharest, Faculty of International Business, research studies in the period 2009-2012).

The research methodology used consists in collecting and analysis data from national and international publications, their validation, followed by a dissemination of the results in order to express a personal opinion regarding CAP and its reform. The results of the research consist in proving the opportunity of a new reform due to the fact that Health Check belongs already to the past. The paper belongs to the field research mentioned, in the attempt to prove the opportunity of building a new EU agricultural policy.

The challenges CAP is facing are: food safety, environmental and climate changes, territorial balance as well as new challenges-improving sustainable management of natural resources, maintaining competitiveness in the context of globalization growth, strengthening EU cohesion in rural areas, increasing the support of CAP for member states, farmers and active farmers-, sign in outlining the CAP contribution to the “EU 2020 Strategy”.

This paper aims to prove that the future CAP should become a more sustainable, balanced, better focused, simpler and more efficient, more responsible to the needs and expectations of EU citizens.

Key words: Common Agricultural Policy, reform, rural development, Health Check, EU 2020 Strategy

JEL Classification Code: Q18, O13, F59

I. Introduction

The paper presented belongs to the research field “International Affairs and European Integration”. Entitled “Common Agricultural Policy from Health Check decisions to the post-2013 reform”, it aims to analyze the Common Agricultural Policy (CAP) from the Health Check adoption in 2008 to a new reform post-2013 and tries to prove the need and importance of the reform. The objectives of the paper are the presentation of the Health

Check with its advantages and disadvantages as well as the opportunity of a new EU agricultural policy need and its reforming having in view that the analysis of the health condition of this policy was considered a compromise.

II. Analysis of the research

The paper is related to the internal and international research consisting in several books, studies and documents that analyze these aspects of the most debated, controversial and reformed EU policy. Health Check was analyzed by several Romanian and foreign authors, the conclusion being that it made only small technical steps in the path of the reform. The Communication of the European Commission regarding Health Check represents a document that define that so-called analysis of the Health Check. In this context, the opportunity of a new EU agricultural policy and its reforming represent a subject deeply debated by EU member states and as well as a theme analyzed through many studies, documents like the research made by big European think-tank, the position of European Commission and European Commissioner for agriculture, regarding CAP after 2013 regarding the needs of carrying on the reform. A personal study is represented by the first report within the PhD paper called “The reform of CAP and its implications for Romania’s agriculture”(coordinator prof. Gheorghe Hurduzeu PhD, Academy of Economic Studies Bucharest, Faculty of International Business, research studies in the period 2009-2012).

III. Research methodology

The research methodology used consists in collecting and analysis of internal and international data, their validation followed by the dissemination of the results with a view to building and expressing a personal position regarding CAP. Health Check belongs already to the past and for that reason the paper tries to prove the need of building a new EC agricultural policy and of reform.

IV. Results of the research

Following the collecting and analysis of data regarding CAP since 2008 to present and after 2013, the results of the research can be expressed by the need of building a new EU policy having in view that Health Check, through its changes, made only small steps in the direction of a new reform.

Common Agricultural Policy (CAP), one of the first common policies adopted by European Union (EU) has been, in over half of century of existence, the most debated, controversial, analyzed and reformed EU policy.

If in the beginning it was based on output subsidy and protection of internal market against non-European producers, subsequently subsidy aimed to support directly the income, not the stimulation of the production, focusing on rural development and environment protection.

Health Check was adopted in November 2008 by the ministers of agriculture of the EU member states following the political agreement regarding the health condition of CAP and represents a package of amendments to policy regulations, amendments of small steps only at technical level towards the reform. Considered as being a compromise, Health Check gave the member states a significant number of instruments to support the producers. The changes adopted solved difficult problems that the Fischler Reform didn’t in order to avoid being rejected by member states. So, intervention on markets is reduced, modulation is extended and decoupling is carried on:

- national milk quotas were supplemented with 1% per year, going to be eliminated in 2015;

- in case of wheat bread, buying from the market at intervention price were limited to 3 million tonnes (on the entire EU), interventions over this quantity being done through public auction (at a lower price);
- keeping land fallow was eliminated (set-aside-the obligation to let a part of lands not cultivated in order to limit the offer of products);
- modulation foresees that payments for farms that receive more than 5000 euro to be reduced by 10% till 2012 (and those for farms receiving more than 300,000 euro to be extra-reduced by 4%), money being transferred to the rural development budget;
- decoupling, essential result of the 2003 Reform, achieved by introducing the single payment scheme at farm level (and in case of new member states the single area payment) was imposed also to those subsectors from some countries that chose the maintaining of coupled support [Luca 2009b: 15]

Among the disadvantages of Health Check are:

- deficiency in the implementation of guidelines that were going to be written by each member state;
- refuse of the Commission to discuss a proposal in order to equalize the rates of direct payments in the entire EU;
- falling to adopt an upper limit to the level of direct farm payments, big farms being further the main beneficiaries of CAP, in contradiction with its objectives to support family farms and to preserve rural environment;

The main provisions of Health Check were those that involve the disappearance of market regulation tools and those of rebalancing production support (crop, livestock, horticulture, etc.). While at European level discussions were held on subjects like: management tools of food market production, modulation, conditionality, biodiversity, price volatility of agricultural products, environment protection, climate changes, etc., at internal level farmers protested against decisions taken by state institutions regarding: fuels excise duties reduction, low amount received as payment area and falling to pay it on time, market of agricultural products, low price received by farmers within the pathway to recovery.

Debates regarding limits and modulation finalized in decisions providing: low limitation: minimal limit to 1 ha or 100 euro; for Portugal, Hungary, Slovenia the limit remains 0,3 ha; upper limitation: no legislative measure; compulsory modulation: an increase of 5% distributed in 4 steps, starting with 2009 (2%) and 1% for 2010-2012; progressive modulation: an additional discount of 4% for farms over 300,000 ha.

Health Check resumes to less tools for market regulation and for funds transfer from the first pillar to the second one, financing of the rural development programs. Although most member states were aware that a reduction of agriculture budget could not be avoided, the debates within Health Check could not define a common position of member states, not even as principles, regarding the direction of the reform after 2013.

Health Check is already a matter of past, debates within EU are subject to the new CAP after 2013 and its reform.

After the extended public debate organized by the European Commission in early 2010, the Council discussed the reform over four successive presidencies, the European Parliament adopted a report by its own will regarding CAP after 2013. The conclusion after these discussions was that the future CAP should remain a strong common policy structured around its two pillars.

The CAP is facing challenges like: food safety, environment and climate changes and territorial balance. Although CAP has developed, many changes are still needed in order to answer to new challenges like the improving of the sustainable management of natural resources (water, biodiversity, soil), the maintenance of competitiveness in the conditions of globalization growth, the recovery of the diversity of agricultural structures and output in EU, the strengthening of the territorial and social cohesion in rural areas of EU, the increase of CAP support for member states, farmers and active farmers.

Responding to these challenges, CAP will also contribute to the “EU 2020 Strategy” concerning:

smart growth: by increasing resource efficiency through technology and innovation, developing high added value and quality of products, green technologies, investing in training, providing social incentives in rural areas; sustainable growth: ensuring sustainable land management through: providing environmental public goods, avoiding to lose biodiversity, promoting renewable energies, reducing gas emissions and developing the potential of rural areas; inclusive growth: by unlocking economic potential in rural areas, developing local markets and jobs, sustaining the restructuring of agriculture and supporting farmers’ income [European Commission]

The main three objectives of the future CAP are: viable food production, sustainable management of natural resources and climate action, balanced territorial development. The achievement of these objectives depends to the maintaining of public support for agriculture and rural areas.

An agricultural policy designed at EU level is necessary in order to ensure fair conditions with a common set of objectives, principles and rules and provides a more efficient use of budgetary resources than the coexistence of national policies.

The main orientation of the public debate is reflected by three general policy options which rely on the structure the policy’s two pillars: an enhanced Status-quo; a more balanced, focused and sustainable support; less market tools and reduced income support.

With a view to improve the quality of legislative proposals, the improvement of smart regulation, simplifying the policy and reduction of administrative charges are required.

An important step for such an important policy like CAP is represented by the fact that the Parliament will be involved together with the Commission in the process of taking decisions and will respond in a better way to the expectations of farmers, inhabitants in rural areas, to citizens in general. The legal proposals will be submitted later this year and legal documents might enter into force in 2014.

The future CAP represent a subject extremely debated in working-papers, reports and conferences by several European think-tanks having different profiles from international and commercial relations to land use and food safety. Among these are: Groupe de Brouges, French Institute for International Relations, Land Use Policy Group, European Centre for International Political Economy, Notre Europe, Agriculteurs de France.

Europe must stimulate the building of a modern agriculture, to create working places and to ensure a fair management of the EU agricultural area. The future CAP should contain a more equitable distributed first pillar and a second pillar focusing more on competitiveness and innovation, climate change and environment. A special attention should be given to the development of rural area.

CAP reform must continue in order to promote competitiveness, efficient use of resources,

adoption of appropriate measures in order to ensure food safety, social and territorial balance in the context of climate changes, taking into account the constraints of limited budgetary resources and the impact of the economic crisis in agriculture.

The future CAP should become a more sustainable, balanced, better targeted, simpler, more efficient, more responsible in order to meet expectations of the EU citizens.

V. Conclusions

The paper is related to the research papers in the field “International Affairs and European Integration” and tries to complete the studies regarding the opportunity of the CAP reform.

As Health Check represented only small steps in the direction of reform, being already a problem of past, the paper reflects the need of building a new CAP and of a reform post-2013. The new challenges CAP is facing will contribute to the “EU 2020 Strategy”.

SOME ASPECTS CONCERNING THE DIPLOMATIC PROTECTION OFFERED BY THE EUROPEAN UNION FOR THE CITIZENS IN THE PRESENT ECONOMIC SITUATION

Timofte Claudia Simona Cleopatra

Universitatea din Oradea Facultatea de Științe Juridice

Mirișan Ligia-Valentina

Universitatea din Oradea Facultatea de Științe Juridice

Based on the particular meaning that is specific to European citizenship and that is involved in the practice of citizenship, it causes modern concepts of citizenship which are derived from the universal norms of citizenship.

It's important to underline that the European citizenship is a concept which does not replace the National citizenship, but it is a new modern concept which has a real connection with the national citizenship and why not connected with the Romanian citizenship.

From this point of view, emphasize in this paper that the diplomatic and consular authorities from member states of the Union have to guarantee the protection of the European citizens in third countries in which their state is not represented.

The cooperation of the diplomatic representatives is an important point for the Foreign Politic of the European Union.

Keywords: citizenship, European citizenship, diplomatic/consular protection, European Union

Cod JEL:K33

I. Introduction

The introduction of citizenship of the Union constitutes one of the best-known innovations made by the Treaty signed at Maastricht on 17 February 1992¹. Significantly, Part two of the EC Treaty, which is expressly devoted to (and entitled) "Citizenship of the Union", is located immediately after "Principles"² and before "Community policies"³, which marks out its general importance within the system of the Treaty. Whereas the most direct and immediate precedent for the provisions at present set out in Arts 17-22 EC may be found in a proposal put forward by the Spanish Government during the Intergovernmental Conference which resulted in the adoption of the Maastricht Treaty⁴, the idea of identifying a status for individuals benefiting from the process of European integration and its correlative label of "citizen" of the Community or of the Union goes back to the early 1970s. Following an initial initiative at the Paris Summit in 1972, the subsequent summit in 1974 gave rise to a plan for a standard passport for all nationals of the Member States, which was to be followed by a passport union and a core of special rights characterizing the position of the Community citizen. In pursuance of the mandate conferred upon it by the summit, the relevant working party presented in 1975 the so-called Tindemans Report, which contained a chapter on the creation of a "Citizen's Europe".

Those initiatives of the national governments were followed by initiatives from the Commission⁵ and the European Parliament. The latter adopted a resolution on 12 December

1977⁶ and most significantly the *Draft Treaty establishing the European Union* of February 1984, Art. 3 proposed introducing citizenship of the Union⁷. The Single European Act of 17-18 February 1986 (“SEA”), which entered into force on 1 July 1987, did not make any contribution towards translating the numerous projects for Community citizenship into law, with the result that the expression itself did not appear in the Treaty despite the preparatory papers which had given rise to the presentation of the report of the Adonnino Committee on a people’s Europe. Nevertheless, as a result of the Maastricht Treaty, the progress made by European integration and the diminished importance of economic factors as the determinant for Community legislation, together with the emergence of a higher level of democracy in the Community’s institutional life, led to formal recognition of the notion of citizenship of the Union⁸ identifying a special status governed by Community rules for Community citizens.

European citizenship is often regarded by skeptics as a threat to national citizenship which has always been considered „the fortress of state sovereignty and of the national identity. According to Deloye, these fears are well grounded as the „European citizenship is the cause of the reorganization of identities.”¹⁰ Despite its complementary and dispersed nature, European citizenship is a challenge to the structure of the European identity or identities established by the nation-states¹¹. This is because most people assume that the acquisition of European citizenship involves creating a new European identity. The most appropriate example of this fact is Denmark’s rejection of the Maastricht Treaty, because of concerns expressed in this regard. Denmark’s negative response to the concept of European citizenship was followed by a statement of the Council of Europe underlining the fact that none of the provisions of the Maastricht Treaty would replace national citizenship¹². But not even the founding Treaties of the Communities - which stated that this should be “based on the substantiation of a union, as close as possible among the peoples of Europe”¹³ and not to create a new nation¹⁴ – represented satisfactory guarantees in this respect. As Deloye pointed out, any attempt to impose a new configuration of norms and identities by means of European citizenship will come up against the opposition of many social actors¹⁵.

The possibility of combining various levels of identity is confirmed in great part by the results of the Eurobarometer survey on European and national identity of 2002. Thus, 59% of the Europeans, unlike in 1999¹⁶ - when the figure was 52% - admit certain European components in their national identity¹⁷. In early 2004, after including the 10 candidate states, the figure fell by 3%¹⁸.

In the studies dedicated to this subject, an author considered that the appreciation of European citizenship is determined from the angle of the pre-existing factors of the social nature that creates identity¹⁹. According to another point of view expressed in these studies, European citizenship can be structured by law, and the continual progress - influenced by the gradual enhancement in the legal status - can provide the essential condition for an active European citizenship²⁰.

Therefore, several questions come up:

What is the right to consular protection for EU citizens?

Every citizen of the European Union who is in a country outside the EU, in which the Member State of which he/she is a national is not represented, is entitled to protection by the diplomatic or consular authorities of any Member State represented there. EU citizens are entitled to protection on the same conditions as the nationals of that State.

In 1995, Decision 95/553/EC was adopted by the representatives of the governments of the Member States to implement this entitlement.

What kind of assistance is provided?

When an EU citizen seeks such help, he or she must produce a passport or identity card as ***proof of nationality***. If these documents have been stolen or lost, the embassy may accept any other proof.

Diplomatic and consular representations giving protection have to treat a person seeking help as if he/she were a national of the Member State they represent.

The protection offered by embassies/consulates of other EU States comprises:

- Assistance in cases of *death*,
- Assistance in cases of serious *accident* or *illness*,
- Assistance in cases of *arrest* or *detention*,
- Assistance to victims of violent *crime*,
- The relief and *repatriation* of distressed Union citizens.

What is the European Commission doing in this area?

In November 2006, the Commission adopted a *Green Paper* on diplomatic and consular protection of EU citizens in third countries (COM(2006)712), which set out ideas to be considered for strengthening this right of EU citizens.

Following a public consultation, in December 2007 the Commission presented an **Action Plan** (COM(2007)767) entailing the proposed measures for 2007-2009. The plan focuses on enhancing consular protection and increasing awareness of this right among citizens. The Action Plan will be evaluated in the context of a Commission's Communication in March 2011²¹.

II. Definition of concept.

The history of the transformation of the individual in the community legal order begins with the artificial creation of the „market citizen”²², i.e. the person having economic freedoms, quality which confers him the judicial enforcement to play his role in the process of creating the single European Union market. The Economic European Community (EEC) Treaty contains provisions to that effect, and in 1962, even before the Court of Justice of the European Communities had acknowledged the direct effect of fundamental freedoms, the Commission adopted the point of view according to which the individuals in the Community legal order did not exercise their fundamental rights as simple factors of production, but as holders of civil rights. Illustrative in this respect is the Stauder case (1969) which dealt with the personal right of the petitioner who wished to purchase products subsidized by the European Community at a reduced price without having to reveal his identity.

We remind you that the European citizen is a person who has the nationality of a state included in the European Union, but, by contrast, holders of fundamental freedoms are all those upon whom the Community legal order has conferred such rights.

III. Analyses concerning the exercise of diplomatic protection by the Community for the benefit of citizens of the Union

According to the art. 20 EC the citizens of the Union, in the territory of a third country in which the Member State of which he or she is a national is not represented, have the right to

“protection by the diplomatic or consular authorities” of any Member State on the same conditions as the nationals of that State.

This article calls to mind the classic institution of the diplomatic protection of citizens, by virtue of which, provided that certain conditions are satisfied, there is a right to protection from the State for its own nationals who have been harmed by the conduct of another State in breach of international law²³.

Among the requirements which a State must satisfy in order lawfully to exercise diplomatic protection is that the individual in whose interest the State intervenes must be a national, although there are exceptional cases in which a State may exercise diplomatic protection in respect of non-nationals²⁴. The exercise of diplomatic protection by an international organization is, in contrast, somewhat controversial, it being accepted instead in the form of the so-called functional protection of the organization, where, as a result of the internationally unlawful conduct of a State to the detriment of one of the organization’s officials, the international organization suffers damage to its own institutional interests²⁵.

It is considered that the Community may act by way of diplomatic protection to safeguard its own interests, as, for instance, in the case of conduct of third countries resulting in injury to Community officials²⁶.

However, it cannot be inferred from the present state of development of general international law that the Community has the right to act to afford diplomatic protection *vis-à-vis* third countries which have damaged the interests of Member State nationals not connected with the Community by a relationship of service, but in a broad sense. The approach taken in the Community case-law does not appear at all consistent with the aforementioned rule of customary law.

In *Adams*²⁷ the Court of Justice did not deny that the Commission was under a duty to act to defend the applicant (who was not a national of a Member State) before the Swiss courts, where he had had criminal proceedings brought against him for having unlawfully disclosed to the Commission practices of a Swiss company which constituted an abuse of a dominant position; it merely rejected the accusation that the Commission had not so acted because it did not square with the facts. In a more recent judgment, the Court of First Instance dismissed a claim for damages for non-contractual liability based, *inter alia*, on an alleged infringement by the Commission of its duty to intervene actively with the authorities of Guinea-Bissau to obtain the immediate revocation of an unlawful seizure of a vessel flying the Greek flag and its immediate release. In rejecting this plea, the Court of First Instance observed that, from the purely factual point of view, there was no reason to doubt that the Commission Delegation in Guinea-Bissau had “fulfilled ... its duty to provide diplomatic protection to the master [of the seized vessel] and the applicant”²⁸. The Court of First Instance therefore seemed to presuppose that there was a power/duty on the part of the Commission to act to afford diplomatic protection in the face of internationally unlawful conduct on the part of a third country *vis-à-vis* a citizen of the Union, which consisted in the case in question of violation of an international treaty concluded with the Community.

The judgment, which lacks any reasoning with regard to the legal presupposition underlying it, was welcomed by those who accept that the possibility to act to provide diplomatic protection stems from the fact that the Community has international legal personality under Art. 281 EC²⁹.

The introduction of citizenship of the Union, with the resulting strengthening of the legal/political link between the citizen and the Union – even though it is not yet sufficiently

capable of evaluation in terms of its content – could afford arguments in support of the case-law which has just been discussed, which, as has been pointed out, seems to go beyond the rules which may be identified in the present state of development of general international law.

Thus, we may ask ourselves whether the European citizenship is a merely legal construction or whether it also exists in social reality. Different scientific disciplines answer differently to this question, varying with methodology. This is why it is possible to distinguish two main positions: the “multi-national” view and the “universal” view³⁰.

A multinational picture of Europe – which a traditional perspective, based on public international law – is drawn by an overview of the Union member states. The constitutional role of citizenship can be developed from the reserve of multi-leveled identities alone. Three results are worth to be mentioned:

- The view of the necessarily exclusive nature of the position of the individual in terms of citizenship does not do justice to the empirical facts; normative conclusions based thereon are problematic.

- One cannot presume that Union citizenship is lacking any kind of social basis.

- Such studies have shown that identities are particularly influenced by political discourses expressed in the media³¹.

In the last twelve years no other binding acts have been adopted on Consular protection and only recently, after 2006, under the pressure of the European Council and of the Commission the member states have agreed on some complementary and non-binding Guidelines on consular protection of EU citizens in third countries as well as on non-binding measures to counter crisis outside the territory of the EU (such as the notion of the “Lead State Concept” according to which a member state will on voluntary basis coordinate the consular protection in a specific third country and prepare if needed evacuation plans in case of disasters or of terrorists attacks)³².

What about Lisbon Treaty, here is another good question looking for an answer. Well, member states remain jealously attached to the former functions and even after the Lisbon Treaty they avoided a legislative role of the EU institutions by stating that “*Member States shall establish the necessary rules among themselves and start the international negotiations required to secure this protection*”. Moreover, a positive evolution could come out from the strengthened cooperation between the MS diplomatic missions with the new European Union External Action Service as defined by the Article 35 TEU (ex Article 20 TEU) which states that : “*The diplomatic and consular missions of the Member States and the Union delegations in third countries and international conferences, and their representations to international organizations, shall cooperate in ensuring that decisions defining Union positions and actions adopted pursuant to this Chapter are complied with and implemented. They shall step up cooperation by exchanging information and carrying out joint assessments. They shall contribute to the implementation of the right of citizens of the Union to protection in the territory of third countries as referred to in Article 20(2)(c) of the Treaty on the Functioning of the European Union and of the measures adopted pursuant to Article 23 of that Treaty*”³³.

IV. Conclusion

Latest developments in this area show that The Commission published on 23 March 2011 a Communication on consular protection which takes stock of the Action Plan 2007-2009 and

presents the future measures for the next years. The Commission also launched a *website on consular protection* for the citizen which will contain, among other useful information, the contact details of Member States consulates/embassies in all countries outside the EU.

Following the entry into force of the Lisbon Treaty, this protection is conferred directly on every EU citizen by Article 23 Treaty on the Functioning of the European Union. This right is also enshrined in Article 46 of the Charter of Fundamental Rights of the European Union. These fragmentations of the rights of citizens along the national borders and the European policy have created a new understanding of citizenship, which challenges the modern concept of it. Based on the particular meaning that is specific to European citizenship and that is involved in the practice of citizenship, it causes modern concepts of citizenship which are derived from the universal norms of citizenship.

FOREIGN DIRECT INVESTMENTS DURING FINANCIAL CRISES

Vintila Denisia Mariana

The Academy of Economic Studies Bucharest

Faculty of International Business

The fundamental idea of International capital flows is that short-term flows can be easily reversed, while flows on a longer time horizon are more stable. Crises are associated with withdrawals of short-term capital flows and growth of the foreign direct investment flows. The current crisis has meant a major decline of international capital flows, also of the foreign direct investment. The analysis in this article tries to establish *if and under which conditions foreign direct investments can bring greater stability during the crisis, comparing the evolution of foreign direct investments in the current crisis with their response in previous crises. We show that during previous crises foreign direct investments were stable, behaving differently from other types of capital. Yet, during the current crisis, foreign direct investments have proven to be not so stable and all the components declined, raising questions about the resumption of the positive trend. The stability of foreign direct investments in the past was given by the increase of mergers and acquisitions during the crisis, reflecting fire-sale FDI. This feature is not found in the current crisis as mergers and acquisitions were severely affected by the crises and recorded a major decline. The current paper is realized in the doctoral program entitled “PhD in economics at the standards of European knowledge- DoEsEc”, scientific coordinator Prof. PhD Rodica Zaharia, institution The Academy of Economic Studies Bucharest, Faculty of International Business, period of research 2009-2012.*

Keywords: foreign direct investment, financial crisis, fire-sale FDI, international capital flows, Asian crisis

JEL Classification: F30, F32, G21

I. Introduction

Potential positive effects generated by foreign direct investments(FDI), such as technology transfer, human capital formation, creating a more competitive business environment lead countries to create an investment climate more attractive to investors as above features, contribute to the economic growth and economic development. Short-term capital flows, as opposed to long-term flows, are considered to be reversed easily, being driven by interest rate differentials and exchange rate fluctuations leading to volatility in capital. FDI are associated with economic characteristics that involve a long time horizon, becoming more stable flows. (Bird and Rajan 2002: 2)

The present research aims to analyze the evolution of FDI during current financial crisis 2007-2010, making a comparison with the evolution of FDI during past crises and is part of the author's future PhD dissertation paper on the subject: “Foreign direct investments and their role on the economic development of Central and Eastern Europe. Comparative study Romania versus Poland.” The current paper is realized in the doctoral program entitled

“PhD in economics at the standards of European knowledge- DoEsEc”, scientific coordinator Prof. PhD Rodica Zaharia, institution The Academy of Economic Studies Bucharest, Faculty of International Business, period of research 2009-2012.

Increasing activity of multinational companies determine the importance of FDI in the global financial crisis. Alfaro and Chen (2010) highlights the fact that in 2007 FDI accounted for 17.2% of capital formation in developed countries and 12% in developing countries, while production of the foreign affiliates was 12% of global gross domestic product(GDP) and exports about one third. (Alfaro and Chen 2010:3)

Financial Crises generates both positive and negative effects on the activity of transnational companies in the economies affected by the crisis. Athukorala(2003) identify three positive effects of the collapse of currencies on FDI. Massive depreciations reduce local production costs and countries become more attractive for export-oriented foreign investments, FDI becoming in this way more profitable. A second effect would be the reducing investment costs due to reduced costs of the assets, as the demand decreases. Last but not least, anti-crisis package and new legislation regarding foreign control can create new opportunities for acquisitions and mergers. The negative effects refer to negative effect on domestic market-oriented foreign investment(Athukorala 2003:4-5)

Alfaro and Chen (2010) analyzing the behavior of subsidiaries of transnational companies during crisis, show that they are more stable compared to local firms, even if during normal periods, no major differences were found . The foreign companies respond much better to crisis than local firms do, even if they have the same economic features. Vertical links with the mother companies prove to be more powerful during crisis, while in case of horizontal links there is a greater risk of volatility. Foreign firms usually receive a financial support from parent companies if the case of worsening financial and credit conditions in the host country. During crisis taking place only at the level of host countries links with parent company provide higher stability, as the mother company is not affected by local crisis. (Alfaro and Chen 2010:2-6)

II. Previous crises and the evolution of FDI

Foreign portfolio investments are motivated by immediate financial gains and investment decisions don't have a long-term time horizon, thus they are very volatile, therefore foreign portfolio investments volatility can strongly affect capital flows during crises.

FDI is not a simply transfer of capital. They are associated with technology transfer, new marketing practices or management techniques. All these aspects involve a relationship on a long time horizon and their mobility is limited, being more stable than the remaining components of capital flows.

Although most of the literature highlights the fact that FDI is more stable than other forms of capital, there are studies that suggest otherwise. For example, Claessens et al. (1995) show that FDI volatility is as high as of any other type of investment.

At individual country level, Reinart and Rogoff (2008) analyzes the characteristics of the financial crisis erupted in 18 developed countries. As the importance of these crises is relatively low, the authors focused more on crises erupted in five states, whose consequences were more important: Spain (1977), Norway (1987), Finland (1991), Sweden (1991) and Japan (1992). The conclusions of the research show that financial crises have three common characteristics: a drastic reduction in asset prices, an important reduction in

production and the rising of unemployment, and the increase of the public debt to alarming figures. (Reinart and Rogoff 2008:2)

Lipsey (2001) analyzed the evolution of FDI in Mexico during the 1994 crisis. He highlights that between 1992-1993 FDI have doubled, but in the crisis year(1994) they fell by 15% and just over three years, in 1997 they returned to the pre-crisis values. But in this case, the portfolio investments fell by 75%, a much stronger decline than the one recorded by FDI, indicating that the latter are more stable (Lipsey 2001:7)

The most important global crises were considered by Poulsen and Hufbauer (2011) four in number: 1975, 1982, 1991 and 2001. In all these periods, are identified three common characteristics that have led to crises: global GDP has fallen below 2%, GDP fell by 1.5% compared to the average of the last five years and was at a minimum level compared to the levels earlier or over next 2 years. In these crises, following the oil shocks and recession during the '90, FDI have returned to pre-crisis levels after a period of approximately three years, but they were strongly supported by measures of global liberalization. (Poulsen and Hufbauer 2011:8)

Latin American currency crisis of 1982 led to a decline in investment flows to the region, FDI remaining still positive, although only in 1988 it will reach the levels recorded before the crisis. Instead, portfolio investments recorded negative values in 1983 and begin to recover only in 1988. (Lipsey 2001: 4-5).

The crisis in Southeast Asia 1997-1998 was the subject of numerous investigations. The way FDI and portfolio investments have evolved during the crisis are similar to the ones in Mexico in 1994: portfolio investments decreased by 40%, while FDI only by 13% in 1995.(UNCTAD, 2009).

According to Kiminsky and Reinhart (1998) Latin America has suffered during 1970-1995 more financial crisis than any other developing region, with 50% more compared to the countries in Asia or Eastern Europe. Although the characteristics of the crisis differ from one region to another, the crisis in East Asia borrows many of the characteristics of the Latin American crisis (volatile capital flows and a weak financial system) (Kiminsky and Reinhart 1998:1-5).

The literature regarding the link between FDI flows and financial crises brings up the phenomenon of "fire-sale FDI": the fact that FDI increase during crises. FDI are carried out on a long time horizon and are attracted by cheap assets arising during the liberalized regime crisis. 1997-1998 East Asian crisis has confirmed this theory, with the except of Indonesia, which has witnessed both a political and economic crisis. (Hill and Jongwanich 2009: 2)

If during the crisis in Latin America, FDI have fallen much less than other types of investments, the crisis in Mexico was similar, the FDI flows decreased but much less respecting to other form of capital and never became negative. In contrast, in East Asia, FDI inflows have registered a modest decline in 1998 but recovered in 1999 (Lipsey 2001: 15)

During financial crisis, the FDI to East Asia fell by 15%, this demonstrates that the massive withdrawal of capital was due to the other forms of capital, such as portfolio investments and bank loans, which dropped by 102% and 220%. (Athukorala 2003: 6-8).

Studying the behavior of foreign direct investments and foreign portfolio investments, Achayra et al (2009) show that in countries affected by the 1997 Asian crisis, there is a strong correlation between the two types of investments, which is a positive correlation

during non-crisis periods and a strong negative one during the crisis, concluding that the financial crisis in Asia has not represented a massive reduction in FDI to the countries of the region, but only a modest decline. Massive capital outflow was driven by other forms of capital: portfolio investments and bank loans (Achayra et al 2009: 20 -22)

III. Foreign direct investments during the 2007-2010 financial crisis

The crisis erupted in 2007 represented the collapse of foreign direct investments, being the biggest financial crisis since the Great Depression of 1930. It is characterized by rapid contagion to all world countries, the high speed with which it occurred, different intensities had over time, as well as over various components or different regions. (Milesi-Ferretti and Tille 2010:7-8) Began in the U.S.A, as a sub-prime crisis, has affected the entire financial structure of the country and then rapidly spread to non-financial sectors worldwide.

The global financial crisis led to a collapse of foreign direct investment flows worldwide. After reaching a new historical record in 2007, 2 trillion dollars as a result of four years of continual growth, foreign direct investment fell in 2008 by 14% at global level (UNCTAD 2009: 3). If developed countries were most affected, with a decline of 30% in 2008, the developing countries continued to attract FDI, 17% higher respecting to 2007. FDI continued to decline, the decrease being 30% globally in 2009 compared with 2008, while developed countries recorded a decline of 44%. Although in the previous year 2008, FDI to developing countries seemed not to be affected by the global crisis, in 2009, this category registered a decline of 24% (UNCTAD 2010: 3). All FDI components were adversely affected by the crisis, and countries have not only tried to attract new investment, but also tried to keep the existing ones.

Milesi-Ferretti and Tille (2010) identify three periods of crisis. The first starts in August 2007, once the beginning of the problems for Lehman Brothers when international capital flows declined in the banking flows in developed countries. Between late 2008 and early 2009, takes place the second stage of the crisis, characterized by the repatriation of capital flows, especially the banking loans. The last period of the crisis that began in the second half of 2009, representing a slight revival of non flows and banking in Asia and Latin America.(Milesi-Ferretti and Tille 2010:2)

As the financial crisis has affected the U.S.A and Western countries initially and then propagated at global level, FDI to developed countries fell the most, contributing heavily to the decrease in mergers and acquisitions by 67% in 2008 (Poulsen 2011:3). The reduction of mergers and acquisitions in the current trend is contrary to previous crises, when, by the nature of “fire-sale” phenomenon, the acquisition and mergers increased.

All FDI components recorded reductions, but the most important one was the one registered by equity investments, this being a signal that the revival of FDI flows may last for some time (Poulsen 2011:3)The decrease in global FDI since 2008 is the result of many factors, including global financial crisis, reduction of corporate profitability, the decline of the stock market, reducing of the global demand and reducing funding capabilities due to increased cost of credit (UNCTAD 2009,2010).If during the Asian crisis portfolio investments fell sharply, reaching even negative values, the period 2008-2009 is slightly different. Portfolio investment began to decline only in the second half of 2008, not being so volatile and began to rise slightly in 2009. (Hill and Jongwanich 2009: 18)

IV. Conclusions

Comparisons with past crisis can be considered insignificant because the magnitude of the current crisis is much higher than the previous ones. Foreign direct investment during current crisis dropped by significant values and reacted faster to the crisis respecting to the other forms of capital flows, showing that they are not so stable and can be as volatile as any other type of flows if the global economy is affected.

DEVELOPMENT AND COMPETITIVENESS**

LOCAL ACTION GROUPS - THE EUROPEAN INTEGRATION CATALYST FOR THE ROMANIAN RURAL AREA

Ailenei Dorel

Academy Of Economic Studies

Mosora Liviu-Cosmin¹

Academy Of Economic Studies

Romania has the highest share of European Union rural areas (44.9% in 2009), which generates and maintains a long series of regional disparities. Because of these disparities, the economy faces a number of elements that undermine the quality of human and social capital and reduces the potential for growth: precarious social and economic infrastructure, reduced access to markets and thus to goods, a low level of both economic cohesion and living standards, and a difficult access to education and training (leading to the underutilization of labor in rural areas, while major shortages in the labor market and increased migration phenomenon manifests).

In these circumstances the European Union LEADER initiative is an important chance for the development and tightening of the rural - urban continuum in Romania. A fundamental element of this initiative are the local action groups. These local action groups are conceived rather as an ad hoc framework for exchanging ideas, for debate on matters of local interest, on initiatives to boost economic activities. Thus, these local partnership structures can be self-organized by very real problems and directions: to promote a brand of product made in a certain area, the image of a tourist attraction, of traditional occupations, crafts of products, etc.

In this paper, the authors aim to highlight the difficulties of European integration for rural areas in the new Member States, considering that the LEADER initiative would be a good opportunity to accelerate this process. To emphasize this, a review of the progress in implementing the LAGs program in Central and Eastern Europe was undertaken. Also, we identified the success factors of this program based on the experience of the European Union developed countries. Finally, we provide arguments in favor of local action groups as the solution to the rural problem of Romania.

Keywords: local action groups, regional disparities, regional development policies.

JEL Codes: O18, R11, R58.

1. European integration of the rural area in the New Member States

After the "Purgatory" transition to a market economy of former Central and Eastern Europe communist countries, their process of modernization continued through the EU accession. But the integration into a developed European economic and social space is difficult and

¹ This work was cofinanced from the European Social Fund through Sectoral Operational Programme Human Resources Development 2007-2013, project number POSDRU/1.5/S/59184 „Performance and excellence in postdoctoral research in Romanian economics science domain”.

fragmented. Beyond the various measures and assessment of the convergence process, the peripheral area fragmentation of the EU due to centripetal and centrifugal forces of the integrating process is more than obvious. These differences are evident both on the national and regional dimensions, but also on other dimensions of the EU: institutional, economic, social, political, cultural, etc.. From this perspective, the authors consider that the most serious fracturing of space in the Central and Eastern EU is the one concerning the rural - urban areas. Disparities between urban and rural areas are by far the most conspicuous in the heterogenic landscape of the Central and Eastern EU both in synchronic and diachronic terms. Without insisting on the spatial distribution causality of economic activities, even under an optimistic attitude about the present (which would consider disparities as ephemeral), we are, however, concerned about the significant differences in the time horizon perception of the economic development. Often, Eurobarometers show net discrepancies in the assessment of economic development opportunities, degree of optimism, confidence in progress, etc. between residents in urban areas and those in rural areas. As shown in some studies (Cristescu A., Andreica. M.E., 2011) there are considerable differences even in the inflationary expectations in relation to the residential environment of individuals.

In these circumstances the European integration of Central and Eastern Europe former communist countries has an additional problem - the rural area.

Supported financially and institutionally through pre-accession funds (ISPA and SAPARD in particular), these countries have made great efforts to modernize their rural area. After the EU accession the new member states from Central and Eastern Europe have benefited from additional financial resources made available by the European Agricultural Guidance and Guarantee Fund. However, opportunities in the new Member States to improve the quality of European integration of the rural areas increased dramatically with the adoption of the European Agricultural Fund for Rural Development² (EAFRD). In accordance with EAFRD, Member States should develop and implement the National Rural Development Programs. An important component of these programs is the LEADER axis, which underlies the local action group (LAG) initiative in the new EU Member States.

LEADER is a European initiative for rural development that started in 1991 with LEADER I. It continued with LEADER II (1994 – 1999) and LEADER+ (2000 – 2006). Today it is the fourth thematic axis of the Rural Development Policy (2007-2013).

The aim of LEADER is to introduce a new approach to territorial rural development from bottom to top, integrated, that builds on identifying local needs and support local development strategies that combine one or more priority objectives - competitiveness (axis one) and life quality/diversification (axis three). LEADER target areas are geographically, socially and physically, homogeneous small territories that are often characterized by common traditions, local identity, common needs and expectations. The main aim of LEADER is to improve local governance in order to boost economic and social development and the main vehicle is given by LAGs. This is a local partnership made up of organizations from different socio-economic sectors.

Between 1991-2006 1143 LAGs were created in 25 EU Member States. Thus:

- 52 LAGs had the "Use of new know-how and new technologies" theme;
- 187 LAGs had the "Improving the Quality of Life in Rural Areas" theme;

² Council Regulation (EC) 1698/2005

- 114 LAGs had the "Adding value to local products" theme;
 - 235 LAGs had the "Best Use of Natural and Cultural Resources" theme.
- Of course, the differences in institutional culture and in the temporal moments of accession were significantly reflected in the LEADER initiative implementing (Table no 1).

Table no 1: LEADER implementation in the New Member States

Country	Implementation	Rural area (%)*	No of LAGs	Budget (mil. €)	LAGs surface		LAGs population	
					Km ²	% out of total surface	mil	% out of total population
Poland	2006-2008	39	167/80	30,44	125 500	39	7	18
Slovakia	2007-2013	43	11	-	-	-	0,1	2

As seen, the best results in implementing the LEADER are registered by Poland. According to European Commission reports, Poland has already completed the action for financial support of about 80 LAGs, covering 39% of the country and 18% of the population. In terms of eligible LAGs, Hungary has more than Poland (186 vs. 167, but the first has established only 70 LAGs and has a lower allocated budget). Hungary covers 31% of the country with the financed LAGs and 15,2% of the population.

Czech Republic select the same number of LAGs as Hungary (70 out of 133 eligible), but their activity is financed by almost a quarter of the budget allocated for Hungary. As a result, both Czech LAGs area and population are smaller compared to those of Hungary (6% out of total area and 3,1% out of total population).

Slovakia has 11 local partnerships that are ready to become LAGs (covering 2% of the country population), while Slovenia has a very consistent budget allocated to preparatory actions for LEADER implementation (about €19 millions).

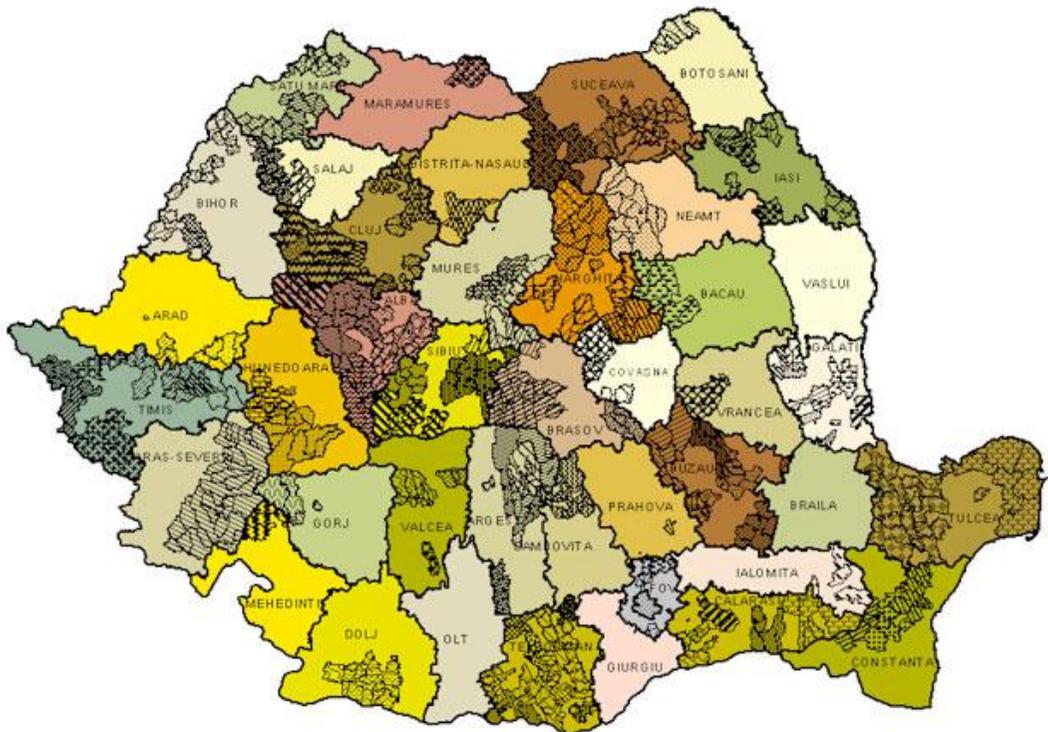

Although they have smaller budgets allocated for the LEADER implementation, the Baltic countries have already made significant advances in implementing this program. Thus, all three countries selected and funded LAGs, which comprise between 30% and 33% of their total population. Most funded LAGs are in Lithuania (29), followed by Estonia (24) and Latvia (17).

With a later EU accession, Bulgaria and Romania planned to implement the LEADER initiative between 2007-2013. At the program beginning, Bulgaria recorded 11 LAGs, while Romania has selected 120 sub-regions that were eligible to be funded as LAGs.

After analyzing³ the social, economic and geographical context, the territorial cohesion and its homogeneity, reported to the residents number and to the eligible area, considering the financial allocation for the LEADER axis and the interest of local actors, it has been estimated that following the selection procedures an approximate number of 80 LAGs can result in Romania.

Thus, the area eligible for LEADER comprises a population of approximately 11,7 million, of which about 2 million are from small cities with up to 20000 inhabitants. Therefore, 17% of LEADER eligible population may come from small towns and about 9% of the eligible area will be owned by cities.

Fig. no 1: Map of potential Local Action Groups in Romania

2. The experience of EU more developed countries

Taking into account the experience of EU developed countries it seems that a good practice⁴ in implementing a LAG depends on the following factors:

-*Area-based approach*. This entails defining a development policy on the basis of an area's own particular situation, in terms of its strengths and weaknesses.

-*Bottom-up approach*. This aims to encourage participatory decision-making at the local level for all development policy aspects.

-*Partnership approach and the Local Action Group*. All the partners are invited to provide ideas about how to develop the project concept.

-*Innovation*. Three fields of innovation are important:

a.specialization: to learn about *quality instead of quantity* as a principle for agricultural development;

b.quality: the preparation of a project is based on a broad consultation about a clear innovation in the region;

c.marketing: learning about the importance of marketing innovative products and the necessity of marketing for goods produced by LAGs.

⁴ http://ec.europa.eu/agriculture/rur/leaderplus/lagdb_en.htm

-Integrated approach. The actions and projects contained in the local action plan are linked and coordinated as a coherent whole. The idea originated in the LAG, which aimed to find a widespread bottom-up support for it.

-Local financing and management. This means delegating to the LAG a proportion of the decision-making responsibilities for funding and management.

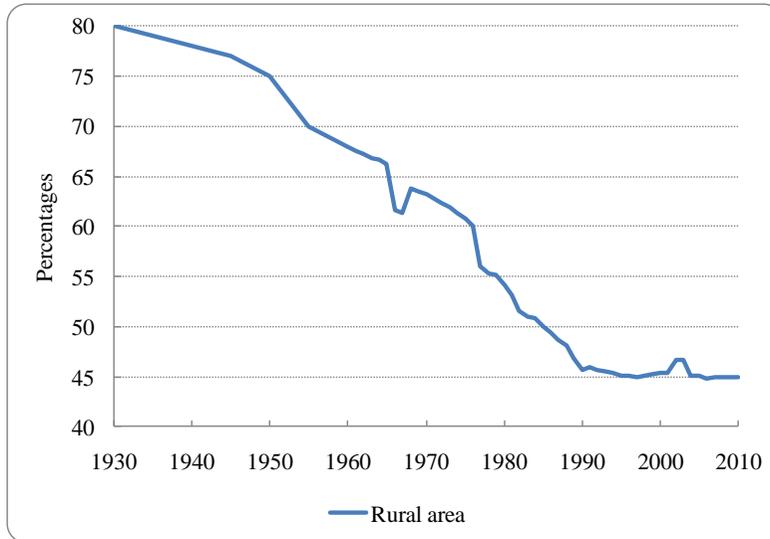

-Transferability. The action/project is transferable to other rural areas with similar geographical and economic characteristics.

-Sustainability. Projects developed by LAGs are conceived that in the long run will contribute a lot to the economic development of the agricultural sector in the region.

3. LAGs a possible solution for the Romanian rural problem

In Romania rural areas (87.1% of territory and 45.1% of population) are typified by a scattered population and very low quality infrastructure (only 33% of rural residents are connected to a water supply network, only 10% to a sewerage system and only 10% of rural roads are of adequate standard). Basic social infrastructure (health and education systems, finance and credit provision etc.) is also much less developed than in urban areas. These factors affect the quality of life in rural areas, hamper economic development, increase outmigration, and exacerbate health and environmental problems. The rural economy is highly dependent on agriculture and forestry, with low development of alternative activities, and lower incomes than urban areas. Moreover, the structure of gross domestic product creation is much different than that of the EU developed countries. We still have a large share of agriculture and even industry, while the share of services is significantly below the European average. The same with the structure and use of labor, which differs even more than that of EU developed countries, especially on account of population employed in agriculture. If we consider other factors such as access to education, quality of life, the differences between rural and urban economic and social infrastructure, then the factors that slows down economic development in Romania are even more obvious.

However, the problem of "rural burden" in development of Romania has historical traditions, which seem to contradict some legends such as "Bucharest - Little Paris" or "eternity was born in the village" and shows a significant structural gap between western economies and societies and ours (Fig. no 2).

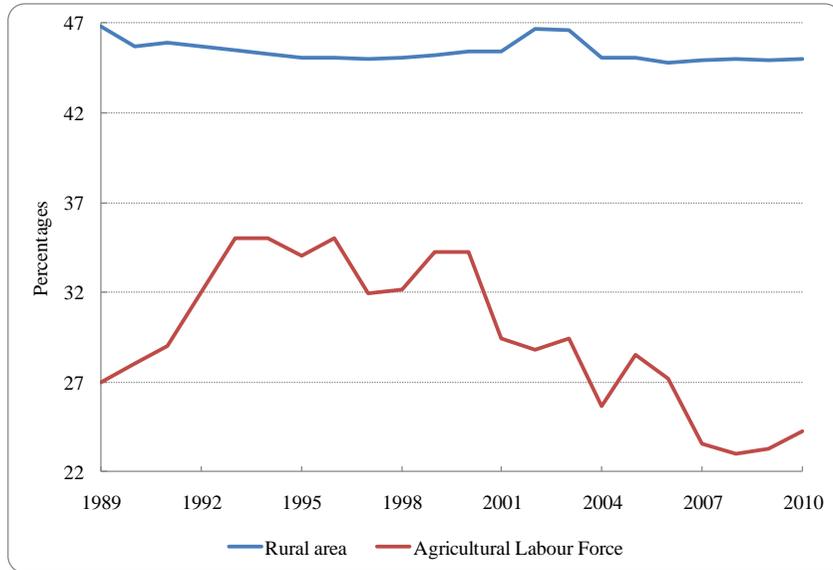

Source: made by the authors

Fig. no 2: Dynamics of rural population in Romania between 1930 - 2010

In the communist era the reduction of rural area was forced by different means, most often destructive (systematization planning program in the Ceausescu period). Even the transition to a market economy has failed to improve the situation given that urban-rural migration flows have exceeded the rural-urban flows in the last years, making the large share of the rural area a problem that blocks absolutely necessary structural economic mutations needed for modernization and European integration.

The agricultural sector is more important than in most other Member States, with 28,7% of the civilian population employed in agriculture and forestry, contributing 6,37% to GDP in 2009 (7,08% to total Gross Value Added), this being largely responsible for maintaining the high percentage of rural area (Fig. no 3).

Source: made by the authors

Fig. no 3: Trends of the population employed in agriculture and of the rural area between 1989 - 2010

The authors consider that given the urban deficit of Romania, the organization and development of LAGs could be a constructive solution to reduce the rural share and to revitalize the development of urban centers. But solving the rural problem exceeds the National Rural Development Plan (2013) horizon and tends to a medium or long run, considering that the rural share settled at a rate of 44-45% in the last decades. Therefore, for Romania, the LAGs initiative will remain current even after the completion of LEADER. By developing activities in rural networks around smaller towns, LAGs can economically and socially revive these centers accordingly to the theoretical model of Lössch (1940). In turn, these small towns can boost the development of urban centers. This can generate an economic growth effect having LAGs as growth poles.

EUROPE AND ITS GREEN FUTURE. ELECTRIFICATION AND DECARBONIZATION

Benea Ciprian-Beniamin

University of Oradea,

Faculty of Economics, International Affairs Department

Baciu Adrian

Minister of Communications and Information Technology

This paper aims to present a great challenge which humanity faces, and which is climate change. Together with food and water shortages which will hit more and more humanity in the years ahead, climate change (which will only amplify these negative facts) will bring negative consequences on economy and society, and in international relations area, too. In this context, the importance of the subject speaks for itself. The research is focused on EU objectives in climate area and in sustainable development, indicating that renewable energy could be a solution for energy independence, and for reducing CO₂ concentration level, too.

The subject is very important one nowadays being subject of intense debates and negotiations, having a high degree of visibility in international forums and in international press.

The paper wants to show what EU aims in the future related to its development through fossil fuels consumption reduction and as a base for starting research are researched realized under the aegis of Group Futuribles from Paris, of the National Centre for Sustainable Development from Bucharest, from American Academy of Arts and Science, and International Energy Agency from Paris.

We take from IEA data and present them in the tables in order to have a synthetic view upon energy in EU countries, and of course, there are presented trends in energy consumption in renewable at European level. The development of the subject with the involvements in transport area only brings a fresh air in the debates regarding reducing energy vulnerability together with fighting climate changes.

There are presented some peculiarities of CO₂ pollution and their implications, and consequences; and of course, solutions for fighting climate change is part of this presentation. Reducing oil consumption and expanding renewable resources (wind, solar, and hydro) and nuclear energy coupled with the electrification of the economy and transportation sectors, and rising energy efficiency are of outmost importance in fighting climate change. Becoming leader in this area, EU aims not only to promote sustainable development, but to influence in a significant manner the future negotiations in climate area, gaining through this strategy a better position on the world scene.

The added value of our endeavor is in the superposed areas of EU energy independence, freeing transportation sector from the place of being hostage to potential oil crisis in the future, and all of these in the context of fighting climate change. The paper presents how energy independence could be obtained through renewable expansion, while fighting climate change, too.

Keywords: climate change, de-carbonization, electrification, transportation, energy efficiency

JEL Classification: O0, O3, Q4, Q5

Climate change – even if some of us don't think it is real – had already produced some visible effects, and the future, if the appropriate measures wouldn't be taken, reserve very different framework in comparison with which we are accustomed. The burning of fossil fuels (coal, oil and gas) is responsible for green house gas emissions, which bring the temperature's increasing, due to its concentration level's rising in the atmosphere. Nowadays at global level over 4/5 of energy is produced using fossil fuels (Malița 2009: 296). The industrialization process in last two centuries has put pressure upon Earth's resources and upon environment, nowadays humanity being menaced both by scarcity of resources, and global warming. Between 1900 and 2000 the temperature rose with 0,3-0,6 Celsius degree (Malița 1998: 213). Climate change experts concluded that the worst scenario which climate change brings could be avoided if CO₂ concentration level would be kept below 550 ppm (parts per million), which means twice the level specific to preindustrial times (Lester and Rosner 2009: 22).

The present CO₂ concentration level is 380 ppm, which, together with another 70 ppm CO₂ equivalent (resulted from nitrates oxides, and methane) gives a concentration of CO₂ equivalent of 450 ppm. The stabilization of CO₂ concentration at 450 ppm would bring in the long run a rising temperature by 2 degrees Celsius at global level. The stabilization of CO₂ concentration in the 450-550 ppm interval is the main focus of recent political debates, although it is noteworthy to be mentioned that at this level of concentration there would be *significant* economic and ecologic damages (Lester and Rosner 2009: 22).

In this context, EU wants to be a world leader in promoting a de-carbonization of economy and transportation, and rising of energy efficiency. The crisis which become so visible in the summer of 2008 could be regarded as a bell which rang and brought attention that the past and present trend would bring a slow, but a dangerous decline. In a world that rapidly may be nearing its ecological carrying capacity because of growth imperative – which in the past was the main reason for economic and military policies of developed states – there is nearing the day when the national interest will require a different articulation of well-being (Wendt 2007: 236). The role which state is asked to play is greater than in the past decades; the reduced degree of interventionism specific to this period when the neo-liberalism was the main economic doctrine will definitively be replaced by a rising role of the state, (Malița 2010: 29) which will regulate economic activity taking account of sustainable development, providing that kind of development which will bring well-being.

European Commission proposed in 2010 five targets to be reached until 2020, all of them defining the process at EU level and with the obligation of being transposed in national policies, one of them being directly related to *climate change and energy* (Gheorghiu 2010: 118). In 2007 EU adopted a new communal strategy for energy, the objective regarding security of supply being integrated with those related to consolidation of competition on the market and those related to climate changes. Even if after the Kyoto Protocol will expire without a new international accord being implemented, EU assumed *unilateral* measures to be taken: the targets 20-20-20 (Gheorghiu 2010: 121-122). These are: reducing greenhouse gas emissions with 20% in 2020 in comparison with 1990, increasing the share of renewable

energy in energetic mix from 7% (2006) to 20% in 2020 in total energy consumption, and rising energy efficiency in order to save 20% of primary energy in EU. It could be noted the role which state is ask to play in order to direct and coordinate national policies for these objective's achievement, its role being felt even in relation with third countries, which don't implement policies which would constrain their economic through pollution taxation. The strategies for achieving this are (Abbas 2009: 53-67): trade liberalization as stimulus for combating climate changes; renegotiating of new accords, taking account of reducing competition in EU countries due to taxes imposed on pollution; derogation from the multilateral norms; and putting in place a mixed governance World Trade Organization – The Climate Change Framework Convention.

What is a focal point regarding energy is the fact that energy security and climate change could push both of them to promote energy efficiency, and de-carbonization of economy. They are expected to encourage the development of renewable energy for electricity in many parts of the world, and as EU wants to be a leader in fighting climate change (being in the same time very vulnerable in energy field), she have to rethink its strategy related to nuclear power. Even with a significant increase of wind and hydro capacities (where there is potential) in EU countries, if nuclear option is not on the decision table, then fighting climate change could be very costly, even without expected results. Renewable energy sources are quite important for electricity generation worldwide; it amounted to 3470 TWh (2006), or 18% of total output (IEA 2008: 149). In Reference Scenario, it rises to 4970 TWh (2015), and over 7700 TWh (2030), 23% of total electricity production, respectively (IEA 2008: 149).

The most important renewable are wind and hydro power, global output of wind expecting to rise eleven-fold, becoming the second-largest source of renewable electricity after hydro in 2010 (IEA 2008: 159). The *largest increase* is in the EU countries which in 2030 could have a share of wind power in its energy mix of 14%.

In 2006, seven of the top ten wind-power markets in the world are EU members.

Table no. 1. Wind-power in EU countries

Country	Installed capacity (GW)	Wind power production (TWh)	Share of total generation (%)
Germany	20,6	30,7	4,9
Spain	11,6	23	7,7
Denmark	3,1	6,1	13,4
Italy	2,1	3	1
United Kingdom	2	4,2	1,1
Portugal	1,7	2,9	6
France	1,6	2,2	0,4

World Energy Outlook 2008, IEA

There is potential for expanding this kind of energy in EU countries, especially in UK (which has the greatest potential), and France (which has the second potential in EU) (Florian et Temime 2008: 27). And this could be reached following a policy of encouragement from *states*; indeed, this is the case: the price of wind electricity is sustained in numerous countries through a tariff policy aimed at the development of renewable energies (Florian et Temime 2008: 31).

Hydropower is the world's largest renewable source of electricity, generating 3035 TWh (2006), around 16% of total electricity (IEA 2008: 402).

But there must be understood that the force of atoms could help generate energy in a clean manner, and together with renewable energy, to promote the increase of energy security through the development of alternative sources of energy, and decrease the concentration of CO₂ due to energy production.

In the nuclear field, EU countries are important players, one of them implementing the most successful nuclear program in the world – France. The potential of nuclear expansion in EU countries is quite large, but its expansion could head the opposition coming from different groups and institutions.

It is noteworthy to be mentioned that European countries depend nowadays in great part (some of them almost totally) on energy imported from other countries; the shift to nuclear, and other renewable resources could help them in mitigating climate change, in rising their energy security, and in promoting a better position in global negotiations regarding climate change. The European countries dependence on imported Russian gas is a hindrance in promoting a cohesive energy policy in EU at large, situation which is exploited with great success by Moscow through its giant arm – Gazprom. The dependence of European countries on Russian gas is presented in the following table (Table no. 2):

Table no. 2. European countries dependence on Russian gas

Country	Energy which is based on imported natural gas (%)
Bulgaria	100%
Slovakia	100%
Finland	100%
Estonia	100%
Letonia	100%
Lithuania	100%
Greece	84%
Austria	78%
Hungary	77%
Czech Republic	75%
Poland	63%
Romania	63%
Slovenia	51%
Germany	32%
Italy	32%
France	23%
The Netherlands	17%
Switzerland	13%

Eni S.p.A., World Oil and Gas Review, 2006

Anyway, the review made in *Germany* (and in other EU countries which after 1979 started to view nuclear energy with skepticism) regarding nuclear energy field in last years (but before March 2011) can be regarded as a positive mark related to nuclear energy renaissance in EU countries.

The present state of nuclear energy in EU countries is presented in the following table (Table no. 3).

Table no. 3. Situation of nuclear generating capacity and reactors in EU member countries

Country	Number of reactors	Installed nuclear capacity (MW)	Share of nuclear capacity installed in total at global level (%)
France	58	63130	17,05
Germany	17	20480	5,53
Sweden	10	8992	2,43
Spain	8	7450	2,01
Belgium	7	5863	1,58
Czech Republic	6	3678	0,99
Finland	4	2696	0,72
Hungary	4	1889	0,51
Slovakia	4	1762	0,47
Bulgaria	2	1906	0,52
Romania	2	1300	0,35

The Netherlands	1	482	0,13
Slovenia	1	666	0,18

IAEA, *Nuclear Power Plants Information (Number of Reactors in Operation Worldwide)* <http://www.iaea.org/cgi-bin/db.page.pl/pris.oprconst.htm>, (vized February 7, 2010);

IAEA, *Power Reactor Information System* <http://www.iaea.or.at/programmes/a2/>, (vized February 7, 2010)

Furthermore, there are in diverse construction phase six nuclear reactors in EU four member countries, the situation being detailed in (Table no. 4).

Table No. 4. Situation of nuclear power plants under construction in EU member countries

Country	Number of reactors	Nuclear capacity under construction (MW)
Bulgaria	2	1906
Finland	1	1600
France	1	1600
Slovakia	2	810

IAEA, *Nuclear Power Plants Information (Under Construction Reactors by Country)*, <http://www.iaea.or.at/programmes/a2/>, (vized February 7, 2010)

But as we can easy note, all these measures mean economy's de-carbonization, and electrification, too. This action will have a profound impact at economic, social, political, and environmental level. In all these fields, the implications are many: reducing energy vulnerability in a historical context in which the hungry for resources will be more and more acute (especially due to the rise of China and India, and due to population's number rising at global level); EU economy's de-carbonization and electrification means a greater energy independence, a vital aspect for national power, with ramifications in the currency area (for a country to have a strong currency, it needs energy independence).

Another area with high impact at economic, social, and political levels is transportation. Transportation's de-carbonization means not only the reduction of consumption of oil, improving energy independence of EU economies, but reducing the CO2 emissions from transportation sector. The climate change accuses the pollution resulted from fuel consumption in transportation as a factor which hurts a lot the environment; in fact, at EU level, over 50% of oil consumption is due to private cars, while some 30% of CO2 emissions in Europe is due to transportation, 84% of which is due to road transport. The de-carbonization of transportation sector means first and foremost that there must be developed new types of transport, while the internal combustion engine losing its primacy. This means a coherent policy at EU level in both areas: in *energy*, and *transportation*.

But these two elements are of outmost importance on each state's agenda in the modern and post-modern worlds. Energy independence means a greater flexibility in foreign policy, and reducing transportation's dependence on fossil fuels only amplifies this aspect: is case of international crises which involves interruption of energy flow, the movements of people and goods is provided by means of transport which aren't based on oil consumption; and in this way there is present a greater independence in mobility, element with strategic implication.

There are three major directions of action in the fields of energy and transportation. As energy production will become cleaner, the electrification of transportation sector is a

natural and direct consequence of this. In this way, new investments in clean energy sector can provide a stimulus for overcome present financial crises, these being simultaneously solutions for solving energy, and environmental crises. Rising the part of energy produced in a clean manner (solar, wind, hydro, and nuclear) while reducing fossil fuel consumption in nothing else than heading to sustainable development. Now, at EU level, the directions for transport de-carbonization are:

- in order to create mobility on medium and long distances the development of railways fitted for *high speed trains* is the best solution for decongestion of already crowded European highways, skies, and airports, saving simultaneously time, energy, and lowering pollution level;

- in order to create mobility on shorter distances the development of electric engines for cars is a solution which involves only reduction of oil consumption in transport, but if this is coupled with;

- the development of clean public means of transport such as tramways, bicycles, and metros (these especially in great urban concentration) coupled with reducing the number of autos, this will contribute to transport fluidization in urban areas, reducing noise, and pollution.

All these three direction have chances of success (there are already numerous examples in Western Europe cities, regions and countries), and this direction will make EU a good example of society which embraces sustainable development. It will be solved simultaneously the problem of crowded highways and airports without affecting mobility, there will be reduced pollution, noise, and the number of car accidents (already car since it was invented had killed more people than both world wars combined (Giddens 2009: 161)), and oil dependence will be attenuated, rising foreign policy independence, and the importance of EU on world stage, due to this reason, and in the climate change negotiations, too.

In this way, EU will obtain benefits internally through sustainable development, and externally, becoming the global leader in sustainable development and in climate negotiations, gaining for it a better position on world stage.

ROMANIA'S ANSWER TO THE NEW DIRECTIONS OF THE REGIONAL DEVELOPMENT POLICY OF EUROPEAN UNION

Berinde Mihai

University of Oradea, Faculty of Economic Sciences

Chirilă Lavinia Florentina

University of Oradea, Faculty of Economic Sciences

The regional development policy of European Union deals with spatial localisation of production and affects the daily life of more than half of the 500 million persons living in the European Union. Conceived at European level as a solidarity policy, it bases especially on financial solidarity through the distribution of a part of the European budget obtained through the contribution of Member States to the less prosper social categories and regions. Regional development policy of European Union for the programming period 2007- 2013 is based on the diversity, opportunities and challenges offered by the regions in Europe. It puts into practice the solidarity between European nations and focuses on a fundamental objective: strengthening the economic, social and territorial cohesion through diminishing the development discrepancies between its regions. The present paper identifies the new directions of the European regional development policy and aims to highlight the importance of this policy for the economic growth and development of Romania. In this difficult period, when Romania felt the effects of the crisis at high level and met a severe economic congestion, the European sources of financing through the regional development policy must not be neglected. We also formulate recommendations in order to increase Romania's structural funds absorption rate.

Key words: regional development policy, European Union, Romania, sustainable development, absorption rate

JEL Codes: R10, R11, R58

Introduction

The regional development policy is one of the most important and complex politics of European Union, position that comes from the fact that through its objective to reduce social and economic disparities existing between different regions of the European Union acts over significant development fields, such as economic development, transports, SME's sector, agriculture, urban development, environment protection, employment and professional training, education, etc. Conceived at European level as a solidarity policy, it bases especially on financial solidarity, through the distribution of a part of the European budget obtained through the contribution of Member States to the less prosper social categories and regions (for the period 2007-2013, the amount for the regional policy represents over a third from the EU budget). In fact, we can say that the regional development policy has a pronounced instrumental character and through its solidarity funds (Cohesion Fund, Structural Fund and Solidarity Fund) contribute to the financing of other politics – such as agriculture policy, social policy and environment protection policy. The present paper identifies the new directions of the European regional development policy and aims to highlight the importance of this policy for the economic growth and development of

Romania. In this difficult period, when Romania felt the effects of the crisis at high level and met a severe economic congestion, the European sources of financing through the regional development policy must not be neglected. We also formulate recommendations in order to increase Romania's structural funds absorption rate.

1. Concept and definition

The regional policy of European Union deals with spatial localisation of production and affects the daily life of more than half of the 500 million persons living in the European Union. The regional development policy implies different subsidies and development projects including infrastructure, education and training and SME's support in order to diminish the regional disparities. The main objective is to strengthen and raise the under-privileged areas potential as well as to strengthen and rebuild the unity between cohesion and diversity within the European Union (Capello et al. 2009: 568).

The regional policy of European Union has its roots in the desire to influence the economic adjustments in four types of regions. The first type of regions is characterised through the fact that the output is obtain mainly from the agriculture sector and in the same time the biggest part of population is occupied in the field of agriculture. These areas are usually underdeveloped country-side areas with low level of income per capita, high levels of unemployment and underdeveloped infrastructure. The second type of regions is those whose prosperity has been based on the industries that now lost importance, such as the steel, coal or textile industry. These are regions that could not keep up with technological changes and therefore could not face external competition (in some cases because of the excessive previous protection). In the case of those regions work force is the first affected when occurs a recession period. The third category of regions is formed of regions with a bigger percentage of the processing industry confronting with congestion and pollution problems. These regions benefit from high utilisation of goods and services. Regional policy will try to reduce the congestion and pollution problems from these areas and to prevent them from worsening. The last category of regions is the border ones, regions that are far from the powerful economic activity areas of a state or union (Capello et al. 2009: 633).

The regional development policy of the European Union has always been a controversial policy. The main reason for the polemic about it is the fact that it has an interventionist character. Those who do not trust the ability of governments are afraid that regional policy fines successful businesses from the prosper regions and encourages unprofitable businesses from the poor areas. Those who share this point of view consider that regional disparities are the inevitable result of the market system – a phenomenon that is tolerable up to a point in which the market evolution determines the migration of work force and of capital investment as well as expansion of commerce which automatically contributes to higher incomes. On the other hand, those who support regional policy and admit its importance are more sceptical regarding markets self-regulation ability and do not believe in the power of the market to solve traditional problems (El Agraa, 2007: 421).

2. Short retrospective of the regional development policy and its importance

The history of the European Union begins in **1957**, when the Treaty of Rome introduced the idea that the European Community should create a harmonious development through reducing discrepancies between regions and the economic differences between the member countries. It is well known the Great Britain case which had to take some measures to decrease the big unemployment rate in industrial areas.

In **1958** were introduced two funds: European Social Fund (ESF) and European Agricultural Guidance and Guarantee Fund (EAGGF). At the beginning, the regional development policy had a strong redistributive character.

The year **1975** brought the founding of the European Regional Development Fund (ERDF) to support the development projects launched by the national governments. The year 1975 is considered the birth year of the regional development policy, because it is the year that has a double significance: on one side, it is a component of the financial common help, meant to augment national efforts in order to reduce discrepancies existing in the European regions; on the other side, it was a mechanism of financial transfer from some Member states, such as Germany, towards other states (Dodescu and Giurgiu, 2008).

The adoption of the European Single Act in **1986** founds a real development policy meant to compensate constrains of a single market that was felt by Southern states and other regions less favoured. At this point was recognised the authority and necessity of a regional development policy, a policy whose main objective to be the reduction of disparities between different European regions, a diversity that was strengthened by the accession of the 6 new Member States.

In February 1988 the regional development policy was given specific objectives and the way of solidarity funds functioning. The content of the structural funds, as they were called now, suffered modifications in 1993 and 1995, and they were allocated 68 billion ECU (at the 1997 level of prices).

When the biggest enlargement of the European Union took place in 2004 and 2007, changes took place at the level of regional development policy as well. Only two of the twelve new accessed states had incomes per capita higher than Greece, EU15's poorest Member State. In this situation, on 2 February 2005, the European Commission took position and introduced the so called Integrated Strategic Lines for Growing and Occupation, where it is stated that the European Union must create an economy orientated towards sustainable growth and raising the work force employment rate.

3. New directions in the regional development policy of the European Union

After the enlargement in 2004 and 2007 the regional development policy of European Union entered into a new phase. The budgetary programming period 2007-2013 is the first one in which the new economic challenges are dealt by the regional development policy of EU (Stierle-Von Schutz et al. 2008: x).

Regional development policy of European Union for the programming period **2007- 2013** is based on the diversity, opportunities and challenges offered by the regions in Europe. It puts into practice the solidarity between European nations and focuses on a fundamental objective: *strengthening the economic, social and territorial cohesion through diminishing the development discrepancies between its regions*. Even though it focuses on poor regions in order to assist them in the process of fast retrieving the discrepancies, the investments from the new regional policy of European Union for the period 2007- 2013 aim, as a novelty, to have a significant *impact over the competitiveness of all regions and over the life status of their inhabitants (European Commission)*.

The priorities of the new Finance frame are different by those of the 2000 Agenda that focused on preparing the EU enlargement from May 2004. According to the Strategic Integrated Lines for Growing and Occupation, there were established for the regional development policy of the European Union for the period 2007-2013 3 priorities:

- Europe – a more attractive place for investments and work;
- The amendment of knowledge and innovation for growing;
- More and better work places.

The fifth report regarding economic, social and territorial cohesion shows that the regional development policy created workplaces, helped at building critical infrastructure and improved environment protection, especially in less developed areas. There is no doubt that without a regional development policy the disparities would be bigger. Even so, the social effects of the economic crisis, the innovation demand determined by global challenges and the necessity to utilise efficiently every Euro for public expenditures send a signal that there is still the need to do an ambitious reform of the policy. With the occasion of presenting the report, the EU commissioner for regional policy, Johannes Hahn, declared: *“how cohesion policy has had a major impact on the European economy, reducing economic differences and promoting environmental and social development. To ensure more value for money, we need to make the policy even more effective, in delivering concrete and measurable result. We need to spend more intelligently, focus on the EU's top priorities and add visible value to what national and regional authorities are already doing. The findings from this report and the consultation to follow will help us prepare a cohesion policy that is better adapted to the economic situation of today”* (European Commission a).

More recently, in order to accomplish its objectives the European Commission adopted Europe 2020, a very ambitious strategy for the coming decade. Its main target is to make Europe's economy become smart, sustainable and inclusive. The Lisbon strategy was first adopted in 2000, but during the 2005 mid-term review, the Lisbon Strategy has been reconsidered and established new targets on economic growth and employment. This change integrated the Cohesion policy into Lisbon Strategy's implementation. So at the moment we cannot speak about regional development policy without Europe 2020 strategy, because they are in a direct link. At European level, the Commission has chosen 5 headline targets in order to acquire the changes needed.

The targets set through the Europe 2020 strategy to be met at the end of 2020, consist of five indicators that are in direct relation to the citizens welfare. One of the targets refers to the percentage of the employed population and says that 75 % of the population aged 20-64 should be employed. Another target refers to the percentage of investment in research and development (R&D) and aims up to 3% of the EU's GDP should be invested in R&D. The third target is represented "20/20/20" and consists of a trinomial regarding climate/energy targets that should be met (including an increase to 30% of emissions reduction if the conditions are right). The fourth target refers to the share of early school leavers that should be under 10% and at least 40% of the younger generation should have a tertiary degree. The fifth indicator stipulates that the number of people living at the risk of poverty should decrease with 20 million.

4. Romania's answer

Romania joined the European Union in 2007, and became a direct beneficiary of the regional development policy. As at that moment the new Lisbon Strategy had just entered into force Romania was determined to accomplish the targets set at national level. A knowledge-based economy represented for Romania the great chance to bring added value to its products and services and increase their competitiveness (Dăianu, 2004). Romania adopted in 2007 the National Reform Programme for the period 2007-2010, whose main objective was to create a stronger economy and an attractive business environment in order to offer the welfare that every citizen wishes for himself and for his family. The targets set

at national level were in accordance to the Lisbon targets but they proved to be unachievable.

For the programming period 2007-2013, Romania has been allocated, through the Structural instruments an amount of **19.7 billion Euros**, implemented through seven **regional and sectoral operational programmes**, to which there are added eight territorial cooperation programmes with other states. In order to be able to implement the regional development policy Romania had to set up development regions. These regions are created through the will of neighbour counties, on the basis of the common European system, the system known as The Classification System of Territorial Units. According to this system, the 8 Romanian regions are level two units, which mean that their population is up to 2.8 million people.

It is estimated that structural instruments will stimulate economic growth in new Member states, including Romania; with an average of 6 % and that they will create about 2 million workplaces. Out of the 19.7 billion Euros allocated to Romania for the programming period 2007-2013, 19.2 billion are allocated for convergence and 455 million Euros for European territorial cooperation. The purpose of these programmes, defined through the regional policy of EU for Romania, it is the development of basic infrastructure according to the European standards, growing long-term competitiveness, developing and efficient using the human capital, development of the administrative capacity, promoting balanced territorial development. Concretely, it is aimed the GDP increase by 15-20 % up to 2015, growing the employment rate from 57.4% up to 64 % and investing in 1 400 km of new or rehabilitated highroads.

The objectives set are ambitious and in the same time welcomed for Romania, but they depend on the absorption rate of the structural funds, which, unfortunately for Romania, is very low. According to the Romanian Agency for Monitoring Structural Instruments, at the end of 2010 the absorption rate in Romania was 8.6%. This value is much under the average absorption rate of structural funds in neighbour countries, which is 17%, according to the last Report of the Financing Committee from 07.04.2011. The low absorption rate transforms Romania from a country that is a net recipient (receives more money from the European Union that gives as percentage of GDP) into a contributor to the European budget (Table 1).

Table 1: European funds allocated to Romania and Romania's contribution to the European budget for the period 2007-2011

	2007		2008		2009		2010		2011	
	mld.EUR	% din PIB								
Total European funds allocated	2.0	1.7	2.9	2.2	3.9	2.5	4.3	2.5	4.5	2.4
Romania's contribution to EU budget	1.2	1.0	1.4	1.0	1.2	0.8	1.3	0.8	1.3	0.7

Source: Economy and Finances Minister, National Statistics Institute, National Prognosis Commission and The National Bank of Romania, www.bnr.ro, accessed on 10.04.2011

On the other hand, in the autumn of 2010, Member States, in close co-operation with the Commission, established national targets and developed strategies for their implementation.

As the Annual growth survey shows, “they were invited to present by mid November, in a draft version, their National Reform Programme ("NRPs"), indicating their national targets and the necessary reforms to reach these targets and remove long-standing barriers to growth”. The fact that each Member State sets its own level of ambitions as regards the overall Europe 2020 targets is an important element of this strategy, ensuring that national targets are "politically owned" (European Commission b). So, in order to accomplish the Europe 2020 targets Romania has to adopt national targets to help us to keep on the track. The Romanian government has formulated provisional targets, but without an important change regarding structural funds approach it is almost impossible to meet these targets and get out of the economic crisis.

Conclusions

Romania severely needs to focus on structural instruments and raising structural funds absorption rate as it is a sure and free source of financing. Because of the world economic crisis that was felt in Romania in the last trimester of the year 2008, at the beginning of 2009 Romanian authorities had to contract a loan from the International Monetary Fund. The Romanian government obtained a loan of 19.5 billion Euros. Through this loan, the government financed the extern and intern deficit. On the other side, the International Monetary Fund imposed measures to guarantee the loan reimbursement and to obtain a transparent fiscal policy. This loan has to be reimbursed and this is for sure not good news for Romania.

Romania must pay attention to the great opportunity that regional policy offers through the structural funds, funds that are created in accordance to the Europe 2020 targets and that therefore have the great purpose of raising living standards in Romania. Unfortunately, regarding the living standard, our country is at the end of the top, fact that shows that we have many chapters where we have a deficit.

The main issues that detain Romania from European funds absorption are the different interpretation given to the Public Procurement Law and the routed custom to contest the results of the assignment procedure; also the coordination and control procedures in the Romanian legislation are sometimes less efficient than the EU Financing Regulations regarding the Structural Instruments, and the list can continue. We suggest a couple of solutions in order to help Romania increase its performance regarding the absorption rate of structural funds and have a better perspective regarding the importance of aligning its national priorities with those of the European Union. We consider that the legislation regarding public procurement and the implementing frame must be revised in order to raise the transparency level and simplify the procedures. We also recommend strengthening the coherence between the strategies regarding the Structural Instruments on one side, and the politics, programmes and national actions taken to encourage the economic and social development on the other side. To resume, we conclude that there is a stringent need to lower bureaucracy of the monitoring structures of Structural Instruments taking into consideration the European criteria.

INTERNATIONAL BIOMASS TRADE AND SUSTAINABLE DEVELOPMENT: AN OVERVIEW

Chiriac Cătălin

“Alexandru Ioan Cuza” University, Faculty of Economics and Business Administration, Iași

Rusu Nicoleta

“Alexandru Ioan Cuza” University, Faculty of Economics and Business Administration, Iași

It is crystal clear that the neoclassical economical theory, despite being probably the best growth model ever invented by man, tickled a cost of environmental degradation which can threaten our wealth and even our existence. For this reason, the concept of sustainable development (SD) is so empathic, being considered probably the best theoretical alternative invented by man to standard growth, because of its vision of a better world, where economics, society and environment are intimately linked. Thus, all human activities have to adapt to this new paradigm, in order to achieve its goals. From the economical perspective, production, consumption and trade must incorporate a kind of sustainable type of activity. In the recent years, growing demands in energy use and the increase of oil and coal prices, have led to the usage of new energy sources such as biomass, water, solar, wind and geothermal energy. This is why we propose in this paper to present an overview of international trade in biomass reported to the philosophy of SD. In short, we want to give an answer at two questions: how much is biomass trade sustainable and what risks may arise if the main source of energy used today, based on fossil fuels, will be totally substitute by biomass? To be sustainable, biomass, must meet certain criteria, such as: to possess a high capacity for regeneration, in a relatively short time; to offer a better efficiency compared with the traditional fossil fuel sources; to be less or non-polluting, to be used in solid, liquid and gaseous form; to have a broad applicability in production and consumption; to have a competitive level in terms of costs and prices for transport or storage, in both stages, as a raw material or as a finished product; to be a good substitute of traditional fuels (gasoline or diesel), without the necessity for structural changes of the of the engine. The article will conclude that the uprising trend of the EU biomass trade and consumption will continue, because of grown concerns of the EU Member States regarding the effects that greenhouse gas emissions have over the environment and over the quality of life standard, despite the critics which states that biomass production may have negative environmental effects, leading to massive deforestation and destruction of soil, water sources and natural habitat.

JEL Classification: Q 01, F 18

I. Introduction

If we take into account one of the simplest but self speaking theoretical construction of the classical school of economics, named *Crusoe Economics* (Rothbard 1998: 29), we learn that economical practices began as a result of natural labor division and exchange. From the very beginning, Crusoe's existence – which has landed on his island, standing face-to-face with nature – is simplified to his instinctive decision making process, necessary to satisfy basic life sustainable needs. In short, he must learn *what*, but mainly *how* to achieve a proper *mix of land and labor*, in order to bring his ends and purposes into effect. The picture changes when, in this idyllic society, another individual has landed. The newcomer, as well as the legendary hero, must mix his labor with land in order to survive. Naturally, the two lean to attain their ends with minimal effort, choosing firstly the simplest activities, but as they acquire technological knowledge the end products are becoming more complex, reaching the point where their production exceeds domestic consumption. Keeping in mind that their skills and interests differ, they have to shape their economic activities of production and exchange in accordance with David Ricardo's *Law of Comparative Advantage*. And this is how, as Rothbard points out, “the process of exchange enables man to ascend from primitive isolation to civilization” (Rothbard, 1998: 36).

This short story is important mainly because it argues that “economics has revealed a great truth about the natural law of human interaction: that not only is *production* essential to man's prosperity and survival, but so also is exchange” (Rothbard 1998: 35). Furthermore, such an analysis – of the interaction of two people in an uninhabited island, as abstract and simplistic as it is, makes sense when the spectrum of thought widens to the size and complexity of contemporary society.

Indeed, production, consumption and especially trade, under classical and neoclassical economic philosophy, have generated economic growth and social prosperity. But this type of development tickled a cost of environmental degradation, which over time, became big enough to jeopardize our wealth and even our existence. The interdependent relationship between economy and environment have been largely ignored by the neoclassical economists, where in their elegant economical growth theoretical constructions, the natural environment has not been included. However, since the early '70s, there were some vices that, through their rigorous studies, began to draw attention to this issue, many of them speaking even of an imminent environmental, economical and consequently a wellbeing crisis. A few years later these initiatives have echoed in the developed world, giving rise to a new paradigm which would link economics with the environment in a different kind of global development, under the name of *sustainable development*. Therefore, eco-efficiency and pollution control quickly became targets for technological research and development. Meanwhile, trade has adapted to change and – for example – a new international market of biomass and bio-fuels emerged and quickly expended.

Given this example, we propose, in this paper, to perform an analysis of international trade in biomass reported to the philosophy of sustainable development. In short, we want to give an answer to two questions: how much is biomass trade sustainable and what risks may arise if the main source of energy used today, based on fossil fuels, will be totally substitute by biomass? For doing this, the paper is organized as follows. The first section will briefly explore for *what* and for *who* is the concept of sustainable development addressing, in order to emphasize on the one hand the energy dependency of people and on the other hand, the need to change the global optics regarding the sources through which this energy is produced, optics that embraces the idea of substituting non-renewable resources with

renewable ones in the production process. The following section will focus on the biomass as an alternative to fossil fuels, on the trend in international trade of biomass – focusing mainly on European space – the purpose being to capture the dynamics of the demand for these products and last but not least, to draw the attention on the risks that we might face in the event that the traditional fuel consumption will be replaced exclusively by biomass.

II. Sustainable development and biomass

Although environmental issues were put on the carpet two centuries ago prefaced in the writings of the classical economist Thomas Robert Malthus, in his *Essay on the Principle of Population*, the main literature focused on the subject beginning with the decade seven of the last century, through a series of papers, reports and international conferences, which worth mentioning: the club of Rome report, entitled *Limits to Growth*, published in 1972 by Dennis L. Meadows *et. al.*; *Plan B* book series by Lester Brown, founder of the World Watch Institute (WWI) in 1974 and the Earth Policy Institute in 2001. The most important conferences gathered representatives from all over the world to discuss the problems with the environmental - economical and social relationships, took place in Stockholm (1972), Rio de Janeiro (1992), in Kyoto (1997) and in Johannesburg in 2002.

All these events have put into the light the environmental issues focusing firstly on the level of consumption of natural resources, in particular the imminent depletion of the non-renewable ones in the near future, secondly, on the problems with pollution control and adverse effects of human activities over environment and biodiversity, and thirdly, on the never-ending bad story of poverty.

The way ahead was outlined and defined in what is called sustainable development in the Brundtland Report entitled *Our Common Future*, published in 1987, when the new concept was defined as “the kind of development that meets the needs of the present without compromising the ability of future generation to meet their own needs” (Mihai, Borza 2009: 86). Sustainable development – thus became the common language of economists, ecologists, sociologists, philosophers and so on – has the task of finding a linkage between the environment and the society (who exploits it), to improve the degree of compliance between them, in order to be able to continue growth and development for us and for the ones who will replace those who live today.

II.1 Biomass resources

The influence of international trade over environment and welfare cannot be questioned, the causal links between these different aspects of life are intimate enough so that any issue caused by internal or external incentives in the market, finding – with little or no doubt – correspondent effect in the social and environmental side.

To be sustainable, biomass, which is considered alternative sources of energy, must meet certain criteria, such as: to possess a high capacity for regeneration, in a relatively short time; to offer a better efficiency compared with the traditional fossil fuel sources; to be less or non-polluting, to be used in solid, liquid and gaseous form; to have a broad applicability in production and consumption; to have a competitive level in terms of costs and prices for transport or storage, in both stages, as a raw material or as a finished product; to be a good substitute of traditional fuels (gasoline or diesel), without the necessity for structural changes of the of the engine, etc.

For these reasons, biomass resources appear, in a good extent, to provide a compromise between utility and eco-efficiency, having a real potential for sustainable energetic development.

The most important biomass energy sources are made of wood and wood waste, agricultural crops and agricultural byproducts from waste, waste derived from food processing and other plant and animal waste. Among these, the largest share in manufacturing biomass is wood and wood waste (64%), municipal solid waste (24%) and agricultural waste (5%) (Demirbas *et. al.* 2009: 1746).

In industrialized nations, biomass is mainly used as a source of fuel used directly or indirectly (through combinations in different percentages between traditional and bio-fuels). The most used biofuels are *ethanol* and *biodiesel*. The first is produced from several categories of biomass and used as a substitute for gasoline. It can be used 100% as a transport fuel or mixed with gasoline in different proportions. Used in blend, ethanol offers the advantage of significant reductions in petroleum consumption and in greenhouse gas emissions, due to high oxygen concentration.

The second one, biodiesel, can replace diesel in the same way that ethanol replaces (or blends with) gasoline, except that biodiesel can be used only if changes are made to the engine structure. The great advantage of biodiesel lies in the source of its production. It can be produced from rapeseed oil or coconut oil or even recycled cooking oil.

In the European Community, demand for biofuels is growing, and as such, international trade in these products are, for some time now, on an upward trend, described briefly in the following.

III. International trade with biomass

With the diversification of the economies and growing concern of nations in fighting and controlling the devastating effects of their gas emissions and in accordance with the gas emission targets under Kyoto Protocol, the use of biomass has become more than necessary. One important means of achieving this objective is to increase the rate of renewable sources in total of energy supply. Thus, the European Union proposed, in the Renewable Energy Directive, a minimum of 35% to reduce the gas emissions, in terms of the agricultural and forestry biomass, solid and liquid biofuels.

Growing demands in energy use and the increase of oil and coal prices have led to the development of new energy sources such as biomass energy, water energy, solar, wind and geothermal energy.

Table 1. Energy sources in total primary energy

Energy Sources	2008	%
Nuclear energy	241.763	28,7
Solid Fuels	177.348	21,0
Natural gas	168.116	19,9
Oil	107.351	12,7
Renewable Energy	148.134	17,6
which:		
biomass and waste	102.315	69,11
hydro electricity	28.147	9,0

wind energy	10.165	6,9
geothermal energy	5.778	3,9
solar energy	1.729	1,2

Source: Eurostat, data processed by Rusu Nicoleta at Apr 10, 2011

In 2008, approximately 18% of the European energy consumption came from renewable sources, where 70% from those came from traditional biomass production and 9% from hydro electricity. The new renewable energies (wind, geothermal, solar and biofuels) have a large and growing area. According to the European Commission, the biomass represents 4% from the EU energy needs. European Commission Action Plan sets out measures to increase biomass by creating incentives and removing barriers to market development, further promoting biofuels and finding new opportunities for the developing countries (European Commission).

Literature review reveals that Latin America, Sub Saharan Africa and Eastern Europe, North-East Asia and Oceania will be the most important biomass producers in the long term, while the main demand will be found in OECD countries and Asia South East, which means that one of the most important role trade will be played by biomass (Heinimo and Junginger 2009: 1311). As the demand for biomass products is increasing, and international sales market is in developing, these resources are unequal distributed in different parts of the world, the biomass trade is in a continuous growth among the European Union countries.

According to the European Commission reports, the EU is a net importer, in the present the rate of energy import dependency is 54%, and while in 2020 is expected to lead to an addiction rate of 70% if no measures will be taken to increase production of domestic energy. Although fossil fuels can't be replaced with renewable resources, it can be taken to combine them with those from renewable resources in order to obtain the desired effect, which is reducing the gas emissions (Magar, et al. 2010: 2).

The European Union is far from being the largest producer of biomass; it must then rely on imports, becoming a net importer. Thus, ethanol, vegetable oils, firewood, coal and wood pellets are the most important products which are currently the most traded energy purposes. They may be imported and used in their unprocessed shape or can be used as raw materials, in terms to be exported. In the mentioned period (Table no. 2.) reflects the rate of imports dependence of European Union, emphasizing it in 2008.

Table 2. International Trade biomass EU27, 2007-2008

	2007 TJ(GCV)	2008 TJ(GCV)
Primary production	4094966	4283722
Imports	211434	245111
Exports	93257	112631
Stock changes	-7567	-10511

Source: Eurostat - Energy balance sheets, 2007-2008 data processed at Apr 15, 2011 by Nicoleta Rusu

In 2008, primary production of biomass was 188 756 TJ higher than the previous year, this upward trend mainly thanks to the growing importance of biomass energy.

Although the European Union is a net importer of energy, biomass imports are relatively small. In 2008, imports of biomass were 2,4% of total primary supply, and according IEA, in 2009 they have raised to a level of 4,5% of total primary supply (International Energy Agency).

Because of insufficient production, member states dependent on imports of biomass, they use increasingly more often other EU member States or beside.

According to the European Commission report on the sustainability requirements for the use of biomass resources for electricity and gas, heating and cooling, increased trade is attributable to the form of pellets (a type of biomass, generally made from waste forestry industries) (European Commission).

Pellet production and consumption has increased in recent years, EU countries registered a high consumption, so a number of countries outside the EU produce wood pellets only for the European market. The biggest consumers of EU pellets were Sweden (1.8 million tons), Denmark, Holland, Belgium, Germany and Italy (all about one million tons), the main suppliers being Canada and the United States and Australia with a contribution of Argentina and South Africa. According to EAI reports, the European Union in 2009 imported pellets worth of 3,9 million tones, of which half were EU inside imports.

An overview of the biofuels trade shows that the largest global producers of ethanol are the U.S. and Brazil; the EU is a net importer. In 2009 estimated data shows that were traded 40 - 50 PJ of ethanol. Data on trade in ethanol are imprecise because of its multiple uses and lack of appropriate codes for biofuels in global trade statistics. In 2009, EU states have produced biodiesel of around 334 PJ (7,04 million tons), the main producers are Germany, France, Spain and Italy (International Energy Agency).

Production of biodiesel in the European Union represents two thirds of world production of biodiesel. According to the EAI report, biodiesel trade in 2009 totaled 80 PJ (1,60 million tons) from a one PJ in 2005.

Import dependence varies between Member States, this being due to uneven spread of renewable resources. Thus, the Netherlands, Denmark and Britain are major countries producing of biomass, being the only member states where the ratio of import/export is negative, this being due and rich endowment of renewable resources and their processing and refining capacity.

IV Barriers in international trade of biomass

Over the time the demand for biomass products has increased, which led to an intensification of international trade, development that was hampered by a number of barriers.

We define a "barrier in international trade in biomass" an issue that may directly or indirectly affect the development of the biomass trade to final consumers. Thus, although the use of these products on the environment is undeniable, there are many voices critical regarding the European Commission's position to achieve by 2020 a level of 10% use of biofuels. They support the idea to reduce the proportion up to 4% by 2015. Arguments supported by the members of the European Parliament where about the negative effects of biofuels over the cultivated areas, leading to massive deforestation, on soil, on water. Other critics have been on the effects of biomass would have it on food prices, increasing those.

Major obstacles to international trade of biomass can be referred to the tariff, especially affecting the ethanol trade, while logistical barriers have a greater impact on trade with

pellets. Technical barriers relate to physical and chemical descriptions of fuels, including biofuels, were introduced to ensure the safety and health of consumers.

To counteract the effects mentioned above, the main importing countries began to develop biomass national sustainability requirements for bioenergy, which led to the creation of some systems of certification (voluntary and mandatory) in agriculture, forestry and energy sectors (European Commission).

V. Conclusion

International trade of biomass produced by the European Union has intensified in recent years and this upward trend may continue in the future because of growing concern of the EU Member States regarding the sustainability and the effects that their greenhouse gas emissions have over the environment. Although there have been many critics over the sustainability of biomass products, their effects on the environment remain compelling. A step towards a wider application of biomass should be a more pronounced promotion policy of biofuels and the effects they have on our environment.

The EU Member States must intensify its efforts to increase investment in the renewable resources by supporting and encouraging the production of biomass and the adoption of policies that support production, utilization of renewable energy and providing incentives for biomass production and consumption at national and local levels.

COMPARATIVE ANALYSIS BETWEEN THE OBJECTIVE AND THE SUBJECTIVE QUALITY OF LIFE APPROACH – STRENGTHS AND WEAKNESSES

Constantinescu Mihaela

Academy of Economic Studies Bucharest Marketing Faculty

Moise Daniel

Academy of Economic Studies Bucharest Marketing Faculty

Quality of Life (QOL) can be defined as the degree in which the objective needs of an individual are satisfied in relation with the subjective perspective of his well-being. Thus, there are two different approaches in QOL evaluation: the objective approach (which analyzes the quality of life through economic indicators) and the subjective approach (which evaluates quality through the individual's opinion and actions). There isn't a widely accepted view referring to the use of one of those two QOL approaches, each having a series of strengths and weaknesses. This paper presents a comparative analysis of the advantages and disadvantages brought by these two approaches in QOL studies. The objective analysis has a series of strengths (among which we mention the fact that allows valide comparisons and the fact that doesn't depend on individuals perception), but has also a series of weaknesses, starting with the dependence on statistical data, which in many cases has incomplete registrations, and ending with the fact that doesn't reflect the real value of the well-being perceived by population. The motives for which the QOL subjective approach is promoted, therefore its strenghts, refer to the fact that it reflects important experiences for each individual and the fact that it reveals how macroeconomic policies satisfy the individual's needs. Certainly, this type of QOL analysis has also some weaknesses, like the lack of validity and accuracy in the data collected through surveys. Considering all the above, there is a conclusion with a wide aplication in the present context of the economy: we can't make a clear delineation between the two QOL approaches, moreover we can state the fact that the is a strong correlation between those two. Thus, the most precise systems of quality of life evaluation are those which use both objective, and subjective indicators, reaching a high level of aggregation at the national and international level.

Keywords: Quality of Life, Objective Approach, Subjective Approach, Strenghts, Weaknesses

Cod JEL: I31

1. Introduction

Quality of Life (QOL) can be defined as the degree in which the objective needs of an individual are satisfied in relation with the subjective perspective of his well-being. This concept has gained theoretical valences in the first part of the 20th century, when the society has realized the need for a concrete evaluation of the qualitative level that characterizes the standard of living of the population.

The starting point in the QOL development in the United States was represented by the fact that, although in full economic growth, the society was confronting with an increase in violence, criminality and public disorder. The economic growth was enough anymore in describing the quality of life, therefore in order to judge well-being of a nation had to use also social indicators. The source of QOL research is represented by the emergence of consciousness that economic growth doesn't necessarily bring wealth and happiness (Bălțătescu 2009).

In Romania, QOL studies appeared in the early '70, when our country was trying to delimit itself from the soviet political power, fact that favored the promotion of accidental concepts, such as the concern for well-being and quality of life (Mărginean 2004:19). These concepts were somehow promoted even by State institutions, in order to highlight the desire to by much closer to the Occident.

2. Literature Review

Given the nature more practical than theoretical of the quality of life, there are much more practical studies of the phenomenon. Thus, there are a number of authors who have focused on measuring quality of life at the national level, from whom we can mention Mark Rapley (2003), Kenneth D. Keith (2001), Ed Diener and Eunkook Suh (1997) or Jonathan Perry (1995). Equally in number or higher are the studies developed by several organizations acting in the social sector, such as OECD, UNESCO, WHO, Eurofound (European Foundation for the Improvement of Living and Working Conditions), ISQOLS (International Society for Quality-of-Life Studies). Some institutes have developed even their own system of QOL measurement: International Living (Quality of Life Index), Institute for Risk Research Canada (Life Quality Index), The Economist Intelligence Unit (Quality-of-Life Index), Mercer - Human Resource Consulting (Quality of Living survey).

These studies have highlighted the fact that the practice has developed such that the quality of life can not be approached anymore in theory as a whole, but rather separately, taking into consideration its factors of influence. Thus, there are two different approaches in QOL evaluation: the objective approach (which analyzes the quality of life through economic indicators) and the subjective approach (which evaluates quality through the individual's opinion and actions).

The need to make a differentiation in QOL approach is present even in the early '70 papers, when the specialists were preoccupied with the population's level of satisfaction regarding their living conditions (Stagner 1970: 59-68). However, a direct preoccupation with the objective/subjective duality can be found starting with the work of Siri Naess (1999) and Robert Cummins (2000), joined later by Joar Vittersø (2004) or Bernhard Christoph and Heinz-Herbert Noll (2003).

The subjective approach of analyzing the living standards has emerged as necessary variant due to the fact that the nations level of development was evaluated a long period of time almost exclusively through economic indicators. Consequently, even when the transition's effects were from the most painful ones, the economists insisted that the macroeconomic adjustments must be followed without any hesitation or remorse (Bălțătescu 2007: 26). Starting from the idea that the economic indicators reveal only a limited part of a nation's progress, the subjective indicators are more and more present in the scientific literature, but also in practical QOL studies.

Of course there are criticisms brought to both QOL approaches. Those specialists that critic the objective analysis argue that a simple evaluation of the national level of development using economic indicators doesn't present a detailed image of the quality of life perceived by population.

The counterargument of those who critic the subjective approach starts from the fact that evaluating QOL through the level of satisfaction is actually showing the measure in which the individual has adapted to the present living conditions (Stiglitz 2002: 25).

3. Comparative analysis between the objective and the subjective QOL approach

Considering the facts presented above, emerges the need to identify the strenghts and weaknesses of the two QOL approaches. Table no. 1 contains a detaliated presentation of those elements, the starting point being E. Diener and E. Suh paper „Measuring quality of life: Economic, social and subjective indicators” (1997), to which were added the elements identified in the most relevant QOL definitions.

Table no. 1. Strenghts and weaknesses for the two QOL approaches

	Strenghts	Weaknesses
O B J E C T I V E	a) Allows valid comparisons	a) Incomplete statistical registrations
	b) Full acceptance of the indicators sense or value from the society	b) Different ways of measurement and interpretation for a macroeconomic statistical indicator
	c) The characteristics can be measured with precision	c) Indicators with a negative connotation may have different interpretations in different countries
	d) Doesn't depend on people's perception	d) Compromise between two objective indicators e) Doesn't reflect the real value of the well-being perceived by population
S U B J E C T I V E	a) Reflects important experiences for each individual	a) The lack of validity and accuracy for the data collected with surveys
	b) Measurement indicators are more easily modifiable	b) The influence perceived depending on the macroeconomic predictions
	c) Reflects the degree in which individual's needs are satisfied by the macroeconomic policies	c) The variability (both between individuals, and for the same individual between different periods of time)

Made by author

The **strengths** of the *objective* approach refer to the following theoretical and practical aspects:

- because it uses international accepted indicators, *it allows valid comparisons* both from the geographic perspective (comparisons between regions, countries or continents), and from the temporal one (evaluating how the objective indicators have evolved from period to period reflects the level of development of a region, country or continent);
- the objectivity of the used indicators leads to a *full acceptance of their sense or value from the society*; having a clear delimitation between the indicators with a negative connotation (such as infant mortality rate) and the ones with a positive connotation (literacy, for example);
- in a objective QOL evaluation we use mostly quantitative indicators, fact that *offers precision to the measurement techniques*;
- maybe the most mentioned strength for the objective QOL analysis is the fact that doesn't depends on people's perception, therefore there is no subjectivity in evaluating quality of life.

In return, there are a series of **weaknesses** for the *objective* QOL evaluation:

- outlining a general index for QOL evaluation depends largely on the statistical registration made by each country, fact that can become an inconvenient because of the *incomplete statistical data* (there are countries in which the census doesn't have the same accuracy because of the impossibility to register some data, but also because of the people's reluctance to declare the real state of their life);
- although it's using international accepted indicators, the objective QOL evaluation is negatively influenced by the *different ways of measurement and interpretation for a macroeconomic statistical indicator* (for example, self-consumption and its influence on GDP);
- different cultures between countries can lead to *different interpretations for indicators with a negative connotation*, such as criminality, deforestations or gender equality;
- at the macroeconomic level, the policies adopted in order to improve the quality of life can sometimes lead to a series of *compromises between the objective indicators*; in order to obtain a certain level of economic development a series of recovery measures are taken, fact that in some cases means the scarifications of lower importance indicators; for example, in order to lower the infant mortality rate from 5/1000 to 1/1000 are necessary major investments in the medical system, investments that in many cases the government is redirecting to other domains with a higher importance for that period of time (Diener și Suh 1997: 196);
- the most important weakness for the objective evaluation refers to the fact that *it doesn't reflect the real value of the well-being perceived by population*, considering the fact that a economic developed society doesn't necessary mean a higher level of satisfaction for all individuals from that society (many personal or temporal factors can negatively influence the well-being of an individual).

The *subjective* approach on quality of life has also some **weakness**, such as:

- considering the fact that it represents an analysis at the individual's level, this approach *reflects important experiences for each individual*, fact that adds a plus to understanding the manner in which quality of life is perceived by each person;

- if a inadequacy is found in the subjective QOL measurement, *researchers can easily make rapid changes for the next studies*, trying to improve the instruments and adapt them to the data that is collected, thing that is not possible in a short period of time in the objective evaluation;
- through direct researches within the population, the subjective QOL evaluation *reflects the degree in which individual's needs are satisfied by the macroeconomic policies*.

As mentioned early, there are a series of criticisms brought to the **subjective** evaluation also, considering the following **weaknesses** that characterize this approach:

- the fact that this type of QOL evaluation uses interviews at the individual's level, we can register a *lack in validity and accuracy for the data collected*; most problems emerge from the fact that the subjective analysis uses surveys, this type of research being characterized, first of all, by a margin of error, and second, by a partial lack of information veracity;
- the subjective evaluation may be *influenced by the macroeconomic predictions*, considering the fact that the level of satisfaction is influenced by the optimism or pessimism that characterizes a person; the evaluation will have a better result if it's made in a economic context that is compared with the previous one that was less favorable; however, if the national policy concentrates on the present problems within the society, the comparison item for the individual also change, leading in most cases to a poorer QOL evaluation (Diener and Suh 1997: 196);
- evaluation quality of life only in a subjective manner can not lead to pertinent comparison within the society, considering the fact that such an evaluation is characterized by a *higher level of variability* (both between individuals, and for the same individual between different periods of time); each individual perceives in a different manner the events around him, giving them a greater or lesser importance depending on his expectations and needs; moreover, for the same person, the evaluation can vary from a period of time to another, depending on the modifications occurred in his life, fact that changes to some extent his priorities.

Considering all the strengths and weaknesses presented so far, the experience of the developed countries demonstrates the necessity of a higher coordination between the economic components and the social ones. We can not obtain spectacular results in economy as long as the social sector doesn't receive the proper attention.

Thus, in the scientific literature there are more and more frequent the research models that evaluate quality of life both in an objective and a subjective approach. Among the first authors to highlight such a model is Wolfgang Zapf (1984), who presents in his book "Living Conditions and the Perceived Quality of Life: Individual Well-being" a model that is based on the duality objective/subjective, leading to a more appropriate classification of the QOL level for the individual within the society.

4. Conclusions

As can be seen from the comparison of the objective and subjective QOL approach, we can not make a clear delimitation between these two; moreover we can state the fact that these approaches are interrelated. In this respect, E. Diner and E. Suh (1997) highlighted that a thorough understanding of the subjective QOL requires the understanding how the objective conditions influence the individual's evaluation of his living conditions.

A pertinent analysis for the quality of life takes into consideration both aspects: the macroeconomic analysis and the individual's evaluation. The starting point is the identification of the objective elements that describe the current level of the economic and social development of a nation, fact that represents the ground for the development of a social policy that promotes QOL improvement. The second stage is a subjective analysis for the quality of life, the focus being on the standard of living and individual's well-being, on how he adapted to the living conditions offered by the society.

SOCIAL AND ECONOMIC IMPACTS OF WIND POWER IN CORELATION WITH THE FINANCIAL CRISES

Cucoş Alina-Florentina

Dunărea de Jos University Galaţi, Romania

The work of Cucoş Alina-Florentina was supported by Project SOP HRD - TOP ACADEMIC 76822

Given the present day and age we live in, it is vital that the world considers the various natural resources available to us and how to best make use of them. Furthermore, it is imperative nowadays to look at the many environmentally friendly energy sources which will reduce the ill effects of global warming and provide a host of economic and social benefits too. One such beneficial resource is wind and the consequent conversion of wind energy into electricity. In fact, the advantages of wind energy are so immense that even the government has begun promoting it. Since generating electricity from wind doesn't emit any green house gases or produce any particulate emissions, it massively reduces the rate of global climate change, and at the same time doesn't contaminate our water resources such as lakes and reservoirs.

Wind energy provides security and stability in the national consumer energy market. By reducing a nation's dependency on foreign fossil fuels, such as coal and natural gas, spikes in fossil fuel costs or other supply disruptions will not have as much of an adverse impact on the national economy. Also the price of wind energy is relatively stable because there are no fuel costs, which is a major operating expense for most coal and gas fired electric generation facilities. Although wind farms occupy large swaths of land, wind turbine towers themselves take up less space, only a few meters at their base. This leaves space to utilize the land around the turbine tower for several other purposes, such as ranching or agriculture.

The application of advanced technologies has succeeded in making the conversion of wind energy much more resourceful and well-organized. Furthermore, wind is a proven clean, free and renewable form of energy that preserves our natural resources.

Wind energy conserves water resources as wind farms virtually require no cooling, as opposed to natural gas, coal and nuclear power plants that require a tremendous amount of water for cooling. In fact, electricity generation is the leading contributor to water withdrawals from our nation's water reservoirs.

Since wind turbines come in an array of different sizes, they are a great resource to generate energy in remote locations to support varying population levels.

The use of wind energy reduces Greenhouse Gas emissions, and increases security and stability by diversifying the national electricity portfolio.

Apart from environmental profits, there are many social and economic advantages too in promoting wind energy. One of these is that the promotion of wind energy assists in revitalizing rural economies, thereby creating jobs at the ground level, such as assembly workers, surveyors, engineers, lawyers, bankers, technicians, to name just a few. In doing so, it also benefits local communities, mainly in the form of property tax revenues and new types of income for landowners through land lease payments.

Keywords : wind energy, alternative source, ecological advantages

1. Wind energy, environmental impact

Wind energy is considered a green power technology because it has only minor impacts on the environment. Wind energy plants produce no air pollutants or greenhouse gases. However, any means of energy production impacts the environment in some way, and wind energy is no different.

Aesthetics and Visual Impacts – Elements that influence visual impacts include the spacing, design, and uniformity of the turbines.

Birds and Other Living Resources – Preconstruction surveys can indicate whether birds or other living resources are likely to be affected by wind turbines.

Global Warming – Wind energy can help fight global warming. Wind turbines produce no air emissions or greenhouse gases.

Lightning – Ongoing research and increased operator experience are improving the understanding of lightning and wind turbines.

Noise – Like all mechanical systems, wind turbines produce some noise when they operate. In recent years, engineers have made design changes to reduce the noise from wind turbines.

TV / Radio Interference – In the past, older turbines with metal blades caused television interference in areas near the turbine. Interference from modern turbines is unlikely because many components formerly made of metal are now made from composites.

2. Why Wind Energy?

Wind turbines of all sizes have become a familiar sight around the world for a wide variety of reasons, including their economic, environmental, and social benefits. The potential for wind energy is immense, and experts suggest wind power can supply up to 20% of U.S. and world electricity. Nevertheless, the United States currently produces less than 1% of our electricity from wind. The advantages and disadvantages of wind energy are detailed here to help you decide what the future of wind should be in the United States.

Economic Advantages

a) **Revitalizes Rural Economies:** Wind energy can diversify the economies of rural communities, adding to the tax base and providing new types of income. Wind turbines can add a new source of property taxes in rural areas that otherwise have a hard time attracting new industry. Each 100 MW of wind development in southwest Minnesota has generated about \$1 million per year in property tax revenue and about \$250,000 per year in direct lease payments to landowners.

b) **Fewer subsidies:** All energy systems are subsidized, and wind is no exception. However, wind receives considerably less than other forms of energy. According to *Renewable Energy World* magazine, conventional energy receives US\$300 billion in subsidies per year, while renewable energy has received less than US\$20 billion of tax-payers money in the last 30 years.

c) **Free Fuel:** Unlike other forms of electrical generation where fuel is shipped to a processing plant, wind energy generates electricity at the source of fuel. Wind is a native fuel that does not need to be mined or transported, taking two expensive aspects out of long-term energy costs.

- d) **Price Stability:** The price of electricity from fossil fuels and nuclear power can fluctuate greatly due to highly variable mining and transportation costs. Wind can help buffer these costs because the price of fuel is fixed and free.
- e) **Promotes Cost-Effective Energy Production:** The cost of wind-generated electricity has fallen and today is depending on wind speed and project size.
- f) **Creates Jobs:** Wind energy projects create new short and long term jobs. Related employment ranges from meteorologists and surveyors to structural engineers, assembly workers, lawyers, bankers, and technicians. Wind energy creates 30% more jobs than a coal plant and 66% more than a nuclear power plant per unit of energy generated.

Social Advantages

- a) **National Security/Energy Independence:** Wind turbines diversify our energy portfolio and reduce our dependence on foreign fossil fuel. Wind energy is homegrown electricity, and can help control spikes in fossil fuel cost. Distributed generation facilities, like many community wind projects, provide a safeguard against potential terrorist threats to power plants.
- b) **Supports Agriculture:** It is not often a new crop emerges from thin air. Wind turbines can be installed amid cropland without interfering with people, livestock, or production.
- c) **Local Ownership:** A significant contribution to the worldwide energy mix can be made by small clusters of turbines or even single turbines, operated by local landowners and small businesses. Developing local sources of electricity means we import less fuel from other states, regions, and nations. It also means our energy dollars are plowed back into the local economy.

Environmental Advantages

- a) **Clean Water:** Turbines produce no particulate emissions that contribute to mercury contamination in our lakes and streams. Wind energy also conserves water resources. For example, producing the same amount of electricity can take about 600 times more water with nuclear power than wind, and about 500 times more water with coal than wind.
- b) **Clean Air:** Other sources of electricity produce harmful particulate emissions which contribute to global climate change and acid rain. Wind energy is pollution free.
- c) **Mining & Transportation:** Harvesting the wind preserves our resources because there no need for destructive resource mining or fuel transportation to a processing facility.
- d) **Land Preservation:** Wind farms are spaced over a large geographic area, but their actual "footprint" covers only a small portion of the land resulting in a minimum impact on crop production or livestock grazing. Large buildings cannot be built near the turbine, thus wind farms preserve open space.

3. Disadvantages

- a) **A Variable Resource:** Turbines produce electricity only when the wind blows. This variability is monitored and compensated in the same way utilities monitor demand changes each day, so there are not any actual changes in power supply for the end users.
- b) **Aesthetics:** People have widely varied reactions to seeing wind turbines on the landscape. Some people see graceful symbols of economic development and environmental progress or sleek icons of modern technology. Others might see industrial encroachment in natural and rural landscapes. There are many ways to minimize the visual impact of wind turbines,

including painting them a neutral color, arraying them in a visually pleasing manner, and designing each turbine uniformly.

c) Shadow Flicker: Shadow flicker occurs when the blades of the rotor cast a shadow. Research has shown the worst-case conditions would affect, by way of light alteration, neighboring residents a total of 100 minutes per year, and only 20 minutes per year under normal circumstances.

d) Noise: Wind turbines are not silent. The sounds they produce are typically foreign to the rural settings where wind turbines are most often used, but as turbine technology has improved over the years, the amount of noise has fallen considerably. The sounds of wind turbines do not interfere with normal activities, such as quietly talking to one's neighbor.

e) Biological Resource Impacts: As with any construction project or large structure, wind energy can impact plants and animals, depending on the sensitivity of the area. Direct fatalities from collisions or electrocutions and loss of wildlife habitat and natural vegetation are the primary wildlife concerns associated with wind energy. Extensive environmental impact analysis are integral of project development to mitigate impacts as much as possible.

f) Construction: Wind systems can involve the transportation of large and heavy equipment. This can cause a large temporarily disturbed area near the turbines. Erosion is another potential environmental problem that can stem from construction projects. The single most reliable technique for limiting erosion is to avoid grading roads and to perform site reclamation post construction.

g) Radar: Radar interference by wind turbines is rare and easily avoided through technological improvements and proper siting of turbines that are close to sensitive areas. A number of U.S. government installations have both wind turbines and functional radar, and the British military has a track record of successfully addressing these challenges.

4. Impact of Financial Crisis on Wind Energy Installations Globally

Global Wind Energy Market Analysis and Forecasts to 2020 report gives details historical and current statistics relating to wind energy installed capacities and their growth scenarios until the year 2020. It also provides an analysis of the historical and forecast growth of installed capacity, and the market structure and regulatory policies that govern the world's key wind power countries. The report further includes information relating to the important cost, technological, market, and research and development trends on a global basis. It also analyzes the wind power deals that have taken place over the years and gives detailed profiles of the top five market players for each of the sub-sectors in the global wind energy industry. The report facilitates market analysis and forecasting of future wind energy industry trends. It helps identifying growth segments and opportunities in the energy industry. The news and deals portfolio provided in the report helps an investor to gauge the global wind energy market and accordingly direct their investment. Of the available renewable energy sources, wind is the most established commercial generating technology with highly effective and reliable equipment and machinery. It has observed tremendous growth, with the total installed capacity augmenting from 23,900 MW in 2001 to over 121,013 MW in 2008, reflecting an annual growth rate of 26% for the 2001 - 2008 period.

Annual Wind Energy Installations to be impacted by the Financial Crisis. The current financial crisis is severely affecting the growth of wind energy globally. The global wind energy industry is witnessing many cancellations of turbine orders, freezing up and sale of

wind farms, and difficulties in securing financial aid for new projects. The worldwide annual wind energy installations will trickle down by more than 15% in the years 2009 and 2010, as against the growth rate of 35% in the new installed capacity of 2008, according to the report. This will further result in a dip in the demand for wind turbines. Increasing Mergers and Acquisitions to be the Outcome of Financial Crisis Wind farms are capital-heavy projects with significant up-front investment that can be financed only by large utilities and investment groups. The critical short-term challenge faced by most wind power developers is financing, particularly for under development projects. The economic downturn, resulting in the failure of some of the world's largest investment banks, has led to an increase in the cost of capital for wind energy projects. Against this backdrop, only a few large wind power companies will be in a position to pursue their project development plans. Shortage of financial resources with smaller players would give an opportunity to the big giants to takeover or form alliances with such companies, thereby increasing the level of consolidation in the wind energy industry.

Declining Share of Europe in By Region Break-up of Wind Energy Capacity

Though Europe is the leading region in terms of the current global cumulative wind energy installed capacity its share in the world's wind energy industry has dropped from over 73% in 2001 to 61% in 2007 and 54% in 2008. Also, the faster rate of wind energy growth in the US, China, India and Canada is increasing the share of the North American and Asia-Pacific regions in the global wind energy industry.

5. Wind Energy Today and Tomorrow

In just a few short decades wind energy has matured dramatically, making wind one of the fastest growing sources of electricity in the world today. Due to technological advancements, policy initiatives, and economic drivers, wind energy is now able to make a cost-competitive contribution to our growing energy needs. Wind Turbine Technology Turbines today are sleek and slender machines, a far cry from their bucolic wooden ancestors. Around the world, wind turbines of all sizes have become a familiar sight; ranging from home or farm-scale machines of 1 kilowatt, all the way up to arrays of large 3 megawatt machines. Modern wind turbines are up to the task of producing serious amounts of electricity. A popular sized machine in the U.S. today is a state-of-the-art 2 MW turbine that stands as tall as a 30-story building and costs roughly \$3.5 million installed. With a good wind resource, this size turbine can produce 6 million kWh of electricity each year, or enough energy to run 600 average. american households.

Wind Energy Around the Globe

Turbines are sprouting up around the globe in record numbers. By the end of 2007, there were nearly 94,000 MW of wind installed around the world, which is a significant rise from the 59,000 MW installed in 2005. The pace of growth is now greatest in the United States, where installed wind energy capacity grew by 45% in 2007. This growth makes the US the leading nation in new capacity installed for wind energy. Yet Germany continues to have the highest total wind capacity of any country with 22.3 GW. The U.S. is right behind them with 16.8 GW of total installed capacity and it is expected that the U.S. will overtake Germany as the leader in installed wind capacity. The recent boom in renewable energy investment, including wind energy generation, is being aided through progressive policies and widespread public support.

In summary

The advancement of large-scale wind turbines has created energy that in some cases is cheap enough to compete with traditional electricity. Still in its early stages, wind power technology has the potential to greatly impact the economy, steering the United States and Europe from dependency on foreign oil to diversified energy sources. Wind power, no longer considered an alternative fuel, has found its way into the mainstream in certain regions of the country. As energy prices continue to rise and the world becomes increasingly aware of greenhouse gasses, wind power's popularity has grown.

The generation of wind power is directly proportionate to the amount of wind that exists in the environment, not demand. This is a major factor that prevents wind power from becoming the prevailing form of energy used in Europe and elsewhere.

You might think that since wind is a free resource, wind energy should be free or inexpensive. However, the infrastructure required to harness and transmit this energy carries a cost that is passed down to consumers. The popularity of wind turbines has risen, with celebrities such as Jay Leno adding smaller ones to building roofs. But these smaller devices are a long way from providing a viable amount of energy.

Technological advancements and supportive policy measures have the ability to drastically increase the future of wind energy development in our nation and our world. Wind power has the unique ability to provide even greater sources of distributed energy production, which means less risk and a stronger energy portfolio. America's ingenuity and drive for independence are well suited to increased wind energy development in the future. Stay tuned to advancements at industry and policy levels as wind energy continues to grow. For the sake of national security, rural economic revitalization, and resource preservation we must promote a renewable energy economy. Wind power can be a cornerstone of that sustainable energy future because it is affordable, provides jobs, substantial and distributed revenue, and treads lightly on our environment without causing pollution, generating hazardous wastes, or depleting natural resources. Embracing wind energy today will lay the foundation for a healthy society.

MAIN THREATS TO THE ROMANIAN LABOUR MARKET IN THE CURRENT CONTEXT

Dimian Gina Cristina

Bucharest Academy of Economic Studies Faculty of Cybernetics, Statistics and Economic Informatics

Dimian Mihai

Bucharest Academy of Economic Studies Faculty of Management

The paper's topic is focused on the Romanian labour market prospects, which is going to be affected by two main threats: aging and population decline. These two factors are supposed to dramatically change Romania's economic structure. It is therefore necessary to know how they will evolve in the next decades, facts which represent the main objective of our article.

These topics are debated at large scale at the European and national level, because they describe a process which implies European Union as a whole.

The methodology used in order to quantify this phenomenon includes statistical methods (correlation analysis and descriptive statistics). We have used data available at national and European level in order to build a proper argumentation.

The results obtained are worrying because there is a high risk to assist at an accelerated aging of the Romanian people, doubled by a very low birth rate. This might create huge problems in the economic and social system due to productivity decrease and the pressures on the pension's funds.

The paper offers scientific arguments for developing macroeconomic policies in order to prevent the negative situation in which we could be within less than 40 years. As a comparison term we brought into attention the Germany situation, country which offers economic equilibrium to the EU, but is also affected by aging.

The manner in which this problem has been approached is an original one because we tried to put Romania's situation into the context of the European Union general situation, the threat being emphasised by the fact that it is going to be a trend for the whole continent.

Actually, if it is not taken adequate measures, we will be confronted with a demographic crisis, much worse than the current financial one, because the effort of the country to reverse a birth rate decreasing trend with an aged population will take decades.

Key words: *aging, labour market, employment structure, sustainable development*

JEL classification: *J11, J21, O16*

I. Introduction

Sustainable development is one of the fundamental objectives laid down by the European Union constitution treaty. The concept of sustainable development refers to meeting the needs of present generations without compromising the opportunities of future generations to meet its own needs.

Given the importance of this objective in 2001 the European Union launched its first Sustainable Development Strategy (SDS), adopted by the European Council in Gothenburg.

In the common vision of the Member States, which can be found in the revised SDS (June 2006), sustainable development implies the need to ensure the preservation of land capacity to support life in all its diversity based on principles such as: democracy, gender equality, solidarity, rule of law and respect of fundamental rights, freedom and equal opportunities for all. The expected result is continuous improvement of welfare and quality of life for present and future generations by promoting a dynamic economy characterized by full employment, high levels of public education and health, social and territorial cohesion, and environmental protection.

In 2010, with the launch of Europe 2020, the priority to ensure sustainable economic growth was reiterated. This became one of the three fundamental objectives of the European Union for the next decade, with smart and inclusive growth. In response to financial crisis and the challenges of globalization, the growing pressure on resources and aging populations, the European Commission established a series of targets in order to achieve economic growth.

The targets established and the initiatives undertaken are strongly correlated. Thus, education, training and lifelong learning will equip the workforce with skills and qualifications needed in order to fulfil the jobs requirements. This will lead to increasing employment rates, incomes and living standards, contributing to poverty reduction.

A better level of education will increase innovation and research capacity of the economy, including developing green technologies. They will help to combat climate change and to boost competitiveness and the number of jobs in environmental protection field (COM, 2010).

In this context, human resource plays a dual role: it is one of the strengths of the European Union (manifested by the talent and creativity of individuals), but also a threat (by negative demographic trend, the aging population and the reduction of the compatibility between qualifications held by the labour force and those required in the current economic labour market).

II. Demographic factors and their impact on sustainable growth

In 2008, EUROSTAT has released the forecasts related to the population growth trend until 2060 (EUROPOP2008, convergence scenario) for all the 27 Member States, including Norway and Switzerland, which have been used by the European Commission in order to analyse demographic aging impact on public expenditures.

The results of these projections bring into attention the powerful negative impact exerted on long term by the population aging on the public finances (pensions, health insurances and long term care), employment, productivity, economic growth and other areas. Life expectancy is supposed to rise, and the “baby boom” generation is going to decrease.

Thus, in 2008, at the level of the 27 Member States, the **total population** counted 495.4 million people, increased by 2% compared to 2000. EUROSTAT forecasts indicate that in 2035 it is going to be recorded the largest number of EU population (520.7 million), but this will gradually decrease until 1st January 2060 at 505.7 million, but it will maintain over the level recorded in 2010 (Fig. no. 1).

Regarding Romania, the decreasing trend of the last years is going to be maintained for the next period. If in 2008 the population numbered was 21.5 million people, falling by 4.4% compared with 2000, in 2060 this is estimated to reach 16.9 million, with almost 20% lower than the number recorded in 2008 (Fig. no. 1).

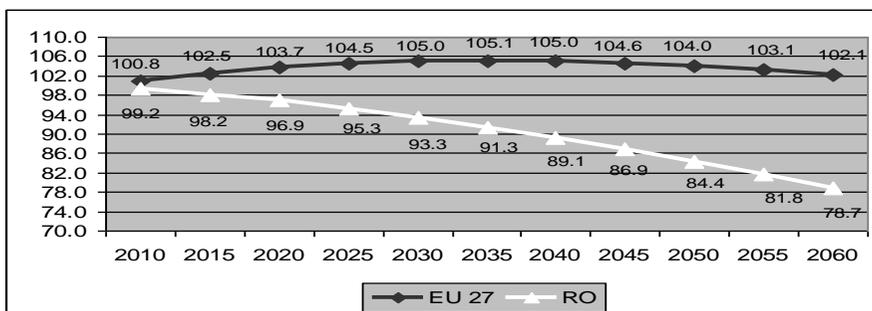

Fig. no. 1 Population projection at 1st January of each year (2008=100)
 Source: EUROSTAT, EUROPOP2008, Convergence scenario

These projections are considered by many Romanian authors too pessimistic. Thus, Lazea (2009) and Bari (2010) put in discussion the forecast number of 157.9 thousand annual births, considering that an average of 210.8 thousand is more realistic.

This has been computed starting from the same average fertility rate of 1.32 births per women, projected by the EUROSTAT study, but considering that 1.1% women from the population of the period 2008-2060 will give birth (1.1% has been also the share of the women from the total population who gave birth during 1990-2005).

According to these hypotheses, in 2060 the Romania's population could reach a number of 19.7 million persons, by 17% larger than EUROSTAT projection (Fig. no. 2).

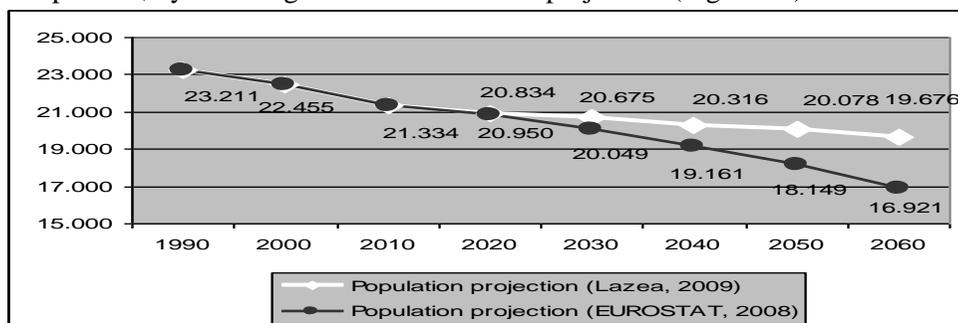

Fig. no. 2 Population projection in EUROSTAT studies (2008) and Lazea (2009)

Even if the hypothesis of a population of 16.7 millions inhabitants in 2060 will not be realised, being one of the most pessimistic, Romania is going to be affected by a strong **aging process**.

First of all, this phenomenon is sustained by the *population age structure*, characterised by the increase of the elderly (over 65 years) and the decrease of young people share (under 15 years) in the total population number (Fig. no. 3).

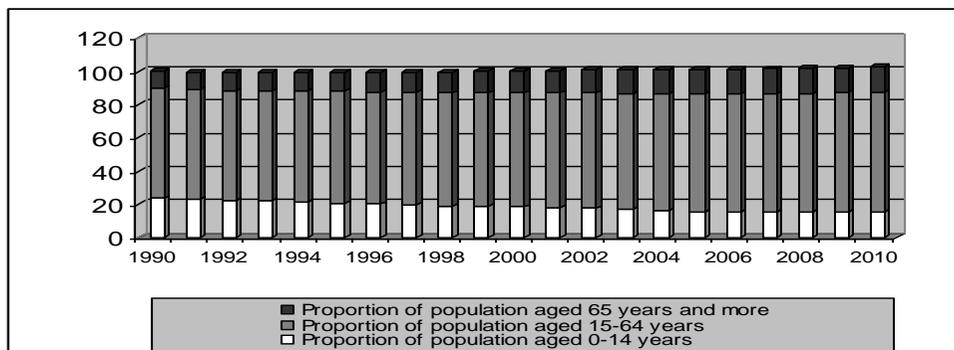

Fig. no. 3 Population age structure (1990-2010)

Source: EUROSTAT, NavTree_en. pdf, Population on 1 January: Structure indicators

This situation can be also emphasized if we analyse *old dependency ratio*, which has progressively increased in the last 20 years, becoming almost equal to the youth dependency ratio that has continuously decreased (Fig. no. 4).

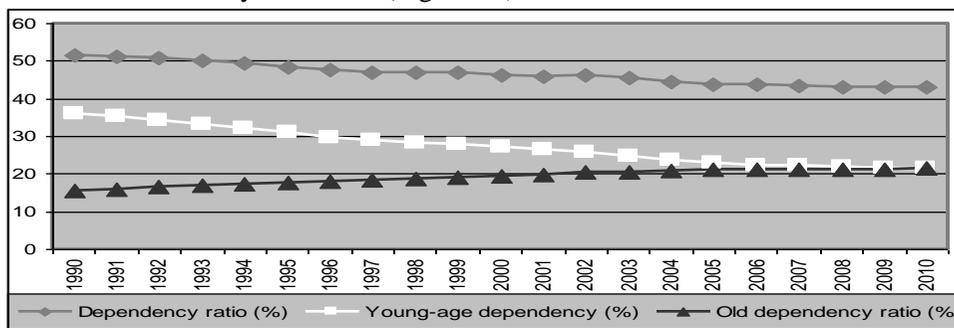

Fig. no. 4 Dependency ratio, young-age dependency and old dependency ratio in Romania (1990-2010)

Source: EUROSTAT, NavTree_en. pdf, Population on 1 January: Structure indicators

The number of elderly at EU level is expected to increase from 84.6 million in 2008 to 151.5 millions in 2060, actually from 17.1% to 30% of the total population number. In these conditions the old-age dependency ratio (population 65 and over to population 15 to 64 years) is going to increase from 25.4% in 2008 to 53.5% in 2060 (Fig. no. 5).

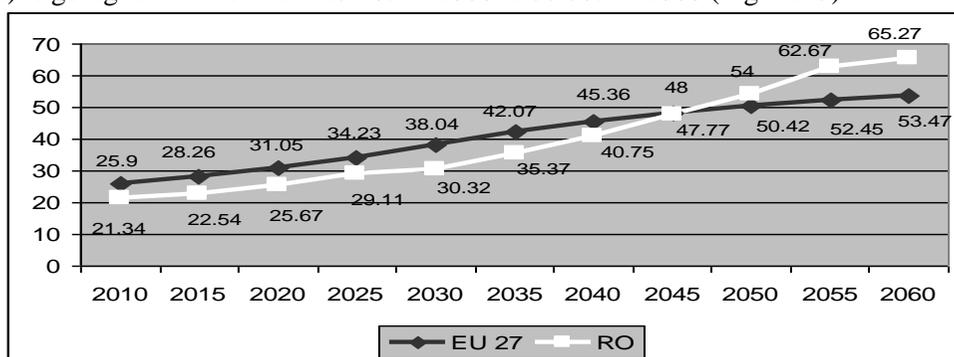

Fig. no. 5 Projected old-age dependency ratio EU – 27 and Romania (2010-2060)

Source: EUROSTAT, EUROPOP2008, Convergence scenario

Regarding Romania, the old-age dependency ratio is going to record an accelerated growth, being estimated to overstep the EU average in 2045 and reach a value of 65.27% in 2060 (Fig. no. 5).

Even if according to the papers released by the above mentioned Romanian authors it is sustained the fact that this indicator will not reach the level of 65.27% in 2060, more reliable being a lower percentage (almost 53.37%), this represents an increase by 150% compared to the value recorded in 2010.

In these conditions it is expected that the economic effects of the projected demographic evolutions to be very strong, and a long term sustainable development to be not so sure. The main cause is represented by the decrease of the population number capable to work and, consequently of the activity rate, this fact having a direct effect on reducing the output and slowing down the economic growth process.

III. Demographic aging and structural changes in economy

One of the direct effects of demographic aging on the economic activity will be changing the structure of demand for goods and services fact which is going to have a significant influence on this market, but also on labour and capital markets (Börsch-Supan 2003).

Thus, the demand for goods and services special designed for old people it is going to raise. In 2060 a smaller number of the work force will have to produce more in order to assure at least the actual level of consume and the capital will be mainly allocated to the countries where the population is younger and the earning rates could be higher.

In the case of Germany, the above mentioned authors have synthesised the effects of demographic aging according to the next forecasts:

- In 2035 the workforce will have to be by 15% more productive in order to obtain the gross domestic product per capita that could have been realised if the demographic aging had not been recorded;
- Only half of this increase in productivity could be achieved by increasing the efficiency of capital use, taking account of the human capital deterioration that comes up with demographic aging;
- Many of the jobs will be subject to a process of economic restructuring, the result of changes in the structure of demand for goods and services.

In this respect, in the paper entitled *Aging and Structural Change* (ThieBen, 2007) using a regression function with panel data the author analyses the impact of aging on the structure of the economy.

Analysed data support the idea according to which aging will accelerate the relative decline of some sectors such as agriculture and mining, the increase of the financial sector, real estate and social services, and also will slow down the decline of manufacturing industry.

The most interesting result of the research is the fact that aging will sustain the increase of the sectors with quite low productivity that will affect on long term the economic growth process.

For Romania, the situation is much more difficult. Thus, a simple analysis proves the fact that in 2060, in order to maintain the same standard of living recorded in 2009 (GDP/capita of 2607 USD) for the 19676.4 thousand persons that will represent the population of

Romania, the productivity of the 11083.4 thousand persons at the working age should be by 28% higher (this in order to obtain the production realised by the 15478 thousand persons at the working age in 2009).

But, if we intend to reach the level of the developed countries, the productivity should rise more than that.

According to the data offered by the World Bank for 1990-2008 period, it seems that for Romania the link between the proportion of elderly and the proportion of people employed in agriculture has an reverted U shape. If until 2001, the two indicators had recorded the same direction of evolution, it seems that, after this year aging determined a decrease in employment in agriculture (Fig. no. 6).

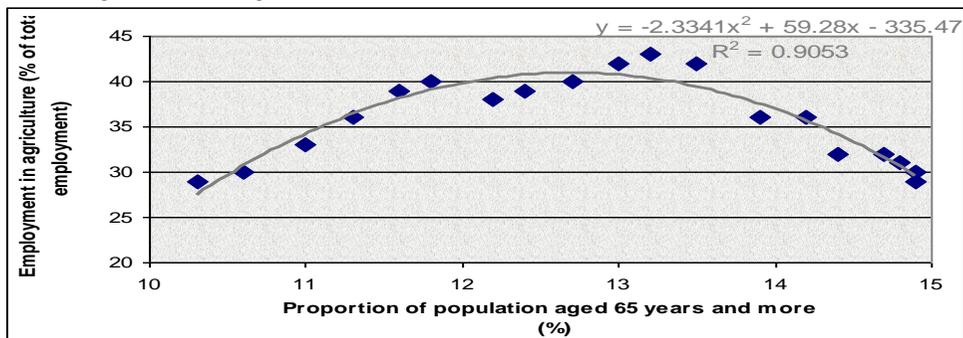

Fig. no 6 Correlation between demographic aging and employment in agriculture
Source: Own processing according to the World Bank data

A more stable relation can be seen between the population employed in industry and the indicator that quantifies the process of aging. Thus, a long period of time, aging has conducted to the decrease of employment in industry, but for the moment this relation tends to change (Fig. no. 7).

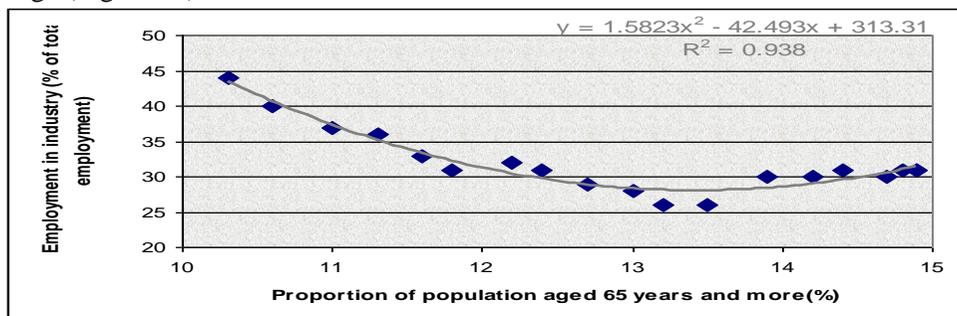

Fig. no 7 Correlation between demographic aging and employment in industry
Source: Own processing according to the World Bank data

Regarding the tertiary sector, as in Germany, the correlation between the two indicators proves the existence of a direct, very strong relation. Thus, with the acceleration of aging, as expected, employment in services has recorded an increasing trend (Fig. no. 8).

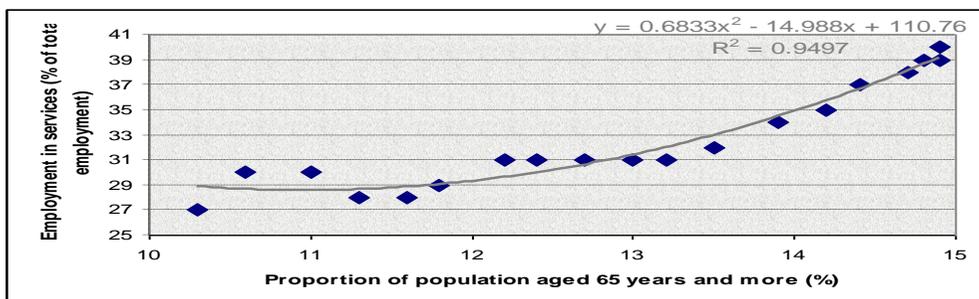

Fig. no. 8 Correlation between demographic aging and employment in services
Source: Own processing according to the World Bank data

IV. Conclusions

According to data presented above, in the coming decades internal growth potential of Romania will be affected not only by the consequences of the financial crisis that our country is passing through, but also by a negative demographic process.

First, this will reduce the size of one of the main factors of production – labour force and will determine its deterioration due to population aging. In the absence of significant increase in labour productivity the economic effects of negative demographic trends will be felt through a slowdown in the process of economic growth. The main reason is the decrease in the working age population and therefore in the rate of activity, which will have a direct effect of reducing production.

Due to the aging process the structure of economic activity is expected to change, by increasing the share of tertiary sector, i.e. services for older people and with this the structure of employment.

In addition, external challenges manifested by increased competition in international markets will force our country to quickly change the economic structure and the system of education in order to be able to adopt technological changes necessary for a sustainable economic growth.

CREATIVE POTENTIAL OF RESEARCH AND DEVELOPMENT - A COMPOSITE INDEX OF POTENTIAL SCIENTIFIC CREATIVITY

Dinescu Maria- Cristina

Academy of Economic Studies – Faculty of International Business and Economics

Fabian Anne- Marie

Faculty of Philosophy – Bucharest – Master in European Studies and Ethics in International Business

Both Lisbon Council in March 2000 and the one in Barcelona in 2002 represent major turning points in science and research activities at European level. At that time there was a formal recognition that science, technology and innovation, coupled with a quality education is the key to development and long-term competitiveness of European space. Moreover, the decade 2000-2010 was declared as a dedicated to the investment in these sectors, and 2009 was named Year of Creativity and Innovation at European level. In a study in the EU States and candidate countries, whose results were published in 2010, it was noted however that, despite the special attention given lately to these issues, index fund allocations for research and development budgets national level of 2007 is 0.67% on average in the EU (27 countries), compared with Japan (0.68%), South Korea (0.80%) and especially the United States (1.03 %).

The purpose of this paper is to identify those factors that influence a nation's potential of scientific creativity and to find a way to compare different countries in terms of such potential. If until now many attempts were made to create an index of national or regional creativity, our goal is to narrow the field of creativity to scientific research and to compare the performance / potential of Romania compared to other European Union countries. Among the basic elements which have a direct impact on the potential for innovative scientific development, one can identify investment, human resources and current performance. Based on the above factors, a composite index of scientific creativity potential was developed, which takes into account the three main elements described above: human capital (human resources in science and technology and researchers), financial capital (investment in research and development) and scientific performance (Hirsch Index). Data for the first two were extracted from the Eurostat database for comparisons to be made between countries, while the third one has been estimated by specialized research teams based on data available on Essential Science Indicators (ESI) of Web of Knowledge. The main limit is the level of accuracy in data provided by each nation, and the extent to which such data were estimated, not final. The main benefit is that of identifying the position one country compared to others, but also to find the main factors that placed that country at one level or another in the overall classifications, thus allowing for the development of action plans particularly focused on those elements.

Keywords: research and development, human resources, creative potential, investment in research and development

JEL Codes: O15, O31, O32

1. Introduction

Although basic research has traditionally registered relatively late economic effects, there are many areas of applied research where they are recorded much faster. This is demonstrated by the growth in importance that research and development departments of several private companies are gaining in several sectors: IT, pharmaceutical, automobile, etc. Many results of these departments are applied in production and the increasing global competition (see the IT sector) makes that the time distance between these results of a research process and their implementation is increasingly lower. Our theory is that research and development is part of the creative economy and represents, perhaps, even though apparently without immediate and direct results, one of the main engines of global growth. The purpose of this paper is to define the main factors that impact on the country's scientific creativity and to compare, using a composite index, the creative potential of countries belonging to the European Union.

2. Consecrated indexes in the estimation of creative potential

One of the most popular theories of economic growth has been developed by Richard Florida (2002), and is based on defining the creative capital as an engine for development. In order to quantify the economic development potential of a city or a region he identified and defined three parameters, which he called the three T: Technology, Talent (skills) and tolerance (Florida, 2002). While his study in 2002 was concentrated on the United States, in the book "The Flight of the Creative Class" (Florida, 2007) he added a part dedicated to an international study. Data used for the study were provided by the WTO, UNESCO, World Bank and Ronald Inglehart's study for the period 1995-1998 in terms of tolerance. Moreover, it also calculates the Global Creativity Index (GCI). Its formula was determined by Tinagli and Florida (Florida and Tinagli, 2004) and was extended from Europe to a global level. GCI is the equally distributed average between Talent (skills), Technology and Tolerance indicators, where national values for each indicator were normalized on a scale from 0 to 1. Romania occupies the last position in the Global Creativity Index ranking with a score of 0.127. The first three positions are occupied by Sweden (0.808), Japan (0.766) and 0.684 Finland. United States occupies the fourth place with a score of 0.666. Romania's low score comes from all three indicators, the lowest compared to the first classified, was that of innovation (which participates in the formation of the technology index), 433 times lower than in Sweden (0.45 to 195 97).

In the last decade another composite indicator of the creative economy has also been estimated (CICE - Creative Economy Composite Index - Bowen, HP et al., 2006). The indicator takes into account three main components: innovation, entrepreneurship and the level of openness. Each of the three components has three sub-components in its structure. Thus, innovation index takes into account the human resources in science and technology, patent applications and Internet access. Entrepreneurship index is composed of indicators that give information about the number of newly established companies, the fear of failure and venture capital. Openness considers the share of urban population, immigrants and foreign students. The authors have developed and used these indicators in particular at regional level, where they had access to comparable data.

3. Defining the composite index of scientific creativity potential (CISCP)

Creativity is in part the ability to find innovative solutions to problems, create new products or processes, either from existing ones or from nothing. Thus, it appears to be closely linked to innovation and has become evident that promoting and encouraging the innovative character of a nation are essential to future economic development. Among the basic elements, which have a direct impact on the potential for innovative development, one can identify: investment in research and development (financial capital), human resources in science and technology and researchers supply (human capital). Of high importance is also the current scientific performance, that makes a country competitive in the field of science. Based on the above factors, a composite index of the potential of scientific creativity was developed that takes into account and is equally divided among three main elements: human capital (human resources, science and technology and research), financial capital (investment in research and development) and current scientific performance.

Human capital (H). Human capital (skills and knowledge) is regarded as having a crucial contribution in developing the scientific creativity and is a key element of a country's competitiveness. Meeting the demand for highly skilled human resources requires constant investment in education. Human capital has a 1/3 share in CISCAP composition, equally divided between human resources in science and technology and the supply of researchers.

Human resources in science and technology (HRST). A common indicator of the level of human capital in a country or region is the total amount of human resources employed/educated in science and technology. In the index calculation in particular, we took into account those resources holding the proper education, even if they are not working in a field of reference. They are, however, potential resources, benefiting of the necessary foundations. This index includes thus people who have obtained a tertiary degree in a field of science and technology (eg, science, engineering, medicine).

Researchers. Human capital fully devoted to research activity is a direct indicator of the extent to which this area is of interest to a nation. The share of researchers in total employment was taken into account in the analysis.

Financial capital (F) The index takes into account the share in total GDP dedicated to research and development. Research, especially the fundamental one, is most often not self-funding. Government participation is crucial in this respect, most leaders from developed countries, having understood it and pursue it thus with utmost care. This element was given a weight of 1/3 in the composite index calculation.

Scientific performance (S). In order to measure scientific performance, the element taken into consideration is Hirsch national index for each analyzed country. Jorge E. Hirsch (2005) introduced the h-index to quantify the scientific publication output and the impact of the work of researchers. It is a composite measure based on the combination of the number of papers published and the number of citations these papers have received according to records created for and reported by Web of Science (WoS) and Scopus. H-index reflects both the number of publications and the number of citations per publication, making it possible to have a ranking among countries in terms of scientific competitiveness.

For comparability reasons, for each element of the indexes above, data was normalized (to the maximum value obtained), and the normalized values are taken into account in estimating the composite indicator.

Thus, for a country x, the CISCAP is calculated as follows:

$$CISCAP_x = 1/3 * H_x + 1/3 * F_x + 1/3 * S_x$$

4. Estimation of the index at Romanian level and comparison with the other European Union states.

In order to understand Romania's position in terms of innovative/scientific potential, we calculated the indicators developed above for all 27 countries belonging to the European Union. Thus, for each of them H, F,I and S were calculated. Data was extracted from Eurostat website for the first two indicators and while Hirsch indicator was calculated by specialists based on ESI database (Csajbok &all, 2007). Each set of data was normalized from 0 to 1, with reference to the highest vale (assigned as upper limit 1). Starting from here values were then assigned to each country (between 0 and 1).

Thus, for HRST index, the highest value was found and calculated for Finland, where people with tertiary education in science and technology accounted for 41% of the total population. Romania here registered the last position, with a 16%, representing a HRST index of 0.4, almost half the EU average of 0.71. Data were available for 2009, excluding Luxembourg, for which the most recent data available are from 2008. A similar situation was noted for researchers, where Romania's position is also at the lower limit, accounting for 0.33% of total employment, compared to 2.14% in the case of Finland. The index has the value 0.15, while the European average reaches about 0.45. Data were extracted from the Eurostat website, mostly available for 2007, except for the Czech Republic, Estonia and Slovakia (2008), Italy (2006), Greece (2005) and Netherlands (2003). Given that there is a field of reduced fluctuation, which requires a relatively high degree of specialization, we took into account those older data, as well, where recent data was not available.

The financial capital invested (total spending for research and development as a percentage of GDP) is one area where our country is still at the bottom of the range, surpassing, this time with by very little (1%), Cyprus and Latvia. It registered a score of 0.12 compared to Finland, which leads the classification in this case, as well. European Union recorded an average index of 0.4. In this case, the most recent information has been provided by Austria and Finland (2010), and the oldest by Greece (2007), while the remaining information was available for 2009.

As far as the scientific performance is concerned, the highest h-index in EU countries was registered by the United Kingdom, holding a value of 426 and is followed by Germany and France (392 and 362). Romania's h-index amounts to 44, reaching the 20th position out of 27 countries. In terms of normalized values, 9 countries out of 27 register a higher value than 0.5 (with Romania's value reaching 0.1).

Taking into account all the elements we discussed above, a weight was assigned to each calculated index and thus estimated the composite index of scientific creativity potential for each country. Results can be observed in the following graph:

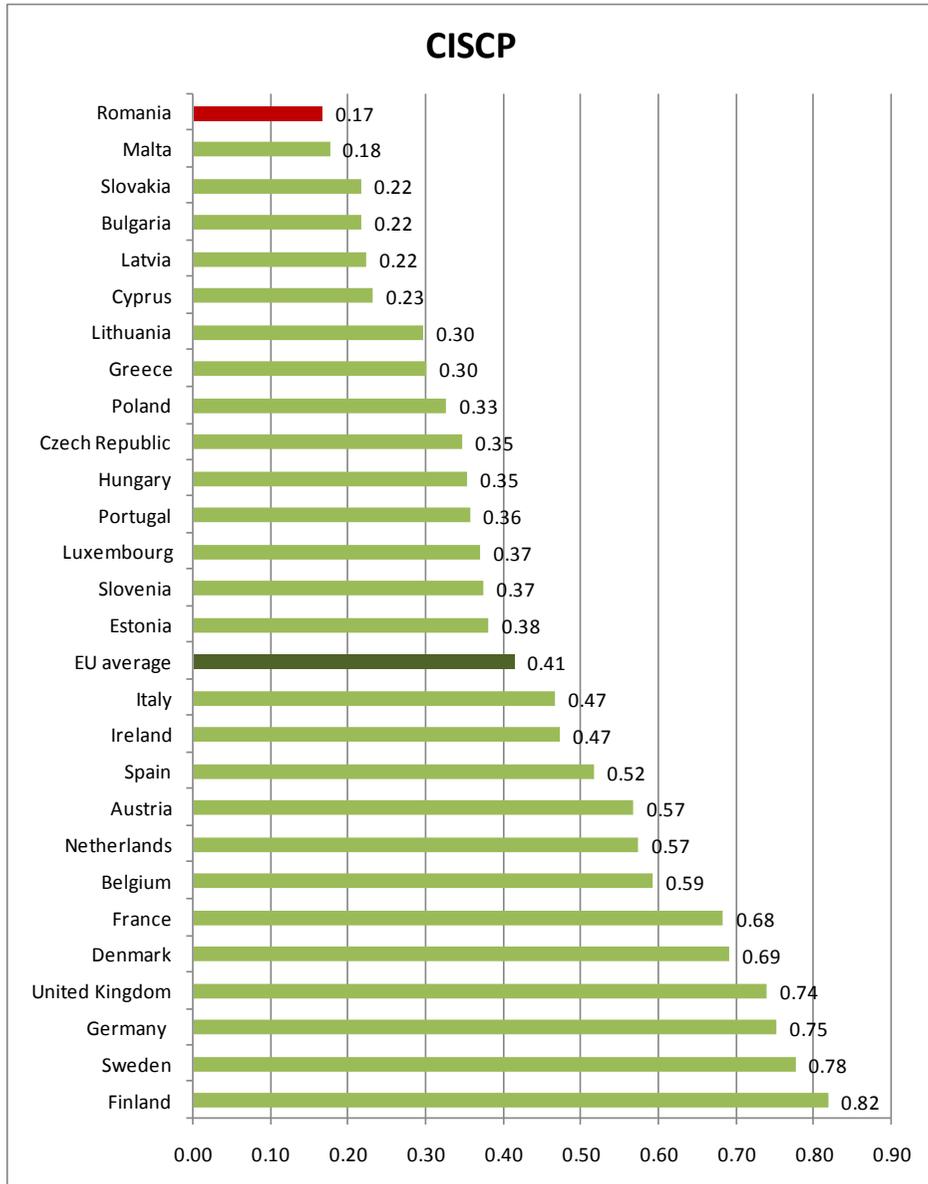

Fig.1. CISCP for EU countries

Source: Obtained by the authors

As a result of the above analysis we observed the fact that Romania occupies, in this case, the last place in the European countries with a score of 0.17. The maximum score, as expected, given the individual values obtained, is registered by Finland and has a value of 0.82. The European average is at the level of 0.41, more than twice the index of Romania.

Conclusions. Romania's scientific potential of is far below the EU average, in some cases even hovering in last place. Given that these resources should underpin a country's competitiveness, it is clear that measures will be needed in order to encourage the development of this potential. Along with greater emphasis on the financial terms for this segment, the orientation towards research should be encouraged as well. At this time there is a vicious circle out of which exist is expected to be relatively difficult. Thus, the attractiveness of potential human resources field is reduced, particularly due to lack of funding and a certain level of performance. Romania is currently facing a potential crisis in research. One reason is the lack of attractiveness for younger generations, both because they no longer see a clear future in this direction, and the lack of a sufficiently advanced level of education. Another reason is the current conditions of the Romanian research, the criteria for measuring performance and remuneration are still ambiguous and poorly applied. This has encouraged and will continue to encourage the exodus of human resources to other countries. At the same time, a high performance level and funding attraction can be achieved only if there is human capital that can support development.

COMPARATIVE ANALYSIS OF THE RECENT EVOLUTIONS OF ROMANIAN AND EUROPEAN UNION'S COMPETITIVENESS

Felea Adrian Ioan

University of Oradea Faculty of Economic Sciences

The main subject of this paper refers to an analysis of the recent trends and evolution of Romanian competitiveness compared to the European Union competitiveness and it is structured in four main parts. The first section of the paper regards an introduction of the competitiveness evolution process, recalling the three actual evaluation models of the competitiveness level. In the second part of the paper there can be found the competitiveness indexes practiced and published by the World Economic Forum, indicators that are structured on three main levels as following: the Global Competitiveness Index and its aggregate indicators that are developed on three categories of factors that are essential for the competitiveness process (Basic requirements, Efficiency Enhancers, Innovation and sophistication factors) and the indexes associated to the twelve pillars of competitiveness: Institutions, Infrastructure, Macroeconomic stability, Health and primary education, Higher education and training, Goods market efficiency, Labor market efficiency, Financial market sophistication, Technological readiness, Market size, Business sophistication, Innovation. Based on the values obtained after consulting the World Economic Forum Reports and regarding the competitiveness from a global perspective, the third part of the paper presents a comparative analysis of the evolution of the Romanian competitiveness process and the one of the EU25. In the last part of the paper there can be found the conclusions of this analysis, with respect to the values found

Key word: competitiveness, indicators, analysis, differences, evolution

The article's JEL code: O10, O11, O52, O57

Introduction

At the beginning of the XXI century, the world economy is governed by two strong forces: technology and globalization, both of them having an important impact on the companies, economies and countries. Nowadays, when the globalization process is happening significantly, the main objective of any country and nation remains the competitiveness.

After a 235 years long evolution, from Adam Smith [1] to present, the concept of competitiveness is considered by the economists, the governing law of the capitalist economies. Economic literature [2,3,4] presents the important personalities, starting with the year 1776, that have contributed to the development of competitiveness concept.

In 1990, Michael Porter published his work entitled „The Competitive Advantage of Nations”[5], paper in which he mainly resumes all competitiveness related ideas developed ever since. Michael Porter presents them in a universal model, entitled “competitiveness diamante” basically devoted to the companies competitiveness analysis, that is based on the following factors:

- Production factors (4)

- Local / National demand (2)
- External environment of the company (2)
- Related and complementary industries (2)

Nowadays, the competitiveness concept has different approaches, both at company level and at national level, and the recent written economic literature shows that concept is also raising a regional dimension.

The practical importance of competitiveness is designed by a large number of international institutions that manage the research in this field.

- International Institute for Management Development, World Competitiveness Yearbook
- World Economic Forum, Global Competitiveness Report
- World Bank, Doing Business, KAM
- Organization for Economic Co-operation and Development, New Economy Report
- European Commission, European Competitiveness Report

IMD World Competitiveness Centre director, Prof. Stephane Grelli, is the author of certain competitiveness related theories [6]. In this context, one nation's competitiveness factors are distributed by Prof Stephane Garelli in the so called "competitiveness cube", in which every two of the eight facets are connected to the fundamental or essential drivers:

- Economic performance: Attractiveness vs. Aggressiveness
- Governmental efficiency: Proximity vs. Globalization;
- Business efficiency: Stock vs. Processes
- Infrastructure: Cohesion vs Assumed Risk

At the beginning of the XXI century, the world economy is governed by two strong forces: technology and globalization, both of them having an important impact on the companies, economies and countries. Nowadays, when the globalization process is happening significantly, the main objective of any country and nation remains the competitiveness.

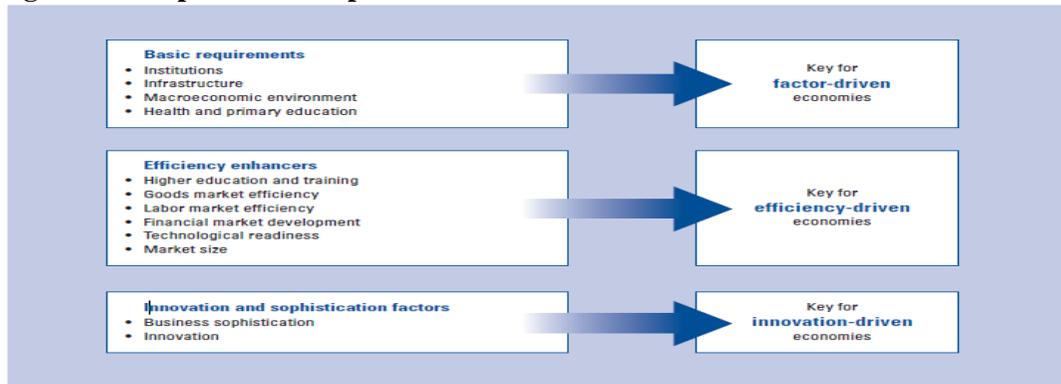

World Economic Forum (WEF) competitiveness index

World Economic Forum is an independent international organization committed to improving the state of the world by engaging business, political, academic and other leaders of society to shape global, regional and industry agendas. Over the past 30 years this institutions has published annual reports regarding the world economy status, has also analyzed policies and economic indicators.

Starting with the year 2005, the World Economic Forum underlies its competitiveness analysis, defined as being an ensemble of political factors plus the Global Competitiveness Index (GCI). This aggregate index has been developed by Prof. Xavier Sala – i – Martin and it is meant to quantify the national performances, by including certain complex aspects, appropriate to the multidimensional phenomenon that this index is modeling [7]: diversity and the numerous competitiveness factors, their evolution through time, positive impact of some key factors (for example Education and continuous formation) and the negative impact of some other factors.

The Global Competitiveness Index evaluation starts from quantifying the competitiveness main factors, that are grouped in 12 pillars [7], presented in Figure 1, where there are also resumed the key directions for competitiveness growth and pillars split in certain specific directions:

Fig. 1: The 12 pillars of competitiveness

Source: *Global Competitiveness Report (GCR) 2010 - 2011*

Every year the World Economic Forum publishes the Global Competitiveness Report, that presents the evaluation methodology of the GCI and the obtained values, for the countries that provided the data needed for the index assessment. The Global Competitiveness Report (GCR) represents an essential document at international level, that is usually consulted by the economic and political actors, with the purpose of identifying the best solutions for improving the competitiveness.

Since 2005 the Global Competitiveness Report evolution refers to its content and inward and outward data accuracy [7,11]. The Reports issued starting with the year 2006 – 2007, are extremely important for Romania, as they are based on the information provided by the Applied Economy Group and are also assumed by certain international institutions, in the context of preparing our country's EU accession.

The main purpose of this paper is to present the Romanian competitiveness level, based on the Global Competitiveness Index values registered in the period 2006 / 2007 until 2010 / 2011.

The following table presents the development stages of different economies, depending on GDP per capita values.

Table 1: Income values for development stages

Stage of development	GDP per capita (in US\$)
Stage 1: Factor driven	< 2,000
Transition from stage 1 to stage 2	2,000–3,000
Stage 2: Efficiency driven	3,000–9,000
Transition from stage 2 to stage 3	9,000–17,000
Stage 3: Innovation driven	> 17,000

Source: *Global Competitiveness Report 2010 - 2011*

Comparative analysis of Romanian competitiveness evolution

The Global Competitiveness Report provides the values for the following indexes:

- Global Competitiveness Index; (GCI)

- The Aggregate Indexes organized in three factor categories that influence the competitiveness (Figure 1 IAC)
- Indexes associated to the 12 pillars of competitiveness (IPC)

The research methodology used in this paper implies following the next steps:

Step 1 – The evaluation of the following measures taken for every type of indexes

The medium value for EU25:

$$I = \frac{\sum_{i=1}^n I_j^i}{n}, \quad (1)$$

where $I = \{GCI, IAC, IPC\}$; $i = 1, 25$ for UE 25 $j = 1$, for GCI ; $j = 1, 3$ for IAC; $j = 1, 12$ for IPC

Romanian competitiveness indexes values deviation, compared to the EU25 average

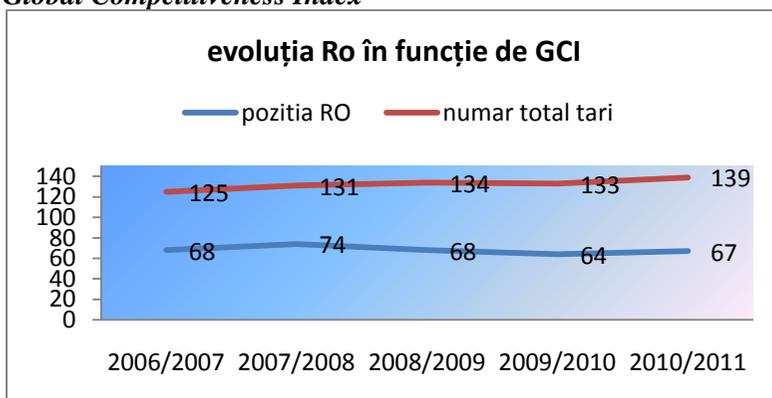

$$\Delta I_j = I_j - I_{rj} \quad (2),$$

where I_{rj} is the *type i and j category* Index for Romania

Step 2 – The graphic representation of the time evolution in the period of deviation analysis: $\Delta I_j = f(t)$

Step 3 – Identifying the Romanian competitiveness strengths and weaknesses, based on the previous characteristics; outlining the possible solutions for increasing the competitiveness. Besides the evaluations and graphic representations, the next figure, Figure 2 presents the evolution of our country's position, considering the value registered by the Global Competitiveness Index compared with the countries listed in the Global Competitiveness Report

Figure 2: The evolution of our country's position, considering the value registered by the Global Competitiveness Index

Source: Author's calculations

It is very important to mention that under the development stage (in Table 1), during the analyzed period of time, Romania is listed in “Group 2”, except 2009 / 2010 when our country is listed in transition from stage 2 to stage 3 countries group

In the following table, Table 2 there are presented the average values of competitiveness index at the EU 25 level and at our country’s level, during the period of time analyzed.

Table 2: Average values of EU (Ij) and Romanian (I_{rj}) competitiveness indexes

Anul		2006/2007 [1]	2007/2008 [2]	2008/2009 [3]	2009/2010 [4]	2010/2011 [5]	
Nivelul indicatorului	UE 25	GCI	4,9672	4,8048	4,804	4,7456	4,7432
		IAC	1	5,3144	5,2636	5,2868	5,1772
	2		4,866	4,7244	4,7708	4,746	4,6924
	3		4,6216	4,4972	4,4636	4,4284	4,3868
România	GCI	4,02	3,97	4,10	4,11	4,16	
		IAC	1	4,19	4,07	4,15	4,10

Conclusions

The Global Competitiveness Report issued by the World Economic Forum is actually a reference document at international level, due to its method of outlining each nation's competitiveness stage.

According to the Global Competitiveness Report for the period of time analyzed 2006 / 2007 until 2010 / 2011:

- Romania tends to occupy the 68th position in the total of 132 (average) countries analyzed;
- Romania is placed under the second group “stage 2 – Efficiency driven” with an average GDP per capita of 3000 and 9000 USD

The evaluations made with reference to the evolution of deviation values of indexes for Romania compared with the EU 25 are the following:

- The obvious tendency of recovering the gap between Romania and EU 25, under the aspect of Global Competitiveness Index
- Recovering the gap between Romania and EU 25 is made with the aggregate index IAC1 and IAC 2
- The aggregate index IAC 3 follows a contradictory evolution in the period analyzed and that leads to a decrease in the competitiveness gap recovery between Romania and EU25.
- Throughout the 12 pillars of competitiveness associated indexes we can note that IPC10 values are over the value of EU25, this being the most powerful gap recovery instrument for the period analyzed. For IPC1, IPC3, IPC5, IPC6, IPC7 and IPC8 the main tendency is to reduce the gap. The indexes IPC11 and IPC12 need to be carefully monitored because they contribute to the increase of the gap between EU25 and Romanian competitiveness, and the indexes IPC2, IPC4 and IPC9 tend to have the same effect, during the period of time analyzed.

THE ROMANIAN EXTERNAL TRADE AND THE FOREIGN DIRECT INVESTMENTS INFLOWS AFTER 2007. A CRITICAL SURVEY.

Giurgiu Adriana

Focusing more on the evolution of the Romanian external trade and FDI inflows after 2007 – the year of Romania’s EU integration - the paper provides insights in the trade and FDI inflows determinants in the context of the convergence process and also in relation to the financial global crisis. As the statistic data envisage, Romanian exports and imports were high over the period 2000-2010, and there were also large FDI inflows in the economy, mostly until 2008. Although the data appear to be encouraging, it seems that Romania did not succeed to maximize the benefits which should result from such a situation. Moreover, the situation after 2008 shows that Romania is in a deep recession accelerated and maintained by uninspired government policy measures with a strong negative impact on the Romanian economy.

The aim of this paper is to empirically investigate Romanian export and import demand functions after the year 2007, and to compare them with those of the period 2000-2006, using quarterly data, in correlation with the FDI inflows.

The main contribution of the paper is that it is an empirical analysis on Romania’s FDI and external trade, providing the impact of the main determinants of export and import of Romania, by using the Engle-Granger two step method. Following Allard (2009) rather than just providing the elasticity, this method combines the elasticity with the evolution of the explanatory variables to quantify their impact during the analysed period. The analysis aim to cover all possible factors underlying the external sector performance of Romania and thus, they are complemented with country specific analysis. The empirical analysis will therefore provide some interesting insights not only in the context of the convergence process of the country with the Eurozone but also in relation to the exchange rate regime.

The theoretical framework relies on the “imperfect substitutes” model (Goldstein and Khan; 1985), and it is used in the paper to estimate the demand functions of the Romanian exports. Furthermore, the effect of the FDI on export performance is also investigated.

The conclusion which came out was, on one side that the export growth in Romania since 2007 is mainly due to strong FDI inflows since 2000, while the real exchange rate appreciation seems to not have significant impact on export developments of the country. On the other side, the significant imports growth was due to strong reduction in productivity and in the gross capital formation rate, which combined with the lack of domestic capital, have largely affected the private sector, and mainly the manufacturing one, on which the Romanian economy should rely on, mainly due to its competitiveness.

Key words: external trade, FDI inflows, exports, imports, Romania’s economy

IS THERE ANY CORRELATION BETWEEN THE CHRONIC BALANCE OF TRADE DEFICIT AND THE ROMANIA'S INCREASING EXTERNAL DEBT?

Giurgiu Adriana

According to the data provided by the Romanian National Institute of Statistics and Eurostat, the balance-of-payments current account registered a permanent and increasing deficit since 1990, while the domestic production was accelerated decreasing and the FDI inflows were far from being enough to cover the internal consumption needs. These being the facts, the present paper aims to underline the fact there is a direct correlation between the increasing external debt of Romania in the last years, and the balance of trade increasing deficit, which is due mainly to the lack of domestic capital, as well as to the decreasing productivity. The research methodology is based on a theoretical model of external debt sustainability, using time series data for Romania and using a multi-equation model.

The results show that the relationship between external debt and the balance of trade deficit should be analysed with a simultaneous equation model, because there is a two-way relationship between debt service and deficit growth: the higher the imports, the higher the external debt, and as a consequence, the higher the balance of trade deficit, if the productivity is low. This result is consistent with the Romanian experience, and its implications are very large and will multiply over the years, if there will be no adequate policies meant to revival the private sector, mainly the SMEs.

In this respect, the paper concludes that the Romanian government should immediately take the necessary measures to facilitate the easy access to capital for the private investors, which will further stimulate the internal production, with a direct impact onto the increase of exports, which will determine on the one hand, the reduction of the balance of trade deficit and simultaneous, the increasing of the necessary budgetary revenues to pay back the external debt. Otherwise, all costs will be supported by the next generations, with no return, if the probability for declaring "default" will be successfully surpass in the short run.

Key words: Romanian external trade, balance of trade, current account deficit, external debt

FINANCING INSTRUMENTS USED IN THE CENTRE DEVELOPMENT REGION

Hada Teodor

“1 Decembrie 1918” University Alba Iulia, Faculty of Science

Crețu Simion

“CENTRU” Regional Development Agency

The paper presents the main financing instruments (projects) used in the Centre Region, approaching aspects regarding the Centre Development Region, such as its features in terms of the geographical profile of employment. In regard to the involvement of the population to the economic life, statistics show relatively low values of the overall activity and employment rates recorded primarily in the rural area. If we consider only the population included in the age group 15 to 64, the active population represent 62.2% of total, and the employment rate is 56.3% of the total active population, both declining in the last 15-20 years. At regional level, in order to implement the regional development policy in accordance with Law no. 315/2004 on regional development in Romania, two institutions are functioning: Regional Development Board and “Centru” Regional Development Agency. The paper also presents the use dynamics of funds in the Centre Region. Starting with 2007, “Centru” Regional Development Agency has become an intermediary body within ROP 2007-2013 with the role of promoting and managing the funds allocated to this region. In regard to the stage of implementation of ROP in the Centre Region, starting with February 25th, 2011, all 12 key areas of intervention of the programme were launched and a number of 1.053 projects were submitted in the Centre Region for a total amount of 1.033,99 million euro, the paper showing a diagram of the submitted projects. There is also a diagram of the amounts requested for funding the projects submitted until February 25th, 2011 at the Centru RDA and the available financing budgets on priority axes. Until February 25th, 2011, a number of 174 projects were contracted under ROP for a total value of 1.549.430.419,97 lei. In the end, we review the main indicators of the contracted projects. They belong to rural development, transport infrastructure, social infrastructure, regional and local business environment, tourism development and promotion.

Key words: Centre Region, labour force, project, indicators, structural funds

JEL codes: R1, R58

CENTRE Development Region

In the context of the economic and political changes that took place in our country, it was required and important steps have already been taken towards ensuring a proper institutional structure for adopting and implementing a coherent policy of regional development. On these lines, based on Law no. 151/1998 repealed and replaced by Law no. 315/2004 on regional development in Romania, were established eight regions of development in Romania and the institutions that implement the regional development policy at the level of

these development regions – Regional Development Agencies and Regional Development Boards.

The development regions represent the framework for developing, implementing and assessing policies of regional development, as well as programmes of economic and social cohesion. Development regions also represent a framework for collecting specific statistical data in accordance with European regulations developed by EUROSTAT for the territorial units for statistics NUTS II.

In this context, by associating the administrative and territorial units of Alba, Braşov, Covasna, Harghita, Mureş and Sibiu countries, the “CENTRU” Development Region was created.

This geographical area is not an administrative and territorial unit and has no legal personality; it represents only the application framework of the regional development policy at the level of the six counties. The implementation of the regional development policies in the Centre Region is done by the “Centru” Regional Development Agency.

In regard to the involvement of the population to the economic life, statistics show relatively low values of the overall activity and employment rates, recorded primarily in the rural area. If we consider only the population included in the age group 15 to 64, the active population represent 62.2% of total, and the employment rate is 56.3% of the total active population, both declining in the last 15-20 years

At regional level, in order to implement the regional development policy in accordance with Law no. 315/2004 on regional development in Romania, two institutions are functioning:

Regional Development Board;

“Centru” Regional Development Agency.

The use dynamics of funds in the Centre Region

From the moment it was set up until the accession of Romania to the European Union in 2007, Centru RDA, as implementing authority, had managed at regional level a series of financing programmes with funds from the European Union, as well as from the Romanian Government. The main pre-accession fund of EU managed at regional level by Centru RDA was **PHARE, component of Economic and Social Cohesion**. On these lines, 20 financing schemes of the PHARE 1998 – 2006 programme were carried out and they provided funding in areas like: supporting the SMEs sector, development of human resources, social infrastructure, educational infrastructure, environmental infrastructure (waste management, water supply and sewage), local and regional infrastructure (transports, tourism, business structures). These funding schemes helped implement in the Centre Region a number of **472 projects with a total value of 95.32 million euro, 55,71 million euro of this amount being non-refundable funds**.

Between 1998 and 2006, Centru RDA also managed a series of programmes with funding from the state budget, which focused on investments for the support of companies located in areas with problems, investments in tourism and in social services. Thus, **95 regional projects** were implemented, **having a total value of 21,82 million euro, 9,04 million euro of this amount being non-refundable funds**.

These projects created: 1617 jobs, 27 waste collection systems, rehabilitated county roads, 17 streets and alleys and 3 bridges rehabilitated in Sovata resort, 9 rehabilitation works of the water supply and sewage network, 1 industrial park, rehabilitation of 38 schools and resource centres, 4 new workshops, 12 rehabilitated workshops, 20 social centres (new and

rehabilitated), 374 training courses, 18.361 trained people, 32 environmental studies and projects, 11 feasibility and business management studies.

Since 2007, after Romania's accession to the European Union, Centru RDA has become an Intermediary Body within the **Regional Operational Programme 2007-2013**, whose role is to promote and manage the funds allocated to the Centre Region through this programme. As such, the Regional Development Agency takes over some of the tasks of the Management Authority – established in the structure of the Ministry for Regional Development and Tourism.

ROP implements the key elements of the National Strategy of Regional Development of the National Development Plan (NDP), contributing together with the other Sectoral Operational Programmes to achieving the objective of the National Strategy of Regional Development and of the National Strategic Reference Framework, namely to reduce economic and social development disparities between Romania and the EU member states. The Regional Operational Programme was approved and became operational on July 12, 2007.

The strategic objective of the Regional Operational Programme 2007-2013 consists of supporting the economic, social, territorially balanced and sustainable development of Romanian regions depending on their specific needs and resources, with emphasis on the urban growth poles, the improvement of the basic infrastructure and of the business infrastructure in order to make Romania's regions, especially those a little behind, more attractive places to live, visit, invest and work.

The Framework Document for Implementation – a national programmatic document – was developed on the basis of the Regional Operational Programme and details, on areas of intervention, who are the beneficiaries of projects, eligible activities, eligibility and selection criteria for projects, the size of financial allocation, the implementation, monitoring and evaluation system. The Framework Document for Implementation of ROP was approved by joint Order of the Ministry of Economy and Finance no. 403260/06.06.2008 and Ministry of Development, Public Works and Housing no. 736/06.06.2008, amended by Order of the Ministry of Regional Development and Tourism no. 2653/20.12.2010 and Order of the Ministry of Public Finance no. 25/04.01.2011.

The Regional Operational Programme comprises 6 priority axes at national level, which include 14 key areas of intervention. These 6 priority axes are:

Axis 1 - Support to sustainable development of cities – urban growth poles

Axis 2 – Improvement of regional and local transport infrastructure

Axis 3 – Improvement of social infrastructure

Axis 4 – Strengthening the regional and local business environment

Axis 5 – Sustainable development and tourism promotion

Axis 6 – Technical assistance

Through ROP, 3,726 billion euro are allocated to Romania from the European Regional Development Fund for the period 2007-2013. In addition, the national contribution (public and private) is 0,703 billion euro, the total sum allotted through ROP being 4,437 billion euro.

The financial allocations for each region were established during the first meeting of the Regional Operational Programme Monitoring Committee (ROPMC), which took place on August 16, 2007. **The Centre Region - Alba, Braşov, Covasna, Harghita, Mureş and**

Sibiu counties – was allotted 10,9% of the total ROP budget for Romania, meaning 483,62 million euro for the period 2007-2013, of which 455,48 million euro came from ERDF and the state budget. The allocation of funds on development regions was done in accordance with the objective of ROP 2007-2013 regarding **the support of a balanced development for all the regions of Romania**, inversely proportional with the development level of the regions. In this regard, the less developed regions and areas received more money in order to prevent the increase of existing economic and social disparities between regions. To achieve a fair distribution, they used as indicators the Gross Domestic Product per capita, adjusted with a coefficient of population density.

The ROP budget was distributed on axes, as follows: sustainable development of cities (31,36% of ROP budget), improvement of regional and local transport infrastructure (19,76%), improvement of social infrastructure (14,81%), strengthening the regional and local business environment (17,93%) and sustainable development and tourism promotion (16,14%).

The financial allotments of ROP established as percentage on regions, axes and areas within the ROPMC meeting don't have a definitive character. During the implementation of the programme and as a result of intermediary evaluations, the ROP Monitoring Committee may approve reallocation between certain axes and/or areas of intervention.

The implementation stage of ROP at the level of the Centre Region

Until **February 25th, 2011**, all 12 key areas of intervention of the programme had been launched and a number of **1.053 projects had been submitted in the Centre Region** for a total amount of 1.033,99 million euro.

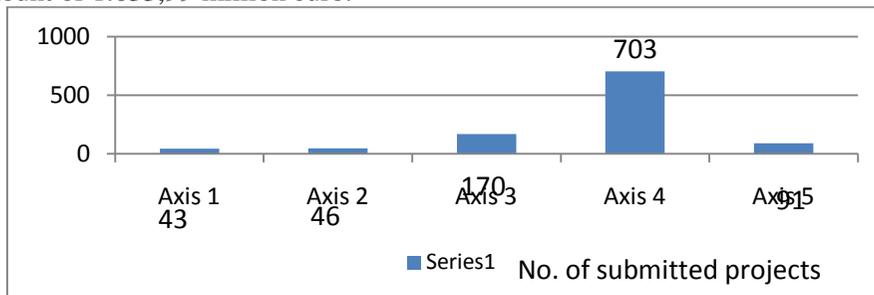

Fig. 1 Number of submitted projects

Of the 1053 submitted projects:

-174 projects have been contracted: 14 projects within Priority axis 1, 13 projects on key area of intervention 2.1 of ROP 2007-2013 – “Rehabilitation and modernization of county roads and urban streets network – including construction/rehabilitation of ring-roads”, 4 projects on key area of intervention 3.1 – “Rehabilitation, modernization and equipping of health services’ infrastructure”, 8 projects on key area of intervention 3.2 – “Rehabilitation, modernization, development and equipping of social care infrastructure”, 1 project on key area of intervention 3.3 – “Improvement of equipment used by operational units for public safety interventions in emergency situations”, 16 projects on key area of intervention 3.4 – “Rehabilitation, modernization, development, and equipping the school infrastructure for

undergraduate, vocational training and university education”, **2** projects on key area of intervention 4.1 – “Development of sustainable business support structures”, **99** projects on key area of intervention 4.3 – “Support for the development of micro-enterprises”, **5** projects on key area of intervention 5.1 – “Restoration and sustainable promotion of cultural heritage; setting up/modernising related infrastructure” and **12** projects on key area of intervention 5.2 – “Creation, development, modernization of tourism infrastructure for the sustainable promotion of natural resources”, with a total value of the requested amount of **257,58 million euro**.

-149 projects are in the pre-contractual phase: 10 on Priority axis 1; 4 on KAI 2.1; 2 on KAI 3.1; 9 on KAI 3.2; 8 on KAI 3.4; 6 on KAI 4.1; 1 on KAI 4.2; 103 on KAI 4.3; 2 on KAI 5.1 and 4 on KAI 5.2 with a total value of the requested amount of 107,64 million euro;

-104 projects are on the reserve list – 12 on KAI 2.1; 6 on KAI 3.1; 11 on KAI 3.2; 56 on KAI 3.4; 4 on KAI 4.1; 15 on KAI 5.1. These are projects that are not funded, but passed the technical and financial evaluation or the evaluation of conformity and eligibility according to the instructions of ROPMA, with a total value of the requested amount of 232,43 million euro.

-186 projects are in different stages of evaluation and selection with a total value of the requested amount of 71,69 million euro;

-440 projects were rejected: 12 on KAI 1.1; 17 on KAI 2.1; 2 on KAI 3.1; 17 on KAI 3.2; 22 on KAI 3.4; 19 on KAI 4.1; 1 on KAI 4.2; 306 on KAI 4.3; 10 on KAI 5.1; 34 on KAI 5.2.

The diagram (Fig. 2) of the amounts requested for funding by the projects submitted **until February 25th 2011** at Centru RDA and of the available budgets on priority axes is presented below:

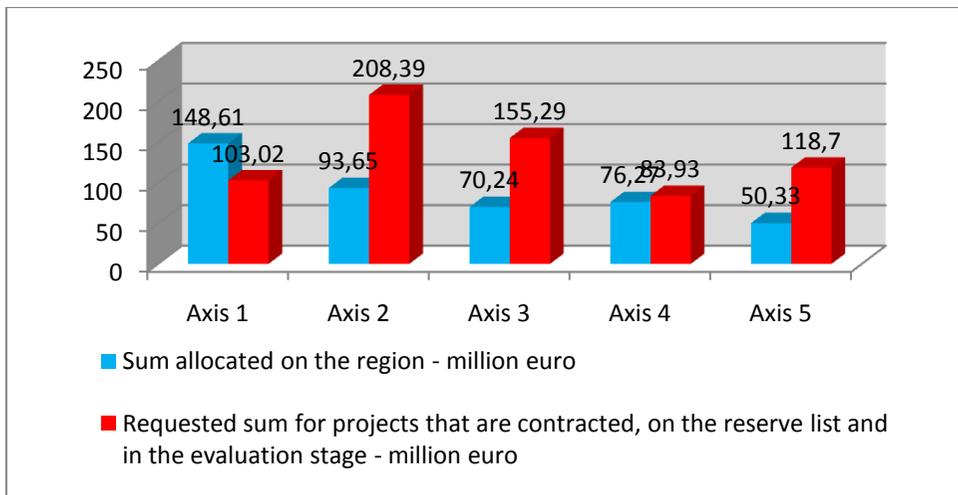

Fig. 2 Available funds, requested funds

Given the mentioned aspects, we may say the total value of the requested amount by the contracted projects, by the projects in the pre-contractual phase, on the reserve list or in the

evaluation stage within ROP at the level of the Centre Region at February 25th, 2011 **represents approximately 152,44%** of the funds allocated for the Centre Region by ROP 2007-2013.

The implementation of the contracted projects:

Until February 25th, 2011, in the Centre Region, a number of 174 projects were contracted under ROP for a total value of 1.549.430.419,97 lei, of which the requested amount is 1.104.220.309,58 lei.

Table. 1 The main listed and achieved indicators of the contracted projects

Priority axes/ Key areas of intervention	Indicator	
	Listed in contracted projects	Achieved
1. Urban development		
1.1. Integrated urban development plans	26 streets totalling 18,78 km 89.224,49 sqm of access roads and modern passage ways 14.651,71 sqm of built bike trails 4.784,78 sqm of built pedestrian system 8.071 sqm of degraded and unused space that was rehabilitated and turned into a green area 4 rehabilitated social centres	
2. Transport infrastructure		
2.1. Rehabilitation and modernization of county roads and urban streets network – including ring-roads	201,18 km of rehabilitated county roads 6,43 km of ring-roads 20,219 km of rehabilitated urban streets	39 km of country roads 3,62 km of urban streets 6,43 km of ring-roads

3. Social infrastructure		
3.1. Rehabilitation, modernization and equipping of health services' infrastructure	4 rehabilitated specialized outpatient centres	
3.2. Rehabilitation, modernization, development and equipping of social care infrastructure	5 rehabilitated social centres for disabled persons; 5 rehabilitated residential social centres for elderly; 1 centre of neuropsychiatric recovery and rehabilitation; 1 medical and social unit - modernization	5 rehabilitated social centres for disabled persons; 1 rehabilitated residential social centres for elderly
3.3 Operational units for public safety interventions in emergency situations	40 equipped mobile units	40 equipped mobile units

3. Social infrastructure		
3.4 Rehabilitation, modernization, development and equipping of the school infrastructure		
	18 rehabilitated schools	
4. Local and regional business environment		
4.1. Development of sustainable business support structures		
	2 built business centres	
4.2 Rehabilitation of disused polluted industrial sites and preparation for new activities		
4.3 Support for the development of micro-enterprises	76 micro-enterprises - modernization 291 new jobs created	43 micro-enterprises - modernization 201 new jobs created
5 Tourism development and promotion		
5.1. P Restoration and sustainable promotion of cultural heritage; setting up/modernising related infrastructure	3 rehabilitated fortresses of cultural heritage 18 fortified churches restored and incorporated into the tourist circuit 1 restored evangelical church of cultural heritage	
5.2 Creation, development, modernization of tourism infrastructure for the sustainable promotion of natural resources	7 upgraded accommodation units; 3 developed recreation units; 3 built mountain rescue units and 1 rehabilitated mountain rescue unit; 1 new ski slope of 540 m 181 new jobs created	

The absorption degree of EU funds in the Centre Region for the Regional Operational Programme **was 11,20%** on February 25th, 2011, taking into account only the value of the paid reimbursement claims.

ROMANIAN INVESTMENT POLICY ANALYSIS

Hațegan D.B. Anca

University of Oradea Faculty of Economic Sciences

Starting with the year 2009, the European Union, as well as the rest of the world, was affected by the economic and financial crisis, and one of the effects reflected in the decrease of foreign direct investment (FDI) projects and also in the reduction of their host locations. Creating a healthy economic environment, that should be efficient for any form of international investment, represents the nowadays challenge of all market economies. This paper concentrates on analyzing our country's attractiveness from the international investor's perspective, it also focuses on the Romanian investment policy, its investment climate, as well as on identifying or valuating the strengths and opportunities offered by Romania. The advantages of the foreign direct investments are universally recognized and they basically include the expansion of the production capacity and income, job creation, technologically diffusion and economic development. Creating an appropriate economic environment, that is efficient for any form of international investments represents the nowadays challenge of all market economies. OECD member states experience, for example, outlines the advantages of a functional legal and normative climate, based on the principles of transparency and non discrimination, that are essential for attracting foreign investments. In the actual competition for attracting FDI, every state tries to offer as many incentives to the future foreign investors. The Romanian investment policy sets out incentives in a non-discriminatory and transparent way offering the investors the specific criteria. The Romanian business environment has improved significantly in recent years, driven in particular by EU accession. Major progress has been recorded in areas such as the fiscal environment, rule of law, the fight against corruption and property registration. When considering our country a possible location for the development of their businesses, the foreign investors are driven by the advantages offered for encouraging the FDI attraction, and so, they closely analyze the following aspects and advantages: geographic and market related advantages, the Romanian resources (natural, material, human resources), economic, politic and social drivers and also international status, regarding the diplomatic bilateral agreements.

Key words: Foreign direct investment (FDI), investment policy, incentives, attracting FDI, economic development, economic growth, investment climate

The article's JEL code: F21, F23, F55

Introduction

The advantages of foreign direct investments (FDI) are universally recognized and they basically include the expansion of the production capacity and income, job creation, technologically diffusion and economic development. Creating an appropriate economic environment, that is efficient for any form of international investments represents the nowadays challenge of all market economies. OECD member states experience, for

example, outlines the advantages of a functional legal and normative climate, based on the principles of transparency and non discrimination, that are essential for attracting foreign investments.

In my opinion, FDI can be easily attracted when the investors understand very well the environment in which they will operate, that is why for an investment policy to be efficient, it is necessary to be focused on the transparent legal environment based on the principle of stability and predictability, and also on actions and services concentrated on promoting the investments.

The principle of national treatment refers to the fact that the governments of FDI host countries' must treat the foreign investors as well as the national investors. Practically, the majority of countries still maintain some restrictions regarding the foreign investments, in order to protect some industries considered strategic.

Lately, Romania registered an important progress in including the national treatment in its investment policy, eliminating a great part of its restrictions. In Romania, the forms of national treatment restrictions are the following:

- a 49% foreign ownership limitation in industries and sectors related to arms manufacturing, trading and production
- a limitation on foreign ownership of agricultural land
- restrictions on the purchase of real estate in areas deemed sensitive, e.g. forests, border zones, national parks and historical areas

The Romanian business environment has improved significantly in recent years, driven in particular by EU accession. Major progress has been recorded in areas such as the fiscal environment, rule of law, the fight against corruption and property registration. Harmonisation of the fiscal system with EU legislation and norms has brought about a modern and predictable tax system. Moreover, lower corporate and personal tax rates have contributed to improving the fiscal environment. Strengthening the rule of law has also been a priority. New legislation was passed in 2006 to improve transparency, and a National Integrity Agency was established in 2007. Public awareness campaigns to fight corruption in public administration and the judiciary have been carried out over the past two years (FIC, 2009). Romania is also member of WTO and applies the rules of TRIMS and GATS and it is the only country in the South Eastern Europe that signed OECD Declaration on International Investments and Transnational Corporations.

The transfer of capital, the repatriations of profits and liquidities is an essential determinant of FDI, contributing to any state's capacity of attraction and absorption of FDI. In Romania, the capital inflow from FDI is free and without delays.

In the actual competition for attracting FDI, every state tries to offer as many incentives to the future foreign investors. OECD defines the FDI incentives as "measures ment to influence the size, location and industry of a FDI project, by modifying its cost or its associated risks, throughout several conditions that are not available for the national investors".

The incentives offered to the foreign investors may take the form of fiscal, financial and normative incentives. Romania offers the following incentives to the international investors:

- Tax exemptions: total or partial reductions on the earnings tax for a certain period of time;
- Grants: based on the number of jobs created;
- Special zones: access to industrial parks;

-Free trade areas

The Romanian investment policy sets out incentives in a non-discriminatory and transparent way offering the investors the specific criteria.

The performance requirements represent certain conditions imposed by the host countries to foreign investors. According to an OECD study released in 2010, Romania meets all these requirements, due to its WTO membership and its status of TRIMS Agreement signatory.

Secure and transferrable rights to rural, urban and other types of land and forms of property are a prerequisite for a healthy investment environment. Well defined property rights represent determinants that attract and maintain FDI.

After our country's accession to the EU, foreign investors are allowed to own residential, industrial and agricultural land.

Intellectual property rights give investors an incentive to locate their businesses in Romania, when referring to the development of new products and services. It also gives investors the needed confidence to expand their production throughout Joint Ventures and licensing agreements. Due to its EU and WTO membership, Romania made an important progress in its efforts of defining the intellectual property framework.

The compensation of expropriation is another important incentive in the process of attracting FDI, but in certain situations the governments may legitimately need to enter in possession of certain private property, like in some cases of transport and energy infrastructure development projects. In Romania, the compensation of expropriation or the nationalization process takes place under constitutional provisions, that are different from Romanian FDI legislation.

Economic and investment climate in Romania

According to the Europe's Investment Attractiveness Report issued in 2010 by Ernst&Young, the foreign investors interest for Europe and also Romania reduced significantly. Compared to the year 2008, in 2009 Europe registered a 11% decrease in the number of FDI projects and a 16% decrease in the number of jobs created, also being confronted to serious difficulties due to investors lack of capital and the tightening of financing conditions.

In 2009, the number of FDI projects almost halved and the number of jobs created reduced with almost 44%. According to the same Ernst&Young study, Romania registered a 48% decrease of the number of FDI projects and a 44% in the number of jobs created, compared with the previous year.

In 2009, Romania attracted 75 FDI projects, this number representing 2% of the total number of projects attracted in Europe, generating 6.384 new jobs or 5% of the total number of jobs created.

In 2009, Romania classified the seventh in Europe according to the number of jobs created, and eleventh according to the FDI share in the total FDI.

Despite the difficult period that challenges our country from this point of view, Romania is still considered an attractive destination for industrial FDI projects, representing 7% of the total number of FDI projects in Europe.

Our country's accession to the EU, materialized in a period of economic growth, occupying the second position in South Eastern Europe, considering the value of GDP per capita of 12600 USD. According to the information presented by the IMF (in 2009), Romania recorded a medium annual GDP growth of 6% in the period 2003 – 2007, increasing in 2008

at 7.1%. This increase was due to the strong internal demand and investments. In 2009, our country's economic growth slowed down considerably, and according to the European Commissions' forecasts, it decreased significantly with 8%. Romanian government negotiated a 12.3 billion USD Stand By Agreement with the IMF and the crisis generated by the measures taken strongly affected the financial sector, most of the banks canceling their development plans and restricting their regulatory framework.

Our country was considered an attractive location for the foreign investors due to its low labor costs and taxes, also to its developing market and its accession to the EU. In 2008, the FDI inflows represented 9.1 billion USD, in other words 6.7% of GDP (UNCTAD 2009). The main sectors that benefited from FDI were constructions, real estate, industrial sector, financial services and insurance (FIC 2009).

Romanian business environment improved considerably with our country's EU accession, occupying the 55th position in the top published by the World Bank in 2010, being the second in the South Eastern Europe economies.

The fields the improved the most were the financial sector, the rule of law, the fight against the corruption

and the intellectual property. The fiscal system harmonization with the EU legislation and norms materialized with a new, modern and predictable taxation system. But a slow - down in the reform process could also be noticed after Romania joined the EU in January 2007, some fields still needing important changes, like the corporate governance for example.

As regarding the investments promotion, Romania is in process of revising the Foreign Investments Promotion Agency. Romanian should also increase the quality of the services offered to the foreign investors in the pre and post – entrance phase, regarding: the consultancy offered in order to business registration, licenses and work permits. It could also consider the implementation of a certain program that should facilitate the commercial connections between the foreign investors and the local companies.

When considering Romania a possible location for their business development, the foreign investors look closely to the advantages offered by our country. In this context, according to the Romanian Agency for Foreign Investments there were identified certain advantages offered in order to attract FDI.

From a *geographical and market perspective* Romania is one of the largest markets in Central and Eastern Europe (ranking 7th , with over 21 million inhabitants); EU unique market gateway (access to approximately 500 million consumers) and is also an attractive location: situated at the turning point between EU, the Balkans and CIS countries, our country is crossed by three important pan-European transportation corridors: corridor no. IV linking Western and Eastern Europe, corridor no. IX connecting Northern and Southern Europe and no. VII – Danube River, facilitating inland water transportation, at the same time connecting the Romanian Port of Constanta (the biggest Port to the Black Sea) to Northern Europe, through the Rhine.

From the *resources perspective* Romania owns highly skilled labor force at competitive prices (solid knowledge in foreign languages, technology, IT, engineering, etc); rich natural resources, including surface and underground waters, fertile agricultural land, oil and gas; high potential for tourism.

From the *international perspective*, foreign investors have the following advantages: EU, WTO and NATO membership, member of the UN and other international organizations, like: OSCE, Council of Europe and International Organization of La Francophonie.

From the *economic perspective*, Romania offers the following incentives: Tax exemption of the reinvested profit; state aid schemes for encouraging investors to take upon Romania; increasing interest on behalf of Foreign Investors – leader destination for FDI in the region (2010 A.T. Kearney Foreign Direct Investment Confidence index) and also sound fiscal policy (16% flat tax).

From the *legal perspective*, the foreign investors have similar legal provisions as in the EU (Acquis Communautaire implementation); fiscal policy regulated by the Fiscal Code.

Other advantages are the continuously improving infrastructure (commitment to improve the highway infrastructure to EU standards); well-developed networks of mobile telecommunications in GSM systems; developed industrial infrastructure, including oil and petrochemicals; extensive maritime and river navigation facilities.

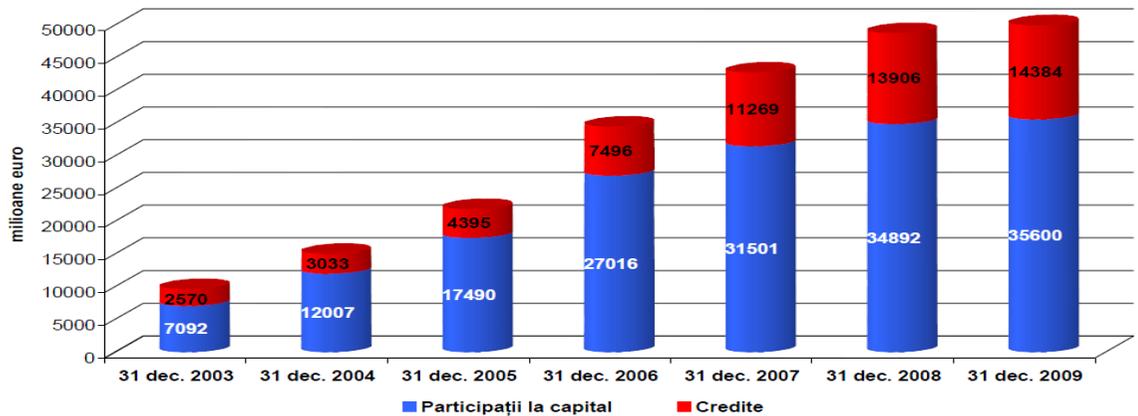

FDI in Romania

The net FDI inflows in Romania in 2009 reached 3488 million euro and their structure is the following: *foreign investors net participations* to the FDI social capital registered 1729 million euro (49.6% of the net FDI flow) and the *net credit of Joint Ventures* coming from the foreign investors summed 1759 million euro (50.4% of the net FDI flow).

In 2009, the *FDI stocks* summed up 49984 million euro, 2.4% more than in 2008.

The social capital participations (including the reinvested profit) of FDI registered 35600 million euro (71.2% of the final stock of FDI), 2% more than in the previous year and the *total net credit* of FDI registered reached 14384 million euro, representing 28,8% of the total FDI stock and also presenting a 3.4% increase compared with the previous year.

Figure 1: FDI flows analysis in Romania during 2003 – 2009

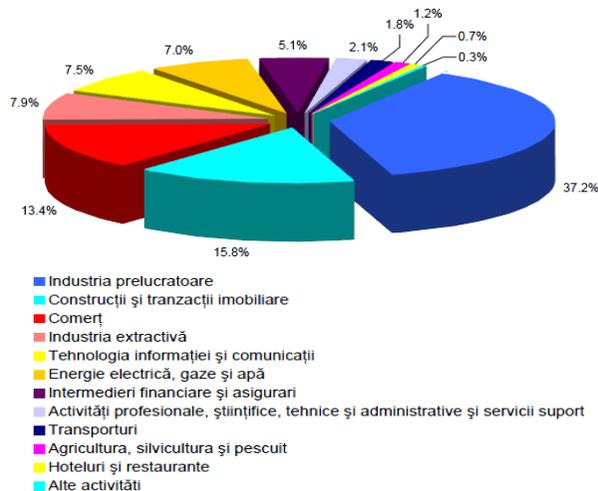

Source: Information published in the NBR FDI Report, 2009, available at link <http://www.bnr.ro/Investitiile-straine-directe-%28ISD%29-in-Romania-3174.aspx>

From the investors orientation perspective, FDI were located in the *manufacturing industry* (31.1% of the total) and the best represented sectors being petrol, chemicals, plastic masses (6.3% of the total), metallurgy (5.2%), transport industry (4.7%), food, beverages and tabaco industry (4.1%) and cement, glass and ceramics (3.3%). The textile and confection field (1.4%) registered value is less than expected.

Expect the industry field, other sectors that attracted important FDI are *financial services and insurance* representing 19% of the total FDI inflows, *constructions and real estate transactions* (12.9%), *trade and retail* (12.3%) *ITC* (6.5%)

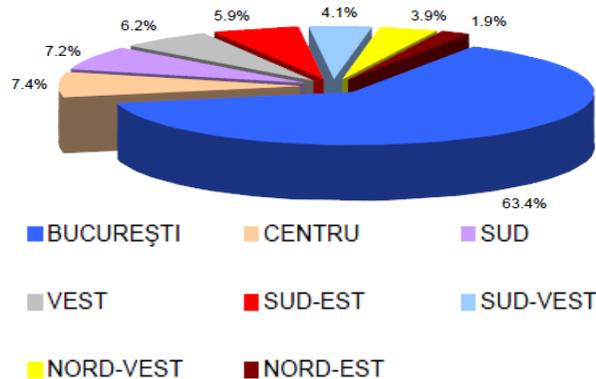

Figure 2: FDI stock structure in Romania - 2009

Source: published in the NBR FDI Report, 2009, available at link <http://www.bnr.ro/Investitiile-straine-directe-%28ISD%29-in-Romania-3174.aspx>

From a territorial perspective the orientation of FDI is clearly heading to Bucharest – Ilfov development region (63,4%), but other FDI host regions are: the Centre Region (7,4%), South Region (7,2%), West Region (6,2%) and South – East Region (5,9%). The North East Region is the least attractive one for the foreign investors, registering only 1.9% of the total amount of FDI.

Figure 3: FDI structure on development regions - 2009

Romania's competitive advantage compared to the other countries in the region is not represented by the low cost labour force, in my opinion the market dimension is the driver that counts. After Poland, Romania has the most important consumption potential, hosting a bigger population than Hungary and Bulgaria together.

In conclusion, if Romania doesn't want to lose its few foreign investments attracted until now (less than Hungary and Poland in 2008) the national authorities should focus its actions on stimulating the consumption rather than the excessive fiscal system.

NEEDS OF LOCAL SUSTAINABLE DEVELOPMENT

Ioniță Predescu Lorena

Valahia University of Târgoviște Faculty of Economic Sciences

Radu Florin

Valahia University of Târgoviște Faculty of Economic Sciences

Tăbîrcă Alina Iuliana

Valahia University of Târgoviște Faculty of Economic Sciences

In terms of structure of local authorities, we made an analysis of how the principle of sustainable development applies by highlighting the fact that it differs locally in structure and content from the overall development which shall be addressed at national level. Locally, we have identified disruptions that may adversely affect the implementation of sustainable development policies. It is about the existence of undue restrictions in allocating funds from the state budget. In most cases these restrictions have a political tint. Specifically, we stressed the requirements of sustainable development in Romania, consisting mainly of a responsible financial management and human resources management, towards meeting the needs of local people.

Keywords: sustainable local development, local administration, public policy, public services

JEL code: Q50, H76, H83, M41

1. Remarks on the development in general and local development in Romania

The concepts and mechanisms resulting from research show that worldwide there is particular interest to implement policies on sustainable development which means mainly meeting the needs of the present generation without compromising the needs of future generations and the development of the free man, that must take place in harmony with the environment and, as a must, in a balanced society.

In other words, in the current time of turbulences, sustainable policies are primarily directed towards economic growth, reducing unemployment and improving the people's standards of living.

As a member of the European Union, Romania acts towards the implementation of the principles of sustainable development, particularly at the national, regional and local level (cities, towns and villages).

Of course, our country also had so far a general economic development policy and less a policy of local development.

The performed research revealed that it is necessary to define and clarify the concept of overall development (national development), local development and sectoral development in order to avoid any interference that may have negative effects on those concepts.

Overall development is generally one of the government's functions that has the duty to establish investment objectives and investment policies for the sectors of the economy that can ensure economic growth and, on this basis, a sustainable development (overall fiscal

policy to stimulate investment, providing skilled labor, development of revenue-producing activities for which sources of raw materials and local skilled labor are ensured, providing general interest infrastructure (railways, highways, motorways). These objectives are financed from the state budget resources, as well as grants and reimbursable funds.

Local development is, in fact, the policy through which the local administration authorities conceive the specific objectives of their communities in order to meet the needs of the local people and to ensure financing for these objectives. Within local development, the targets are as follows: providing public services to the population, providing the local transport infrastructure, the water supply and sewerage network, the heat and gas supply networks, streets, sidewalks, parking lots, green spaces and leisure areas; providing and ensuring operation of the local health and education systems, the social assistance system, increasing the level of employment and community's standards of living, improving the habitat and the natural environment, etc.

In conclusion, from the above it results out that the local development differs fundamentally from the overall development, both in content and structure, but local development carried out in all localities finally ensures Romania's development and contributes directly to the improvement of the people's quality of life.

Sectoral development belongs to central level by making investment in important public sectors such as education, health, culture, stimulation of economic activity (mines, railway transportation).

Taking into account that the sectoral development is carried out by the central administration, it can interfere directly in the local development by building common objectives in the mentioned sectors (education, health, culture and infrastructure).

However, we need to say that in the local development field that was put in practice so far, there was a series of shortcomings with negative consequences in what concerned ensuring a continuous development of the local economy. The shortcomings consisted in: poor management; unrealistic view on the effects of the public investment; failure to providing financing resources or changing their destination during execution; unjustified high costs for achieving the objectives; inappropriate reflection of the financing and the development objectives in the local budget.

The regulations in force have also contributed to these shortcomings because they provide that an investment is an asset whose value exceeds the amount of 1,800 lei, without requiring the budget holders to provide objectives that can contribute to increasing the added value and objectives with an unproductive administrative nature.

Sustainable development must bring fundamental changes in the decision-making capacity of the local administration so that it can set development goals concerning particularly the meeting of the local population's needs and ensuring the necessary public funds.

We believe that, at present, at local level, it can no longer be about a "general" development because the experience of past 20 years shows that the policy that was put in practice did not bring the expected results, although significant amounts of money were allocated for this purpose.

Therefore, we believe that the concept of sustainable development is a practical tool by whose help the local public administration can proceed to ensure normal living conditions on a given territory.

The responsibility of the elected bodies is a feature of the sustainable development concerning their obligation to draw up targeted development projects in the fields of public

service, education, health, all of them being sectors which bring the people the most of the complaints.

In this context, an important role should rest to accounting. By means of the used techniques and tools, accounting will reflect, through specific financial indicators, the way the objectives are being achieved and the related costs. The provided information will be particularly important when becoming transparent, namely known and subject to analysis by the entire community.

2. Requirements of sustainable development at local level

In this paragraph, it is described the result of the research work on the implementation of the principles and rules of sustainable development at local administration level, taking into consideration the concepts and provisions of the international bodies and Romania's achievements in this field.

Sustainable development at local level aims at local economic prosperity and social welfare by creating a favorable business environment, along with the integration of vulnerable groups into the community, the use of endogenous resources, and the private sector development.

The local communities build, operate and maintain the economic, social and environmental infrastructure, supervise the planning process, establish policies regarding the environment and contribute to the implementation of national and regional plans.

The concept of local development concerns not only the local administration units, but also the units at intercommunity, interregional and even cross-border level. In the context of regional development, it is necessary to understand the place and role of the local development, partnership development and types of relationships at various administrative levels.

Particular attention was paid to corroborating the legislation about operating the local administration units (on the model of a capital city of a county) with the new concepts of sustainable development, especially as they have significant material, human, financial and natural resources, which can substantiate the development programs whose implementation will contribute to improving the civilization of the community members.

The experience acquired in the past 20 years of activity in a democratic system has revealed the fact that maintaining a high degree of decision-making at central level had a negative influence on the operation mechanisms of the local administration, thus the effects passing on all sectors (education, health, public order, etc.), as well as on people.

The modernization and decentralization process that begun in the past years creates the potential to widen and improve the local administration's functions and thus the local administration will have more possibilities to act in the interest of all citizens and of the whole community.

The analysis of the human and material potential existing in the local administration units has revealed that the implementation of the sustainable development principles will contribute to improving the civilization of the whole community. *The positive effects are to be felt as follows:*

improvement of education system; effective organization and functioning of health system; increase of the employment and standards of living in the community; decrease of the number of people who live below the poverty line; food, habitat and social environment

improvement; increase of air, water, soil and environment quality; protection and extension of green areas; waste storage and processing; improvement of public service quality; appropriate spatial planning policies; attraction of foreign investment and increase of autochthonous investment.

Consequently, local administration authorities have a duty to develop strategies to attract investment and especially to intensify their efforts to finance those objectives which are to the direct interest of the community.

For the local public administration, local decentralization will play an important role which will lead to welfare, because the public services will be carried out by the administrative level which is the closest one to the citizens.

This is confirmed by the European practice, where efforts have been directed towards the following objectives: most services of the public sector shall be provided by local public administration because this situation can offer great benefits at low cost to the population; government administration should only provide national services - defense, foreign policy - where local competences cannot be operational; local public administration should limit itself to services which the market cannot offer to the local community and for which the citizens pay taxes and local taxes; the economic development must be achieved in close contact with the decentralization; local public administration should reduce its operational costs; the benefits of a better political representation shall be made visible.

In order to support the sustainable development of all regions of the country, the local public administration authorities in Romania have promoted local development policies that included a series of measures, planned and promoted by central and local authorities in partnership with various private actors, public actors, volunteers with a view to ensuring a sustainable economic growth and improving the living conditions.

The country's social and economic development depends largely on the rational territorial organization of the local administration units. Thus, a relatively small number of development poles with economic and social power will be re-defined with a view to managing creatively and efficiently the local activities.

The competitive advantage of the development poles lies in: the existence of highly developed companies, universities, skilled labor, transportation infrastructure, production activities structure.

Developing cities - as centers of growth - can lead to a polycentric development of the Romanian territory. Thus, the objectives to be achieved are the following:

- increase of the economic and social role of the urban centers, through a polycentric approach in order to stimulate a balanced development of the regions;
- improving the accessibility of the regions and particularly the accessibility to urban centers and their links with the surrounding areas;
- improving the quality of the social infrastructure of the regions;
- improving the competitiveness of the regions as business locations;
- improving the contribution of tourism to the development of the regions.

All these objectives, that are reflected in policies and regulations issued by the central authorities, will determine the reduction of both the inter-regional disparities and those within regions, between urban and rural areas, between urban centers and adjacent areas, and in cities they will determine the reduction of the disparities between the areas which are attractive and unattractive to investors, through a better use of the regional synergies.

The balanced development of all regions of the country can be achieved through an integrated approach, based on a mix of public investment in the local infrastructure, active policies to stimulate the business activities and support to the capitalization of the local resources.

As an urban area is not a closed system, the achievement of the objectives is based on an efficient management leading to development by observing the principles included in basic documents on sustainable development (the Report "Sustainable European Cities", Brussels, 1996, the Statement of the Bremen in 1997, the Treaty of Amsterdam in 1997).

Among the objectives that these documents set, we are mentioning the following:

- sustainable development so that, on long-term, changes produce in terms of culture and attitude related to the resources that the population and companies use;
- reinforcing the institutional capacity through efficient management, defining and restructuring the public services according to the current financial resources, the objectives of the sustainable development and community's needs;
- connecting a community to certain networks with a view to exchanging information on the best practices between communities; implementing programs and projects in the framework of the public-private partnerships; carrying out the public investment that the private sector cannot accomplish;
- integrating horizontally the development policies in order to simultaneously achieve a synergistic effect between sectors - and integrating vertically the policies of the community with the regional policies; integrating the energy, material, financial and human resources flows into a natural cycle; using market mechanisms to achieve sustainability, that is issuing regulations on eco-taxes, functioning of public utilities as a market system, investment evaluation based on environmental criteria;
- decentralization of management in the energy sector; sustainable architecture design, by using green building materials.

The needs of the sustainable development include conditions for the local administration units because the legislation concerning their operation has been put in line with the European Charter on Local Self-Government.

Thus, local public administration law no. 215/2001 provides: "local autonomy is the right and the effective capacity of the local public administration authorities to solve and manage the public affairs, under the law, on behalf of and in the interest of the local communities they represent" (5).

In other words, at present, the local authorities are able to take autonomous decisions concerning the following: establishing and collecting the local taxes; land administration; setting up the budget of revenue and expenditure; prioritizing sustainable development of local community; public order; allocation of public services; making efficient the public and private activities of the territorial administrative unit .

Following the analysis of this issue, it has been noticed that in comparison with the necessary financing for the sustainable development, the local communities have not sufficient resources, which leads to call for transfers from the state budget, as broken down quotas and subsidies.

In this area, there is a malfunction with consequences on sustainable financing development that consists of: the elected local administration bodies have autonomy in setting the objectives for the sustainable development; the completion of the local financing resources for sustainable development - as broken-down quotas and subsidies, where appropriate - is

provided by central government through the county councils which might have political interests, and that leads finally to reducing the degree of autonomy.

In this specific field, there is a need of measures to correct these failures so that every community can have access to resources within the limits established by law and without any intervention of the political structures.

We believe that the local authorities have the necessary conditions for implementing sustainable development principles, but at this stage, a concentrated effort towards the training of their employees is needed, with a view to learning the mechanisms and policies to implement at territorial level.

3. Conclusions

Addressing the issues on a good basis of research and substantiation can be summarized as follows:

- Concerning the structure of the local authorities, we've made an analysis of the implementation of the sustainable development principle by highlighting the fact that, locally, it differs in structure and content from the overall development that is to be addressed at national level.
- Concerning the local sustainable development, we have brought my own contribution to a broader definition of sustainable development because my research work was conducted based on a model of a capital city of a county that provided us the appropriate information and arguments.
- We have identified local failures which may adversely affect the implementation of the sustainable development policies. It's about the existence of undue restrictions in the allocation of funds from the state budget, and that, in most cases, has a political tinge.
- Concretely, we outlined the requirements of sustainable development in Romania that consist mainly of a responsible management of the financial and human resources towards meeting the needs of the local people.

A good-result implementation of the policies concerning the sustainable development at local administration level is directly related to the existence of an appropriate accounting system adjusted to these requirements and that can provide data and information to substantiate the decisions locally.

CONTEMPORARY TENDENCIES AND ASYMMETRIES IN THE E.U. UNEVEN ECONOMIC GROWTH AND GLOBAL GROWTH DIFFERENCES

Iovițu Mariana

Academy of Economic Studies, Bucharest

Being in the phase of searching for the best socio-economic recipe, Europe is facing two tendencies: economic revival and global growth differences. Both processes require subsequent management at a local, national and European level in order to reduce the socio-economic risks.

Facts, arrangements and decisions with European consequences are unreeling, currently, heavy and slow due to the lack of cohesion between the European and the national interest. Economic politics form a European level, on currently relevant economic crisis, have an impact on social changes exacerbated by the resources crisis and the environment's critical state.

The economic crisis's domino outcome overshadows the Europe's social and economic future, and will suffer. Currently, the conflict between national and community interest (trade and financial protectionism) generates tensions between European countries, creating "asymmetries regarding economic relaunch".

Economic performance implications on the social ones are the basis for "operating trilemma" of the European economy. Balancing the budget, reducing the economic inequalities, the increase in the employment level, initially formulated in the Lisbon treaty, remain, further on, in actuality regarding the relaunching the European economy.

Key terms: globalization, economic growth, financial protectionism, unequal development, economic relaunch.

1. - Uneven economic relaunch

The beginning of the year 2011 has been marked by the German and French efforts in obtaining the support from other Eurozone countries regarding the setting up of a pact to strengthen the economy's Eurozone⁵. The project established a series of measures regarding the improvement of competitiveness in the euro market to help fight the debt crisis. It is noted the special interest for restoring the functionality of the financial markets as an engine for economic relaunching. The proposed measures refer to objectives from the fiscal policies field, from the employment field and demographic policies⁶.

The two countries wish that the pact should be included in a complete ***package that should also include changes made to the European Financial Stability Fund***. The aim should be twofold: the increase in the funding capacity and increase in flexibility for the use of money.

⁵ EurActiv: 4th February 2011

⁶ Specifically it is about new limits on debt levels written by national laws, higher retirement age based on demographics, the elimination of wages indexed to inflation, a minimum income tax rate. Proposals have been rejected as devoid of attractiveness and interest for countries like Belgium, Austria, Ireland, Spain, Portugal and Poland who were against the new measures proposed by Germany and France characterizing them as difficult to accept.

In an exploratory period on policies for ending the crisis and economic relaunching, already uneven from a country to another, this test may exacerbate even more the internal tensions of the E.U. countries.

“**Competitiveness Pact**” proposed by Germany and France has been criticized, not being the right solution for economic crisis Eurozone⁷ because, in addition to the labor market issues and the correction of some difficulties at the money market level, there are other imbalances that affect the European market⁸.

In its original form, the Competitiveness Pact can be linked to a crisis program. Having in mind all these considerations, economists believe that the current *crisis is not a currency crisis but rather a crisis caused by the economic instability in certain parts of Europe*. We bring back to discussion the problem regarding the notable differences on development and growth, and also on the different ways of coping with the crisis, through national eco-social policies.

In order to reduce differences and create an economic upturn, the competitiveness pact proposes restoring confidence within the financial markets, by increasing the 440 billion euro allocated to the *rescue fund* destined to the Eurozone countries, with large external debts.

The “Pan-European” solution proposed by Germany seeks to make European Central Bank to focus exclusively on the monetary policy, acting with caution in regards of fiscal policy and launching sovereign bonds.

The question is asked: *Global economy governance may decide Europe’s future?*

The grounds and the continuity of the welfare state, have serious problems. The golden age of “welfare states” ended as unemployment, inflation, and globalization, lack of social protection measures were accumulated and put to test the European social model.

If the observed correlation, the European social model, economic prosperity, when the indicator GDP per capita is eloquent evidence that support the high economic performance and social performance standards of living.

A *regulatory* approach puts the analysis within the parameters of the Lisbon Treaty, while the positive approach encounters difficulties as jobs lead to market development, and therefore to economic growth. Emphasizing competition generates, yet, the social justice. So, how can it be ensured the compatibility between economic growth and social justice? Of course, thesis according to which, where there is equality there is no competitiveness has its degree of truth, and the businesses that are seeking economic growth, often, have to sacrifice the equality through economic policies that support competition. The reverse: where economic performance is missing there is poverty.

European Commissioner responsible for Economic and Monetary Affairs, Olli Rehn, said: that he expects for the GDP from the 17 countries from the Eurozone to increase by 1.6% in 2011. Under these circumstances, an increase in domestic demand it is expected, as a result of a more sustainable growth, while exports should contribute more to support the economic upturn.⁹

⁷ The initiative has been criticized also by former presidents of the European Commission Romano Prodi and Jacques Delors.

⁸ In essence, these measures relate to: raising the retirement age, strict budgetary controls, the harmonization of income taxes, a ban on wage indexation arrangements.

⁹ It is expected that the growth rates would be for Germany 2.4%, France 1.7%, Great Britain 2%, Italy 1.1%, Spain 0.8%. Regarding Romania’s output during the economic collapse, there were opinions according to which

The increase in oil prices (by 6,1% compared to 2010) related to the already existing inflationist pressure in the Eurozone could persuade the European Central Bank to abandon the very low level of the interest rate sooner than anticipated¹⁰.

In the same context, we can find Jose Manuel Barosso's opinion, according to which the biggest geopolitical event of the last decade, a true "rendez-vous" with history, is represented by the "Jasmine Revolutions" throughout the Arab world¹¹. The socio-economic effects will be felt in the whole world, fact that requires a new political parading for the Europe's relations with the surrounding southern.

the Government and IMF estimate, for this year, an economic growth of 1,5%. The national institute of statistics will present on 13th may the evolution of GDP in the first quarter of this year.

¹⁰ Euractiv 4 march 2011

¹¹ Euractiv 3 March 2011

2.- Agreed,...but better, not!

Formed in a landscape marked by the old order of the centralized control, the EU combines the socio-economic and political interests of nation-states in the competition with the world. The states' Europe doesn't mean the abolition of the European nations, but the different pace for development and economic growth are difficult to harmonize. The different economic dynamics has been transferred to the different political dynamics. Hence, the tension between the competing countries which have to deal with pressures from two directions. On the one hand the integration pressure and on the other the globalization pressure (through transnational organizations).

Caught between these two forces of integration- globalization, nation-states aspire further on to compliance with the national initiative law and to protecting the national interest.

Initiated as an intergovernmental forum for coordinating the national goals, the E.U. becomes presently, an area of influence of the Franc-German authorities, on the proposal package motivated by the crisis and the urgency of relaunching.

The meeting from Davos 2011¹², earlier this year, has occasioned a review of the main directions which the European economic policy is concerned about. Regarded as a *global evolution indicator summit for this year*, the meeting called into question the major European concerns as well as the global ones.

The erosion of the euro, the reduced potential for sustainable growth of developing countries, the erosion of the America's role in the world, devastating global warming, led delegations attention, who expressed their concerns for the European and planetary future.

Analyzing the situation of countries all over the globe, in the globalization context, new data has emerged regarding China's evolution as an emergent country with a very strong economic potential. The effects of development and economic growth in China would probably pass and be felt on global economy in matters like overcoming U.S.'s economy in the next 20 years¹³. Corresponding with data provided by the World Bank, China has a growth potential of 8% annually, being the 2nd biggest economic power of the world. In the past 10 years, China's economic growth was on average of 10% each year, with a GDP that exceeds the GDP of France, Germany, Great Britain and Japan.

If India and China exploit the comparative advantages by entering in force on the European and U.S. market, we find it necessary to update David Ricardo's theory on comparative advantage under the new conditions of globalization. However, the inflationist increase in energy price in India has become complicated with a potential food crisis. As a palliative measure, India could reduce custom duties¹⁴ by encouraging food imports.

Emerging countries (India and China, the biggest emerging economies in the world)¹⁵ have been the focus of Davos summit due to the exception of economic growth recorded even with the highest global recession in recent history.

Interpreting the measures of economic policy in time of crisis, China has managed to keep national currency constant against the US dollar. This wise decision helped China to counteract the competitive depreciation in the East Asia area, measure that contributed to the efficient economic upturn of the financial markets in the area.

¹² EurActiv 31 January 2011

¹³ Euractiv 23 March 2011

¹⁴ In January, the current year, food price inflation reached 15,575 in India, due to some large agricultural problems caused by climate change:

¹⁵ Thomas L.Friedman-,*The Earth is flat*”,Polirom publishing house 2007

At the same summit in Davos, there were mentioned the sovereign debts of developed countries. The opinion expressed was that they represent “*a time bomb for the global economy*” (especially in the E.U. and the U.S.). Chinese representatives have emphasized on this occasion, that Dagong Credit Rating warns on the danger of loss of the U.S. dollar stability as a global reserve currency, in the future¹⁶.

Regarding the economic recovery efforts, crediting some economies that are in a prolonged crisis (emergency funding for Ireland and Greece) raised the issue on reducing the interest rate. This will affect, however in a negative way, the European budget and the pace of economic recovery of the E.U.

3. Economic recovery in the Eurozone

The summit in Brussels on 24-25 March the current year brought into discussion the economic governance package. On this occasion it was decided to create *the Europlus Pact*, which by then was known as the Pact for Competitiveness.¹⁷ European Stability mechanism will be implemented from January 1st 2013, will become operational in June 2013 and will have as a goal ensuring the financial stability of the euro zone, replacing the current mechanism and supporting the Member States from the Eurozone which manifest severe funding problems.

Concerned about strengthening the security mechanism of the European single currency, EU pledged to ratify the amendment of the Treaty by the end of 2012. The total fund at the disposal of the mechanism will be of 700 billion euro, collected in five years from the entry into service of the mechanism. The main mechanisms to strengthen the protection package community currency envisage creating a permanent crisis fund (for emergency crediting) and measures to penalize nations that causes deficits exceeding the agreed limits, contributing to an increase in the economic European imbalance.

Appreciated as the main instrument in relaunching the European economy, the E.U. Budget for next year will focus on employment, economic governance and economic growth. E.U. Budget considered as being an investment budget includes a research projects carried out over several years and infrastructure works¹⁸. Other prospective goals in the E.U. 2020 strategy relate to employment, innovation, research and development, climate change and energy, education and social integration.

Of course, the socio political events (in the Arab world, from the beginning of this year) and the need for assistance and support for these countries may jeopardize the ability of the European budget for underfunding. Reduction of some budget funds intended for cohesion, citizenship and foreign affairs could jeopardize the effectiveness of actions and current programs in progress at a European level.

¹⁶ The emerging countries which hold large amount of U.S. government bonds are advised to reduce their purchases to avoid losses at the expense of their national interests. China is currently the largest holder of U.S. government bonds.

¹⁷ Romania was among the six states that have joined the Europlus Pact, arguing that imposing the tax level remains a national right

¹⁸ Year 2012 being the sixth year in the current "financial perspectives" (2007-2013), the Commission will present its formal proposal for the 2012 EU budget , on 20th April.

Prospects for Romania's exit from the economic collapse period, have resulted in views of the Government and IMF that have estimated a growth of 1, 5% this year¹⁹

Concerned about the debt problem, the recent summit in Brussels has given rise to the formulation of a comprehensive system of protection against debt crisis, including increased financial support fund for the euro zone. Portugal, Greece and Ireland require a temporary addition to the support fund (fund established last year).

Discussions on how to extend the fund were postponed until June this year, because this decision constitutes a huge effort for the European Community. Real lending capacity would have to be expanded from 250 million euros to 440 billion euros. In addition, establishing a permanent fund (permanent mechanism for stability) to support economies that are in economic trouble is to be established by mid-2013. New lending capacity will reach 500 billion euros, if the countries from the area will contribute with approximately 80 billion euro starting with mid-2013.

In addition to this assistance measure for the countries with recovery deficits, strengthening the budgetary policy at a European level seeks also other directions oriented toward operating "European pact" on promoting and supporting economic reforms and a fiscal policy convergence.

The process began as proposals from France and Germany, which were mentioned in the "**Compatibility pact**" (though, unsupported by the E.U. countries) and replaced by the "**Europlus Pact**" which reflects the efforts and searches from an E.U. perspective, so that the appropriate measures and strategies would reflect and contribute to overcome the crisis and to development.

¹⁹ The National Statistics Institute of statistics will present on May 13 the evolution of the GDP in the first quarter of this year.

INNOVATION VERSUS INCOME CONVERGENCE IN CENTRAL AND EASTERN EUROPE. IS THERE A CORRELATION?*

The heterogeneity of response of the different economies facing the world economic crisis has brought into attention once again the issue of convergence inside the European Union. The high growth rates experienced by CEEC during the last decade created an optimistic view of rapid convergence towards Western Europe. But the crisis showed that the sources of economic growth in the region were not appropriate for a long run growth. Innovation is a key source of competitiveness and a contributor to a sustainable growth path. Even though CEEC lag behind other European countries in terms of R&D investment, a certain progress can be observed. The objective of the present paper is to establish if there is a correlation between the convergence in terms of GDP and the convergence in terms of innovation for the CEEC. Based on yearly Eurostat data for the period 1998-2008, we quantify the progress of each of the 10 CEEC both in closing the income gap and the innovation gap. We then rank the countries according to their speed of convergence and perform a Spearman rank correlation analysis. The results show that, on average, convergence in R&D is not correlated with convergence in GDP. The Czech Republic is the only country with a positive correlation between R&D intensity and GDP growth. Bulgaria, Hungary and Slovakia show a negative relationship between investment in R&D and economic growth. This implies that for most of the countries in Central and Eastern Europe, economic growth during the period 1998-2008 was mostly driven by non-innovation factors.

Key words: convergence, growth, innovation, R&D

1. Introduction

All central and eastern European countries have faced a recession period after the fall of the socialist regime, followed by a return to positive growth rates in the mid and late nineties. Some countries have found the growth path relatively fast, during the early nineties, while others (like Romania, Bulgaria) have experienced long recession periods and reached a dynamic growth only starting from 1997-1998.

Economic growth during the transition period had a particular pattern in CEEC. Capital has provided a certain positive contribution to growth, while labor had a small or even negative contribution (IMF, 2006). In this respect, CEEC stand out among other emerging countries, where labor input has typically contributed substantially to growth. Most of the growth

during the transition period was actually accounted by the increase in total factor productivity (TFP). Even though the classical source of TFP growth is technical progress and innovation, growth during transition was mostly explained by efficiency improvements in the use of capital and labor (Havrylyshyn, 2001).

Starting in the late nineties, CEEC experienced a return to the classical factors determining growth, with an increase importance for innovation and technical progress. Once the transition period completed, the growth process in CEEC should be sustained by factors like capital intensity, innovation, human capital and competition (OECD, 2003). Since the main source of productivity growth during transition was actually the decrease in employment and only to a small extent the faster increase in output (Van Ark and Piatkowski, 2004), the post-transition period calls for new and sustainable sources of long term productivity increase.

In this context, investment in research and development (R&D) becomes an important component of the competitiveness of CEEC, not only in terms of creation of new technology, but mostly as a determinant of the absorptive capacity. Local innovation and creation of new technologies becomes complementary to the transfer of innovation created abroad (Mitra, 2008). Since CEEC are rather technology using rather than technology generating (Radošević 2005, Arnold et al. 2000), this second aspect may become the most important feature of the role of R&D as a factor of economic growth in Central and Eastern Europe.

The inclusion of innovation and research and development as determinants for economic growth is supported both by theoretical growth models and empirical research. Neoclassical theory Solow (1957) puts technical progress in the heart of long term growth, but states its exogenous nature. Endogenous growth models like Romer (1990), Grossman and Helpman (1991) are searching for the sources of technical progress and find innovation to be a solution to diminishing returns of classical factors. The “new growth theory” argues that R&D investment can foster long run economic growth. The interest of policy makers in the role of R&D is all the more important when considering the social rate of return, which surpasses the private rate of return of companies undergoing innovation activities (Griliches 1992).

The objective of this paper is establish if there is a correlation between the convergence process of CEEC towards the knowledge based economy and the income convergence of GDP/capita. We would normally expect a positive relationship between the two evolutions, since R&D investment is considered to be a determinant factor of economic growth. We first construct two rankings and compute a rank correlation coefficient, which turns out to be statistically insignificant, due to the heterogeneity of the countries in the sample. We then proceed with an individual analysis, which confirms the different patterns exhibited by the CEEC in the R&D-economic growth relationship. The Czech Republic is the only country where R&D intensity is correlated with economic growth, while most of the countries show in inconclusive relationship.

The structure of the paper is as follows. Section 2 presents a descriptive analysis of the convergence process in CEEC, with emphasis on research and development. This allows us to identify specific patterns in the relationship R&D – economic growth. Section 3 presents the methodology and the data being used, as well as the results obtained. Section 4 outlines the policy implications and the main conclusions of the paper.

2. GDP and R&D convergence in CEEC

There has been little research on the determinants of growth for the Central and Eastern European countries in the post-transition period, even less including research and development or human capital. One important reason for little research at macroeconomic level is poor data quality and availability for these countries, which makes econometric applications very sensitive and often leads to inconclusive results. Another reason might be the fact that the low volume of R&D investment seemed insufficient to generate a significant effect on economic growth. Indeed, during the nineties, the increase in productivity was actually accompanied by a decrease in R&D investment, so growth was generated by non-R&D factors (Radosevic, 2005).

The process of income convergence between CEEC and the European Union is clearly taking place, but with various speeds and different enhancing factors (Daianu, 2002). On average, CEEC reduced their income gap from 52% to 36% during the period 1998-2008 (see Table 1). The evolutions seem to follow a β convergence pattern, meaning that countries that were the least developed experienced a rapid growth (the Baltic states), while more advanced countries like Slovenia or the Czech Republic were progressing more slower (Veugelers and Mrak 2009).

It is well known that CEEC do not yet produce fundamental innovation, but rather adapt existing technologies transferred from abroad (Verspagen, 2001). Both human capital and effort in R&D can substantially facilitate the effectiveness of this transfer and the capacity of the receiving economy to implement such innovation created abroad (Griffith *et al.*, 2004; Aghion and Howitt, 2005). At a first glance, CEEC seem to have an advantage in this matter, having inherited solid R&D and education systems from their socialist past. Unfortunately, R&D is still oriented towards fundamental rather than applied research, making cooperation between universities and enterprises rather rare. Therefore, the R&D process has a relatively low efficiency due to the difficulty in transposing the R&D effort into an increase in productivity (Radosevic, 2005).

If convergence of CEEC towards EU27 in terms of GDP/capita is progressively taking place, catching-up in terms of knowledge economy is much more slow (Aralica et al. 2009). There are even opinions stating that a convergence towards a given target, as it was the case with the Lisbon agenda, is not suitable for all member states (van Pottelsberghe de la Potterie 2008). Even though a certain increase in R&D intensity can be observed, the differences compared to the European average remain significant. Table 1 presents these differences in R&D intensity and calculates the gap between CEEC and EU27, both in terms of R&D and GDP/capita.

Table 1. R&D intensity in CEEC and the catching up process, 1998-2008

		1998	2000	2004	2005	2006	2007	2008
EU27	R&D intensity	1.79	1.86	1.83	1.82	1.85	1.85	1.92
	St. dev.	60%	63%	67%	65%	63%	62%	61%
CEE C	R&D intensity	0.72	0.72	0.75	0.80	0.87	0.85	0.89
	St. dev.	42%	46%	47%	47%	49%	48%	49%
Gap in R&D intensity		60%	61%	59%	56%	53%	54%	53%

Gap in GDP/capita	52%	52%	45%	43%	41%	38%	36%
-------------------	-----	-----	-----	-----	-----	-----	-----

Source: Own calculations based on Eurostat data. The gap represents the difference in R&D intensity, as a percentage of EU27. We define R&D intensity as the share of total R&D expenditure in GDP.

With an average share of R&D expenditures in GDP well below 1%, CEEC obviously lag behind the other members of the EU, having an R&D intensity below what might be expected given their income level (Radosevic, 2005). The gap in R&D intensity is decreasing over time, but the speed of convergence is fairly small. From a gap of 60% in 1998, CEEC have only managed to reduce the gap to 53% by 2008, so the difference remains remarkably high.

Both the level of R&D intensity and its dynamics present considerable variation between EU countries, and this variation seems to have increased over time. Table 2 presents the convergence status of R&D intensity for each of the 10 CEEC, depicting a heterogeneous behavior among these economies.

Table 2. The gap in R&D intensity between CEEC and EU27

	1998	2008	Average yearly evolution of R&D gap	Convergence status towards EU27
Bulgaria	68%	76%	0.7%	No convergence
Czech Republic	36%	23%	-1.2%	Convergence
Estonia	68%	33%	-3.5%	High convergence
Latvia	78%	68%	-0.9%	Low Convergence
Lithuania	70%	58%	-1.1%	Convergence
Hungary	63%	48%	-1.5%	Convergence
Poland	63%	69%	0.6%	No convergence
Romania	73%	70%	-0.3%	Low convergence
Slovenia	25%	14%	-1.1%	Convergence
Slovakia	56%	76%	1.9%	No convergence

Note: The gap represents the difference in R&D intensity between each of the countries and EU27, as a percentage of EU27.

Inside the CEE group, several patterns emerge. A sub-group of countries present no-convergence in terms of R&D during the period 1998-2008: (Bulgaria, Poland and Slovakia), with a clear divergence in the case of Slovakia. The second sub-group presents a decrease of their gap towards EU average (Estonia, Czech Republic, the Baltic States, Hungary, Romania and Slovenia). Romania and Slovenia present a low, but positive, speed of convergence. The difficulty in R&D intensity convergence could be explained by the fact that for countries with high rates of GDP growth, as CEEC, R&D expenditure as % of GDP needs to grow at very high rates in order to close the gap (Veugelers and Mrak 2009).

3. Research methodology, data and results

We have established in the previous section that both income and R&D convergence is taking place in CEEC, but at fairly different speeds. The research question we address is the

existence of a correlation between the two convergence processes. If such a correlation is to exist, then R&D can be considered an enhancing factor for economic growth.

We construct two rankings of the 10 CEEC according to their speed in closing the GDP gap and the R&D intensity gap. We then test the correlation between the two rankings by using the Spearman rank correlation coefficient. The formula used to compute the coefficient is the following:

$$\rho = 1 - \frac{6 \sum_{i=1}^n (x_i - y_i)^2}{n(n^2 - 1)}$$

Where:

- x_i and y_i are the ranks occupied by country i in GDP convergence ranking and R&D convergence ranking respectively.

- n represents the total number of countries, in our case 10.

The Spearman correlation coefficient is a non-parametric measure similar to a Pearson correlation coefficient between ranked variables, without making the assumption that the variables are extracted from a normal distribution. The advantage over the Pearson coefficient is that it does not require a linear relationship between the two variables. A coefficient equal to zero shows no correlation between the two rankings. A coefficient equal to 1 implies that an increase in R&D intensity is always accompanied by an increase in GDP. A positive, but less than 1, coefficient would imply that GDP tends to increase when R&D intensity increases. Equally as important as the value of the coefficient is its significance level. Since the Spearman coefficient does not assume a specific distribution, the significance value is obtained based on a table of critical values, provided by Best and Roberts (1975). After running an overall analysis based on the sample of 10 CEEC, we proceed by depicting individual correlation analysis between growth and R&D intensity for each of the countries.

The data we used comes from Eurostat, has a yearly frequency and is available for the period 1998-2008. For the construction of the rankings, we used GDP/capita expressed in purchasing power standards and R&D intensity computed as the share of total R&D expenditures in GDP. We then calculated the gaps in GDP/capita and R&D intensity as a percentage of EU27. The same series were used to compute the individual correlation coefficients.

Based on the analysis presented in section 2, we constructed a ranking of the countries according to their speed in reducing the R&D intensity gap. Data is presented in column (1) of Table 3. Estonia, Hungary and the Czech Republic present the fastest convergence of R&D intensity towards European average. Poland, Bulgaria and Slovakia occupy the last ranks, presenting, as described above, a divergence process in R&D investment.

We added a ranking in terms of income convergence in order to see whether there is a correlation between the two rankings (column 2 of Table 3). In terms of increase in GDP/capita, the Baltic countries are the top runners. They have started with relatively high income gap, but manage to reduce it by more than 20 percentage points in 10 years. Countries that occupy the last ranks are actually those who had a smaller gap from the beginning (i.e. Slovenia and the Czech Republic had only 20-30% gap in 1998). So this is a

confirmation of the hypothesis of β convergence, according to which countries with larger gaps converge faster than countries with smaller gaps.

Table 3. Correlation analysis between GDP/capita and R&D convergence

Countries	Ranking by R&D convergence	Ranking by GDP convergence	Individual correlation between GDP growth and R&D intensity
	(1)	(2)	(3)
Estonia	1	1	-0.34 (0.2989)
Hungary	2	9	-0.56** (0.0722)
Czech Republic	3	8	0.77*** (0.0059)
Lithuania	4	2	0.50 (0.1209)
Slovenia	5	7	0.18 (0.6016)
Latvia	6	3	0.15 (0.6521)
Romania	7	4	0.12 (0.7356)
Poland	8	10	-0.03 (0.9338)
Bulgaria	9	6	-0.61** (0.0476)
Slovakia	10	5	-0.70** (0.0174)
Spearman rank correlation		0.163	
Significance (p-value)		0.65	

Source : Authors' calculations based on Eurostat data, using the STATA software. The first two columns contain rankings of the 10 CEEC according to the reduction in their income and R&D gap, for the period 1998-2008. Column (3) presents the individual correlation coefficients between GDP growth and R&D intensity, with the corresponding p-values in brackets. The symbols *, ** and *** indicate significance levels of 10%, 5% and 1% respectively.

The Spearman rank coefficient has a value of 0.163, showing a low positive correlation, which in turn is not statistically significant (p-value = 0.65). We cannot therefore establish a significant correlation between the two rankings, meaning that an increase in R&D intensity is not systematically accompanied by an increase in GDP. Even though on the long run both convergence processes are taking place, GDP convergence does not seem to be correlated with R&D convergence. This lack of correlation is due to other factors determining growth, which generate the observed differences in the speed of convergence. The result does not imply that R&D does not have a positive contribution to growth, but it states that, on average, investment in R&D does not speed up the process of income convergence. The

present levels of R&D intensity are not sufficient to generate a visible increase in GDP, so its relative importance seems to be much lower than for other determinants of growth.

We proceeded with an individual analysis of economic growth versus R&D intensity for the 10 countries, during the period 1998-2008. We performed an individual correlation analysis, in order to identify if the countries follow a similar path. Results are presented in column (3) of Table 3. We found that the average evolution depicted earlier hides heterogeneous patterns.

Hungary, Bulgaria and Slovakia show a negative correlation between economic growth and R&D intensity. While they were progressing in economic growth, they allocated less of their income to R&D expenditure. So growth seems to have been decoupled from R&D expenditure in these countries. One possible explanation resides in the sources of innovation. Some countries might create it locally by investment in R&D, while others might import it by foreign trade or foreign direct investment (Perugini et al. 2008, Narula 2009). Slovakia actually experienced a severe drop in all R&D components during this period and is a particular case of growth without R&D investment.

The Czech Republic is the only one of the ten countries presenting a highly significant positive correlation. Being one of the more advanced CEEC, the Czech economy has settled on the more classical factors of long term economic growth, like innovation and human capital investment. (Perugini et al., 2008). Its constant increase in R&D expenditure was accompanied by sustained GDP growth.

The other six countries show a rather insignificant correlation between GDP growth and R&D intensity, given by high p-values associated with their coefficients. Though the R&D intensity in these countries has continuously increased during this period, they have not yet reached the point of transforming this effort into an increase of output. They still suffer from weak R&D systems, which make cooperation between academia and industry sectors difficult (Radosevic 2004, 2005). Estonia stands out being on the first position in both rankings and showing a considerable progress along the convergence path. Slovenia also visibly increased its R&D expenditure, so a positive and significant contribution to growth is expected in the future. The Baltic States, although not presenting yet a significant correlation, have a high potential in innovation driven growth, because of their constant increase in R&D expenditure.

Our research has several limitations. First, the Pearson correlation coefficient assumes a linear relationship between the two variables. The lack of linear correlation does not exclude non-linear forms of correlation, like an exponential one, which may account for continuous R&D investment with a later effect on growth. Second, a correlation between two variables does not mean a causality relationship, even though theory suggests that R&D should act as a cause in economic growth. For the case of CEEC, a hypothesis that higher income levels lead to an increase of R&D investment may very well be plausible. These limitations open the field for future research: including R&D in a cross-country growth regression and testing the nature of the causal relationship.

4. Conclusion

As a general conclusion, CEEC present a heterogeneous pattern in the path towards the knowledge based economy, though a small but positive trend in R&D intensity can be identified. Bulgaria, Poland and Slovakia seem to make an exception to the rule, reducing their share of R&D and therefore magnifying their gap with the European Union. On the other hand, Estonia shows a remarkable progress both in innovation and income levels, being the top runner among CEEC.

In the post-transition period, CEEC are in search of sustainable factors to increase productivity and foster long-term growth. The crisis has particularly affected these catching-up economies, and the recovery path is likely to be more knowledge-based. Innovation and research and development could be important contributors to sustain the competitiveness of these countries and the re-adjustment of the catching-up process. The aim of this paper was to test whether the income convergence in Central and Eastern Europe was correlated with the increase in R&D intensity. We constructed two rankings of the 10 countries according to the status of convergence (income and innovation) and computed a Spearman rank correlation coefficient. The result shows a slightly positive, but insignificant correlation between the two evolutions. Suspecting high heterogeneity among the sample, we proceed with an individual analysis. The Czech Republic is the only country where the two evolutions are positively and significantly related. Hungary, Bulgaria and Slovakia show a negative relationship between economic growth and R&D intensity, which is consistent with the view that growth was mostly generated by non-R&D factors. The other six countries in the sample do not present a significant correlation between the two variables. The results indicate that for the majority of the new member states, the income convergence is not supported by innovation-convergence.

These differences in the innovation capacity point out to two different factors: differences in the stocks of capital, labour and knowledge, but mostly different efficiency of the innovation systems. This means that besides the effort put into R&D, the economies should also have the capacity to transform knowledge into growth. This is thought to be one of the weak points of CEEC. The structure of their research systems in favor of government and education sectors renders business applications difficult. R&D activities also need a certain maturation time to generate an increase in productivity, which CEEC have probably not reached yet.

As policy recommendations, countries with large gaps in terms of innovation (Bulgaria, Slovakia, Romania, Latvia, Poland, Lithuania) should focus on improving their absorptive capacity rather than investing high shares in fundamental research through government and academic systems. The challenge they are facing is to create an innovation demand from private companies, who do not find profitable opportunities for innovative activities. They should also improve their educational systems, which struggle with low efficiency. Despite high enrollment rates, there is a lack of correlation with the needs of the private sector.

Countries with smaller gaps, like the Czech Republic, Slovenia and Estonia, should concentrate on local innovations to sustain productivity growth and stimulate applied business research. Even though they are investing in R&D, they have difficulties in leveraging this effort into an increase of output. Government policies should facilitate cooperation between academia and private sector and increased government R&D spending should have a stimulating role on business innovation activities.

REGULATORY BENCHMARKING IN CENTRAL EUROPE: CURRENT PRACTICE AND POSSIBILITIES OF DEVELOPMENT FOR THE ENERGY SECTOR

Machek Ondrej

University of Economics in Prague, Faculty of Business Administration

Benchmarking is a technique of performance evaluation in which comparisons are made to benchmarks that represent external performance standards. In the field of regulation of public utilities, benchmarking can be used as an element of performance-based regulation or as a pure regulatory method, called yardstick competition. In the absence of competition, benchmarking can be used to simulate competitive pressures by comparing a regulated firm's performance against an efficient standard.

The aim of this paper is to examine the Central European regulatory benchmarking practices in the energy sector, namely the electricity and natural gas distribution industries, and to analyse the possibilities of further development of regulatory benchmarking in this region. The countries onto which we focus are Czech Republic, Slovakia, Hungary, Poland, Germany, Austria and Switzerland. In the region of Central Europe there are still significant differences between countries, especially in terms of experiences in modern regulation, regulatory methods and practices, level of economic development etc. Differences are considerable especially between Western countries (Germany, Austria and Switzerland) and the countries of former Eastern Bloc (Czech Republic, Slovakia, Hungary and Poland). As a result, the degree of the use of regulatory benchmarking is also very diverse within this region.

In the first part of the paper, we develop basic theoretic concepts of economic regulation. Then we describe the most frequently used regulatory methods – cost-of-service regulation, incentive regulation and yardstick competition – and we deal with common regulatory benchmarking techniques, describe their principles and main challenges. Subsequently, we provide an overview of regulatory methods and benchmarking practices for each country in the region of interest. In the final part of the paper, we analyse the challenges and possibilities for further development of regulatory benchmarking in the Central Europe.

We have found that except for Switzerland, all Central European regulatory regimes are based on some form of incentive regulation. The most sophisticated methods of benchmarking are used in Germany and Austria. In these countries, benchmarking is used in both electricity and natural gas industries. The Polish regulator is using a benchmarking method in cost efficiency analysis in electricity distribution. In Hungary, a specific method of benchmarking is used. In Switzerland, no benchmarking is used at present. In Czech Republic and Slovakia, some principles of benchmarking are adopted, but not directly to the revenue requirements setting. We summarize that the possibilities for development of regulatory benchmarking in the Central Europe could be extended by reducing market concentration, unbundling large vertically integrated companies, establishing a closer cooperation with the private sector and closer harmonization of regulatory frameworks.

Keywords: regulatory benchmarking, public utilities benchmarking, Central European utilities, public utilities regulation, regulatory framework

1. Introduction

Energy sector, which traditionally includes electricity, gas and heat industry, has some inherent characteristics which result in state regulation of energy utilities. Contemporary trends, such as privatisation, mergers, legal unbundling, separation of competitive and non-competitive segments produce new challenges for regulation in Europe. The main purpose of economic regulation is to achieve competitive results in an environment where competition is (for various reasons) not feasible.

An efficient competition puts a company under pressures, sometimes referred to as „carrot and stick“. The carrot means that if a firm produces at lower costs than its competitors, then its profits will be higher. The stick means that an inability to keep costs below its competitors will make the firm go out of business in long term. Regulatory commissions, willing to achieve maximum efficiency, therefore face the challenge to simulate competitive pressures, which should induce a company to behave as if it were exposed to real competition. However, traditional methods of regulation do not provide sufficient incentives for utilities to increase productivity in a quest for lower costs.

Regulatory benchmarking is an element of incentive regulation that can be used to set efficiency requirements based on a relative efficiency assessment. This paper examines the actual practice in central Europe (ie Czech Republic, Slovakia, Hungary, Poland, Germany, Austria and Switzerland) and possibilities of improvement in the field of regulatory benchmarking within this region.

2. Basic concepts of economic regulation

Regulation usually takes place when (Phillips, 1993)

- competition is feasible but does not last long, so a competitive output is not achievable;
- competition is feasible but a competitive output is not achievable due to market imperfections;
- competition is feasible and a competitive output is achievable, but with regard to the social welfare this output is not sufficient.

Usually, regulated companies have characteristics of natural monopolies, although not all of them (eg trucking in the United States). Market conditions are constantly changing – new technologies are being developed, market size is changing – so a demise of natural monopoly is almost never excluded.

Public utilities often have the following properties (Bonbright, 1961):

- inherent economies of scale and scope;
- essential product with a low price and cross elasticity of demand;
- capital-intensive production, the product represents an essential input for other industries of the entire economy;
- non-storable and non-transferable product, synchronous production and consumption, excess capacity, fixed connection with customers;
- variable and seasonal character of demand;
- obligation to serve all customers who are able and willing to pay for the service (public service obligation).

Following the concepts of natural monopoly or destructive competition (Kahn, 1988) or for social reasons, government may decide to regulate price level, quality-of-service, market entry and exit conditions and impose public service obligations.

This paper focuses on price (tariff) regulation. The main task of regulatory agencies is to set a price level that mimics the competitive price level. However, when competition is not feasible, this is a formidable task. The situation of natural monopoly tariff setting is illustrated below.

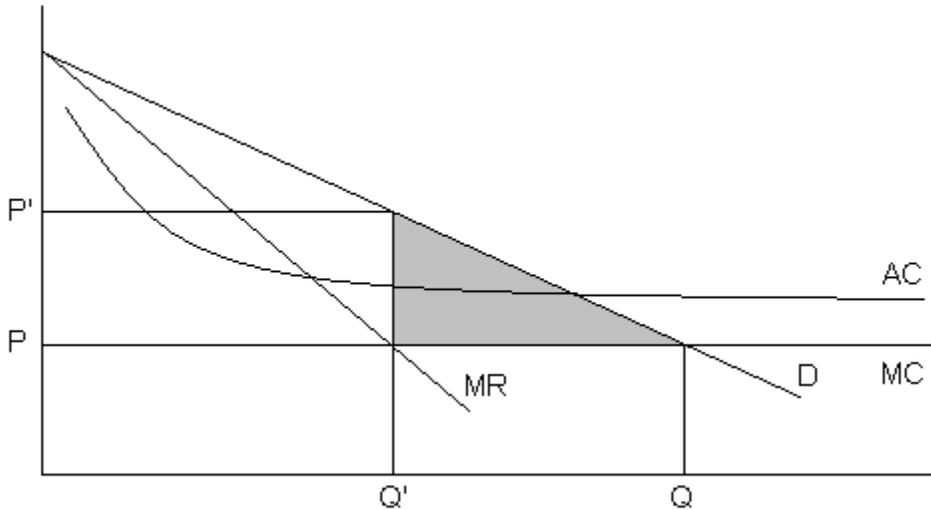

Figure 1: The concept of natural monopoly

Source: Lesser, A., Giacchino, L. Fundamentals of Energy Regulation. Vienna, Public Utility Reports, 2009.

In conditions of natural monopoly, the curve of average costs (AC) is decreasing due to the economies of scale. Monopoly power causes that the marginal revenues curve (MR) has a lower slope than the demand curve (D). The competitive output (Q) and price (P) is achieved at the intersect of demand (D) and marginal costs (MC). However, if the price was set at P, total revenues ($P \times Q$) would not cover total costs ($AC \times Q$) and the company would eventually go out of business. The task of regulators is to achieve competitive output and to allow the regulated company to cover its costs and achieve a reasonable rate of return on its capital.

3. Basic methods of tariff regulation

Traditional tariff setting is based on revenue requirements (RR) that should allow a company to cover its expenses and have a reasonable rate of return on its invested capital. Eligible expenses must be „prudent“, „known and measurable“ and „used and useful“ (Lesser, 2009). All other expenses are excluded from revenue requirements.

Usually, revenue requirements for a regulatory period (typically 5 years) are calculated using the following formula (Lesser, 2009):

$$RR = O\&M + A\&G + T + D + (WACC \times RB), \quad (1)$$

where RR denotes revenue requirements, $O\&M$ denotes operation and maintenance costs, $A\&G$ denotes administration and general costs, T denotes taxes, D denotes depreciation and amortization, $WACC$ is the weighted average cost of capital (after taxes) and RB denotes regulatory asset base (sum of assets book value and working capital).

A classical **cost-of-service regulation** (COS regulation) is based on summing eligible expenses and calculating a required rate of return. This approach has several disadvantages – information asymmetries between regulator and regulated companies, incentive to overinvest (A-J-W effect) or to invest imprudently (gold plating) – and does not simulate competition pressures, especially the above-mentioned „stick“.

The aim of **incentive regulation** (performance-based regulation, PBR regulation) is to reduce the impact of information asymmetries and to provide a stronger incentive for a company to reduce its costs. Usually, it is based on a price cap or a revenue cap. For each year, the regulatory agency limits the price level or revenues. The regulated company is motivated to reduce its costs in order to increase profits. The revenues are capped according to the inflation rate (RPI-factor) and efficiency factor (X-factor), that's why this method is also called RPI-X regulation. However, if the cap is set also according to a company's own costs, then the negative effects of COS regulation (overinvestment, gold plating etc.) are not fully eliminated.

In a competitive environment, a firm's earnings are related to the industry average and to the firm's relative market position. A firm has to reduce its costs below its competitors in order to survive. Setting the cap with respect to the performance of other companies is the main principle of the third regulatory method, **yardstick competition**, which is based entirely on regulatory benchmarking.

4. Regulatory benchmarking

The idea of regulatory benchmarking is that a firm's revenue requirements should not be based on its own costs, but rather on a relative efficiency measurement (Schleifer, 1985). The objective of benchmarking is to establish a system that determines a firm's efficient revenue requirements based on measuring a firm's efficiency against a reference performance. If correctly applied, this approach eliminates the negative consequences of information asymmetries. Regulatory benchmarking can be used to determine both price and quality efficient levels.

However, some issues arise when applying this approach. Firstly, regulatory agencies have to choose an adequate sample of firms, but firms and their environment tend to be heterogeneous. Difficulties also arise in gathering and comparing data. Thirdly, modelling can become more and more costly and marginal benefits of more accurate price setting can be overwhelmed by marginal costs of doing so. Fourthly, regulated firms could agree to act in some collusive fashion and to manipulate with data together. Fifthly, a threat of going out of business has to be credible, but governments usually tend to protect utilities from bankruptcy (Lesser, 2009). Sixthly, adequate methods have to be chosen.

A utility's performance can be measured in three basic areas: quality, efficiency and productivity. Productivity is measured as a ratio of output and input. These indices can be based on partial indicators (labour, costs etc) or total factor productivity (TFP), but issues resulting from heterogeneity prevail.

In regulatory practice, frontier methods for estimating efficiency are the most widely used. Cost frontiers define minimum cost level of producing a given output with a given input. Inefficiency is then represented as the distance of a company from this frontier.

Deterministic methods (OLS, COLS, MOLS) assume that all data can be observed. OLS (ordinary least squares) is a classical technique of estimating cost frontiers: it is an estimate of an average cost function of a sample of firms based on the relationship between total costs and other variables (market conditions, area, grid length etc). Statistical analysis can be used to isolate the impact of specific conditions. This method can be used in the case of companies with relatively similar cost structure and requires large data sets to obtain reliable results. COLS (corrected OLS) is a modification of OLS, with a shift of the frontier towards the best performing company. MOLS (modified OLS) is less restrictive than COLS with a slighter shift of the cost frontier.

Stochastic methods (stochastic frontier analysis, SFA) take into account possible measurement errors and chance factors. An estimate of noise distribution has to be made for each observed firm. Typically, higher efficiency scores are achieved than when using deterministic methods.

Data envelopment analysis (DEA) is a method in operations research. It is based on comparison of multiple variables (costs per customer, costs per km of grid etc), searching for points with the lowest unit costs and connecting these points to form an efficiency frontier. Companies not on the frontier are considered inefficient. As with above-mentioned methods, inefficiency is represented by the distance of a company from the frontier.

5. Benchmarking in the Central Europe: an overview

In this paper, we focus on regulatory benchmarking practices in following countries: Czech Republic, Slovakia, Hungary, Poland, Austria, Germany and Switzerland.

Czech republic

The Czech energy regulatory agency (Energetický regulační úřad, ERÚ) is using a revenue-cap incentive regulation. To determine revenue requirements, an ordinary RPI-X regulatory formula has been used, where certain parameters (WACC, D/E ratio, beta coefficient) and X-factor were determined using simple benchmarking methods. As the Czech energy market is relatively small, foreign experiences have been used. For example, the beta coefficient was set as an average of comparable European firm's beta from abroad. However, revenue requirements are being set based on a firm's own costs, which causes that issues of traditional regulatory methods are not eliminated. No true regulatory benchmarking was used (ERÚ, 2009). The number of firms operating on regulated markets is relatively low.

Slovakia

The Slovak energy market is regulated by the Agency for regulation of network industries (Úrad pre reguláciu sieťových odvetví, ÚRSO). Price regulation is based on a traditional price-cap incentive regulation. Prices are set individually according to regulatory formula which takes into account price inflation and X-factor (ÚRSO, 2008). The formula and its parameter setting are very similar to the Czech ones. No true regulatory benchmarking was used. The regulated markets are very concentrated, for instance, only one pipeline

(Slovenský plynárenský priemysel) is operating in natural gas regional distribution. The price caps in gas transportation and gas storage are based on comparing Slovak tariffs with EU tariffs (ÚRSO, 2009). The analysis has to take into account only similar European firms, with regard to geological, technical and other (working capacity, injection rate and production capacity) characteristics.

Hungary

Similarly to the Slovak ÚRSO agency, the Hungarian energy regulatory agency (Magyar Energetikai Hivatal, MEH) is using a price-cap RPI-X incentive regulation for the electricity sector. Unlike ERÚ and ÚRSO, MEH calculates regulatory formula parameters (beta, WACC etc) based on Hungarian local conditions, such as BUX stock exchange index and companies stocks (MEH, 2009). D/E ratio is determined using domestic benchmarking. In the field of natural gas and electricity transportation and distribution, a relatively complicated but promising non-frontier benchmarking system has been used to determine allowed operational costs. Before benchmarking, costs were corrected in order to mitigate regional differences (wages, consumer structure) and geographical and technical differences. Average (benchmark) operational costs were then incorporated into revenue requirements. Both international and domestic data have been used (Haney, 2009). A simple frontier technique has been used in setting quality requirements, where desired quality performance has been calculated from average values over a short period. Failure to comply with these standards was penalized, although there was a 5% tolerance in order to mitigate chance factors (Tersztyanszky, 2005).

Poland

The Polish energy market is regulated by the agency Urząd Regulacji Energetyki (URE), but rules of tariff setting are determined by the Ministry of Economy (Ministerstwo Gospodarki). A price-cap RPI-X incentive regulation has been used. As the Polish energy market is relatively large, benchmarking methods are more easily applicable. However, there are only a relatively few companies operating on the market, with regard to the total country area and population. Benchmarking has been used only in the field of electricity distribution. Electricity transmission and gas transportation and distribution are not regulated using benchmarking techniques.

As benchmarking technique, a Bayesian random effect model (a SFA method) in cost efficiency analysis was used. A DEA or COLS methods are in consideration for the next regulatory period (Haney, 2009).

Germany

The German energy market is significantly larger (in terms of system operators) than the above-mentioned markets. It is regulated by Bundesnetz-agentur (BNetzA). A revenue-cap RPI-X regulation has been used since 2009. BNetzA uses a regulatory formula which contains a general and an individual X-factor. The individual X-factor is determined using benchmarking DEA and SFA methods for both electricity and gas industries. The two methods are applied to two cost bases and a „best-of-four“ scheme is then applied: out of four results, the efficiency score that is the most favourable to a company is taken to calculate its individual X-factor. A total controllable expenditures (totex) benchmarking has

been used, in contrast with UK, where operational costs (opex) and capital costs (capex) are treated separately.

After benchmarking, an intransparency has remained, so legal steps by many operators have been undetaken.

Austria

The Austrian regulatory agency Energie-Control (E-Control) is using benchmarking methods for both electricity and gas industries. As in Germany, the Austrian energy markets is much less concentrated than in other previously mentioned countries and there is a large number of system operators in the market. Domestic and international data have been used for regulatory benchmarking. As in Germany, total expenditures (totex) are taken into consideration. The regulator has been using DEA and MOLS methods. DEA and MOLS give different results, which are then weighted using a „weak-of-method“: the better results gets weighted by 60%, the worse result by 40%. Contrarily to Germany, benchmarking results were widely accepted by regulated companies.

Switzerland

Having only a short history of regulation, the Swiss energy regulatory framework is carried out by multiple institutions – for example the ElCom regulatory agency, the association of companies operation in the electricity sector - Verband Schweizerischer Elektrizitätsunternehmen (VSE), Bundesamt für Energie (BFE) and more.

As natural gas plays only a minor role in the Swiss energy industry, tariffs in the gas sector are not specifically regulated, but they must comply to the national antitrust law. Tariffs for electricity distribution have been regulated based on a rate-of-return (COS) method. The methodology has been co-prepared by the VSE association, so regulated firms have been directly involved into the regulatory process. Due to a large number of companies involved in distribution sector, possibilities for benchmarking are considerable, but still it is not used.

6. Conclusion

Regulatory methods differ across the region of Central Europe, but except for Switzerland all of them are based on some form of incentive regulation. Regulatory benchmarking can be used as an element of incentive regulation or as a pure regulatory method (yardstick competition).

The most sophisticated methods of benchmarking are used in Germany and Austria, where energy markets are developed and a large number of firms are operating on the market. In these countries, benchmarking is used in both electricity and natural gas industries. The Polish regulator is using a SFA method in cost efficiency analysis in electricity distribution. However, the Polish energy market is still very concentrated, which limits the possibilities of further development of domestic benchmarking. In Hungary, a non-frontier method of benchmarking is used. The Hungarian energy market is relatively small, causing the need for data from foreign companies. In Switzerland, no benchmarking is used at present. In Czech Republic and Slovakia, some principles of benchmarking are adopted, but not directly to the revenue requirements setting. These markets are small and relatively concentrated.

The possibilities for development of regulatory benchmarking in the Central Europe could be extended by reducing market concentration in order to obtain a larger sample of firms.

Domestic benchmarking is more accurate due to more similar environment (including political and economic conditions, legislation, regulatory framework etc). However, long time series are not obtainable, due to only a short history of modern regulation in most countries (notably those from the former Eastern Bloc). In addition, large vertically integrated companies are still present in the markets, which complicates the separation of regulated and non-regulated activities. An unbundling of these companies would facilitate data collection and comparability. A cooperation with the private sector is needed in order to establish an acceptance of the benchmarking results, which would reduce court costs due to companies undertaking legal steps. A closer harmonization of regulatory frameworks would slightly reduce the disparity of companies and data gathered. Although regulatory agencies are members of pan-european organisations such as ACER or CEER, regulatory policies remain still in the hands of individual countries.

This paper was written with financial support from the Internal Grant Agency of the University of Economics in Prague, project No. F2/22/2011 "Regulation of energy utilities in Central Europe and the possibilities for improvement."

THE NEED FOR PUBLIC DEBT MANAGEMENT IN THE CONTEXT OF SUSTAINABLE DEVELOPMENT WITHIN THE EUROPEAN UNION

Marcu Nicu

University of Craiova, Faculty of Economics and Business Administration

Meghişan Mădălina Georgeta

University of Craiova, Faculty of Economics and Business Administration

Public debt is created when the necessary resources for the socio-economic development of a state are greater than the opportunities that exist at that time. The destination of the necessary resources acquired from foreign markets can be either consumption by raising the standard of living (on short term) or investments in order to reduce the discrepancies in relation to the European Union through investments in infrastructure, jobs, human and technical capital development.

The scientific research aims to clarify several key objectives, namely: the theoretical concept and its belonging in the governance politics; the dynamics of public debt in Romania and the identification of specific features of the indebtedness decision, the influence of the current global economic crisis on the Romanian economy, the analysis of Romania's public debt sustainability integrated in the European structures, and proposals for action in order to return as soon as possible to a positive economic dynamics with direct impact on people's standard of living.

The theme of this research is contemporary in the context of the financial and economical global crisis and the difficulties in overcoming this period. The need to coordinate the fiscal and budgetary policies in Romania, the awareness that the accumulation of a large public debt presents a threat to future generations, the increase of the tax pressure over a market that trends towards globalization and the impact that the aging of the population will have on the public finances sparked public controversy, both in the academic environment and in the media. To continuously borrow resources and maintain a stable level for them requires a sustainable public debt, an important objective of any state's tax policy. A sustainable public debt is the result of the market and of the fiscal and budgetary policy decisions.

Although the sustainability of public finances and implicitly of public debt has been an issue extensively debated for over a century, they currently remain vague concepts. Although, intuitively, it is natural to consider that a fiscal policy is sustainable if it avoids financial collapse, there is no generally accepted definition in terms of sustainable public debt, respectively a sustainable level of public debt. The methodology of this research is stressed by the large number of statistical data on public debt dynamics used in the analysis, relevant in this regard are the national and international databases: the National Bank of Romania, Ministry of Public Finances, World Bank, Euro stat, the statistical database of the European Commission, the database of the International Monetary Fund, the Organization for Economic Cooperation and Development, the normative documents consulted in order to ensure the terminological accuracy of the concepts, the numerous theoretical and empirical studies of Romanian and foreign specialists, the views and arguments of scientific researchers with high experience in the field.

The personal contribution to the researched field is present throughout this work. Thus, I aimed to clarify some theoretical aspects of the issues addressed, of some concepts and economic notions to elucidate the studied phenomenon by using a large number of statistical data in order to analyse the dynamics of public debt in Romania, in comparison with other former communist countries and to formulate proposals for a long-term sustained recovery and a sustainable economic growth.

Keywords: public debt, budget deficit, external financing, public debt management, degree of indebtedness, public debt service

JEL Codes: H63 - Debt, Debt Management, Sovereign Debt

I. Introduction:

"The need for public debt management in the context of sustainable development within the European Union" presents the main theoretical issues related to public debt management and its importance in the effective management of public debt, over the objectives and risks associated with public debt management. Moreover, the main objective of public debt management is to ensure that the government's need of funding and its payment obligations are met at the lowest possible cost, on medium and long term, consistent with a prudent degree of risk. The issues of public debt management often start from the lack of attention of decision-makers regarding the benefits of a cautious debt management strategy and the costs of a weak macroeconomic management of excessive levels of public debt. In the first case, public authorities should pay attention to the beneficiaries resulting from the use of a prudent public debt management strategy and of public policies that are coordinated in a complete macroeconomic framework. In the second case, fiscal-budgetary policies, monetary policies and exchange rate policies that are inappropriate to the economic situation generate uncertainty in the financial markets regarding the future returns of investment expressed in local currency, which will lead investors to request higher risk premiums. Particularly in emerging or developed markets, debtors and creditors alike, applying long-term commitments can suffocate the development of financial markets and they can severely impede public debt managers' efforts to protect the government from refinancing and currency exchange risks.

Moreover, poorly structured public debt in terms of maturity, currency or the composition of the interest rate to which unfunded big liabilities are added, were important factors in the induction and propagation of the debt crisis in many countries over time.

The process of managing public debt portfolio is a priority for every government in order to reduce medium and long term exposure to risks.

The main objective in process of public debt management is represented by providing for the governmental financing needs in terms of minimizing long term costs and limiting the risks involved. In our country, during the period proposed for analysis, a series of measures for the permanent improvement of the legal and institutional framework for public debt management were taken. These measures corresponded to a positive macroeconomic context; Romania obtained the best results at the beginning of the transition period. Analyzing the macroeconomic and policies - fiscal, budgetary, monetary, of exchange rate – one can see their continuous orientation towards public debt and budgetary deficit. The financing strategy for the budget deficit and the refinancing strategy for public debt will focus on contracting domestic loans by launching the issuance of public securities.

Domestic public debt represents the total of loans contracted directly by the state or guaranteed by it, from the internal market, in order to cover fiscal deficits, by financing and refinancing them. Also, domestic public debt represents the state's takeover of debts based on special laws, due to losses registered by some companies and state-owned banks. A series of public spending, financed in order to achieve objectives of national interest can also be seen as domestic public debt. The annual growth of external public debt (direct and guaranteed) was based on a rigorous foundation regarding the contract criteria, within limits that did not exceed the country's capacity to assure the service, respectively the reimbursement of capital rates, interests and related fees without a strict policy regarding the use of borrowed resources.

An incorrect structured debt by maturity date is an important factor in triggering the economic crisis. Short and medium term contracted loans with variable interest rates may expose the state budget to a high risk if the international capital markets have changed the conditions regarding the refinancement of these loans. International financial organizations, the IMF and the World Bank, make suggestions on contracting loans for the purposes of directing those loans towards those on long term, thus avoiding countries' indebtedness on short and medium term. Also, an analysis of internal and external public debt service is presented.

II. Literature review

Foreign loans allow a country to invest and consume beyond its domestic production capacity and therefore, to finance the development of capital not only by mobilizing domestic savings, but also by drawing resources from countries with capital surplus. In order to define external public debt will start from the definition of external debt as the due amount in currency, at some point, by one country(s) to other countries and / or international financial institution on the basis of the credits received by the state (government), by private companies with the state's guarantee and also by companies or individuals, that remains to be paid in a period longer than one year²⁰.

The internationally accepted definition of external debt that results from the research conducted by international organizations, which have as the main field of activity crediting those countries that face problems in providing for their financial needs, presents gross external debt at one point as "the total of contractual liabilities used and unpaid by residents to nonresidents and the residents' obligation to reimburse capital rates, with or without interest, or to pay interest with or without capital rates²¹."

In Romania, the Law of Public Debt No. 313/2004 defines the external governmental public debt as "the part of the governmental public debt representing all financial obligations of the state that derive from loans contracted directly or guaranteed by the state from nonresidents individuals or legal entities in Romania"

External public debt is a key parameter to assess the state of public finances; it can be defined as a consequence of the following macro economical issues²²:

²⁰ Ceaușu, Iulian. Enciclopedia Managerial Dictionary, Vol. I. Bucharest: Academic Management Publishing, 2000;, p. 264.

²¹ Klein, Thomas M., External Debt Management – An Introduction, World Bank Technical Paper Number 245, Washington, D.C., p. 56.

²² Gaftoniuc, Simona. International Finances. Bucharest: Economic Publishing, 2000, p. 403.

- low production capacity in relation to consumption, investments and public expenditures;
- insufficient domestic saving, in relation to investments and the budgetary deficit,
- a overly high current account deficit, compared with net inflows of funds (debt is exempted);
- Excessive capital outflows in the form of direct investment or "capital leaks" abroad.

Consequently, the role of external public debt can be seen through the following implications²³:

- a) external loans allow the contracting country to invest and consume beyond its current internal possibilities and, in fact, to finance capital development not only by mobilizing domestic savings, but also by using the savings of countries with capital surplus;
- b) External loans may lead to a faster economic growth, enabling the financing of a greater volume of investments and the mobilization of the country's available resources, giving them a more cautious but a more effective usage.
- c) External loans can also serve to finance temporary deficits of the balance of payments and can provide the authorities with the solution to avoid to taking actions that could jeopardize the country's development program.

III. Research Methodology.

In order to assess the level of external public debt and to correlate it with the situation of other macroeconomic variables (these ratios are more conclusive than the absolute size of debt), a series of indicators are being used:

- external public debt in the year (DPE):

$$- \quad DPE = DPE_d + DPE_g ,$$

- where:

- DPE_d is the external public debt of the state;
- DPE_g is the external public debt guaranteed by the state.
- External public debt service (SDPE), which represents the payments due in order to reimburse external public debt, representing the mature rates in a period of one year (RDPE), the interests and the related fees as well as the costs of issuance and placement of securities (Dob_{DPE})^{24,25}:

$$- \quad SDPE = R_{DPE} + Dob_{DPE} ; (1)$$

- the share of external public debt in GDP:

$$- \quad DPE_{/PIB} = \frac{DPE}{PIB} \cdot 100 ; (2)$$

- the share of external public debt in the volume of exports of goods and services (E)

²³ Klein, Thomas M., External Debt Management – An Introduction, World Bank Technical Paper Number 245, Washington, D.C., p. 2.

²⁴ Moșteanu, Tatiana (coord.) și colectiv, Finanțe publice: note de curs și aplicații pentru seminar, Editura Universitară, București, 2005, p. 264

$$- \quad DPE_{/E} = \frac{DPE}{E} \cdot 100; (3)$$

- the share of interests of the existing external debt in GDP

$$- \quad Dob_{DPE/PIB} = \frac{Dob_{DPE}}{PIB} \cdot 100; (4)$$

- the share of the external public debt service in GDP:

$$- \quad SDPE_{/PIB} = \frac{SDPE}{PIB} \cdot 100; (5)$$

- the share of external public debt service in the volume of exports of goods and services:

$$- \quad SDPE_{/E} = \frac{SDPE}{E} \cdot 100; (6)$$

- external public debt service in the state's budget expenditures (Ch_{BS}):

$$SDPE_{/Ch_{BS}} = \frac{SDPE}{Ch_{BS}} \cdot 100. (7)$$

IV. Results of the research

The period 2007-2010 was characterized by the expression of the global financial and economical crisis. Although all European countries have been marked by different bubbles (the most frequent being the real estate bubbles), the crisis manifested unevenly, depending on specific conditions and governmental policies from each country and especially depending on the anti-crisis measures taken as a response to the crisis.

In Romania, in comparison with developed countries, external public debt has been and continues to be the main component of public debt. Throughout the period, the actual public debt was fueled substantially by external loans and only to a lesser extent on the domestic loans, this structure being specific to developing countries which lack their own capital market capable of meeting the needs of the private and the public sector. The funds attracted were from international organizations (IMF, IEB) with compliance to the conditions imposed and in the cases where the government could not meet those conditions, it turned to private banks that granted loans but with a higher interest rate.

Under the pressure of external financing of budgetary deficit, the authorities have promoted macroeconomic austerity measures, aimed to restrict governmental spending, reorganize the system of pensions paid from public funds, the system of social benefits and health insurances, which had short-term constriction effects.

The painful budgetary adjustments, especially in the field of social benefits have been politically legitimated by the "state reform" slogan and the construction of a neoliberal minimal state.

In reality, this approach was not accompanied by an appropriate and encouraging fiscal recovery, especially in the field of labor taxation nor by a real liberalization of some services or the entrustment of infrastructure works to the market.

An extremely important issue for fiscal and budgetary sustainability on long-term remains the reduced capacity to collect public revenues, which causes an additional tax burden on taxpayers and keeps the premises for structural budget deficits. In this respect, the areas that

require special attention should aim to modernize the rural economy, adjust the tax level of properties, the taxed labor shortages, tax evasion and the numerous exceptions to the general tax regime. The reduced ability to collect or to generate additional budgetary revenues imposes on Romania a redefinition of the fields of state intervention.

In the long term, macroeconomic policies should aim to achieve general economic balance, a medium and long-term sustainable economic growth with the purpose to achieve real convergence, whether it will be expressed by growth of GDP per capita, by reducing labor costs, by the relocation of the share of national economy branches in the generation of GDP or by the degree of openness of the Romanian economy.

The draining budgetary measures taken in 2010 have been misinterpreted as an actual reduction of the Romanian state's intervention in the economy; they rather represent the only solution to reduce the budget deficit because of its funding difficulties.

V. Conclusions

For the recovery of the Central and Eastern European economies several groups of countries can be distinguished. Some countries have managed to contradict the experts forecasts, obtaining better results (Poland, Czech Republic), others have met their forecasts, those being the countries with the strongest economies in the EU (France, Germany), while others faced the collapse of their national economies (Greece, Spain).

To help cushion the impact on their citizens, governments have implemented a variety of initiatives. There are three important reasons why the analyzed countries were affected by the crisis. Firstly, the dependence on the foreign capital inflows (the ability to attract foreign investments meant to develop the national economy) and the money sent home by those working abroad to support consumption and hence the national budget. For example, in Romania and Bulgaria in 2009, the money sent home dropped by 30% -50% compared to 2008 levels. Secondly, a large part of their exports were for countries in the region and the euro zone, so that the volume of transactions fell dramatically. Thirdly, several of the analyzed countries had their national currency dependent on the Euro and the weakened economies had been strongly influenced by Euros fluctuations which have often suffocated the exports.

In the case of Poland, the government used quickly and effectively all the European funds at its disposal in order to cover the capital withdrawals amid the international crisis, the current account deficit became stable and zloty's fall was stopped by the central bank of Warsaw with the help of BCE, avoiding mortgage debtors' entry into payment incapacity on mortgage loans denominated in foreign currencies.

Although the government has contracted a loan through the new "flexible credit arrangement" of the IMF, in very favorable conditions, the National Bank of Poland was not forced to resort to these reserves. Although it had to postpone its accession to the European exchange rate mechanism (ERM II), the Polish government initiated an extensive privatization program to reduce the budget deficit and maintain public debt below 50% of GDP. Thus, Poland regained the investors' confidence that began to return to their country. Because of the fact that this economic crisis was much longer than expected, the 50% threshold was exceeded due to the financing needs of the budget deficit which has increased 5 times in the period under review. The goal of the deficit was the need for co-financing the projects with EU grants and also the investments in infrastructure that is why the output

from this EU recession will find Poland with a healthy economy based on sustainable development.

Before the crisis started, Romania faced a high budget deficit, an overly indebted private sector, a real estate bubble and an over heated economy, Romania called on the help of the IMF in order to flatten the adjustment of internal and external imbalances set in motion by the global economic crisis.

Because of the delay of the Government in adopting tough structural reform measures and reduce public spending, eventually to channel the funds at its disposal to the economic sectors that would really help the development of a sustainable economic development, Romania was looked at and cataloged by the analysts as being without an economic horizon. Even though the percentage of the public debt in the GDP is a reduced one (30.8% in 2010) it is alarming that this public debt has risen with 300% in the analyzed period, from the borrowed sums being financed the social budgets deficits, the Government being content with a relative quietness of the social strata and waiting for the passing of this period without major interventions. The measure to reduce budgetary spending by cutting 25% in the public sector did not have a macroeconomic result because of the useless spending made from the same amount. In the analyzed period, Romania was the only country that had registered a decrease in productivity.

An aspect that probably did not get enough attention is that the financing of the excessive budgetary deficits, whether is done internally or internationally, is not a costless action. On the contrary, the level of the interest rate at which the debt has been contracted, as well as its schedule are extremely important aspects and can become an extreme burden, as situations exist in which the principal of the debt can be compared with the interest. Confronted with the lack of immediate low cost financing, some states have even advanced the unorthodox solution that the government securities be repurchased by the central bank. This option can not even be taken into consideration, as the conditions of the Romania's accession to the Monetary Union targets too also other dimensions of the nominal convergence, beside the stability of the public finances, as would be: inflation, the stability of the exchange rate, interest rates, which would strongly affected by such a decision.

Intensive agriculture, industrial type, contributed to environmental degradation and pollution. Thus, on the one hand, makes intensive use of chemicals has led to neglect of duty to maintain the natural fertility of the soil organic matter through proper fattening. On the other hand, organizing specialized industrial environments, high animal breeders, considered the only marketable livestock production, neglecting the production of manure, thus representing a break with the brutal nature of biological circuits

Following the experience accumulated over two centuries, mankind has drawn valuable education obligation to safeguard the habitat of nature as a collaborator. In this respect, the main task of our times is to develop appropriate technologies humanist ideal, so that man can become a being as fully integrated into the social and cosmic environment.

In the present period as a peasant household current form, is typical of developing countries. It is generated by the result of families who received income from farming and increase farm animalelor. Gospodăria organizational structure is the basic economic and agricultural economy.

On the basis of the idea that organic production is the main cause of degradation of the biological quality of products is inadequate human intervention at various structural levels of the biosphere, and the most severe effects on humans resulting from the cumulation of errors relating to soil, plants and animals. Organic farming places emphasis on quality natural products, the quantity and productivity issues as a peripheral level.

A balanced rural development policy for the future is not an option but a necessity, especially considering the fact that the issue of agriculture and rural development has important national connotations and is a very complex and timely in Romania

Regional development is a concept that aims at stimulating and diversifying economic activities, encouraging private sector investment, helping to reduce unemployment and ultimately lead to improved living standards, according to the regions of the country's development.

Keywords: Peasant household, sustainable development, farms, subsistence, european agriculture

Codes JEL : Q0 , Q1

Introduction

Agriculture is important not only for what they produce, but also the function of society by large agricultural population and its role in environmental protection, preservation of rural life and landscapes. Because of the importance of agriculture in the economy is imperative to be among the priorities for short and medium term development in the restructuring and modernization, and long term to remain a chance for sustainable development of European rural.

1. Typology of farms

Diversification of products and services produced in the rural economy of our country, shows a heterogeneous structure of the activities of farms area, which makes it difficult to define their typology, according to uniform criteria. The activities to be carried out as a peasant grow, the more it requires the establishment of multiple and different criteria. From within the unitary system of criteria: two needed to define the specific nature and peasant: the size of production capacity, the structure of income and use of working time

1.1. Classification according to production capacity

Peasant household can produce goods and services directly correlated with wealth and resources available at household work. Distinguish two types of households:

- *Subsistence peasant farm is a closed household, whose dominant feature is the self-consumption*, combining self-sufficient nature of marketing the production of varying amounts, small products. Priority is self-consumption production in many changing situations is not fully insured to the real needs of rural families ensure their living from agriculture. Living standard of such a farm is different and varies from region to region. Principal factors that determine such differentiation are: wealth of the farm, inherited mentality and traditional culture, education, access to services, the local development, local market for specialty products and public services, incentives and facilities for the small producer, etc..

Subsistence family farms, in most can not qualify to become a strong farm type, they produce primarily for their own consumption. As economic modernization and expansion of market mechanisms, reduces the number of such households is manifested more pronounced tendency of associative forms of organization, leading to the formation of viable farms, run by professionals who produce for market conditions efficiency. Associative forms are now operating type lease agricultural associations and that the economic results achieved so far inconclusive, failed to convince landowners of their viability. This phenomenon is influenced by the current state of the owners having no other alternative, are placed in a position to call the organizers or entrepreneurs associative forms to be received in such an association.

The combination of the developed countries to build on small property fund, which by association, finds support both in production and circulation in the area by providing necessary inputs and value by selling their products in terms of economic return.

Small farms (up to 5 ha) can be considered subsistence family farms. Such a holding is generally devoid of means of production and financial resources which, without state support, have little chance of survival. It produces small quantities of products and varied, depending comercializându need them acoperirii expenses.

- *The peasant type, whose dominant feature is the production for market*, for profit. From this typological group are households that have an adequate financial situation and

investment and specialization of activities are likely to become a modern farm. The commercial farms, have all chances to become family farms like those operating in developed countries.

As development and increased investment process, the peasant household is increasingly linked to the market. This is a springboard for Western-style farms, the entrepreneurs who take on lease land from owners who can not work the land, and entrepreneurs to develop viable farms, the optimum size.

1.2. Classification by income structure and use of working time

Although the two components seem different, they essentially are the same. According to this criterion we distinguish:

- *Agricultural farms derive income solely from agriculture*, the whole working time is allocated only to agricultural activity. This does not mean that the active workforce is employed within the household. Peasant families who have small areas, generally produced for own closed circuit.

Depending on their placement from the market, there are small holdings of about 0.5 ha arranged greenhouses for cultivating vegetables and flowers in culture alternatives to get much higher revenue than grain growing areas of 5-10 ha. Moreover, grain producers have an occupancy rate of time much less than those who practice the culture reduced in protected areas. Due to the low level of technical equipment, a dominant feature of these groups of outer type production extensively.

- *Pluriactive peasant households* who derive income from agriculture and at least another activity such as employment, practicing some crafts or providing services, after the occupation of working time allocated to agricultural activities. Peasant households are deriving income households practice mixed pluriactivitatea generated by objective factors such as: have a surplus of labor, time allocated to domestic and agricultural work are not utilized, farm size does not ensure the existence and the revenue needed development; traditionalism of households to practice agricultural activities during the off season friendly farming: different trades, crafts or provide services to farmers and rural population.

The frequency of these households is higher in hill and mountain areas where the average farm size is small, and in areas where local resources are varied and rich.

2. National Rural Development Programme Objectives

National Rural Development Programme (NRDP) 2007-2013 will be implemented in a period of significant change for agriculture and rural areas of Romania as the country takes its first steps on the EU market and the full effect of the reforms of the Common Agricultural Policy (CAP) will be felt during this period. The first effects are felt in those years, when significant changes occur. Also, growth of the economy in general has a significant impact on the sectors of agriculture and rural economy in terms of opportunities and threats.

National Rural Development Programme in Romania will focus on issues such as competitiveness, environment, quality of rural life, with the overall objectives:

- increasing the competitiveness of agriculture and forestry;
- improving the rural environment;
- improve quality of life and diversification of rural economy;
- initiation and operation of local development initiatives.

Measures under Axis 1 aim, first, improving the efficiency of agriculture and forestry sector to succeed to face the competition resulting in an open environment of foreign trade. The results should be a workforce better trained in agriculture, with an improved age structure, a better structure of land resources, the subsistence farms entering the market, modernized commercial agriculture, higher added value and quality improved products which will further enhance productivity and competitiveness of agriculture and forestry.

3. Support for semi-subsistence farms

Supporting the overall objective of the measure of semi-subsistence farms (141) is to increase the competitiveness of agricultural holdings undergoing restructuring to help ease problems of transition, given that the agricultural sector and rural economy are exposed to competitive pressures of the single market .

Beneficiaries of the measure are individuals engaged in economic activities, mainly farming, the farm which has an economic dimension between 2 and 8 ESU is located within the country, is registered in the register of farms and farm register, sell a part of produced agricultural production and establish a business plan.

Support under this measure is necessary to ensure income during the restructuring and transformation of semi-subsistence-oriented farm market through sustainable use of factors of production, diversification of agricultural production through improved management and introduction of technologies adapted to local conditions.

The first session for submission of projects was held between December 3, 2008 to February 27, 2009, session benefiting from an allocation of 47,607,740 euros, or 10% of the established government financial allocation for 2007-2013.

During this session for submission were submitted 6442 projects with a total amount requested by eligible 48315.000 thousand euros. Of the 6442 submitted projects were selected following the 6262 Selection Committee meeting, out of which 6148 were contracted projects with a value of 46110.000 thousand Euro grant eligible.

Regarding the distribution of approved projects according to farm size, the situation is as follows:

- Holds the largest share of category size <5 ha (74.69% of total projects approved for this measure) of 4592 eligible projects approved and a grant value of 34440.000 thousand Euro;
- 5 ha size ≤Dimension <10 ha has a weight of 15.11% of total projects approved for this measure, approved 929 projects with a value of 6967.500 thousand Euro grant eligible;
- Category "Size ≥ 10 ha" has a weight of 10.20% of total projects approved for this measure, approved 627 projects with a value of 4702.500 thousand Euro grant eligible.

Table 1: Status of projects for each type of farm size

Dimension of the farm	Number of project	Value €	Share (%)
<5 ha	4.592	34.440.000	74.69
5-10 ha	929	6.967.500	15.11
>10 ha	627	4.702.500	10.20

Powered by author

The total number of semi-subsistence farms supported (6148):

- 786 farms are headed by women;

- 2012 farms are run by young people under 40 years;
- 2711 holdings are in disadvantaged areas;
- 803 apply for Agri-environment farms.

In terms of regional distribution, Constanta South East Region 2 has the largest share, ie 18.38% of total projects approved this measure, followed by North West Region 6 Satu Mare, accounting for approximately 18.33% of total projects approved and South-Muntenia Region 3 with a weight of 16.36%. The three regions have a share of approximately 53.07% of all projects approved under this measure.

Table .2: Regional distribution of aproved projects

Region	Number of aproved projed	Eligible grant amount Euro
1 North – East Iași	977	7.327.500
2 Constanta South East	1.130	8.475.000
3 South Muntenia Târgoviște	1.006	7.545.000
4 South West Oltenia Craiova	615	4.612.500
5 West Timișoara	413	3.097.500
6 North West Satu Mare	1.127	8.452.500
7 Centru Alba Iulia	855	6.412.500
8 București Ilfov	25	187.500
Total General	6.148	46.110.000

By the end of 2009 have made payments of approximately 9207.196 thousand euros, representing EAFRD contribution 7365.757 thousand euros.

Payments situation in terms of farm size is as follows:

1. Size <5 acres - have made payments amounting to 6878.268 thousand euros, representing 74.69% of the public contribution paid to beneficiaries for the measure, the EAFRD contribution being 5502.614 thousand Euro;
2. 5 ha ≤size <10 acres - have made payments amounting to 1390.210 thousand euros, representing 15.11% of the public contribution paid to beneficiaries for the measure, the EAFRD contribution being 1112.168 thousand Euro;
3. Size ≥ 10 acres - have made payments amounting to Euro 938,718 thousand, representing 10.20% of the public contribution paid to beneficiaries for the measure, the contribution of the EAFRD is EUR 750,975 thousand.

Table .3 Value payments broken down by farm size

Dimension of the farm	Amount paid €	Contribution FEADR €	Share (%)
<5 ha	6.878.268	5.502.614	74.69
5-10 ha	1.390.210	1.112.168	15.11
>10 ha	938.718	750.975	10.20

Conclusions

European agriculture has a key role in protecting biodiversity. It is important that action on these Community priorities are further strengthened rural development programs. Innovation can contribute particularly to the development of new technologies, products and processes and will therefore support efforts to tackle climate change, renewable energy, water and biodiversity management. Should be granted specific support for innovation with reference to these challenges, to increase the effectiveness of those operations.

With a total area of 238,000 km² and a population of over 21 million inhabitants, Romania is the largest, the second new EU member state. It represents 6% of the total EU and 4% of its population. Investment and competitiveness in Romania are still issues to be improved to be able to accelerate growth and ensure income convergence with the EU.

A balanced rural development policy for the future is not an option but a necessity, especially considering the fact that the issue of agriculture and rural development has important national connotations and is a very complex and present in Romania

Thanks

STUDY ON THE CAUSES OF REGIONAL ECONOMIC DISPARITIES IN ROMANIA

Talmaciu Mihai

„Al. I. Cuza” University of Iasi, Romania, Faculty of Economics and Business Administration

Borza Mioara

„Al. I. Cuza” University of Iasi, Romania, Faculty of Economics and Business Administration

Successive enlargements of the European Union have led to increasing heterogeneity of the development levels of the states and regions members. The Romanian development regions are among the most poorly economically developed European regions and are regarded as economies based on production factors where the development of economy is mainly triggered by the poorly qualified labour and the natural resources.

This paper aims to analyse and to identify the factors lying at the bottom of regional development and the causes of Romanian regional disparities, by comparative analyse and the break down the basic development indicators into their components.

The regional economic disparities from Romania tend to be more prominent due following causes: low level of development of most regions, structure of economy dominated by economic sectors with a low productivity; the low research-innovation potential; the low share of the population having a higher education, reduced capacity of the poorly developed regions to withhold the highly qualified labour, the weak development of infrastructure, particularly poor quality of infrastructure networks.

Romania stays anchored in a development model characterized by an anachronous economic structure, a poorly qualified labour, a slow accumulation of capital and a reduced sustainability of the development rate.

Keywords: disparities, economic development, region, factors, convergence

Clasificarea JEL: O11, O47, R11, R13

1. Introduction

Given the high heterogeneity of the development levels of the states and regions members of the European Union, the regionally policy occupies a central place within the European Union policies. According to the European Committee, in every fourth region of the widened Europe GDP/per capita is below 75% from the EU average, a fact determining the eligibility of regions for the Convergence of the European structural funds objective” (The European Committee, 2006). These “convergence regions” have several characteristics: low levels of GDP and occupancy, they share within the total GDP of the EU being only 12.5%, as compared to 35% for the total population of the EU (Béla Szörfi 2007: 101).

The main objective of the EU regional policy is the increase of the economic welfare and the bringing near of the development levels of regions, the obtaining of the economic and social cohesion meaning the reduction of the economic and social inequalities among the European regions. The economic cohesion is a desiderate followed by the European Community ever since its setting up, so it was mentioned in Article 130a of the Treaty of Rome for the setting up of the European Community. Article 3 of the European Union

Treaty stipulates „European Union must work for a sustained development of Europe based on a balanced economic increase and.. promote the economic, social and territorial cohesion and solidarity within the member states” (European Union 2006: 118).

The important themes of the European Union cohesion policy are the following:

1. Competitiveness which is the central theme of the regional and economic and social cohesion policy. Otherwise, in a report of the European Committee (2002), the EU experts wonder whether the policy of industrial agglomerations itself may be the “landmark” of the EU’s reference objective, namely to become the most competitive region in the world until 2010. In concordance with the mutations produced in the evolution of theories and models for economic increase and development, the Lisbon Agenda put in the centre of attention the economic growth based on the technologic progress and employment.
2. The active policies related to the labour market focus on the encouragement of employment, the consolidation of the social cohesion and reduction of the poverty risk and incidence.
3. The sustainable development means the orientation of the regional policies towards the attaining of the objectives established by Goteborg agenda (2001).

2. Literature review – Economic development and regional disparities

According to the large economic thinking currents that lay at the bottom of formulation of increase/development theories and models, the support of the regions left behind so as to recover the gap separating them from the developed regions may be achieved in two ways: regional development policies and measures (Keynesian and post-Keynesian approaches) and promotion of the economic liberalism (neoclassical approaches) leading to the general economic progress.

A controversial issue related to the regional growth disparities refers to the medium-long term vision on the consequences of regional growth. Based on Solow’s model (1956), the neoclassical economists underlying the role of demand within the regional growth came up with the idea that the regional disparities diminish once with growth.

On the other hand, Myrdal (1957) and other post – Keynesians sustain that the regional growth process is a spatial cumulative one leading to the increase of regional inequalities.

Williamson (1965) shows that in the initial stages of development, when investments in the physical capital are the main engine of economic growth, inequality stimulates growth through the orientation of resources towards those who save money and invest more. Conversely, in developed economies, the accumulation of the human capital replaces the accumulation of physical capital as the main engine of growth. Williamson sustains that in the initial stages of a country’s development, there are increases of regional disparities whereas in more advanced stages, development may lead to regional convergence.

The issue of disparities in the regional economic development gives rise to intense discussions among the development theorists since the goal of regional development is not just the one of identifying methods for the promotion of economic growth and structural changes in economy, but also of improving certain social aspects such as health, education, the work conditions etc. An important problem is to find an adequate manner for the analysis of the regional growth and development processes, to identify the factors contributing to accentuation or diminution of disparities. Depending on the purpose for which they make the measurement of the economic growth and disparity analysis, we may

use the following indicators: increase of total output, increase of output per employed person, increase of output per capita.

The identification of causes of regional disparities supposes the identification of the causes leading to the interregional gap of GDP/inhabitant. Thus, we may identify four factors tightly connected to the interregional differences of GDP/inhabitant: structure of the economic activity, the size and potential of the research/innovation activity, region's infrastructure and accessibility, education and labour qualification (Ciupagea C et al. 2004: 115).

The studies carried out show that between the abovementioned factors influencing the regional GDP and the economic growth potential, there is a relatively strong connection (Ciupagea C. 2004). Thus, the developed regions are characterized by high employment rates in high productivity sectors (industry, constructions and services, mainly productive/producers' services) whereas the poorly developed regions are characterized by large shares of employment in agriculture, a fact that hampers the economic growth. At the same time, a high level of education as well as the existence and development of an adequate infrastructure favours economic growth.

The framework for the analysis of regional development and the accentuation/reduction of the interregional disparities should be extended on other factors related to the mutations and evolutions occurred within the EU economic policies at world level. Thus, knowing that the engine of capitalist economy is represented by the free initiative and competition among entrepreneurs, it is necessary to include in the regional analysis the residential population's capacity to take the risks and responsibilities afferent to the private initiative, to generate the technical progress and innovating activities that might propel them in leading positions of the market, to benefit from competitive advantages created by the property rights.

Regardless of the economic theory or theories shaping the regional development policies at a certain time, a decisive role in the general progress of the region might be played by the social innovations. They refer to the capacity and will of individuals, enterprises and public entities (central or local) to collaborate in order to adapt and permanently improve the economic policies so as to ensure the balance between the capitalization of the factors lying at the bottom of the economic progress and the changes occurring in the economic realities.

3. Research methodology

The different approaches of economic theories and policies related to development must identify and take into account the factors that may lead to the economic convergence or non-convergence among regions and countries. (Ray Debraj 2008). In order to analyse the traditional indicator of the development level – GDP per capita – and to study the causes of its evolution at regional level, it is useful to break it down and study the influence of six factors on the economic development level. These factors mainly refer to the structural characteristics of regions such as: structure of economy, demographic structure, relative competitiveness of factors, efficiency of operation of the local market and labour, productivity differences – given the regional structure of the industrial mixture, the differences in the occupancy rate – given the regional demographic structure (Bruno Bracalente and Cristiano Perugini 2008: 2). This paper aims to analyse and to identify the factors lying at the bottom of regional development and the causes of Romanian regional disparities, by comparative analyse and the break down the basic development indicators

into their components: structure of the economic activity, the size and potential of the research/innovation activity, education and labour qualification, region's infrastructure.

4. Research results - Causes of regional economic disparities in Romania

The comparative regional analyses of our country indicate that there are no developing regions where the economic progress and the development level are uniform in all the composing counties and areas/spaces. In most regions, despite their diversity, we must consolidate and capitalize the factors lying at the bottom of development from the free market perspective (Ciupagea C et al.2004: p117). Thus, besides the activity domains of social interest we must stimulate the economic activities making the object of private initiatives from all fields.

Table 1 Indicators of regional economic disparities
2007

Indicator \ region	GDP/inhab. PPS/inhab.	GDP/inhab. % in EU average	GDP/employee EUR (2006)	Income of private household (PPS/inhab)
North East	6600	27	6583,8	4064,4
South East	8400	34	9219,1	4669,7
South	8500	34	8741,8	4478,5
South West	8100	33	7918,2	4705,5
West	12000	48	12476,1	5757

Bucharest	23000	92	21505,4	9296,3
Romania	10400	42	10496,2	7053
EU27	25000	100	53074,6	18976

Source: Achieved by author based on data Eurostat, Regional statistics, Regions and Cities

The Romanian development regions are among the most poorly economically developed European regions and this fact is shown by Eurostat statistics and documents that characterize the economies of the regions from our country as having a medium development level and so they are regarded as economies based on production factors where the development of economy is mainly triggered by the poorly qualified labour and the natural resources. The only region making an exception and falling into the category of intermediate regions is Bucharest-Ilfov region that registered in 2007 a GDP/inhabitant of 92.2% from UE27 average (Paola Annoni and Kornelia Kozovska, 2010).

The heterogeneity of levels of regional economic development in Romania is very high (table 1). Thus, the North-East region is by far the most poorly developed of the regions of our country characterized by a GDP per inhabitant 3.48 times lower than that of Bucharest-Ilfov region and 3.8 times lower than the average GDP of UE27. PIB/inhabitant of the North-East region established as a share from the average GDP/inhabitant of UE27 is 27%, one of the lowest of all the EU development regions. At the same time, the available income of the private households is about 2.3 times lower than that of Bucharest region and 4.7 times lower than the average income of UE27.

An explanation of these gaps in terms of the GDP per inhabitant is the low work productivity from the development regions of our country as compared to the average productivity of UE27. Thus, the work productivity of the North-East region, expressed as a ratio between the regional GDP and the employed population, is 1.6 times lower than the national average, about 3.3 times lower than the Bucharest region and 8.1 times lower than the average productivity of UE27 regions. The low level of regional work productivity may be attributed to the structure of regional occupancy by activity fields (table 2).

Table 2 Regional economy structure - Employed population by sector

2006

Sector region	N-E	S-E	S	S-V	V	N-V	C	B
Agriculture	47,7	32,5	35,4	46,4	18,7	29,4	16,8	2,1
Industry	23,1	27,9	32,4	24,1	41,3	32,6	41,7	28,2
Services	29,2	39,6	32,2	29,5	40,0	38,0	41,5	69,7

Sursa: Achieved by author based on data Eurostat INSSE, Statistici regionale

In 2006 the structure of the activity fields was dominated by agricultural activities in the most poorly developed Romanian regions, 47.7% in the NE region and 46.4% in the SW region. The more developed regions (Bucharest-Ilfov, Central area, the Western area) are characterized by a better employment in the industrial and service providing sectors with a work productivity superior to the one in agriculture. We also may notice in all regions a shifting of the labour from agriculture towards the non-agricultural branches, the share of employment in agriculture registering a descending trend. However, the transfer rate of labour from agriculture to industry and services was faster in the more developed regions (central area, western area) than in the more poorly developed regions (NE, SW, NW). The inadequate structure of economy and the high importance of the sectors characterized by a low work productivity in employment and GDP explain why the Romanian economy has known a larger GDP contraction: -7.1% in 2009 and -1.3 % in 2010, as compared to the UE27 average: -4.2% and 1.8% (Eurostat). Accentuation in time of the interregional disparities from Romania is highlighted by increase of dispersion of the regional GDP/inhabitant from 12.8 in 1995 to 35.3 in 2007, whereas for the entire UE27 the regional GDP/inhabitant has a slightly decreasing trend from 35.4% in 2001 to 32.7% in 2007.

An important role in the process of development of regional economies is played by the access of residential population to education and professional training. EU regional statistics shows that the share of the population aged between 20 and 24 years included in the tertiary education is higher in the regions with economy more developed: Bucharest 248.9%, the Western area 66.3%, the central area 55.5%; and lower in the in the less developed regions:

North East 34.2%, South Muntenia 19,7 %, South West Oltenia 36,4 % South East 32.7% (data from 2008). These weights have seen an upward trend during 2002-2008 in all regions, but this was more pronounced in developed regions. The share held by the development region of Bucharest (248.9 %) shows that the academic education institutions from the country's capital city attract students from other development regions. The highly qualified human resources are attracted towards the developed regions offering a better access to the labour market and remuneration.

**Table 3 The extent and potential of research / innovation activities
2008**

Specification	Human res. In science and tech. (% ec. act. pop.)	Researchers, all sect. (% total empl.)	Employment in high-tech sect. (% of total empl)	Total intramural R&D expend. (eur/inhab.)	Total intramural R&D expend. (% GDP)
North East	17	0,12	1,31	15,7	0,39
South East	18,5	0,06	1,21	9,5	0,18
South	16	0,13	1,23	18,9	0,35
South West	18,5	0,09	0,95	10,5	0,21
West	21,8	0,11	4,16	21,6	0,31
North West	22,4	0,16	2,03	25,8	0,45
Central	22,2	0,1	1,71	8,6	0,14
Bucharest	42,2	0,97	6,55	224,9	1,42
Romania	-	0,31	5,6	37,6	0,58
EU27	-	1,04	6,59	481,6	1,92

Source: Achieved by author based on data Eurostat Eurostat, Regional statistics, Regions and Cities

Current models of development in advanced countries and regions, focus on promoting a knowledge-based economy, technological progress, research and innovation (Romer 1986, Lucas 1998, Aghion și Hewitt 2009), but Eurostat data show that the most regions in Romania are not yet able to implement such a model (table 3). The shares of human resources involved in the research and high tech activities are higher in the developed regions than in the less developed ones. Thus, the north-east region which is the weakest of all the Romanian development regions was characterized in 2008 by 0.12% population employed in scientific research as compared to 0.97% for Bucharest region and 1.04% the UE27 average. At the same time, employment in the high-tech sectors was in 2008 of only 1.2 % in the North-East region as against 5.45% in Bucharest-Ilfov region and 6.59% the EU average. In 2008 the research-development expenses per inhabitant from the north-east region were 14.3 times lower than the ones from Bucharest-Ilfov region and 30.7 times lower than the average of UE27 regions. However, these expenses have registered an ascending trend for all regions and the gaps tend to slightly diminish. In 2008, the Romanian development regions allocated for the research-development expenses shares between 0.14 (the central region) and 0.45% from the GDP (north-west region) as compared to 1.42% from the GDP in Bucharest-Ilfov region and 1.92% which is UE27 average. The involvement of the private sector in the research-development activities in the Romanian

regions is extremely reduced as compared to the UE27 average. Thus, the share of the private sector within the average research-development expenses per Romanian inhabitant was 30% whereas the regional average of UE27 was 63.2%.

The data presented above show that the development model of the Romanian regional economies comes into contrast with the current trends of the development models from the European developed countries and regions. Thus, if the main engine of development of the regional economies from the developed countries is the research-development-innovation activity and the development of the innovating sectors characterized by high technologies, the Romanian development model is characterized by an inadequate structure of economy where the agricultural sector absorbs a very large part of the active population.

5. Conclusions

The regional economic disparities from Romania tend to be more prominent due to the low level of development of most regions; thus Kuznetz's and Williamson's hypotheses, according to which in the initial stages of a country's development, there are increases of regional disparities whereas in more advanced stages, development may lead to regional convergence, are confirmed. At the same time, we may notice the existence of some regional growth poles (the country's capital city, Bucharest, and several more important towns of the country) where the factors favorable for development are concentrated: internal and foreign capital, highly qualified labour and the research-innovation activity.

Among the causes of accentuation of the regional economic disparities we can stand out:

- the structure of economy dominated by economic sectors with a low productivity of the production factors. In the most poorly developed region of the country the population is preponderantly employed in agriculture what explains the reduced regional productivities. Unfortunately, the transfer rate of labour from agriculture to the non-agricultural sectors is a very slow one, due to the slow development of the entrepreneurial initiatives of the residential population, mainly in the industrial domains and services having a high technological level.

- the low research-innovation potential due, on one hand, to the insufficiency of the financial resources allocated from the state budget and the poor implication of the private sector in funding the research-innovation activities and on the other hand, to the insufficient human resources weakly motivated and the migration of the highly qualified labour and the people having a higher education towards the developed regions offering better perspectives for employment in fields of competence, better jobs and remuneration. To stimulate the research-innovation activity, it is first of all necessary to develop the business environment and to promote social innovations, the collaboration among the research institutions, the private organisations and the public institutions.

- the low share of the population having a higher education as compared to the developed regions due to the reduced capacity of the poorly developed regions to withhold the highly qualified labour. Another drawback refers to the quality of the training activity and the capacity of education to offer the labour skills and competences required in the labour market. To a certain extent, this explains the weak collaboration or the lack of communication between the business environment and the educational institutions so as to highlight the deficiencies in the formation of labour and to identify the skills/abilities necessary to ensure the access of graduates to the labour market.

As a general conclusion, while the developed countries discuss the passing from the development models focused on the accumulation of production factors to models centered on innovation and the human capital with high skills and competences, Romania stays anchored in a development model characterized by an anachronous economic structure, a poorly qualified labour, a slow accumulation of capital and a reduced sustainability of the development rate.

Currently in Romania, the information sources available to farmers are limited and belong mostly to the public sector. The knowledge provided is relevant but insufficient in order to meet the needs of the Romanian farmers, especially since they are not oriented towards the market, as the main segment of interest. This paper has the intention to emphasize the need to introduce ICT as the main tool in supporting the decision making process and in resolving the specific issues faced by this sector. In analyzing the current situation regarding this matter, in order to propose ways to resolve the problems encountered in achieving knowledge transfer, until now, were addressed issues such as: the evolution of the knowledge transfer concept, development milestones and actions that marked the RDI sector as the main producer of information, the main supporters of the farmers in their information actions (World Bank, IFAD), means, procedures and techniques used for transmitting knowledge (extension; consultancy). But what is most important is making all this resulted information available for the farmers, fact which can only be accomplished, in our opinion, by introducing and implementing ICT in the rural areas. The main method of research is the statistical data analysis of the data regarding the components involved in the knowledge transfer process and the current status of implementation of ICT in the rural areas. Among the expected results are included identifying the main restrictive factors in achieving knowledge transfer in rural and the main implications that implementing ICT would have on farmers' market position. Introducing ICT in the rural area is, in our opinion the best way to transform information, as a research result, into knowledge, becoming this way a real input for the farmer. In practice, this will lead to lower production costs, lower prices for inputs, increased revenues by increasing the production's prices and, not least, increased level of the European funding resources attracted for supporting investments.

Keywords: knowledge transfer, ICT, sustainable development, rural areas, knowledge society;

JEL Codes : Q01 , Q16

1. General context

The new emerging society based on knowledge, imposes a new approach in the development of rural areas, in which innovation, information and ICTs have become at least as important as the physical geography and infrastructure.

The rapid development of ICTs is transforming the world's economy and society. In the last years, ICT usage in EU has increased considerable to the level in which, according to statistics, more than 250 million people from the member states, are regularly using the internet. At the same time, the public sector has advanced in the use of ICT for delivering its services more efficiently in sectors like education, health and public administration giving birth to the so called online public services. But this is not the case also for the micro-enterprises and SMEs from the rural areas, for which poor access to internet is a discouraging factor for businesses in their attempt to develop various activities and to enter different markets which are still controlled by large enterprises who continue to dominate the use of modern technologies. One reason for this is that existing entrepreneurs have insufficient skills to use modern technologies. Therefore ICT, due to its impact on individuals, businesses and on the socio-economic environment in general, has become one of the most significant factors determining productivity growth, which is reflected in the GDP growth registered by the EU member states.

But despite the progress made in recent years, significant differences still exist not only between Member States, but mainly at national level, between rural and urban areas. According to statistics, by 2007, only 70% of the EU rural population was able to subscribe to a broadband connection as opposed to 98% of the population in urban areas. This was the situation before the accession of Romania and Bulgaria which tipped the balance even more in favor of the urban areas.

In order to be able to identify the main factors of change and the competitive advantages that ICT usage would bring for the rural areas, requires a rigorous analysis of the current way in which services, that are highly impacted by ICT applications, are provided or businesses, as the main source of income for rural communities, are run. This is, a growing.

We also have to consider that the use of ICTs opens up new areas of economic, social and cultural activity, of considerable importance for rural and communities, and calls into question aspects like geographical and political orders, conventional approaches to employment, education etc. In practice this means a thorough rural restructuring that will significantly accelerate the development of the targeted areas, but only if the ICT services provided will be adapted to the specific needs of local population.

In this general context the European Commission has assigned a central role to the development of on-line services. The low level of socio-economic development of the rural areas and the fact that almost half of the EU population resides there, make them the best candidates in taking full advantage of the benefits offered by ICT usage. But introducing these services will be very difficult due to the action of several restrictive factors and will require further planning, provision and support for training, connectivity, equipment.

This is way EAFRD is supporting the development of ICT businesses, services and broadband in rural areas. The opportunity to invest in these areas and in the upgrading the rural population skills, has been strongly encouraged. Investments in hardware and software are eligible in all programmes and in all measures, where their use is relevant. For example investments in broadband infrastructure are concentrated in the measure for developing basic services for the rural population and economy under Axis 3 of rural development.

2. Restrictive factors in implementing ICT in rural areas

Analyzing the situation strictly from the geographical location we can see considerable differences in access and use of PCs and particularly of Internet. The rural areas find themselves in great disadvantage to the big cities for several reasons among which the fact that Internet requires network infrastructure and services and in rural areas, the cost of access tends to be higher and quality of service lower, despite some countries' efforts to ensure standardized pricing and quality. Also incomes tend to be lower in rural areas, and ICT costs are relatively higher for low income groups. Moreover, the members of households in urban areas are more likely to have jobs and different other economic or social occupations in which computers and the Internet are needed. But even if we manage to surpass the technological problematic aspects, the main problem will be to find adequate financial sources to introduce them in this areas.

At the moment only two data sources are available at EU level concerning ICT, namely the Idate data on broadband coverage and the Eurostat Community Survey on ICT usage in households and by individuals. But the information provided is sufficient and relevant in order to describe the general current situation. After analyzing the available data the results confirm the situation outlined before namely that there are significant gaps between urban and rural areas, thinly and densely populated areas, and that these gaps cannot be ignored and need to be reduced.

In order to due that we need to identify and analyze the main restrictive factors from the rural areas that prevent ICT development. Among them we mention:

2.1. Infrastructural deficiencies

Great efforts are needed to create equal conditions in rural areas compared to urban areas in order to minimize the existing gaps, especially since, in some specific cases, there are not even the most elementary technical facilities in the rural areas for using broadband and having internet connection.

Like in the case of Lithuania, Poland, Slovakia broadband coverage in rural areas is particularly low because of local geographical specificities and the related high costs for maintaining the network infrastructure. This is the reason for which the telecommunications operators are oriented to the massive and commercial urban market. Finding a economically feasible solution for both service providers and end users that will satisfy bough is imperative. Thus, one of the most important aspects that has to be taken in consideration in the process of designing and implementing new applications is the consumers capabilities. This is way in order to achieve their potential benefits it is necessary to focus on user-oriented and cost-effective services rather than on technology-driven applications.

2.2. High costs –low incomes for the farmers

Like in other parts of the EU, the high degree of dispersal of the population in the rural areas complicates and increases the price of the provision of infrastructures and basic services, constituting a significant deficiency, because, most of the time, ICT's prices become inaccessible for the Romanian rural population, which leads to situations like the fact that In broadband penetration is about 6 times higher in urban than in rural areas,. This is way the low incomes of the farmers (compared not only to the incomes of the urban population but

also to the incomes of the farmers from other EU Member States) continue to be one of the most important factors holding down ICT usage, especially in countries which have to catch up economically like Romania.

2.3 Young people migration towards rural areas

Rural areas have been out-drained for knowledge mostly by the out-migration of young people to cities and urban areas. This characterizes especially the new Member States among which is Romania. As a result of this negative process, e-learning and the development of infrastructure for its diffusion such as training centers become important priorities for rural areas.

2.4 Low level of education of the local population especially in the field of ICT

The competitiveness of industrial sectors in rural regions depends on the quality of research and the ability of consumers to transform its results (that in the last years can be accessed mainly under electronic form) into knowledge, by consuming it properly. This is way upgrading e-skills through local educational courses and training on PC use as well as training on broadband network development, which will address not only the population involved in agricultural activities but also the ones that develop different activities, becomes a necessity for local rural communities.

The effects of such an action will be seen in the improvement of the decision making process of the farmer that not only has increased his access to more information but also has improved his capacity of understanding it, resulting in a better usage.

3. Main effects of implementing ICT in the rural areas

Implementing ICT can impact on the rural areas in various ways. The effects can be found bought at individual level - farm businesses, but also at community level. Experience shows that even the most traditional activities can, or have the potential to, generate economic opportunities. ICT could provide access to new technologies, practices and production methods, markets current situation, information about different players in the field that would the development of relationships of all types within certain agro-food chains, that would support the cultivation of this opportunities.

Basically ICT and access to the internet represent support tools on one hand for communication and relationships between the rural community members and, on the other hand, for establishing a permanent connection to the economic environment, national or international, especially with the markets and their evolution.

3.1. Improving education level of the local population

ICT and Internet usage requires a set of skills and competencies which are mandatory in order to benefit from their advantages. This is way one important aspect contributing to the development of the rural areas is the farmers ability, as producers and managers, to take fast and correct decisions as well as to implement production practices and technological processes in a way that ensures their sustainable development.

Skills upgrading is a major factor in achieving these objectives. Developing IT competence among the farm community is an essential part of rural development policy and its outcomes can make a vital contribution, for example, to the adjustment of farmers to market situations and the use of new technologies.

Developing broadband without potential beneficiaries who have the skills to use it will not result in positive outcomes. Training can serve not only as a skills upgrading measure, but also as an instrument reducing unemployment, developing entrepreneurship and promoting knowledge.

So shortages of skills and qualified staff represent a major obstacle, and special attention should be given by the authorities in order to improve the situation .

3.2 Improving the local population access to information

The database currently existing in the rural areas is incomplete and inadequate for the farmers current needs, and is still transmitted by oral means among the members of the community, not being able to guarantee the accuracy of the information and giving it a highly volatile feature, This puts Romanian farmer in a disadvantage compared to the other participants from the agro food market. Introducing and promoting ICT has an important role in integrating the existing information in a wider database, making the data more reliable and accessible, for all the community members. The effects would be a shift in the market position of the Romanian farmers that will automatically become more competitive as a result of being better informed.

3.3 Income diversification for the farmers delivering ICT services

Implicating the local population in implementing ICT and maintaining it will result in creating new jobs. By creating additional income opportunities, that will allow the farmers not only to support themselves and their families, but also to become less dependent on changes in climate conditions and market fluctuations, will prevent the migration towards the cities and could even attract part of the population towards the current rural depopulated areas and enrich the socio-economic development of rural areas by providing the local population with services.

3.4 Modernization of agricultural holdings and adding value to products

The European Union, true the funds for sustaining new member states gave Romanian farmers the possibility to modernize their businesses. Substantial support for agricultural holdings, including for the purchase of computers and new technologies and machinery, are provided under two measures of Axis 1 of rural development — “Modernization of agricultural holdings” (code 121) and “Adding value to agricultural and forestry products” (code 123). The purpose of this action is to improve the consumption of information by giving farmers the possibility to develop the necessary infrastructure for accessing it.

3.5 Creation of micro-enterprises and business development

Micro-enterprises and rural off-farm businesses will also benefit substantially when it comes to the development of IT. The creation of ICT-based services, cooperation networking, e-commerce and e-marketing, cluster formation and bookkeeping, are the main targets of the current policy in the field. It is considered that they will represent a real support not only for the existing businesses but also for the start-up companies that will benefit for all the new technology and information provided by ICT.

3.6 Rural tourism and ICT

Rural tourism represents one of the major economic pillars for business development in the rural areas, a non agricultural activity that has become very popular in the last several years and that provides the local population with an additional income.

Tackling rural tourism with ICT can lead to positive effects everywhere, but especially in areas with poor or missing telephone infrastructure where access to the internet is hugely disadvantaged or absent.

In the new period ICT will contribute to rural tourism mainly through the creation of websites for marketing and e-booking, tourist web portals, information centers equipped with ICT, etc

3.7 Other expected effects

The current situation presents sufficient evidence that growth in rural areas can be achieved if ICT is used correctly by addressing current market and socio-economic deficiencies. Among other expected effects that will benefit the rural areas we can mention reducing the unemployment rate by creating new jobs, raising environmental awareness by distributing knowledge and education on environmental problems and issues and promoting sustainability, insuring the local population with the basic services, promoting the local cultural and natural heritage.

4. Conclusions

The new technologies that will emerge could radically change the present distance constraint of the ICT. These points to the need to develop tools and techniques to help rural areas to plan and ensure that the appropriate solutions are selected for their individual needs and in order to adopt to new technologies.

Never the less implementing ICT will benefit the rural areas by providing aid to traditional activities in the promotion and the commercialization of existing, traditional, products (small industry, handicrafts and agriculture) by creation of new service activities.

Agricultura este importantă nu numai pentru ceea ce produce, ci și pentru rolul deținut de societate prin populația agricolă numeroasă și prin rolul său în protecția mediului, în conservarea vieții rurale și a peisajelor. Datorită importanței agriculturii în economie este imperios necesar să se afle între prioritățile de dezvoltare pe termen scurt și mediu în vederea restructurării și modernizării, iar pe termen lung să rămână în continuare o șansă pentru dezvoltarea durabilă a mediului rural european

THE FINANCING OF THE ADMINISTRATIVE – TERRITORIAL UNITS IN THE WEST DEVELOPMENT REGION THROUGH THE REGIONAL OPERATIONAL PROGRAMME 2007 - 2013

Munteanu Nicolae - Eugen

West University, Faculty of Economics and Business Administration, Timisoara, Romania

The research approaches the theoretical and empirical aspects regarding the way the Romanian administrative-territorial units and development regions are organized and function, with emphasis on the West Development Region. It also focuses on the way the local autonomy is exercised and the administrative-territorial units may cooperate in order to perform common projects.

Furthermore, the financial resources of the Romanian administrative-territorial units are analyzed, with focus on the non-reimbursable funds available during the period 2007 – 2013 through the Regional Operational Programme 2007 – 2013, resources which allow the implementation of the European Union principles of cohesion policy.

The status analysis of the implementation of the projects submitted by the administrative-territorial units from the West Development Region and financed through the Regional Operational Programme 2007 – 2013 highlights which are the main areas of interest for the authorities of the public local administration and gives practical solutions for the reduction of the intra-regional development gaps.

This article is intended to be a guide for the administrative-territorial units in the systematic mobilization of the existing local energies and resources by means of projects which should meet the specific needs for development and which should involve the attraction of non-returnable funds with a minimum effort of co-financing.

Keywords: administrative-territorial units, non-reimbursable funds, region, local autonomy, projects.

JEL: F36, O18, O22, R58.

1. Introduction

In the current context, when the Romanian economy deals with the strong effects of the global economic crisis, the local public authorities incur difficulties in the settlement of the problems they deal with and in finding long term development solutions.

The first step to be taken by a local public authority in order to perform a coherent and durable development of the community is represented by the elaboration of projects in conformity with the development needs.

In such a situation, the financial support granted by the European Union to the member states by means of the structural instruments which finance the policy of economic and social cohesion represents an important opportunity of development for the administrative-territorial units.

2. The Administrative Organization of the Romanian Territory

In Romania, the communes, towns, municipalities and counties are defined as administrative-territorial units within which the local autonomy is exercised and the authorities of the local public administration are organized and operate.

The local, communal, town, municipality and county councils, as deliberative authorities, and also the mayors and the presidents of county councils as executive authorities have the duties to solve the public matters of the community, acting as authorities of the Romanian public administration.

According to the Law of the public administration no. 215 dated on the 23rd April 2001, with its subsequent amendments and addendums, in Romania, the local autonomy is only administrative and financial, having as objective the organization, operation, competencies and tasks, and also the management of the inland resources.

The principle of the local financial autonomy implies the fact that the administrative-territorial units have the right to financial resources, which can be used by the authorities of the local public administration when exercising their tasks. The authorities of the local public administration administer or, as the case may be, dispose of the financial resources, and also of the goods in public or private property of the communes, towns, municipalities and counties, in conformity with the principle of local autonomy (Law 215/2001, article 10).

3. The Development Regions

3.1. Definition of the Development Regions

The region notion bears several definitions, according to the type of the European institution which uses it.

The European Union defines the region as “the immediately inferior unit of the state”.

For the European Parliament, the region is “a territory which forms, geographically, a net unit, or a similar assemble of territories which has continuity, where the population has certain common elements and desires to maintain its specific feature thus resulted and to develop it in order to stimulate the cultural, social and economic progress”.

The European Council considers the region “as a medium size interval which can be geographically delimited and which is considered to be homogenous”.

The Assembly of the European Regions defines the regions as “political entities inferior to the state, which dispose of certain competencies exercised by a government, which in return answers before an assembly democratically elected”.

For the European Union, by means of EUROSTAT, there was elaborated the legal framework for the territorial and geographical division of the European Union territory, in order to coordinate the national and communitarian statistics: The Nomenclature of the Territorial Units for Statistics – NUTS (Common classification of territorial units for statistics).

In Romania, the development regions comply with the provisions of the EC Regulation no. 1059/2003 regarding the settlement of a common classification for statistics of the territorial-statistic units for the regions NUTS II and NUTS III and it represents the framework for the collection of specific statistic data in conformity with the European regulations elaborated by EUROSTAT for the statistic territorial level NUTS II.

Thus, in order to provide stability to the NUTS classification, the Law no. 315/2004 regarding the regional development consecrate the composition of the regions NUTS II, by specifying the counties which are part of the respective regions. Thus, at the end of 1998, eight development regions were created. They represent the framework for the elaboration,

implementation and assessment of both the regional development policy and the programs of economic and social cohesion.

3.2. The West Development Region

The West Development Region is administratively-territorially made of four counties: Arad, Caraș-Severin, Hunedoara and Timiș. The West Region has a surface of 32,034 km², representing 13.4% of the country's surface.

Within the West Region, 323 territorial administrative units are registered, which could be distributed as following: 12 municipalities, 30 towns and 281 communes made of 1327 villages. On the 1st January 2010, the population of the West Region was of 1,919,434 inhabitants, representing 8.94% of the Romanian territory's population.

4. The available financial resources for the Romanian administrative-territorial units

The budget represents the document by which each year there are provided and approved the incomes and expenses or, as the case may be, only the expenses, according to the funding system of the institutions (in conformity with the Law 273 of the 29th June 2006 regarding the local public finances, article 2).

The public expenses from the local budgets are materialized in the acquisition of goods and services by the local authorities for the citizens, in the payments made to the citizens in the form of transfers (pensions, subventions, unemployment allowance, etc), and also in the payment of the loans contracted by the main credit authorizing officers.

The local budget incomes are made of: inland incomes (made of revenues, taxes, contributions, other payments, other incomes and defalcated quotas from the income revenue), defalcated amounts from some incomes of the state budget, subventions got from the state budget and from other budgets, donations and sponsorships, sums received from the European Union and/or other donors on behalf of the performed payments and pre-financing (Law 273/2006, article 5).

The inland incomes are the incomes realized locally by the authorities. The level and sources of these incomes are controlled and decided by the local authorities.

The incomes coming from the national level have as main objective to correct the possible unbalances which occur locally both vertically (the level of the local revenues and taxes do not cover the expenses necessary for the provision of public services), and horizontally, since not all the collectivities manage financially in the same way, although they have the obligation to provide equivalent services, both in quality and in quantity.

The authorities of the local public administration have the possibility to complete their own financial resources by contracting internal or external loans, which they could use to both realize public investments of local interest or to re-finance the local public debt.

According to the Law of the local public finances, the local budget incomes could be made also of the non-reimbursable funds granted by the European Union. Thus, as a Member State of the European Union, Romania participates with full rights in the policy of economic and social cohesion of the European Union.

The cohesion policy of the European Union has as objective the reduction of the development gaps between the member states and between the richest and poorest regions, being financed from the budget of the European Union from three funds: The European Fund for Regional Development, The European Social Fund and The Cohesion Fund, referred to as the Structural Instruments.

Within this policy, during the programming period 2007 – 2013, Romania benefits from a financial support in value of 19.667 billion Euros from the Structural Instruments. They represent financial instruments by which the European Union finances the cohesion policy in Romania, taking act for the removal of the economical and social disparities, in order to perform the economic and social cohesion.

5. The Regional Operational Programme 2007-2013 (ROP)

5.1. ROP in Romania

The Regional Operational Programme 2007-2013 represents one of the seven operational programmes elaborated by Romania and adopted by the European Commission and it is financed by the European Fund for Regional Development. The Regional Operational Programme pursues to support the economical and social development of the Romanian regions, both territorially balanced and durable, according to their needs and specific resources, by focusing on the growth urban poles and on the improvement of the infrastructure conditions and of the business environment.

ROP operates in all the eight development regions of Romania, being allocated throughout the current program period 4.178 billion Euros for the purpose of the local and regional integrated development.

The management, administration and implementation of ROP are borne by the Ministry of Regional Development and Tourism (MDRT), which is appointed as the Management Authority for this programme. The eight Agencies for Regional Development and the Directorate of Communitarian Funds Management for Tourism within the MDRT are designated as Intermediary Bodies for the ROP implementation. The Intermediary Bodies bear the responsibility of fulfilling the tasks delegated to them by the Management Authority.

The main eligible applicants to obtain finances through the Regional Operational Programme 2007 – 2013 are the authorities of the local public administration.

5.2. The status of the ROP implementation in the West Region

The financial grant for the West Region in the period 2007 – 2013 managed by the West Regional Development Agency (acting as Intermediary Body for the ROP implementation) is of 416.52 million Euros, representing approximately 10.34% of the total funds granted to ROP financing.

Until the 15th April 2011, 696 projects were submitted to the head office of the West Regional Development Agency, in order to request non-reimbursable financing.

139 projects were contracted, their total value being 350.93 million Euros, of which 254.46 million Euros represent the value of the non-returnable funds, the contracting degree being of 61.09%. 392 projects are under various stages of assessment, pre-contracting or reserve, having a total value of approximately 796.75 million Euros, of which approximately 569.49 million Euros represent the value of the non- reimbursable financing.

Synthetically, the ways which the key areas of intervention of ROP are accessed are presented in the table below:

Table 1. The implementation of Regional Operational Programme 2007 – 2013 in West Development Region (million Euros)

Source: data supplied from West Regional Development Agency and processed by author

* The values of the projects were calculated in million Euros

** (contracted value / regional allocation)

*** ((value of submitted projects – value of rejected projects) / regional allocation)

**** Administrative-territorial units are not eligible

Due to the great number of submitted projects, the most of the key areas of intervention were closed and no further projects could be submitted for them, except 1.1, 3.3 and 4.2.

It can be noticed that the most attractive key area of intervention for administrative-territorial units was 2.1, dealing with the financing for the road infrastructure, mostly county roads.

The second area of intervention is represented by the educational infrastructure financing, mostly for the schools rehabilitation.

Regarding the rehabilitation of the patrimonial touristic objectives, due to the considerable value of the projects, only 3 projects could be financed, according to the regional allocation.

On the key areas of intervention where the rule of the state aid is applied (4.1 and 5.2), due to the high level of co-financing, administrative-territorial units from the West Region were not very interested to submit projects, regional allocation being covered from projects submitted by private companies.

Also, where the rule “first-come, first-served” applied, a high competition was recorded and the available funds were quickly finished, in comparison with the key areas of intervention where the funds were distinctively granted for administrative-territorial units acting as “urban development poles” and “urban growth poles” respectively, for which even up to the current date there were not submitted sufficient projects to cover the allocated funds.

Conclusions

In Romania, the communes, towns, municipalities and counties are the administrative-territorial units within which the local autonomy is exercised and where the authorities of the local public administration are organized and operate, having the purpose to solve the public matters of the community. For the purpose of carrying out certain projects of common interest, the administrative-territorial units could cooperate together or could be associated, forming partnerships or associations of inter-communitarian development.

The solving of the community problems depends on the level of the available resources, on the management quality of such funds, but also on the cooperation between the various structures of the local administration.

The degree of the local autonomy of a community depends to a great extent on the amount of the incomes realized locally correlated with other income resources of the local budgets. The ideal situation would be that the inland incomes could cover the expenses made in order to fulfill the local needs. But for that purpose, the competences of the local authorities should be correlated with the incomes of the local budgets, and in reality this happens very rarely.

The development regions of Romania do not have the statute of administrative units, but they represent territorial units large enough to constitute a good basis for the elaboration and implementation of regional development strategies, allowing an efficient use of the financial and human resources. The scope for which these development regions were created had in view the support granted for the larger communities in their action to settle the problems which go beyond the administrative borders and which surpass the financial possibilities of one county.

By implementing the Regional Operational Programme 2007 – 2013 it is intended to reduce the inter-regional disparities, and also the disparities inside the regions, between the urban and rural areas, between the urban centers and their adjacent areas, and, within the towns, between the attractive and non-attractive areas for the investors.

The regular assessment of the progress recorded by Romania in the process of European integration has constantly showed the necessity to strengthen the capacity of the administrative-territorial units by means of projects which should allow the attraction of non-returnable funds with a reduced effort of own co-financing.

Acknowledgments: "This article is a result of the project "Creșterea calității și a competitivității cercetării doctorale prin acordarea de burse". This project is co-funded by the European Social Fund through The Sectorial Operational Programme for Human Resources Development 2007-2013, coordinated by the West University of Timisoara in partnership with the University of Craiova and Fraunhofer Institute for Integrated Systems and Device Technology - Fraunhofer IISB."

THE DANGER OF “PUTING ALL THE EGGS IN ONE BASKET” SOME CONCERNS REGARDING ROMANIA’S EXTERNAL TRADE

Negrea Adrian

University of Oradea, Faculty of Economic Sciences

Trade patterns across the globe vary in certain ways. For the EU27, the analyzed data suggests that approximately 70% of all Romania’s imports, and the same amount of its exports, are intra-community oriented. The question that arises is what will happen to te Romania’s external trade, if a crisis hits Europe? If countries like Germany, France, Italy, and United Kingdom are hit the hardest in this hypothetical European crisis, Romania will soon follow them. In order to decrease the impact of such possibility, it is necessary to tap new trade opportunities. For this purpose, first we have to analyze the present situation. Based on Eurostat, World Trade Organization, and the Romanian Statistics Institute data from 1999 to 2009, and on the works about trade creation (Balassa 1965, Jovanovic 2005, Molle 2006), the paper wants to point out the aspects of trade concentration in certain regions after the establishment of free trade agreements, and the danger posed by financial crises. This paper analyzes first the situation in the EU27, scanning each member state in order to see the degree of trade relations intra / extra – EU. The data will be than compared to another set of analyzes of other four important regions, the Andean Community, ASEAN, MERCOSUR, and NAFTA, whose free trade agreements could support such of comparison with the EU trade relations. The paper follows the assumption that EU27 has the most integrated trade relations among all the analyzed regions. Based on this assumption and on statistical data that points out the percentage change of total imports and exports in the Romanian GDP, some conclusions will be drown out in order to establish some necessary measures to prevent a future crisis, measures that involve the political class, taping new trade opportunities such as Latin American countries, Middle Eastern countries, and South-East Asia, but not forgetting Russia, Romania’s former main export partner, establishing clear objectives to future embassy personnel, and a more aggressive advertising campaign in the selected target markets conducted by national agencies.

Key words: free trade agreements, custom union, Romania’s trade relations, imports, exports.

JEL codes: F01, F10, F14, F15,

Introduction

Everybody wins from external trade. This phrase is used almost in every book that you read on this subject. It doesn’t matter that you are a producer, a consumer, a retailer, a distributor, or an economic agent part of the logistic chain, everybody takes a piece of the pie, and they are happy about. People have started trading because not all the goods and services are produced inside a country, because that country is not endowed with the necessary resources (natural, technological, human and capital resources), or just because the purchasing costs are cheaper. That’s why people started focusing on barter as the main process, ending up paying money on what they want to buy. For example, if you are a Romanian consumer that

wants an iPod, you need to import it because this device is designed and produced outside the Romanian custom territory.

This relationship between supply and demand has been the cornerstone of modern capitalism and free markets, where clients demand newer, cheaper, enhanced, greener products every time, and producers trying to keep up with them. If you look this thing from the supply side point of view, you will be confronted with two scenarios. In the first situation, you can be a big multinational corporation, having production facilities all over the world, supplying the international markets from multiple locations. In the second situation, you are a small company, with no production facilities abroad, trying to export your products. If you sell them to another company, you need to search the international markets for someone whose needs match your offer. After negotiations, you will start doing business with that company because the price is right. After a while, you get acquainted, starting an interpersonal relationship, ending up putting the bricks to a solid foundation. In the end, almost all of your production is sold to your partner, and everything goes smooth. But what happens to you, and your business, when your partner starts facing some setbacks?

Trade situation in the EU and across the Atlantic

The answer lies in the analysis of trade patterns across the globe. Based on Eurostat and World Trade Organization data from 1999 to 2009, and on the works about trade creation (Balassa 1965, Jovanovic 2005, Molle 2006), the paper wants to point out the aspects of trade concentration in certain regions after the establishment of free trade agreements, and the danger posed by financial crises.

The main purpose of a free trade agreement is to encourage trade creation among the states that signed it. For the EU27 as a trade union, and for the other four free trade agreements, based on Eurostat and World Trade Organization data, the figures bellow presents the current state of external trade among regions and countries.

For the EU27, data analyzed (Table 1: Share of the Intra-EU27 trade, and the situation of the Trade Balance) suggests that approximately 70% of all imports, and the same amount for exports, are directed to other member states.

With the exception of the Netherlands (where the average sum shows that less than 50% of its imports come from the EU27, but more than 80% of its exports go to the EU27), and Malta (where the average sum shows that less than 45% of its exports go to the EU27, but more than 70% of its exports go to the EU27), the rest of the 25 member states register high figures both on the import side and on the export side.

Cyprus registers the biggest increase in its trade with EU27, with its figures jumping from 60% in 1999 to almost 70% in 2009.

Although the financial crisis affected trade relations, the figures presented show that in 2009, almost every state kept its share of trade with the EU27.

If we take a closer look at the situation of the external trade balance situation, out of the 27 countries, only 7 register a trade balance surplus with the EU27, the Netherlands, Germany and Belgium having the highest figures.

On the trade balance deficit side, out of the 20 member states, the United Kingdom, France, Spain, Greece, Portugal and Romania register the worse deficits with the EU27 member states. What is more curious is that France and Portugal do not register corrections amid the financial crisis, having their trade deficits increased between 2007 and 2009.

The worse correction was suffered by Spain, its trade balance deficit reducing by almost 60%. Romania and the United Kingdom follow the same correction, the first having its trade balance deficit reduced by 55%, and the second with 30%.

The curious evolution is represented by Poland, reducing its trade balance deficit year after year, ending 2009 with a surplus of 609 million euro's.

From all of this, the Czech Republic and Slovakia win the most, registering trade surpluses in all the years analyzed, having their trade balanced increased exponentially between 2005 to 2007, and keeping this phase through 2009.

Source: Own computations based on Eurostat data for the EU27 member states.

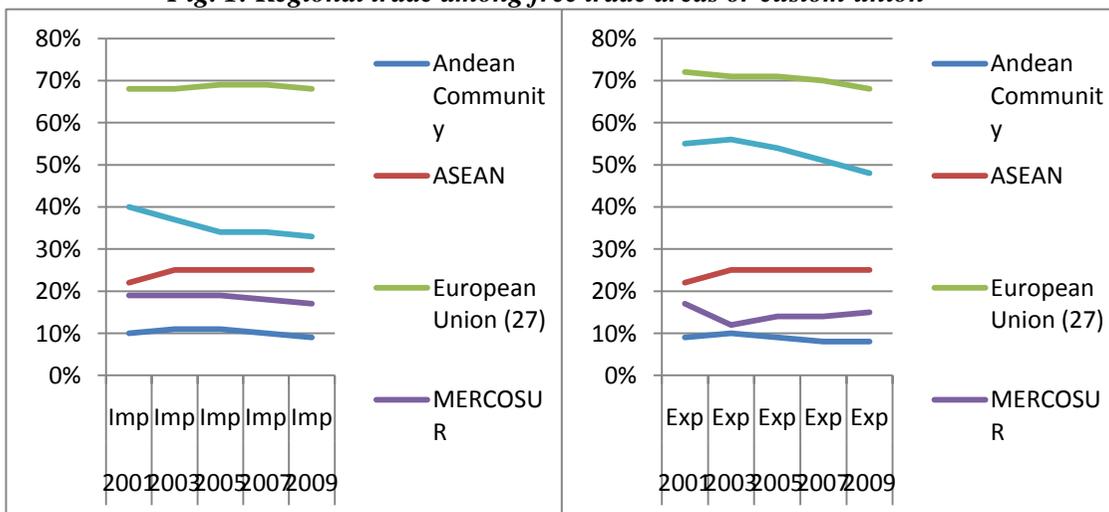

On the other side of the Atlantic, the situation is a little different. Having picked the regions for analysis, with:

- Andean Community (Bolivia, Colombia, Ecuador, Peru)
- ASEAN (Brunei, Cambodia, Indonesia, Laos, Malaysia, Myanmar, Philippines, Singapore, Thailand, Vietnam.)
- EU 27 (countries stated above)
- MERCOSUR (Argentina, Brazil, Paraguay, Uruguay, Venezuela)
- NAFTA (United States, Canada, Mexico)

The results showed bellow (Fig. 1: Regional trade among free trade areas or custom union), illustrate that on the import side, the EU27 has the most integrated commerce of all the analyzed regions, with imports holding steady around 70%. The closest regional trade community is NAFTA, which registers a decline on its imports in the analyzed period, decreasing from almost 40% to 33%. ASEAN countries register a steady evolution, their imports increasing from 23% to 27% and holding steady. The imports in MERCOSUR suffer a slight decrease, amid the financial crisis, from almost 20% to a figure close to 17%. And last but not least, the Andean Community which registers steady figures near 10%.

On the export side, the situation with EU27 remains almost the same, decreasing from 2007 to 2009. In the NAFTA region the figures are more interesting, observing a steep decrease of exports between the three countries starting in 2003, decreasing from 56% to 48%, a decrease of almost 15%. ASEAN registers the same evolution on the export side, meaning a steady increase from 23% to 27% and holding steady. The fluctuations inside MERCOSUR on the other hand, point out a decrease from 2001 to 2003, and after that, just a mild recovery. Again the last but not least, the Andean Community is closed to the 10% line, having slight fluctuations in the analyzed period.

The regional crisis hypothesis and its impact on Romania's trade

We are familiar with a crisis situation from time to time. An old saying tells us to learn from our mistakes so that we won't repeat them but somehow, we manage to forget this wisdom. The current financial crisis that began in late 2007, was so intense, that surpassed the previous regional ones (The "Tequila crisis" 1994 , the Asian Crisis 1997, the Russian Crisis 1998, and the Argentinean Crisis 1999-2002).

Because of its intensity, almost every corner of the globe was caught in this whirlpool. Consumption dropped dramatically, unemployment phenomenon and the bankruptcy cases soured, lending money became scarce, and investments stalled. Because of all this, inevitably, trade was affected.

Assuming now that there is only a regional crisis, like those mentioned before, the question is what happens to the Romanian trade, if a crisis situation hits Europe. As we saw above, almost 70% of our trade relations are with the EU member states. If countries like Germany, France, Italy and United Kingdom are hit the hardest in this hypothetical European crisis, Romania will soon follow them.

Trying to see what happened in the current financial crisis, and trying to cope the numbers with a future European crisis, we take a closer look at Table 2. If we watch closely, the steepest decline was in the import section. Because many Romanians were relying on cheap credit to finance their consumption and because in 2008, all the banks stopped lending money, we can see what happened (a sharp decline of imports).

On the export side, although it surged from 24% to 25% in nominal terms, in real terms, it didn't. In 2009, the Romanian GDP decreased with almost 8%, meaning that the same amount of exports of 2008, were now divided to a smaller GDP. That means, the West stopped making new orders, the industrial production declined, and so did our exports.

Table 2: Share of Exports and Imports in the Romanian GDP between 2000 - 2009

	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
%X/GDP	28	28,4	30,3	30,8	31,2	28	26,4	23,9	23,7	25
%IM/GDP	32,5	35,7	36	38,6	39,9	37,8	38,5	38,3	37,5	30,2

Source: own computations regarding the percentage of imports and exports in total GDP, based on data provided by INS (*National Institute of Statistics of Romania*)

Conclusions

Trade relations among EU27 member states represent more than 70% of their total trade. It is a high figure that can have severe consequences if a regional crisis hits the region. In order to reduce this possibility, it is necessary to tap new trade opportunities.

The data analyzed points out that the Andean Community, ASEAN and MERCOSUR have the least integrated trade relations, while NAFTA and EU27 present a different situation. If a crisis hits the first three regions, it is possible to avoid a steep decline in trade relations, because the main trade partners are not there.

Highlighting the Romanian situation, it is known that its products are not as competitive as the products of our EU15 Member States. Because of this, we should rethink our strategy and try to encourage the following strategies:

- benefiting from all trade agreements signed by the EU, we should try to divert a part of our exports to Latin American countries, Middle Eastern countries, and South-East Asia, where the Romanian products are more competitive.
- the state department agencies should work together in order to promote more aggressively the Romanian products and services on the international arena, especially towards the selected target markets, through international fairs, bilateral economic forums.
- making international political visits that involve the participation of high ranking political figures accompanied by important business people, in order to establish future commercial contracts and develop trade relations
- all our ambassadors and economic attachés should review their work by including some clear objectives regarding a certain number of export contracts, a quantum sum that needs to be achieved, and what measures need to be taken in order to have a good information flow between them and the national business associations.

SUSTENABLE DEVELOPMENT OF THE ROMANIAN ECONOMY BY ADOPTING THE CHINESE MODEL OF SPECIAL ECONOMIC ZONES

Negrea Adrian

University of Oradea, Faculty of Economic Sciences

The architecture of the Chinese economy began to take shape in the late 1980's, because of the new reforms that the Chinese Communist Party started to take. With the death of Mao Zedong in 1976, the Chinese leadership is taken by Deng Xiaoping, who stated a blitz course in capitalism. The new president encouraged foreign direct investments by creating special economic zones near the coastal cities, where foreign companies obtained several tax breaks and other incentives, only to invest in those regions. With the help of statistical data from WTO, IMF, and the World Bank, the current paper analyzes the impact of these special economic zones on the Chinese economy, ranging from mutations in the labor market and economic sectors structure and their evolution in the formation of the GDP, FDI inflows, and last but not least external trade and current account situation. On the other hand, the paper tries to make a connection with Romania, computing and predicting, based on the Chinese figures, the way in which the Romanian economy, by creating four economic zones within the counties of Satu Mare, Bihor, Arad, and Constanța, will be able to experience the same growth. The first three counties have been picked up based on their proximity to the Schengen area, and/or on their infrastructure, plain terrain, and a qualified and skilled labour force. Constanța, the only one that resembles with its Chinese counterparts, has been taken in consideration because of its capabilities of shipping products right away as they are manufactured. The results would decrease the disparity that exists in revenue levels across Romania, Bucharest leading the group way ahead of the other counties. Foreign direct investments in those areas will attract more others made by the local authorities in the infrastructure (schools, universities, roads, airports, high speed railways). This development will have a direct impact on the current account of the Romania's balance sheet of payments, while its external trade deficit will reduce in time, even transforming in a trade surplus, and helping this way in putting an end to the chronically external debt.

Key words: special economic zones, counties, external trade, economic impact, foreign direct investment

New conditions of doing business in China

Leaders of any country feel when something needs to be changed. In 1978, the Chinese communist leader Deng Xiaoping, felt that the Chinese economic model was suffering greatly and something was needed to be done. In a comparison with Romania today, when every economic reform affect all the inhabitants, the Chinese started with only a handful of regions where they tried to experiment different approaches that were targeting fiscal policies, labor legislation, bureaucracy and other measures that were similar to those in the capitalist western economies. All these measures were put in action in the so called "Special Economic Zones" or simply SEZ.

In order to understand what a SEZ is, we will take a look at what some international organizations define them:

-SEZs are generally defined as geographically delimited areas administered by a single body, offering certain incentives (generally duty-free importing and streamlined customs procedures, for instance) to businesses which physically locate within the zone

-Designated areas in countries that possess special economic regulations that are different from other areas in the same country. Moreover, these regulations tend to contain measures that are conducive to foreign direct investment. Conducting business in a SEZ usually means that a company will receive tax incentives and the opportunity to pay lower tariffs.

In 1980, four SEZ were created - Shenzhen, Zhuhai, Shantou and Xiamen - in order to experiment how new legislation, labor conditions and a lower bureaucracy will interact with the economy. And the results came quickly. As presented below (Table 1: FDI Inflows in SEZs, million current US\$, 1978–2008) foreign direct investment started to pour in, reaching almost 4 billion \$ in 2008 for Shenzhen, 1 billion for Zhuhai and Hainan. All the figures indicate a huge increase, especially after the year 2000, after China got accepted in the World Trade Organization. This move made China more appealing to international investors. As presented below, all four SEZ registered a surge in FDI inflow.

Table 1: FDI Inflows in SEZs, million current US\$, 1978–2008

Year	Shenzhen	Zhuhai	Shantou	Hainan
1978	5.48	n.a.	1.61	0.1
1990	389.94	69.11	98.09	100.55
2000	1961.45	815.18	165.61	430.80
2006	3268.47	824.22	139.61	748.78
2007	3662.17	1028.83	171.62	1120
2008	3929.58	1138.49	n.a.	n.a.

Source: SBHN 2007, SBST 1994, SBST 2007, SBSZ 2007, SBSZ 2008, SBZH 2007

All of the investment made was concentrated on building production facilities from scratch, and from there to supply the internal market and the ship products all over the world. As presented in Table 2, exports increased exponentially, Shenzhen leading the group and being the first in the group to register figures above 100 billions \$, reaching almost 170 billion \$ in 2007. These numbers are the result of FDI inflows in these regions, as well as the accession into the ranks of WTO.

Table 2: Exports, million current US\$ in SEZs, 1978–2008

Year	Shenzhen	Zhuhai	Shantou	Hainan
1978	0.009	0.009	0.251	n.a.
1990	8.152	0.489	0.841	0.471
2000	34.654	3.646	2.595	0.803
2006	135.959	14.843	3.484	1.376
2007	168.542	18.477	3.912	1.838
2008	163.780	19.73	3.278	n.a.

Source: SBHN 2007, SBST 1994, SBST 2007, SBSZ 2007, SBSZ 2008, SBZH 2007

All that inflow of FDI, the surge in exports, automatically influenced the living conditions in those zones. For instance, if we watch closely in Table 3 and 4, its presented the evolution of the GDP and Per Capita GDP.

These four zones made it possible to present the multiplier effect of Keynes upon the local economy. If the state offers you tax brakes for the next 30 years, you, as a business entity, will build a production facility. Building a production facility means hiring local workers. Perhaps, some of your suppliers will follow you there. If everything goes well, some of your competitors will join in. This step can be made in any industry. At one point, if the Chinese see that there are jobs needed in that region, they will move there in order to work for a higher salary and better working conditions.

If this thing happens, we can imagine that the local administration will earn a lot of money from local taxes. If the GDP of the region rises, so does the incomes for that region. Now the local administration has money to invest in the infrastructure (roads, highways, electricity, airports, bridges, optical fiber, railways, hospitals, schools, and universities). All these measures connect themselves, developing that region, enhancing its competitiveness.

Table 3: GDP of Special Economic Zones, 1978–2008, billion current RMB

Year	Shenzhen	Zhuhai	Shantou	Hainan
1978	0.196	0.209	1.079	2.886
1990	17.167	4.143	7.245	10.242
2000	218.745	33.143	45.016	52.672
2006	581.356	74.77	73.738	105.285
2007	680.157	89.59	85.01	122.96
2008	561.176	70.041	72.083	106.275

Source: SBHN 2007, SBST 1994, SBST 2007, SBSZ 2007, SBSZ 2008, SBZH 2007

Everybody wins from this chain of events. The companies receive tax breaks, and in time they will be able to search from a pool of better educated workforce. That workforce, in the beginning, it will be composed of “blue colored” jobs, meaning the workers on the production line. After a while, when investments will be made in the education sector, “white colored” jobs will become more and more demanding, and better paid. Table 4 illustrates that path, in 2007 a worker receiving more than 10 times it did in 1990, in almost every region.

Table 4: Per capita GDP of Special Economic Zones, 1978–2008, current RMB

Year	Shenzhen	Zhuhai	Shantou	Hainan
1978	6.6	579	366	510
1990	8.724	6.678	2.029	1.562
2000	32.8	27.693	9.741	6.798
2006	69.45	52.185	14.872	12.654
2007	79.645	61.693	17.048	14.631

Source: SBHN 2007, SBST 1994, SBST 2007, SBSZ 2007, SBSZ 2008, SBZH 2007

These figures make us think, for how long are we going to be able to call China a cheap country. If the level of income will rise in the same manner, we will see how part of the production of these zones will be diverted from exports, to internal demand.

Present situation on the home front

The Chinese case can be a good case practice, in order to imitate and try to implement in our own way. We also should pose the same question that Deng Xiaoping did in late 1980s, when he asked himself: what fiscal measures are needed in order to boost the FDI inflow. In order to answer that question first we have to analyze the balance sheet of one municipality, let’s say Oradea. In Table 5 are stated the main indicators that compose the municipality balance sheet.

It is known that due to the “color” of the government, some municipalities that have mayors from the ruling party receive larger subsidies, and those who don’t receive less. In this case, Oradea has the color “yellow” and the ruling government is “orange”.

I have omitted those subsidies because they can vary from time to time, as the government does, and try to stress those factors that have a more stable component.

Table 5: Brief balance sheet of the city of Oradea in 2010

No.	Explanation	Code	Plan thousand Lei
A	Incomes		246.018
1	Split shares from the income tax	04.02.01	111.020
2	Taxes on corporate buildings	07.02.01.02	25.500
3	Taxes on corporate motor vehicles	16.02.02.02	6.900
4	Revenues from concessions and rentals	30.02.05	5.800

Source: Local Council approved balance sheet on 2010

If that’s the case, than any municipality needs to widens its share from the income tax. As we can see in Table 6, a large portion of the income tax comes back to the place where the contributor pays he’s taxes. We can observe the evolution, from 47% in 2006, to 44% in 2010, and perhaps in the future, even less.

Usually these money are spent on infrastructure maintenance (roads, schools, hospitals), and on public services. If this is the case, than any municipality needs to widen its colleting points by encouraging companies to invest in its zone, and to hire locally. From this point of view, if a town receives more, it can spend more.

Table 6: Percentage of the revenue tax returned to the place of the taxpayer

Revenue tax	Law no.273/2006	OUG 63/2010
% returned to municipalities where the tax payers register their activities	47%	44%
% returned to county budget where the tax payers register their activities	13%	12%
% returned to a distinct account to the tax collectors of each county, in order to stabilize the deficit	22%	21%

We also have to take in consideration that a suffocating fiscal legislation opposes and diminishes the entrepreneurial spirit, suffering modifications almost every year that doesn't take into account mid or long term planning activities of local companies. There is no consistency of the fiscal policies, some of them entering in effect not from the beginning of the new fiscal year, but right away as the law passes the senate approval. The other disturbing case is the sum of taxes that an employer must pay for one employee, sum that amounts almost 60% of its gross salary, so for example if somebody wins 1.000 LEI, the state takes 600 LEI.

The need for a change

Why do we need to adopt the Chinese model of Special Economic Zones?

We should adopt that model in order to experiment how different policies interact with the economy. If we want to reduce the amount of taxes that an employer pays for one employee from 60% to 45% or less, or to reduce the amount of the income tax, than we need to observe this phenomenon on a small scale, not to implement it and observe it on the whole country.

In this paper, four counties have been chosen, Satu Mare, Bihor, Arad, and Constanța, the first three counties being picked up based on their proximity to the Schengen area, and/or on their infrastructure, plain terrain, and a qualified and skilled labor force. Constanța, the only one that resembles with its Chinese counterparts, has been taken in consideration because of its capabilities of shipping products right away as they are manufactured.

If we want to reduce the social contributions, the income tax, health tax, place a moderate tax on land and buildings, offer free terrain, or whatever measure that attracts FDI, we should do it first on a small scale, and then apply it on a bigger one.

If these zones are created in these four counties, we should expect a surge in FDI as we have seen in the four Chinese counterparts. Production will grow, exports will surge, workers will be needed, salaries will increase, infrastructure spending will go up based on new income, and with this, the competitiveness of these regions will register the same effect.

Lets not forget the demographic impact that these four regions will have, especially when we talk about regional migration. Taking in consideration that large areas are interconnected, being not that far away one of another, for example Cluj Napoca is situated only at 150 km from Oradea, having a proper highway between these two cities, a worker can make a trip of one hour onwards and backwards, not three hours like today.

If some measures are viable, they should be adopted at national level, in order to decrease the disparities that exist among counties and regions. But I feel that once the counties feel independent from the state, they will search for more authority and power, transforming Romania from a republic, to a federation.

POVERTY AND LIVING ROMA. POOR NEIGHBORHOODS IN ROMANIA AND HUNGARY

Olah Gheorghe
University of Oradea

Olah Șerban
University of Oradea

Flora Gavril
Christian Partium University of Oradea

Szekedi Levente
Christian Partium University of Oradea

The first part of our paper is a theoretical debate of the most important research results concerning the Roma population in Romania and Hungary, while in the second part we proceed to the interpretation of our own empirical research data.

Methodologically, our research is based on sociological survey. Data concerning socio-occupational characteristics of Roma communities have been collected by means of a questionnaire based survey of active aged Roma population from Oradea and neighbouring rural localities in Romania and Hungary (Oșorhei, Ineu de Criș, Biharkeresztes, Told).

The paper concludes with policy recommendations aimed at the members of the target group.

This paper presents the outcome of an euro-regional comparative research conducted in 2010 in two neighboring border areas: Bihor (Romania) and Hajdu-Bihar (Hungary), financed by a grant awarded by the European Regional Development Fund. The first part of the paper includes a theoretical overview of the most important research results concerning the Roma population in Romania and Hungary, while in the second part we proceed to the analysis of our own empirical research data. Methodologically, our research is based on the sociological survey. Data concerning socio-occupational characteristics of Roma communities have been collected by means of a questionnaire based survey of active aged Roma population from Oradea and neighboring rural localities in Romania and Hungary (Oșorhei, Ineu de Criș, Biharkeresztes, Told). Due to the fact that data set is very large and complex we will focus on data concerning living conditions in poor neighborhoods.

1.1.Introduction

The Roma (or Gypsies) are a unique minority in Europe. Unlike other ethnic groups, they have no historical homeland and live in almost all countries in Europe and Central Asia. The origin of the Roma in Europe is widely debated. Historical documents indicate that Roma have migrated in waves from northern India to Europe between the 9th and the 14th century. On the other hand, historical studies show that the Roma were very much persecuted by the majority from the very beginning of their arrival in Europe. The measures taken against

them ranged from hanging, drowning, reddening with iron, imprisonment, enslavement, deportation. The Western Europeans were more drastic in their measures against the Roma than the more permitting Turks, who invaded the South-East and parts of Central Europe²⁶. Perhaps this explains even in today Europe a greater concentration of Roma in the Central and Eastern European countries.

Roma is an extremely diverse population with multiple subgroups based on language, history, religion and different occupations. While in some countries Roma are nomadic, most of them in Central and Eastern Europe have become sedentary – some of them in the days of the Ottoman rule and others in the socialist period.²⁷

Estimating the size of the Roma population is a complicated issue. Census data are intensely disputed as many Roma do not identify themselves as Roma in surveys. On the other hand, the official figures, the results of the population censuses are contradicted by other studies which aimed to estimate the number of Roma population²⁸. Some estimates show that the number of Roma increased up to 6 and 9 percent in Bulgaria, Macedonia, Slovakia and Romania. These percentages may increase for the foreseeable future because of the difference between fertility rates in populations of Roma and non-Roma. Romania has the largest Roma population in Europe, estimated figures ranging from 1 to 2 millions. A large Roma population (between 400,000 and 1 million) lives in Hungary, Bulgaria, Slovakia, Turkey and Serbia. The largest population of Roma in Western Europe is in Spain (about 630,000), France (310,000), Germany (70,000) and Italy (130,000). In total between 7 and 9 million Roma live in Europe - a population equal to that of Sweden or Austria.²⁹

The Roma population in Romania and Hungary has some special characteristics compared to other minorities. By tradition, it is a population with a low social status, typical object of comparison as the poorest category of population and strongly exposed to discrimination and social exclusion. To these one should add other features, such as failure of modernity or difficulties of identifying the exact size of the Roma population.³⁰

Historically, the Roma population had a disadvantaged position over the centuries. While by the end of the XIXth century, Roma were slaves on the estates of Romanian or Hungarian nobles (Transylvania), in the last two centuries, this population has experienced a period of emancipation, have been offered equal rights with the majority population and small land plots. In the socialist period the situation of Roma populations improved to some extent. These policies resulted in a relative improvement of their education level and the beginning of their involvement in the formal economy. However, the price they paid was forced integration and a loss of cultural specificity.³¹

The post-communist transition has caused many changes in the life of Roma communities. Some Roma even regret the socialist regime; even if they were not recognized as a national

³¹ Ibidem

minority, the assimilation policies were offering them at least some degree material safety. In contrast, the post-socialist period was full of changes and paradoxes for Roma. On one hand, it allowed the recognition of Roma identity, politically and culturally, on the other hand, it emphasized the economic and social marginalization and rejection of this community.³²

In the present context, the Roma issue is not a simple one. Several economic and social factors are combined here; while the ethnic dimension of the problems can not be ignored, it stems to great extent from the crisis crossed by Romania and Hungary during the transition period, which has a particular effect on the Roma population. Viewed in economic terms, we can say that Roma are the poorest population in Romania and Hungary, perceiving the economic vulnerability and social exclusion as their main problems.³³ The poverty level of this ethnic group is a combined outcome of several factors. As Marian Preda stated, poverty can be considered only a specific dimension of social exclusion, the financial one³⁴. Other forms of exclusion are also involved: exclusion from the democratic and legal system, labor market exclusion, exclusion from the state welfare system, exclusion from the family and community system.

According to recent research, the causal factors seem to have mainly an individual determination and to a certain extent, a cultural one, pointing to self-exclusion³⁵. The economic vulnerability of Roma is thus caused by a complex of factors such as low educational and vocational training, the precarious position on the labor market, the great number of children in Roma families, their discrimination by the majority group and the involvement in the informal economy. One can speak of a vicious circle in the case of the Roma. Being poor in the vast majority, they do not have the resources to complete their educational and professional training. Many of them not having jobs, they get involved in the informal economy, or immigrate to western countries.

1.2. Roma in the sociological literature

The sociological literature on the problems of the Roma community is rich. The research developed on the Roma communities is achieved both by quantitative and qualitative methods. Both approaches appear to have pros and cons. Quantitative methods are useful to illustrate comparisons between the populations of Roma and non-Roma, both at a national and a European level. On the other hand, information on Roma can not be regarded as the most reliable data and they are also difficult to be obtained. Due to statistical problems related to ethnic self-identification, the quantitative research has serious limitations. However, the quantitative data provide possibilities for comparative analyses of welfare measures that can improve the elaboration and implementation of social policies.

While quantitative research shows that Roma poverty is distinct, it does not provide an adequate basis for understanding the specific dynamics circumscribing Roma economic vulnerability. In this field of study, qualitative research might have a higher effectiveness in identifying social processes, mechanisms and relationships between variables that are

³² Pons, Emanuelle, 1999, *Țiganii din România*, Editura Compania, București, p. 137

³⁴ Preda, Marian, 2002, *Politica socială românească între sărăcie și globalizare*, Editura Polirom, Iași, p. 101

³⁵ Ibidem, p. 168

difficult to be emphasised by using exclusively quantitative methods. Qualitative research, however, has also certain disadvantages. It tends to focus on just one specific issue, focusing on a limited number of factors. That is why a combination of quantitative and qualitative methods can provide a complementary set of perspectives leading to a better understanding of social problems and policies.³⁶

A remarkable comparative research project on the Roma community in six Central and Eastern European Countries (Hungary, Bulgaria, Slovakia, Poland, Russia and Romania), both quantitative and qualitative, has been conducted between 1999 and 2000, coordinated by Ivan Szelenyi (Yale University).³⁷ Some interesting methodological conclusions for the study of Roma communities have been drawn. During one year, the researchers analyzed between 10,000 and 19,000 Roma households. In the same time a questionnaire was applied on an oversample of Roma in Bulgaria, Hungary, Poland and Romania. The researchers have also made some qualitative studies of communities in extreme poverty in these countries.

In 1993 people in all countries experience a similar deterioration in living standards compared to 1988. Since 2000 the trend is a decrease of the poverty in countries that have implemented more rigorous liberal reforms, for instance Hungary and Poland, as well as in countries with slow progress to the model of liberal capitalism.³⁸

The study revealed that transnational differences are as important as the ethnic differences. For example, Roma in Hungary are slightly poorer than non-Roma in Bulgaria. In all the countries, Roma are overrepresented in the poorest deciles of population. However, most of the very poor people consist of non-Roma. There is also a significant category of Roma who has a good enough standard of living in all the countries mentioned. The conclusion of the researchers is that the Roma who have successfully maintained the traditions were more likely to avoid the trap of poverty than those assimilated to the fringes of society.

One of the most quoted qualitative studies in the international literature studying the Roma is the English anthropologist Michael Stewart's, presented in "*The Time of the Gypsies*" (1997), a remarkable social ethnography of the Roma in the Hungarian town of Harangos, located at north of Budapest, a survey using the method of participatory observation. The English anthropologist developed the research through a field work conducted during 18 months between the years 1984 and 1985. During this period he lived with his wife and children in an area called "*The third class*" in a Roma neighborhood of the town, a town where, according to a census of that time, around 1000 Roma lived.

Until 1989 the official communist policy was to integrate the Roma in the "leading" class, the communist working class. However, Roma have found ways to maintain their own identity. Michael Stewart's book examines the refusal of Roma to abandon their lifestyle and accept assimilation to the majority population. Forget, Michael Stewart warns us early in the book, about the carefree freedom of caravans and campfires. These men lived hard and brutal sometimes. They dreamed of richness gained through gambling and stealing horses, but in reality were poor as a church mouse. They lived in ghettos, but their names and law argued that the Roma are working people, often working for low wages in industry and

³⁶ Ringold, Dena, Orenstein, Mitchell, Wilkens, Erika, 2003, **Roma in an Expanding Europe. Breaking the Poverty Cycle**, The World Bank, p.4

³⁷ One outcome of this research is a work entitled *Poverty, Ethnicity and Gender in Transitional Society* (2002).

³⁸ Ibidem, p.9

collective farms. And despite the marginal position and sufferings they endured they preserved the dignity and the joy of being Roma.³⁹

Michael Stewart's book describes the cultivation, celebration and reinvention of the cultural difference and diversity of some people deemed by their superiors too stupid and uncivilized to have their own culture. Since the beginning of the Second World War there were two dramatic ways to solve the "gypsy problem". Between 1941 and 1945, the Nazis exterminated about 500,000 Roma in their effort to clear the "degenerated" and "antisocial" way of life. Between 1957 and 1989, said Stewart, a different type of anti-Gypsy campaign took place in the Eastern Europe. Nobody was made prisoner, left to die alone. Repression and discrimination did not exist in the plan of the communist reformers. But the final goal was strikingly similar to the fascist one, the Gypsies disappearance. The East European communists' task in 1957, says the English anthropologist, was really Herculean: the cultural assimilation of millions of people who had suffered discrimination for centuries. The former Yugoslavia being partially an exception, Gypsies had been subjected to a systematic campaign of assimilation. Czechoslovakia, Poland, Soviet Union, Romania and Hungary pursued almost identical policies.⁴⁰

The English anthropologist notes, however, that, ironically, far from being assimilated in the working class, the problems associated with the Gypsies became larger as the campaign of assimilation continued. Stewart noted that in the Hungary of the period the research was held, the Gypsy issue was given greater importance than ever, since the 1930s. Two sources led to this attitude. First there was a dramatic gap between the theory of social inclusion and the reality of increasing social differentiation. The Communists told to the non-Roma that they had done much to improve the lives of Roma and their disappearance could be expected soon. But there was little evidence in this case. Two: the policies reproduced in a new form the old ideas about gypsies being "others". The economic and social system entered into crisis in 1980s, the Gypsies otherness became clearer and more ominous.

The Romanian literature on the Roma issues is related especially to the researches carried out by the Institute for Quality of Life in Bucharest.⁴¹ The work coordinated by Elena and Cătălin Zamfir, *Gypsies between worry and neglect* (1993) can be regarded as the first and perhaps the most extensive analysis of the problems of Roma in Romania, based on a quantitative research on a representative sample of Roma households. In this book a number of issues concerning the Roma are considered, such as housing, education, professions and occupations, family and living conditions of the children.

Nine features are invoked - social-economic trends of the Roma population - which have an overwhelming effect on their their opportunities: decreased access to jobs offered by the modern economy, labor market niches that Roma have a special access (traditional professions, businesses on their own, unskilled jobs), precarious and uncertain nature of many economic resources traditionally exploited by the Roma, marginal or even deviant

³⁹ Michael Stewart, 1997, **The Time of the Gypsies**, Westview Press, Colorado, p. 1

⁴⁰ Ibidem, p.5

⁴¹ After 1990, a number of research papers on this area appeared: Cătălin Zamfir and Elena Zamfir, *Gypsies between worry and neglect* (1993), Cătălin Zamfir and Marian Preda, *Roma in Romania* (2002), Marian Preda, *Romanian social policy between poverty and globalization* (2002), Manuela Stănculescu and Ionica Berevoiescu, *Poor as a church mouse, looking for another life* (2004). In the work *A new challenge: the social development* (2006), coordinated by Cătălin Zamfir and Laura Stoica, there is a chapter signed by the sociologist Mihai Surdu on school segregation and schools with Roma students.

exploitation of the community, increasing crime, its organized character and violence, antagonizing relations between the majority population and Roma population, the number of children, poor housing conditions and migration to cities and the risk of “pockets” of poverty and chronic juvenile with a strong ethnic coloring. The conclusion of the whole analysis is that the Roma population faces serious social and economic crisis. The traditional life strategies provide only the chance of survival in this crisis, but not for its overcoming.

1.3. Living in poor areas

The analysis of the poor areas as living spaces is an integral part of any discourse on new poverty and its focus on clearly defined territories. To validate an area as poor assumes the presence of deprivation concerning the housing and the prevalence of precarious living conditions. In this regard, the poor areas are described as areas with no or poorly equipped facilities, poor natural environment, the house in an advanced state of degradation and poorly provided with urban facilities. The specific phenomena for the poor areas are housing insecurity and overcrowded housing.⁴²

There are several important analyses on living in poor areas in the international literature. In the West sociologists are primarily concerned with the poor areas of the urban, often called ghetto or banlieue. As William Wilson, an African-American sociologist considers, the concentration of black people in the ghetto is the result of the reduced access to employment and socialization. European sociologists such as Loic Wacquant, are adding another element, namely the already mentioned stigmatization of people living in poor areas of large urban agglomerations. The Dutch researcher Eva van Kempen also mentions a fourth factor, the limited access to social rights⁴³.

In connection with the topic discussed, there is a recently completed European project coordinated by Ronald Van Kempen, a Dutch urban geographer at the University of Utrecht, entitled *Large Housing Estates in Europe: Good Practices and New Visions for Sustainable Cities and Neighborhoods*. The main objectives of this project (which includes case studies in cities in Hungary) were to identify the social and economic changes that took place in the social world of the blocks built after the Second World War and the development of some items which proved to be important in the success or failure of the social policies applied to the areas of blocks⁴⁴. The researchers concluded that these areas of blocks concentrate people with modest incomes and a low stock of social cultural and political capital. The block areas are also characterized by a higher rate of unemployment and crime and a higher level of social exclusion. Although the researchers found that the block areas are in a state of failing all over Europe, there are also situations where deprivation, bad construction and management do not result in revocation. Second, East-West differences are noticed in terms of social cohesion and solidarity of the inhabitants of the blocks in the projects of rehabilitation of buildings and layout of the green spaces surrounding these buildings.

⁴⁴ Murie, Alan, Siedow-Knorr, Thomas, Van Kempen, Ronald, 2003, **Large Housing Estates in Europe.General Developments and Theoretical Backgrounds**, Utrecht University, p.11

With regard to housing problems in the poor areas of Romania (most papers on this topic focusing on the housing problems of Roma communities), I should mention the work of researchers like Cătălin and Elena Zamfir (1993), Cătălin Zamfir and Marian Preda (2002), Manuela Stănculescu and Ionica Berevoescu (2004), Cătălin Berescu and Mariana Celac (2006) or Cosima Rughiniș (2008). The main issues considered by these works are: poor housing, housing density, documents of the buildings and land ownership and access to utilities. The main findings of the authors are the significant differences between the statuses of Roma and non-Roma, and also the significant differences between rural and urban areas, the Roma living in the rural environment having poor living conditions. We will see to what extent some of these findings could be verified on the cases studied by us in Bihor and Hajdu Bihar.

1.4. Roma in Bihor and Hajdu-Bihar

1.4.1 Bihor County

Bihor County is the third in Romania according to the percentage of the Roma per population (5.01%), after Mureș County (6.96%) and Sălaj County (5.01%). There are around 30,200 Roma in Bihor County. Most of them live in Oradea, 6,000 to a total of 206,000 inhabitants. The most concentrated Roma communities are in Săcuieni (3,700), Tinca (2,500), Diosig (1,500), Batăr (1,500), Sânmartin (1,070), Aleșd (1,000), Suplacu de Barcău (900) and Ineu (850).

Roma, statistically a minority, are 89% of those who abandon school in Bihor County and, according to police estimations, 8 of 10 offences are committed by Roma. Only 10% of the Roma are employed and only 50% of them have an identity card. These are some statistical data which illustrate a dramatic reality of this minority. As in the other parts of Romania, the problems the Roma have to face in Bihor are the low level of education, the dropout, the precarious position on the labor market, living and health problems.

In recent years, two qualitative studies have been conducted on the Roma in Bihor: The first study (Olah, 2004) focused especially on the dropout, stressed that education is a major factor for the modernization of the Roma's life, maybe the decisive factor, and that the low level of education is strongly correlated with the precarious integration of the Roma on the labor market and with the juvenile delinquency. An important conclusion of the study is that Roma elite with high education should be the solution for the change of the dramatic situation of the Roma communities⁴⁵. The second study (Olah-Baltatescu 2008) focused on the problems of the Roma in Oradea⁴⁶. The data analysis confirmed that the problems of the Roma are related to:

- improper conditions of living
- extreme poverty
- the precarious health (especially contagious diseases like TBC)
- lack of professional training, the precarious position on the labor market, low incomes due to the lack of professional training
- the precarious education.

⁴⁵ Olah, Șerban, 2009, **The School Dropout in Bihor county. A Qualitative Approach**, Revista Universitara de Sociologie, Craiova, Romania, Year VI, nr.1(11), p.101

⁴⁶ Olah, Șerban, Băltătescu, Sergiu, 2008, **Nevoi și servicii sociale în comunitățile de romi. Studiu calitativ în municipiul Oradea** in Revista de Asistență socială (nr.3-4), București, ISSN 1583-0698,p.34

The initiative of the Romanian Government in 2000-2004 to create some special places for the students of the Roma communities seems to be efficient. There is also needed a more active involvement of the NGOs, Town Halls, leaders of the Roma communities.

The main reasons of the dropout in Bihar are: poverty, low level of education of the parents in the Roma community, the parents' lack of interest for school problems, family life disorganization, the tradition in the Roma community, the wrong attitude of some teachers towards some pupils, especially Roma, the low number of school psychologists in the schools of Bihar and the friends of the pupil.

Both mentioned research papers are underlining the necessity of continuing the social projects for the Roma, developing the NGOs which carry out such projects and forming the elite of the Roma community who will support the disadvantaged communities by involving them in such projects.

1.4.2. Hajdu-Bihar County

In Hajdu-Bihar, 10 836 persons declared Roma identity at the latest census (in 2001), comprising 5,7 % of the total Roma population of Hungary. The share of Roma within the county's total population is 2 %. However, the number of those who live a specific Roma way of life is much higher. A nationwide representative survey conducted by the Hungarian Statistical Office in 2003 found that in Hajdu-Bihar county 44 200 persons (8, 2% of the total population) are assigned a Roma (Gypsy) identity by their immediate neighborhood. According to this indicator, Hajdu-Bihar is the county with the fifth largest Roma population in Hungary.

The Roma population of Hajdu –Bihar country is confronting to a large extent with the same problems as their co-ethnics at the other side of the border:

- Comparatively very high rates of fertility combined with high rates of mortality, which results in a rather young age structure compared to that of the county's total population
- Much lower educational level than the county average
- Extremely reduced level of economic activity/employment

A survey of 200 Roma families conducted by the Department of Sociology at the University of Debrecen⁴⁷ found that the rate of Roma employment is six times lower (in case of female population seven times lower) compared to the general rate of employment. Most of the Roma subjects questioned during the survey expressed their desire to work, but complained of lack of job opportunities.

Beyond this general image, however, a rather perceptible generation-related differentiation has been observed. Members of the middle aged generation who had been occupied in economic activities during communist times are more likely to be employed today as well, compared to the members of the new generation socialized after 1989, who tend to prefer social benefits instead of work. Most of them never had any legal job.

As far as perception of the employers' attitudes is concerned, 72% of the respondents said they never experienced any discrimination while looking for a workplace, however 26% of those questioned indicated that they were not hired due their belonging to the Roma population. Among the surveyed families 40% have some links with agriculture: 18% is

⁴⁷ Beres, Csaba, 2004, **A Hajdu-Bihar megyében élő Roma lakosság helyzete.**
http://www.romaweb.hu/doc.../szociologiai_tanulmany_hbm.doc

cultivating a piece of land, 10 % are occupied with livestock-farming, and 12 % are doing both. In the case they would receive free of charge agricultural land for personal use from the local government, 25% declared that they would not cultivate it, but 72 % said that they would. (41% would produce only for personal use, 31% even for the market)

The survey found that in the preceding month 10% of the respondents had some income originating from occasional, usually agricultural work. One working day in the local agriculture is normally 10 hours long, and the per diem payment stands at 3000 forints (approximately 12 euros). Persons belonging to the poorest strata of Roma population, most of who also suffer of various illnesses, cannot access even this rather modest work opportunity.

On the other hand, the results of research show that in certain conditions occasional work might also become a resource of upward social mobility. For example, in one rural locality (Bagamer), 50 Roma workers employed in agriculture on day to day basis managed to learn how to produce horse-radish, and subsequently used this knowledge in order to start their own small farms, in pieces of land bought from or lent by local inhabitants. A social land-lease program by the county authorities encouraged Roma communities to start agricultural initiatives (such as poppy seeds cultivating or goat –breeding) in other localities as well. Some of these endeavors proved successful, but others failed, mainly due to the lack of Roma agricultural tradition and business skills. In order to maximize the outcome of these programs, members of the Debrecen University research team suggested that as a first step it would be more beneficial and sustainable to focus on producing for family consume, rather than for the market.

1.5. Quantitative Data Analysis

How satisfied are Roma with their life? Is the quality of life of Roma in Hungary higher than that in Romania? Which is the quality of Roma living in the two countries? What is the relationship between the Roma and various items of labor? Which is the level of education and occupational training? What work experience they have in the formal economy? What incomes do they have? How healthy they are? How religious they are?

These are only a few of the starting questions of a quantitative research conducted between January 10 to March 7, 2010 in several urban and rural areas in Romania and Hungary. The research is an integral part of a cross-border project called *Roma Employment*, funded by the European Regional Development Fund This project analyses the integration of the Roma into the labor market in Romania and Hungary and includes both a research component (data collection, a test of occupational skills, applying a questionnaire, conducting focus groups) and practical activities such as organizing two job fairs for Roma (Oradea and Biharkeresztes).

The quantitative research aimed at collecting data on quality of Roma life in settlements with a high density of people belonging to this category: Oradea, Osorhei, Ineu de Cris in Romania and Biharkeresztes and Told in Hungary. It should also be noted that in most of these places Roma live in neighborhoods where they are the majority. We have to mention that interpretation of our research data is based on comparative analysis of two samples of Roma, one from Romania(Bihar county) and another from Hungary(Hajdu-Bihar county). The sampling method used is the non-probabilistic one and involves the snowball principle. Only persons able to work and who are seeking employment, aged between 18 and 55, were selected. In total, a number of 322 subjects answered to the questions.

As collected data are numerous and extremely complex, in thi paper we focus only on those related to living conditions. We aim to realize the presentation and analysis of the full set of quantitative and qualitative data in a volume dedicated to the study of Roma in Romania and Hungary.

In our research we will test several hypotheses which we shall mention below.

H1. There are significant differences between the housing conditions of Roma in Romania and Hungary.

H2. There is a significant relationship between satisfaction with life and satisfaction with housing.

H3: There is a direct link between satisfaction with housing and income.

H4: There is a direct link between the size of dwelling and income.

H5: There is a negative correlation between the number of persons in the household and the income.

1.5.1. Satisfaction with life

How satisfied are Roma with their life? What are the determinants of the satisfaction with life? The research results drawn from the research samples in Romania and Hungary are shown in the tables below.

Table 1. Satisfaction with life at the Hungarian Roma

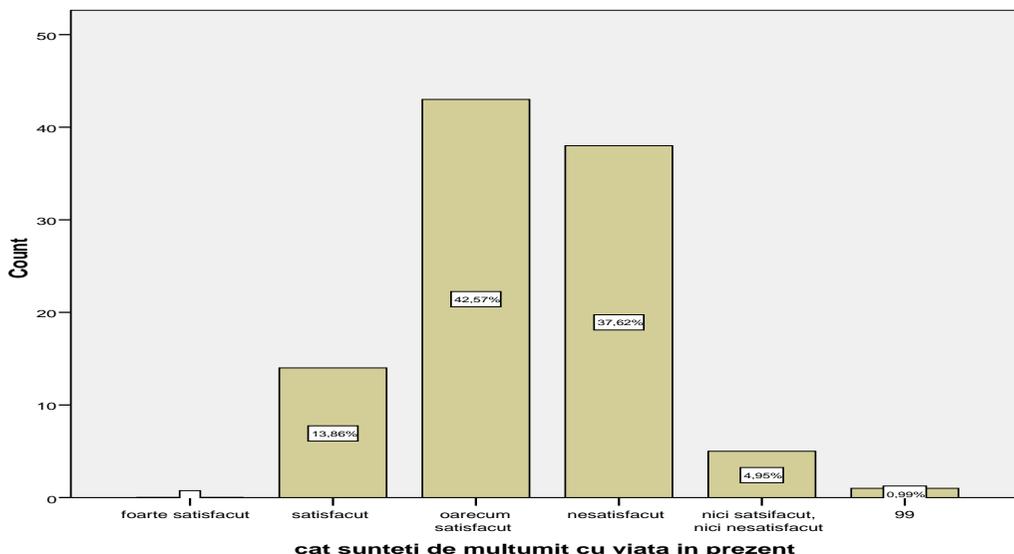

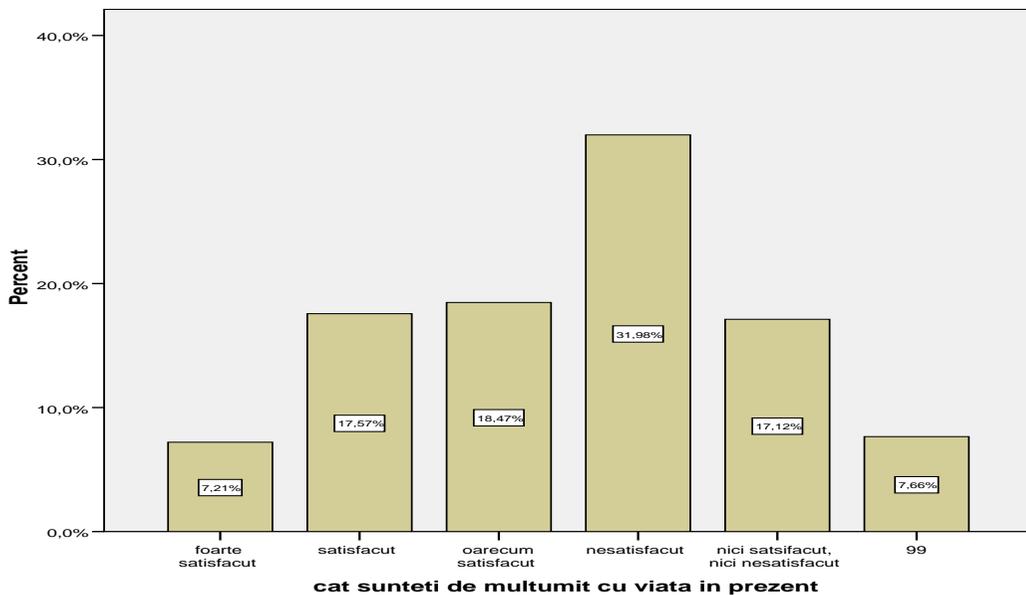

Table 2. Satisfaction with life at the Romanian Roma

—
 We can see in the two tables that on the one hand, the share of very satisfied in Romania is higher (7. 21% vs 0%) and also the percentage of those dissatisfied is lower (31. 98% compared to 37. 62%). Is this happening because of a higher quality of life or the effect of other factors? We will give an answer along the way.

1.5.2 The economic vulnerability of the Roma

A first step we need to make is to see the perception of the Roma on poverty.

Table 3. Income poverty (Roma in Hungary)

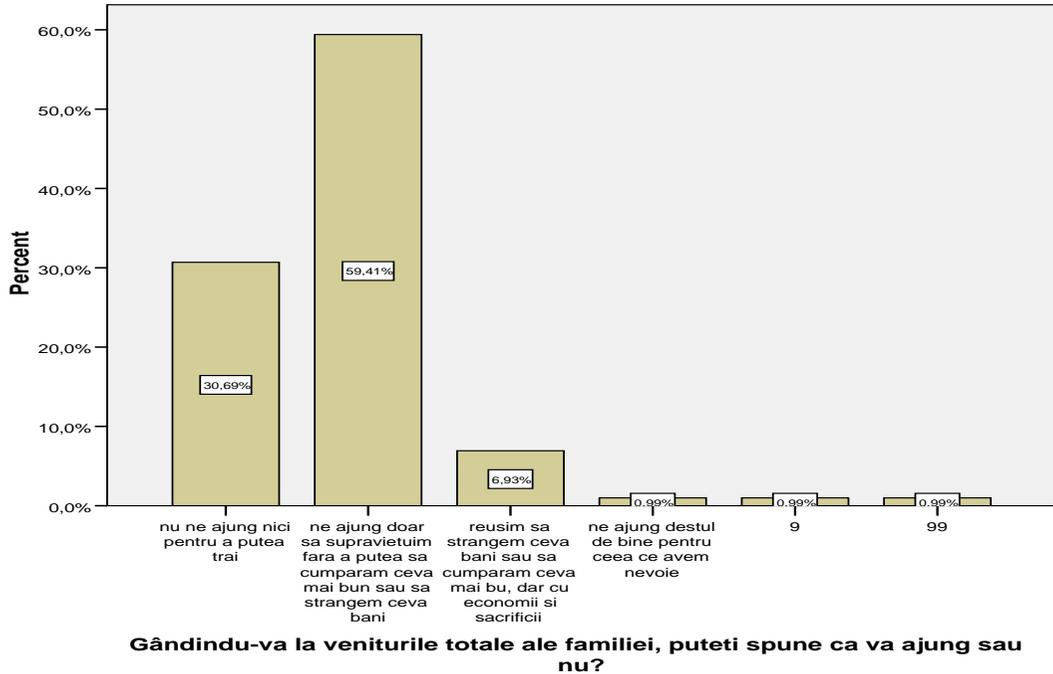

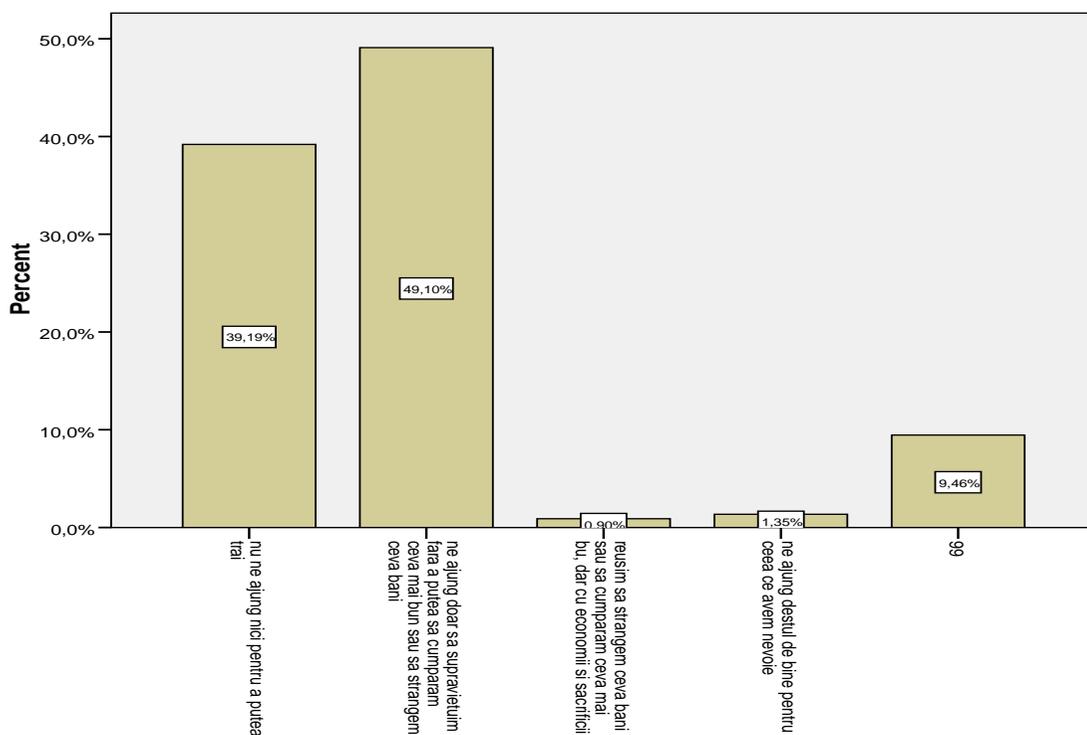

Table 4. Income poverty (Roma in Romania)

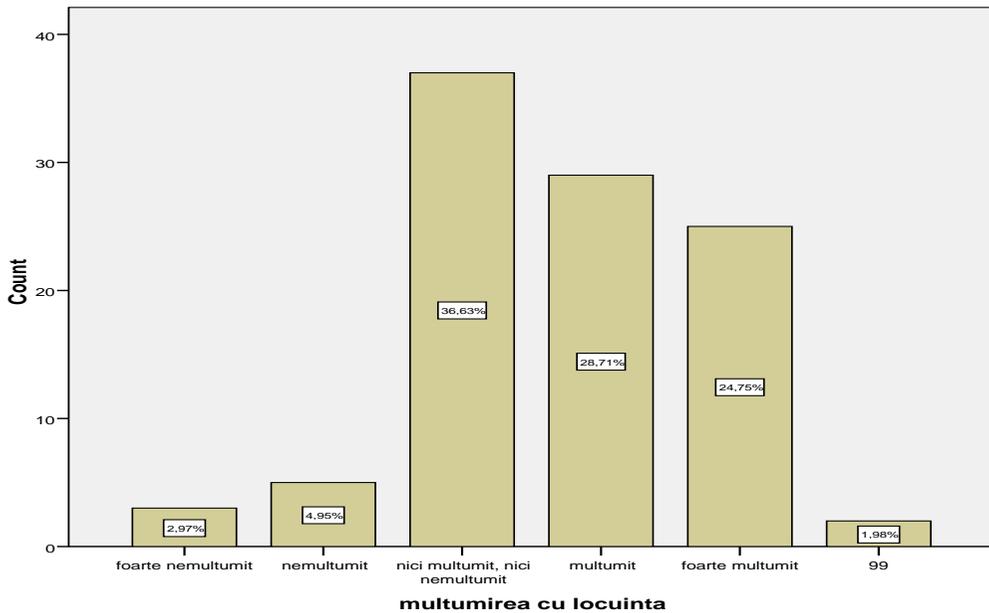

Cândindu-va la veniturile totale ale familiei, puteți spune ce va ajung sau

Comparing the two tables, we can see that the Roma in both countries perceive themselves poor and very poor. If we observe the first two items, the percentages are quit similar in the two countries (about 88. 29% in Romania compared to 90% in Hungary). If we take items 3 and 4 however, the situation is more favorable for the Roma in Hungary (8%) compared to 2. 25% for the Roma in Romania.

1.5.3. Housing conditions

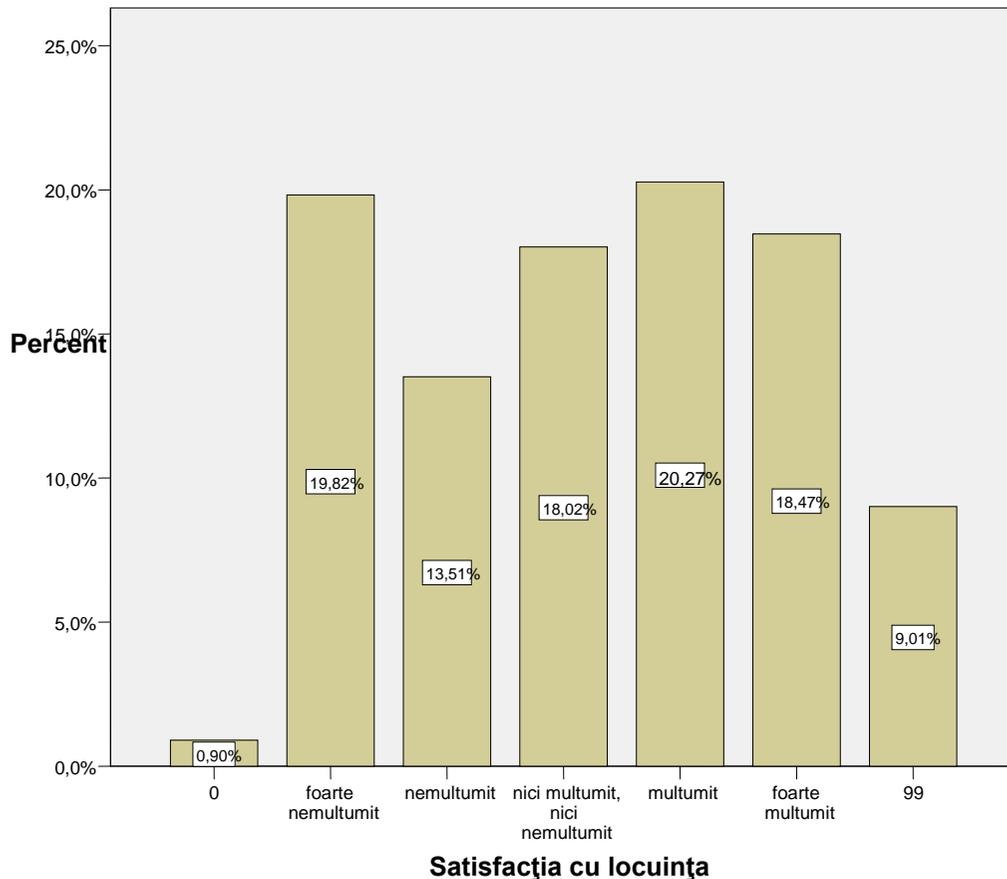

A first step towards interpreting the above mentioned surprising situation is to inquire about the living conditions in the two countries. How satisfied are the Roma with their home? Here are the data from Hungary.

Table. 5 Satisfaction with housing at Roma in Hungary

A question to be raised is how the satisfaction with life is associated with the satisfaction with housing. The regression model applied to the data from Hungary proves a significant combination, but not a strong link between the two variables, as will appear in the data presented in the annex 1.

Table 6. Satisfaction with housing at Roma in Romania

We can notice in the two graphics, on the one hand, that the percentage of satisfied and very satisfied is higher in Hungary (26. 71% and 24. 79%) compared to Romania (18. 47% and 20. 27%, and secondly that the percentage of dissatisfied and very dissatisfied is much higher in Romania (19. 82% and 13. 5%) compared with those in Hungary (4. 95%, respectively 2. 97%). Perhaps this is due to issues such as housing density, housing size, number of rooms and the materials the houses are made of.

One of our assumptions is related to the direct link between satisfaction with life and satisfaction with housing. Making a regression analysis on the data from Romania, we can see that the association between the two variables is significant and, as shown by the data in the table below, the correlation between the two variables is over 0.79, so it is quite strong. The comparison between the two regression analysis (the Romanian and Hungarian cases) shows a stronger association between the data from Romania than in those from Hungary.

In most studies the income seems to be the best predictor of satisfaction with life, so it would be interesting to have a look at the results of the regression model between the income and the satisfaction with life(annex3).The correlation coefficient ($r=0,99$) proves a very strong link between these two variables.On the other hand the regression model between the income and satisfaction with housing (a significant combination and a very

strong connection) proves that in the case of Hungary, the income variable is a better predictor of life satisfaction than the satisfaction with housing(annex5).

Applying the same regression analysis for Romania, we notice a significant association and a stronger link (although the values are very close) than that between satisfaction with housing and satisfaction with life. The differences that arise between the situation in Romania and Hungary are likely due to differences in income between the Roma in the two countries, but also to the way the Roma minority relates to their neighbors. The data presented in this paper show us that the Roma in Romania live in neighborhoods with Roma majority, while the Roma in Hungary live in ethnically rather mixed areas.

Further we proceeded to test the link between housing and income satisfaction in Romania (annex 6). The data demonstrate a significant association between the two variables and also a strong connection. This assumption/hypothesis is valid for Hungary. The data demonstrate a significant association between the two variables and also a strong connection, in the case of Romania. So, this hypothesis is valid for Romania, too. We note in the case of Romania a stronger value of the correlation coefficient, but the difference from the coefficient of Hungary is too small (0. 813 vs. 0. 701) for giving rise to any interpretation.

An important item in many inquiries about housing in poor areas is the state of dwelling ownership.

Table. 7 State of ownership of dwelling (Roma in Hungary)

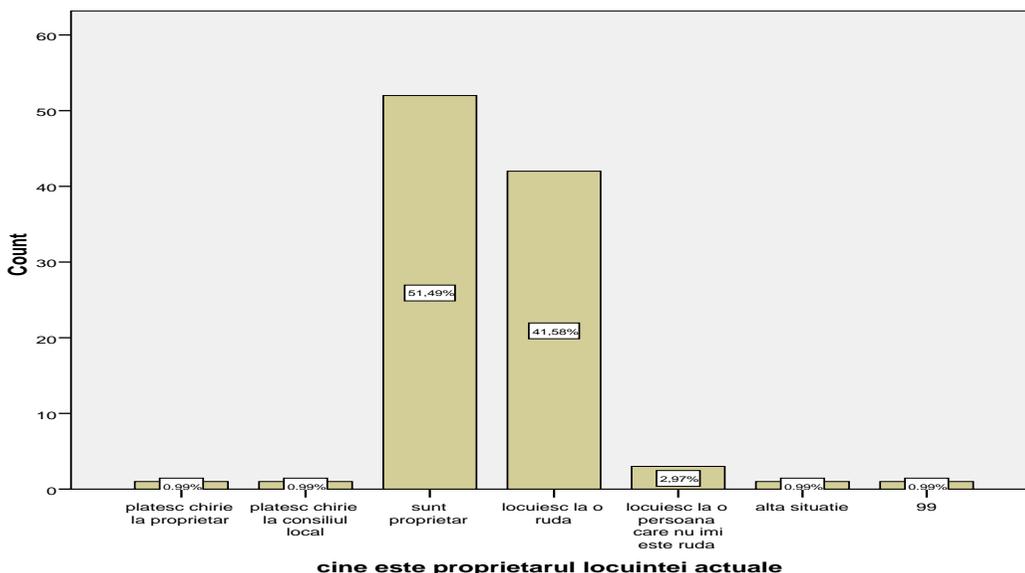

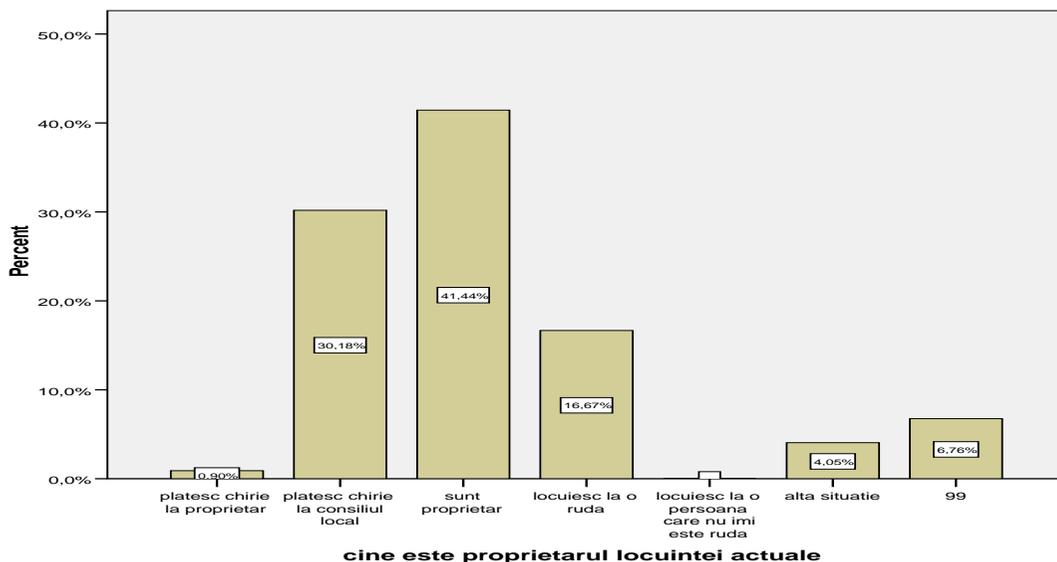

Table 8 State of ownership of dwelling (Roma in Romania)

When comparing the two situations, we can notice some aspects. First, in Romania there are several cases in which they pay rent to the City Council (30.18%) compared to a very small percentage, 0.99% in Hungary. The percentage of those who are owners is more favorable for Hungary, 51.49% compared to 41.44% in Romania, while in Hungary there are many more cases when the family lives at a relative, 41.58%, and when the family lives at persons who are not relatives, 2.97%, compared to Roma in Romania (16.67% and 0%).

Table 9. The materials the houses of the Roma are made of (in Hungary)

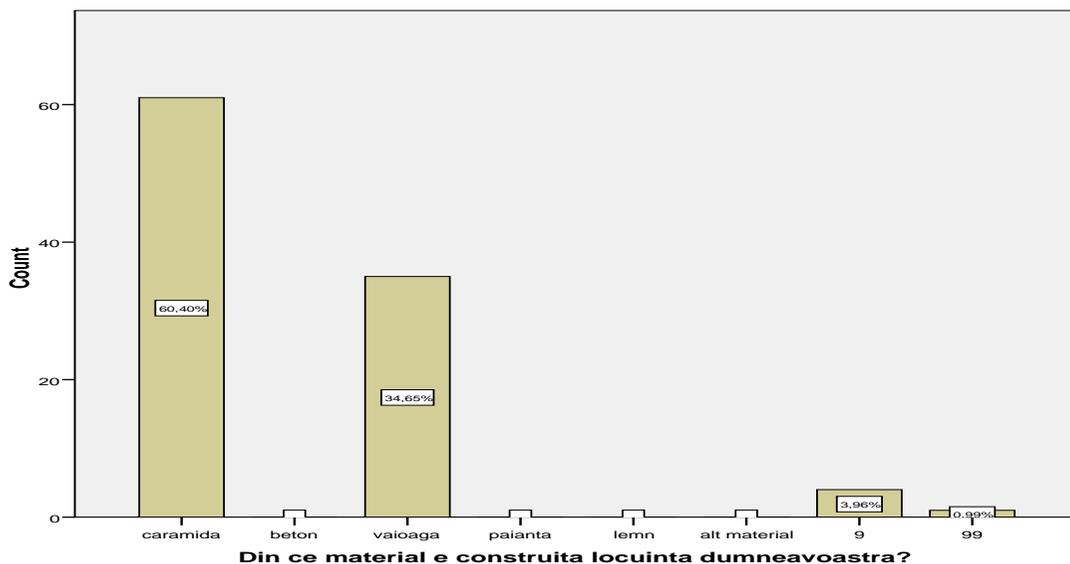

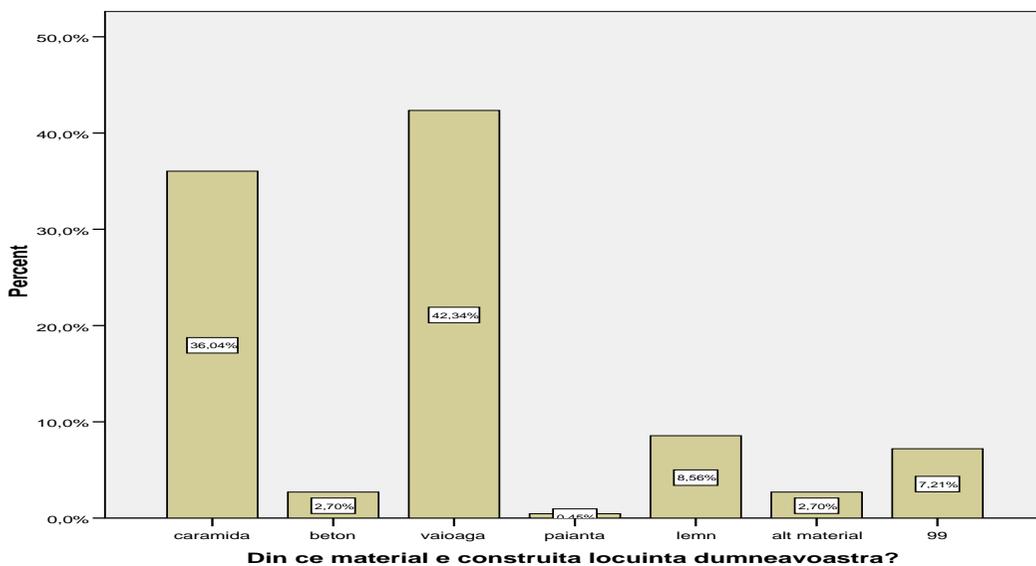

Table 10. The materials the houses of the Roma are made of (in Romania)

We can see in the two graphs that the Roma in Hungary have more modern houses, built mostly of brick (60.40%) and a smaller proportion of adobe (34.65%), while the dwellings of the Bihor County Roma are mainly made of adobe (42.34%), brick (36.04%), but also other materials (wood-8.56%, concrete 2.7%, half-timber work 0.45%).

Table. 11 How many people live in your home? (Roma in Hungary)

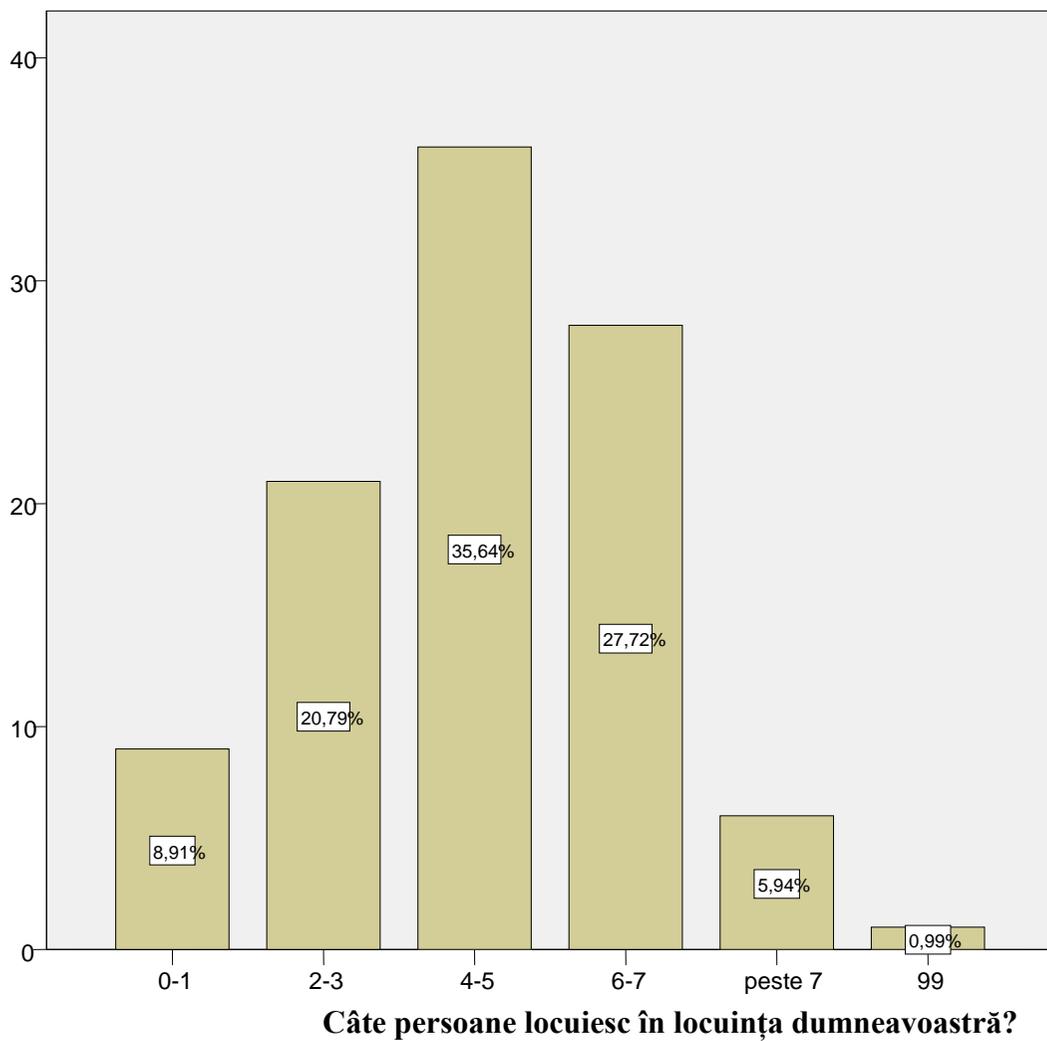

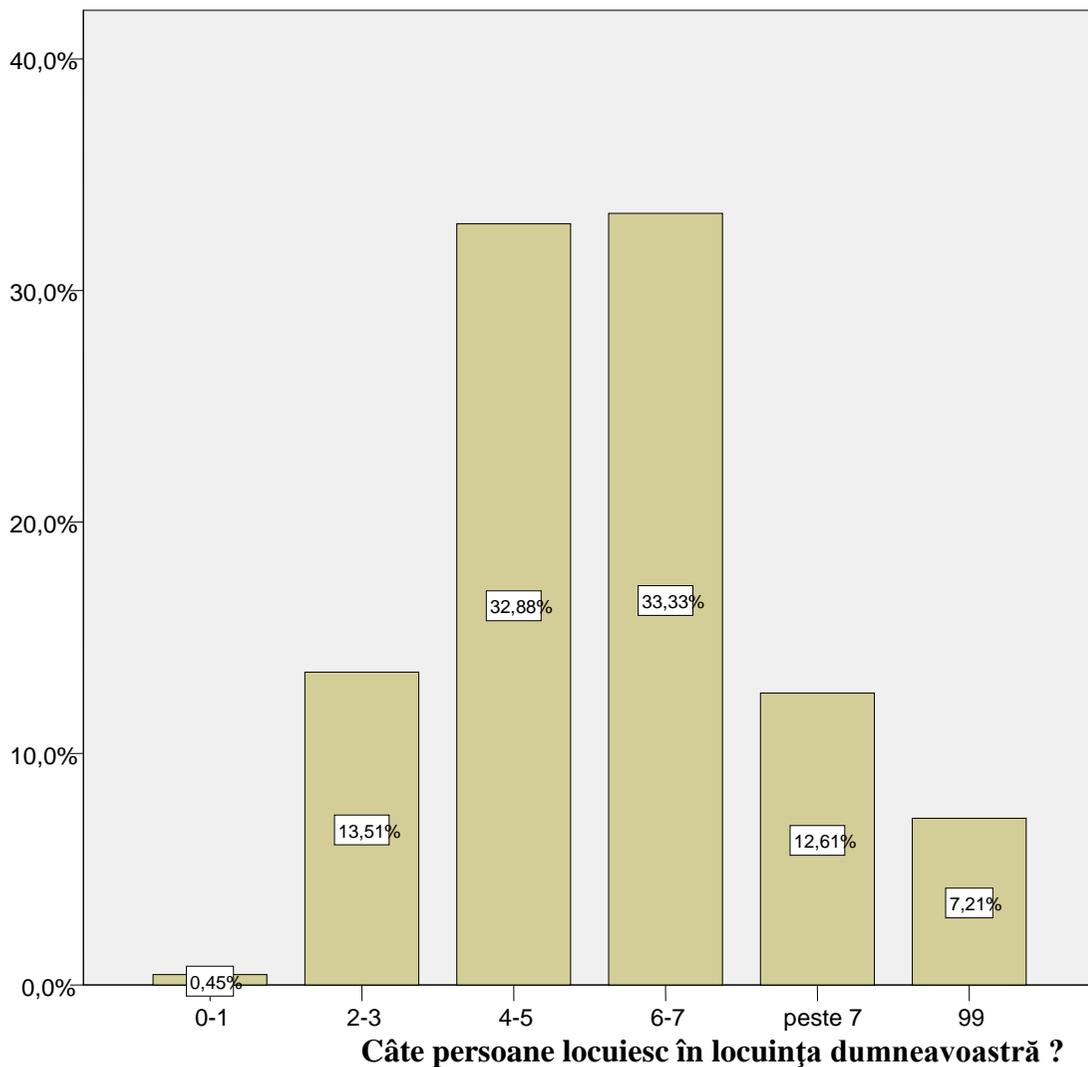

Table 12. How many people live in your home? (Roma in Romania)

We can notice in the two tables that housing density is higher in Romania than in Hungary, as in the case of 6-7 or more than 7 persons in the household, the share of cases in Romania (33.33% and 12.61%) being higher than in Hungary (27.72% respectively 5.94%). On the other hand, for 1 or 2-3 persons in a house, the situation in Hungary is comparatively better (8.91% and 20.79%) than in Romania (0.45% respectively 13.5%). These data should be added to those on the dwelling area, number of rooms and facilities.

Table 13. The size of the Roma dwelling in Hungary

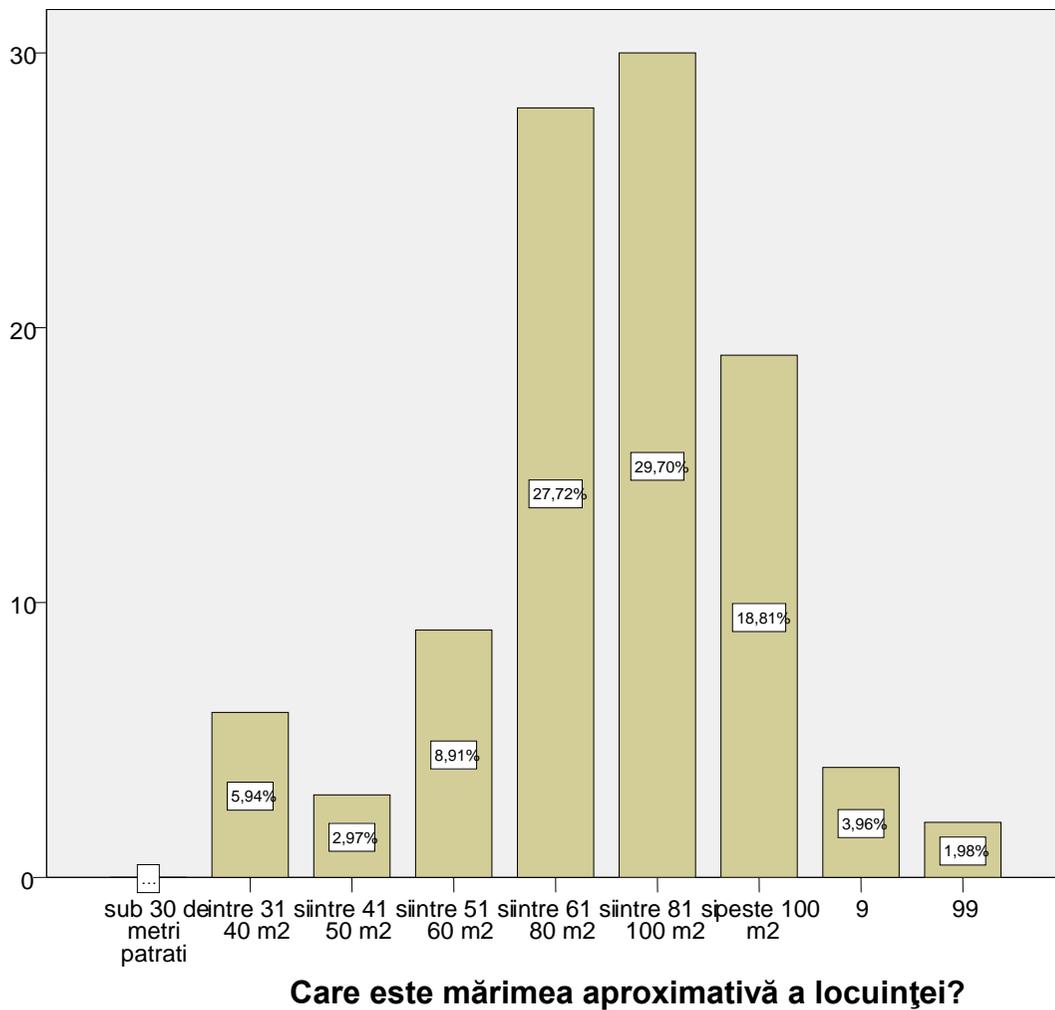

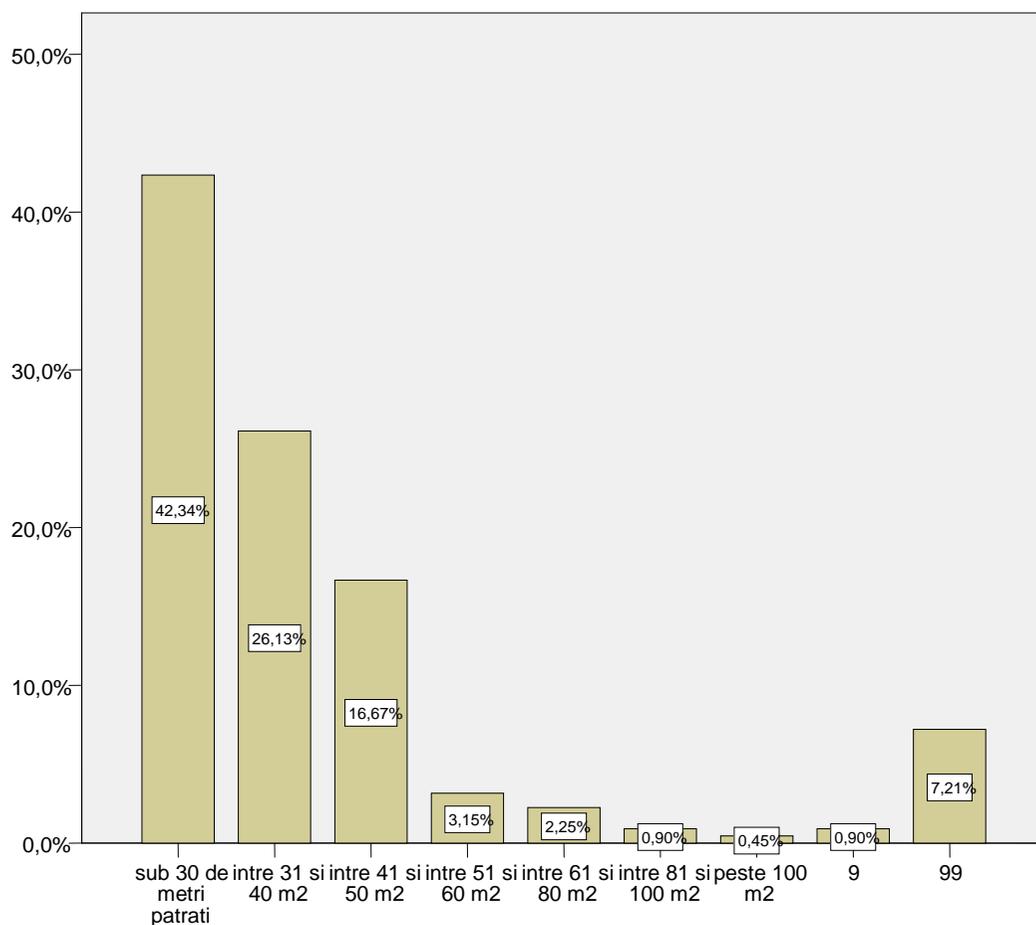

Table 14. The size of the Roma dwelling in Romania

Care este mărimea aproximativă a locuinței?

We can notice in these two tables that while in Romania the housing size is mainly under 60 sq.m., the prevailing housing area is over 60 sq.m. in Hungary. It seems that the size of housing is a significant indicator of the gap which separates housing conditions and more generally the civilizational integration levels of the Roma living in the two countries.

Table 15. How many rooms does your dwelling have? (Hungarian Roma)

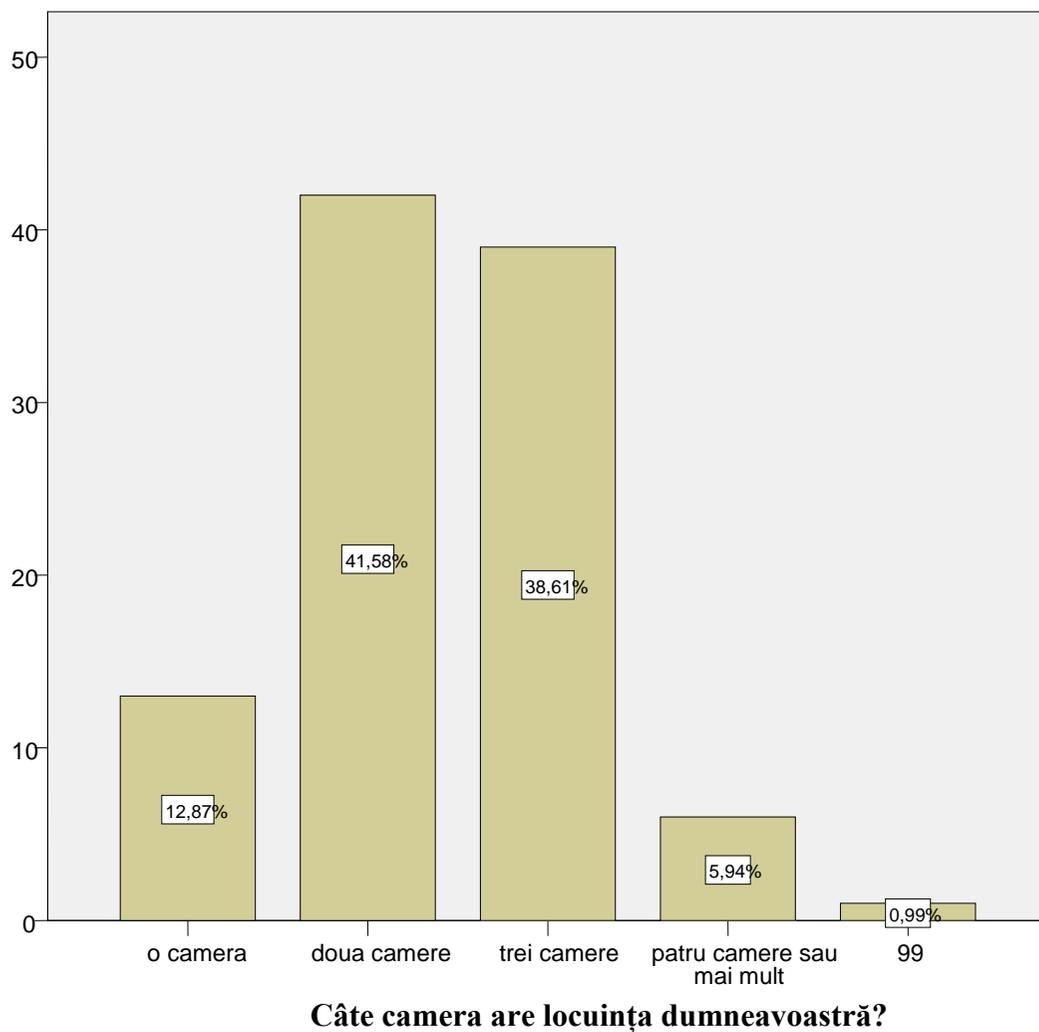

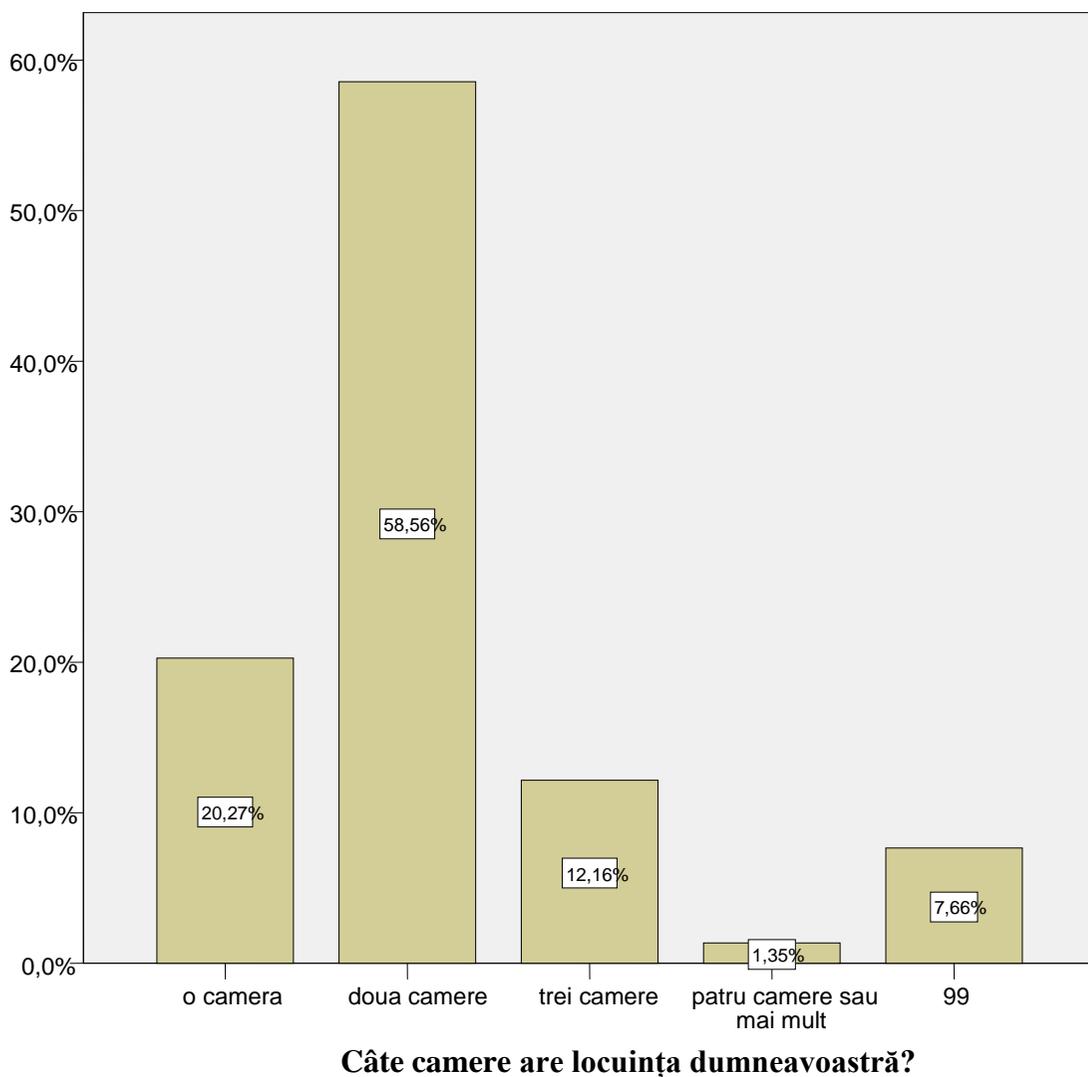

Table 16. How many rooms does your dwelling have? (Romanian Roma)

Again the difference is very high between the two samples. A share of 44.4% of Hungarian Roma live in houses with three rooms or more, while the corresponding percentage in the Romanian sample is only 13.4%. However, the situation is rather different in the case of houses with one or two rooms (79% of Roma in Romania and 64.4% in Hungary). According to the results of regression analysis in both countries there is a significant link between the housing size and income and also between the number of persons in the dwelling and the income (annexes 7 to 10). This outcome denotes the frequent occurrence

of multiple disadvantaging factors(such as precarious living conditions, high number of family members living in small size dwellings and extremely low level of income).

Table 17. Dwellings with bathroom facilities (Hungarian Roma)

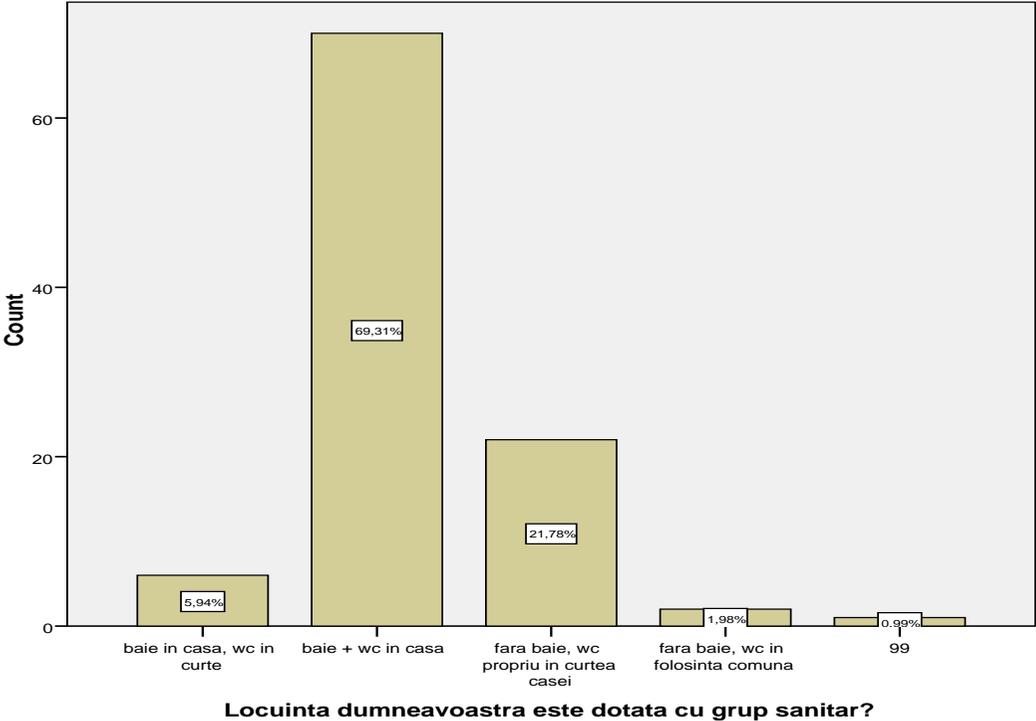

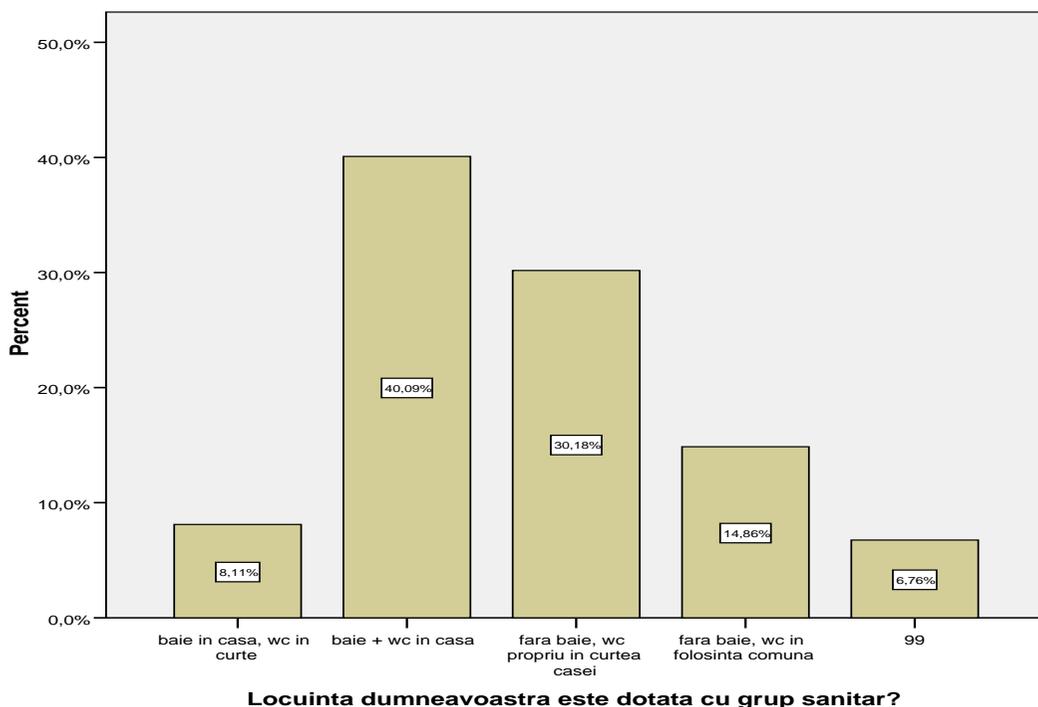

Table 18. Dwellings with bathroom facilities (Romanian Roma)

The two tables show very clearly that the Roma in Hungary have better living conditions than those from Romania. If we compare those with the best conditions, i.e. with bathroom and toilet in the house, the weights of the two samples are 69.31% in Hungary and 40.09% in Romania. If we compare instead those with the worst conditions, in other words those who do not have a bathroom in the house and a toilet in common usage, the corresponding values are 14.86% in Romania, respectively 1.99% in Hungary.

Another important housing facility is the home kitchen. The following two tables illustrate the situation in the two cases.

Table 19. Kitchen in the house (Hungarian Roma)

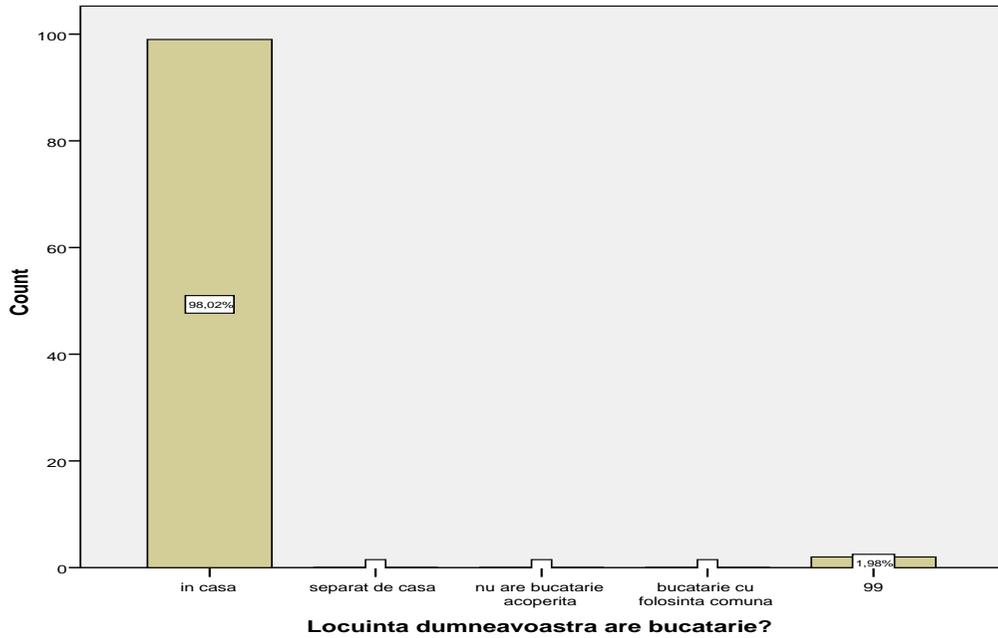

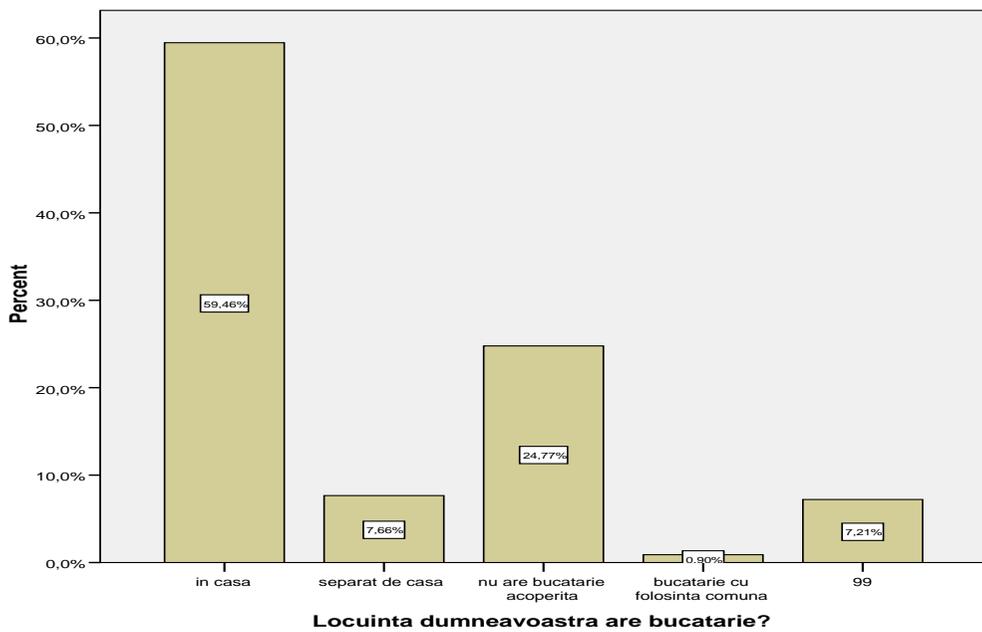

Table 20. Kitchen in the house (Romanian Roma)

Comparing the situation in the two countries, some important differences occur again. Thus, if 98.02% of Roma households in Hungary have a kitchen in the house, this is happening

only in 59.46% of Roma in Romania. Instead we have here a percentage of 7.66% of cases in which the kitchen is separated from the house, 24.77% have a not covered kitchen and even a small percentage (0.90%) use common kitchen with other families in town.

Table 21. Is there current water in the household you actually live? (Roma in Hungary)

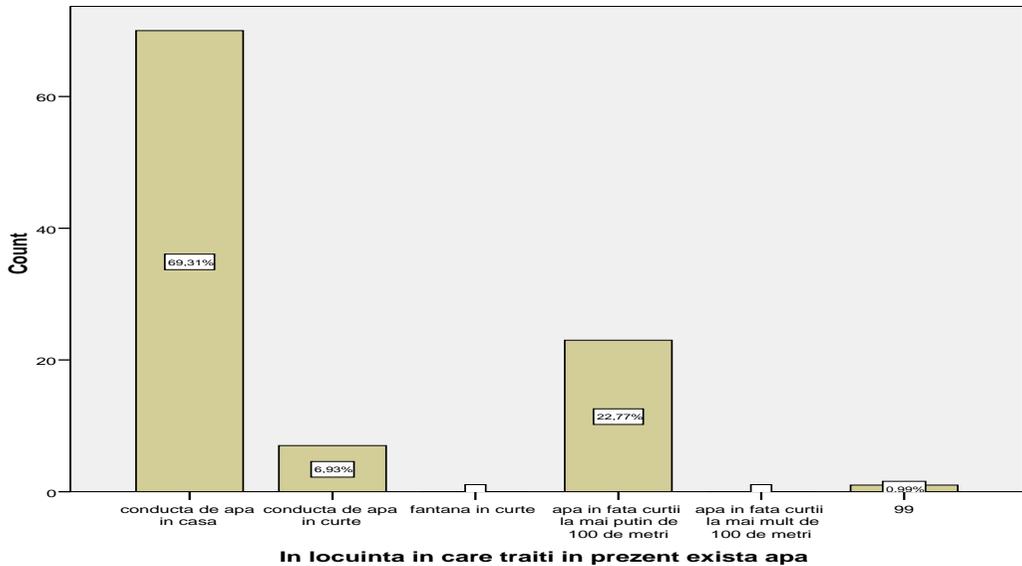

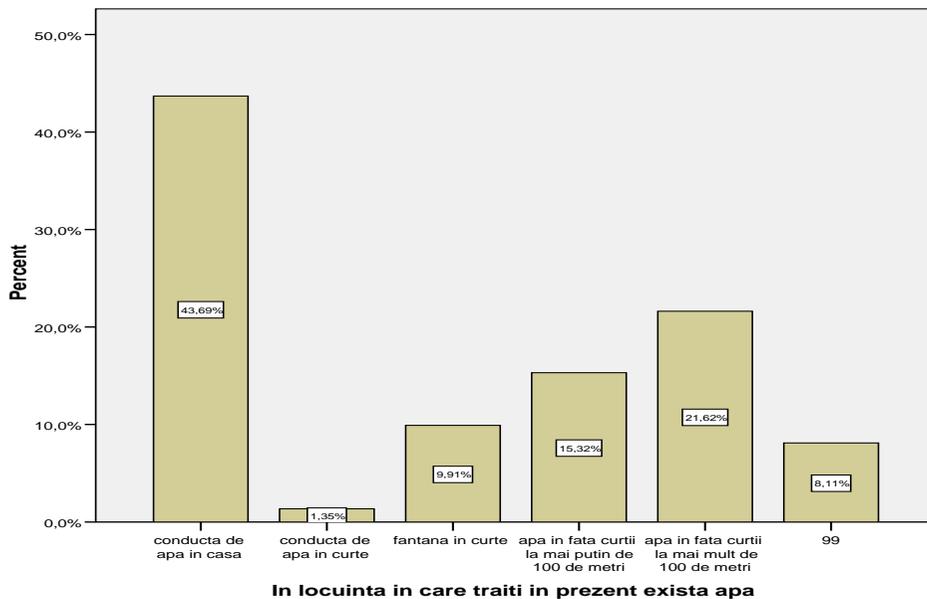

Table 22. Is there current water in the household you actually live? (Roma in Romania)

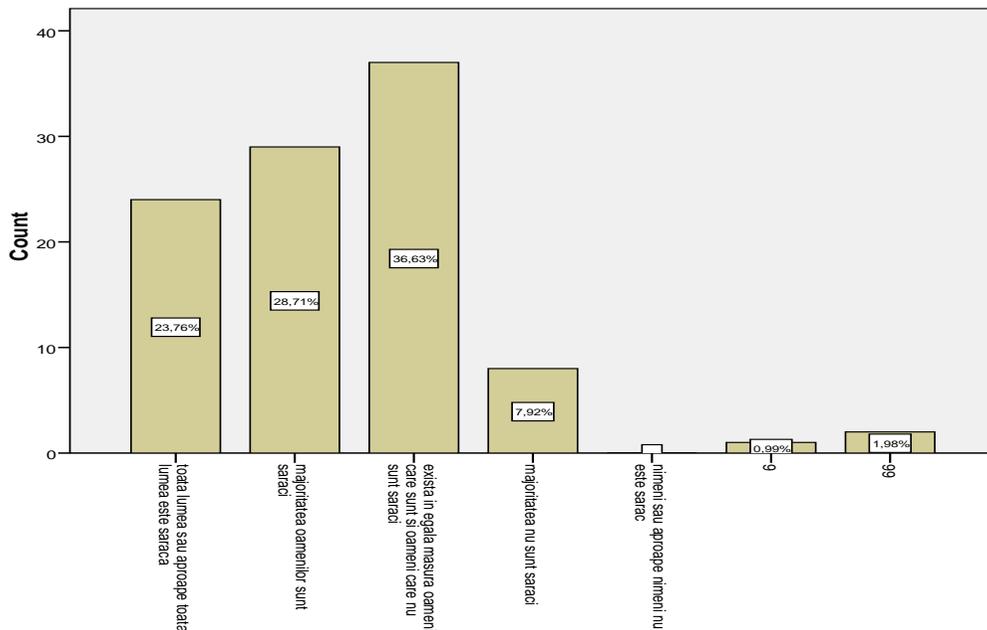

In terms of water use in the home, there are also significant differences between the two cases. Thus, in Hungary 69.31% compared to 43.69% in Romania are endowed with water

pipe in the house. 9.91% have a fountain/well in the courtyard in Romania compared to zero percent in Hungary. 15.32% of the Roma households in the Romanian sample are using the water source in the front of the courtyard at less than 100 meters compared to 22.7% in the Hungarian sample. 21.62% of the Roma households in the Romanian sample have water in the front of the courtyard at more than 100 meters compared to 0% in the Hungarian sample. Again, big differences appear between the two cases.

1.5.5. The poverty of the neighborhood

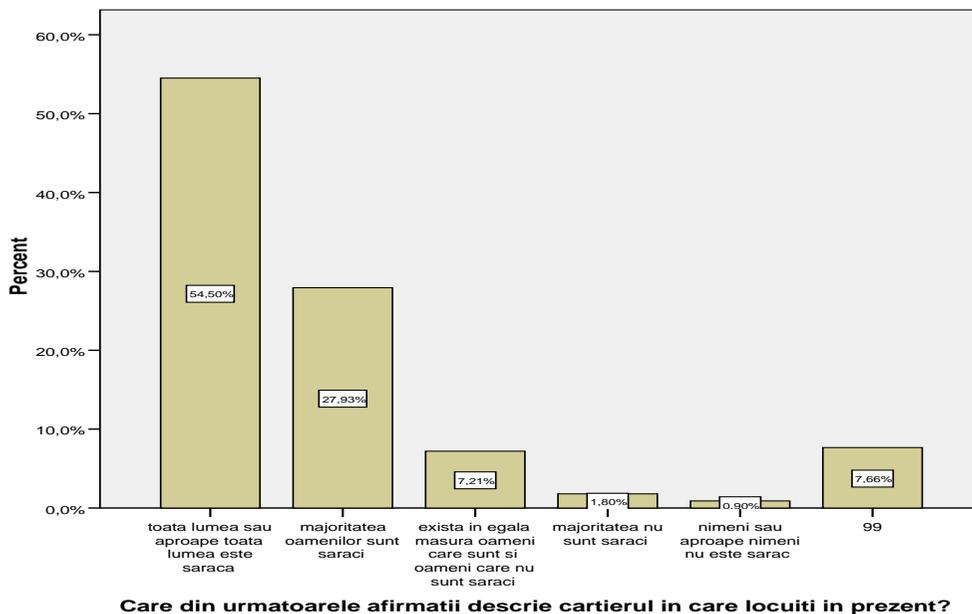

The Roma of the samples selected from the two countries live, in most cases, in poor neighborhoods compared with the majority. In our survey we inquire about the perception of the Roma on the neighborhoods in which their dwellings are.

Table 23. The perception of the poverty of the neighborhood (Hungarian Roma)

Care din urmatoarele afirmatii descrie cartierul in care locuiti in prezent?

Table 24. The perception of the poverty of the neighborhood (Romanian Roma)

It can be clearly seen that the perceived level of poverty is much higher in the Roma neighborhoods in Romania compared to that in Hungary. If we take the first two items (*Everybody or almost everybody is poor* and *Most of the people are poor*), their percentage is definitely higher for Romania, 82.4%, compared to 52.4% for Hungary. As far as item 4 is concerned (*Most of them are not poor*), we notice that the relevant percentage is lower in Romania (1.80%), than in Hungary (7.92%).

To have a better idea about the neighborhood of the Roma households, let's see who the neighbors of the subjects of our sample are (Roma or non-Roma neighbors).

Table 25. Who are the neighbors of the Roma? (Hungarian Roma)

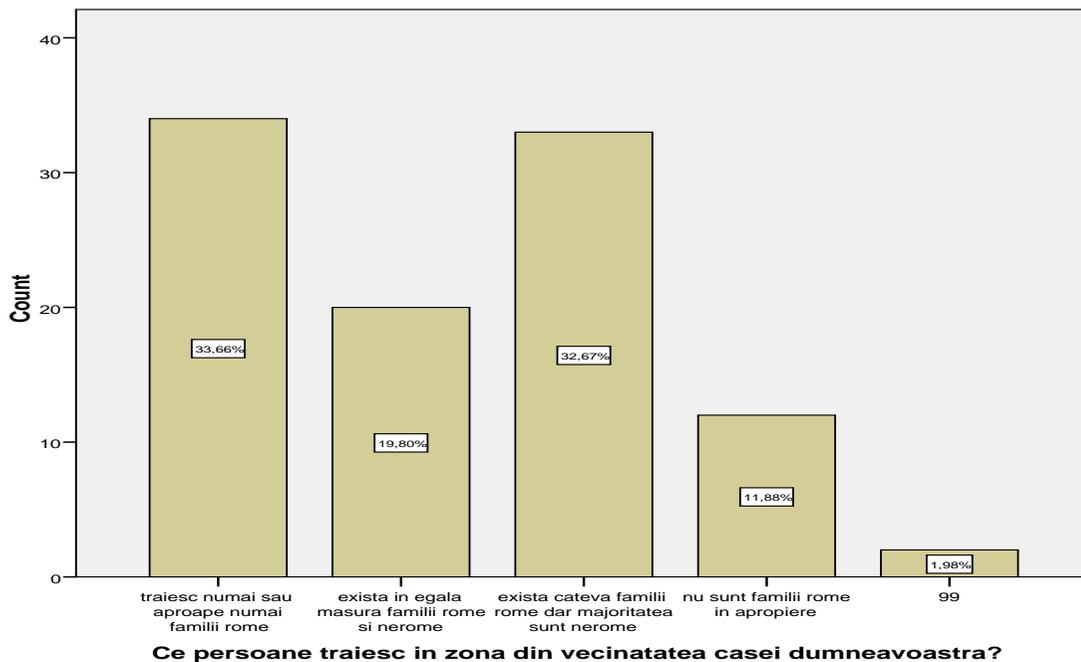

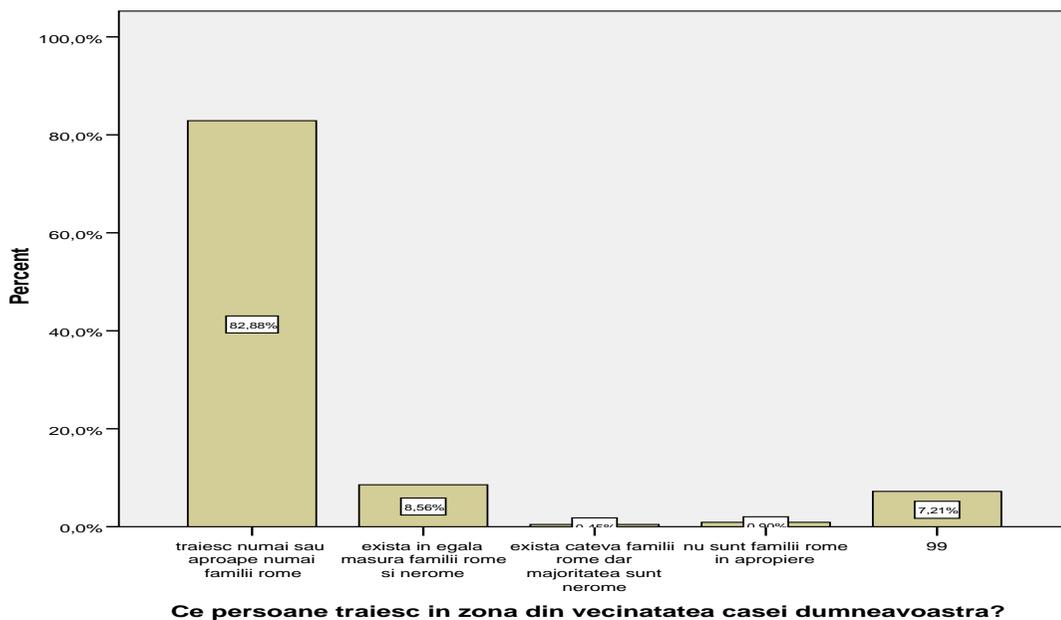

Table 26. Who are the neighbors of the Roma? (Romanian Roma)

Although the localities were selected by Romanian and Hungarian experts on the criterion of poverty and occurrence of social problems of the Roma communities, we can notice

differences in the ethnic composition of the neighborhoods. In Romania, the Roma tend to live in compact areas with Roma majority population (82.88%), while in Hungary the percentage is only 33.66%. However if we take items 3 and 4, the situation is clearly different for the two countries (44.55% in Hungary and 1.35% in Romania).

Table 27. Satisfaction with the neighborhood (Roma from Hungary)

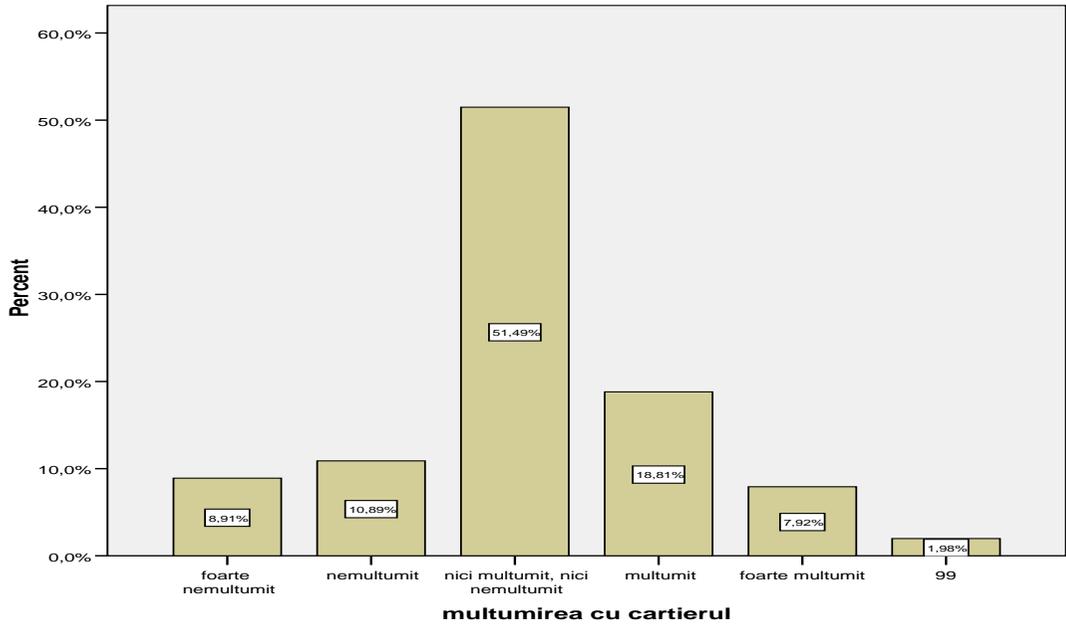

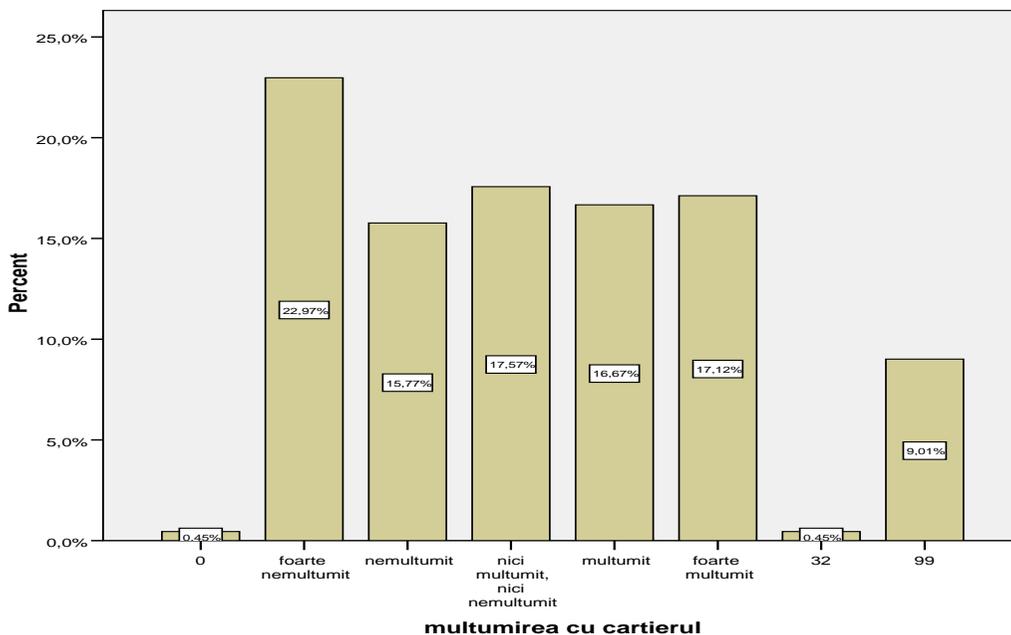

Table 28. Satisfaction with the neighborhood (Roma from Romania)

Concerning the satisfaction with the neighborhood, we notice again that the percentage of those very dissatisfied and dissatisfied is much higher (almost twice as high) in Romania than in Hungary (about 38.77% compared to almost 20%). It is interesting to notice that the percentage of those satisfied and very satisfied is greater in Romania (around 33.79% compared to almost 27%).

1.5. Conclusions

Analyzing the data on the Roma communities living in Romania and Hungary, we can find some significant differences. Even if Roma in Romania are more satisfied with their life, perhaps as the consequence of their more traditional life outlook, but also due to the ethnic composition of their neighbourhood, the Roma living in Hungary seem to be more satisfied with their dwellings. In terms of most objective indicators (ownership status, building materials, the number of rooms, the number of persons in the household, the hygiene, the possession of bathroom, toilet, kitchen, heating), Roma in Hungary are living in comparatively better conditions.

In contrast with their co-ethnics from Romania, Hungarian Roma live in neighborhoods that include both Roma and non-Roma, an aspect that has a great importance in their integration into society. Although according to Michael Stewart they resisted assimilation during socialism, our data demonstrate that today they seem to be much closer to the civilizational level of the larger society than ever before. It is worth to mention that they define themselves mostly as Hungarian Roma („magyar cigany”), unlike Roma from Romania, who mainly identify with their traditional community belonging (neamuri). The higher level of integration of Roma in Hungary is also proved by the attachment of most of them to the

mainstream churches, while in case of Romania the influence of Neo-Protestant religious communities is much higher among the Roma population.

One indicator of integration is the one related to housing quality. From this point of view too, Roma in Hungary are socially more integrated than the Roma in Romania. Their dwellings indicate a serious lag compared both to the Roma in Hungary, but also to the majority group. Roma in Romania seem to be much more traditional if we analyze all these indicators of housing quality.

In terms of differences between localities, they are more pronounced in Romania, where, according to our data, the community of Osorhei seems to be the poorest, having worse conditions not only compared to Oradea, but also to Ineu de Cris. Relatively small differences can be noticed in Hungary, between the communities of Biharkeresztes and Told, may be due to geographical proximity and to the fact that Told is a rural community while Biharkeresztes became a town only recently, still having mostly semi-rural community features.

Housing is an important indicator of the quality of life, influencing the health status, the participation in education and perhaps to some extent also the level of integration into the formal economy. For the development of the quality of housing, a more active involvement of the Government and of the local authorities, as well as the involvement of NGOs and Roma leaders is needed, even if the home's quality primarily depends on the income level of each family, and that is a problem in each case.

It is true that the same issue depends also on the neighborhood. If Roma see that the neighbors are poor and do not make efforts to improve their living conditions, they are tempted to do the same. If instead their neighbours belong to another ethnic group and Roma see that they have higher living conditions, this may also be an incentive for Roma. This fact is influencing to a large extent the difference between housing conditions of Roma in Hungary compared with those from Romania. Roma in Romania live in compact areas with a high density of social problems and a serious shortage of modernity. Perhaps a solution would be that Roma in Romania live in ethnically mixed neighborhoods or areas. Roma in Romania are isolated, marginalized, segregated compared to other ethnic groups both in terms of housing, participation in education or integration into the formal economy. On the other hand, there is also a dissociating mechanism probably related to their traditional values.

Probably long-term solutions would be large-scale investments in educational and also social economy programs, which could promote a better integration into the formal economy and to the successful securing of sustainable sources of income leading to better housing and civilizational conditions as well.

THE JOURNEY TO COMPETITIVENESS: EU SPEEDING UP ON THE ROAD PAVED WITH KNOWLEDGE AND INNOVATION

Oprescu Raluca

Bucharest Academy of Economic Studies

Faculty of International Business and Economics

In the attempt to boost its international competitiveness, the European Union realized that it should enrich the ways to achieve it by using the intangible assets that it holds. Knowledge and intellectual capital, innovation, science and entrepreneurship are key drivers of economic development and renewal. The traditional resources on which economies rely on are scarce, while these ones are abundant and steady. Moreover, this type of assets can easily increase their value through sharing and they trigger multiplicative effects in the economy. The paper tackles these issues and makes an assessment of the degree of innovation in the EU. The study aims to provide an answer to the question of whether EU's overall performance proves that it is truly driven by knowledge and innovation or not. Using a qualitative method of research, this paper identifies innovation patterns of the member states from a geographical perspective. In order to provide a compelling analysis, the data ranges from indicators capturing science and technology activities, firm innovation to the internationalization of research activities and the tertiary-level graduates. The results show substantial discrepancies between the European countries and reveal that knowledge flows scaled by the level of innovation are a localized phenomenon, therefore some countries are more innovation-oriented and they reap the benefits better.

Keywords: *knowledge-based economy, competitiveness, innovation, R&D, technology.*

JEL code: *O31, O33, M21, I25*

I. Introduction

The European Union is continuously trying to enhance its international competitiveness and to find new sources of growth by using intangible assets such as innovation, science and entrepreneurship. The development of the knowledge-based economy highlights the need to generate knowledge, to exploit, to transfer and to apply it. Since nowadays information is widely accessible, the knowledge and skills are assets that can provide a real edge. Knowledge and innovation are hot topics because they are key drivers of economic development and along with other components they can turn into a strong competitive advantage of any nation. So far, regions were identified as important players in the knowledge-based economy. Because they fail to enhance their potential on their own, the triple helix model involving the public sector, the business community and the higher education institutions was developed. Its purpose is to create links and interactions between those three and in this manner to create a synergy. UE regions and countries differ from each other in terms of intangible assets and factors of competitiveness.

Knowledge is a special type of resource for an economy and it's a non-rival input in generation of new knowledge. This particular subject is important because unlike most resources that become depleted when used, knowledge can be shared and grow through

application which further leads to innovation. Knowledge is not based on the scarcity principle but rather on abundance, hence knowledge and technology became the heart of the global economy. This points out that intangible assets are increasingly turning into competitiveness determinants. Moreover, evidence from a number of countries suggests a faster growth of investment in intangible assets than in tangibles hence the interest for them. The Knowledge Economy Index developed by the World Bank shows that in 2009, the top five countries are European. Denmark is ranked first, followed by Sweden, Finland and the Netherlands, this fact suggesting that the Nordic countries of EU are economies driven and based on knowledge. Among the economies least based on knowledge are Greece, Bulgaria and Romania. EU's competitors in the global arena are Canada (ranked 6th), the United States (ranked 9th) and Australia (ranked 11th).

Through the multi-level policy governance, the European institutions support the investment in research, infrastructure and transfer of knowledge and technology. The most important pillars are the 7th Framework Programme for Research and Technological Development, the Competitiveness and Innovation Programme and the Structural Funds as tools. Innovation is a growth driver for businesses, industries and countries as it reinforces their competitive position on the markets, boots their productivity and develops key competences. At the European level there are large discrepancies concerning the innovation rates. While different forms of innovation activities do occur in most of the EU regions, those based on R&D are spatially concentrated. Industrial structure, capabilities and other territorial characteristics affect the capacity of various economic actors to generate and absorb knowledge, as well as fostering the innovation processes. EU spends annually an average of 1,81% of the total GDP on research and development activities. Regional knowledge networks and joint research initiatives of the business community and the European universities are becoming increasingly prevalent. The creation of science parks is one of the strategies used by the European universities in order to enhance the knowledge spillovers. Science parks enable rapid technology transfer, offer improved funding for academic programs, sponsored research agreements and they create opportunities to trade the intellectual property. Research partnerships between companies and universities often lead to a high impact on the knowledge flows and innovation.

The paper aims to investigate the degree of innovation throughout the member states of EU as well as to launch hypotheses regarding the causes of the discrepancies between countries. The study attempts to answer the following question: "To what extent is the European Union driven by knowledge and innovation?". The main goal of the research is to identify the innovation patterns of countries from a geographical perspective and to assess the overall status of the EU as a knowledge-based economy.

I. Literature review

The literature referring to the intellectual capital or knowledge, human capital and innovation is not as broad as other topics in economics because it is relatively new and many areas are still to be explored. The theories of knowledge creation have social foundations as Fleck (1935) defined "thought communities", Schon (1983) investigated the "communities of reflective practitioners", Egestrom (1987) "activity systems". Others researched the "communities of practice" or "networks of practice" (Brown and Duguid, 2000). A substantial addition to the literature was brought by Nonaka (1995, 2008) though the concepts of "socialization and Ba". The innovation theories are rooted in a

microeconomic approach as they started to arise based on the firm level and later they extended to markets, which further led to a regional approach. A large part of them related to the organizational theories, investigated the conditions in which innovation arises, the intensity of it, the impact of external knowledge while others attempted to create models of innovation (Von Hippel, 1977; Chesbrough, 2003; Nonaka, Toyama and Hirata, 2008). Gary Backer was the pioneer of the human capital theory. The emphasis on human capabilities has been followed and expanded in modern research on innovation. Studies regarding innovation reveal that the development of new technologies and innovation itself occurs through the activities of skilled personnel such as researchers, engineers and managers. Innovation is a social process, involving not only new techniques but also new forms of knowledge and competences. Competence is embodied in the collective experience and activities of the people who implement new technologies (OECD, 2010: 8). Competitiveness depends, to a large extent, on the ability to generate a good momentum of employment, which is the result of issues related to demographics, limitations of the labor market, qualifications of human resources and achievement of high levels of productivity (Couto, Vieira and Tiago & Natario, 2006). Econometric studies confirm the positive relationship between labor productivity and innovation (Vieira and Vazquez, 2008: 60). In the knowledge-based type of economy, wealth is increasingly created through effective management of knowledge workers instead of using the efficient control of physical and financial assets. The growing importance of knowledge and innovation leads to more investments in the companies' intangibles such as experience, talents, skills, capabilities and intellectual capital (Stewart, 1999: 67).

European cross-country studies using equilibrium models were conducted to define the dynamics of innovation and productivity growth. One particular paper finds that technology diffusion between countries falls as the distance between them grows (Eaton and Kortum, 1996: 251-278). The same authors conclude that human capital raises the ability of a country to absorb technology. The technology diffusion is significant and proportional to the countries' ability to absorb innovation, thus spillover effects arise in different regions (Bottazzi and Peri, 1999: 8). The fact that innovation production is more sensitive to demand pull pressures and less sensitive to supply pressure is underlined by other studies (Gerowski and Van Reenen, 1996). Parts of the literature also tackle the personnel mobility issue and the national innovation systems. The movement of labor force and the tacit knowledge they carry with them is a key flow in any national innovation system. The movement of workers through sectors and firms is a way of spreading innovation. Knowledge transfer, human capital enrichment in the form of the production of graduates along with the development of the regional labor force by training activities outlines the potential to promote economic development (Riddel and Schwer, 2003: 80). Despite restrictions and limitations, universities serve as sources of knowledge for businesses. Policies designed to build new niches of knowledge and develop more effective mechanisms for transferring university-based knowledge to regional partners can bolster technology communities and shape innovation cultures (Benneworth and Charles, 2005). Another important idea provided by the literature is that just as agglomerations of traditional resources appear, knowledge spillovers can generate an agglomeration of innovative activity.

III. Methodology

The paper uses an exploratory data analysis in order to examine the spread of knowledge and innovation within the EU, through the research and development activities. The qualitative method of direct observation was considered appropriate in this particular case because it allows making suitable connections between the indicators and it is proper for comparisons. Following it, meaningful conclusions will arise and the main goal of the study can be achieved. A pool of six countries was chosen as a base for the comparison along with the European level comprising the 27 member states. The selection was carried out by geographical criteria and each of the countries aims to represent a group (the core of EU or the West countries, the Central countries, the Nordic countries and the countries located to the periphery). The data collection entailed identifying appropriate indicators that can describe the extensiveness of the R&D activities and their effects (the level of firm innovation, the type of innovation). The “Science, Technology and Industry Scoreboard 2009” by OECD was the primary source for data collection and the information refers up to the year 2008. The first group comprising of four indicators captures a synoptic view over the expenditures in R&D, the main sources and the performers of these activities (Table 1). The second group including three indicators aim to emphasize how does EU and its countries compete in the world economy as far as innovation is concerned, and the next two provide an insight of how Europe connects to the global research. Finally, the last indicator shows to what extent the European Union invests in the knowledge economy through education.

Table 1 *The status of research and innovation in the EU*

Source: compiled by the author based on OECD statistics (“Science, Technology and Industry Scoreboard 2009”)

In the coming part I will point out the reasons for choosing these indicators and their relevancy for the analysis. The Gross Domestic Expenditure on Research and Development (GERD) is an indicator of the science and technology (S&T) activities and it is used as a summary of R&D activities. The purpose of including is to assess the amplitude of these expenses in each of the countries included in the study and to underline the large differences in the absolute value. If linked to growth and national income indicators it can contribute to measuring the sustainable development of a country. Further, identifying the finance sources for the R&D activities can uncover the proportion in which a country relies on the private business sector and on the government in this matter. Depending on which sector prevails, conclusions can be drawn regarding the interest and the financial power of each in supporting such activities. As the next step, it is important to also identify which are the

performers of the R&D activities and evaluate to what extent the sponsors are also performing them. However, because expenditure does not reflect the potential of R&D in a given country but only the effort conducted in a certain period of time it is appropriate to add other relevant indicators to the analysis.

To have a deeper understanding it is necessary to take a microeconomic approach of this issue and assess the innovation and firm performance. Innovations have different degrees of novelty and the impact of those is significant on the performance and on the competitiveness. Nevertheless, it is a clear distinction between being an adopter and being an innovator. The share of large firms with a new-to-market product innovation indicator aims to show the scale or the spread of the innovation phenomenon. Large companies were preferred as a measurement unit because usually small and medium enterprises are less likely to introduce novel innovations and they are rather known as adopters. In order to appraise the diffusion of new technologies in EU, the indicator related to in-house product innovators captures whether an innovation was developed within or outside the firm. This shows to what extent the firm interacted with other parties during the process. Innovation has both technological and non-technological aspects. The non-technological innovation arises especially in the case of services and it deals with the development of new marketing methods. EU's economies are mostly tertiary hence it is appropriate to analyze the cases in which innovation is not dependent on technology.

Cross-border inventions occur when the country of residence of the owner and the inventor are different and in most cases it is a result of the activities of multinational corporations (the applicant is a corporation and the inventors are located in a foreign subsidiary). The internationalization of research activities is a driver of innovative firms and country competitiveness. This is often measured through the share of patents filled by one country for an invention made in another country. This ratio shows the extent to which domestic firms control inventions made by residents of other countries. Employment of tertiary-level graduates is an indicator of the innovative potential of an economy and of the capacity of its labor market to allocate human capital to the production processes. Additional data concerning the investments in knowledge economy measured by the new university graduates unwraps pinpoints that EU has a 35% university graduation with almost 2,2 millions of degrees annually. This indicator reflects a country's capacity to absorb, develop and diffuse knowledge and to supply the labor market with highly skilled workers. The scientific studies are more popular in the Nordic Countries where science and engineering degrees account for more than 37% and 29% of total awards [1]. However, most university degree recipients graduate in the social sciences, which in Poland and Hungary exceed 40% of total graduates.

IV. Results

The research and development activities in most of the EU member states are financed by the private sector, through the industry but in the Central and periphery countries a large share is still supported by the national governments. The main performers of these activities are those who fund them, therefore the business sector. However, higher education institutions (universities, institutes or research organizations) conduct a significant part of the European R&D activities (24%). Countries like Portugal or Sweden have a significant level of researching within the academic environment, while Luxemburg does not rely on this category of performers. In the Nordic countries, the governments develop research

activities in an extremely limited share as they prefer to contract these services either from institutes, either from business performers. The European Union has more than a million and a half of researchers of which almost one fifth comprises of German researchers. Finland and Sweden have a reduced population but a large ratio of researchers while countries in the Central Europe have higher population and a lot lower shares of researchers than the Nordic ones. The statistics show that product innovation within the large companies in EU is not very widely spreaded, only 32% of the firms were able to bring completely new-to-market product innovations. This means that the majority of companies, both MNCs and SMEs are adaptors and not innovators. However, there are substantial discrepancies between countries but the West and Nordic ones seem to develop new products or improve the existing ones at a larger scale than the rest of the member states. On average, just 39% of the European companies prefer to engage in the innovation process within their own organization, which means the environment for technology diffusion is proper as they strongly interact with other entities. Luxemburg is an exception from this case. Due to the fact that almost all EU's countries have tertiary economies, the non-technological innovation has very high levels which indicates to some extent a certain level of creativity of the marketers. The data emphasizes that a weakness of the European Union is the reduced internationalization of the research activities. This fact is proven both by the low share of ownership of inventions made within the EU states and the reduced percentage of firms involved in collaboration on innovation. That is rather a surprising finding considering that EU is the host of many transnational corporations, which usually trigger the research internationalization phenomenon. However, significant differences among the countries can be observed in this case too. The Nordic countries or small economies of EU (Luxemburg) tend to collaborate more frequently with foreign partners. Cross-country differences in international collaboration could be explained by the propensity of the firms. Some have similar innovation rates but a different international collaboration rate, which suggests that some are more open or inclined to participate in joint activities. The innovation partnership outside EU is much less frequent and it is usually below 5% in most EU countries. At last, the labor markets within the European Union don't seem to benefit of a strong supply of highly skilled graduates. The low share of tertiary-level graduates indicates that valuable human capital is not allocated properly to the production process, which means that the innovative potential is not harnessed.

V. Conclusions

The European Union raised the awareness of the prominence of knowledge, technology, innovation and science in the race for the world competitiveness. The study confirms that knowledge flows measured by the level of innovation are a localized phenomenon. The West and the Nordic European countries are those with intense research and innovation activities. Furthermore, some countries have a high-income per capita, which could lead to the conclusion that innovations arise only in certain conditions. The presence of research hubs belonging to the multinational corporations, the public research labs and leading research universities, all located in these countries, could be an explanation for this phenomenon. However, the rest of the regions are catching up by developing their research capacity. One major problem is that due to the economic turmoil, the R&D budgets of the European companies were severely diminished. Once the economies will overcome the disarray completely, the situation will certainly improve.

One common characteristic of the European countries is that R&D activities are funded by the business sector which is also the main performer. Private enterprises are those that compete on the national, European and international markets, consequently a higher competitiveness can be achieved by extensive innovation at this level. Large companies innovate more frequently than small and medium size companies, but the situation is not exceptionally great because only one third of them were able to compute new-to-market product innovations. However, the majority of the European firms rely on marketing innovations and not on process, procedure or product innovation. Organizational capabilities and the blend between creativity and productivity usually leads to incremental innovations, which are the most widely spread in business. EU has a proper environment for technology diffusion and innovation as companies are linked through innovation and knowledge flows [2]. Unfortunately, the research activities known as a key determinant of the enhancement of innovation has a low internationalization. Collaborating on innovation with foreign partners is an important source of knowledge inflows and the European companies should be aware of that. The linkages between firms are allowing them to access a broader pool of inputs (technology, human resources, funds, information) than what is available in their local environment as well as it lowers the costs and they share the risks. Since the companies prefer to innovate mostly with partners within the European Union, it suggests that geographical and cultural proximity are factors that have an influence on the innovation processes. A few EU countries are conducting a considering part of the research and development activities through education institutions. It is generally acknowledged that EU has low-mobility labor market and the low share of tertiary level graduates overcasts the innovative potential. It is extensively consented that research and development and a highly trained labor force are among the conditions for innovation and economic development of a country, region or group of countries.

This study contributes to the existing literature by focusing on basic aspects of the R&D activities in the EU countries, making connections between knowledge flows and innovation from a territorial perspective and revealing both strengths and weaknesses of the European innovation networks. Just like a racing car on the move, the European Union despite of having good aerodynamics it cannot reach the finish line (achieving the world competitiveness) if the road is not safe and paved with a durable material (knowledge and innovation).

VI. Notes

- 1.Science degrees include: life sciences, physical sciences, mathematics and statistics and computing, Engineering degrees comprise: engineering and engineering trades, manufacturing and processing; architecture and building.
- 2.and services) or process innovations (mainly production processes).

Summary:

European Union and its Member States shall adjust some provisions of the development strategies aimed at increasing food production in sustainable ways, protecting natural resources and increase competitiveness of European agriculture on the world market.

Romania faces imbalances in market conditions is not rationally use land particularly favorable to obtain a competitive agricultural supplies. Large annual variations in crop conditions in which the yields per hectare and per animal is about half the EU15 average does not provide the power necessary at affordable prices, especially for vulnerable population groups.

Addressing structural and operational problems of the institutional system of agriculture in Romania's European integration process is an important way of overcoming the situations to which the elimination of disparities in economic development and social peace disturbed by high and rising prices of food, produced in quantities increasing imports.

In the current international situation in which Romania difficulties in structural adjustment in agriculture and reduction of disparities compared to EU Member States, a national policy of granting real priorities for the sector is badly needed. These priorities cover both ways of achieving the overall objectives which fall within the strategic guidelines of the European Union and European integration meets the needs and solving specific national targets.

Keywords: European integration, rural development, agricultural policy, national objectives, agricultural holdings.

JEL Codes: Q0 , Q1

1. Strategic directions for agriculture and rural development in line with the EU strategy

European Union of 27 Member States has the strategic directions to integrate agriculture and rural environment for sustainable development to cope with economic risks and uncertainties, environmental, social and health. New challenges on the global market instability and food crisis have emerged under the impact of climate change, degradation of natural resources and soaring energy prices. The effects of income inequality have generated and rising food prices. As a result of these disturbances, and the predictable results of the negotiations of the WTO on agricultural trade liberalization, the European Union and its Member States shall adjust some provisions of the development strategies aimed at

increasing food production in sustainable ways, protect natural resources and increasing the competitiveness of European agriculture on the world market.

Community development in Romania are the conditions under which agriculture has not yet made the expected progress in adapting its structures based on competitive market demands, while the national economy is growing in 2000. To overcome this situation, which limits the expansion potential of the agricultural economy and measures are required to accelerate the modernization and organization of agriculture in sustainable use of renewable and non renewable resources for food security and economic equilibrium. Although Romania is not facing a food crisis, agricultural production is highly dependent on climatic conditions. Market imbalances have widened in the absence of coherent agricultural policy to ensure a certain continuity of funding during the transition period, due to the de structuring of products in the reform process and difficulties adapting to European agricultural model. Restoring private ownership of land has been separated from their organization and operation were not created to provide basic infrastructure services necessary for the production and marketing of agricultural products. Financing agricultural policy measures is still lacking, both in terms of ensuring the necessary funds and bureaucratic system of allocating them. Therefore, Romania is facing imbalances in the market conditions are not rationally use land particularly favorable to obtain a competitive agricultural supplies. Large annual variations in crop conditions in which the yields per hectare and per animal is about half the EU15 average does not provide the power necessary at affordable prices, especially for vulnerable population groups. The perpetuation of this situation and in years with high yields because of lack of storage and marketing structures, inflated and unjustified price of food imports.

In the new global conjuncture, the threat posed by climate change and escalating energy prices requires a new approach to the role of agriculture as a balancing factor for Romania's economic growth model.

2. Romanian agriculture integration in the EU requirements and national priorities

Romania needs to build a national agricultural policy into line with requirements and rules for the CAP to the market orientation of agriculture, modernization of rural communities and enhancing environmental protection measures. At present concerns for the Common Agricultural Policy implementation mechanisms, the priority now, do not put enough emphasis on the fact that they must be combined with specific measures of association and cooperation of small farmers to increase production to the market, excessive land parceled out to the practice of merging technologies, training food chains, national agricultural research reconsideration.

Without visible results in the evolution of these structures is difficult for the Romanian agriculture to become short and medium term consistent with the Western European. As a member of the European Union, Romania has a significant community support for the market and especially for rural development, plus national and support. Adapting agriculture to EU requirements creates benefits for countries that are in an efficient organizational system such as that of the European Community. To qualify for these benefits are necessary major adjustments in operating structures for the formation and expansion of the commercial sector to include family farms with opportunities to become viable, by providing material and technical facilities in Europe as parameters to approximate the existing level the old Member States on yields per hectare and per animal, ensuring food

security and agricultural performance of the population. The Romanian agriculture at the end of 2007 there were approximately 3.93 million farms, of which 89.6% have an average size less than 5 hectares, 7.79% are farms that have between 5 to 10 hectares and only 0.37% of total have over 50 ha. Over 48% of utilized agricultural area is operated by units with legal personality, large and extra large. Dual character of the form of exploitation is reflected in the existence of more than 3.1 million individual household subsistence and subsistence, with an average area of 2.25 ha, OR (2005), which also hold about 90% of cattle herds 97% of sheep, 99% of the goat. In 2007 only 9,595 households had individual market sales of own production of more than 50%. Own consumption ranges on average for the country to a level of approx. 40% and in rural areas about 80%.

Number of farms directly eligible for Community support is 1.245 million. About 60% of the total households remain outside the system if the owners do not associate support for accessing European funds for agricultural and non-agricultural activities diversified. This remains a priority objective of national agricultural policy since rural areas have important natural resources and a large work force poorly used in small individual households.

Romanian economy's dependence on agriculture is a strong handicap to approach European levels of economic development. Share of agriculture in GDP was in transition at very high, between 12-18%, decreased to 7.8% in 2006 and 6.8% in 2007 due to overall economic development, but also the conditions bad weather affecting agricultural production (excessive drought, floods). Agricultural contribution to GDP compared with the share of active agricultural population in total employment (about 30%) reflects a low level of agricultural labor productivity gaps of about 1:8 to old Member States. Large numbers of people active unemployed or partially employed in economic activity led to a migration of excessive rural labor to countries young European members of the European Union and following the abandonment of agricultural activity, especially in households.

As a result of agricultural policies did not support the economic organization of small farmers, especially in the creation of infrastructure for storage, processing, transporting and marketing their products, about 3 million acres per year remain fallow. Lack of investment in the modernization of agriculture and rural areas increased market imbalances and volatility in food prices due to low yields and difficulties in market access for producers direct. Large annual crop losses due to difficulties in contracting and transportation of products, and the lack of storage space. Most farmers sell their crops directly in the field, at low prices, lack of deposits held by the association which can provide much lower costs than the big stores.

The state of agricultural production has worsened in the past 18 years, tending toward a more unbalanced structure: in 2007, 60.2% is the value of plant products, and only 38.3% of the value of animal products, the opposite of the structure consumption. Agricultural supply has declined to a smaller number of products, cereals and oilseeds have very large weights (in 2007 the share of cereals cultivated area was 65.4%, 17.2% plant oil), and beet crops sugar, flax and hemp, tobacco, fodder, etc. areas have reduced.

Wheat production, subject to annual climate variations and lack of storage capacity, not supplying rhythmic processing sector and therefore increase bread prices in January-June when stocks fall. The trend of excessive growth of area under oilseeds (rapeseed and sunflower) for biofuels, as a result of Community support supplement per hectare (an area

of 3.1-fold increase in 2007 compared with 2006 to rape), disturbances in ensuring rational crop rotation and crop structure removed from the major corn and barley business to the detriment of the livestock sector. The degree of self-sufficiency in domestic market knows and has high annual variation trend wear. In 2007, the level of supply was 97.2% grain, 97.9% in potato (in circumstances where small producers have remained unsold due to large amounts of existing difficulties in organizing the market), 92.2% for vegetables, fruit 73.9%, 17.6% sugar, 100.7% for milk and milk products, 101.1% for eggs, meat and organs 63.5%, 16.3% fish, 82% vegetable and animal fats. This indicator, which reflects the low level of consumer gratification needs of national production, worsened in recent years, although most products Romania can achieve efficiencies close to those in western European countries with similar natural conditions. In 2007 agricultural production was heavily affected by excessive drought. In 2008, although high yields were realized there were no reductions in food prices due to strong network marketing defavorizeză farmers and agricultural policy mechanisms that no effective measures to ensure the concentration of supply, transport and warehouse. Livestock sector is in decline further, both in terms of livestock and production, except for cow's milk.

Romania faces imbalances agricultural market is not fully functional. Offer is poorly diversified domestic and imported products play an increasingly important role in sales volume in urban areas. Food prices are high relative to household income and the prices of some products exceed EU countries, is an important determinant of inflation as food costs have more than 40% in the consumer basket. In today's soaring prices of cereals and other agricultural products in international markets, rising food prices in Romania and the need for integration into EU structures, restructuring and modernization of agriculture in reducing and eliminating disparities in development are priorities of economic policy.

3. Agriculture and rural development objectives for 2007-2013

The food crisis in poor countries and pressure on agricultural markets due to energy crisis and climate change policies require global emergency. Doubling the price of basic foods, particularly in urban areas in poor countries and escalating world prices of agricultural products, while meat and milk demand in emerging countries, and increasing use of part of the harvest of cereals and oilseeds biofuels (20% of U.S. corn were used for ethanol production in 2007) put strong pressure on markets. In the context of lower grain stocks to the lowest level (since 1995) reduction policy in EU intervention stocks and production of drought damage in many areas of the world, excessively high prices have benefited speculators and holders deposits. The lack of infrastructure, small producers could not benefit from high prices in this period. Food security has become a major international concern, which requires emergency action and change some rules in agriculture today. These changes are designed to protect natural resources and creating transport and storage infrastructure products, network marketing organization, to assist the great mass of farmers.

Addressing structural and operational problems of the institutional system of agriculture in Romania's European integration process is an important way of overcoming the situations to which the elimination of disparities in economic development and social peace disturbed by high and rising prices of food, produced in quantities increasing imports. Broken paths in food products since 1990 and their lack of measures to restructure the ownership and

operating the new structures have resulted in increased imports and the entry of large supermarkets, Romanian farmers and processors are becoming more dependent on retail outlets that secure conditions acquisition and food prices. Small producers are virtually non-existent on the market, as well as retailers. The purchase prices for agricultural products and foodstuffs offered by supermarkets for Romanian producers are poor while their income increases as a result of soaring prices. In the current international situation in which Romania difficulties in structural adjustment in agriculture and reduction of disparities compared to EU Member States, a national policy of granting real priorities for the sector is badly needed. These priorities cover both ways of achieving the overall objectives which fall within the strategic guidelines of the European Union and European integration meets the needs and solving specific national targets.

The main overall objective of ensuring that the EU policy are:

- Promoting sustainable consumption and production model, along with protection of ecosystems and decoupling economic growth from environmental degradation. These objectives are the future arrangements for Romania to increase food production in sustainable ways for food security and food safety, while improving the production system in order to stop land degradation and natural resource protection;

- Improving competitiveness of agriculture and adding value throughout the food chain. This objective meets the need of organizing channels on the product, economic growth performance in agriculture and food industry, modernization of marketing channels;

- Helping farmers adapt to climate change and energy saving. This can be achieved by supporting Romania reorganization of agricultural research thoroughly marginalized and lacking financial resources for investment and training of researchers, improving the management at farm level and the institutions that apply to agricultural policy mechanisms;

- Implementation of good agricultural practices, forestry and processing to ensure consumer safety and food safety. This objective allows the Community Benefit that requires compliance requirements to facilitate access to the Romanian market and unique food products to ensure public health.

- Diversification of rural economy, modernization of villages, implementation of cultural heritage in rural areas, etc.. These objectives financed by the National Rural Development Programme 2007-2013 are meant to solve a number of shortcomings related to the creation of jobs for youth stabilization, improved social conditions, revenue growth, etc.

These general objectives common to all European Union member states are added to a series of specific targets for recovery and modernization of the Romanian agriculture, as:

- The formation and consolidation of farm enterprises, and the associative family and economic organization throughout the food chain. By achieving these goals are stabilization of the internal market and increased productivity of natural and human capital in rural areas;

- Measures to accelerate the European integration process towards consolidation of agricultural land and farm planning organization formed after the producers association;

- Promote and expand the varieties and hybrids created by the Romanian scientific research that adapts agricultural conditions in different areas and provides increase in average yields, yields to levels closer to the EU 15;

- Support of investment in agriculture and rural economy to ensure that revenue growth and stabilization of youth;

- Modernization of irrigation systems through rehabilitation and adapting them to new land management structures and construction of economic systems based on low energy

technology in the context of climate change and excessive drought in southern areas of the country;

- Creation of rural infrastructure and agricultural services, transport, storage and marketing of products to ensure access of small and medium market;
- Diversification of economic activities in rural areas by developing small and medium enterprises in tourism, agricultural products processing, etc. various rural services. to increase the number of jobs and providing alternative incomes;
- Public intervention to correct market dysfunction selective agricultural policy mechanisms to ensure food security, protection of renewable resources and agricultural products more competitive. These objectives are additional measures of support from the national budget and attracting external sources other than those set by existing agreements with the European Union (EU sources of support, external loans);
- Reorganization of agricultural research and support agricultural education in rural areas to eliminate the fundamental gap separating Romania from developed countries. Achieving these objectives will contribute to structural changes in depth and limiting rural migration.

Conclusions

European Union of 27 Member States has the strategic directions to integrate agriculture and rural environment for sustainable development to cope with economic risks and uncertainties, environmental, social and health. New challenges on the global market instability and food crisis have emerged under the impact of climate change, degradation of natural resources and soaring energy prices. The effects of income inequality have generated and rising food prices. As a result of these disturbances, and the predictable results of the negotiations of the WTO on agricultural trade liberalization, the European Union and its Member States shall adjust some provisions of the development strategies aimed at increasing food production in sustainable ways, protect natural resources and increased global market competitiveness of European agriculture Community development in Romania are the conditions under which agriculture has not yet made the expected progress in adapting its structures based on competitive market demands, while the national economy is growing in 2000. To overcome this situation, which limits the expansion potential of the agricultural economy and measures are required to accelerate the modernization and organization of agriculture in sustainable use of renewable and non renewable resources for food security and economic equilibrium. Although Romania is not facing a food crisis, agricultural production is highly dependent on climatic conditions. Market imbalances have widened in the absence of coherent agricultural policy to ensure a certain continuity of funding during the transition period, due to the destructuring of products in the reform process and difficulties adapting to European agricultural model. Restoring private ownership of land has been separated from their organization and operation were not created to provide basic infrastructure services necessary for the production and marketing of agricultural products. Financing agricultural policy measures is still lacking, both in terms of ensuring the necessary funds and bureaucratic system of allocating them. Therefore, Romania is facing imbalances in the market conditions are not rationally use land particularly favorable to obtain a competitive agricultural supplies. Large annual variations in crop conditions in which the yields per hectare and per animal is about half the EU15 average does not provide the power necessary at affordable prices, especially

for vulnerable population groups. The perpetuation of this situation and in years with high yields because of lack of storage and marketing structures, inflated and unjustified prices for food imports.

In the new global conjuncture, the threat posed by climate change and escalating energy prices requires a new approach to the role of agriculture as a balancing factor for Romania's economic growth model.

E-GOVERNMENT: A DRIVING FACTOR FOR STIMULATING INNOVATION PERFORMANCE IN ROMANIA?

Preda Ana-Maria

The development of public services is one of the priorities on the agendas of all policies, both national and European. One of the most recent concerns of the European Commission, as shown in the 2010 Innobarometer, is to find ways and develop strategies to support the innovation in the public administration sector, in the context of the continuously changing economic background. In this paper, we'll investigate the relationship between e-Government, and the overall innovation performance at national level, for some European Union countries. e-Government is already a known concept, widespread in the world, promoting the implementation of information and communication technologies in the public administration, in order to provide better public services to citizens and businesses. A main component of the e-Government concept is the "counter reform", aimed to streamlining administrative act quickly in order to respond to the demands of citizens, businesses and government structures. Innovation in e-Government will be measured with two Eurostat indicators – "e-Government on-line availability" and "e-Government usage by individuals" – while for the overall innovation performance we'll use a composite indicator – the Summary Innovation Index (SII) – from the Innovation Union Scoreboard (IUS). In Romania, even if the values of these indicators are not at the level of other EU countries, we can say that the situation has improved and electronic public services are being used increasingly often. The study also includes a comparison between two „modest innovators”: Romania and Bulgaria. Regarding the overall innovation performance, according to the 2010 Innovation Union Scoreboard ranking, Romania is the leader of the "modest innovators" countries, overcoming Latvia, Bulgaria and Lithuania. However, in the field of e-Government our country has major shortcomings. Romania has registered a significant progress in the years after the EU integration, followed by a setback in 2009, still having values below those of other EU countries, including Bulgaria.

Keywords: innovation, e-Government, public sector, SII, correlation

JEL classification: O11

1. Introduction

European Commission's recent concerns are focused on innovation, inclusive in the public sector. Through the "Innovation Union" flagship initiative, launched within *Europe 2020*

Strategy, the European Commission proposed, among others, monitoring innovation in the public sector using a “European Public Sector Innovation Scoreboard”. A first step towards achieving this instrument was the “Innobarometer 2010”, which was devoted to an analytical study of innovation in public administration. This document, based on a survey of 4000 public administration institutions in all 27 Member States of the European Union (EU), has shown a relatively high degree of innovation in this sector (“*at the EU level, two-thirds of public administration institutions introduced a new or significantly improved service in the last 3 years*” (European Commission 2010a: 8). The report also highlighted out *the positive effects of innovation on the activity of the public administration institutions, among which: the improved user access to information, improved user satisfaction, more targeted services, faster delivery of services, simplified administration, improved working conditions or employee satisfaction, and cost reduction resulting from innovations* (European Commission 2010a: 9).

E-Government or electronic government is the use of ICT in public administration in order to improve public services provided to citizens and businesses. Implementing electronic government is not an easy process. Providing user-centered public services designed to reduce bureaucracy involves profound organizational changes. Thus, the transition to e-Government meets resistance because many times, although efforts involved are obvious, benefits they bring can be seen only over time. These benefits, however, play an important role in social and economic model of Europe, being the starting point in ensuring a higher level of welfare for its citizens, leading to economic and social cohesion and supporting the development of a functional market economy.

In this context, we have analyzed the relationship between e-Government and the overall level of innovation at country level, in order to determine the main factors that stimulate the innovation process. This is of special importance for Romania, given that our country is still a “modest innovator” within the European Union.

2. The SII indicator – measure of Innovation performance

SII (the Summary Innovation Index) is a composite indicator that measures the overall innovation performance at country level. It has been computed since 2001 and annually published in the European Innovation Scoreboard (EIS), under the surveillance of the European Commission, through the PRO INNO Europe initiative (EIS 2001, 2002-2006, 2007, 2008, 2009, 2010). Over time the SII structure and methodology have changed, and starting with 2010, the European Commission has proposed to “abandon” the EIS and create a new instrument, called the Innovation Union Scoreboard (IUS).

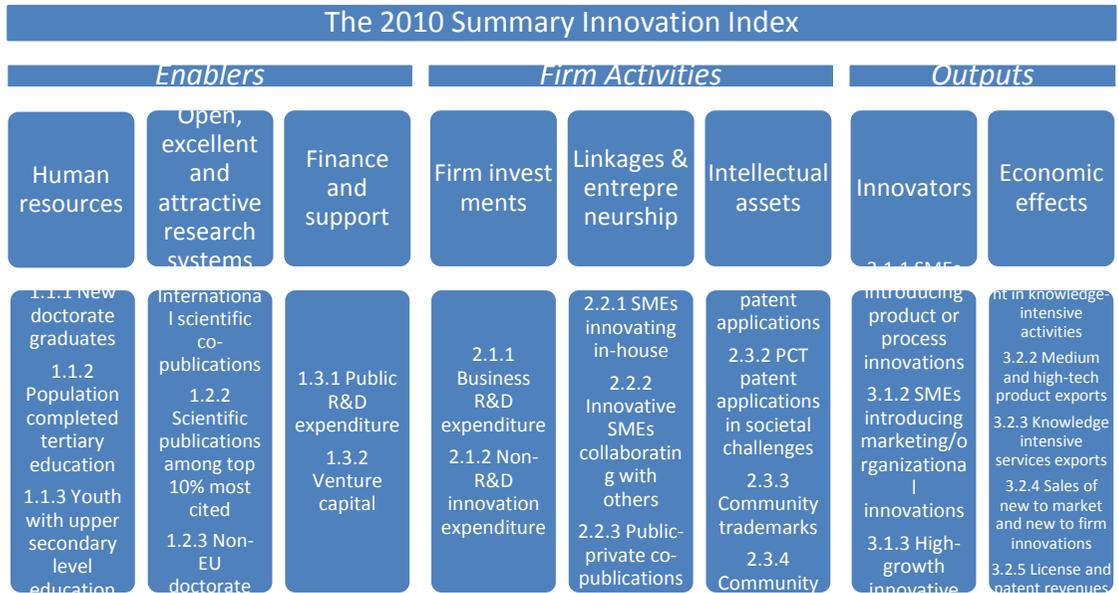

Figure 1. The structure of the 2010-SII indicator: the first level represents the three main types; the second level includes the eight dimensions which contain 25 sub-indices (Source: figure made by the authors)

The IUS purpose is to monitor implementation of innovation policies and strategies under the flagship initiative “Innovation Union”. Thus, in February 2011, the first edition of the IUS – IUS 2010 – was published, using a new structure for the SII indicator. The SII 2010 is a composite indicator that summarizes the performance of research and innovation systems at country level using 25 sub-indices, grouped into three main categories – “Enablers”, “Firm activities” and “Outputs” – and eight dimensions of innovation (Figure 1). SII 2010 includes 18 of the 29 sub-indices used in SII 2009 and 7 new sub-indices. Due to the lack of data for each of the sub-indices used in the SII 2010, only 24 of them could be effectively taken into account (the exception is the sub-indicator 3.1.3.). However, out of the 24 sub-indices, 4 relate to information in 2007, 10 to data of 2008 and 10 gives the values for the year 2009; therefore, the SII 2010 does not capture the full impact of the economic and financial crisis on innovation. Depending on the SII 2010 values (ranking), the 27 EU member states have been divided into four groups (clusters) of innovation:

- “*innovation leaders*”: Denmark, Finland, Germany, Sweden;
- “*innovation followers*”: Austria, Belgium, Cyprus, Estonia, France, Ireland, Luxembourg, Netherlands, Slovenia and the UK;
- “*moderate innovators*”: Czech Republic, Greece, Hungary, Italy, Malta, Poland, Portugal, Slovakia and Spain;
- “*modest innovators*”: Bulgaria, Latvia, Lithuania and Romania.

3. Econometric tests

We have investigated the existence and the intensity of the correlation between “e-Government” and the innovation performance at country level, registered in the EU. In this

regard, we approached the “e-Government”, both in terms of the “supply” of electronic public services (“*e-Government on-line availability*”) and the “demand” for these services (“*e-Government usage by individuals*”). Our working hypothesis was that e-Government (both the demand and the supply) is closely linked to innovation, influencing it and being influenced by this one.

3.1. The correlation between e-Government and innovation performance at country level for some EU countries, in 2006-2010

We have calculated the correlation coefficients between the overall innovation indicator *SII* and two representative e-Government indicators, respectively “*e-Government on-line availability*”⁽¹⁾ and “*e-Government usage by individuals*”⁽²⁾ for 22 EU Member States ⁽³⁾. The results, presented in Annex (Table 1) and plotted in Figures 2 and 3 reveal the four clusters of innovation (the leaders in innovation on the right side, the modest innovators on the left side).

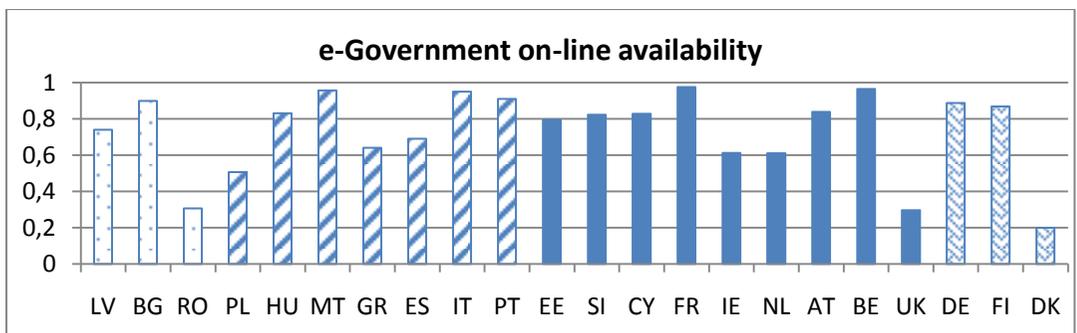

Figure 2. Correlation between “*e-Government on-line availability*” and innovation performance for 22 EU countries in the period 2006-2010 (Source: figure made by the authors)

Statistically, data presented in Figure 2 show that – although there are three countries (including Romania) that do not register a significant correlation between the two indicators, and for another six countries there is a weak linkage – the most of EU countries analyzed had a significant correlation (above 0.75), and even a strong one (above 0.90, for five countries, including Bulgaria). Generally, countries with moderate innovation level, considered as “*moderate innovators*” and “*follower innovators*” countries (according to the IUS 2010 report) present a high correlation between the innovation performance and the availability of the public service indicator.

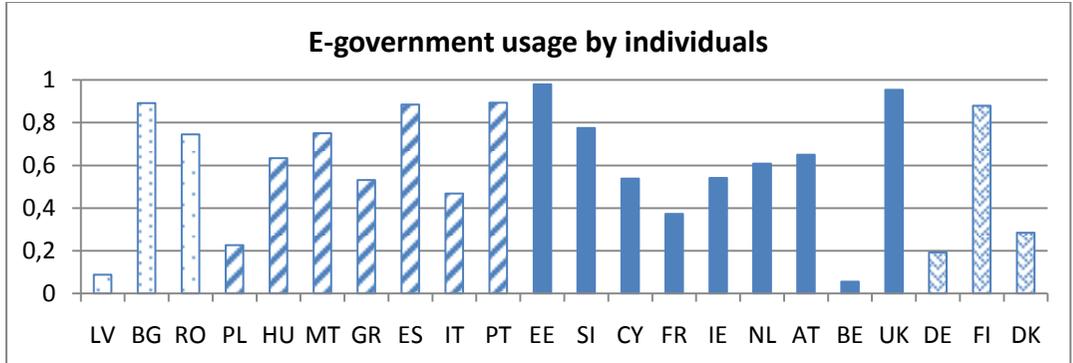

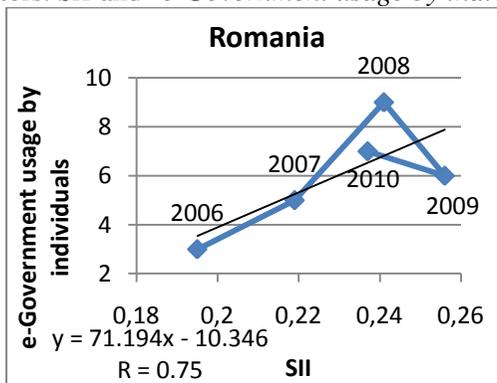

Figure 3. Correlation between “e-Government usage by individuals” and SII for 22 EU countries in 2006-2010 (Source: figure made by the authors)

In figure 3 it can be noticed that the degree of correlation between the two indicators is significant in most countries with medium level of innovation (the “followers in innovation” and the “moderate innovators” groups) and even very strong for Romania and Bulgaria, who are leading innovators within the group “modest innovators”.

3.2. The correlation between “e-Government usage by individuals” and SII for Romania and Bulgaria during 2006-2010

In order to describe the relationship between the degree of interaction of citizens with public administration, using Internet, and the overall innovation performance for Romania and Bulgaria, we have examined, for the period 2006-2010, the correlation between the indicators: SII and “e-Government usage by individuals”.

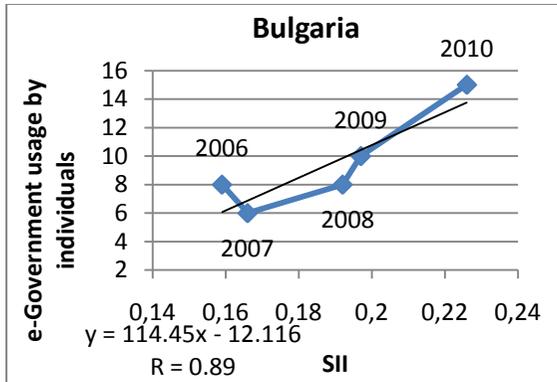

Figure 4. The correlation between “*e-Government usage by individuals*” and *SII* for Romania and Bulgaria during 2006-2010 (Source: figure made by the authors)

As it can be seen in Figure 4, the correlation between the analyzed indicators for both countries is significant, Bulgaria reporting even a very strong correlation. Both countries have made progress in terms of overall performance in innovation, following the integration in the European Union, but they had different evolutions in the period 2009-2010. Thus, Romania, unlike Bulgaria, recorded in 2010 a decline of SII value (from 0.25 to 0.23), while remaining yet the leader of the “modest innovators” group of countries, according to the classification published in the IUS 2010 report and overcoming Latvia, Bulgaria and Lithuania. Regarding the indicator “*e-Government usage by individuals*”, Bulgaria after its integration into UE, progressed steadily, with significant values that have increased from 6 in 2007 to 15 in 2010. As for Romania, it has made a significant progress after its integration into EU (from 5 in 2007 to 9 in 2008), but has reported a significant decrease in 2009 (down to a 6), and a slight recovery in 2010 (value 7).

4. Conclusions

After the integration in the European Union, Romania recorded a real progress in innovation performance, reaching in the year 2010 a top position in the group of the “modest innovators”, according to the classification published by the European Commission in the IUS 2010 Report, overcoming Latvia, Bulgaria and Lithuania. However, the SII indicator value is still very low and therefore there is a major concern of stimulating the innovation in all fields and to identify factors that can stimulate it. Through a set of econometric tests, our approach proves that the e-Government system can be such a driver.

In general, the indicators of the “supply” and the “demand” for electronic public services (e-Government) are significantly correlated with innovation performance at country level, as measured by the SII indicator for most countries of the European Union between 2006 - 2010. This suggests that improving the performances of the e-Government system in Romania, at least reestablishing the position from 2008 as a very near future desiderate, could yield to the increase of the innovation level.

5. Notes

⁽¹⁾ The “*e-Government on-line availability*” indicator is provided by EUROSTAT and it is measured as the percentage of online availability of 20 basic public services. The data are last updated in March 2011.

⁽²⁾ The “*e-Government usage by individuals*” indicator is provided by EUROSTAT and it is measured as the percentage of individuals aged 16 to 74 using the Internet for interaction with public authorities. The data are last updated in April 2011.

⁽³⁾ The 22 UE countries are: Austria (AT), Belgium (BE), Bulgaria (BG), Cyprus (CY), Germany (DE), Denmark (DK), Estonia (EE), Spain (ES), Finland (FI), France (FR), Greece (GR), Hungary (HU), Ireland (IE), Italy (IT), Latvia (LV), Malta (MT), Netherlands (NL), Poland (PL), Portugal (PT), Romania (RO), Slovenia (SI) and United Kingdom (UK).

Academy of Economic Studies Faculty of Accounting and Management Information Systems

Benchmarking is a method used to measure the products, services and processes in comparison to an entity recognized as a leader in terms of performance of its operations. Used in the years 1970-1980 in the strategic management of the company currently has proven to be increasingly useful in many areas, including in international analysis models. In the European Union benchmarking indicators are used especially in the digital economy and as perspective indicators for 2011-2015 (Eurostat, Database).

In the introduction we present and define forms of benchmarking, as well as a number of specific terms, which contribute to a better understanding of the content of this scientific work. Time series are used to highlight advances in labor productivity in EU countries, and the analysis is particularized for two countries: Romania and Germany. Quantitative data were collected from the source Eurostat website.

A comprehensive indicator at macroeconomic level is resource productivity, representing GDP in relation with domestic consumption of material (DCM). DCM measures the amount of materials used directly by an economy. It is presented in tabular form for all European Union countries and Switzerland, as evolving over a period of eight years.

Benchmarking method is used to highlight some differences (gaps) between EU countries regarding productivity and particularly the one between Germany and Romania is highlighted, concerning the performance of manufacturing industries. It is expected that this gap will diminish. The gap was highlighted by relevant graphics and interpretations.

The second part of the paper focuses on comparative analysis of factors productivity using the production function. We analyze labor and capital productivity and other factors that determine the level of production. For highlighting the contribution of the labour factor we used the number of hours worked, considering that it reflects the analyzed phenomenon more realistically. For highlighting the contribution of capital factor we used as an indicator the capital stock in euros, available for Germany in the Eurostat database, and for Romania in the Statistical Yearbook 2009, expressed in RON, as comparable prices and then converted into euros at the average rate calculated by the NBR. The results for the entire manufacturing industry represent the basis for further expansion of benchmarking to the main components of this industry, especially automobile building, transportation

vehicules, furniture, clothing, leather chemical, etc., providing a scientific basis to fundament the economic policies including commercial ones.

Keywords: benchmarking, labor productivity, resource productivity, capital productivity, sustainable development strategy

JEL Codes: F15 - Economic Integration, F31 - Foreign Exchange, L6 - Industry Studies: Manufacturing

1. Introduction: Characteristics of benchmarking

Benchmarking - a process that aims at seeking solutions to enhance the performance of the organization, based on the best methods and procedures of the industry. Setting business goals based on optimal methods and procedures existing in the industry are an important factor in the success of business strategy.

Benchmarking techniques were originally developed in strategic management in order to identify aspects through which one can compare an organization with similar organizations, even though they may function in a different industry or have a different target group of customers. In addition, benchmarking can be a valuable tool to identify areas, systems or processes that need improvement, which can take the form of a continuous development or of a dramatic change as business process reengineering.

There are several types of benchmarking, the most common being: - Technical benchmarking - involves identifying products and services capability, especially in comparison with similar products and services of leading competitors, market leaders, using a scale of 1-4 (4 being the best score) to quantify properties of products and services from your organization. If input data about products and services are difficult to obtain, they may be regarded as inappropriate to be competitive.

- Competitive benchmarking - involves a quantification of the main attributes, functions or values associated with products or services, so you can make a comparison between them and those of market leader (Sherman and Zhu, 2006)

- Functional benchmarking – represents using benchmarking methods to compare a particular business function in two or more companies (Lerna and Price, 1995). Camp (1989) defines it as a particular function comparison with best practices in that area.

Our aim is to conduct a study on industries in different countries using benchmarking. The research methodology consists of preparing the statistical series for a period long enough to show realistically the phenomena investigated, on productivity in EU member states and highlighting indicators of efficiency in manufacturing production in Romania and Germany. The indicators were estimated using the Cobb-Douglas function of production for the manufacturing industry in the two countries, using data according to CAEN Rev.1.1 (including 2008).

2. Literature review

The International Association Global Benchmarking Network (GBN) is joining private and public institutions, non-profit or research organizations which have expertise in benchmarking. The role of this association is to share knowledge and capabilities in the field of benchmarking through exchange of experience between its members and promoting the best practices identified. Through the association's members, who are from different parts of

the globe, the association keeps in touch with the current stage of development in the field of benchmarking and enhances the development of this branch of study.

In order to use benchmarking techniques it is essential to have a common understanding of specific terminology, which enable experts to express their ideas in a concise manner. In this respect GBN association has developed a glossary of terms. For a better understanding of this research paper, we considered necessary to present a selection of some relevant terms from the glossary of benchmarking terms, as it follows:

- Benchmarking Gap - represents the difference in performance between an activity conducted at a company and the same activity at other competitors on the market.

- Benchmarking of sectors - compares performance of two sectors, the purposes of comparison being to take best practices from one sector, and applies them to the weakest sector on that particular criterion.

- The productivity of capital - is an economic indicator of productivity, which measures the level of output (in euro or dollar) made for each euro/dollar invested in fixed assets.

- Core competence - a company's strategic capability, which gives them a market advantage.

- Productivity Benchmarking - provides companies with a systematic method to compile indicators of economic growth in order to create a table of economic productivity used to identify activities and processes which do not add value, but represent an additional cost. Another important concept that will be used in the proposed research is that of labor productivity.

The generally accepted definition of labor productivity is quantity of production obtained per unit of labor, which can be represented by the number of hours worked, number of employed persons (employees and other categories) or number of employees. The version which takes into account the number of hours worked is the most used, reflecting more realistic the phenomenon analyzed. The labor productivity determined using the number of employees, it is easier to calculate, but the quality of results is more modest. (Bolstorff and Rosenbaum, 2003)

Labor productivity can be determined for different representations of economic performance: total production or gross value added. We opted for the last presented expression of performance. Statistical data show significant differences between countries on this indicator.

3. Research Methodology

The research objective is to realize a comparative study between the performance of industries in different countries, and we chose Romania and Germany in particular. The research methodology consists in taking the benchmarking method, and apply it in research of industry performance, comparing different countries of the European Union (to complete the picture of the studied phenomenon, we introduced the comparisons also Switzerland).

We sought to highlight indicators of manufacturing production efficiency in Romania, taking specific indicators in Germany as point of reference.

It should be noted from the very beginning that, during 2000 - 2007 (2008), for which we had available statistics provided by Eurostat, Romania has a notable gap compared with Germany.

4. Comparative analysis of labor productivity

Regardless of the calculation method (see Literature review), labor productivity is only a partial measure of productivity, showing the cumulative effect of several factors: mainly capital and intermediate consumption, and technological and organizational efficiency, economies of scale or potential growth in utilization of production capacity. A comprehensive indicator at macroeconomic level is resource productivity, representing GDP in relation with domestic consumption of material (DCM). DCM measures the amount of materials used directly by an economy. In table 1, this indicator is presented for the EU members and Switzerland for the year 2007 compared with 2000.

Table 1: Resource productivity in the years 2000 and 2007 in EU countries and Switzerland (EUR per kg)

	2000	2007		2000	2007
UE 27	1,21	1,3	Lithuania	0,44	0,43
UE 15	1,4	1,57	Luxemburg	2,78	4,32
Belgium	1,32	1,47	Hungary	0,45	0,6
Bulgaria	0,13	0,14	Malta	3	2,14
Czech Republic	0,33	0,42	Holland	2,16	2,6
Denmark	1,28	1,24	Austria	1,41	1,4
Germany	1,41	1,71	Poland	0,32	0,38
Estonia	0,32	0,27	Portugal	0,66	0,62
Ireland	0,63	0,66	Romania	0,18	0,14
Greece	0,88	0,98	Slovenia	0,48	0,46
Spain	0,93	0,9	Slovakia	0,4	0,49
France	1,64	1,8	Finland	0,76	0,79
Italy	1,25	1,6	Sweden	1,71	1,79
Cyprus	0,66	0,64	United Kingdom	2,11	2,54
Letonia	0,24	0,31	Switzerland	3,05	3,36

Data source: Eurostat, Statistics, Sustainable Consumption and Production

We observe that the pursued indicator values are dispersed (from 0.13 Bulgaria, 4.32 Luxemburg), for 18 out of 28 countries (including Switzerland) the value of indicators has increased, most important being in Luxembourg, United Kingdom, Switzerland, Germany and Italy; for other 10 countries the value of the indicator has decreased, highlighting a diminish of efficiency in resources utilization.

To emphasize the important differences between countries on the resource productivity and its changes over time, we presented in chart 1 a upwards ranking of countries by indicator values in 2007, based on data in Table 1.

It appears that both the EU 27 and EU 15 increased in resource productivity, and former socialist countries, now EU members, without exception, are at levels below the EU 27 average.

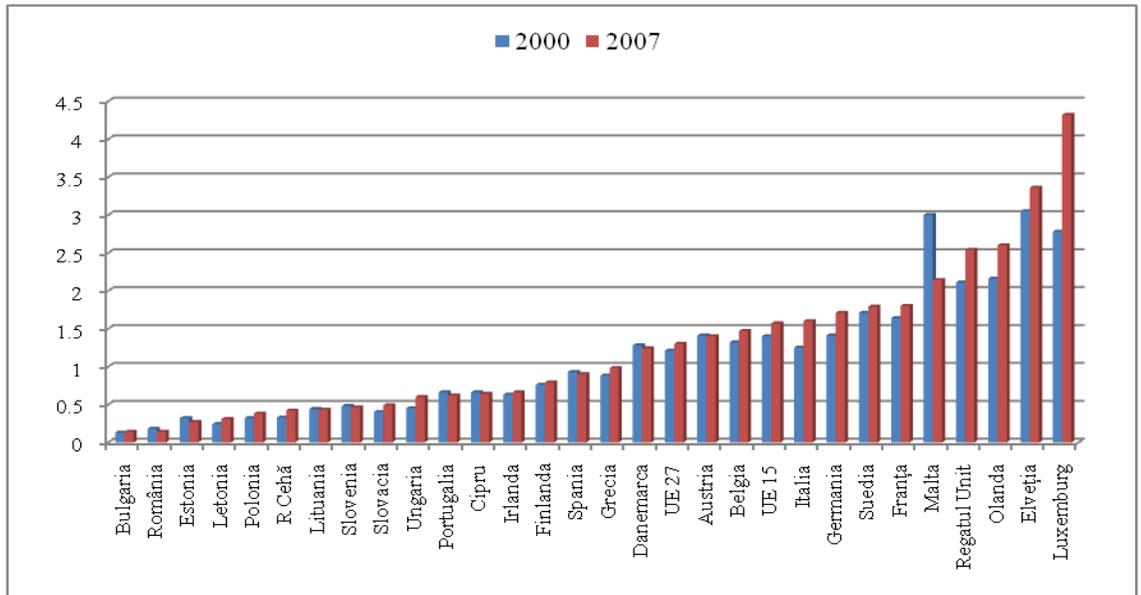

Figure 1: Comparison between the productivity of resources in 27 EU countries (and Switzerland) and Romania in 2000-2007

Source: Based on data from Eurostat Statistics, Sustainable Consumption and Production

Romania, as well as Bulgaria, is experiencing an amazingly low level of this indicator and, unlike Bulgaria, has recorded a decrease in time. Figure 1 shows a comparison between the evolution in time of the indicator in Romania and the European Union average.

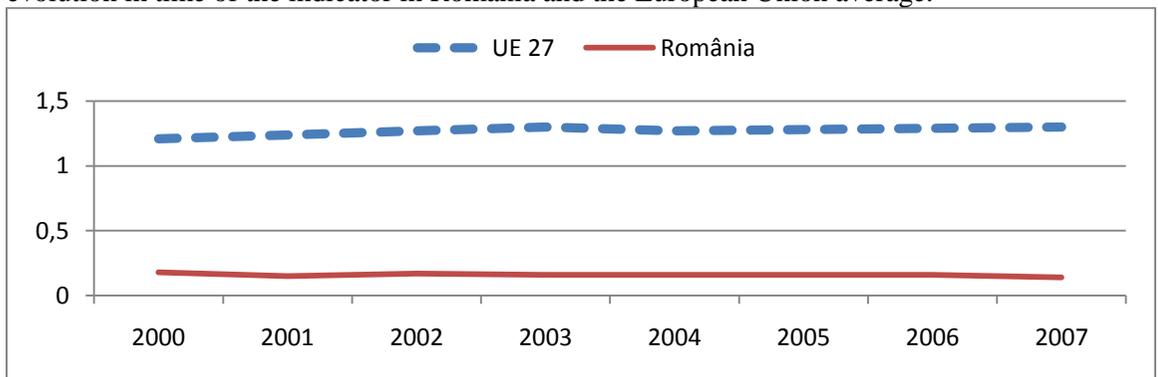

Figure 2: Comparison between the average productivity of resources in EU 27 countries and Romania during 2000-2007

Source: Based on the data from Eurostat, Statistics, Sustainable Consumption and Production

5. Capital productivity and capital stock

Capital productivity index shows the economic result (gross value added) produced by a certain amount of immobile productive capital.

To measure the capital stock involved in a production process, literature and empirical analysis recommends several methods:

- The flow of productive services provided by an asset in the production process;

- Gross stock of capital obtained by cumulating the investment flow, adjusted by the rate of removal from service of capital goods.
- The net stock of capital obtained by correcting the gross stock capital with the loss of productive capacity.

Given the availability of statistical data, we used the gross stock of capital to estimate the coefficients for the production function. In the process of estimating the production function coefficients, we have highlighted the contribution of other factors, besides labor and capital. Multifactor productivity (MPF) allows the identification of distinct contributions of labor, capital, intermediate consumption and technology/efficiency to the final production. This contribution is shown by indicator PMF - KLEMS (capital-labor-energy-materials-services), considered to be the most comprehensive measure of efficiency at industry level, calculated only for 25 countries from the EU, Romania and Bulgaria being excepted.

6. Results of the research and conclusions

For econometric estimation of production function coefficients for the manufacturing industry in the two countries, we used statistical data about gross value added (VA), the number of hours worked (HEMP) and gross capital stock (KGFCF) from the Eurostat database for Germany and the corresponding data of the same variables in the Statistical Yearbook of Romania 2009. Variables were converted from RON to euro for Romania, using the average annual exchange rate, published by the BNR. Before 2000, the exchange rate seemed to distort the value sizes studied, so we decided to limit the time series data to the period 2000-2007, although statistics provide data since 1995. The production function has the following expression:

$Y = A * L^{\alpha} * K^{\beta}$, where Y, L and k are respectively VA, HEMP and KGFCF and the exponents are elasticities of output (production) to input (production factors). A expresses the contribution of other factors, besides labor and capital. The values estimated using multiple regression are summarized in Table 2.

Table 2: Estimated coefficients for the production function related to the manufacturing industry in Romania and Germany for the period 2000-2007.

	A	α	β
Germany	19,04085387	0,857702548	0,146318628
Romania	0,581636175	0,052085522	0,972634345

Source: made by author based on econometric calculations

In Germany the elasticity of production to labor is 0.86, that means work contributed decisively to the increase of production in the period studied, while in Romania it is close to zero. Coefficient A shows the effect of technical refinements, organizational, etc. over production growth: it is high in Germany and low in Romania. Unlike labor factor, capital factor has had a remarkable contribution to increasing the production in Romania (although this increase was modest). We provide those interested many useful statistical data series concerning the investigated theme.

We believe that the elements outlined above can represent the base for analysis for all Romanian manufacturing industries because the comparison of them with several leaders of the world economy can represent the scientific fundament necessary for elaboration of economic policies.

FOREIGN DIRECT INVESTMENT AND INNOVATION: AN ANALYSIS OF SPILLOVER CHANNELS

Sandu Steliana

Institute of National Economy

Stimulating innovative behaviour has become a priority at EU level under the Lisbon 2010 and Europe 2020 Strategies, which considers innovation to be the engine of economic change. There is a rich literature focused on role and effects of FDI on innovation, competitiveness and economic growth. Among the generally recognised benefits deriving from the presence of FDI in an economy the following could be mentioned: financing a savings gap or balance of payments deficit, increasing exports and earning foreign currency, and increasing employment. But these, although important effects of FDI, would not alone justify the preferential policies FDI enjoys from a large number of governments. Therefore, it can be generally assumed that FDI is accompanied by new technologies and knowledge, which has a positive effect on the host economy. Technology diffusion from MNCs could contribute, but not in any cases, to the enhancement of innovative performance of domestic firms. The structural effects of FDI are present both within the industry, where they occur through horizontal linkages (competition), as well as in other industries through vertical linkages (backward and forward linkages). Especially for the case of structural effects, empirical literature has indicated both opportunities and risks for the local economy, the final outcome depending on the balance between benefits and costs. While these size effects of FDI may well be vital in certain circumstances, they have no long-term effect on economic growth. A large number of countries have adopted policies attracting foreign direct investment, based on the general belief that the role of FDI goes beyond that of mere financing alternative for firms and the economy. Positive external effects for the growth of the host economy are expected as a consequence of technology transfer and efficiency spillovers. A good knowledge of the underlying mechanisms of these spillovers is indispensable for a sensible policy orientation. FDI has an impact on innovation through demonstration effects and reverse engineering, labour turnover, competition and inter-industry linkages. This paper endeavours an in-depth look at the current research on transmission channels of the impact of FDI on innovation and to identify new directions for scientific research and to discuss policy alternatives in the field in Romania. The conclusion which could be drawn from the analysis of spillover channels of FDI on innovation and the review of current empirical research related to this topic is that the positive effects of FDI on innovation seem to be conditional. FDI and recipient country heterogeneities determine whether the positive effects of FDI outweigh the costs. Therefore it is important that policy measures regarding FDI are supported by empirical research studies. Considering the fact that empirical literature regarding the impact of FDI on innovation consists mostly of country studies, results cannot be easily generalised. To be more supportive for policy-makers, research on this topic should be more integrated (the effects of FDI, R&D and trade on innovation should be analysed in a common framework) and should focus more on cross-country studies with a generous time horizon to ensure long-term effects are also captured.

Keywords: foreign direct investment, spillover channels, innovation performance, technology transfer, innovation policy.

JEL classification: F23, O31, O33. F21; F23; O14; O30

1. Types of effects of FDI on the host companies

The interest in attracting the foreign capital through direct investments of the multinational companies as ‘greenfield investments’ or ‘joint ventures’ is, especially for the governments of the developing countries, a strategic priority, being encouraged by the existence of a multitude of benefic effects which the FDI produces in the host country on different time horizons, which is mentioned both in the theoretical and empirical studies (5, 6).

Even if faced with the effects of the crisis, in the context of an increase in the number of regional integration processes and globalization of markets, the interest of the multinational companies for the strategic placement of the direct investments in order to obtain or maintain the competitive advantages continues to be visible with different intensity in geographical areas, countries or areas of activity (11).

The economic theory argues, in many studies, that in the context of appropriate policies of the host country, FDI can accelerate the sustainable economic growth through investment in physical and human capital that will determine potential positive externalities, evidenced by increases in the level or the rate of productivity in the long run, at regional or national level, or by an increase of the rate of the technology transfer and, consequently, the degree of innovativeness of local firms (7). Experts argue that the foreign direct investment is a source of new technological and management knowledge, incentives for scientific research, technological development and innovation and, therefore, an endogenous factor of sustainable economic growth.

The literature (9) identifies the following **types of interactions** between the multinational company and the local firms, which determine externalities (spillover) on the vertical axis, which may intensify the degree of innovativeness of the latter: support for potential providers to operate production units in order to offer new products and technologies; stimulating the demand for high quality products; offer technical assistance or information necessary to help improve the products or to facilitate innovativeness; assistance in order to improve the management; support the local providers in attracting other similar customers, by placing them in other subsidiaries of the same multinational companies; increase of the demand in the intermediate products market, which favors obtaining benefits from the economies of scale; the effect of competition.

Also, the quality requirements imposed by the multinationals in the contractual relationships with both suppliers and distributors, encourage and even force the improvement of the processes or products and services offered, often through innovative activities, which may trigger a higher training effect in the upstream and downstream industries.

The main way through which the presence of FDI determines beneficial effects on the innovativeness of the local firms is the one of **the positive externalities of knowledge**, which, through various mechanisms, facilitates the access of a potential local innovator to the results of the research conducted by the company with foreign capital.

One of the most important channels for the transfer of knowledge (spillover) of FDI on the innovativeness of the local companies is the so-called **demonstration-imitation effect**. The mere presence of the foreign products on the local markets can stimulate local markets, at different levels (intra-industry, inter-sector), the creativity of the local firms, thus supporting

the generation of new projects, such as products and technologies by the learning process during the execution 'learning by doing' which is associated to the vertical externalities, or, by the observation and the imitation of the local firms operating in the same industry of the results of R&D projects developed by the multinational company.

The process of identifying innovative solutions (through repeated attempts) is thus shortened and the risk of innovation in similar directions by local firms is lower, since the goods and technologies promoted by the firm receiving the FDI have been already tested in foreign markets. This effect is noted by stimulating the 'innovation in the mirror' especially in markets in which the variety of the offer was reduced before the entry of the foreign investors but the potential for innovativeness was highly enough.

Secondly, the new knowledge and technological externalities arising from local firms may be dependent on the *human resource mobility*, the movement of personnel from the company with foreign capital towards the competing domestic companies. Often, the employees of the foreign company open their own businesses, addressing the niche markets covered by the multinational. In any case, the technological knowledge acquired by the workers or the managers who leave the foreign company has the ability to increase the innovativeness performance of the firms in which they are integrated. The foreign companies seek to avoid, by appropriate personnel policies and other precautionary measures, this leakage of value which carries the competitive advantage.

A third mechanism to trigger the externalities associated with the FDI is the so-called *competition effect*. The imbalance occurred in the balance of power in the local market penetration endorsed by the foreign company, requires competitors to make efforts towards the modernization and improving of the production techniques and technologies in order to withstand the competitive pressure. If the aggression of the foreign rival is high and the technological distance between it and the local industry is significant, the effect of competition can lead to the elimination of local firms, respectively, the reduction of the productivity of the local industry.

Through the **effect of export** the improvement of the competitiveness on export of the local industry by learning from foreign subsidiaries (the latter being thus, a derivative of the demonstration effect) may take place.

2. The potential effects on innovativeness

The impact of FDI on innovation at the local level can be evaluated by positively modifying some of the indicators of innovativeness. If we consider the set of indicators that make up the Synthetic Index of Innovation quantified in the European Innovation Scoreboard, we may notice that the references of the industry experts on the positive effects of FDI on innovation covers most of these indicators. The FDI has the role to promote the technological progress as the local firms have a greater chance of observing the advanced technology used by the firms with foreign capital, which contributes to the faster growth of their technological level. Transposed to the indicators contained in the European Innovation Scoreboard, this effect means the growth of employment in the manufacturing industry which uses medium and high technology.

Also, in the case of a developed market with local competitors which have developed the capacity for innovation and absorption at a sufficiently high level, the penetration of the foreign company could be an incentive for innovation as a source of competitive advantage and survival in the market, process suggested also by the Schumpeter's theory. This, as in

the case of vertical externalities, would alter some of the indicators such as the growth in the sales volume of the new products for the company and even for the market, by increasing the number of patents, trademarks, and export of high-tech products (7).

Some authors (3, 9) have presented models of the effects of FDI on innovativeness through the investment in the human capital, noting that there is a direct link between increased FDI and the improvement of the local human capital, with consequences on the growth of the potential of the recipient country to absorb new technologies and therefore to reduce the technological gap and innovativeness compared to the developed countries. The capacity to make new products increases, both for the business and for the market and the export of high technology products increases.

The incorporation on extensive scale of new knowledge about technology, management methods and new products and processes associated with FDI is a quality input in the production of physical capital, resulting in increased productivity of all other factors of production. Overall, the positive effects of FDI manifest themselves in the increase in the productivity of local companies (4).

A distinction between the long-term approach and the short term approach is required as well as a specific analysis of firms belonging to different sectors of manufacturing. The increase of the stock of knowledge leads to a change in the optimal allocation of resources and management effort within the firm between the current production and the capital accumulation specifically in favor of the latter, which, although may lead to lowering short-term productivity, increases the rate of productivity on long term. In this model, the essential feature is that the transfer of technology, even as spillover does not happen automatically but is a costly learning process.

But, the empirical evidence doesn't always support the theoretical arguments listed above. A series of studies on the subsidiaries of the multinational companies located in developing countries, did not reveal the transfer of technology from foreign company to the local (1,5) or the negative externalities associated with FDI on the productivity of the local firms either. The explanation given to these observations was based on the assumption of 'market stealing', the argument is that the firms receiving foreign capital gain the market share of the local firms, forcing them to produce less at higher average costs. Thus, in overall, the positive externalities may be lower than the negative ones.

The effects of FDI on local innovativeness differ from one type of investment to another as the participation of companies with local market experience implies already existent strong links with the local suppliers. In the short term at least, due to the cumulative effects offered by the creation of new production capacity, the contractual experience with the upstream industry, the emergence and capitalization of the channels of externalities is likely in the case of FDI through acquisitions or mergers than in the case of foreign investments held on greenfield.

On the other hand, the investments through acquisitions, mergers or joint ventures can lead to an degree of concentration increased, with an effect of discouraging the local investment in R & D, anti-competitive behavior (6). Thus, the impact of such type FDI on intra-industry externalities can be reduced in proportion to the intensity of the competition in the industry.

An empirical study (6) conducted on the Romanian companies, confirms the hypothesis that the ownership structure of foreign direct investment significantly affects the intensity of horizontal and vertical FDI externalities. Especially in the context of local industries with lower technological level than the parent company for companies with mixed capital (local

and foreign) it is more convenient (in terms of costs) compared with those with foreign capital, to look for partnerships with local suppliers of intermediate products and raw materials. This implies that the potential positive externalities on local producers from the upstream industry is higher in case of joint / ventures.

Secondly, as far as the horizontal externalities are concerned, it is noted that the multinationals tend to transfer less complex technology that they have in the subsidiaries with local shareholders than those with foreign capital. This, together with the increased access to technology together with the participation of local shareholders in joint projects, enhances the absorption of technology by the domestic firms in the same sector. Furthermore, the findings of the study show that the negative effects of FDI flows associated with the increased competition from the horizontal axis are lower than in the case of joint venture investments with foreign capital.

The hypothesis that the level and complexity of the externalities depend on the geographic proximity of the potential beneficiaries has also been confirmed by the empirical studies. Both horizontal and vertical externalities' capitalization is more efficient if the beneficiary local firms are located closer to each other, thereby facilitating the flow of knowledge. The main spillover channels, such as the labor force movement, the formal and informal relations between the staff of the foreign company and the one of the local business and the supplier-customer relationship as well, work best between firms spatially grouped.

Also, the relations between the multinational and the local industry depend on the extent to which the foreign business's activity involves the intensive consumption of intermediate goods, the costs of communication between the subsidiary and its parent company and the degree of similarity between the market in the country of origin and the host country.

For the potential FDI externalities to become real, a decisive role is the one of the technological and human capabilities of the host economy. The size of the target market, the local regulations and the technological capacity of the local firms influence the size and intensity of the connections between the foreign company and the domestic industry. In this respect, policies that not only will increase the economic attractiveness for foreign direct investment in high technology industries must be developed, but also to encourage the cooperation in research and development and innovation projects between the multinational and the local companies and to pursue the increase of the capacity for local absorption and innovation.

Although the existence of a technological distance between the foreign and the local firms makes possible the emergence of positive externalities of FDI on economic growth, through the various channels mentioned above, it must allow the local firms to develop and improve their own products and processes through the integration, adaptation and application of the knowledge technology provided by the multinational in their innovative activities. Perez and Soete (8) found that the occurrence of positive externalities in the innovation of a company requires a critical level of technological and scientific knowledge and skills. Beyond this limit, the cost of integration and adoption can become prohibitive. Moreover, as the distance between the transmitter and receiver of technology is higher, the intensity of the spillover channels is lower.

The creation of links between the FDI's objective and the domestic companies target, internalizing the beneficial effects of the multinational activities and their potentiating by encouraging the type of FDI favorable to the host economy (usually, the one through

mergers, acquisitions and joint ventures) depend on the state of technological and innovative development of the local industry and its absorption capacity as well.

The empirical research also indicates that the firms that have more advanced technology and a significant amount of expenditure on R & D benefit more from the presence of foreign companies.

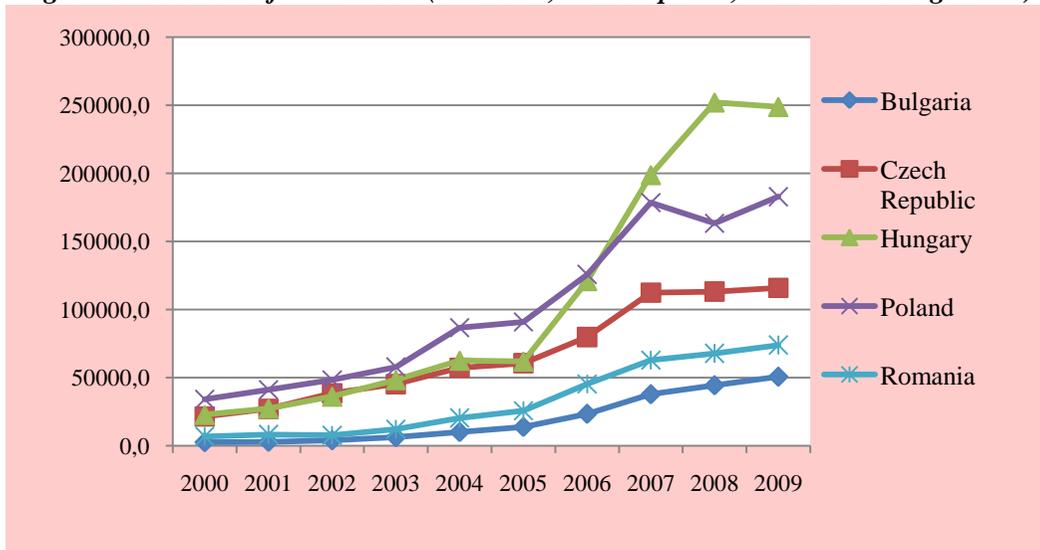

3.Opinions about FDI effects in Romania

A report published in the spring of 2008 (10)⁴⁸ on the countries from the Central and Eastern Europe presents a number of conclusions on the impact of FDI on the innovativeness of the Romanian industry, noting not only the positive effects but also the vulnerabilities. ‘Like other post-communist countries, in Romania the rate of promotion of the innovation at the level of the local industry is discontinuous and unsustainable, and the innovation activity is low except the one from the FDI. The growing dependence of the economies recipient of direct investment from multinationals in the acquisition and exploitation of new ideas and technologies is a source of vulnerability for the economies of the analyzed region’.

Despite the large opportunities for FDI externalities, the expected positive impact on the efficiency of the factors stimulating the innovation has been very limited in the case of the less developed EU countries such as Romania and Bulgaria. The low innovativeness performance also means a low level of the real externalities of FDI on local firms’ innovativeness.

⁴⁸ The report is based on a survey on 370 respondents, managers of companies or divisions working in 19 different industries and with significant presence in their respective sectors, with a turnover generally between 10 and 100 million dollars per year. Applying an assessment model of innovation its EIS, and they took another 20 in-depth interviews with executives, consultants and other experts in the field and they held an intensive office research program.

Fig.nr 1. The trend of FDI stocks (mil. USD, current prices, current exchange rates)

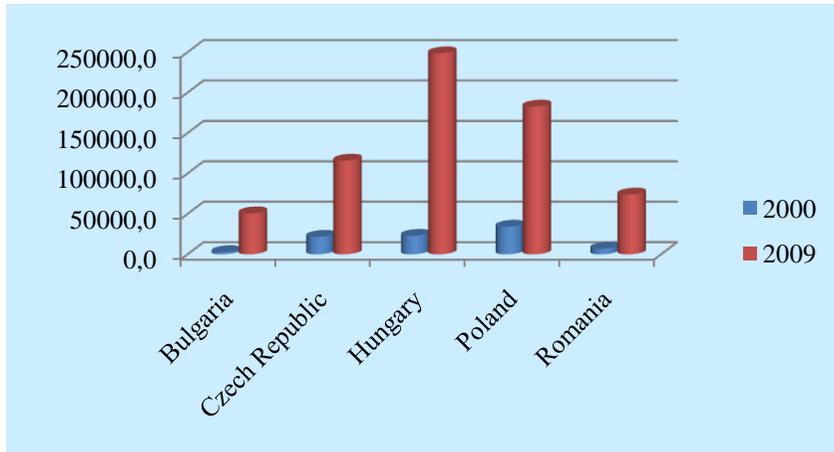

Source: UNCTADSTAT (unctadstat.unctad.org)

With few recent exceptions, many multinational companies do not opt for partial relocation of some of the R&D units and innovation at the level of the subsidiaries in Romania, or for their placement in areas particularly to facilitate the transfer of knowledge and technology to the local industry.

Although the sector that has the largest share of FDI stock is the manufacturing industry (30.5% in the year 2008 according to data offered by the Central Bank), followed by the financial and insurance intermediation sector (24.5%), the major injection with foreign capital goes towards the industries less intensive in high technology and with a low value-added. In the IT industry, the percentage ranged around only 5-6% of total attracted FDI in manufacturing. In medium or high technology sectors, the FDI under the form of greenfield investments is predominant, which diminishes the chances of knowledge and technology transfer in the upstream or the same sector.

Fig.2 FDI stocks (mil. USD, current prices, current exchange rates), by 2000 and 2009

Source: UNCTADSTAT (unctadstat.unctad.org)

The competition between the local firms and the multinationals on the high-skilled labor market and with potential for innovation is very intense. The local firms also face the brain drain to other EU countries. The fact that Romania is a pool of talented human capital favorite in the Central and Western European companies, does not solve the problem of brain drain, it only relocates it by increasing the competition in the local market. A higher local demand for highly skilled labor may increase its cost and lower in the future, the foreign interest for local investment

We can mention also the fact that since the beginning of 2007, the access to public funds for R & D& I is open to foreign participation as well. Also, the appropriate tools to encourage foreign investors to integrate themselves into technology clusters and research-development platforms in order to facilitate the transfer of knowledge, technology and new management and technical skills have not yet been distinguished.

Conclusions

Maximizing the benefits that may arise from the presence of FDI in other countries, especially those with technological gaps from the mother company can only occur by taking into consideration of all types of potential, positive and negative effects, which may arise and the conditions for their generation.

The theory and experience of many countries has revealed the prevalence of positive multiplier effects when there are favorable conditions in the host country as far as the labor quality is concerned, the innovativeness of the firms and their capacity of absorption as well.

The political initiative, the most important and urgently needed to attract FDI with high potential for positive externalities should consider creating effective tools for ensuring the conditions necessary for firms to internalize these externalities. The multinational companies will invest in high tech sectors, which have a greater potential for positive externalities if they find strong complementarities strongly consolidated. Setting connections with the multinational companies, internalizing the spillover effects associated with their activities depend on the local absorption capacity.

For FDI to contribute effectively to economic growth in the host countries, a rethinking of the way to harmonize the policies on FDI in the industrial, research and development, innovation and education field is needed. At present, the degree of correlation is low and poorly integrated.

EVALUATING THE EFFICIENCY OF LOCAL ECONOMIC DEVELOPMENT POLICIES

Săutiuș Lavinia Sidonia
University of Oradea

Sărac Ionuț Pavel
„1 Decembrie 1918” University Alba Iulia

This paper studies the way public authorities can fundament and evaluate the local economic development policies they want to promote, according to their efficiency. After presenting the relevant literature overview regarding the local economic development and its policies, we try to underline the importance of evaluating and prioritizing the local development policies and also to propose an efficiency-based model that we later use in building and evaluating local development policies scenarios. The research methodology is both descriptive, while presenting the theoretical framework, and empirical, while building scenarios and evaluating local policies. The obtained results show us that the local policy we tested is efficient, enabling new investments to bring bigger financial benefits than the cost needed to attract them.

Keywords: local development, policies, measuring, efficiency.

JEL classification codes: O21, O22

I. Introduction

One of the main challenges facing the European Union in the last years is the development disparities between Member States and also between its regions. EU's regional policy aims to reduce these differences by directing financial resources to less developed areas through the European Regional Development Fund, European Social Fund and Cohesion Fund.

However, to eliminate disparities in development between EU regions at all existing levels, a sustained effort is required by national and local public authorities to promote and support economic and social development.

Given limited resources, on one hand, and multiple and diverse development needs, on the other hand, and competition between public authorities in attracting investors, it is imperative for those public authorities to substantiate, monitor, evaluate and prioritize their local development policies. This paper proposes the use of theory in critical point in achieving the above.

The objectives of the scientific research in this paper refers to the stage presentation of previous research related to local development and local development policies, emphasizing the importance of grounding and prioritizing local development policies, presenting a model for the assessment of these policies and, finally, to test this model and presentation of research results.

II. Literature overview regarding local economic development

The literature in the field contains many and various approaches and definitions of the concept of local economic development. In the view of most economists, development

refers to stimulating local economic activity, boosting investment, helping to reduce unemployment and improving living standards (Matei and Anghelescu 2009: 14) in a certain area or a particular community.

According to the paper "Local Economic Development. Quick Reference" prepared by the Urban Development Unit of the World Bank in 2006, local economic development is the process in which public, private and non-governmental organizations work together to improve conditions for economic growth and employability of the workforce. Analysing the presentation of the same World Bank study and the historical evolution of local economic development, we see a move of the centre of gravity in the three analyzed periods (60s - 80s, 80s - mid 90s, late '90 - present) from the exclusive action of the state, towards acts of state and public-private partners and diversification of these actions.

On the same note, Canzanelli and Dichter (2001: 12-13) observed a change in local economic development perspective in terms of participation (from trying to reach a consensus, to participatory decision making), goals (from the increase rate of employment to improving the quality of life), policies (from policies oriented to domestic firms and SMEs to development policies of the local economy), tools (from specialized services and specific help for SMEs, developing industrial parks, use of local human resources to more integrated and more complex actions, such as development projects), social inclusion (from the lack of its promotion to promoting it locally in view of existing needs) and sustainability (from financial and managerial dependence to public sector to sharing revenues, responsibility and power).

The purpose of local economic development, according to World Bank, is strengthening the economic capacity of the administrative-territorial units to improve the economic future and quality of life for all residents.

In terms of local economic development objectives, Parlagi (2000, in Matei, Anghelescu and Savulescu 2009: 12) believes that they are represented by economic prosperity and social welfare by creating a favorable business environment, with the integration of vulnerable groups in the community, the use of endogenous resources and private sector development.

A key role in local economic development is held by strategic planning with regard to the specific area (Matei and Anghelescu 2009: 28). This refers to establishing a local development strategy, of the connected development policies and the needed activities or instruments to implement these policies.

Based on existing scientific work up to that point, Neiman and Fernandez (1999: 322-327) group and prioritize local economic development policies, as follows: institutional reform policy (facilitating the establishment of companies, representing business environment, public-private partnership, business networking, providing a solid legal framework for development), classic development policies (increasing business through assigning larger territory for business, allocation of land for commercial businesses, developing public infrastructure to boost business), indirect subsidies (exemption from payment of development fees, subsidized infrastructure costs, allocated business grants, tax breaks) and direct subsidies (grants for staff training, discounts on utilities costs, lower taxes, creating industrial parks, loans for businesses).

In a less structured form, the World Bank lists among local economic development policies stimulating local business growth, collaboration between communities, human resource development, sustaining the increase of life quality, facilitating the formation of clusters,

bringing local and regional development programs. We can observe the key role of the collaboration between the public sector private sector and civil society in ensuring local economic development, which makes us conclude that this cooperation is itself a main factor.

Formulation and implementation of local policies must take into account factors such as infrastructure (roads, public utilities, transportation, telecommunications, tourism infrastructure), buildings and land available (free land for the location of economic activities, available buildings, business centers), resources human resources (skilled labor, training), financial support (local, regional, national, European), support and dissemination of knowledge management (advisory services, dissemination of information), the living environment (quality of service natural environment, criminal status) and organizational capacity (organizational structures, economic cooperation, private sector involvement) (Roscovan 2003: 17). They provide the ability to develop a SWOT analysis on the relevant administrative-territorial unit on which to build strategies, policies and activities needed to ensure local economic development.

The criteria for evaluating local development policies may consider the relevance, effectiveness, efficiency and utility or durability (Matei, Angheliescu and Savulescu 2009: 33-36). The relevance shows the connection between the objectives and the needs, the effectiveness shows the quality and quantity of the achievement of objectives formulated through appropriate solutions, the efficiency compares the costs associated with the proposed policies with results, and the usefulness shows in which extent the policies implemented meet the needs. Through the present paper we propose a model for evaluating the local public development policies which analyzes their efficiency, comparing the financial benefits brought by a new investment with the necessary funds for attracting it.

III. Measuring the efficiency of local development policies

To fundament, measure and evaluate the effectiveness of economic development policies supported by local government we resorted to constructing an index (I_e) which compares the revenue from a new investment with expenses needed to attract such an investment, meaning the facilities that are granted. For a local policy to be effective, the index must have a value over 1. Financial income to the local budget is composed of tax on buildings (I_{cl}), land tax (I_{teren}), income from selling or leasing land (V_{teren}) and shares deducted from the tax rates on income (CD_{IVG}) in percentage of 47%. Facilities granted by the local authority to new investors refer to economic incentives (F_{ec}) which consists of the opportunity cost of sale, the land concession, tax incentives ($F_{fiscale}$) which consists of tax reductions and exemptions from tax on building and land and also facilities regarding public utilities (F_{up}), the local authority committing in some cases to ensure the necessary utilities.

Therefore,

$$I_e = \frac{I_{cl} + I_{teren} + V_{teren} + CD_{IVG}}{F_{ec} + F_{fiscale} + F_{up}}, \text{ and}$$

$$I_{cl} = \sum_{i=1}^n \frac{(c_{im} + k_{Mj}(i-1)) \times B_i(V_i)}{(1+r_a)^i}, \text{ where } n=\text{duration of use, } c_{im}=\text{tax share, } k_{Mj}=\text{tax rate increase, } B_i(V_i)=\text{taxing base/investment value, } r_a=\text{discount rate}=5,5\%$$

$$I_{teren} = \sum_{i=1}^n \frac{S_t \times I_t [lei / ha / zonă] \times (1 + k_{Mj}(i-1))}{(1 + r_a)^i}, \text{ where } S_t = \text{land size, } I_t = \text{set tax}$$

$$V_{teren} = S_t \times V_t, \text{ where } V_t = \text{trading value}$$

$$CD_{IVG} = \sum_{i=1}^n \frac{\overline{N}_s \times \overline{S}_m \times c_{IV} \times 47\% \times 12}{(1 + r_a)^i}, \text{ where } \overline{N}_s = \text{average employees no.}, \overline{S}_m =$$

average salary, c_{IV} = income tax rate = 16%

$$F_{ec} = S_t \times (V_p - V_t), \text{ where } V_p = \text{market value}$$

$$F_{fiscala} = p_{red}(\%) \sum_{i=1}^5 I_{cl_i} + I_{teren_i}, \text{ where } p_{red} = \text{reduction percentage } (\%)$$

$$F_{up} = \sum_{i=1}^{n_{up}} C_{u_{up}} \times U.M._{up}, \text{ where } n_{up} = \text{no. of utilities, } C_{u_{up}} = \text{unit cost of public utility,}$$

U.M._{up} = measuring unit for public utilities (kml)

IV. The research methodology and findings

Starting from the theoretical basis set above which is the result of descriptive research methodology, we continue with the empirical research. This refers to the use of efficiency method to substantiate the various simulations and evaluation of local development policies. For these simulations to be as real as possible, we analyzed existing policies of Oradea municipality based on "Rules of granting tax incentives on taxes on corporate buildings and land, in order to attract investment and support sustainable economic development" attached to the Council's Decision no. 407/2010.

Under this regulation, traders who start a business in Oradea with an investment value of over € 500,000 benefit from reductions in tax on buildings for a period of five years, the limit of the equivalent in lei of 200,000 euro, 100,000 euro for transport profile companies, as well as exemption from land tax payment for the period of validity of the construction permit. The share of total tax reduction is calculated by adding the tax reductions according to the following criterias: the investment value, investment value for SMEs established by young entrepreneurs, medium number of employees, location and profile of investment or profile. To evaluate this local development policy, we used the theory of critical points in the analysis of two facilities which benefit from minimum and maximum reductions from taxes from Oradea municipality.

The first simulation refers to a trading business with a investment project (construction of a building) in value (V_i) of EUR 500,000, respectively 2,000,000 lei, situated in an area tax C (S_t) of 1.5 ha and will employ 80 people (N_s). The land required is owned by Oradea municipality who is willing to lease it (V_t) starting from a price of 1 euro/sqm/year, while the market value (V_p) is 3 Euro/sqm/year, or starting to sell it at a price of 10 euro/sqm,

while the market value is 20 euro/sqm. Also, the municipality will ensure the provision of 0.1 kml water and wastewater utilities (500,000 euro/kml) road (one million euro/kml) and electricity (200,000 euro/kml).

The tax rate for buildings is 1.1% in Oradea and we assume that its annual growth and land tax will be 1% each year. We consider the normal use of the building for 10 years, and the discount rate of 5.5%. According to the Monthly Statistical Bulletin of Bihor, the average gross salary in January 2011 was 1,474 lei.

Given the characteristics of the investment, the trader will receive a share of the reduction on buildings tax of 30% (15% for investment amount, 5% for the number of employees, 5% for the fiscal area and 5% for the activity profile).

For this policy to be effective, the efficiency index at local level must be bigger than 1.

$$I_{cl} = \sum_{i=1}^{10} \frac{(1,1 + 0,01(i-1))\% \times 2.000.000}{(1 + 5,5\%)^i} = 171.948,93lei$$

$$I_{teren} = \sum_{i=1}^{10} \frac{1,5ha \times 3.832lei / ha / zonaC \times (1 + 0,01(i-1))}{(1 + 5,5\%)^i} = 45.085,50lei$$

$$V_{teren-concesiune} = 15.000mp \times 4lei / mp / an \times 10ani = 600.000lei$$

$$V_{teren-vanzare} = 15.000mp \times 40lei / mp = 600.000lei$$

$$CD_{IVG} = \sum_{i=1}^{10} \frac{80pers \times 1.474lei / luna \times 16\% \times 47\% \times 12luni}{(1 + 5,5\%)^i} = 802.086,30lei$$

$$F_{ec-concesiune} = 15.000lei / mp \times (12 - 4)lei / mp / an \times 10ani = 1.200.000lei$$

$$F_{ec-vanzare} = 15.000lei / mp \times (80 - 40)lei / mp = 600.000lei$$

$$F_{fiscale} = 30\% \sum_{i=1}^5 I_{cl_i} + I_{teren_i} = 30\% \times 95.563,03 + 5.448,34 = 28.668,91 + 5.448,34 = 34.117,25lei$$

$$F_{up} = (500.000 + 1.000.000 + 200.000)euro / kml \times 0,1kml = 170.000euro = 680.000lei$$

$$\Rightarrow I_{e-concesiune} = \frac{171.948,93 + 45.085,50 + 600.000 + 802.086,30}{1.200.000 + 34.117,25 + 680.000} = 0,85 < 1$$

$$\Rightarrow I_{e-vanzare} = \frac{171.948,93 + 45.085,50 + 600.000 + 802.086,30}{600.000 + 34.117,25 + 680.000} = 1,23 > 1$$

Given the resulted values of the efficiency index, it can be concluded that although the facilities considered are the minimum allowed, this policy is not effective if the land is leased at a rate so low. Sale of land, even if performed well below market price contributes to a useful development results. However, we propose a increase in land selling price, closer to the market price.

The second simulation refers to a production firm wishing to invest (construction of a building) in value (V_i) of 10.5 million euro, meaning 42,000,000 lei, located in tax area D and on a surface (S_t) of 1.5 ha and will employ 350 people (N_s). The remaining specifications remain the same as for the first simulation. Given the characteristics of the

investment, the trader will receive a reduction share of the tax on buildings of 85% (40% for the investment amount, 20% for the number of employees, 10% for the tax area and 15% for the profile of activity).

$$I_{cl} = \sum_{i=1}^{10} \frac{(1,1 + 0,01(i-1))\% \times 42.000.000}{(1 + 5,5\%)^i} = 3.610.927,57lei$$

$$I_{teren} = \sum_{i=1}^{10} \frac{1,5ha \times 1.821lei / ha / zonaD \times (1 + 0,01(i-1))}{(1 + 5,5\%)^i} = 21.425,02lei$$

$$V_{teren-concesiune} = 15.000mp \times 4lei / mp / an \times 10ani = 600.000lei$$

$$V_{teren-vanzare} = 15.000mp \times 40lei / mp = 600.000lei$$

$$CD_{IVG} = \sum_{i=1}^{10} \frac{350pers \times 1.474lei / luna \times 16\% \times 47\% \times 12luni}{(1 + 5,5\%)^i} = 3.509.127,84lei$$

$$F_{ec-concesiune} = 15.000lei / mp \times (12 - 4)lei / mp / an \times 10ani = 1.200.000lei$$

$$F_{ec-vanzare} = 15.000lei / mp \times (80 - 40)lei / mp = 600.000lei$$

$$F_{fiscale} = 85\% \sum_{i=1}^5 I_{cl_i} + I_{teren_i} = 85\% \times 2.006.823,67 + 2.589,10 = 1.708.389,22lei$$

$$F_{up} = (500.000 + 1.000.000 + 200.000)euro / kml \times 0,1kml = 170.000euro = 680.000lei$$

$$\Rightarrow I_{e-concesiune} = \frac{3.610.927,57 + 21.425,02 + 600.000 + 3.509.127,84}{1.200.000 + 1.708.389,22 + 680.000} = 2,16 > 1$$

$$\Rightarrow I_{e-vanzare} = \frac{3.610.927,57 + 21.425,02 + 600.000 + 3.509.127,84}{600.000 + 1.708.389,22 + 680.000} = 2,59 > 1$$

The results of the second simulations indicate that the policy to stimulate local economic development by providing incentives for investment in Oradea is very effective in the long term. According to the calculated indicator of efficiency, the benefits of a high-value and durable new investment are at least two times higher than the cost of facilities provided, even when the municipality bears the cost of equipping the facilities of the location.

V. Conclusions

This paper proposes the evaluation approach of local development policies in terms of their effectiveness through an analysis of costs and benefits of the local public authority. This is a scientific and financially accessible method, with immediate application in substantiating certain local policies. It can be the starting point of more complex analysis on the effectiveness of local development policies on economic and social level, and also on their relevance, effectiveness and utility.

The authors have proposed a model for assessment of local development policies that have proved effective through the policies of Oradea municipality of granting tax breaks, reasoned by attracting investment and supporting sustainable economic development.

Belu Mihaela Gabriela

Academy of Economic Studies, Faculty of International Business and Economics

Dieaconescu Vlad Constantin

Polytechnic University of Bucharest, Computer Science Faculty

In the context of the EU single market formation it was observed a trend of giving up local deposits in favor of central regional warehouses. Another factor favoring centralization of storage is the economic crisis that has forced the need for efficient activity by making decisions on reducing costs. The first part of this paper focuses on literature review and presentation of the most important decision-making models developed in the field of logistics. Several models were selected and analyzed in detail to build a modern research methodology, based on precise mathematical calculations.

In the decision making process of selecting an optimal location for a central warehouse, we used a series of mathematical models to identify the exact geographical position, which induces minimal cost for transportation to consumption points.

In the second part of the paper, the article aims to identify the optimal location for a central warehouse in Romania.

In this methodology, we chose 100 cities in Romania, positioned throughout the country and characterized as input by three sizes: latitude, longitude and population size. Latitude and longitude were used for graphical representation of the space considered (Romania) by individual points (cities), and the population was used as approximation of the demand for generic products. We applied a mathematical model in order to calculate the gravitational center using an excel spreadsheet. Each step in applying the model is explained in detail in the paper. The results of the research indicate the optimal location (characterized by its latitude: 45.469408 N and longitude: 25.630817 E) for placing a central warehouse that can supply the 100 cities with minimal transportation costs. We also calculated the distances between the optimal location and the 100 cities and then identified 10 cities, the closest to our optimal location (Sinaia, Sacele, Brasov, Campina, Campulung, Ploiesti, Fagaras, Pitesti, Mierucurea-Ciuc, Odorheiu Secuiesc). Any of these cities can be chosen as location to build a central warehouse in Romania, because they represent a relatively good approximation for the gravitational center identified in the model applied.

Keywords: logistics, decision making process, optimal location, warehouse, spatial modeling

1. Introduction

At the microeconomic level, there are several categories of decisions to be taken for the development in terms of efficiency of economic activity of the company. These categories refer to:

- Choice of locations for production and distribution (storage)
- Establishment of production and inventory levels
- Selecting the way for transport, routes and shipment size

All these decisions can be taken on short, medium and long term. In general, decisions about production and storage location are taken for long term (5-10 years) and those related to transport routes and size expedition on a short time horizon. Every decision belongs to a specific market with its own supply and demand (the company's product market, transport market, the market for storage space) and the effects of decisions are interconnected. Models have been developed to deal with one of these categories of decisions, but complex and dynamic models attempt to provide a long-term interaction of each decision and the related markets.

2. Literature Review

The decision-making process regarding the way of transport has been incorporated into theoretical models, which can be classified by type of strategic decision to be taken, which may be concerning the supply, production, transportation or distribution.

2.1 Decisions related to sales and supply

The two functions of the firm, supply and sales have a spatial interaction: at the aggregate level this type of models are used to calculate the exchange of goods between regions. Depending on the assumptions of the decision process at individual level, there are two types of spatial models:

- Linear programming models (LP models), in which decision making is based on the determination of alternative relationships, this model is applicable to individual firms, but cannot be applied for predicting the behavior of a large number of carriers in the business of transport of generic goods (Harker, 1988);
- Gravitational models that assumed that decision-making occurs in random utility terms (random utility conditions); models derived from this class use behavioral principles related to profit maximization model for interpreting the decision variables (Linneman, 1966);

2.2 Models related to logistics and storage services (inventory models)

In order to ensure product availability according to demand conditions, a temporary storage is needed. Ensuring the optimal functioning of a production process or the supply with different types of products according with market demands is performed using storage models (Trandafir, 2004).

Using traditional storage models (conventional inventory model) provides an optimal inventory policy.

To find the optimal balance between stock size (which involves storage costs) and quantity of individual supply/delivery (involving transport costs) information on shipping is necessary, as well as the size and frequency. This way we can determine storage and related costs, in terms of actual costs and opportunity costs.

The inventory model is based on data regarding product logistic characteristics (amount, method of packing, size of shipments, volatility of demand). The necessary time for transport, and its security are essential variables in inventory models, so the choice of route and transport modality should be integrated into the model. In some models the choice of location and size of deposit is not a decision variable (Stada and Hauwert, 1992).

3. Research Methodology

The methodology used for the empirical research in this article is based on selected elements from different models listed below.

3.1 Modeling the decision regarding the mode of transport

The decision regarding the mode of transport used for delivery can be made either by the seller or the buyer, either by forwarding company, for the sender or recipient.

Regarding the reference delivery quantity for which a decision is made there are two different approaches. A first type are models that take into account delivery units at individual shipments level or total amount delivered over a certain period of time (classified according to product type and point of origin/destination). Decisions are taken in the context of minimizing the costs of storage and transportation, and the size and frequency of delivery are considered fixed in the model input (Di Gangi et al, 1994; Montella et al, 1994).

Another type of models is those with a logistic approach of choosing the mode for transport, which takes into account simultaneously the decision regarding the size and frequency of delivery. In general delivery unit of reference in this case is considered annual. Models of this type have been developed at MIT (Freight Transportation Group, 1980; Vieira, 1992).

Nuzzolo and Russo (1998) developed a logistic decision making model for choosing the mode for transport, which takes into account specific delivery units for different types of transport

3.2 Models for minimizing the aggregate transportation cost

This model is based on linear programming problems, which is based on certain hypotheses, including:

- We consider m supply centers (warehouses) and n points of consumption (stores)
- For simplicity, we consider a single product, which is found in the amount a_i at the warehouse i and the quantity b_j is required in the shop j, where:

$$1 \leq i \leq m \quad \text{si} \quad 1 \leq j \leq n$$

- The cost of transporting a unit of product from warehouse i to store j is c_{ij} , and it does not depend on the amount transported

The methodology for building the model is the following:

- X_{ij} denote the unknown quantity of product that will be transported from the warehouse i to the store j

- We express the required amount of product from the warehouse i to all the n stores:

$$a_i = x_{i1} + x_{i2} + \dots + x_{in} \quad (1)$$

- We express the quantity transported from all the m warehouses to store j:

$$b_j = x_{1j} + x_{2j} + \dots + x_{mj} = \text{quantity required at store j} \quad (2)$$

- The cost of transport for the whole amount of product is $c_{ij}x_{ij}$

Conditions: $x_{ij} \geq 0$, $1 \leq i \leq m$, $1 \leq j \leq n$

- Total cost of transport from all m deposits to all n consumption centers is:

$$\sum_{i=1}^m \sum_{j=1}^n c_{ij}x_{ij} \quad (1)$$

In order to realize the transport it is necessary that:
(equilibrium condition)

$$\sum_{i=1}^m a_i = \sum_{j=1}^n b_j \quad (2)$$

The system of equations (1) and (2) has an infinity of solutions, of which we are interested in those with the minimum cost of transport. In order to obtain it, we built a linear transport program:

$$\begin{aligned} \min \quad & \sum_{i=1}^m \sum_{j=1}^n c_{ij} x_{ij} \\ \sum_{j=1}^n x_{ij} &= a_i, \quad 1 \leq i \leq m \\ \sum_{i=1}^m x_{ij} &= b_j, \quad 1 \leq j \leq n, \quad x_{ij} \geq 0 \end{aligned}$$

Solving this linear transport problem is accomplished using specialized software that obtains the solution / solutions that lower the total cost of transport induced by the transport of goods from warehouses to points of sale. Similar models can be built to find solutions that minimize the cost of raw material supply for production centers. The model may be complicated by adding additional conditions (constraints), such as a minimum amount that can be ordered, or different price depending on the size of delivery.

3.3. Modeling decision on choosing the location for production and storage centers

The location of factories and warehouses is an essential problem in the firm's logistics strategy.

One way of constructing such a model is based on the transport problem, which starts from the assumption of fixed supply and consumption and the solution must minimize the cost of transportation between origin and destination points (Ballou, 1999).

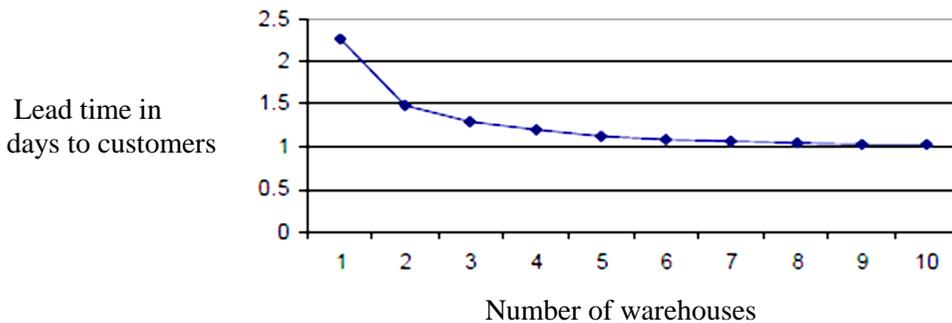

In order to build a simple gravity model we need a map with points of consumer demand (defined by latitude and longitude). The model will identify the optimal location solution for a central warehouse, with the lowest costs for transportation between the storage and consumption points.

Newest approaches performed a combination of cost minimization model and a gravitational model with double restriction. This model allows to set customer service level requirements (for example, imposing a maximum delivery time of 24 hours or less) as an additional restriction on the choice on optimal locations (Wilson, 2008).

The doubly constrained gravitational model uses a matrix that contains the centers of production and consumption. The matrix is used as basis to build a linear programming model that approximates the optimal flows between these locations.

Chicago Consulting (2003) applied such a model for the entire territory of the United States and identified the optimal location for a single central store in the city of Bloomington Indiana. The model took into account the possibility of adding additional storage (up to 10), each store added reducing transit time to customers.

Figure 3: The optimal locations for placement of deposits in U.S.

Sursa: Chicago Consulting, "The 10 Best Warehouse Networks 2003", <http://www.chicagoconsulting.com/10best.shtml2003>

We can observe in Figure 3 that as an extra storage is added to the model the delivery time (in days) decreases.

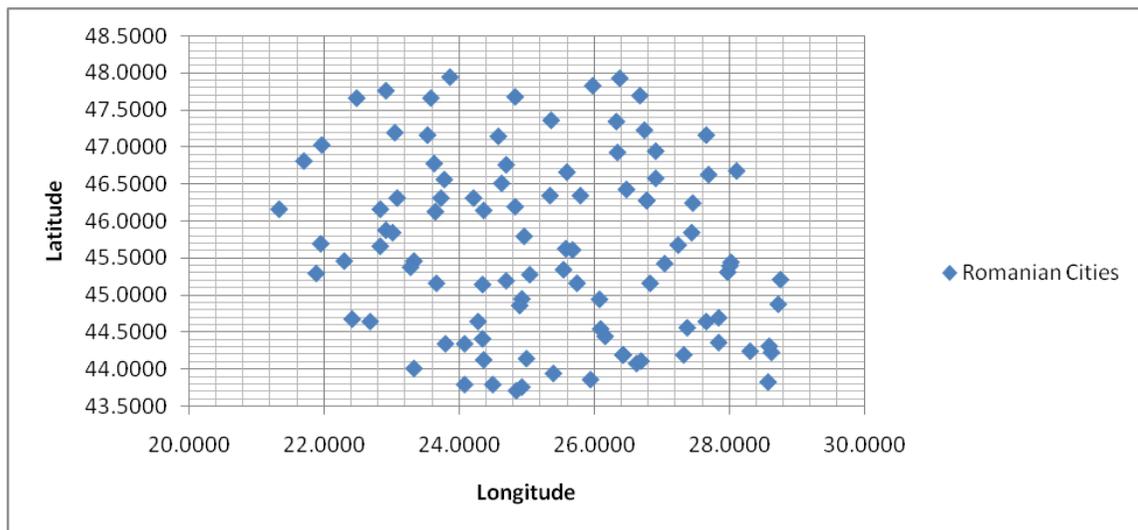

4. Case study: determining the optimal location for a central warehouse in Romania

In order to build a model for determining the optimal location for a central warehouse and apply it, we selected 100 towns in Romania and found their geographical position data by latitude and longitude coordinates. Based on a table in Excel with all the details, the geographical coordinates were transformed in decimal numbers using the excel formula:

TEXT (ROUND (LEFT (F5, 3) + (MID (F5, 5,2) + RIGHT (F5, 5) / 60) / 60.6), "00.000000")

So we created a new table with decimal numbers based on which we made a graph that illustrates all selected cities.

Figure 4: Spatial distribution of 100 selected cities in Romania

Source: by the author

To determine the geographic coordinates of the gravity center, we used the formula:

$$Lat_{cg} = \frac{\sum Lat_i * P_i}{\sum P_i} \quad Long_{cg} = \frac{\sum Long_i * P_i}{\sum P_i}$$

Lat_{cg} – latitude of the optimal gravitational point

Long_{cg} – longitude of the optimal gravitational point

P_i – population of the city i

To exemplify, we present a sample of the excel table used, representing the top 5 cities listed in alphabetical order.

Table 1:

City	Longitude	Latitude	Population
Abrud	23.0833	46.3167	6803
Aiud	23.7333	46.3167	28909
Alba-Iulia	23.6500	46.1333	66369
Alexandria	25.4000	43.9500	50591
Arad	21.3333	46.1667	172827

Source: realized by the author based on data available on www.wikipedia.com

The city's population was taken from the data made available according to the latest census in Romania.

After calculations, we have identified the point coordinates (lat 45.469408 N, 25.630817 E long), which represents the optimal location for placing a single central warehouse that provides lower costs for product distribution in the 100 selected cities from Romania.

Figure 5: Location of the gravity center (the optimal location for a central warehouse)

Source: Google Maps

5. Research results and conclusions

We can observe that the nearest villages are: Sinaia, Predeal, Brasov.

In order to determine the optimal location and distances of all other cities we used the following algorithm:

R = earth's radius (mean radius = 6,371km)

Δlat = $\text{lat}2 - \text{lat}1$ (latitude difference)

Δlong = $\text{long}2 - \text{long}1$ (longitude difference)

$a = \sin^2(\Delta\text{lat}/2) + \cos(\text{lat}1) \cdot \cos(\text{lat}2) \cdot \sin^2(\Delta\text{long}/2)$

$c = 2 \cdot \text{atan2}(\sqrt{a}, (\sqrt{1-a}))$, atan2 = excel function

$d = R \cdot c$, the distance between two points, first with a $\text{long}1$ and $\text{lat}1$ and the second with $\text{long}2$ and $\text{lat}2$.

We choose only the top 10 cities, the closest to the location for a single central warehouse.

City	Longitude	Latitude	Population	Estimated distance (km)
Sinaia	25.5500	45.3500	14636.0000	16.0248
Sacele	25.6833	45.6167	29967.0000	17.3756
Brasov	25.5833	45.6333	283901.0000	18.9675
Campina	25.7500	45.1667	38758.0000	36.1595
Campulung	25.0500	45.2833	38285.0000	67.7832
Ploiesti	26.0833	44.9500	232452.0000	76.5609
Fagaras	24.9667	45.8000	35759.0000	82.4518
Mioveni	24.9333	44.9555	35849.0000	96.2896
Miercurea-Ciuc	25.8000	46.3500	41852.0000	99.6575
Odorheiu Secuiesc	25.3500	46.3500	36948.0000	102.7237

Any of these cities can be chosen as location to build a central warehouse in Romania, because they represent a relatively good approximation for the gravitational center identified in the model applied.

THE ROLE OF THE PREVENTIVE MEDICINE IN SUSTAINABLE DEVELOPMENT. A STUDY CASE ON THE PRIVATE MEDICINE SECTOR IN ORADEA

Unița Lucian

Straciuc Oreste

University of Oradea, Faculty of Medicine and Pharmacy

The concerns with respect to healthy life styles, preventive medical approaches, safe environment, and early warning systems represents the Millennium Development Goals, the United Nations Organization's so called Decade for "Education for Sustainable Development", the European Union's sustainability strategy, the Global Environmental Outlook of the United Nations Environment Programme (UNEP) and the ten Principles of the UN Global Compact, all aiming to attain the sustainable global health, which is possible only through collective multilevel efforts for the sake of human wellbeing, equity, livelihood, and worldwide sustainable development and stability.

Romania, as an EU Member States, have to take into consideration the fact that health is a precondition for economic growth and sustainable development, and this way, it has to promote the EU common approaches to health policy. Between these approaches, the prevention plays a key role when addressing to the global health challenges such as the pandemics' control, and the rising tide of non-communicable diseases. For these purposes, preventive strategies need to include promoting policies that foster a healthy environment, healthy life styles and equitable access to health care and information, so, it is necessary to meet the requests towards sustainable global health.

From this perspective, for the empirical research pursued in this paper, we have considered the Global Challenge Index, which focuses on seven global challenges of the new millennium, and on this basis, we have compared Romania with the other EU Member States. Then, we have computed the index for Oradea and its neighbour region, including the framework of a comprehensive analysis of political, economic and social target system.

The key issues we have considered in this context were referring to lifestyles, life care and education for lifelong well-being, partnerships for health, institutions and related policy areas, alternative intercultural preventative medical approaches, and the good governance, policy relevance, and corporate social responsibility, and were analyzed mainly referring to the potential of the Romanian private medicine sector in preventive medicine.

The conclusions of the paper reveal the fact that the region of Oradea is much above the average index of Romania when it comes to preventive medicine, but still behind the other EU Member States. So, the background for meeting the precondition for economic growth and sustainable development in Oradea was created, but there are still a lots to be done on

short term, even because of the features of this area, which situates it at the top of the cancer diseases registered cases in the country.

Key words: sustainable development, preventive medicine, Romanian health care system, private medicine sector, Oradea – Bihor County

THE PRODUCTION OF MEDICINES IN ROMANIA AFTER 1990. WHAT'S THE REASON FOR IMPORTS?

Unița Lucian

Since 1990, Romania turned itself slowly but surely, from a large drugs producer, which has used to supply drugs to the whole former Council for Mutual Economic Assistance Member States, and with a net positive trade balance in medicine sector, into a large drugs importer, trying hardly to attract investors which could produce medicines not only for the Romanian domestic market, but also for all other Eastern European markets, Ukraine, Russia and Turkey.

This paper focuses on the empirical analysis of the medicines production sector in Romania after 1990, aiming to emphasise the factors which have mostly affected this industry, in correlation with different interests and reasons which determined the increasing imports of drugs during the last years, by underlying at the same time, the role of the new public authority in charge of supervising the distribution and import of medicines in Romania, The National Medicines Administration (NMA).

The paper relevance relies in the fact that Romania registered during the last years drug imports of an average of 1.7 billion euros, while the drug exports were only around 0,1 billions euros, according to the computations made on the data provided by the Romanian Institute of National Statistics (INS). The most imported products are patent drugs, which are more expensive than those produced by the domestic manufacturer. At the same time, Romania registered an increase of the pharmaceutical market of around 20% only since its EU integration, this market proven to be largely driven by expensive products.

Our research conducted to the conclusion that the Romanian resort authorities have to immediately adopt measures meant to limit consumption of expensive drugs, on the one side, and to reinforce the domestic manufacturers on the other side, even by attracting major investors in this sector. We have also identified that there is a large competitiveness for Romanian medicine products on the international market, due to its production costs (Romania still is a low cost economy in this sector), as well as due to its tradition.

Key words: drug manufacture, medicine production, Romanian economy, FDI, exports and imports

THE BUSINESS ENVIRONMENT**

IS TRANSLATING E-COMMERCE WEBSITES AN EASY TASK?

Coancă Mariana

Romanian-American University

Museanu Elena

Romanian – American University

Teaching the terminology of various fields has been for a long time the privilege of the translation schools. Specialized translation is subject to certain lexical constraints: collocations, idioms and expressions specific to the respective field. A term gets a real meaning, only if it is linked to other terms specific to the field, with whom it establishes logical connections. Therefore, the translation of e-commerce sites can help customers to better understand the description of products and their features. It is recommended that the translations be made by a native speaker of the language that the online company wants the e-commerce website converted.

Keywords: e-commerce, website, specialized translation, conceptual equivalence, translators.

Cod JEL: Z 19

1. Being more than a simple linguistic instrument, the terminology of e-commerce websites is an essential vector that transfers technical and scientific knowledge. Teaching various terminologies has been for a long time the privilege of the translation schools. Nowadays, on the one hand, it is a part of the technical wording and a part of the teaching/learning specialized languages, on the other hand. Teaching/learning terminology means “to look for the characteristics and qualities of the technical and scientific communications” (Humbley 2008 : 261-265).

Translating e-commerce websites means knowing e-commerce terms that occur in our native language or other languages. Obviously, the position of terminology in learning how to translate the websites, cannot limit to the learning of word lists. Furthermore, translation requires an exquisite interpretation of the text meaning and the terms in context; this interpretation cannot be made without thorough knowledge concerning the e-commerce field. A term gets a real meaning only if it is linked to other terms specific to the field, with whom it establishes logical connections.

If the term integrates in a field, it becomes part of the discourse. Thus, the specialized translation will be subject to certain lexical constraints: collocations, idioms and expressions specific to the respective field. Teaching/learning the translated terminology is achieved both at a conceptual level (by knowing the field) and a functional level (by knowing the specialized discourse). Slodzian outlines the necessity to replace the term into discourse:

“We take into consideration that terminology, from the translation perspective, leads to the emphasis on the notion of syntagmatic terminology, consisting of terms which are very active in discourse. Additionally, the connections between term and text are put in the foreground” (Slodzian 2000: 61-85).

As an essential vector of knowledge, terminology integrates naturally in the technical and scientific wording, being an element that ensures the quality of language and communication. In this way, “relying on a terminologic background, one can ensure not

only coherence of all the texts, but also coherence of the text subject to translation” (Humbley 2008: 261-265). As we have already seen, terminology plays an important role when a certain language wants to distinguish itself as a technical and scientific language. The society’s technological development has had a great impact on various terminologies. Likewise, it has changed the proportion between the literal translations and the specialized ones; Lately, the latter ones have been very demanded. This fact should lead to a thorough analysis in order to meet the theoretical and practical needs of the technical translations. So, it is highly important for us to get familiar with the websites’ terminology, to study the key problems concerning the websites’ translation and to achieve our main goal (conceptual equivalence in the translation process).

2. The main goals of an online company is to attract other foreign customers. In order to achieve this goal, its customers have to receive and understand the company’s online messages. Additionally, the content of e-commerce websites should be translated in other languages, in order to build trust with local customers.

The Internet World Stats reported that in 2010 the English language was the top language on the Internet with 536.6 million users with Chinese following closely at 444.9, then Spanish 153.3, Japanese 99.1, Portuguese 82.5, German 75.2, Arabic 65.4, French 59.8, Russia 59.7 and Korean 39.4 (see <http://www.suite101.com/content/e-commerce-language-conversion-software-vs-hiring-translators-a301443>).

“If I am selling to you, I speak your language. If I am buying from you, dann müssen Sie Deutsch sprechen.” is a relevant quote belonging to German Chancellor Willy Brandt. Briefly, he points out the fact that businesses tend to communicate with vendors in their native language, so why would their customers not expect the same treatment? According to Forrester Research more than one-third of all internet users are non-native English speakers and visitors stay for twice as long if the website is in their own language. Therefore, we would like to add that translation of e-commerce sites can help customers in order to better understand the description of products, their features (see <http://www.suite101.com/content/e-commerce-language-conversion-software-vs-hiring-translators-a301443>). Also, this aspect can lead to an increase of orders and sales, ensuring that essential information such as order-tracking, contact numbers and transaction details are given in the customer's native language.

3. Language Conversion Software or Hiring Translators to translate the e-commerce websites?

Firstly, we would like to mention that *translating* a website is different from *localizing* the language. When we translate a website without localizing it, we convert only the language and this language can contain sentences with inappropriate words and terminological units that are not commonly used.

Nowadays online businesses can benefit from three types of *language conversion software*: software programs installed onto their server, software to convert the language and then paste the results onto the website and third-party hosted software which automatically translates the website for the user.

Regarding the second one, the one that we brought into discussion is quite inexpensive and has a quick integration. In spite of having a quick integration, there are several drawbacks: language is not localized, expressions and words used incorrectly, confusing translations

(see <http://www.suite101.com/content/e-commerce-language-conversion-software-vs-hiring-translators-a301443>).

Secondly, localization is the process of converting the content and the design of a website in a form that is specific to the foreign market both linguistically and culturally. This way, the e-commerce site makes a good impression and generates revenues.

When we use *language conversion software*, we help customers navigate the site and understand what the online business is trying to tell us. *Translators* can make the e-commerce site appear as if the business was completely focused on the foreign country and more international customers become interested in the online products.

In comparison to *language conversion software*, *translators'* work is easy for customers to understand, builds trust with international customers and locates within a country, being in a permanent contact with local residents. Among the drawbacks regarding the hiring of translators, we mention that this service is more expensive and time consuming. In order to avoid blunders and awkward translations, we consider that hiring translators to translate e-commerce websites is the best choice. Furthermore, it is recommended that the translations be made by a *native speaker* of the language that the online company wants the e-commerce website converted. To put it in a nutshell, just these *translators* are good at using idioms, expressions and sayings that are common to native speakers.

4. Translating the content of e-commerce websites

We have previously mentioned that *translators* are the *native speakers* of the target language, but they should also know specific terms of the e-commerce terminology. If they make use of a data base (thus ensuring accuracy), *translators* check the text from the cultural point of view, taking into account the subtleness of each language, so as to keep the message of the text. Sometimes it is extremely hard to translate from English into another language. Armando Roggio mirrors this aspect in his article entitled *Ecommerce Know-How: Translate your Ecommerce Site*. Furthermore, he mentions that if we wanted to translate the idiom "don't judge a book by its cover" into French, it would more convenient to say, *l'habit na fait pas le moine*, (the clothes don't make the monk) than *ne juge pas un livre par sa couverture*, which is the literal translation. The French idiom, *l'habit na fait pas le moine* has the equivalent meaning to the English idiom, even though the actual words are nothing alike. This idiom is used in English to say that things are not always what they seem, or that sometimes what is inside of a thing is greater than what is on its surface (see <http://www.practicalecommerce.com/articles/1241-Ecommerce-Know-How-Translate-Your-Ecommerce-Site>).

Taking into consideration this article, we admitted that we are able to find equivalents, as long as we understand the languages involved in the translation process. Sometimes the content of an e-commerce site consists in too long sentences and *translators* are forced to cut the sentences and to rewrite short sentences in order to convey the message of the texts.

We selected some texts from the content of three websites – *online companies selling beauty products, furniture and watches*. If we want to translate into Romanian the texts, our activity will be marked by the following aspects:

a. *Mancine's body butter is formulated by **whipping** botanical extracts together with shea butter to create a perfect, emollient-rich body butter. It is great to re-hydrate and nourish the skin. It can be used daily all over body concentrating on extra dry areas, particularly on the hands, feet, knees and elbows.*

We started to translate the text in *a.*, but we realized that it is better for us to rewrite the text in English, then translate in order to transmit a clear and concise message to the customers, not forgetting two important components: to recommend the product and to urge customers to buy it. Here is the reduced text that could be translated into Romanian:

Mancine's body butter is an emollient-rich body butter which contains botanical extracts together with shea butter. Use it daily to re-hydrate and nourish the skin, especially dry areas: hands, feet, knees and elbows.

b. This coconut and vanilla blend will leave your skin smelling **scent-sational!**

c. OPI latest gift pack is an on-the-go manicure kit. Pampering has never looked so gorgeous with two pretty pink nail lacquers and adorable FREE nail file and tweezers.

Bring the salon touch to your fingertips!

d. We do offer a **layaway program** with no penalties for cancellation. Please contact us below for more details.

e. Algologie Moisturising Cooling Cream- Gel. Suits dry skin, with oily areas. Good for hot climates. A cream-gel, with fresh and non oily texture, acts in three ways to moisturise and brighten **thirsty skin**.

Concerning b., c., d., e., the literal translation of the words and phrases in bold would lead to an awkward translation. To convey the intended meaning, we should look for synonyms and should adapt to the Romanian language. Of course, knowing legal terms is a plus (see d.).

f. Delivery was fast and customer service is **top notch**. We will be shopping with you more. Thank you.

g. Our delivery times vary. A good **rule of thumb** is to allow 4-6 weeks of delivery.

As our goal is to reach the lowest level of reader, we must not translate literally the bold phrases in *f.* and *g.* because we do not convey the intended meaning. We need to provide an easy-to-read content and not a confusing translation. Last, but not least, we communicate the intended meaning of the phrases, in essence, we do not translate the actual English words. Also, we could make a list of English business idioms and find their Romanian equivalent so as to make our translation activity much easier.

Another example is the product description below:

h. Citizen Exceed Solar Radio Women's Watch # EBD75-2721. Dial: **Shell white butterfly**. Band: Stainless Steel. Case: Stainless steel. Glass: spherical sapphire glass (**non-reflective coating**). Clasp: **fold over clasp** with push button. Caliber: H336. Driving period: Full-charge time about 1.5 years. Accuracy: ± 15 seconds/month (non-receiving).

We need to translate it in a descriptive way, to ensure customers' understanding. But, first of all, we should know the specific language used in this description: **shell white butterfly, non-reflective coating, fold over clasp**. By using specialized dictionary, we translate the product description in due time and identify interdisciplinary terms.

5. Conclusions

The World Wide Web plays an important role in our daily life. As consumers, we can meet our needs by placing online orders. That is why, online companies should present its profile and services properly, in order to meet the customers' needs and understanding globally.

The visitors of a website are ready to order and purchase products, especially when the content of the website is presented in their native language. Therefore, translators become

the most import key, because they translate not only the words and sentences on the website, but also the general tone and the key messages, adapting each cultural reference.

We focused on the translators' task and we presented some techniques regarding the translation process. The best translators are the ones which are native speakers of the target language. Good written English language can be very difficult to translate in Romanian. To exemplify, we selected texts from three websites and we concentrated on the words, expressions, idioms that pose problems to their translation into Romanian.

Eventually, we reached the conclusion that translators-native speakers are more reliable than language conversion software. In comparison with the language conversion software, translators create a text that is accurate, appropriate for the potential customers and consistent with the corporate image of the online company.

A-T-ON VRAIMENT BESOIN DE LANGUES ÉTRANGÈRES DANS LE TOURISME ROUMAIN? PROPOS SUR LA LÉGITIMITÉ DES COMPÉTENCES MULTILINGUES

Constantin Felicia

University of Oradea, Faculty of Economic Sciences

Situées dans une zone de confluence entre la philologie et l'économie, les langues étrangères pour les affaires représentent un domaine de plus en plus intéressant pour les responsables économiques européens conscients de la valeur générée par les compétences multilingues. Le présent article se propose d'offrir une lecture du document Master Plan pour le développement du Tourisme National de la Roumanie 2007-2026 en clé linguistique applicative, dans la tentative de synthétiser le rôle attribué aux langues étrangères dans la stratégie nationale de développement du tourisme. L'ample étude réalisée par le ministère roumain, remarquablement conseillé par l'Organisation Mondiale du Tourisme, offre une image réaliste du tourisme roumain au moment de l'intégration dans l'UE et en prévoit l'évolution sur une période de 20 ans. Les recommandations du Forum des Entreprises sur le Multilinguisme et les conclusions de l'étude ELAN mettent en évidence l'impact des langues étrangères sur le milieu des affaires, la relation directe entre la compétence linguistique, la performance, le profit et le développement. La méthodologie de recherche utilisée a supposé l'identification des unités de logement (hôtels et pensions) d'Oradea, la ville municipale du département de Bihor et Băile Felix, renommée station balnéaire située à environ 10 km d'Oradea (les deux situées dans la région frontalière avec la Hongrie) et l'analyse des sites internet correspondants. Leurs présentations virtuelles sont réalisées en général en roumain, mais nous constatons une préoccupation réservée pour la présentation virtuelle multilingue; notre but est de résumer, dans la perspective orientée vers le tourisme international, le paysage linguistique créé dans cet espace en ligne. Nous constatons, suite à cette recherche, que les langues étrangères sont presque unanimement ignorées, malgré leurs valences de profitabilité incontestables, par les officiels et par les propriétaires d'hôtels et de pensions de la région de Bihor qui ne choisissent pas d'appliquer une stratégie multilingue pour la promotion. Les langues utilisées prioritairement sont le roumain et l'anglais, suivies, à distance, par l'allemand, l'italien et le français. L'originalité de l'épreuve est donnée par la mise en relation du tableau linguistique de la promotion touristique locale (zone frontalière Bihor) avec la vision du document cadre. Les données offertes permettent des conclusions théoriques et des solutions pratiques, applicables à plusieurs langues et dans plusieurs régions touristiques du pays. Elles compléteront aussi l'argumentation en faveur du multilinguisme, dans le cadre d'une étude doctorale, menée à l'Université de Reims, France, avec la collaboration d'une équipe préoccupée par la gestion multilingue de l'information, sous la coordination des professeurs J.E. Tyvaert E. Castagne.

Keywords: langues étrangères spécialisées, tourisme international, multilinguisme, présentation virtuelle, Bihor

Cod JEL: Y8

1. Introduction

Le point de départ de notre étude est représenté par l'une des conclusions du Rapport Davignon relatif à l'impact des langues étrangères sur le milieu économique «L'Europe court le risque de perdre la guerre des compétences, alors que les économies émergentes, principalement en Asie et en Amérique latine, acquièrent rapidement les compétences linguistiques et autres nécessaires pour dépasser leurs concurrents sur les marchés de demain» (Rapport Davignon 2008: 8).

En extrapolant une observation d'Odile Challe, on constate que dans le domaine du tourisme international «les problèmes de communication linguistiques sont négligés parce que considérés comme secondaires» (Challe 2002: 130). Après l'adhésion de la Roumanie à l'UE, les officiels ont posé sérieusement le problème de l'élaboration d'un Master Plan du développement du tourisme national, dans la perspective d'une approche durable du développement de ce secteur extrêmement offrant. Réalisé en collaboration avec l'Organisation Mondiale du Tourisme, ce document est une ombrelle qui couvre une longue période, comprise entre 2007 et 2026. La vision générale ne reste pas dans un périmètre restreint, local et national, mais elle se rapporte à une dimension internationale, dans le sens de l'atteinte des standards européens et de l'ambition de développement dans un rythme supérieur à d'autres destinations touristiques de l'Europe (Master Plan 2007: 163), ce qui transforme les langues étrangères dans un facteur incontournable dans le domaine du tourisme.

2. Visiteurs étrangers et leur rôle dans l'élaboration des objectifs cible du tourisme en Roumanie

Les responsables du plan stratégique pour le tourisme estiment que dans la conception des objectifs cible du tourisme roumain, le paramètre *visiteurs étrangers* représente une importante ressource qui ne peut pas être détachée de la langue qu'ils parlent. Si nous acceptons l'affirmation de Mesplier et Bloc-Duraffour, conformément à laquelle le tourisme est «un phénomène sélectif, à l'origine des modifications profondes de l'environnement et de l'organisation régionale», nous nous demandons s'il est possible «de maîtriser un phénomène aussi puissant» (Mesplier et Bloc-Duraffour 1997: 14). A-t-on vraiment la chance de gérer avec succès les croissances estimées à long terme dans le cadre du tourisme international en Roumanie? Hésitons-nous encore à mettre en œuvre les importantes actions de communication et de commercialisation? (Patin 1997: 60)

2.1 Objectifs prévisionnels concernant le nombre de visiteurs étrangers dans la période 2006 - 2026

L'augmentation du nombre de touristes européens sera spectaculaire, passant de 2,8 millions (en 2006) à plus de 8,5 millions en 2026 ; les touristes de l'Europe non UE monteraient de 2,8 millions à 5,3 millions. Très loin se situent dans les estimations les touristes de l'Amérique du Nord, dont le nombre augmentera 4 fois (ayant cependant un point de départ fragile, un peu plus de 150.000 visites en 2006) et les touristes du reste du monde, ci-inclus le Japon et l'Israël, qui seront à leur tour 4 fois plus nombreux par rapport à une valeur de 180.000 visiteurs enregistrés en 2006». (Master Plan 2007: 165)

Tableau 1 Nombre estimé de visiteurs étrangers pour la période 2006 – 2026 (milliers de touristes / an)

Provenance	2006	2011	2016	2021	2026
UE	2803	3777	4990	6569	8642
Europe non UE (Moldavie, Ukraine, Bulgarie, Turquie, Serbie / Monténégro, Fédération Russe, Biélorussie et petits États)	2886	3428	4022	4663	5340
Amérique du Nord (États Unis, Canada)	164	235	337	484	695
Reste du monde (ci inclus Japon et Israël)	184	267	387	563	808

Réalisé par l'auteur à base des informations fournies dans le Master Plan (p.165) (En 2006, quand la prévision a été faite, la Bulgarie n'était pas encore membre de l'UE)

2.2 Objectifs prévisionnels concernant les dépenses des visiteurs étrangers dans la période 2006 – 2026

L'interprétation des chiffres offerts par le Master Plan (Master Plan 2007: 166) nous a permis d'observer facilement un rythme fortement ascendant; on apprécie que le total des dépenses réalisées en 2026 par les visiteurs roumains et étrangers dépassera la valeur de 16.000 millions d'Euros, dont plus de 7500 millions par les touristes étrangers. Ces sommes détermineront théoriquement, une évolution du PIB de la Roumanie, allant de 3,5% à 6,9%.

L'établissement d'une relation de dépendance entre ces performances financières et la maîtrise d'une/de plusieurs langue(s) étrangère(s) serait un argument suffisant pour une reconsidération des priorités, par l'introduction des compétences linguistiques en langues étrangères au premier-plan des stratégies de développement. L'argent sera utilisé en bonne partie pour le logement, parce que les chiffres prévisionnels indiquent une évolution de la demande de logement, en relation logique avec l'augmentation du nombre des visiteurs.

Dans le contexte d'une croissance moyenne annuelle prévisionnelle presque double pour les nuitées des visiteurs étrangers dans les unités de logement (9,6% par rapport à 5,8%), celles-ci devraient être capables de proposer une offre adaptée; on considère que «la croissance la plus importante sera nécessaire pour les catégories d'unités de logement avec un haut standard de qualité ... Pour les catégories de qualité moyenne une augmentation devrait se produire jusqu'à la fin du Plan, allant de 83.000 à 130.000. Plus de la moitié des chambres correspondant aux catégories de basse qualité ne seraient plus nécessaires » (Master Plan 2007: 167). Ainsi se fait-il que les pensions et les hôtels de catégorie moyenne et supérieure restent la principale destination de séjour pour les touristes étrangers.

2.3 Modifications des habitudes d'information des visiteurs étrangers

On constate que dans le contexte de la révolution informationnelle et de la démocratisation de l'accès à l'information, «il y a un nombre croissant d'utilisateurs de l'internet sur les marchés générateurs de tourisme, qui utilisent de plus en plus l'internet pour la recherche de destinations et pour la réservation en ligne des besoins de voyages». Les solutions offertes par les responsables du tourisme doivent être adaptées et actualisées, afin de s'harmoniser avec les modifications culturelles. «Pour mieux accueillir les exigences de cette catégorie de consommateurs, on doit utiliser le plus possible les moyens électroniques, à côté des voies de communication telles que la téléphonie et la poste électronique». (Master Plan 2007: 106)

Caraiani remarque le rôle des langues étrangères dans la communication virtuelle „un élément important qui influe sur l'utilisation de l'Internet au niveau global et implicitement sur les activités de marketing sur internet; c'est la maîtrise d'une langue de circulation internationale.” (Caraiani 2008: 23)

La demande des touristes doit être anticipée et *accueillie* par les propriétaires d'unités de logement, qui entreront dans une phase de concurrence étroite, simultanément avec la croissance du volume et la transparence des informations publiées sur internet; l'accessibilité de l'information rendra encore plus difficile la fidélisation d'un important nombre de touristes. L'information correcte et actuelle, présentée de manière attractive, dynamique et interactive, seulement en roumain et/ou un nombre réduit de langues étrangères, ne suffit plus si nous nous situons dans la perspective d'un tourisme ambitieux d'attirer des touristes étrangers et de contrecarrer la concurrence faite par d'autres pays. Aussi la promotion virtuelle de l'hôtel ou de la pension sur les propres sites représente-t-elle une solution stratégique valable et valorisable à long terme. La question se pose alors en quelle mesure les unités de logement sont préparées à satisfaire les exigences des touristes étrangers.

3. Étude de cas – département de Bihor (département dans l'Ouest de la Roumanie, à la frontière avec la Hongrie)

Dans cette étude nous suivrons la réflexion multilingue des informations relatives aux unités de logement de la région de Bihor (plus précisément d'Oradea, ville municipale et Băile Felix, renommée station balnéaire située à environ 10 km d'Oradea), telles qu'elles sont représentées sur les sites internet correspondants aux pensions et aux hôtels les plus représentatifs. L'analyse des données collectées par documentation sur internet nous a permis d'inventorier ces unités de logement et d'en rechercher les sites officiels. Un nombre significatif de ces unités ne disposent pas de site individuel, mais bénéficient de présentations en résumé sur des sites type portail, tels que www.tourismbihor.info, www.pensiunioradea.ro, www.bihar-bihor.eu. Celles-ci n'ont pas été considérées dans notre analyse, parce que les versions en langues étrangères qui existent sur les sites de réservation en ligne sont réalisées d'habitude par des modalités autres que la traduction classique du matériel à présenter (c'est bien le cas des dispositifs de traduction automatique, avec des performances amendables).

3.1 Hôtels de Băile Felix (ci-inclus 1 Mai)

Tableau 2 Hôtels de Băile Felix

langue	ROM	HU	EN	GE	IT	FR
total	13	1	3	1	0	0
pourcentage	100%	7,6%	23%	7,6%	0%	0%

Réalisé par l'auteur

L'analyse présente une situation au moins paradoxale et partiellement explicable. Les hôtels de Băile Felix ne valorisent pas le potentiel stratégique de la présentation multilingue sur leurs sites. L'activité touristique dans la zone Băile Felix se réduit de manière inquiétante, mais une solution simple et peu coûteuse comme la traduction du site est ignorée. Sur un total de 13 hôtels, on retrouve une traduction en allemand et une variante magyare. Nous devons cependant prendre en considération le fait que plus de la moitié de ces hôtels appartiennent à SC Turism Felix, société qui a construit un seul site, en langue roumaine, pour tous les hôtels administrés.

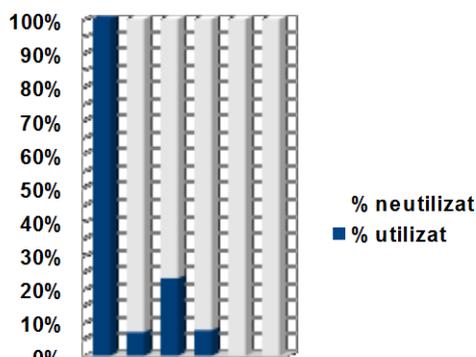

3.2 Pensions, villas, maisons de vacances dans Băile Felix (ci-inclus la localité Sânmartin et la station balnéaire 1 Mai, situées dans le voisinage)

Tableau 3 Pensions Băile Felix

langue	ROM	HU	EN	GE	IT	FR

le voisinage),

nous avons utilisé comme sources d'information le site du Ministère du

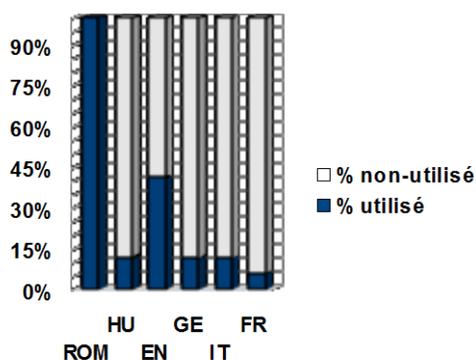

Tourisme et du Développement et de nombreux autres sites de promotion touristique. Sur les 68 pensions, villas et maisons de vacances identifiées comme fonctionnelles et actives, nous constatons que seulement 17 en détiennent des sites individuels, avec un domaine qui porte le nom de l'unité. Nous avons considéré implicitement que l'absence d'un site de promotion excluait d'emblée la préoccupation pour les aspects linguistiques ; ainsi se fait-il que nous avons éliminé de notre évaluation plus de 50 unités de logement qui existent dans la station balnéaire située près d'Oradea. Sur les 17 pensions qui disposent de sites individuels, seule la Pension *Diana* a un site traduit en 5 langues (moins le hongrois, conformément à l'inventaire linguistique final). Nous y voyons un intérêt timide pour les langues étrangères, ce qui au niveau de toute la station se traduirait par un vrai désintérêt ; l'exception en est l'anglais, avec une présence de 40% de sites individuels traduits.

3.3 Hôtels d'Oradea

Dans la ville d'Oradea, nous avons identifié 20 hôtels, avec des classifications entre 2 et 4 étoiles. Par rapport aux hôteliers de Băile Felix, nous constatons un intérêt plus marqué pour les langues étrangères, mais les tentatives sont loin d'être significatives. La majorité des hôtels ont des présentations en roumain et en anglais, un quart d'entre eux bénéficiant de présentations en hongrois, allemand ou italien. Il n'y a pas plusieurs hôtels avec des présentations complètes multilingues, les options pour des langues de présentation étant

différentes, en fonction d'unité. Il n'y a pas une stratégie unanimement acceptée dans la promotion des hôtels; un seul hôtel, *Atrium*, a le site présenté en 6 langues étrangères; 2 hôtels, *Ramada* et *Melody*, sont présentés en 5 langues; sur les 4 hôtels avec présentation quadrilingue, nous notons le cas de l'hôtel *Living In*, le seul de ces unités de logement d'Oradea qui a une présentation en hollandais.

et en anglais sont suffisantes. Une seule pension, *Eclipse*, se présente dans toutes les langues, en utilisant cependant un texte minimal. Malgré l'existence de quelques catégories de touristes en transit, qui préféreraient un logement dans un autre endroit que l'hôtel - un accès à l'information directement dans leurs langues maternelles en faciliterait le choix - les propriétaires de pensions urbaines véhiculent une information «close» dans l'espace d'une langue inconnue pour les touristes (la langue roumaine); une ouverture est réalisée cependant par l'anglais, mais celle-ci est plutôt accessible aux touristes étrangers plus jeunes. Les Français, les Italiens, les Espagnols ou les Allemands d'un certain âge préféreraient leur langue maternelle.

Les pensions d'Oradea sont peu nombreuses, mais elles se remarquent relativement par la même approche de l'information de promotion: on considère que les variantes en roumain

Figure 4 Pensions d'Oradea (réalisé par l'auteur)

Conclusions

Une vue d'ensemble sur les graphiques relève que:

- dans l'espace virtuel des unités de logement de Bihor, l'inventaire linguistique est formé par les langues suivantes : le roumain, le hongrois, l'anglais, l'allemand, l'italien et le française (ROM, HU, EN, GE, IT, FR en abrégations dans le texte);
- on ne remarque pas un intérêt particulier pour les langues étrangères du tourisme; bien au contraire, il est évident que ce potentiel est ignoré, à quelques exceptions près, par les propriétaires privés, a priori plus orientés et plus ouverts vers le nouveau et vers l'optimisation de l'activité dans les unités;
- malgré le fait qu'il s'agit d'une zone transfrontalière, les plus nombreuses unités de logement ne disposent pas de la version anglaise du site;
- les hôtels de Băile Felix ont, en proportion de 23%, des présentations en anglais et ceux d'Oradea en proportion de 73%; les unités de logement plus petites (pensions, villas, maisons) disposent de présentation en anglais en proportion de 40% (Băile Felix), respectivement 70% (Oradea);
- la présence des traductions en allemand, italien ou français peuvent être reliées à la présence constante ou passagère des touristes qui parlent ces langues ou bien à l'intention d'attirer prioritairement des touristes qui viennent des espaces linguistiques correspondants;
- on constate que les langues allemande et italienne occupent une position modeste et relativement égale dans le paysage linguistique de la promotion touristique; le français jouit lui aussi d'une présence modeste, malgré le fait que le public francophone a un potentiel très important, provenant de plusieurs pays: la France, la Belgique, la Suisse, le Canada, etc.;
- on constate l'absence totale de l'intérêt pour des langues comme l'espagnol ou le chinois qui correspondent à un nombre significatif de parleurs au niveau mondial, extrêmement mobiles lors des dernières années ;
- la zone urbaine est plus ouverte a la promotion multilingue des destinations touristiques.

Malgré le fait que «le tourisme este ainsi devenu un secteur économique de première importance, un enjeu âprement disputé par un nombre croissant de pays» (Mesplier et Bloc-Duraffour 1997: 53), il paraît que les plus nombreux acteurs impliqués dans le tourisme roumain ignorent des modalités simples, accessibles et peu coûteuses de renforcement des chances de réussite dans le contexte du tourisme international, l'une des solutions stratégiques en étant la présentation en plusieurs langues, sur le site de l'unité touristique. La traduction d'un site suppose un investissement initial modique, renouvelable surtout dans les données chiffrées; l'actualisation peut en être faite par tout connaisseur moyen de la langue.

Le désintérêt pour les pages de présentation virtuelle en plusieurs langues n'est pas propre aux acteurs locaux du tourisme. La page de promotion touristique www.turism.ro est disponible en quatre langues (roumain, anglais, français, italien) mais des données vieilles y sont utilisées, dépourvues d'une présentation dynamique et interactive. Le site de présentation touristique de Bihor www.turismbihor.info est traduit seulement en anglais et en hongrois.

Plusieurs opportunités de recherche s'ouvrent: une étude sur l'étude du statut des langues étrangères dans la présentation en ligne pour d'autres zones à fort potentiel touristique de Roumanie, la mise en place d'une corrélation entre les performances économiques et le niveau des compétences linguistiques de la région de Bihor, le lien entre la provenance des investisseurs étrangers de la région et les langues étrangères valorisées socialement et économiquement. Ces données complèterons aussi l'argumentation en faveur du

multilinguisme, dans le cadre d'une étude doctorale, menée à l'Université de Reims, France, avec la collaboration d'une équipe préoccupée par la gestion multilingue de l'information, sous la coordination des professeurs J.E. Tyvaert et E. Castagne. Nous ne nous sommes pas proposé dans cet article d'analyser de manière exhaustive les causes de cet état de fait qui définit le profil linguistique dans la zone du tourisme bihoréan; on note seulement la nécessité impérative d'un changement tout aussi drastique que le Master Plan l'exige (Master Plan 2007: 92). Normalement, les langues étrangères devraient occuper une place légitime prioritaire dans la stratégie de développement de la Roumanie, afin que celle-ci devienne une destination compétitive au niveau international. Et nous comprenons par là toutes les langues, puisque «Bien qu'il paraisse certain que l'anglais conservera son rôle dominant de langue internationale des affaires, les autres langues feront la différence entre l'ordinaire et l'excellence et apporteront un avantage concurrentiel». (Rapport Davignon 2007: 5)

ENGLISH LANGUAGE FOR SUCCESSFUL INTEGRATION: LEARNING FROM THE BOLOGNA PROCESS

Hernández-Carrion, José Rodolfo

University of Valencia (Spain) Faculty of Economics / Dept. Economía Aplicada

The Bologna Process aims to provide tools to connect the European national educational systems. The purpose of this paper is to analyze what we have learned and what challenges remain today. Since the beginning all participating countries had to agree on a comparable three cycle degree system for undergraduates (Bachelor degrees or Grades) and graduates (Master and PhD degrees) in order to create compatibility and comparability for achieving international competitiveness and a worldwide degree of attractiveness in higher education. The Bologna Declaration, originally signed by 29 countries, has now reached 47 countries, engaged in the process of creating a European Higher Education Area (EHEA), searching to be competitive to launch the European Academia of the 21st Century.

The European Credit Transfer and Accumulation System (ECTS) has turned out to be the perfect tool to design, describe, and deliver programs and award higher education qualifications. Markets and European universities are going to be able to compete overseas in the future if the new regulations let them to create profitable business in the education area. As expected, European Universities have responded promptly and actively to the call.

In the case of small countries like Spain, it is an opportunity to internationalize Spanish universities; moreover, there is the opportunity for the expansion and consolidation of the Spanish language as the second most important foreign language. The 2009 Report highlights that early teaching of a foreign language is advancing in Europe. In lower secondary education, earlier teaching of English is becoming widespread; and the three Nordic countries, Germany, and the UK are the highest innovation performers. The result is a system of higher education more competitive and more attractive for Europeans and non-European students and scholars. Reform is needed today if Europe wants to match the performance of the best performing higher education systems in the world. The English language seems to be the response in the search for a common European answer to solve common European problems.

Keywords: English, Bologna Process, European Higher Education Area, EHEA, Spanish

JEL Code: I23

Introductory notes

The Bologna Process had the aim to create a *European Higher Education Area (EHEA)*. The year 2010 was the reference for achieving this goal since the beginning. More deeply the idea was to build a market for the European Public Education System. Even being so many countries and different cultures were involved in the challenge, with different heritage and tradition, the project is getting going further with the last incorporated countries that are right now participating in the whole network.

From the Bologna Declaration of 19 June 1999, after ten years of willingness, we can talk of reaching *success* in the creation of a wide area of recognition and compatibility in University and Higher Education studies. Taking part in the Bologna Process initially was a

voluntary decision (even if there were not many other choices) made by each country and its higher education community to endorse the principles underlined in the European Higher Education Area. The purpose of this paper is to analyze what we have learned from this important example of fast unification process and what is still the challenge today.

The Bologna Process did not aim to harmonize national educational systems but rather to provide *tools to connect* them. The intention initially was to allow the diversity of national systems and universities to be maintained while the European Higher Education Area was adding more transparency among national higher education systems. The key element was to implement tools in order to facilitate recognition of degrees and academic qualifications, mobility, and exchanges among the European institutions. The reforms were based on ten simple objectives which governments and institutions are still currently implementing. All participating countries had to agree on a comparable three cycle degree system for undergraduates (Bachelor degrees or Grades) and graduates (Master and PhD degrees). It was a duty to follow for whatever country wanting to be part of the big picture, following the general rules applying to the network.

Origins of the project and expected goals

The Bologna Declaration was originally signed by 29 countries in order to reform the structures of their higher education systems in a convergent way. These countries who originally signed the initial agreement were: Austria, Belgium, Bulgaria, Czech Republic, Denmark, Estonia, France, Finland, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovenia, Slovak Republic, Spain, Sweden, Swiss Confederation, and the United Kingdom. All of them wanted to keep competitive in the launching the European Academia of the 21st Century.

The Sorbonne declaration of 25th of May 1998 had previously stressed the Universities' central role in developing European cultural dimensions. It emphasized the creation of the European area of higher education as a key element to promote citizens' mobility and employability and the European Continent's overall development. Further than to achieve "greater compatibility and comparability in the national systems of higher education" (mainly an intra-European issue), the Declaration of Bologna wanted to increase "the international competitiveness of the European system of higher education". So it is important for European students themselves but for foreign students attending European education as well. The signatory countries explicitly expressed their goal to "ensure that the European higher education system acquires a worldwide degree of attractiveness equal to [Europe's] extraordinary cultural and scientific traditions".

According to the Bologna Declaration, Europe's response had to support the general principles laid down in the Sorbonne declaration, engaging coordinating of European policies to reach the main objectives considered to establish and promote the European system of higher education world-wide which were the following eight ones:

- Adoption of a system of easily readable and comparable degrees, also through the implementation of the Diploma Supplement, in order to promote European citizens *employability* (person's capability of gaining initial employment, maintaining employment, and obtaining new employment if required) and the international competitiveness.
- Adoption of a system essentially based on two main cycles, undergraduate and graduate.

- Access to the second cycle shall require successful completion of first cycle studies, lasting a minimum of three years. The degree awarded after the first cycle shall also be relevant to the European labor market as an appropriate level of qualification. The second cycle should lead to the master and/or doctorate degree as in many European countries.
- Establishment of a system of credits - such as in the ECTS system – as a proper means of promoting the most widespread student mobility.
- Credits could also be acquired in non-higher education contexts, including lifelong learning, provided they are recognized by receiving Universities concerned.
- Promotion of mobility by overcoming obstacles to the effective exercise of free movement for students, access to study and training opportunities, and for teachers, researchers and administrative staff. Recognition and value of periods spent in a European context researching, teaching and training.
- Promotion of European co-operation in quality assurance with a view to developing comparable criteria and methodologies.
- Promotion of the necessary European dimensions in higher education, particularly with regards to curricular development, inter-institutional co-operation, mobility schemes and integrated programs of study, training and research.

Following the process and getting further in the expansion, the whole area has been increased reaching now 47 countries engaged in the process of creating a European Higher Education Area. We could call it now the Euro-Asia Area according to which countries are now belonging to this “Knowledge Region”. The whole area now includes: Albania, Andorra, Armenia, Austria, Azerbaijan, Belgium, Bosnia-Herzegovina, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Georgia, Germany, Greece, Holy See, Hungary, Iceland, Ireland, Italy, Kazakhstan, Latvia, Liechtenstein, Lithuania, Luxembourg, Malta, Moldova, Montenegro, Netherlands, Norway, Poland, Portugal, Romania, Russian Federation, Serbia, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, "the former Yugoslav Republic of Macedonia", Turkey, Ukraine, United Kingdom.

It seems interesting to understand how much the Bologna Process has been revolutionary and how far the cooperation in European higher education could expand further of this experience. Markets and European universities are going to be able to compete overseas in the future if the new regulations let them to create profitable business in the education area. As expected, European Universities have responded promptly and actively to the call, but also the countries with near location to the European Union borders.

There are many potential students from countries belonging to South America, Australia or Asia who are investing their money (and/or their governments' money with grants and fellowships) in higher education for attending universities overseas. The opportunity cost for Europe now is very high. They are spending from 5 to 10 years in the United States of America when they used to come to Europe for that education in the past. Most of them wanted to improve their English language skills and knowledge at the same time that they develop their higher education studies. We have to consider seriously about how many students, from China or Japan for example, used to come to Europe or only to the United Kingdom or France, but they are fighting today in order to be able to attend a US university today.

The United States of America is the largest economy in the OECD controlling this international market and would be the only one able to react to the magnitude and significance of the Bologna Process. We have to balance between running following the American model, an open door in the higher education system under which anyone with a high school diploma can enter some institutions that are classified as higher education. The European system is very competitive but not so open to foreign students. Exchange programs have helped a lot for creating the network that let students get official recognition; this would be the case of the ERASMUS program.

Main instrument in use for achieving the goal: the European Credit measure (ECTS)

The European Credit Transfer and Accumulation System (ECTS) seems to have been a good choice for evaluating. ECTS is a tool that helps to design, describe, and deliver programs (or programmes) and award higher education qualifications. The use of ECTS, in conjunction with outcomes-based qualifications frameworks, makes programs and qualifications more transparent and facilitates the important recognition of qualifications.

ECTS was introduced initially in 1989, being one of the cornerstones of the Bologna process, as tool of the credit system for higher education used in the European Higher Education Area, involving all countries engaged in the Bologna Process. First used within the framework of Erasmus, later part of the Socrates program. ECTS was the only credit system which has been successfully tested and used across Europe. ECTS was set up initially for credit transfer. The system facilitated the recognition of periods of study abroad and thus enhanced the quality and volume of student mobility in Europe. Later ECTS was developed into an accumulation system to be implemented at institutional, regional, national and European level.

Recognition of prior learning is a key element in order to promote *lifelong learning* later. Potentially recognized as learning outcomes, ECTS credits describe what a *learner is expected to know, understand and be able to do* after successful completion of a process of learning. They relate to level descriptors in national and European qualifications frameworks. ECTS credits are based on the workload students, which indicate the time students typically need to complete all learning activities (such as lectures, seminars, projects, practical work, self-study and examinations) required to achieve the expected learning outcomes.

Two famous new concepts arrive: “learning outcomes” and “competences”, both used with different shades of meaning and in somewhat different frames of reference. In all cases they are related to what the learner supposedly will know, understand and be able to do at the end of a learning experience. Their widespread use is part of the shift in the arriving paradigm that places the *learner at the heart* of the higher education experience. This shift is the foundation basement of the European Higher Education Area, the Bologna Process and ECTS.

By standardizing the size of components and goals, institutions allow for more flexible, multidisciplinary and interdisciplinary pathways among programs. On the other hand, the definition of learning outcomes within a component has been constrained by the predefined number of credits that set *a priori* the workload for each component. Institutions have a lot of flexibility because they must consider the total time needed by students in order to achieve the desired learning outcomes with potentially several flexible learning paths.

The credit allocation to a new program or component should be validated according to national and/or institutional rules and should be regularly monitored. If evaluations reveal a discrepancy between the anticipated workload and the time actually taken by the majority of students to achieve the expected learning outcomes, becomes necessary a revision of the workload, learning outcomes or learning/teaching methods.

Anyway the big challenge is going to achieve *quality assurance*, which is going to be the primary responsibility for each institution. Taken together, internal quality assurance and external quality review (undertaken by quality assurance agencies) aim to implement *the Standards and Guidelines for Quality Assurance in the European Higher Education Area*. Transparency and accessibility constitute the revolutionary elements for the whole of institutions and apply equally to language too. The publication should be available on the website, and not only in the local language, but preferably also in another widely-used language (which means English language more or less) in order to enhance transparency at international level too.

What becomes important then for institutions is how the new system encouraged them to publish on their *websites* their recognition policy and practices for all formal and informal learning. They have to adapt and renew all the information regarding the new concepts of ECTS and the Diploma Supplement. A “good Course Catalog” means to provide information on the Institution and the courses covering other important aspects in an official way. This effort of renovation and adaptation has represented probably the key factor for improving competition and creating an increasing market which conduct the whole system to modernization, applying to all European universities and educational institutions in general including the oldest and most famous ones.

Research on how countries are responding to the challenge: the case of Spain

In the case of small countries like Spain, the challenge represented an opportunity for getting involved in a huge amazing project of internationalization of the Spanish universities. The best opportunity for Spain could be the expansion and consolidation of the Spanish language as a key element to take into account. Spanish is an important and extended world language, and the one with the highest current rate of growth. Spanish is also the official language used in many international organizations. The United States of America has now more Spanish speakers than Spain and, in fact, it is only surpassed by Mexico. Nowadays, Spain is the third country according to population speaking the Spanish language.

Perhaps the case of Spain does not represent the situation to emulate in Europe. Foreign students can choose to go to study in Spain as a second chance with around 400 million speakers, it is the third most spoken language in the world today, after Mandarin Chinese and English and it is an official language in 21 countries. Anyway, the first reference and the only relevant language in the international higher education right now perhaps is the English language.

Being a big old country at the time of the foundation of the first universities in Europe, Spain has the chance to participate in this knowledge heritage for reaching a better position in the modern global context. So... 'the history of Spain's universities dates back to the beginning of the thirteenth century when the first university institutions were founded in the kingdoms of Castile and Leon, under the auspices of the *Cathedral Schools* of Palencia (between 1208 and 1214) and Salamanca (1218). During that century, many of the

kingdoms in the Peninsula created their own *Studia Generale*. Institutions of this kind were established in Valladolid towards the middle of the century, in Lleida between 1279 and 1300, and in Alcalá in 1293. The greatest expansion took place between 1450 and 1625, with the opening of universities in Barcelona (1450), Santiago de Compostela (1495), Valencia (1499), Granada (1531) and Oviedo (1608).

In modern times, the Spanish university boom coincided with the process of decentralization following the ratification of the Spanish Constitution in 1978, as many sectors of society began to demand access to higher education for the first time. In 1984, Spain had 34 universities and 700,000 students. By 1995, almost a million and a half students were enrolled at a total of 51 universities, and five years later the number of universities had risen to 61. [...] Today, in 2011, the Spanish university system is made up of 76 public and private universities which offer students from Spain and abroad a broad-ranging, highly-regarded variety of courses at undergraduate, master's and doctoral levels'.

The Spanish site map (<http://www.universidad.es/>) reflects what are the important questions to be answered and other relevant information not so relevant for the big challenges:

- The Foundation (The Foundation Universidad.es / Contractor's profile / Presence abroad / Job opportunities / Documents).
- Universities (Spain's universities / Other teaching and research centres / Who is Who)
- Degrees (The Spanish university system / University admissions / Degrees / Degrees in foreign languages / The cost of studying in Spain)
- Research and innovation (Research / Innovation)
- Studying Spanish (Why study Spanish? / Before arriving / During your stay / Other co-official languages / Diplomas in Spanish (DELE-Diploma of Spanish as a Second Language)
- Information and resources (Before arrival / During your stay / Scholarships / Getting to know Spain)
- Fairs and events (Calendar) // Alumni Network // Online student and researcher service (Talk to us / Frequently asked questions) // Mapa web

Conclusion: English is the only language and an advantage for Northern countries

Sharing and exposing so much relevant information for all the universities will help students from all over the world and systems to improve and choose a better way. The first mandatory step is been developing by all the universities in Europe. The second step is to react to the big challenges and to implement a new policy according to the best practices that could be designed. The continuation of the reform process needs the acceptance among teachers and students but English seem to be the only important language for going ahead.

According to the 2009 Report is highlighted that early teaching of foreign language is advancing in Europe. In lower secondary education, earlier teaching of English is becoming widespread. The three Nordic countries (SE, FI, DK), Germany, and the UK are the highest innovation performers as measured by the European Innovation Scoreboard and a strong concentration of the "creative class" with high educational attainment in and around capital cities contributes to the performance.

In the whole region students are supposed to be able to choose from a wide and transparent range of high quality courses and, more important, they would benefit from smooth recognition procedures. The Bologna Declaration of 1999 has put in motion a series of reforms needed to make European Higher Education more compatible and comparable

being applied simultaneously in all the countries involved. The result would be a system of higher education more competitive and more attractive for Europeans and non-Europeans, for students and scholars coming from other continents. Reform is needed today if Europe wants to match the performance of the best performing systems in the world, notably following at least the United States and Asia education systems.

The Declaration reflected a search for a common European answer to solve common European problems. The process originated from the recognition that in spite of their valuable differences and language limitations, European higher education systems were facing common internal and external challenges related to the growth and diversification of higher education, the employability of graduates, the shortage of skills in key areas, the expansion of private and transnational education, etc. The Declaration recognized the value of coordinated reforms, compatible systems and common needed action.

BUSINESS BUZZWORDS: RIGHTSIZING, DOWNSIZING, RE-ENGINEERING, DE-LAYERING

Pop Anamaria Mirabela
University of Oradea
Faculty of Economics

The paper attempts to analyse the rise and use of a new vocabulary (economic buzzwords) related to staff dismissal in the new economy of the world. In this new economy, the organizational boundaries between states and firms become unclear and a new vocabulary has been conceived in order to express the changes the firms are undergoing. The new rhetoric includes buzzwords like privatization, de-regulation, re-engineering, rightsizing, downsizing, de-layering, quality service or global sourcing. The research is based on the conclusions of bibliographical and direct research of the literature relevant in the field, trying to emphasise the importance of strategic language when it comes to human resources management. Concepts like “freedom of speech”, “politically correct language” or “non-discriminatory language” are brought to attention and analysed focusing on their importance during periods of change and uncertainty characterising the economic environment nowadays. Two trends are depicted in the paper: the first is that of the supporters of political correctness who attempt to homogenize the language and thought to enhance the self-esteem of minorities. One approach to reaching this goal is to eliminate discriminatory or offensive words and phrases and the substitutions of harmless vocabulary at the expense of economy, clarity, and logic. Another approach is to deconstruct a word or phrase into its component parts, treat the component parts as wholes, and focus on secondary meanings of the component parts. On the other hand, reflecting upon the nature of large-scale organizational restructuring, there are the critics arguing that this type of language is a euphemistic form of phraseology. The analysis starts with the assumption that the economic lexis is not a rigid system of terms. Morphologically, there is a high degree of variety in productive types of compounding which exceeds the possibilities that exist in the common English vocabulary. In this view, four buzzwords (rightsizing, downsizing, re-engineering, de-layering) have been chosen as representative for this process and, also, due to the difficulty of translating them into Romanian. Also, the etymology of these buzzwords is analysed and by this the paper attempts to find why managers have adopted these as their favourite terms when discussing large-scale organizational restructuring.

Keywords: buzzwords, rightsizing, downsizing, re-engineering, de-layering.

JEL Code: Y90.

1. Introduction

There are numerous researchers in the sociology of organizations and the study of social movements who have examined the strategic use of language. Whether it is called rhetoric (Suddaby and Greenwood 2005:35-67), or framing (Benford and Snow 2000:409-430), these studies have shown how language can be used to influence perceptions of events or practices, and that these perceptions can influence behaviour and actions. Metaphors especially are considered to be a very powerful tool in this process. Lakoff and Johnson (1980) stated: “The essence of a metaphor is understanding and experiencing one kind of

thing in terms of another” (Lakoff and Johnson 1980:5). Metaphors are used to elucidate an abstract or difficult concept by stating it in terms of a concept which is easier to relate to. The two authors go on showing how metaphors are used in everyday language to the point that they go undetected in people’s basic understanding of concepts. In all aspects of life, people define reality in terms of metaphors and then proceed to act on the basis of the metaphors. They draw inferences, set goals, make commitments, and execute plans, all on the basis of how they in part structure their experience, consciously and unconsciously, by means of a metaphor (Lakoff and Johnson 1980:158).

Matissa Hollister considers that, in a related process, perceptions are influenced by the practice of naming or labelling, quoting Safford (2009): “People rely on these labels to figure out how to behave toward one another. So the power to shape the meaning and application of such labels lies at the heart of politics in both organizations and society more broadly. It’s something to be taken seriously”. (1)

The literature in the field shows that the use of strategic language is especially important during periods of change and uncertainty, when the new conditions and environment require new non-routine practices (Fiss and Hirsch 2005:29-52). In these conditions, strategic language can be used in order to accomplish the tasks associated to the job.

2. Non-discriminatory language or “politically correct” language

No society has ever permitted total freedom of speech without any restrictions whatsoever and it is hard to see how it could. In contemporary America and Britain there are a multitude of restraints on free speech. A large number of employers place restrictions on their employees’ freedom to speak about their work or to go to the press. These restrictions are usually presented as matters of respect for authority, or not bringing the company into dispute or just good manners, but they remain restrictions on freedom of speech nonetheless. Recently, there have been attempts to broaden the concept of *non-discriminatory language* beyond its application to gender to consider traditional language that discriminates against people on the grounds of: race, ethnicity, religion, age, sexual orientation, physical ability or physical appearance. Hence, the phrase “politically correct” language was coined. The term “politically correct” appears to have originated within the left. Paul Berman states that: “Politically Correct’ was originally a phrase on the Leninist left to denote someone who steadfastly toed the party line. Then it evolved into ‘PC’, an ironic phrase among wised up leftists to denote someone whose line-toeing fervour was too much to bear. Only in connection with the PC debate itself did the phrase get picked up by people who had no fidelity to radicalism at all, but who relished the nasty syllables for their twist of irony” (Berman 1992:5).

In some critics’ opinion “political correctness” becomes ludicrous and self-parodying. For example, Beard and Cerf (1992) analyse terms such as *differently abled* (of a person confined to a wheelchair), *nonwaged* (unemployed), *physically challenged* (disabled), *vertically challenged* (short), *horizontally challenged*, *differently-sized*, *sizeism survivor* (fat), *cattle murderer* (grazier or rancher), *melanin-impoverished* (white), *sex worker* (prostitute), *unpaid sex worker* (wife), *achieve a deficiency* (fail), *member of a career-offender cartel* (mafioso), and *substance-abuse survivor with difficult-to-meet needs* (alcoholic serial killer) (Cerf and Beard 1992).

Modern dictionaries of euphemism like Ayto (1993) include politically correct expressions among their entries, considering that the phrase *politically correct* is completely mixed up

with euphemism and jargon. In *Copy Editing for Professionals* (2000), Edmund Rooney and Oliver Witte define euphemisms as a “polite expression for an impolite idea.” They state: “Euphemisms are offenses against plain speech and clear communication, which is why bureaucrats and the politically correct love them... Perhaps those who have been fired from their jobs would be more accepting if they understood that they participated in the corporate *downsizing*. It didn’t take long for *downsizing* to acquire a bad name (*down* has an unfavourable connotation), so the term became *rightsizing*” (Apud Knight 2003:129). Yet, contemporary studies on non-discriminatory language deny that the use of politically correct terms is euphemistic. They consider that the use of politically correct language calls for a more precise and accurate use of language.

3. Buzzwords

The word buzzword is a neologism coined in the 1960’s. A buzzword is “a word or phrase... often authoritative or technical that is a vogue term in a particular profession, field study, [or] popular culture (Random House Dictionary). Yet, this definition essentially collapses buzzwords into jargon or argot. “Jargon” is a medieval word meaning gibberish. “Argot” means the languages of thieves and rogues. Nowadays, both terms have retained the pejorative meaning and they are used to criticize the secret codes of particular groups, especially of professions.

According to Kaufer and Carley (1984), buzzwords cannot provide detailed elaboration of what the buzzword strictly means. Unlike argot, a buzzword is “never a dense reference. A buzzword functions rather as an instrumental reference to topics that are only loosely connected to it” (Kaufer and Carley 1984:178). Buzzwords are the reality of the impact a specialised group has on the larger culture. Buzzwords are coined when the words of an inside community have implications for a larger community of outsiders, even when the outsiders cannot fully grasp the precise meanings of the words.

Specialised language is not a fixed set of terms. It evolves and renews itself according to the changing interests within communities of practice. According to Roos (1987), “the lexis of business and economics is characterised by a high degree of freedom, productivity, creativity and imagination” (Apud Crawford Camiciottoli 2007:138).

Redundancy and dismissal are one area of management practice that particularly suffers from euphemistic jargon. According to Redman and Wilkinson (2005), some of the terms managers use include: *building down, career alternative, enhancement program/career, re-appraisal, compressing, decruiting, de-hiring, dejobbing, de-layering, demassing, de-selection, disemploying, downscoping, downsizing, involuntary quit, lay-off, letting-go, non-retaining, outplacing, payroll adjustment, previously unrecognized recruitment errors, rationalizing, rebalancing, re-engineering, releasing, resizing, re-structuring, retrenchment, rightsizing, separation program, severance, slimming, streamlining, termination, volume-related production schedule, adjustment, wastage.* (2)

3.1 Business buzzwords: *rightsizing, downsizing, re-engineering, de-layering*

Rightsizing, downsizing, re-engineering or de-layering are “politically correct” terms relating to the planned reduction of programs or staff.

- My uncle was “dehired”.
- John Taylor was “involuntarily separated” from the company.
- Alec Smith was “downsized”.

- Jane Alexander was “de-recruited”.

Yet, regardless of the name, these words should be thought of as a change process, to be implemented with the same thoughtful, systems approach as any other major organizational development initiative. Authors like Collins (2000) noted the damage that these words had upon lives and communities, bringing into attention the comparison that Moore (1997) made between radical, organizational restructuring initiatives and terrorism (Collins 2000:312).

Whatever the label, the tendency of companies to reduce their staff in response to an economic disaster affects their employees at all levels. It has been seen that “from banking to home appliances, industries are shedding jobs and eliminating excess capacity. And even when companies bulk up to compete globally, they’re paring their work forces to hold down costs” (*Business Week* 1991: 88-89). *Business Week* (1992) also reported that “Since the mid-1980s, as corporations have responded to global competition and technological change by merging and consolidating, downsizing and de-layering, some 2 million middle management positions have been permanently eliminated” (*Business Week* 1992: 56-63).

“Downsizing,” “rightsizing,” or “re-engineering” represents the lean philosophy of American business today. An important indicator of the high degree of freedom characterising the lexis of economics is word compounding, or the process of forming new words from two or more independent words. The words analysed in this paper are formed by extensive compounding:

- a. adjective + *ing*-verb: *right-sizing*, *down-sizing*
- b. prefix + *ing*-verb: *de-layering*, *re-engineering*.

a. Rightsizing

The first popular buzzword was *rightsizing*. It refers to reducing the total size of the people employed by the company to cut down on costs. Implicitly, there is the assumption that the company being downsized is essentially over-staffed and that performance levels can be maintained or even improved by reducing the number of the employees. *Rightsizing* is often used as a euphemism for *downsizing*, or *de-layering*, with the suggestion that it is not as far-reaching. This term was coined because many companies discovered that the people given voluntary retirement were performing useful functions which cannot be handled effectively by the remaining staff. Theoretically speaking, the term *rightsizing* implied that companies should determine and maintain only right employment for its requirements and increase their efficiency and reputation. (3)

b. Downsizing

The practice of downsizing and the use of the term *downsize* emerged in response to the economic crisis of the early 1980’s. It marked an end to the social contract of long-term commitment between employers and workers and downsizing continues today, as showed by daily announcements of job reductions. Downsizing refers to the reduction of employment in an organization (McKinley, Zhao and Rust 2000:227-243). The label of “*downsizing*” played a role in the process in which the corporate players had to convince themselves and others that the practice was both effective and ethical. Using an implied metaphor helps both explain why the practice would work and reduce concerns about the moral questions. This buzzword is a “convenient, shorthand form of phrasing deployed to disguise the meaning and effects of recent organizational restructuring activities, which acts to distance management from responsibility for mass dismissal associated with organizational restructuring since the 1980s” (Collins 2000:282).

Downsizing is also commonly called *reorganizing*, *re-engineering*, *restructuring*, or *rightsizing*. Regardless of the label applied, however, downsizing essentially refers to layoffs that may or may not be accompanied by systematic restructuring programs, such as staff reductions, departmental consolidations, plant or office closings, or other forms of reducing payroll expenses. Matissa Hollister suggests three possible dimensions along which “downsizing” could differ from “lay off”. The first dimension is related to people arguing that layoffs are just one of several tools used in downsizing for job reductions may also be achieved voluntarily retirement. A second distinction between “downsizing” and “layoffs” refers to whether the job losses are temporary or permanent. Previously, layoffs used to refer to temporary dismissal from work because these were the most common types of job reductions. In what downsizing is concerned, when it was first introduced, the job losses were permanent. The third possible dimension is related to the fact that downsizing must involve specific intentions. (4)

Commonly, “downsizing” and “redundancy” are considered synonyms, linguistic alternatives conveying the same meaning. According to Collins (2000), this is not “quite accurate since where redundancy situations are associated with a decline in both employment and work, downsizing is associated with a reduction only in former” (Collins 2000:286). The same author argues that while the term “downsizing” is used to describe factors associated with the radical restructuring of the organization, the etymological origins of the term suggest a qualitatively different type of concern with “structures” and their “restructuring”: “The term downsizing has its origins in the US automobile industry – particularly in Detroit – where it was used to encapsulate the driver to reduce car size and engine capacity in response to the oil crisis and the growth of environmental concerns during the early 1970’s” (Collins 2000:286). In this view, the term “downsizing” might be considered as an effort, facilitated by euphemism, to accentuate key moments of downsizing, moments of planning, strategy and the inevitable business outcomes of competitive imperatives, while downplaying other negative moments, months of uncertainty, hardship and enforced mobility within a changing system of work (Apud Collins, 2000:288).

c. Re-engineering

Re-engineering is the process of removing levels in the hierarchy. The purpose is to give the organization a flatter structure and thus the decision-making process is pushed down to lower managerial levels. The assumption is that this will produce quicker decision-making by managers who are closer to their customers and more in touch with their competitive environment. The studies show that the re-engineering concept is built on a previous eclectic collection of terms relating to competitive advantage. The metonym of the 1990’s, “re-engineering” (Hammer and Champy 1993:32) or “strategic core re-organization” (Fairbrother 1991:69) has become executive rhetoric in both private and public organizations. At the end of the 20th century, the term *re-engineering* lost its appeal and the new terminology of *global sourcing* emerged (Kakabadse and Kakabadse 2000).

d. De-layering

The reasoning behind *de-layering* lies in the belief that as organizations grow, they become unmanageable, bureaucratic, and inflexible. More than that, they can be suffocated by rules and procedures, slow decision-making processes, and a lack of creativity. The solution is to

flatten the structure (*de-layer*) to streamline the operations and increase flexibility and responsiveness to customers and competitors. *De-layering* is normally associated with other management initiatives, such as *Total Quality Management*, *business process re-engineering*, or *continuous improvement*. (5) De-layering has important consequences for managers because it invariably leads to job losses and, also, increases the number of tasks at work and responsibilities of lower-level managers. Even if it is accepted that some of the activities of middle management add little or no value and can be eliminated or contracted out, there are inevitably many aspects that will be passed down the hierarchy, which leads some commentators to suggest that many contemporary managers are now seriously overworked, although they may also be better paid.

4. Conclusions

Words are the primary means by which people communicate. Broadly conceived, political correctness includes a number of initiatives such as: altering vocabularies in order not to offend particular groups, affirmative action in admissions and hiring, and broadening the aim of classical texts to include those written by minority authors and women, not because of the quality of these texts but because they reflect minority realities. When words are eliminated from use due to political incorrectness, the options for conveying messages in the clearest and most accurate form are reduced. For the most part, the larger the vocabulary used by a sender and a receiver, the greater the opportunity to accurately transmit messages. Also, when certain terms are replaced with new words whose meanings are less well understood, the probability that the messages will be received as intended is reduced. Business relations in the new economy are completely different, therefore, the new rhetoric of organizations has included *flexibility*, *responsiveness*, *privatization*, *de-regulation*, *re-engineering*, *restructuring*, *de-layering*, *agility*, *quality service* and *global sourcing*, a rhetoric which reflects the rise of the network society, multi-layered governance and the new production of knowledge.

For a native speaker of Romanian who has acquired a partial command of English it might sometimes be difficult to judge whether a given politically correct expression is appropriate or not, or whether a given expression is funny or not. From a linguistic point of view political correctness seems to have no future either in English or in any other language because in spite of its highly inflective character in the past, in the last century English has shown a remarkable tendency towards economy.

VOICE PROBLEMS IN TRANSLATIONS OF ROMANIAN AND ENGLISH ECONOMIC TEXTS

Sim Monica Ariana

University of Oradea, Faculty of Economics

The difficulties brought about by the passive constructions have been an issue to debate for many linguists and scientist. Translations become ever more important in an increasingly global marketplace, and they are sometimes taken too lightly, when in fact it is a serious business that should be approached sensibly in order to avoid poor results.

Business translation is a specialised branch of translation, which requires specific skills and also methodology, theme as well as terminology competences.

Without being exhaustive the aim of our paper is to focus on the types of the passive constructions specific to the scientific discourse, the economic one, in particular. It also tackles the translation difficulties that may come along when dealing with scientific papers and rendering texts from Romanian into English. Passive constructions are frequently used both in English and Romanian. However, active forms are more common in literary writing or where the focus is on the people who make things happen. In contrast, passives are mainly specific to texts where the focus is on events and processes, in things that happen.

The most common problem in writing economic texts is overusing the passive voice. Specialists recommend or even require the passive voice in scientific, technical writing; motivating that by using the passive voice in scientific writing it achieves an objective tone whereas, sometimes it only obscure the text.

The scientific discourse and the economic one in particular, basically mean presenting ideas, descriptions, definitions, classifications, instructions, etc. The speech is brief, the technical person, and the scientist managing to say things which in ordinary language would require a vast amount of talk. Therefore, speakers or writers use the passive constructions in the scientific discourse for the following reasons: a) when there is no use of identifying the agent of the action, being unimportant or obvious from the context; b) to avoid repetition of the subject; c) to put emphasis on the action or the process; d) to convey objectivity; e) to avoid a long active subject.

Keywords: translation, passive voice, Romanian language, English language, difficulties

Cod Jel: Y90

1. Introduction

The general tendency is to consider translation as something that anybody can do with the help of an adequate dictionary. In fact, producing a written text using another text as a basis is a much more complex phenomenon than what is commonly believed. This difficulty becomes even more evident when the text in question deals with specialized, technical subjects such as finance, banking, or the like. Specialists have argued that the main difficulty of scientific English in general, business or economic English in particular, lies more with the grammar than with the vocabulary. In this particular case, when words belonging to the so-called General English appear next to specific terms and within a specific context, they contain nuances that must be accounted for in the final translation.

It is common sense that translators are responsible for and faithful to source texts. Professional translators should be expert linguists who know quite well the correct grammar of both the source language and the target language.

2. Definitions

The scientific rigor of this paper cannot be without previously dealing with the fundamental concepts of passive voice on one hand, and the scientific or specialized text on the other hand. First, let us review what passive voice is.

2.1. The passive voice is a grammatical construction in which the subject of a sentence or clause denotes the recipient of the action rather than the performer, that is, a category of verbs that is related to what thing or person is acting and what thing or person is being acted upon (Crystal 1997). It should be noted here that both active and passive constructions exist in English as well as in Romanian. In the English language, the English passive voice is formed with an auxiliary verb (usually be or get) plus a participle (usually the past participle) of a transitive verb. In Romanian the passive voice is formed with the auxiliary a fi and the past participle of the verb to be conjugated, the participle behaving like adjectives, and thus agreeing in number and gender with the subject.

e.g. The contract was signed by all the members of the Board.

Contractul a fost semnat de către toți membrii Consiliului.

Not all verbs can be expressed in the passive voice either in English or in Romanian for example *die*, *arrive* and *have* are all inherently active. According to Greenbaum and Quirk, the distinction between active and passive applies only to sentences where the verb is transitive (Greenbaum and Quirk 1990:44; Popescu 2001:107).

2.2. Specialised language. The concept of technical or specialized language bears several features, among them, according to (Bakr-Serex 1997: 54):

- a) logical order of statements with clear indication of their interrelations and interdependence;
- b) the use of specific terms to each given branch of science;
- c) the frequent use of specific pattern-sentence, the impersonality of this type of writing being mostly revealed in the use of *passive voice constructions* with which scientific experiments are generally described;
- d) the use of its own terminology, besides the specific syntax.

Specialists recommend or even require the passive voice in scientific, technical writing; motivating that by using the passive voice in scientific writing it achieves an objective tone. The scientist's use of language is "specialized" and "peculiar", the speech brief and the language effective and powerful. (Bloomfield 1933:74).

Scientific discourse basically implies written scientific English. It mainly concentrates on presenting ideas, descriptions, definitions, classifications, instructions, etc. The fundamental characteristic of the scientific discourse is conciseness. As J. Swales discusses, the passive is generally used "to give the information in the best possible way: impersonally, concisely, objectively and giving importance to the most important facts" (apud Croitoru 1996:138).

In the scientific texts, the passive is mainly used for rhetorical purposes. The most common uses of the passives is when the action is more important than the agent, as in formal notices, instructions, processes, etc, which are specific to the scientific discourse.

e.g. *The employee **has been given** instructions to review the balance sheet. (by the employer).*

This passive sentence is about the employee.

In an active sentence, the agent, the doer of the action usually comes first:

e.g. *The employer **has given** the employee instructions to review the balance-sheet.*

Thus, the sentence in active voice is about the employer, not the employee.

3. The Use of the Passive Voice: when, why, how.

The scientific discourse abounds in passive construction; the emphasis is usually put on the action itself, on the person or thing that “suffers” from the action or on the results of the action. There are some cases when the agent is not even mentioned the so-called agentless sentences such as:

- the agent is not important, the emphasis being on the object
e.g. *The solution **has been discussed** for more than two hours.*
*25 votes **are required** to pass the bill.*
*The delivery notes **are being written** (by Mr. Smith).*
*The goods **will be delivered** immediately.*
- the agent is unknown
e.g. *The credit card **has been stolen**.*
*Our letter **hasn't been answered** yet.*
*Over 120 different contaminates **have been dumped** into the river.*
- The speaker or writer intends to make a statement impersonal:
e.g. *The invoice **should have been** thoroughly **checked** 20 minutes ago!*
*Appointments **are required** in such cases.*
- the agent is obvious:
e.g. *Many cases of fraud **have been solved** nowadays.*
- the agent is a long phrase:

e.g. active: *The union leaders as well as the management **concluded** the agreement.*

passive: *The agreement **was concluded**. (both by the union leaders and the management).*

- in the scientific genre that traditionally relies on passive voice when the focus is usually on events or achievements, rather than on agents:

e.g. *This cost-effective method **has been applied** in many computer companies.*

*Contracts **can be cancelled** within five business days.*

- When deliberately you do not wish to name the agent, i.e. you want to be vague about who is responsible. According to Emery (2005), “the passive voice is often used as a strategy that allows language users to avoid mentioning the agent”, and in majority of cases, the subject of the active verb – the agent - is not expressed in the passive.

e.g. *One thousand dollars **has been contributed**.*

*The net benefits of subsidiary divestiture **were** grossly **overestimated***

However, the passive voice is especially used when there is a need to *be diplomatic* or want to avoid personal pronouns to create an *objective* tone.

e.g. *I **recruited** seven programmers last month.*

*Seven programmers **were recruited**.*

*You lost the shipment.
The shipment was lost.*

Here we actually have to do with one of the most famous political uses of the passive: to hide blame or obscure responsibility. *You* wouldn't do this, but you can learn how to become a critic of those who exhibit what George Orwell included among the "swindles and perversions" of writing (apud <http://www.unc.edu/depts/wcweb/handouts/passivevoice.html>).

e.g. *Mistakes were made.*

The Exxon Company accepts that a few gallons might have been spilled.

It costs so much money to pay for these campaigns that mistakes were made here by people who either did it deliberately or inadvertently. Now, others—it's up to others to decide whether those mistakes were made deliberately or inadvertently. (Bill Clinton, January 28, 1997)

4. Passive versus Active Voice.

There is always a strive to achieve a style that is so clear that their messages cannot be misunderstood. One way to render a clear style is to minimize the use of the [passive voice](#). Although the passive voice is sometimes necessary, often it not only makes the writing dull but also can be ambiguous or overly impersonal. Here's an example of the same idea expressed both passive and active voice:

e.g. *The net benefits of the subsidiary divestiture were grossly overestimated.*

(passive: Who did the overestimating?);

The Global Finance Team grossly overestimated the benefits. (The second version is clearer and thus preferable).

Another reason for this shift in our psychological thinking about science: nowadays there is a growing demand for greater transparency in science by requiring that published scientific and specialised papers in general, and economics texts in particular. Active voice proves a better choice when emphasizing the agent of the action. The other good reason behind this growing preference for active voice is stylistic: often passive voice is simply more awkward, less direct, and less clear and this will be later tackled in the paper.

But historically the sciences have encouraged the use of passive voice. And the reason for this tradition was that passive voice helped emphasize the objectivity of the sciences better:

e.g. *Microsoft was founded in 1975.*

The employee was last seen entering the warehouse two hours ago.

The passive voice can also prove useful if you want to put the doer of the action at the end of the sentence in order to create a bridge to the next sentence:

e.g. *Saturn was created in 1985 by General Motors. GM, the world's largest auto maker, was trying to learn a new way to build and market cars.*

5. Difficulties in Translating Passive Constructions

Technical translation has been considered as part of specialized translation; consequently being non-cultural, it is universal, as the benefits of technology are not limited to one speech community. (Ionescu 2000:217). The most common problem in writing and then translating economic texts is overusing the passive voice but it is seldom easy to cut down on the *passive* just to avoid any misunderstanding or ambiguity. All that is required in fact is the accuracy and clarity of expression achieved also by verbal expressions. Scientific

translations differ from ordinary and literary ones as they do not accumulate emotional associations and implications.

Specialists advise the use of active voice in such texts, as much as possible as it is agreed that active voice adds value to the force and strengths of the texts.

There are situations when the use of voices does not coincide in Romanian and English. Some technical novice translators display a tendency to translate English passive sentences literally into Romanian and vice versa:

a. A common mistake in translating a passive construction is due to English **wording** which differs from the Romanian one: in a passive sentence the subject takes front position as compared to the Romanian one beginning with the predicate:

*e.g. The Memorandum of Association is normally **signed** by at least two subscribers.*

*Contractul de asociere **se semnează** în mod normal de cel puțin doi dintre asociați.*

*A company is **formed** by the issue of a certificate of registration by the Registrar.*

*Pentru **a înființa** o firmă se depune certificatul de înregistrare la Registrul Comerțului.*

*The Certificate of Incorporation **will be issued** in a few days.*

***Se va emite** certificatul de înmatriculare în câteva zile. (Pop and Sim, 2005: 20-23).*

b. The so-called **report verbs** (verbs that report people's opinion) like: *request, believe, think, claim, mention*, etc., are commonly used with impersonal passive constructions like infinitive followed by verbs of saying or thinking. The passive construction is employed to avoid a weak subject or to give an opinion that is shared by a large number of people. It is another difficult construction pattern to be rendered from Romanian into English or vice versa: Examples in case are the following:

*e.g. These accountants **are known** to be very thorough.*

***Se știe / se cunoaște** faptul că și contabilii sunt foarte minuțioși.*

***It is believed by the company staff that** the current chief accountant will be appointed manager.*

*Personalul firmei **crede** că actualul contabil șef va fi numit director.*

***It is believed that** the stocks will go up within the next five days.*

***Se crede** că acțiunile vor crește în următoarele cinci zile.*

c. Causative **get** and **have structures**, which can be used in both active and passive patterns may create difficulties of translation. Mention must be made that *get* passives only occur in dynamic events, *be* passives are not sensitive to dynamicity, and therefore can be used in both dynamic and static events, which explains why *be* passives are more common. These structures are more commonly used in spoken English rather than in written English. Thus, the active patterns **get + person +to-infinitive**, or **have + person + bare-infinitive**, have the meaning "cause or order somebody to do something". (Maftei and Dobrota, 2009: 318)

*e.g. The President will **get** the trustees **to sign** the agreement.*

*The President will **have** the trustees **sign** the agreement.*

*The boss will **have/get** the computer **fixed** in half an hour.*

d. Phrasal verbs are commonly used in the passive. The main difficulty caused by phrasal verbs, either in active or in passive is that they have different meanings and when used in the passive its meaning may be even more problematic.

e.g. *The meeting was **called off** by the Chairman. Întâlnirea a fost anulată de Președinte.*

*The red invoice **will be handed in** three days. Factura în roșu va fi predată în trei zile.*

*The agenda for the next meeting **is being whipped up**. Se discută ordinea de zi pentru ședința următoare.*

There are instances when it is possible to end a sentence with the preposition of the phrasal verb that was made passive:

*Active: A high price **might weigh** our product marketing **down**.*

*Passive: Our product **might be weighed down** (by a high price.)*

Active: Un preț prea mare ar putea împiedica vânzarea rapidă a produsului nostru.

Passive: Vânzarea produsului nostru ar putea fi încetinită de un preț prea ridicat.

e. Collocations are two or more words that often go together just because they sound "right" to native English speakers, who use them all the time such as: *deal with, head for, insist on, prevent from, rely on, save from, reply to, to run out of, start up* etc. Sometimes grasping the exact meaning of a collocation and rendering it into the target language may be a real challenge.

e.g. *He **must be prevented from** leaving the company. (Pop and Sim, 2005:12)*

Trebuie să fie împiedicat să părăsească firma.

*The company **has been saved from** bankruptcy.*

Compania a fost salvată de la faliment.

*The goods **have been paid for** by cash and not by Bills of Exchange.*

Plata pentru bunuri s-a făcut în numerar și nu prin cambii.

5. Conclusions

As it has been demonstrated, passive constructions are frequently used both in English and Romanian. However, active voice is mainly employed in literary, creative text whereas passives are very common with exact, scientific, specialised pieces of writing.

To conclude, passive constructions in the scientific discourse are used for the following reasons: 1. when there is no use of identifying the agent of the action, being unimportant or obvious from the context; 2. to avoid repetition of the subject; 3. to put emphasis on the action or the process; 4. to convey objectivity; 5. to avoid a long active subject.

This work is based on the analysis of the public and private support to education and human capital development in two specific national contexts: the U.S. and Italy. Recent researches have firmly demonstrated the value of higher levels of education for socio-economic development, poverty reduction, higher incomes, employment and eliminating child labour, gender equality. The increased competition and globalization of economic activity, acceleration in technological and scientific knowledge, information revolution and more recently the worldwide economic recession continue to raise the value of education and training in preparing individuals for future employment, upgrading skills for greater workplace mobility, and underpinning wealth creation and economic development through human capital formation. The International Labour Organization (2010) has pointed out the key role played by higher levels of education and skills training in employment and social protection policies. In the Western world, the education industry is complex and diverse. It combines a dominant public sector of schools and universities and community colleges which educate the majority of students; a varied private sector mainly consists of nonprofit organizations that encompass some of the world's most elite education and scientific institutes. The importance of education for economic growth and development is well documented from a historical and economic standpoints. In this research we examine some evolving relationships between the marketplace, the state, and education institutions, knowing that the context of these relations has evolved strikingly in recent years, which have seen three major developments: a growing system differentiation, changing governance patterns, and a diminished direct involvement of governments in the funding and provision of education. Therefore, we are interested in understanding on one hand the possible evolution of the studied phenomenon, and on the other if the experience of a leading country as the U.S. may represent a useful starting point of imitation. So that, our analysis is focused on the investigation, through a period of ten years, of students enrollment according to the willingness to invest in education, independently of the resources needed. In particular, we use the Box-Jenkins methodology to fit data by using an ARIMA model and in order to achieve more information about the phenomenon. Our findings show a similar trend over time both for public and private enrollments although backgrounds and rules are very different in the two nations considered.

Keywords: human capital, public and private education, time series analysis.
JEL code: C23, E24, I25.

1. Introduction

Although not a pure public good, public provision of education is widely viewed as a primary function of government and it satisfies a natural commitment to the welfare of people. In many of developed countries public spending on education accounts for as much as 10% of government expenditures and as much as 5% of GNP. At the same time, the private sector of education has been growing in importance over the past decades, and public education has been commonly supplemented by private education, since there are few technical barriers to its private provision (Stiglitz 1974). The processes of education and training, by supporting the formation of human capital, acquire a meaningful relevance especially in the more advanced socio-economic contexts, such as those belong to EU or OECD. In our analysis we consider two advanced countries, the U.S. and Italy, which were both in the former G8 group. The aim is to recognize a similar path in choosing to invest in public or private education, mainly the higher one. We focus on college or university registration, trying to find a trend by which this economic point could be explained. The differences in scholastic achievement of public and private schools have been the topic of a large number of studies in the educational sciences, economics and sociology, mostly in the U.S. but also to some extent in Europe. Within this literature, a significant distinction emerges inside the private sector, namely between publicly financed and private independent schools (Godwin and Kemerer 2002).

2. Related literature and other resources

As a few other Western countries, the U.S. have a system of education and training which enables not only widespread knowledge and lifelong learning, but also the possibility to establish very advanced educational paths. This purpose is shared by central institutions and by peripheral ones, with obvious differences which can arise in a country with a typical federal character. This so highly competitive socio-economic context leads the national system to seek and use especially that part of the workforce with high efficiency. On the other side, Italy has the same American public purpose, but differently its centralized institutional structure denotes that the selection of goals only depends by central government, without any peripheral institution directly involved in development of human capital. So that it is necessary to examine the possible motives for households or individuals to choose a type of public or private education. Certainly, this choice covers issues related to the quality of educational institutions, which reflects better preparation for students, who gain more experience and skills in specific perspectives. These differences in educational systems should be stronger in countries where wider space is left to private, and the State chooses not to provide significant resources to public education. In a complex economic system such as that of the U.S. there are additional conditions in order to choose, and the study of choices is a separate field of scientific inquiry (*e.g.* Murnane *et al.* 1985, on the quality of schools in the U.S. and the differences for various ethnic groups). Focusing on the private school, Cheslock's work (2005) examines the share of transfers which constitute the total number of students in public and private schools, noting that the percentage for the latter is lower if compared to the other. This would not occur for less attractive institutions, but only for the most selective, and consequently the role of transfers become critical in the

U.S. higher education system. From such studies it is clear that both types of education require additional features, such as the selection, fees, and financial resources. This can also lead to transfers between different private institutions, more or less “selective”. However, over time there has been a quantitative advantage in terms of transfers to the public part, certainly influenced by the fact that there are more opportunities to enroll. There are also differences in autonomy, and consequences of selection decisions to human resources and programs, which of course has always been higher in the U.S., compared to the European experience. Before examining the influence of education on the future well-being of individuals, it is necessary to consider how, today, we can estimate a different level of quality for the various training courses. Certainly there is no a single method, and we can mention some of those who are close to our case studies. For the U.S. case, Cherchye *et al.* (2010) uses a nonparametric approach for the evaluation of public and private education. In fact, even in contexts where private education is widespread, public funds should still be used in an effective and useful way through education programs. Another approach is instead to test the results on the next level of education (see for example Horowitz and Spector 2005). In this work the authors in comparing students who attended public, private and religious schools, notice that they seem to get the best performance once in college. However, if it is possible to demonstrate the superiority of one of the possible better education, it should have general benefits, and therefore should be supported with public funds. In terms of benefits, there are also studies dedicated to estimating the contribution of public and private investment in education on economic growth. These include, for example, de la Croix and Doepke (2004), who estimate a greater contribution to the economic growth of private education when it is present in a low level of inequality in human capital, taking into account levels of fertility and the trade-off between quantity and cost of education of children. Finally, Arclean and Schiopu (2010) study the interaction between public and private spending in a two-stage education framework (K-12 and tertiary education) and their effects on economic growth. Obviously, economic theory highlights positively the contribution of specific investments, both public and private, when they support an increase in the average human capital. In this sense, in a balanced socio-economic system the public spending should encourage private investments, also understood as the costs of households for their children. For this reason, in a highly competitive and multifaceted system, as in a Western country, it is necessary to create a harmonious and mutual support among the various education levels, integrating where appropriate public and private institutions. This may happen for example when only a certain type of private institutions, having more autonomy, can create specific courses of study, identified as useful to the global national context.

3. Analysis and findings

Starting from U.S. Census Bureau and OECD databases concerning education, we find a ten years data, 1998-2008, related to registration in higher schools, divided into public and private institutions. According a time-series analysis, this could allow us to describe the behavior of institutions and people on choosing their type of investment in schooling. Preliminary, we consider a simple axiom, which we could summary as following: people in a moment of their life decide to spend money to assure themselves to pursue their educational path; this amount of money is given and the same is for the private and public

profiles, and people do not have benefits to acquire more education than the minimum required to enter in the workforce. At least, the only people problem is in which institution they want to learn. According to this statement, we follow the evolution of data, and at the end we try to predict them, according to the Box-Jenkins approach and applying an ARIMA model to find the best fits of a time-series to past values, and to make forecasts and verifying, where possible, if forecasts are closer to data. The method applied consists in an iterative three-stage modeling methodology:

- *model identification and model selection* making sure that the variables are stationary using plots of the autocorrelation and partial autocorrelation functions of the time-series to decide which, if any, autoregressive or moving average component should be used in the model;
- *parameter estimation* using computation algorithms to arrive at coefficients which best fit the selected ARIMA model, and we use the most common method of maximum likelihood estimation;
- *model checking* by testing whether the estimated model conforms to the specifications of a stationary univariate process, verifying that the residuals are independent of each other.

Moreover, in our analysis we consider four time-series with the same temporal scheduling and annually frequencies started in 1998 and ended in 2008, covering a period of ten years. In a first moment we can see, because the fact that economically the two countries are very similar, that the curve hits the value and it seems to have the same shape and underlying trend for the public institutions (see Fig. no. 1)

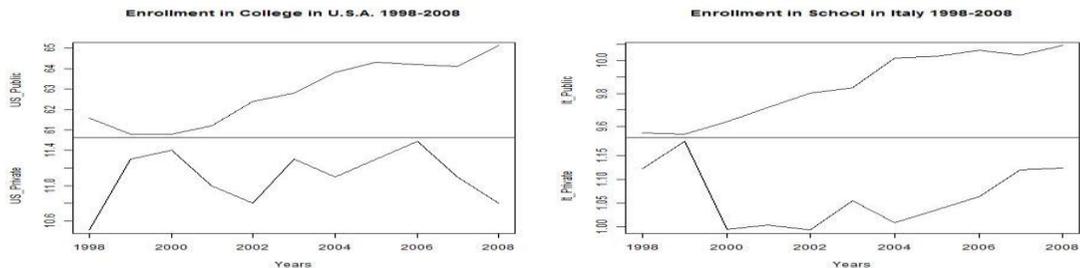

Figure no 1 - Enrollments (made by the authors)

Hence, we determine if the time-series is stationary and if there is any significant seasonality that needs to be modeled. As our time-series have annually frequency we are not able to have a significant seasonality to break up, so we can focus on stationarity which could be assessed from the sequence of plots above (see Fig. no. 1). We can also detect it from the autocorrelation plot, specifically, in our case, stationarity is indicated by an autocorrelation plot with a quick decay, as shown in the following figure. Indeed, for public institutions, both in the U.S. and Italy, the autocorrelation function decays after lag 3, while for private institution it takes place immediately after lag 2 (see Fig. no. 2).

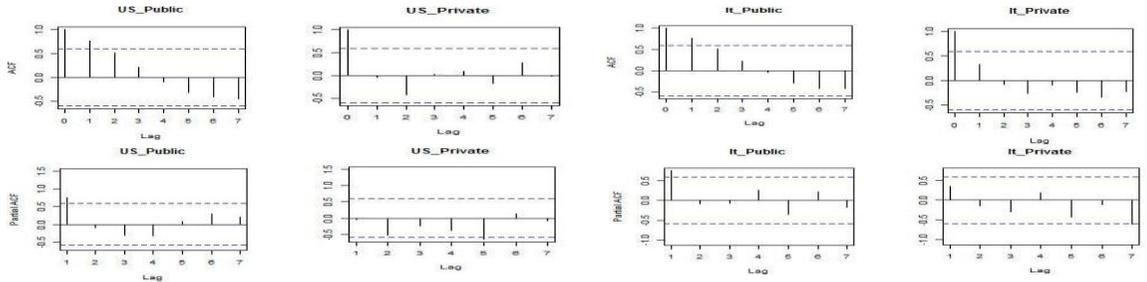

Figure no 2 - ACFs and PACFs (time series) made by the authors

The next step is to identify the order (p, d, q) of the autoregressive and moving average function and the order of the differences at which lag it will be computed. In practice, the autocorrelation and partial autocorrelation functions are random variables and sometimes will not give the same results as the theoretical functions. This could make the model identification more intricate, in particular, if we will find out a mixed models particularly difficult to identify. Thus, we already establish that our time-series are stationary, although the index of the partial autocorrelation function could suggest a cyclical period. We use statistical software R to determine that our time-series regarding the U.S. could be modeled by ARIMA process $(2,0,0)$ with non zero mean, while the others two regarding Italy could be modeled by ARIMA $(1,0,0)$ with non zero mean, supported in our choice by information-based criteria Akaike Information Criterion (AIC), technique that could help in the process of identification of the model. This model could be summarized by the following table (Table no 1):

Table no 1 - ARIMA coefficients

	AR(1)	AR(2)	Intercept	Est. σ^2	Log-ML	AIC
U.S. Public	1.4499	-0.6016	63.4474	0.3165	-10.59	29.17
U.S. Private	-0.0789	-0.6865	11.1334	0.05091	0.13	7.74
IT Public	0.9485		9.8296	0.005956	11.42	-16.84
IT Private	0.3655		1.0695	0.003185	15.94	-25.88

made by the authors

The model diagnostic is similar to the validation for non-linear least squares fitting, where the error terms are assumed to follow the assumptions for a stationary univariate process. The residuals should be white noise drawings from a fixed distribution with a constant mean and variance. If the Box–Jenkins model is a good model for the data, the residuals should satisfy these assumptions. The plot of the mean and variance of residuals analyzed over time and that of autocorrelation of residuals help us to identify to select the model. As in the plot (see Fig. no. 3), our data assure the respect of those assumptions so the model is checked and validated.

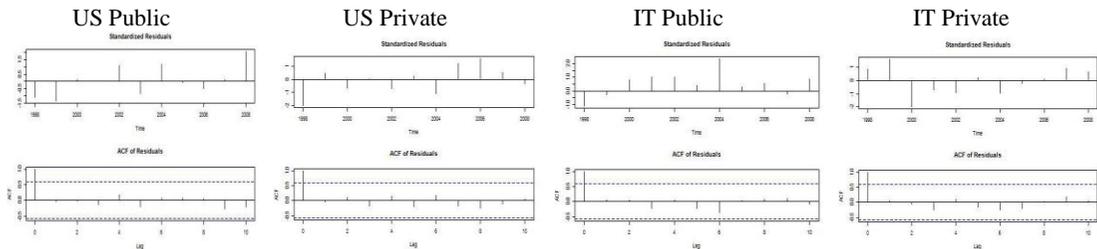

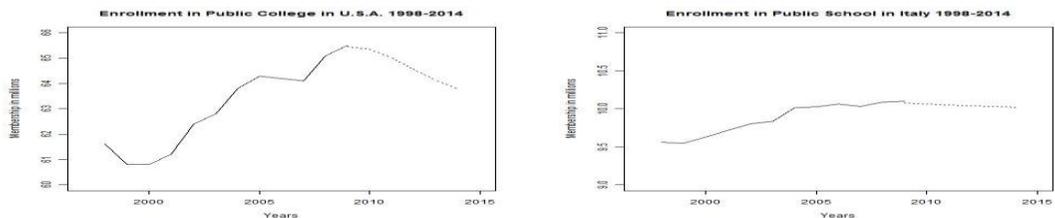

Figure no 3 - Residuals of the model (made by the authors)

After those steps, our model is checked, and it fits well the data since well itemized, so that we can use it to forecast the global behavior of enrollments. In the graphics below (see Fig. no. 4), we can observe that the forecast about American enrollments in public college decays slowly describing an exponential decreasing curve, while the forecast for private college is more erratic and not easily to interpreter. This lack of a continuous and increasing curve may be attributed to a casual elements, different from statistical errors, which affect the total amount independently from the householders’ decision. Forecasts for Italy show a quite stationary values, indicating that decisions to enroll at schools do not suffer unintended effects due to critical situation and the level of enrolments, therefore, are stable over time with unimportant, compared to past, fluctuations in the levels.

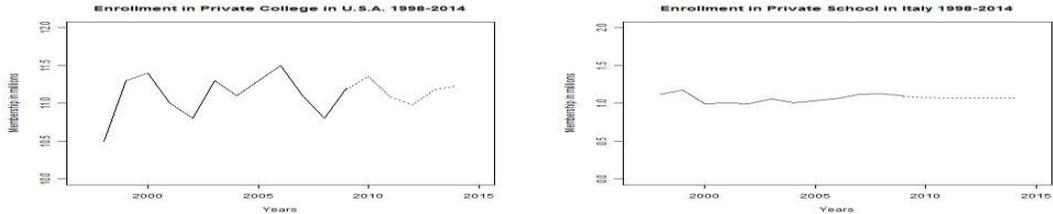

Figure no 4 - Forecasts (made by the authors)

4. Conclusive remarks

This paper show empirically the increasing importance that public and private education assume in two socio-economic systems. In particular, our research is focused in comparison with two countries, the U.S. and Italy, which differ for many things such as the choices of public and private investments, the population, the national financial debt and government expenditures. The preliminary analysis of the curve of enrolments at public school shows a similarity between the U.S. and Italy in their shapes, but not in the values of the curves, while we cannot reflect the same for private schools. This could be interpreted as a proportional ratio in government expenditure in education or, as we believe, in the preference of public education system *coeteris paribus*. Nevertheless, the proportionality of the expenditure is only a quantitative representation. Actually, the reasons for the apparent contradictions should be required in the existence of at least two different views, in many ways divergent, about the ideological role of the university, and more generally education, in those countries. In the U.S., education organization is considered a private investment than an individual or his family voluntarily support, if can afford it, to be capitalize as a result by means of the major income received. In this country, a request for a private education responds also a private offer, where even the public schools and universities operate, with the private ones, in a market logic. Hence, this logic leads to a sort of competition between institutions to be seen as the most suitable not for the quality of education provided but only for the value which people received by attending one noticeable college rather than an unknown one. This kind of competition is carried on only by institutions which have the opportunity, or in most cases the resources, to attract famous professors, researchers or benefactors. Otherwise, in Italy, education is still ensured by national Constitution and it is seen as a right by citizens, often with a financial aid provided by government. This gives rise to a misunderstanding about higher education institutions, so that people do not perceive the need for attending a private schools instead of public one. In conclusion, while data shows a closer paragon between the U.S. and Italy, the realistic representation is far from it. Indeed, the U.S. education becomes a real commodity and it is forced to follow market rules, whereas in Italy it is still a right and our goal is reached and it could be summarized as follow: people choose always the quality, *coeteris paribus*.

The concept of development is not only referred to the level or to the growth rate of GDP of a country, but it concerns different aspects of individual life. Development leads to a changing of values, behaviours and attitudes of people interested in it and in the well-being of the whole society.

Since the second part of the last century, more and more economists always assert that human capital is a fundamental asset to promote economic growth and development. Health and education are the two principal ingredients of human capital. There is a strong positive bidirectional relationship between education and health; in fact, it is statistically supported that the two variables move together, so healthy people are more likely to achieve an higher level of education rather than sick people and, vice-versa, more educated people are more likely to enjoy good health status. This generates a virtuous cycle that can lead to greater development. Indeed, health increases people's capabilities allowing achievement in their well-beings, since healthy people can work longer and with higher productivity than poor health people. For this reason individuals' income rises allowing them major choices in terms of consumption, savings and investments. Considering the economic benefits that start from health and education, not only at microeconomic level but also for a country, it is important to pay attention to the role of this two variables in the economic development process. There are several channels through which health and education can be associated with better enhancement in economic results. They can be find in the labour market and in the participation in the labour market; worker productivity; human capital investments; saving capacity; availability of save to invest in physical and intellectual capital; fertility choices and structure of population.

The present paper analyzes the two-way linkage between education and health and their relationship with economic development identifying the conditions of some Eastern European countries. The methodology through which the results are obtained is the multidimensional scaling method which allows to define relations between countries in terms of proximity/distance with respect to the considered indicators, providing a spatial representation of them.

Keywords: human capital, education, health, economic development, multidimensional scaling.

1. Introduction

Increasing attention is been paid by researchers to the discussion on what are the principal determinants of economic growth but first of all on what are the most important drivers to achieve a growing level of development.

There are two different approaches to development. On one hand there is the income-centered approach that asserts that investments in human capital, including health and education, have to be promoted if the rate of return of the investment exceeds the capital cost. On the other hand there is the capabilities approach (Sen: 1999) that argues that the enhancements of people's ability to read and write, or to be well-nourished and healthy, have to be encouraged even if the conventionally measured economic return to investment in literacy, or improved food intake and health care, is zero (Anand and Ravallion: 1993). This second approach is supported by the greater part of the literature on economic development that claims that investments in human capital are the main instrument to promote it. This evidence is concentrates on the role of health and education, and especially on the strong two-way link that occurs between this two determinants of human capital and why it is so important for development.

The major objective of this work is to examine the existence of relations among indicators of economic development, education and health in some Eastern European countries, with the aim of producing a clustering of them in terms of proximity/distance with respect to the examined indicators. The paper starts with a brief overview of the relevant literature on the topic of human capital and economic development (see par. 2). In the second section, it is provided a data analysis using a Multidimensional Scaling methodology, in order to identify groups of countries that show similar characteristics in relation to the chosen indicators (see par. 3). At the end, some brief concluding remarks, that summarize the results achieved by the analysis, are given (see par. 4).

2. Literature overview

The interest of economists towards non-economic dimensions of economic growth (such as education and health) becomes strong since the Sixties of the last century, when some researchers have noticed, contrary to what they believed, that economic growth was not only dependent on economic and quantitative factors, but it was also due to more complex and intangible factors, the first of which is human capital. As a form of human capital, health is increasingly considered as the driver of economic growth, of development and poverty reduction. Health is defined more generally as the income that can be received if you have the ability to employ your time at work rather than in care in case of illness. Grossman (1972) claims that health is viewed not only as a consumer good but also as an investment good and for this reason an investment in human capital and an output of household production processes. In fact, Grossman, who provided the first formal contribution to the objective study of the determinants of individual health status, argues that it is possible to observe a positive relationship between education and health; in particular, he supports the explanation of the link between education and health which claims that education has a

positive impact on the likelihood of enjoying a good health because it increases the production of health technology, altering both productive efficiency and allocative efficiency. In addition, more educated people are more awareness in terms of adopting prudent use of medical care, healthy responsible behaviours and conscience in the choice of work. In the same way, people that enjoy good health conditions are more interested to invest in education because they have greater cognitive capabilities that allow them to achieve good results. Furthermore, they have more time to spend in study rather than in care in case of illness. So, more educated people have great probability to have a good health status and to be more productive contributing to economic development of one nation.

The importance of education and health for the economic growth and development is due to the returns from investments in the two variables. These are two forms of human capital, the improvement of which should enhance worker's productivity. Several studies show that better health, special early in life, is associated with higher educational attainment. Conti et al. (2010) argue that more educated individuals, in turn, have better health later in life and better market prospects. According to the authors, education has an important causal effect in explaining differences in many adult outcomes and health behaviours (Conti, Heckman and Urzua: 2010).

An improvement of living conditions of an individual, and therefore an increase in the level of health, has effects both at a microeconomic level, thereby improving his welfare and that of the communities in which he lives, and also at a macroeconomic level, allowing a further development of a country. The micro-level evidences are those that support the contribution of health on economic outcomes, like as wages and earnings, amount of hours worked, labour force participation and so on, analyzing for example the link between nutrition and productivity. Fogel (1997), in his analysis on distribution of the height and weight and on food supply and calorie intake across the population in Great Britain and France, estimates that improvements in health and nutrition contribute to about one-third of income growth in Great Britain between 1790 and 1980. The macro evidences concern the effect of population health on economic growth. However, the effects are different and they depend on the initial level of income. For example, Bhargava et al. (2001) believe that a better health is more important for wages, economic indicator of workers' productivity, in low-income countries than in high income ones. Indeed, in low and middle income countries a 1% increase in survival rate in adulthood is positively associated with the increase of 0.05% in the rate of economic growth, while above a certain income the adult survival rate has a negligible effect and in some cases a negative growth rate. Also Weil (2007) suggests that the positive effect of health on GDP is stronger among poor countries.

3. Data, methodology and results

To reach our purpose, which consists in identifying conditions of some Eastern European countries with respect to economic development, health and education, in testing the existence of correlations between the different aspects and in providing a classification of countries, we use the multidimensional scaling method.

Multidimensional scaling is a useful tool through which it is possible to produce a graphical representation of a pattern of objects, in this case the twelve Eastern European countries, based on the degree of similarity/dissimilarity between them.

The goal is to provide a representative map that best approximates the distances observed between countries, concerning economic development, health and education.

This statistical method attempts to build a configuration of the various entities, merged in a small number of dimensions. This is done by defining relations between countries in terms of proximity/distance with respect to the considered indicators. The resulting positioning map has the property to partition the countries into homogeneous groups, so as that the degree of association between two countries is maximal if they belong to the same group and minimal otherwise.

We considered a matrix of twelve Eastern European countries and nine indicators, representing three sets of variables: economic development, education and health. In particular, we have selected three indicators for each topic (Table no 1).

Data refer to the most recent period of five years for which we can find available data; specifically, the considered period usually runs from 2005 to 2009. In the analysis, we use the average value of each indicator over the considered period for each country (Table no 1).

Table 1. Data set

	GDP per capita (current US\$) (a)	Exports of goods and services (% of GDP) (a)	Unemployment (% of total labor force) (a)	Public spending on education (% of government expenditure) (b)	Pupil-teacher ratio, primary (c)	School enrollment, tertiary (% gross) (c)	Health expenditure (% of GDP) (a)	Life expectancy at birth (years) (a)	Mortality rate, infant (per 1000 live births) (a)
Bulgaria	5353,2	53,5	7,7	9,3	16,1	46,2	7,0	72,8	9,7
Cyprus	27480,2	47,6	4,6	13,4	16,4	36,3	6,1	79,6	3,6
Czech Republic	16356,2	75,1	6,3	9,9	17,1	50,8	7,1	76,6	3,1
Estonia	14081,0	75,4	7,5	14,7	11,9	65,0	5,7	73,3	5,0
Hungary	12843,9	76,2	8,0	11,0	10,3	64,4	7,7	73,3	5,7
Latvia	10975,5	43,8	9,3	14,2	12,0	72,8	6,3	71,7	7,7
Lithuania	10645,7	57,7	7,5	14,8	13,7	75,8	6,3	71,6	5,9
Malta	17758,8	82,5	6,7	12,7	13,6	30,7	7,8	79,4	5,8
Poland	10641,8	39,4	11,3	12,1	10,8	65,5	6,6	75,3	6,0
Romania	6981,8	31,5	6,7	11,5	16,7	52,3	5,3	72,5	12,6
Slovak Republic	14836,1	86,0	12,4	10,6	16,9	44,9	7,7	74,4	6,3
Slovenia	22272,4	65,0	5,5	12,6	16,1	81,4	8,4	78,4	2,9

Source: World Bank. (a) Average values refer to the period from 2005 to 2009. (b) Average values refer to the period from 2003 to 2007. (c) Average values refer to the period from 2004 to 2008.

The model's goodness of fit was assessed via the RSQ (0.89), that indicates the proportion of variability explained by the corresponding dissimilarity distances, and the Stress Index (0.14). As a general rule, results are found to be robust when the size k achieves an Stress Index value lower than 0,15. A two-dimensional model was judged to be acceptable according to the values of the Stress Index. Further investigation provided additional basis for choosing the two-dimensional solution: the "elbow" rule suggests to choose the number of dimensions in correspondence to where the diagram yields an "elbow", beyond which the broken line flattens (Fig. no 1).

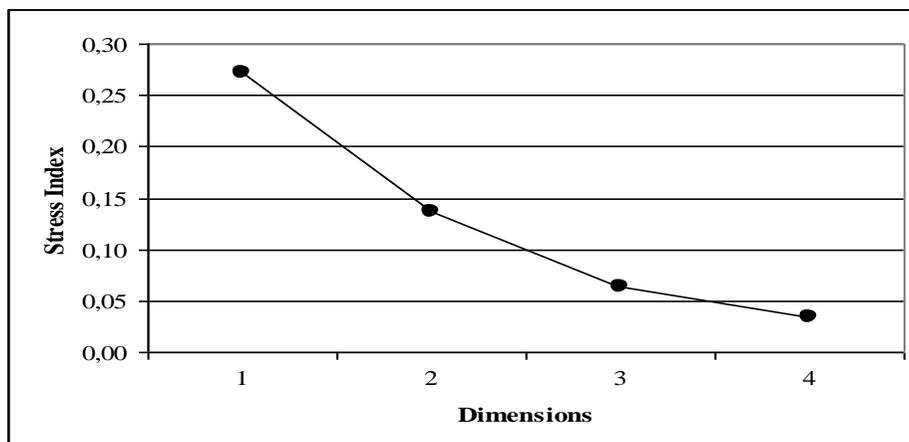

Figure 1. Scree plot

The correlations between dimensions and variables (Table no 2) were useful for naming the axes. The resulting two-dimensional image is shown in Fig. no 2. The horizontal axis represents the variables concerning economic and health indicators (so named Human Development); the vertical one is related to education indicators (so named Education Development).

Table 2. Correlations between variables and dimensions

Variables	Dimension 1	Dimension 2
GDP per capita (current US\$)	0,89	
Exports of goods and services (% of GDP)	0,54	
Unemployment (% of total labor force)		
Public spending on education (% of government expenditure)		0,85
Pupil-teacher ratio, primary		-0,63
School enrolment, tertiary (% gross)		0,50
Health expenditure (% of GDP)	0,63	
Life expectancy at birth, total (years)	0,90	
Mortality rate, infant (per 1000 live births)	-0,78	

Through the multidimensional scaling method we summarize the nine considered indicators by only two dimensions. Specifically, in such a way we are able to obtain a graphical representation of the twelve Eastern European countries object of study, based on the degree of similarity/dissimilarity between them with respect to the value that they assume for the two considered dimensions. Countries are classified into different groups, which are more homogeneous into them and more heterogeneous among them (Fig. no 2).

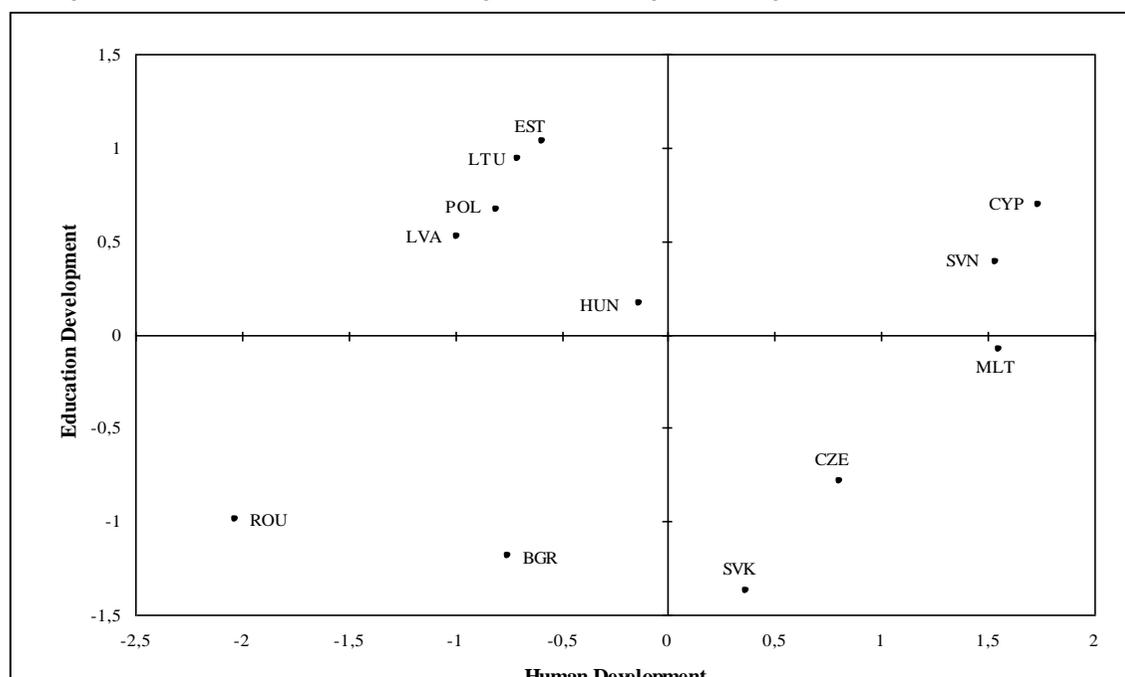

Figure 2. Cluster of countries in a two-dimensional space

Exactly, looking at Fig. no 2, we can see that countries that show a better status related to education, health and economic condition are positioned in the first quadrant (Slovenia and Cyprus). Countries that are located in the third quadrant are those having a lower level of education, health and economic condition (Romania and Bulgaria).

The Baltic Countries, Poland and Hungary show satisfactory level of educational development, but low levels of human development. Finally, Czech Republic and Slovak Republic show relatively high level of human development, but low level with respect to the educational indicators.

4. Conclusions

Human capital is one of the most discussed topics in economics. The initial hypothesis that moves the aim of the present paper is that the two principal components of human capital, education and health, have a positive impact on economic growth and development. Therefore, in this preliminary analysis on some Eastern European countries, we adopt the multidimensional scaling method that allows us to summarize the nine indicators about the levels of education, health and economic conditions in only two dimensions that we named Education Development and Human Development. In such a way, we have made an attempt to identify how the chosen Eastern European countries are positioned with respect to the two important dimensions. The results suggest a partition of countries in four clear groups, across which particularly Slovenia and Cyprus could be identified as benchmark for the others. It is important to underline that this analysis represents a preliminary analysis and it needs further examinations.

This paper considers the issue of competitiveness of national economy, making specific reference to the economic situation of Romania in the year 2010.

The diversity of views on approaches to competitiveness in the literature requires consultation of reports prepared by prestigious international forums and organizations, using relevant indicators and economic variables.

Keywords: Competitiveness, economic growth, productivity, economic environment, economic efficiency.

JEL Codes: F43, O47

1. Introduction

Competitiveness means the way in which nations and the economic environment given all powers to achieve its prosperity.

Competitiveness study allows "the possibility of comparing the performance achieved, and future growth potential" (Spataru) of the company and the economic environment.

Analyzing the structure and dynamics of the competitive system is also an element of absolute completion of analysis and relevant government decisions targeting companies involved in production activity (Airoldi, Brunetti and Coda in 2005: 322), all aimed at raising environmental performance national economy.

In economics, competitiveness is identified as the main active element in the procurement and delivery performance during the competition, the organization the role of 'the situation is in better position as compared to its competitor for the "defeat" for the purposes of reporting gave a performance criterion and followed by all competitors (Voiculescu 2001: 6).

2. Defining the level of competitiveness based approach

The concept can be approached at monoeconomic, macroeconomic and microeconomic level. In that respect this industry experts opinions on the definition depending on the level of approach:

- "Global competitiveness is a matter of economics that analyzes the facts and policies that shape a nation's ability to create and maintain an environment conducive to supporting and

achieving better value for their enterprises and prosperity of its people"(World Competitiveness Yearbook).

- "Competitiveness is defined as that set of factors, policies and institutions that determine the current level of productivity of a country. Productivity determines both the welfare of an economy at a time, and its growth potential in the future. Empirical research has shown that developing a knowledge-based economy is one of the key factors enhancing the competitiveness of an economy"(Imbrescu and Băbăiță).

- "The competitiveness of markets, refers to the degree to which individual firms have the power to influence market prices or terms on which their product is sold. The individual firm has less power to influence the market on selling their product, the more competitive is the market" (Lipsei and Chrystal 1999: 252).

- "The level at which it generates is the microeconomic competitiveness. A country becomes competitive when you manage to build that environment that allows each company to become effective added value, to be able to survive or develop in any national economic environment, especially internationally. The level at which it maintains and strengthens the competitiveness of the macro. The country maintains or improves its profitability internationally when it decides to apply the set of economic policies necessary to stimulate the achieving optimum expansion at the micro level"(Spataru).

Creating a competitive system is an important issue and a policy of "Washington Consensus" for economic growth in developing states (Baumol, Litan and Schramm 2009: 52).

Representation of the competitive system, the example of a competitive economic market can be achieved only by extensive competition model representation. Competitive system structure: the competition extended) is a necessary condition of existence and developing a real competitive.

The four pillars of the macroeconomic level the competitive system are newcomers (especially entrepreneurs), customers (consumers), suppliers and manufacturers of goods substitutable (those who have the ability to conduct marketing pressures).

If new entrants can affect competition by larger volumes of production and reducing unit costs through a variety of products, manufacturers of substitutable products or services will be the source of uncertainty for new entrants if the price / benefit will be one of those consumers' expectations accordingly have propensities for such goods.

Providers will become competitive in particular by focusing on service quality and price of services and clients, through negotiation and price elasticity will be the most important word to say.

The competitiveness suggests safety, efficiency, quality, high productivity, adaptability, successful, modern management, superior products, low cost.

In the battle for new markets, firms need to emphasize their strengths to gain the ground to competitors. Also they have to defend these benefits, known and recognized by constant efforts and also to know and accept that are the strengths of its competitors. At the same time, significantly increase the interest and effort to obtain business benefits both the domestic and international market.

Competitive or competitive ability is just that part on which power and economic strength of the economic conditions of a market economy. Therefore, development of competitiveness, acquiring and maintaining competitive advantage and effective use of the factors influencing it, is the main goal toward which all economic agents.

3. Implications of competitive markets in the growth states

The contemporary world has undergone a series of connections between markets and increasing competitiveness of the country's economic performance in the economic environment runs its business. In this respect shows experts in the field: "To be effective, must include an economic and profitable business based on competitive (...) the true economic substance produced by them, their profitability depends on economic strength and level to live the great country"(Verboncu and Zalman 2005:41).

The competitiveness of a country is assessed by its capacity (Gavrila 2009: 131):

- to export
- to attract FDI
- to harness resources and increase real per capita GDP
- prices were more positive than those of competitors, the offer is characterized by quality, diversity and timeliness

A national economy is competitive in the long term, they ensure the sustainable increase of welfare and population dynamics due to the high overall productivity of factors of production.

It is clear that the competitiveness of an economy depends decisively on the business environment, businesses are the engine of economic growth. Improve business access to factors of their participation in the European Single Market, investment in optimizing their industrial base, while respecting the principles of sustainable development is a critical prerequisite for the operation of the Romanian economy competitive.

As described by Michael Porter in the latest edition (2008) of his famous works, "About the competition, the competitiveness of a country do not relate primarily to macroeconomic stability, neither labor nor public policies, or practices management, but especially in productivity. A nation is competitive when it allows the development of the determinants of productivity and increasing productivity.

Depending on factors contributing to productivity, the report prepared by the World Economic Forum identified three stages in which the countries, namely:

Stage I: The competitiveness of production due to factors - factor - driven (force of unskilled or poorly qualified natural resources). The economy is particularly competitive because of lower prices, but the products are less complex. However, assuming the presence of certain basic conditions are essential (institutions, infrastructure, macroeconomics, health and primary education).

Stage II: Competitiveness by factors of efficiency - efficiency - driven (production more efficient, better quality products). Competitive conditions related to higher education and continuous training and ability to benefit from existing technologies.

Stage III: The competitiveness based on innovation - innovation-driven (new products from innovative, complex production processes).

The importance of individual factors, expressed by weight in the total contribution of the three pillars of competitiveness depends on the stage in which the country concerned.

Table 1 The pillars of competitiveness (on a scale from 1 a worst - 7 the most powerful)

Basic requirements	Score Romania
Institutions	3,7

Infrastructure	2,7
Macroeconomic stability	4,6
Health and primary education	5,5
Efficiency enhancers	
Higher education and training	4,3
Goods market efficiency	4,2
Labor market efficiency	4,3

4. Romania's place in terms of competitiveness in 2010?

According to the Romanian Institute for Social and Economic Research Polls - IRECSO, Romania is one of the last places among the 58 states, namely the 54th place, ahead of Argentina, Croatia, Ukraine and Venezuela. In front of us, at very short distance are Bulgaria (who score a 0.6% higher than the score of Romania) and Slovenia which has a spacing of 1.2 points from November. In the case of former communist countries until 1989 before we can see that under the current economic crisis, Hungary (42), Estonia (34) and Poland (32) have found solutions to increase competitiveness, Romania (54) and Czech Republic (29) retain their positions from 2009 to 2010, while Bulgaria (53), Slovenia (52), Slovakia (49) and Lithuania (43) have recorded substantial decreases ranging from 20 to 12 seats. For a better building on evolution, that the positions occupied in recent years, the Yearbook presents individual country specific contributory factors in terms of competitiveness and the disadvantaged.

In 2010 Romania registered a decline in economic performance, ranked 32 in 2009, ranked 47 in 2010. Although this chapter we have seen a drop of 15 seats still remain before countries like Greece (48), Russia (49), Turkey (50), Estonia (52), Slovakia (54), Ukraine (55) Lithuania (57). Regarding the efficiency of government, I dropped one place from 2009, topped 50. Regarding infrastructure, I grew up 10 seats in 2010 compared to 2009, peaking at number 43 in 2010, and Chapter Efficiency business, grew 13 seats, up from 56 in 2009 ranked the 49th place in 2010.

Unfortunately, Romania has made significant gains in terms of business efficiency and infrastructure were not enough to increase competitiveness as a whole, but given that the economic performance and efficiency of government Chapter I declined, maintaining the position of Romania in 2010, to 2009 levels is due the first two factors. Credit business is beginning to strengthen in recent years and investment in telecommunications infrastructure and in research are beginning to become visible, helping them to contribute in 2010 to maintain the competitiveness of Romania in 2009, the economic crisis.

Strengths of the business concerns in particular the progress made by the Romanian companies in their concern for customer satisfaction for a proper wage service sector, and staff management positions, at a salary that is comparable to that in other EU countries. However, to further strengthen the business environment we need to improve some aspects which for 2010 is still the weak points in terms of competitiveness, namely: the need for specialists in finance raised by the need to increase the capacity of Romanian companies' adaptability to market changes the need to increase transparency of financial institutions in Romania, the stock market decline, and finding solutions so enterprise debts not restrict their ability to be competitive.

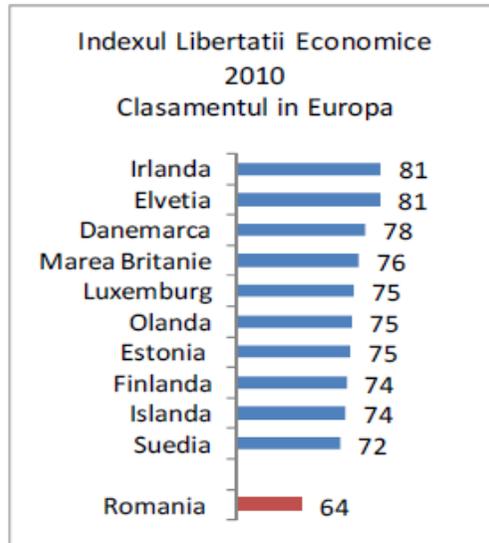

Negative aspects (aspects of which Romania is ranked the lowest in the context of global competitiveness) in terms of economic performance are related to direct investment abroad, investments in capital markets abroad, receipts from tourism and real GDP growth.

Even though the Chapter Efficiency sit well in the government's total public debt and collect taxes on income, weaknesses in the system in terms of competitiveness in 2010 relate mostly to the lack of public contracts open to all bidders, the black market economy that does not allow and competition law can not stop unfair competition.

In conclusion, overall, we assess the competitiveness of Romanian economy as a "disappointing performance." In many ways they are signs of competitiveness,

competitiveness appears other way to start, but in most economic indicators speak for lags, lack of competitiveness.

Heritage Foundation and Wall Street Journal Index of Economic Freedom determines (S), assuming that economic freedom is a precondition for prosperity of individuals and in turn a key driver for competitiveness.

Source: *Index of Economic Freedom, Heritage Foundation, 2010*

Chart no. 1 Rating States of Europe according to ILE

According to the results of this study, the 2010 edition, Romania is the 63rd country in the world in terms of economic freedom, and ranked 28th in Europe.

The Heritage analysis, Romania has achieved a 64.2 index points above the global average. After comparing the first countries in Europe, according to each indicator of economic freedom, Romania has high scores for: free trade, fiscal freedom, government spending, and significantly lower scores than the best countries in Europe obtained if : property rights and freedom from corruption, as these areas are necessary for developing solutions.

Results of the study conducted by the Heritage Foundation shows that Romania's economy is moving towards a greater economic freedom index.

5. Conclusions

For Romania, economic competitiveness is a major component of national development strategy for 2007-2013. For this purpose a special program was developed (Sectoral Operational Programme 'Increasing of Economic Competitiveness 'SOP) in accordance with the Lisbon strategy on improving the economic competitiveness of the European Union.

In full accordance with the conduct of the Commission's proposals for Competitiveness and Innovation Framework 2007-2013, the priorities of Romania's competitiveness strategy, which take into account and take into account the guidelines proposed by the Commission for Cohesion Policy 2007 – 2013, are:

- Improving access to emergency market, capital, technology businesses, especially small and medium enterprises;
- Developing knowledge-based economy: including the promotion of innovation and development of a competitive;
- Improve energy efficiency and use renewable energy.

Competitiveness, although often studied in recent decades even in Romania, remains a qualitative concept, draw conclusions on the competitive status is rather the depth of analysis, the information behind it, the evaluator's experience and, not least, points of view that makes analysis.

TENDINȚE MACROECONOMICE ALE TAXELOR DE MEDIU ÎN ROMÂNIA, COMPARATIV CU ȚĂRILE MEMBRE ALE UE-27

Cristea Anca
Ecological University Bucharest
Faculty of Economic Sciences

Reforms of environmental taxes in EU member states began to consolidate a strategic conceptual basis since the early '90s, when it was launched the idea of changing the tax burden from the tax factor of production, work to the environmental factors and use of environmental unfriendly activities and goods. The theoretical support of this view is represented by the corrective taxes Pigou situation justifying the optimal level of activity of producing goods and services from a social perspective, the collection of taxes imposed by the state of polluters, depending on the amount of damage and damage to third parties, the principle of "polluter pays". Despite the green fees start reforms of the EU member countries and their levels are not increased in recent years as a share of GDP. In the EU-27, 2008, revenues from environmental taxes represented a rate of about 2.8% of GDP and 6.1% of total revenues compared to 2.9% and 7.0% record share of GDP in 1999.

Effects of environmental taxes on eco-efficiency must be seen not only in terms of their size or budget as income tax to GDP ratio, but also as a positive economic and social impact generated by larger beneficial effects of reducing pollution and preserving the quality natural resources and environmental factors.

Keywords: environmental taxes, eco-efficiency, green fees, corrective taxes Pigou.
JEL Classification codes: Q5

În pofida dificultăților de identificare și măsurare a externalităților negative, un astfel de curent de gândire capătă un suport în creștere continuă alimentat de agravarea efectelor schimbării de climă.

Elaborată în anul 1993, sub egida lui Jacques Delors, Carta Albă privind Creșterea, Competitivitatea și Ocuparea a UE, relevă necesitatea reformei fiscale în țările membre ca o opțiune politică atractivă pentru factorii de decizie din acea vreme, tocmai în ideea că o astfel de reformă ar sprijini creșterea, ocuparea și competitivitatea în țările respective prin asigurarea unei mai bune calități și practici a capitalului natural, în consens cu cerințele dezvoltării durabile. O serie de țări între care Danemarca, Finlanda, Germania, Olanda și Anglia, au inițiat în ultimul deceniu, elemente de reformare a taxelor verzi, măbind nivelul taxelor de mediu și utilizând venituri din taxe adiționale pentru a finanța reducerea fiscalității asupra veniturilor personale și muncii, cu scopul transparent declarat de a favoriza creșterea gradului de ocupare a forței de muncă. În paralel, țările respective au întreprins o serie de acțiuni cum ar fi reducerea ratelor de impozitare sau schemele de refinanțare în scopul protejării producătorilor de efectele negative asupra competitivității generate de mărirea costurilor input-urilor. O politică similară a fost urmată și de către țările noi membre ale UE (Slovenia) unde taxa asupra CO₂ se aplică încă din anul 1997 la toate produsele consumatoare de energie. Republica Cehă a demarat reforma taxelor verzi, începând cu anul 2008, în sensul creșterii acestora pentru cea mai mare parte a produselor

energointensive, în perioada 2008-2012, veniturile încasate din taxele respective fiind utilizate pentru sprijinirea politicilor publice de ocupare a forței de muncă.

Dar, în pofida demarării reformelor taxelor verzi în țările membre ale UE, nivelul acestora nu a crescut în ultimii ani ca pondere în PIB. La nivelul UE-27, în anul 2008, veniturile din taxele de mediu au reprezentat o proporție de circa 2,8% față de PIB și 6,1% din volumul total al veniturilor față de 2,9% și respectiv 7,0% pondere în PIB în anul record 1999 (vezi tabel 2). Tendința permanentă de scădere a ponderii veniturilor din taxele de mediu începând cu anul 2004, s-a produs practic în marea majoritate a țărilor membre ale UE, între aceste țări existând diferențe sensibile. Astfel, începând cu anul 1995 se constată o tendință de creștere în Danemarca, Estonia, Letonia, Lituania, Olanda, Austria, Polonia și Slovacia, în timp ce în restul țărilor se constată o quasiconstanță sau scădere a mărimii indicatorului.

1.1. Veniturile din taxele de mediu, nivel și tendințe în România, comparativ cu țările membre UE-27

Volumul valoric al taxelor de mediu analizat pentru perioada 1995-2008 în scopul de a pune în evidență particularitățile, nivelul și dinamica fiscalității de mediu, pe termenul scurt, mediu și lung.

Tabelul nr.1. Analiza comparativă a nivelului mediu^{x)} al proporției taxelor de mediu față de PIB, în România și țările membre ale UE, pe subperioadele 1995-2000, 2001-2006 și 2007-2008

	Subperioadele			(%)
	1995-2000	2001-2006	2007-2008	
România	2,9	2,2	1,95	
UE-27	2,9	2,8	2,65	
UE-25	2,9	2,8	2,65	
UE-16 Zona Euro	2,95	2,76	2,55	

x) media veniturilor

Sursa: calcule proprii pe baza datelor EUROSTAT

La nivelul UE-27, tendința de scădere a ponderii veniturilor din taxele de mediu a fost imprimată de țările cu pondere importantă în economia comunitară, cum sunt Franța, Italia, Anglia.

Creșterea mărimii indicatorului în noile țări membre ale UE în mare măsură a fost generată de cerințele procesului de aderare la UE, chiar dacă unele s-au folosit de ocazie pentru a mări nivelurile taxelor la energie, peste prevederile comunitare.

În țările membre ale UE, taxele de poluare sunt percepute pe unitate de consum fizic și în mod obișnuit se stabilesc în termeni nominali, ceea ce și explică declinul relativ al acestora în ultima parte a perioadei analizate.

Spre deosebire de taxele *ad-valorem*, taxele de mediu pe unitate fizică de consum, ca procent din PIB, au manifestat tendința de scădere, fără a fi ajustate cu rata inflației sau mărite cu regularitate, la diferite intervale de timp.

Principalele motive ale erodării valorii reale a taxelor de mediu au fost:

- cererea de energie a avut tendința de a crește mai lent decât venitul, ceea ce presupune o scădere a ponderii taxelor plătite pentru energie atunci când economia se află în proces de creștere;

- creșterea taxelor de energie, în ultimii ani, a condus probabil la reducerea consumului de energie, ceea ce, pe cale de consecință, a erodat baza de impozitare a energiei, chiar dacă nu s-a înregistrat o reducere a cheltuielilor pentru energie;

- guvernele nu s-au arătat dispuse să mărească în mod constant mărimea taxelor la produse care afectează costurile de energie ale menajelor și industriilor.

În perioada 1992-2004, ratele minime ale UE la uleiurile minerale au fost menținute constante, până când a intrat în vigoare Directiva Taxei pe Energie – Energy Tax Directive (2003/96/EC), astfel că nu au existat motive de mărire a taxelor verzi.

Pe de altă parte, creșterea atractivă pentru comercializarea permiselor de poluare și prețurile înalte la petrol în primii ani ai anilor 2000 a reprezentat un alt factor care a condus la inapetența unor taxe suplimentare de mediu mai ales în ceea ce privește energia.

În ceea ce privește România, datele din tabelul nr.2 evidențiază următoarele tendințe:

- nivelurile veniturilor din taxele de mediu ca procent față de PIB până în anul 1996 a fost mai mic în comparație cu media UE-27;

- a înregistrat o creștere în perioada 1997-2000, după care a înregistrat o tendință de scădere continuă în perioada 2001-2008;

- în anul 2008, România înregistra una din cele mai reduse ponderi în PIB ale taxelor de mediu, 1,8% față de 5,7% în Danemarca, 3,9% în Olanda și 2,7% în Finlanda;

- mărimea anuală a proporției veniturilor din taxele de mediu față de PIB a fost mai oscilantă în România comparativ cu alte țări membre ale UE.

1.2. Structura taxelor de mediu

Cea mai mare parte a taxelor de mediu provin din domeniul energiei (1,4% din totalul de 1,8% în anul 2008, în special din taxarea combustibilului folosit de ramura transporturi 1,1%). Restul provin din impozitarea transportului (mai puțin a celui bazat pe combustibil) ca și din taxe de poluare sau din cele percepute asupra resurselor.

Cu un volum de 2,5 mld.€ în anul 2008, veniturile din taxele de mediu ale României, ocupă în ierarhia țărilor membre ale UE locul al 25-lea, cu unul dintre cele mai reduse niveluri bugetare din această sursă.

Taxele pe energie sunt de departe cea mai semnificativă categorie a taxelor de mediu reprezentând peste trei pătrimi din volumul totalul acestora și a 20-a parte din volumul total al taxelor și contribuțiilor sociale la nivelul UE-27.

Cel mai scăzut volum al taxelor de mediu (5%) revine taxelor pentru poluare și resurse. În majoritatea țărilor UE-27, ponderea taxelor de mediu se înscrie în intervalul 2%-3% din PIB sau chiar peste.

Reducerea ponderii taxelor de mediu în România, în ultimii ani ai perioadei analizate, s-a datorat descreșterii puternice a veniturilor din taxele pe consumul de energie.

Cea mai mare pondere a taxelor pentru combustibilul consumat în transporturi (90%) se înregistrează în noile state membre ale UE.

În vechile state membre ale UE veniturile din taxe asupra consumului de combustibil variază între 90% din total taxe (Irlanda, Grecia, Portugalia și Anglia) și circa 50% în Danemarca și Suedia.

Aceste diferențe se explică prin mărimea diferenței veniturilor din taxele asupra gazelor naturale și electricitate, deosebiri care continuă să existe între țări, deși au existat încercări de micșorare a acestor diferențe prin introducerea unor rate de impozite minime asupra produselor energointensive și electricității prin amintita Energy Tax Directive (2003/95/EC).

Aceste diferențe rezultă din opțiunile pe care le fac țările membre ale UE în materie de impozite și taxe de mediu. De exemplu, în Danemarca taxa asupra consumului de electricitate, în sectoarele non-industriale, depășește rata minimă de impozitare de peste 80 de ori, iar în Suedia de circa 30 de ori. În ceea ce privește taxele pe consumul de combustibil (sectoarele transport și non-transport) diferențele între vechile și noile state membre ale UE sunt mai mici, comparativ cu taxarea energiei în ansamblu.

Ponderea ridicată a taxelor provenind din utilizarea combustibililor în transport, încălzirea clădirilor și afaceri reflectă că alegerea ratei de impozitare minimă a accizelor nu a fost influențată doar de considerente de natură ambientală. Strict din acest punct de vedere, ar fi de preferat impozitarea în mod egal a substanțelor poluante. Cu toate acestea, din motive de ordin social, pot fi practicate, de exemplu, taxe mai reduse pentru încălzirea locuințelor. Pe de altă parte, impozitarea înaltă a transporturilor pe combustibil este motivată și de generarea unor costuri marginale extinse, legate de sectorul transporturi, cum ar fi accidentele, aglomerările și zgomotul, precum și nevoia de finanțare a infrastructurii.

În concluzie, doresc să evidențiez faptul că efectele taxelor de mediu asupra eco-eficienței trebuie percepute nu doar prin prisma dimensiunii lor fiscale ca venit la buget sau proporție față de PIB, ci și ca impact favorabil economic și social mai larg generat de efectele benefice ale reducerii gradului de poluare și preservare a calității resurselor naturale și factorilor de mediu.

O abordare complexă a acestor efecte presupune studii aprofundate privind externalitățile negative și pozitive ale producției și consumului de bunuri și servicii publice și private pe întregul **ciclu de viață** al acestora începând cu faza de concepție și proiectare și terminând cu cea de consum final.

Raportul taxe pe consumul de energie/consum final de energie reprezintă o altă formulă a eco-eficienței care, de această dată în locul PIB-ului sau al producției, folosește la numărător volumul taxelor pe energie. Cu alte cuvinte, cu cât acest indicator are valori mai mari, cu atât mai mult se promovează o politică de protecție de mediului și a sănătății populației pe de o parte prin folosirea mai eficientă a resurselor energetice disponibile și, pe de alta, prin diminuarea poluării sub forme diferite, dar mai ales a GES.

Indicatorul venituri din taxe pe consumul de energie raportat la consumul final de energie în România, comparativ cu alte țări (tabelul nr.3) evidențiază următoarele aspecte mai importante:

- a) în toate țările analizate, în perioada 1995-2008 se constată **o creștere sensibilă** a indicatorului, îndeosebi în prima parte, ceea ce confirmă o multiplicare a numărului de taxe de mediu și/sau o mărire a nivelului celor existenți, o importanță deosebită având și influența creșterii prețului la energie;
- b) în întreaga perioadă, **România a înregistrat cel mai scăzut nivel** al taxelor de mediu la energie raportat la consumul final de energie, ceea ce relevă o contribuție relativ scăzută a acestor taxe la implementarea investițiilor de mediu și reconstrucție ecologică, de aici decurgând necesitatea unei mai mari capacități de absorbție a fondurilor structurale și de coeziune ale UE;

c) în țările dezvoltate membre ale UE-27, indicatorul a fost sensibil mai mare decât în noile state membre ale UE cu economie emergentă, ceea ce evidențiază decalaje importante între cele două grupe de țări atât în ceea ce privește ansamblul politicilor, instrumentelor și mecanismelor cât și posibilitățile de finanțare și eco-eficientizare în domeniul mediului;

d) în perioada 2000-2008, indicatorul analizat a înregistrat creșteri mai scăzute față de perioada 1995-2000, ceea ce constituie dovada faptului că creșterile marginale ale acesteia devin tot mai reduse, ajungându-se la așa-numita **praguri teoretice de „optimalitate”** a fiscalității sau limite „maxime” dincolo de care orice mărime de impozit nu mai produce creșteri corespunzătoare de venituri la buget, ceea ce confirmă „postulatele” curbei Laffer;

e) evoluția indicatorului în România, pe întreaga perioadă analizată a manifestat o tendință generală de creștere în condițiile în care au avut oscilații mai mari sau mai mici de la un an la altul;

f) aceeași tendință generală de creștere se înregistrează și în cazul celorlalte țări cu deosebire că nivelurile indicatorului în multe cazuri au fost de peste 2 ori mai ridicate, comparativ cu nivelul înregistrat în România.

Utilizarea indicatorului venituri din taxe pe consum de energie raportat la consumul final de energie, în esență, are o semnificație apropiată de indicatorul anterior analizat, cu deosebire că datorită numitorului cu valori mai mari ale consumului final de energie, a condus la dimensiuni mai scăzute ale raportului respectiv. În plus, la numitor s-au folosit valori deflate ale veniturilor din taxe, ceea ce implică și însemnat și reducerile de mărime ale indicatorului la numărător, ca urmare a inflației indicelui prețurilor de consum.

Calculul indicatorului de la tabelul nr.5, în condițiile aplicării deflatorului cererii finale (2000 = 100) confirmă aceleași concluzii pe care le-am prezentat la tabelul nr.4, în ceea ce privește nivelul indicatorului în România, comparativ cu celelalte țări. Spre deosebire de concluziile anterioare, calculele în prețuri comparabile evidențiază dinamici mult mai modeste ale indicatorului atât în România cât și în celelalte țări, existând perioade relativ lungi în care oscilațiile acesteia, de la un an la altul, mai degrabă nu au pus în evidență tendințele clare de scădere sau creștere, ca în cazul primului indicator.

1.3. Eficiența energetică

Calculul eficienței energetice E_{fen} a fost efectuat utilizând formula:
$$E_{fen} = \frac{PIB}{K_{gep}}$$

în care: PIB = produs intern brut în euro; K_{gep} = kilogram echivalent petrol.

După cum se poate observa, indicatorul E_{fen} are un caracter mixt, întrucât raportează un indicator în expresie valorică la unul în expresie fizică, spre deosebire de alți indicatori careau la numitor și numărător doar mărimi valorice monetare.

Datele din tabelul nr.6 evidențiază, pentru România, în anul 2008 o valoare a E_{fen} de câteva ori mai scăzută (1,62 €/K_{gep}) decât media pe UE-27 care a fost de 4,99 €/K_{gep}.

Relevanța indicatorului E_{fen} la nivel macroeconomic, dar și la nivelurile micro și mezo, vizează în primul rând performanțe economico-financiare, de mediu și sociale ale entităților analizate. Mai concret indicatorul, în **context comparativ internațional și intersectorial**, ne arată nivelul de dezvoltare economică și socială a unei țări, capacitatea acesteia de a genera valoare adăugată mai mare sau mai mică la consumul unei unități fizice de 1 kg echivalent petrol. Cei mai importanți factori care influențează mărimea E_{fen} se referă la nivelul tehnologiilor utilizate și capacitatea de upgradare a acestora, în funcție de rezultatele

de „ultimă oră” ale activității de cercetare-dezvoltare-inovare din propria țară și alte țări. Pe de altă parte, gradul de complexitate a structurii economiei naționale care se măsoară prin **ponderea** sectoarelor, ramurilor și activităților cu **cele mai mari niveluri ale valorii adăugate**, în lanțurile valorice interne și internaționale (value chains) constituie un alt factor care poate influența favorabil mărimea indicatorului care arată capacitatea de „a produce mai mult cu mai puțin”.

Cele mai mari valori ale E_{fen} s-au înregistrat în Elveția și Japonia cu o mărime de peste 10 €/Kgep, ceea ce înseamnă pentru România un decalaj de peste 5:1.

Analiza tendinței pe termen lung (1070-2008) a indicatorului E_{fen} a devenit o practică internațională tot mai uzitată în a caracteriza măsura în care economiile naționale se înscriu pe traiectoria dezvoltării durabile și a tranziției la economia cu „consum scăzut de carbon” (low carbon economy) sau economia verde (green economy). Creșterea valorilor E_{fen} pe termen lung semnifică o îmbunătățire a randamentelor energetice macroeconomice ale țărilor.

O problemă care vizează cercetările viitoare este aceea dacă creșterea eficienței energetice ca indicator cheie al eco-eficienței este, ca mărime, cea necesară și suficientă pentru menținerea și ameliorarea (mitigation) condițiilor de mediu sau a echilibrelor ecologice. O serie de cercetări în acest domeniu au ajuns la concluzia că în multe țări, mai ales în cele cu niveluri scăzute ale E_{fen} , nu se poate considera că se acționează în măsură necesară și suficientă pentru a satisface cerințele sustenabilității.

În ceea ce privește evoluția E_{fen} , pe termen lung în toate țările analizate s-a înregistrat o **tendință de creștere**, ceea ce atestă dinamica superioară a PIB-ului față de cea a consumului de energie. Aceasta, evident, nu înseamnă „doing more with less”! Oricum, această tendință se înscrie în unul din scenariile posibile de creștere a eco-eficienței, analizate anterior, fără să fie cel mai bun scenariu care presupune creșterea producției de bunuri și servicii în condițiile scăderii sau menținerii constante a consumului de energie.

Problema care se ridică, vizează însă măsura în care acest consum, în creștere și el, va fi sustenabil pe o perioadă mai îndelungată.

Poziția nefavorabilă a României în ceea ce privește indicatorul E_{fen} , evidențiază mai multe probleme cu care țara noastră se confruntă și anume:

- existența unei structuri energofage a economiei;
- productivitatea și randamentele scăzute ale tehnologiilor folosite;
- slaba utilizare a mecanismelor și instrumentelor aparținând economiei reale și celei monetare în direcția eficientizării productivității totale a factorilor;
- capacitate scăzută de adaptare la noile tendințe în ceea ce privește cele mai bune tehnologii disponibile prietenoase mediului (BAT – best available technologies).

În tabelul nr.7 s-a analizat comparativ nivelul eficienței energetice din alte țări față de cel al României considerat egal cu 1, în perioada 1995-2008, cu scopul de a vedea **dimensiunea decalajelor** ce despart România de celelalte țări, precum și **tendințele acestor decalaje**, pe termenul scurt mediu și lung.

Evoluția mărimii decalajelor E_{fen} pe care le înregistrează România față de celelalte țări membre ale UE-27 pe termen lung, din păcate, în cea mai mare parte a țărilor, dar mai ales a celor cu nivel relativ mare de dezvoltare economică a fost de creștere pe întreaga perioadă 1995-2008. Această situație nefavorabilă pentru România trebuie să dea de gândit atât celor care sunt, în palierul decizional al economiei reale, dar și celor care se ocupă de energie

din sectoarele CDI, astfel încât să se poată ajunge la soluții și mai ales decizii care să contracareze această tendință de creștere a decalajelor E_{fen} pe termen lung între România și celelalte țări. Numai pe seama unei tendințe de diminuare a decalajelor respective putem vorbi de o înscriere a economiei românești **pe traiectoria convergenței reale**. Cea mai mare dimensiune a decalajului de mărime a E_{fen} s-a înregistrat față de Germania care avea un nivel, în anul 2005, de 6 ori mai mare decât cel al României. Tendința de creștere a decalajelor României, față de țările dezvoltate în ceea ce privește E_{fen} pe termen lung a fost de creștere pe întreaga perioadă, s-a încetinit evidențiind chiar o scădere ușoară începând cu anul 2004, care totuși, este de mici proporții.

Este important de semnalat cazul câtorva țări cu economie emergentă (Slovacia, Slovenia, Cehia) care au reușit să-și diminueze într-o oarecare măsură decalajele față de țările dezvoltate, ceea ce nu se poate spune și despre România.

În concluzie la analiza E_{fen} , pe baza calculelor efectuate se poate afirma că în condițiile impactului actualei crize economice și financiare, s-au mărit decalajele de eficiență energetică dintre țările dezvoltate și cele mai puțin dezvoltate, deoarece contracția producției a fost cu mult mai mare decât în țările mai dezvoltate și capacitatea de rezistență la șocuri a puțin mai mică.

EXPERIENCES AND TENDENCIES OF DECENTRALIZATION AT REGIONAL LEVEL IN THE EUROPEAN UNION

Dodescu Anca

University of Oradea, Faculty of Economic Sciences, adodescu@uoradea.ro

Romania's integration into the European Union requires, in addition to the complex process of policy transfer, learning new ways to make policies characteristic to a culture of a multi-level governance and of partnerships. From the different levels of governance of the European model, the regional level ("regional governance") reflects most accurately, in our opinion, the complexity of reconfiguring the state's role in economy, at the beginning of this new millennium, in the European Union, and presents the greatest practical importance for Romania, as a new Member State in the European Union, as at the regional level structures are more flexible, and best practices more quickly assimilated. The selection of the best economic policies of regional growth and development, the choice of objectives from a number of competing options, the calibration of powers, roles, competences and responsibilities, in time and space, and the promotion of solutions of the win-win type require resorting to and combination of appropriate and effective tools. Illustrative of the new context, the policy of regional growth and development must incorporate, in Romania as well, more knowledge, more creativity, new combinations of skills and new areas of expertise. This paper presents the preliminary results of the research related to a post-doctoral research project: "Economic policies for regional growth and development. Challenges for Romania in the context of economic-financial crisis and integration into the European model", developed within the project "Economic scientific research, support of the welfare and human development in the European context", financed during 2010-2013 from the European Social Fund (ESF) and implemented by the National Institute of Economic Research "Costin C. Kirițescu" of the Romanian Academy, from December 1, 2010, to November 30, 2012, coordinator: prof. Valeriu Ioan Franc, PhD. The question we intend to answer in the present stage of our research, based on the comparative analysis of the decentralization systems of several Member States of the European Union, as well as on the analysis of regional disparities existing at the European Union level and of the effects of economic integration, is - to what extent should the competences of the regional policy be concentrated in the hands of the regional authorities or of the European Union rather than to be left individually to the Member States so as they may develop their own regional policy? What we pursue in this paper, based on the analysis of experiences of decentralization of economic policy competences at the level of the European Union, is the identification of the regional implications of intermingling tendencies of decentralization, centralization, respectively supranationalization and, implicitly, the analysis of the manner of reconfiguration of the state's role in economy at the regional level, in the context of integration into the European model. The research into the manner of reconfiguration of the state's role in economy at a regional level requires a review of the allocative, distributive and regulatory role of the state, from a the regional perspective, the analysis on the one hand, of the decentralization of economic policy competences from the national to the regional level (e.g. national level: provision of pure public goods, such as national defence and centralization of fiscal policy competences in order to achieve macroeconomic stability and income redistribution; regional level: provision of mixed public goods, such as waste collection and community police), on the other hand, centralization / supranationalization of regional competences at the level of the European Union.

Keywords: *the role of the state in economy, decentralization, European governance, regionalization, regional governance.*

JEL Classification: *F15, H4, H5, H7, R5*

The concept of decentralization

In the broad sense of the term, *decentralization* means the transfer of authority or responsibility, duties or competences from the level of central public administration or central government to a lower level or from the public sector to the private sector or to non-governmental organizations.

As defined by the World Bank, decentralization means “the transfer of authority and responsibility for public functions from the central government to intermediate and local governments or quasi-independent government organizations and/or the private sector” (The World Bank Group, 2011). As the transfer of competences always involves the transfer of financial and human resources as well, decentralization raises not only problems of a political, administrative nature but also of economic, fiscal etc. Depending on the predominance of one or other of these aspects, the literature marks the following forms of decentralization: *administrative* (whose sub-forms in ascending order of the degree of decentralization are: *deconcentration, delegation, devolution*), *economic, fiscal and political*, noting that these forms are obviously interrelated. If the transfer of competences does not exceed the public sector, according to the lower level to which the duties or powers are transferred, one can speak of different levels of decentralization - *territorial, regional, local* level etc. If the transfer of powers is from public to private sector or to NGOs, we talk about *privatization* and *denationalization*.

The reasons why decentralization is brought into public debate and implemented are various. Widely debated in the literature, the reasons for decentralization can be classified, in our opinion, in three categories. The first category is related to *malfunctions* of the public administration or of the central government which leads to lack of response or low sensitivity to local needs: poor allocation of resources, public services absent or defective at a local level, inequities of redistribution at the territorial level, blockages in the central decision making; poor planning and control of the economic and social activities, excessive bureaucracy, low efficiency, flexibility and innovativeness of public policies; low quality of public services etc. Another category of reasons for decentralization are *crises*: political crises (ethnic or religious conflicts, difficult post-conflict situations, states of war etc.), or economic crises, implicitly fiscal, budgetary crises etc. Finally, reasons for decentralization are also represented by *transitions* from authoritarian political systems to democratic systems, from the system of commanded economy to the market economy etc., even the process of a state’s integration into the European Union (EU) is a form of transition.

Whatever, though, the reasons of decentralization, it is widely admitted that politics is the driving force behind it (Eaton et al., 2010). The typical political *objectives* pursued in the process of decentralization are to increase the capacity of political response and to broaden participation in political, economic and social activities at the territorial, regional or local level. Whatever their form, size etc., decentralization requires a change in the institutional rules of distribution of resources and responsibilities between different levels of government, implicitly changes in power and authority and, as highlighted by Kent Eaton, Kai Kaiser and Paul Smoke – as always when power and authority are at stake – decentralization creates controversy and heated debate, regarding the justification of the need of a decentralization process, the objectives pursued, the reform involved, the possible disadvantages etc. (Eaton et al., 2010).

The debate about decentralization is not new. In the EU, subject to our analysis, in the last two decades of the last century, decentralization was often put forward, on the one hand, as a result of the crisis of *the Welfare State*, leading to various experiences of reform through decentralization, the transfer of competences involved being, in this case, of the type *central-local* or *nationalization-privatization*, on the other hand, as a consequence of the *fragmentation of the power of the nation-state* and reconfiguration on various levels of the state’s role in the economy in the context of *the process of integration into EU* (Dodescu, 2011), further implying a transfer of powers of the *central-regional* and *central-supranational* type.

At present, under the economic-financial crisis, the reverse phenomenon of *centralization* gains ground, confirming the validity, on a long term, of the theories on the *cyclicity of the degree of the state's involvement in the economy* (Dobrescu, 1992), on the “*pendular movement*” State-Market or nationalization-denationalization (Dogan and Pelasy, 1992) or on the “*political pendulum*” that moves between the *national-transnational-global-European* arenas, depending on the relative attraction force of these magnetic fields (Wallace and Wallace, 2000).

In our opinion, as the days of the controversy *State versus Market*, in the sense of the “*mirror approach*”, have passed, so has the time of the polemic *Centralization versus Decentralization*. Located in the context of globalization and instability, the debate on decentralization should take into consideration the change of governance levels and “locations” (Wallace and Wallace, 2000), the increase of the role of the sub-national actors (Sharma, 2008, 2011). It is more likely the “time” of networks, partnerships, multitude of actors and interests. This trend is present both globally and at the EU level. As the World Bank showed in its reports, an *appropriate balance of centralization and decentralization* is essential for effective and efficient functioning of government. This translates into balance in decentralization of functions and responsibilities, on the one hand, and centralization of the roles of coordination and supervision, on the other. The combination of functions resulting – decentralized responsibilities with centralized roles of coordination and monitoring – should allow strengthening of the institutional capacity at a local level and effective management of decentralized functions in partnership between local actors - local governments, local private enterprises, local NGOs etc. and central actors involved in planning, coordination etc. (The World Bank Group, 2011). Moreover, in the EU context – of an emphasis on the role of networks in developing and implementing policies, of an assertion of the “*multi-level policy networks*” (Börzel, 1997), unlike the traditional analysis of decentralization, focusing in particular on the political, administrative and fiscal dimensions, or on the provision of services, emphasis is on the *interdependences* between the levels concerned with decentralization, in particular, respectively on the *interdependences* between actors (partners, the parties interested and the multipliers) involved (European Commission, 2007).

We next undertake is to analyse the reconfiguration of state's role in economy *at a regional level*, in the economic literature devoted to decentralization and in the context of the European model, in order to identify the regional implications of the interpenetration of the tendencies of *decentralization, centralization, respectively supranationalization*. Consideration on how to reconfigure the state's role in economy at a regional level requires review of the *state's allocative, distributive and regulatory roles* (Dobrescu, 2000) *from the regional perspective*, the analysis, on the one hand, of the decentralization from the national to the regional level (e.g. national level: provision of pure public goods, such as national defence and fiscal policy and centralization of fiscal policy competences in order to achieve macroeconomic stability and income redistribution; regional level: the provision of mixed public goods as for example, sewage collection and community police), on the other hand, centralization in the sense of supranationalization, regional competences at the EU level.

The economic approach of decentralization. Examination of the way of reconfiguring the state's allocative, distributive and the regulatory role in economy at regional level

The economic literature dedicated to decentralization studies the impact of different types of decentralization on *efficiency, equity* and/or *economic equilibrium* in order to define the optimal level of government decentralization based on comparing the advantages and disadvantages of different solutions for decentralization. The economic objectives pursued in the process of decentralization of production, distribution, financing etc. of goods or services at regional or local

level can coincide with political objectives typical for decentralization: increased political responsiveness and participation at the territorial, regional or local level. As remarked by Kent Eaton, Kai Kaiser and Paul Smoke –“fortunately, the decentralization may be one of those situations when politics and economy can serve the same purpose” (Eaton et al., 2010). This statement should not, however, lead to too high a dose of optimism.

In terms of classical economic theory, the market is the ultimate form of decentralization. At the other extreme, one might consider that the state is automatically responsible for producing and distributing public goods or services. In practice, however, the market can offer often more efficient solutions than the state in the production or distribution of public goods. Also, local or regional solutions may be more effective than the central ones. On the other hand, still in practice, if not well chosen, local solutions can cause loss of economies of scale for public services, failure in the production, provision of public services due to low administrative or technical capacity at local level. Clearly, we are talking here of *the state's allocative role* and of *the objective of efficient resources allocation*. At the same time, by decentralization the equitable distribution may be affected by providing social services that prove inadequate or do not reach all those “in need”. The cause may be the transfer of responsibilities without adequate financial resources. In this case, we talk about *the state's distributive role* and about *the objective of social equity*. Finally, the *state's regulatory role* subordinated to the *objective of economic equilibrium* can be affected when, for example, the coordination of economic policies moves from the hands of central government to the hands of regional government and this fact deteriorates the credit conditions and the possibilities to cover budget deficits at regional level or to the hands of local government and this transfer gives way to corruption at local level.

In terms of theory, there are some established *principles* underlying decentralization, a fugitive foray into their world being based on *Stigler's principles* (1957) that the decision-making should be placed at the lowest level of government in accordance with the objective of the efficient allocation of resources, the degree of decentralization being determined by the extent of the economies of scale and the effects of the type “*spill-over*” (benefits-costs); on *Olson's principle*, characteristic to the Public Choice School, whereby small groups of powerful interests are more efficient in absorbing public funds (Olson, 1969), on Oates's *theorem of decentralization* according to which every public service should be provided at that level of government that has control over the minimum geographic area able to internalize the corresponding costs and benefits (Oates, 1972), on the *principle of subsidiarity* as set by the Maastricht Treaty (1992), whose purpose is to ensure that decisions in the EU are taken at a level as close to the citizens as possible. The theoretical perspectives according to which the decentralization issue is addressed are: *the traditional fiscal federalism* and *The New Public Management* - which focus their attention on the so-called “market failures” and on the ability to deliver public goods efficiently and equitably, the *Public Choice School* and the *Economic Institutionalism* - which focus on “government failures”, respectively the approach of the “*network governance*” type (Shah, 2006).

Defining *government decentralization*, considered economically, as a process of transfer and distribution of state duties in the field of public expenditure and revenue, from national to local or regional level, we try to point out the specific aspects of decentralization, at a regional level, in terms of the three *roles of the State: allocative, distributive and regulatory*.

a). *Regional decentralization and optimal allocation of resources*

In what the *the state's allocative role* is concerned, the analysis of the regional decentralization focuses mainly on *collective goods (public) goods*. According to the current acceptance regarding a democratic state, the number of collective goods produced centrally needs to decrease

and to be restricted mainly to pure collective goods: army, security, foreign policy, justice etc. Not all *collective goods*, however, must be decentralized in the same way or at the same level. The state's role (of the central government) and the limits of decentralization in ensuring the provision of collective goods depend, first, on the nature of these goods and services, on the economies of scale affecting the technical efficiency and on the extent of the spillover effects, beyond jurisdictional boundaries, and on the structure of competition in producing or delivering a particular public good or service. Therefore, choosing a solution of decentralization or a combination of solutions such as decentralized - managed competition - privatization etc. starts from the assessment of the lowest level of governmental organization, at which the public good or service can be produced and delivered effectively, or of the most appropriate forms of privatization (The World Bank Group, 2011).

The possibilities of decentralization of collective goods supply depends primarily on *their effect of overflow* (spatial opening of their externalities), respectively on the *non-rivalry* of their consumption (the possibility of their being used by a large number of people without an additional production cost; a person's consumption doesn't reduce by anything the amount available for all others, and is therefore non-rival to the consumption of others), respectively *non-exclusion* of their consumption (implies that the supplier of the collective good is unable to exclude someone from the consumption of these goods reserving that right to those who will pay a price, so, once produced, the collective good is available to all, free of charge). While some collective goods are only beneficial in the vicinity of the geographical area of their place of production (local police, street lighting, coastal lighthouse for navigation, traffic lights etc.), others have a wider spatial opening of their externalities - regional (road or rail transport, postal service, telecommunications, higher education etc.) or national (national defence, justice etc.). The first category - *local collective goods* - is consumed exclusively at the level of a local community. The indivisible nature of these goods and their optional use create redistributive externalities (for example, those who never go out at night bear the cost of lighting public without having a benefit in exchange), but these do not go beyond local boundaries, existing the possibility to "internalize" them at a local level, the production in an optimal quantity at the local community level being possible without the externalities affecting neighbouring communities. In contrast, there are *national collective goods*, whose benefits are shared equally among all inhabitants of a country. The most illustrative example is the national defence, for which the risks and externalities of a possible decentralization are obvious for communities not large enough to internalize externalities. Between the two extremes we can fit the *regional collective goods* whose externalities extend beyond local boundaries, but which are consumed unevenly. Decentralization of their offer is only possible if the region is large enough to internalize the effects of an overflow, with the risk of insufficient supply, while centralization of their offer involves a uniformity that neglects the regional differences between the tastes and needs of the population, causing allocational and redistributive externalities. (Atkinson and Stiglitz, 1980; Brown and Jackson, 1990; Weber, 1991; Black et al., 2009).

b). Regional decentralization and equitable distribution

From the perspective of the *state's distributive role*, regional decentralization should be analyzed according to its potential impact on the *choice of domicile (emigration / immigration)* and on the *firms' location*. If, for example, a regional government decides to operate a redistribution effort much higher than that of the neighbouring community, applying a very progressive taxation, the community at stake will face a phenomenon of emigration of people receiving an income higher than average to communities with lighter taxation coupled with an opposite phenomenon, the immigration of the poor. Similarly, there may be a phenomenon of delocalisation of firms. For the community concerned this policy will therefore have a *boomerang effect*, because it will

increase its costs and diminish its revenue at the same time. Consequently, the national competence on the redistribution plan depends on the level of the following parameters: the amplitude of the redistributive correction; the disparity of the redistribution efforts undertaken by neighbouring communities, the spatial mobility of economic agents. The reduced mobility of economic agents or the strong attachment of individuals or firms to a region can counterbalance this boomerang effect. Therefore, decentralization of redistributive policy determines, with the price of a greater vertical equity, a horizontal inequity, the decentralization chances being small and dependent on the spatial mobility of the economic agents, on the size and homogeneity of the regional community, in order to practice, within certain limits, an active policy of redistribution (Atkinson and Stiglitz, 1980; Brown and Jackson, 1990; Weber, 1991; Black et al., 2009).

c). Regional decentralization and economic equilibrium

From the perspective of *the state's regulatory role*, the regional decentralization analysis must start from the indisputable fact that *the economic equilibrium* shows the characteristics of a *national collective good*, due to the spatial openness of its externalities. Even though their intensity varies from one region to another, the fluctuations in economic activity and the economic imbalances concern the national economy as a whole, therefore, the decentralization of the stabilization policy increases the risk that a region shall benefit from the stabilization effort of others without doing anything in exchange. On the other hand, the impact of regional stabilization policy is the weaker for the region concerned, the more open it is, the multiplier effect being only partial, because a part of the induced demand addresses a production made outside the region, respectively, the higher national capital mobility is, which deteriorates the conditions of loan at a regional level and the possibilities to cover budget deficits (Atkinson and Stiglitz, 1980; Brown and Jackson, 1990; Weber, 1991; Black et al., 2009).

In conclusion, the analysis of decentralization at a regional level in terms of the three roles of the state, according to the theory of fiscal federalism, leads to a rather simple allocation scheme - the distributive and regulatory role are preferable at a central level, the allocative role being shareable or possible to decentralize in accordance with the *spatial openness of the externalities of collective goods*, respectively with the characteristics of *non-rivalry* and *non-exclusion* of their consumption.

Decentralization at the regional level in the EU. Trends

The decentralization of the responsibilities of governments in the EU must be considered in the context of the *fiscal federalism* and of the *subsidiarity principle*, according to the provision of the Maastricht Treaty. The theory of traditional fiscal federalism involves an administrative organization structured on three levels: *federal, state, local* and, implicitly, a division of fiscal responsibilities between the three levels. The specificity of the EU - as an entity that tends to become a federal state is linked to adding *the regional level* to the three levels of the theory of traditional fiscal federalism. Thus, at present, in the EU there are the following levels of government: *union, national states, regions, local authorities* (usually *counties* and *municipalities*). The allocation of powers at the appropriate level in accordance with the principle of subsidiarity stipulated by the Treaty of Maastricht answers to criticisms about the many overlaps between the upper and lower levels and to the heterogeneity of the administrative arrangements from a Member State to another, hence a tendency of *supranationalization* of competences of the national states (governments) manifesting simultaneously at the EU level, along with the *decentralization* of some of their other competences to lower levels (regional and local). The principle of subsidiarity is intended to ensure that decision-making in the European Union is as closer to the citizen as possible and to validate the need for action at community level considering the possibilities existing at national, regional or local level. According to The Treaty

of Maastricht (Article 3b) “The Community shall act within the powers conferred and objectives assigned to it by this Treaty. In areas not within its exclusive competence, the Community shall take no action, in accordance with the principle of subsidiarity only if and insofar as the objectives of the proposed action cannot be achieved satisfactorily by the Member States, but can be better achieved at community level due to the extent or the effects of the proposed action.” Relative to the state’s roles in the context of *fiscal federalism* and *subsidiarity principle*, according to the provision of the Maastricht Treaty, the *supranational (European)* level is in charge with coordinating the stabilization policy, its management being a competence of the Member States, and with coordinating the territorial redistribution so as to ensure that all regions of the EU offer equal opportunities and uniform provisions of certain basic services, the Member States and the local communities maintaining their responsibilities for managing social policy and income redistribution to suit the preferences of each community (Oates, 2001; Majocchi, 2008). Therefore, the *regulatory role* is centralized and shared between the national level (management) and supranational (coordination), the *distributive role* is mostly centralized and shared between the national level (management) and supranational (coordination) and decentralized at a regional and local level, depending on the possibilities to meet local community preferences. Regarding *the allocative role*, as already noted, this is the one that best meets the requirements of decentralization, depending on the characteristics of the *collective goods*, at a supranational level, here concentrating all efforts to strengthen the internal, single market.

Practically, the European Union’s vision on the policy implementation is a *decentralized one, of the “network” type, of a non-hierarchical nature, and involving sub-national, national and supranational actors*. Following the debates within the European Union, on “*European governance*”, starting from the *White Paper on European Governance*, adopted in July 2001, which defines clearly the five levels of governance: *global, European, national, regional and local* (European Commission, 2001) and describes the geographical decentralization of the EU policy and the sharing of powers and responsibilities of the type EU - member states - regions (European Commission, 2002), continuing with the debate on the *Future of Europe, the European Constitution and the Lisbon Treaty* and, more recently, *the 2020 Strategy*, one can clearly notice the *increase* in the capacity of supranational regulation along with *the decentralization of powers of economic policy at a regional level, the implementation of the principle of subsidiarity and the emphasis of the role of networks in developing and implementing European policies* (European Commission, 2001, 2003a, 2005, 2007, 2010).

However, beyond the complexity of the process of transformation of the “*European governance*” into a “*network type governance*” (Dodescu, 2011), *in terms of a future federal state*, the tendency of *supranationalization* merely means an increase in the EU powers, it being added with further performance of the three roles of the national state described by the public economy: *allocative role* (currently seen in terms of strengthening the internal market and in view of the federal state, including defence, research and development and European transport network etc.), *distributive role* (social protection and struggle against poverty), the *regulatory role* (the coordination of macroeconomic policy aiming at stability at the Union level). With a view to the European federal state, the roles of national governments are simplified, comprising the legal framework, ensuring public order, national infrastructure, public administration, regional distribution, public loans etc., while education, health, local transportation and other services of local interest will be responsibilities of local governments.

Decentralization at a regional level in the EU. Experiences

In the EU states, *the regional level* covers different political and administrative realities, being the result of a process of *decentralization* that combines the specificity of organization of state power in relation to the territory and the historical evolution of that state, to the requirement imposed by the EU of the existence of a sub-national administrative level but higher than the local one. For the EU, the need of a regional level is linked, primarily, to the implementation of financial assistance given by the regional policy, secondly, to the prospect transformation of the EU into a federal state and the high degree of autonomy granted to this level within federalism.

From the perspective of historical developments of the European states, of how nation-states were formed, federalism, however, is rather an exception than a rule, Switzerland, Germany (established in the 19th century), Austria and Belgium (established in the 20th century, in 1920, respectively in 1993) being the only *federal states* in Europe. Most European countries were founded as and are up to now *unitary states*. Obviously, in the EU, the regional level enjoys the greatest autonomy and knows the fastest growth within the *federal states* (Germany, Austria, Belgium) or *regional* (Spain, Italy and, in some parts of the territory, in Great Britain and Portugal) - intermediate structures between the federal and unitary state. For the opposite, the regional level has a reduced autonomy, existing only for administrative reasons or as a response to the need of implementing the EU regional policy within the *unitary states* (France, Netherlands, Greece, Ireland etc.).

The administrative-territorial structure of the EU Member States is extremely heterogeneous and comprises generally *a local level* (towns, villages) and *two main regional levels* structured, organized and named differently from country to country, for example, “Länder” and “Kreise” in Germany, “Regions” and “Departaments” in France, “Standard regions” and “Counties” in the UK, “Regioni” and “Provincie” in Italy etc. The launch of the regional policy of the EC in 1975 met the impossibility of comparative assessment of the economic situation in different regions as a basis for Community intervention to correct regional imbalances. Therefore, to ensure comparable statistics at European level, the EU has developed and regulated The Nomenclature of Territorial Units for Statistics (NUTS) (European Commission, 2003), a standard of geographical coding regarding subdivisions of the States defined for statistical purposes, instrumental in the mechanism of allocation of structural funds. NUTS establishes in each Member State at least three hierarchical levels: NUTS 1 (“Gewesten / Regions” in Belgium, “Länder” in Germany, “Continente”, “Região dos Açores”, “Região da Madeira” in Portugal, “Scotland, Wales, Northern Ireland”, “Government Office Regions of England” in the UK), NUTS 2 (“Provincies / Provinces” in Belgium, “Regierungsbezirke” in Germany, “Periferies” in Greece, “Comundidades y ciudades autónomas” in Spain, “Régions” in France, “Regions” in Ireland, “Regioni” in Italy, “Provincies” in the Netherlands, “Länder” in Austria), NUTS 3 (“Arrondissements” in Belgium, “Amtskommuner” in Denmark; “Kreise / kreisfreie Städte” in Germany, “Nomoi” in Greece, “Provincias” in Spain, “Départements” in France, “Regional authority regions” in Ireland, “Provincie” in Italy, “Län” in Sweden, “Maakunnat / landskapen” in Finland). The heterogeneity continues at the level lower than NUTS 3 as well, of the ‘small administrative units’: “Gemeenten / Communes” in Belgium, “Kommuner” in Denmark, “Gemeinden” in Germany, “Demoi / Koinotites” in Greece, “Municipios” in Spain, “Communes” in France, “Counties / County boroughs” in Ireland, “Comuni” in Italy, “Communes” in Luxembourg, “Gemeenten” in the Netherlands, “Gemeinden” in Austria, “Freguesias” in Portugal, “Kunnat / Kommuner” in Finland, “Kommuner” in Sweden and “Wards” in the UK etc. (European Commission, 2003b, 2008, 2011).

Therefore, for the European Union, the need for choosing a standard unit, as the basic unit for its regional policy is more than obvious. It was elected *the development region - standard unit* with an average size of 13,000 square kilometres and a population of approximately 2.5 million inhabitants, i.e. the intermediate level – NUTS 2. According to the EC, the development region *should not necessarily have an administrative character*, but it was compulsorily created in all EU Member States in order to allow comparability, harmonization of regional statistics of member countries, performance of analyses at a regional level within the EU and elaboration of Community regional strategies, policies and programs. The competition to attract structural funds triggered in time, as, in fact, the EC foresaw initially, a tendency to amplify competition not so much between Member States, but between regions of the same state or of different states, led to the occurrence of new regional actors such as associations of regions, independent from the national states, and of the phenomenon of regional lobby. At Community level, the emergence in 1985 of the Assembly of European Regions, and in 1992, by the Treaty of Maastricht, of the Committee of the Regions, are clear elements in promoting and strengthening the status of regions.

Far from being able to speak about regions as homogeneous entities in the EU, although the definition of region is not a subject of this paper, we shall however note the existence of numerous critical voices which argue that there still is no operational definition of region, from a political, juridical and administrative point of view, at the EU level, that the region is not yet and will not be any time soon at a general level in the EU, an administrative-territorial entity endowed with political representativeness. Therefore, at the EU level, *the regional decentralization* can be described better watching the process of *regionalization*, which according to the typology of particular State, may be linked to *existing regions* as administrative-territorial units or *regions created* as new territorial divisions. Analysing comparatively the regionalization as a process aimed at developing regions as entities located immediately below the central state and above the local (sub-national and supra-local) in the 27 EU Member States (Chirleşan, 2007; Diez, 2006; Stănciulescu and Androniceanu, 2006; Androniceanu and Stănciulescu, 2001), we can distinguish five *types of regionalization*, as follows:

a). *Administrative regionalization (easy administrative decentralization - by deconcentration)* is the type of regionalization resulted from the transfer by a state to *local authorities or bodies directly subordinated to the central government* of certain tasks regarding the promotion of regional economic development by mobilizing local communities and economic organizations. In most cases, administrative regionalization is a response to the need to implement the EU regional policy. The administrative regionalization characterizes at present, at the EU level, as a rule, *the unitary states*. Among the EU15 Member States, we can note Greece (where 13 *administrative regions* were formed, responsible for regional development, led by a *secretary general of the region* assisted by an *Advisory Regional Council* consisting of representatives of local communities, in each administrative region existing a so-called *House of regional development*), Portugal (where there were formed *five regional coordinating commissions* responsible for the implementation of the regional development plan under the authority of government), the UK, except Scotland (known as a “*centralised model*” characterized rather by tendencies of centralizing than of decentralizing, the importance given to the regional level began to increase after the recognition of the political-administrative autonomy of Scotland, Wales and Northern Ireland) and Sweden (the regional level has rather little relevance as compared to the local level, traditionally very strong in the “*state of consensus*”, the administrative regionalization appears here under the form of delegating attributions of regional development to a *district governor* assisted by an *Administration Board* in which local interests are represented; in addition, regional competences include, primarily, the management of health services and of the system of

education). The administrative decentralization also characterized the following New Member States: Bulgaria, Estonia, Latvia, Lithuania, Slovakia and Slovenia and knows also a great variety of forms. For example, in Estonia there is only one Estonian Regional Development Agency, the administrative regionalization is not reflected by the existence of administrative units or administrative regions, but by the fact that state's regional development policy is implemented in the 15 *districts* by a *governor*, in Lithuania – the policy of territorial planning and regional development is managed by a *governor* at the level of the higher administrative units of *provinces / departments*, in Slovakia there are 8 *regions* and 8 *offices* of regional administration responsible for coordinating the activity of the local communities in terms of regional development. Luxembourg falls into this category as a particular case; due to the small size of the state, the four regions created do not need own institutions.

b). *Regionalization by cooperation between existing local collectivities (average administrative decentralization - by delegation)* is the type of regionalization by the agency of decentralized institutions within the local authorities, the functions of central government in the field of regional development being taken by the existing local collectivities. Unlike administrative regionalization, regionalization through existing local collectivities supposes effective transfer of competences from central government to the regions created as institutionalized forms of cooperation between territorial collectivities. This type of regionalization is limited both in terms of resources and of competences and institutions. At the EU level, this type of regionalization characterizes the *unitary states* – Denmark (14 *provincial communes*), Finland (20 *regional councils* and the so-called *unions of communes*), Ireland (8 *regional authorities* and several *specialized agencies*) and – from the New Member States – Romania (8 *development regions* established by law, by voluntary cooperation of the counties, without legal personality and not being administrative-territorial units, a Regional Development Agency existing at the level each of them) and Hungary (originally there were created 8 administrative regions, which were abandoned in 1994, their functions being taken over by the *provinces*, which may cooperate voluntarily with other provinces through *regional development councils*). There is a particular case - Germany, a federal state characterized by *internal administrative regionalization* at the level of the lands (cooperation between local collectivities within the lands).

c). *Regional decentralization (advanced administrative decentralization and average economic and fiscal decentralization)* supposes the formation of regions as new territorial collectivities superior to the existing ones, whose competences regard the regional development. This type of regionalization involves changing the administrative organization of the territory by the emergence of a *new territorial-administrative category - the region*, of the same juridical form as the existing ones, but which is part of the constitutional order of a unitary state. This type of regionalism is characterized by the absence of legislative power, administrative competence extended to fields related to regional development and fiscal power that varies from case to case. At the EU level, this form of regionalization characterized France (“*unitary state in the process of decentralization*”, France currently has 25 *regions*, constituted as autonomous communities, as a result of decentralization of public administration and benefiting from the principle of free administration of local authorities, led by a *Regional Council* elected by universal, direct vote, the competences transferred to the regions following the decentralization process were the territorial planning, the professional training and the transportation infrastructure), Sweden (characterized by a strong tradition of local autonomy, has 20 *regions*, led by a *regional government* that implements the policies decided by the government, which have their own competence in managing municipal hospitals) and as for the New Member States - Poland (16 *provinces*, whose leader controls the respective local community), the Czech Republic (the

formation, under the Constitution, of territorial collectivities of a higher level, in the form of 3 *regions*).

d). *Political regionalization (political decentralization or the so-called “regional autonomy”)* adds legislative power to the regional decentralization. *The regions* have legislative power exercised by a *regional assembly* and in order to exercise competences an executive body is constituted, which has the features of a *regional government*. The competences of the region are much broader in this case and are defined and guaranteed by the Constitution of the unitary state. The regions are not countries and do not have a Constitution and usually do not participate in the exercise of legislative national power by their own representation. This type of regionalization affects the state’s structures. In the EU, it is characteristic to the so-called *regional states* - characterizing the whole territory in Spain (the right of autonomy of the *regions* is recognized and guaranteed by the Spanish Constitution – the state’s structure is based on the indissoluble unity of the Spanish nation and also on the recognition and guarantee of the right of the regions’ autonomy), Italy (under the Constitution of Italy, the Italian Republic, unique and indivisible, recognizes, at the same time, the autonomy of *the regions* by adapting legislative principles and methods to the requirements of autonomy and decentralization, the regions have the power to adopt primary legislation and enjoy financial autonomy) or only certain parts of the territory in the UK (Scotland in particular) and Portugal (the islands). This type of regionalization does not characterize, currently, any of the New Member States.

e). *Regionalization by federal authorities (federalization)* is characteristic to the *federal states*, which were born as unions of states, therefore, *the regions*, in this case, are *states*, political entities, which have a series of regional and ethnic features. Unlike political regionalization characterized by an asymmetry of institutions and competences, the federal state supposes equality in the rights of the member states. At the EU level, this form of regionalization characterizes Germany, Austria and Belgium. While the building of the modern state in Germany and Austria was done through federalism, in Belgium regionalism led to the federalization of the state, in order to allow the formation of a structure that shall ensure greater autonomy to the component units (the case of Flanders), which will progressively accede to the quality of a state. The model of federalism that characterizes Germany is called *cooperative federalism* in which power is distributed among three levels: federal, statal (Länder) and local (regions, cities and communes), the relations between these levels being relations of cooperation dominated by the idea of “*administrative intermingling*” of tasks and competences. From a fiscal point of view, all territorial levels participate to the tax collection to the extent to which they are also responsible for the expenses. As in Germany, in Austria the lands benefit from more competences and resources, their main function being the implementation of public policies, with the distribution of competences between the federation and the lands and the strengthening of the lands’ position being permanently debated.

Obviously, this last form of regionalization, due to its high level of decentralization and territorial autonomy, answers better, in terms of functionality and stability, to the complexity of *European governance*, the functional adaptations on levels (supranational - federal - state - regional - local) are more easily absorbed by the federal structures. This leads, however, to a series of wrong approaches, the federalism being considered an expression of regionalization or a response to regionalism as opposite to the Nation-State. The main concern in the EU is that *the combination of federalism and regionalization* affects the *territorial integrity*.

Conclusions and future concerns

What we aimed at in the start of this approach - a comparative analysis of the experiences and tendencies of decentralization at a regional level in the EU - led us to formulate the following conclusions:

- In the EU countries, *the regional level* covers various political and administrative realities, being the result of a process of *decentralization* that combines the specificity of the organization of the state's power in relation to the territory and the historical evolution of that state with the European Union's requirement, that of the existence of an administrative level inferior to the national level but higher than the local one.
- The *regional decentralization*, typical to France, and embraced by Poland and the Czech Republic, from the New Member States, is an exception rather than a rule in the EU.
- At the EU level, the *regional decentralization* can best be described following the process of *regionalization* which, depending on the typology of a certain state, may be related to the *regions existing* as administrative-territorial units or to the *regions created* as new territorial divisions.
- The most common type of regionalization in the EU27 is the *administrative regionalization* (Greece, Portugal, United Kingdom except Scotland, Sweden, Bulgaria, Estonia, Latvia, Lithuania, Slovakia, Slovenia), followed by the *regionalization through existing local collectivities* (Denmark, Finland, Ireland, Romania and Hungary), which represent rather functional responses to the EU's requirements in order to allow absorption of funds allocated under the regional policy.
- The more advanced forms of regionalization - *regionalization by federal authorities* and *political regionalization* - characterize only 7 Member States of the EU: Germany, Austria, Belgium, Spain and Italy, Portugal (for the islands) and United Kingdom (for Scotland).
- The relationship *federalism - regionalization* responds better to the *European governance* of the *network type* and of the *multi-level type*.
- The expansion of *regionalization* in the EU is favoured by its approach as an *opportunity of regional development* and the blockages of regionalization are related to its approach as a *threat for the territorial integrity*.

Consequently, our future research efforts will focus on identifying and analyzing in detail some models of best practices that have proven effective in the EU for the regional growth and development.

THE INTEGRATION OF YOUNG ECONOMISTS ON THE LABOUR MARKET. THE PROFESSION OPTION – A DECISION FOR CAREER AND FOR A LIFESTYLE

Dodescu Anca

Pop CoHuț Ioana

Borza Adriana

University of Oradea, Faculty of Economic Sciences

Knowing the importance of the integration process of graduates of higher economic studies on a labour market that is becoming more and more demanding, as well as the fact that professional objectives realistic defined represent an essential demand of performance, the present paper aims to determine the relevance of personal decision capacities as a favouring factor of a concrete career option for economist students.

Our research is based on information and statistical data obtained through applying tests and questionnaires on economist students from licence and master studies from three universities: University of Oradea, The West University of Timișoara and “Ștefan cel Mare” University of Suceava, in the project called PRACTeam „The practice of economist students. Inter-regional partnership on the labour market between universities and the business environment” Project co-financed through the Social European Fund, Through the Operational Program Human Resource Development 2007 – 2013 – „Invest in people!”.

In essence we leave from the premises that the professional option reflects a specific side of individual’s personality which does not choose only for a certain occupation but, implicitly for a certain lifestyle. As a diagnosis approach we assume axiomatic the thesis according to which the high level of congruence between the individual psychological availabilities and the occupational environment raises the satisfaction chance and professional success.

The approach that we submit is an interdisciplinary one, as well as the research team formed of two economists and a psychologist. Our study proposes to identify the correlation between the individual decision ability of the subject and the compatibility between a specific interests set of abilities identified on the basis of individual tests. Also, on the basis of processing the results obtained of economist students at the personality tests, we will try to argument explaining the option of some subjects for professions that demand individual qualities that their personality does not imply at the level asked.

Key words: labour market, profession option, economist students, career

JEL Codes: J01, A11, M50, A20

The psychological perspective over young people’s integration on labour market. Individual abilities, occupational environment and career decision

The compatibility between profession and person has been theorised according to some classical models leaving from some common elements of observation, that consider the fact that people are different and work environments are diverse, that the individual option is guided on the basis of determination of a specific set of abilities and interests with the help of some psychometric tests. The model of „matching” between the person and the work environment has been extended by the authors such Rodger (1952), in England or Holland (1959, 1973, 1985) in USA, who observed that between the occupation of a person’s and profession there are often differences that reflect equally a personal option and also the general state of the art of the society and especially a certain economic conjuncture. The application of those models takes to the conclusion that it is

normal that between the profession (qualification) that a person acquires through study and the occupation of that person exists a consistent continuity.

On the labour market, once ending the training, graduates of diverse educational cycles are confronted with the need of exploring the workplace offer. Generally speaking, the choice of a profession is made on the basis of some descriptions of the teaching system components and of the organizing ways. After the accumulate preparation and certificates students make personal career scenarios.

In order to acquire a best insertion of work force on the labour market the graduates and the holders of professional certificates must inform as exactly as possible regarding the occupational alternatives. Usually the occupational information allows individuals to affine the occupational alternatives congruent to the interests, values and abilities proved during the studies. Also, occupational information allows familiarisation to the labour market, the evaluation and identification of negative and positive aspects in order to mend the perceptions of stereotypes about certain occupations. In essence, the information about certain occupation refers to: educational requirements, needed competences and tasks, the nature and environment of the work place, work schedule, the wage standard, the statute offered, lifestyle imposed, promoting opportunities, diverse aspects regarding the professional ethics and respectively the current demand on the labour market (Lemeni & Negru, 2008).

Theoretically, we can consider the career decision as “the process that leads to the selection of a career alternative from the amount of choices available at a certain moment” (Lemeni, 2008). The literature in the field distinguishes three components that interact in the career decision: decision content, the decisional process and the context of the decision.

We can identify a series of individual differences regarding the way one chooses a career. Evaluating the alternatives we observe different decisional styles. There have been identified, on theoretical level, several classifications of the decisional styles. Therefore, we admit that we might have at least the following possibilities:

- rational style (logical and organised approach of decision on the basis of some sprung plans);
- dependent style (the choice is done leaving from advice and directions from closest people);
- avoiding style characterised through postponing;
- intuitive style based on impressions and moment impulses;
- spontaneous style (without deliberations, the decision is rather passionate).

It is obvious the fact that for decisions with long term implications, such as the career decisions, the rational style is the fair solution.

Methodological aspects. The analysis of individual capacities and career decisions of economist students

Baring in mind what we have shown earlier, our study tries to clarify the proportion that is born between the context of decision and its content. Regarding the context of the career decision, we look for explanations considering internal and external factors that influence the complex decisional process.

Internal factors represent the conditions that facilitate individual option for a certain educational and occupational trajectory. In our study, internal factors have been quantified on the base of *measuring the self knowledge of subjects* (interests, values, habits and personality characteristics), *the evaluation of decisional abilities* especially the capacity of correlating self knowledge with the professional and occupational offer. Also, the decisional abilities have been qualified through reporting to the individual’s capacity to analyse alternatives, to take into account and the certainty of the individual that he disposes of consistent means to choose the most appropriate option for himself or herself.

Regarding *the extern context*, we used as a theoretical modelling element a situation reflected by elements that have been identified on the labour market at the present moment. The structure of

opportunities has been modelled into the perspective of jobs in economic field that the labour market offers to students and graduates of economic studies.

As a research method we used questionnaire, applied to a number of 189 students and graduates of economics, participating in the PRACTeam project.

Our study aimed to measure for the tested subjects *the decisional capacity indicator* using a Likert scale from very weak to very good. In order to identify the items there have been used the following instruments:

- decisional ability test (evaluates the rationality of the decision maker, consists of 14 items that describe decisional situations and present alternatives for which the subjects choose, the items being formed as possible choice situations);
- Interest evaluation questionnaire (IEQ) (evaluates the preference of a person for a certain activity or area of knowledge, it is formed of 60 items, grouped in six correspondent scales, to the six groups of interests from Holland's theory: realistic, investigative, artistic, entrepreneurial and conventional).

The hypothesis that we need to statistically validate is that individuals with a high decisional capacity (good, very good), correlate significantly with the set of specific interests and aptitudes determined on the basis of individual tests and personal option for a professional track in economic or other field. In a first phase, the results obtained at the IEQ (objective measure of individual capacities), in terms of a combination of three characters according to the Holland's classification code, has been confronted with the manifested, clear, asserted professional option as a choice of one of the economic specializations: International businesses; The economy of commerce, tourism and services; Finances and banks; Accountancy and stock control informatics; Management and Marketing (to be seen *Table nr. 1 The distribution of subjects according to the preferences for certain economic fields*).

Table nr. 1. The distribution of subjects according to the preferences for certain economic fields

Specialization	The first result on types of jobs according to Holland classification						Total
	Entrepreneurial	Conventional	Social	Realistic	Investigative	Artistic	
International businesses	8	9	11	0	0	0	28
The economy of commerce, tourism and services	9	7	15	1	1	1	34
Accountancy and stock control informatics	2	22	5	1	0	0	30
Finances and banks	4	18	7	0	2	3	34
Management	14	7	5	1	1	0	28
Marketing	10	10	10	1	1	3	35
Total	47	73	53	4	5	7	189

As it is shown in Table nr.1, the distribution of subjects is kept in the expectance horizon created on the basis of common perception over the competencies that are offered to graduates through the specialisations chosen. Students who have chosen International business are grouped in the area of social (11), entrepreneurial (8) and conventional (9) posts. They are aware of the fact that the specializations that they have chosen implies intense interpersonal relationships and

communicating with people (descriptors of social post) managerial and organizing abilities, the capacity to make decisions and assume risks (descriptors for the entrepreneurial post). The polarization in the area of conventional post might seem a paradox in this context, but their orientation towards success implies a realistic passing from working with ideas towards practical manipulation of some concrete data and details from an organised frame.

Management specialization has the options concentrated according to the expectancies in the area of entrepreneurial posts (14) while students in the Accountancy and stock control informatics as well as Finances and banks chose in majority (22 out of 30, respectively 18 out of 34) for conventional posts. Their preference for rigorous checking routines and their bent for organized work through procedures reflects a specific coherence between the subjective set of expectancies regarding own career and the nature of tasks that they are going to effectively fulfil.

Overall, we conclude that the distribution of the subjects confirms the existence of a common mentality *pattern*. We expect intellectual dynamism, advanced communication skills and good negotiation skills from an International businesses specialist. Accountancy implies rigour and inclination towards routine, availability to procedural acting and fulfilment of routine tasks. The specialization Economy of commerce, tourism and services takes the weight centre of preferences in the direction of social posts, where the accent falls on communication with people, helping people and providing services to them.

Table nr.2. Correspondence between the level of decisional capacity and the choices in favour of some professions associated to the field

Specialization	Total respondents/ specialization	Scores at the decisional capacity GOOD and VERY GOOD	Holland codes/ professions associated to the field ⁴⁹
International businesses	28	10	ACR
The economy of commerce, tourism and services	34	24	ACS
Accountancy and stock control informatics	30	19	CIA
Finances and banks	33	16	ASC
Management	27	7	ISC
Marketing	35	17	AIC

As we can see in Table nr.2 and Table nr.3 regarding the distribution of decisional capacity on specializations, the most relevant correlation between the decisional capacity, personal qualities and the specialization chosen appears in subjects enrolled at specialization Economy of commerce, tourism and services. Also, relevant figures appear for the specializations Accountancy and stock control informatics (19 out of 30 subjects proves good decisional abilities), Finances and banks (16 out of 33) and Marketing (17 out of 35). The students, who follow specializations in fields with a clearly defined occupational area, prove better decisional abilities, they choose following well defined objectives and their expectancies regarding their own career prove to be more realistic.

The low scores obtained in the case of specializations International businesses and Management, explain through the relative attractiveness of the areas with new opportunities of self development. The two fields are suitable to occupational areas much more diverse, fact that

⁴⁹ Holland Codes/professions associated to the field: ACR – entrepreneurial, conventional, realist; ACS – entrepreneurial, conventional, social; CIA –conventional, investigative, entrepreneurial ; ASC – entrepreneurial, social, conventional; ISC –investigative, social, conventional; AIC –entrepreneurial, investigative, conventional.

creates the general impression of large opportunity. In fact, on a real labour force, these specializations do not have a large opening. The possibility to employ economists in the field of International businesses is in expansion, but the field still remains an exclusivist one and the chance to employ comes from an equation with quite many variables. The lowest score (7 out of 27) register students enrolled in Management, which is quite surprising. These scores can be attributed, in our opinion, to the obscure significance of management term at the level of common sense and in the context of managerial deficit that regional economy is confronted with. The candidates apply to these specializations on the basis of some choices determined by extern factors (parent's wish, diverse preconceptions regarding what they think "a manager is") and under the pressure of a subjective "mythology" tagged of many preconceptions.

Table nr.3. Data regarding the decisional capacity distribution according to the specializations

Specialization	Decisional capacity					Total
	Very weak	Weak	Medium	Good	Very good	
International businesses	4	5	13	5	1	28
The economy of commerce, tourism and services	3	6	19	4	2	34
Accountancy and stock control informatics	3	6	18	2	1	30
Finances and banks	8	7	15	4	0	34
Management	2	8	12	5	1	28
Marketing	5	8	13	7	2	35
Total	25	40	90	27	7	189

The statistical processing of results validates the hypothesis analysed. We can identify a significant correlation of high scores obtained by subjects at the decisional capacity test, and a relative correspondence on the area of correlations between the personal set of interests (determined on testing with the interests questionnaire - IEQ) respectively the option for a specialization or another. In a concrete way, students who have obtained high scores at the decisional capacity test (to be seen *Table nr.3. regarding the distribution of scores obtained at the decisional capacity tests according to specialisations*) are enrolled in specializations that imply interests and aptitudes in consonance with profession descriptors associated to the license that they are going to obtain.

Conclusions

As a conclusion, the difficulties encountered in the decisional process of subjects seem to be determined firstly by a series of irrational beliefs (myths) regarding the choice of a career and especially of the inconsistency of information about themselves or about opportunities. Obtaining some clear information and not contradictory about themselves can be partially realised with the help of specialists in human resources.

As the data processing reveals, a significant part of subjects obviously operate influenced by contextual pressures derived on one side from elements that regard economic realities (labour market offers important opportunities to fructify education in entrepreneurial field), as well as influenced by a common set of preconceptions. It persists the idea that economic studies offer an easy enclosure on the labour market and, often, individual option is determined by advices and

incentives of some persons with presumptive authority (parents or close friends). Between those, dominates the preconceptions according to which occupation that they will have after graduating from university will be in direct relation to the license obtained at graduation. But on the real market of workforce, the transition proved by the power of evidence that several diplomas does not automatically mean more competence. The tendency to value exclusively and in a narrow field academic education is a not adjusting belief: we must admit and take decisions remembering the fact that the relation between educational programmes and workforce market is not clearly and univocal determined in all fields.

Entrepreneurial occupations, as it results from our data are marked by a relative difference of phase between the university specialization chosen by the subject and the type of occupational interests that resulted after testing. These discrepancies, associated with a low decisional capacity take to choices influenced by conjuncture. The subject chooses the specialization ignoring the personal set of qualities and real interests as he is confronted with a severe need to maximise chances to occupy quickly a place on the an extremely restrictive labour market. The identification of a groove, the opportunism and the failure fear (specific data of an unfavourable economic context) determine the subjects to primary take into account external factors. The global economic crisis and post-transition effects that manifest on the Romanian labour market are arguments that allow interposing conjuncture options in the horizon of normality. Even more, the dynamics of workforce demand represent an important signal for higher economic education regarding the large dispersal of the fundamental field Economic Sciences in too many specializations, in our opinion, at level of BA programs in the conditions in which general economic education and interdisciplinary education seem to be more appropriate formulas in the context of the labour market dynamism.

The current paper presents the preliminary research results in a field that we discover and consider as being fascinating and of real importance and actuality. Our future approaches will be headed to define a set of proposals of measures, strategies, politics destined to higher economic education in order to facilitate the integration of young graduate economists on the workforce market and monitoring the entrepreneurial professional track of economist graduates.

DYNAMICS ECONOMIC DISPARITIES IN NORTH-WEST REGION OF ROMANIA

Florea Adrian

University of Oradea Faculty of Economics

Even though over the years has enjoyed wide media coverage, with highlighted aspects, discrepancies and inequalities of economic potential between different regions of the world, or even parts of the same countries always remained topical. Difficulties arising from these differences were always felt, extremely painful by humans.

Analyzing distinctly, participation of each county to the GDP of the Northwest Region and the composition of all indicators, we can identify significant discrepancies between counties, regions and municipalities. This is one of the reasons that led us trying to identify the causes that generated the current situation. From the perspective of the contribution of each county in the Northwest Region to Region's domestic product composition, the first place is taken by Cluj county 32.3%, followed by Bihor with 24.3%, Maramures, with 14.9% Satu-Mare, 12.1%, Bistrita-Nasaud, 9.1% and 7.2% Salaj. Consulting of the Regional Operational Programme 2007-2013 indicates that the poorest areas in the Northwest Region are in Maramures and Bistrita-Nasaud.

An important part of the active population of North-West Region was employed in public enterprises and an increase of unemployment in the counties of Salaj, Satu Mare and Maramures became predictable, imminent amid restructuring of public enterprises with losses. Studies of employed population by sectors of the economy, shows a high rate of population employed in services in the counties of Cluj and Bihor and high employment in agriculture on other four counties. In a modern market economy, services are most concentrated labors, and how the workforce is distributed in the Northwest region also shows an imbalance. How Northwest Region is participating in international economic cycle has major effects on the population's living standards. Relevant for the inter-district disparities analysis is the human and agents behavior analysis and the savings and loan relationships. How people behave in these ratios in each county tells us much about their economic profile.

Attenuation of long distance gaps in the Northwest region remains a very complex problem, attempts to decrease it, is bringing into question, not infrequently contradictory strategies. Supporting the few remaining state-owned enterprises in the region could lead to a revival of activity, attracting attention of foreign investors can thus lead to recovery of much of the labor resources of the Region. Expansion and modernization of transport and distribution networks would provide a further chance to faster development of the North-West by exploiting the growing regional economic resources available, enhancing economic relations both intra and extra regional.

But we can not fail to mention the part state should play in orchestrating these measures. Despite the independence of regions, they are subordinated to the central administration, and strategic investment policy depends to an overwhelming extent of it. Only by linking effective measures at national, regional and local level will alleviate the sustainable economic gaps.

Keywords: disparities, restructuring, reforms, investments, consequences

JEL: E01, E24, J11, R12, W24

The issue of disparities and inequalities of the economic potential existing between different regions of the world or even between regions of the same countries always remained valid, despite the fact that over time it has received wide media coverage. Difficulties arising from these differences were always felt particularly painful by humans.

Currently, the economy is characterized by an increased mobility of all its components, and economic disparities have begun to worry more and more economic researchers. As a result, simply finding the economic disparities is not satisfying anyone anymore. Maybe that's why people who believe that it is necessary to identify the necessity to maintain and deepen the gaps identified cases depending on the particularities and specificities of each area. It must also decipher their consequences, because they are not limited to the current period, but designing, influencing economic relations on a longer period. In the spirit of the statement we want to present an analysis by geographical regions, North-West of Romania. Among the envisaged objectives we include: identifying the causes of economic disparities emphasis of inter-county geographic area North West of Romania, which are the economic effects of these inter-district disparities

According to information provided by the Regional Development North West Agency, the North-West region (northern Transylvania) is close to European markets, with good road access, rail and air has a strategic geographical position, being the gateway to Romania from the European Union and Ukraine. Even if the region is crossed by 7 European roads, has peripheral position over the European transport corridors, the connection with eminent poles in the neighborhood, with other regions is still difficult. According to the same sources, the North-West of Romania has an area of 34,159 km² representing 14.3% of the total area of the country. Part of this region are the counties: Bihor, Bistrita-Nasaud, Cluj, Maramures, Satu Mare and Salaj having a population of 2,744,914 (14.32% of the total population of the country) and has an average density of 80.1 inhabitants per square kilometer. For that is the number of administrative-territorial units (421), distributed as follows: 42 cities including 15 municipalities, 398 communes and 1823 villages.

Analyzing separately each county participating in the formation of regional GDP and the composition of the indicators, we can identify significant discrepancies between counties, regions and municipalities. This is one of the reasons that led us trying to identify the causes that generated the current situation.

From the perspective of contribution each county has in North-West Region's domestic product formation, first place is taken by Cluj county with 32.3%, followed by Bihar with 24.3%, Maramures, with 14.9% Satu-Mare, 12.1%, Bistrita-Nasaud, 9.1% and 7.2% Salaj. Consulting of the Regional Operational Programme 2007-2013 indicates that the poorest areas in the Northwest Region are in Maramures and Bistrita-Nasaud. Here were identified most areas of industrial decline. Intra-regional differences are closely related to the degree of industrialization, the counties most powerful and industrialized early - Cluj and Bihor - having a high proportion of the employed population (44.5% and 45.7%), while less counties and later industrial - Satu Mare and Bistrita-Nasaud - have lower weights (39.6% and 38.0%). Un-industrialization has led to a restricted job use in industry in counties of North-west, but with large differences from one area to another.

Table 1 Unemployment in North-West

	2007	2008	2009	2010
Bihor	2,4	3	5,8	5,8
Bistrița	2,4	2,8	8,2	6,3
Cluj	3	2,9	6,3	4,9
Maramureș	3,4	3,7	6,4	6
Satu Mare	2,6	3	6	6,3
Sălaj	4,4	5,5	10,3	8,2

Made by author based on information found on the website:

<http://www.insse.ro/cms/rw/pages/buletinStatJud.ro.do>

An important part of the active population of North-West Region was employed in public enterprises and an increase of unemployment in the counties of Salaj, Satu Mare and Maramures became predictable, imminent amid restructuring of public enterprises with losses. Other areas in decline are: the Apuseni Mountains and the northern mountain area. Mining sector restructurations has affected this sector and led to massive layoffs in the area of Baia Mare-Borsa-Viseu.

A lower number of unemployed in Cluj and Bihor to the major foreign investment, which have diminished, even partially, the effects of industry restructuring. North-West has attracted a relatively high number of firms with foreign participation, sometimes grouped in clusters (eg major foreign investors in Bihor County - primarily producers of technological equipment). But we can observe that they are generally SMEs, who often work as subcontractors or contract work or operate based on business ties, traditional Western Europe. It should be noted that SMEs present in the Northwest region of the country accounts for 15% of the national total. The existence of foreign investors to operate in the same field at the same time can create both advantages and disadvantages. On Bihor 's labor market multinationals had a visible contribution to the unemployment rate and the constant increase in demand for qualified manpower, services development.

Studies of employed population by sectors of the economy, shows a high rate of population employed in services in counties of Cluj and Bihor and high employment in agriculture on other four counties. In a modern market economy, services are most concentrated labors, and how the workforce is distributed in the Northwest region also shows an imbalance. Counties in which the employment of labor resources is higher in services, like Cluj and Bihor, also raises the level of economic development compared to other counties.

The presence, quite shy, of industrial parks in the Northwest Region counties, and also their unequal distribution in the Region, is supplying the gaps. We notice the early existence in Cluj County of three industrial parks: Tetarom1 Cluj-Napoca, Cluj Napoca Tetarom2 , Dej ARC Park, which attracted investments of hundreds of millions of euros. A significant impact on the local economy has the making of the industrial park of the Finnish giant Nokia (Tetarom3), Nokia investment reaching half billion euros. Existence in Bihor county of those two industrial parks, one located in Oradea and one in the west of the county, between Oradea and the border with Hungary, has created a domino-type effect, attracting other foreign investors and companies. So Shin Heung Precision of Korea, U.S. Plexus that made investments of over EUR 20 million and a Canadian company that produces equipment (Celestica) made an investment of over 84 million, those 3 assuring to employ over 3,000 people. In other county we could see 25 million euros invested by the French company Michellin in a tire factory in Zalau, the Natuzzi Italian corporation in a furniture manufacturing facility in Baia-Mare in the amount of 40 million euros in Satu Mare Schemmer German company has invested 10 million euros in the production of tubes for cable protection, and in Bistrita-Nasaud a germany company Leoni Wyring System's

presence is noted, producing automotive wiring, but also companies with Italian capital such as Tesitura, Italtexil and Storia, active in textiles field. In all counties in the region, except Bistrita-Nasaud, industrial parks have been established.

The top foreign investors in the county of Cluj is the leader of the Region, and placing their capital where conditions exist for achieving higher returns. All these elements lead to the development of the labor market, bringing financial resources, significantly reducing the unemployment rate, while generating an increase in GDP per inhabitant (Table 2).

Table 2 Average monthly wage

	Salariați (raportat la totalul populației) (%)	Salariul mediu net lunar(euro)	PIB (pe cap de locuitor)
Bihor	27,3	249	5550
Bistrița	19,2	261	4712
Cluj	28,5	345	7100
Maramureș	17,8	235	4090
Satu Mare	19,5	259	4459
Sălaj	17,6	265	4337

Source: National Commission for Prognosis <http://www.cnp.ro/ro/prognoze>

In the Northwest Region, we noted important differences between the counties both in terms of number of employees compared to the total population, the net average wage, and GDP per inhabitants. A cause of this situation may be the preference of investors to place capital in more developed counties, such as Cluj, at the expense of others. Another effect of the existence of gaps in the North West is population migration. If the external migration is already well known, became a phenomenon very carefully studied by the European institutions, migration between counties in the Region being seriously considered, to my knowledge, until now.

Relevant inter-district disparities analysis is to analyze the behavior of the population and the savings and loan relationships. How people behave in these ratios in each county tells us much about their economic profile.

The information presented in the table 3, allows us to identify different behaviors for each of the counties residents regarding loans and deposits. As expected, most of the loans (in absolute value) are in the county of Cluj, followed in order by Bihor, Maramures, Satu Mare and Bistrita-Nasaud. Perhaps more relevant is the percentage of outstanding loans, Cluj and Satu Mare, where only 9.8% and 9.1% of total loans, Bistrita-Nasaud most delicate position having 18.2% of total loans, while the values of Bihor and Maramures 13.2% and 11% standing in the middle somewhere.

Following the structure of loans, it is noted that in the Maramures home credits do not exceed 31.7% of total loans to the public. The explanation could be given by the fact that a large number of Maramures people are working abroad, money they send being used primarily to create new residential areas, so the necessary credits for this area is smaller. Cluj in turn, has the highest share of housing credits in total loans, approximately 42.44%, this being due to increased development of the area in recent years, the number of students who chose Cluj as the city of residence after graduation, relatively high price of real estate in this area compared to other areas as well as greater employment and income more consistent work performed by residents in the area. Bistrita, Satu Mare and Bihor have comparative value of real estate loans in total loans ratio, with values ranging between 34% and 36%, remarkable being the fact that in absolute value Bihor is ranked second after Cluj with a double value total loans and real estate compared to the other counties.

Table 3 Information on credit report in the Northwest Region (mil. RON)

	Total credite Lei și valută	Total restante Lei și valută	Total credite populație Lei și valută	Total credite locuinte Lei și valută	Total depozite la termen lei și valută
Bihor	6071.9	1788.5	2575.8	645.3	2395.8
Bistrița	2135.5	809	1170.2	290.3	1026.7
Cluj	9197.8	862.8	4694.9	1574.7	5583.6
Maramureș	3107.9	264.5	1445.1	305	1524.9
Satu Mare	2632.1	193.1	1099.4	266.5	1040.1

<http://www.bnr.ro/Indicatori-agregati-privind-institutiile-de-credit-3368.aspx>

Attenuation of long distance gaps in the Northwest region remains a very complex problem, attempts to decrease it, is bringing into question, not infrequently contradictory strategies. Supporting the few remaining state-owned enterprises in the region could lead to a revival of activity, attracting attention of foreign investors can thus lead to recovery of much of the labor resources of the Region. The level of resource utilization services sector should also be carefully considered.

Expansion and modernization of transport and distribution networks would provide a further chance to faster development of the North-West by exploiting the growing regional economic resources available, intensifying economic relations both intra and extra regional.

But we can not fail to mention the part state should play in orchestrating these measures. Despite the independence of regions, they are subordinated to the central administration, and strategic investment policy depends to an overwhelming extent of it. Only by linking effective measures at national, regional and local level will alleviate the sustainable economic gaps.

ANALYSIS OF ECONOMIC GAPS BETWEEN URBAN AND RURAL ROMANIAN AREAS

Gâdiu Valeria

Universitatea Babeş-Bolyai Cluj-Napoca Facultatea de Ştiinţe Economice şi Gestiunea Afacerilor

Toader Valentin

Universitatea Babeş-Bolyai Cluj-Napoca Facultatea de Business

In this paper the authors will perform a comparative analysis of the impact that the population residential areas have on the economic and social activity from Romania. Our analysis will be carried out for a time span of 10 years, between 2000 and 2009. The main purposes are to emphasize the economic gaps between the residential areas (urban and rural) and to identify the factors that determine these gaps.

The economic differences between rural and urban areas and their impact on the peoples' standard of living represent an important issue for international institutions like IFRC, UNICEF or OECD. Also, this topic represents a frequent subject in the economic literature from poor and developing countries. Studies conducted by Huong and Booth (2010), Alister, Alana and Ayele (2007), Chao, Zhidong and Mingxing (2008), Mateoc-Sîrb, Mateoc, Darvaşi and Mănescu (2008) or Sahn and Stifel (2002) are representative examples. Most of these papers focus on the living standards differences generated by the differences between income and expenditures between urban and rural areas.

To achieve our goals, we will use the statistical methods to analyze the data released by the National Institute of Statistics. We will try to find some correlations between the economic indicators – household incomes, value and structure of household expenditures, structure of household expenditures – the social indicators – residential area, education level, age and occupation. The highlight of the gaps between the rural and urban areas will be the main objective during this analysis.

We conclude that in Romania there are substantial differences between rural and urban areas. The income differences are determining different consumption patterns between rural and urban persons. In rural areas, the population is spending less in all goods and services aspect that reduce their standard of living. Anyway, the results obtained are the subject of at least two possible limits. The fact that the data series are too short may affect the results we have obtained. Also, the economic gaps analyzed represent an average for the whole country, what means that in some regions these differences may be even higher.

Keywords: economic gaps, households' incomes, households' expenditures, consumption, social indicators

JEL classification: E21, E24

Introduction

Since 2000, the macroeconomic evolutions led to an increase in the level of income per capita. Unfortunately, the differences between rural and urban area continue to be high. In Romania the population below the poverty line is about 15%, the level of rural poverty being double than the level of urban poverty. More than that, “75 per cent of poor children live in rural areas, where the poverty risk is three times higher than for children living in urban areas. Moreover, one third of these poor children live in agricultural families, with a poverty ratio seven times higher than for

children living in families with at least one employee” (IFRC 2010:1). The problem of widening disparities between regions in the case of Romania is also identified by UNICEF.

The gap between rural and urban area is a concern for the European Union policy, because rural areas must exploit their potential or risk falling further behind urban areas (OECD). Member States can use their rural development programs to deliver the priorities of knowledge transfer, modernization, innovation and quality in the food chain, investment in human capital and the creation of employment opportunities (Programul Național de Dezvoltare Rurală, 2007 – 2013).

The Transnational Co-operation Programme for a European area in transition on the way to integration "South East Europe (SEE)" 2007-2013 under the European Territorial Cooperation is significant for the regional disparities in terms of economic power, innovation, competitiveness and accessibility between urban areas and rural areas.

For Romania, within the "Operational Programme Increase of Economic Competitiveness" Programme under Convergence objective co-funded by European Regional Development Fund (ERDF), the general objective is the increase of Romanian companies' productivity, in compliance with the principles of sustainable development, and reducing the disparities between rural and urban areas.

Through the Millennium Development Goals are eradicate extreme poverty and hunger, achieve universal primary education, ensure an environmental sustainability by reducing discrepancies between rural and urban areas (UNDP).

The paper is structured as follows: the literature review chapter presents the results obtained in some representative papers on this subject, in the methodology we describe the analysis and the data used in the study, while the part with results and discussions enhances the results we obtained during our analysis.

Literature review

Using data from Household Living Standard Survey, most of articles are presenting analysis of significant urban-rural discrepancies in poor countries.

In Vietnam, the economic differences between rural and urban areas have increased dramatically from 1993 to 1998, and peaked in 2002 before reducing slightly in 2004 and significantly in 2006. The urban-rural gap increases across the expenditure distribution, the components of expenditure. Also, the differences are in education, household demographic structure, industrial structure and related returns (Thu Le, Booth 2010: 8-14).

In the study "Urban-rural inequality in Africa", the authors measure inequalities in African countries, and determine the extent to which these inequalities are a consequence of discrepancies between urban and rural areas (Sahn and Stifel 2002:12-17). The analysis focuses on living standards, the asset index, education and health. The conclusion is that the living standards in rural areas lag far behind those in urban areas. The gaps between urban and rural areas are in fact dramatic spatial differences.

The paper "An empirical research of urbanization and urban-rural gap in China: 1952-2005" presents two important problems of urban-rural relationship in China nowadays: the accelerated urbanization process and an enlarged urban-rural gap. The researchers emphasize the urban-rural income gap. There is an intensively positive correlation between urbanization and urban-rural consumption gap. The rapid urbanization results in the increase of urban-rural inequalities (Chao, Zhidong and Mingxing 2008: 404-406).

"The urban-rural divide: Myth or Reality?", a study of teachers from Great Britain presents different types of deprivation, measures of deprivation and an analysis of why urban people are more deprived than rural people (Alister, Alana and Ayele 2007:16-19).

In the paper "A study on life quality in the rural area" the authors argued with the idea that in the developed economies there is a trend to remove differences between rural and urban and starting from these premises the authors are making an analysis of the life quality in the Romanian rural

area in 2001-2007. The conclusion is that in Romania there is still a major discrepancy between rural and urban which is not beneficial for the Romanian rural area (Mateoc-Sîrb, Mateoc, Șeulean, Darvași and Mănescu 2008:118-121).

Professor Maria Vincze shows that one disadvantage of rural development in Romania is the lack of horizontal link between communes, difficult collaboration, connections between cities and unbalanced surroundings areas (Vincze 2000:7).

Methodology

In order to achieve our goal, we will focus our analysis on the following differences between rural and urban areas:

- the endowment with durable goods
- the level and structure of households' incomes and expenditures
- the structure of consumption.

The endowment with durable goods will be evaluated using a qualitative scale. We will take in consideration eleven durable goods: washing machine (automatic or no), TV (white-black or color), computer, phone (fix and mobile), refrigerator, stove, fridge, vacuum cleaner, stereo system, car and freezer. The index of endowment with durable goods was constructed using a weighted mean between the weight of each durable goods and the share of households that own these goods (out of 100 households). The value obtained will show the average endowment level with durable goods. The lowest value may be zero – which means the households do not have durable goods at all -, while the highest value may be 100 – which means that all households have all the eleven durable goods taken in consideration.

The analysis of incomes and expenditures will be realized using real values. The data series have been deflated by the inflation values, all the data (incomes and expenditures) being expressed in the prices of year 2000. Thus, the time series will reflect the real evolution of incomes and expenditures, an evolution in a situation of constant prices. The influence of other factors on incomes and expenditures evolutions was determinate using regression equations.

The quantification of educational level for the head of household is realized using a scale from 1 to 3. If the value obtained is near to 1, it means that the majority of households' heads have primary educational level; if the value is near to 2, it means that the majority of households' heads have secondary educational level; if the value is near to 3, it means that the majority of households' heads have higher educational level.

The measurement of consumption structure is realized using two types of data. In the case of agricultural products we have used the monthly quantities consumed by households (measured in kilos, liters or pieces), while in the case of services we have utilized the average monthly expenditures for each type of service. We considered more appropriate to use the quantities and not monthly values of expenditures for agricultural products in order to eliminate the prices impact. For the same reason, the monthly values of expenditures for services consumption were calculated in the prices of year 2000.

Results and discussions

Analyzing the endowment with durable goods in rural and urban areas we observed that the rural areas are less endowed than the urban areas. The index of endowment with durable goods (IEDG) has recorded high differences between rural and urban (as we can see in Figure 1), in 2009 the value of index for rural areas being approximately at the level of the

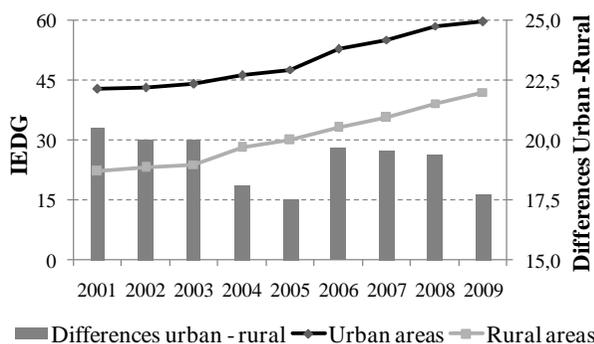

Fig. 1. Evolution of endowment with durable goods

Source: NIS and authors' calculations

index in 2001 for urban areas. Fortunately, the gap between urban and rural is decreasing slowly from 20.5 in 2001 to 17.7 points in 2009.

Analytically, the highest differences are in the case of automatic washing machines - in 2009, 79.8% out of urban households owned automatic washing machines, while only 28.8% out of rural households had an automatic washing machine - and vacuum cleaner - in 2009, 81.2% out of urban households and only 36.4% out of rural households owned a vacuum cleaner (NIS).

Even if the bathroom and the restroom are not durable goods, in the analysis of households' endowment we consider appropriate to analyze their situation. Unfortunately, the gaps between urban and rural are very big in this case also. As we can see in Fig. 2, the existence of bathroom, shower or restroom inside the house is normal in the urban areas, while in the rural areas the usual aspect is that these facilities to be outside the house.

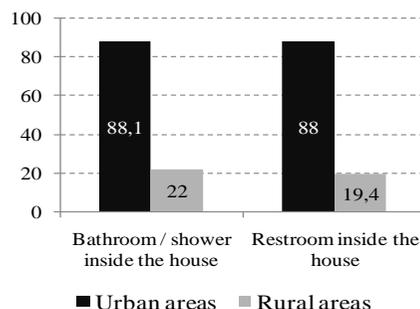

Fig. 2. The share of households by utility equipment in 2009

Source: NIS and authors' calculations

The second analysis is related to the households' incomes and expenditures. As we expected, the level of incomes in the urban areas is higher than in rural areas. The differences are even much higher if we separate the incomes in financial and material revenues. Due to the fact that between 30% - 45% out of total incomes in rural areas are in a material (natural) form, the gap in the financial incomes are even much higher: during the time span 2000 - 2009, the highest differences between financial incomes in urban as reported to rural areas was recorded in 2009, 402 lei (in the prices of year 2000. The corresponding value in the prices of year 2009 is 1039,8 lei).

The study of incomes reveals another conclusion: as income per capita grows, the disparity between urban and rural incomes increases (as we can see on the Fig. 3) - from 76.2 lei in 2000 to 270.1 lei in 2009 for total incomes, or from 151.6 lei in 2000 to 402 lei in 2009 for the financial incomes. In other words, *the economic growth recorded by our country since 2000 instead of reducing the disparities between rural and urban incomes, it has grown them.*

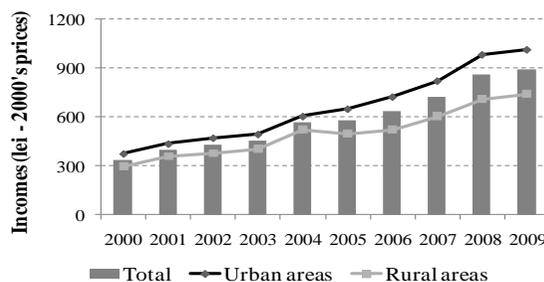

Fig. 3. Evolution of households' incomes

Source: NIS and authors' calculations

An explanation for the income gap is represented by the differences in the educational level. The educational level in the rural areas is much lower than the educational level in the urban areas. In the rural areas the majority of households' heads have primary or secondary educational level, while in the urban areas the majority of households' heads have secondary or higher educational levels. Testing the correlation between households' incomes and the educational level, we deduced that there is a statistically significant relationship between these two variables at the 99% confidence level. The equation (1) expresses the fitted model:

$$HI = 0,00338317 \cdot Ed^{18,504} \quad (1)$$

where: HI - household's income, Ed - educational level. Therefore, every time the educational level of the household's head will increase by 1%, the household's income will increase by 18,504%. In conclusion, the gap in the educational level between rural and urban represents a reason for the incomes disparities.

As in the case of incomes, the level of expenditures is higher in the urban than rural households. In the Fig. 4 we can see the evolution of expenditures and we deduce that the disparities between urban and rural increase during the time. The differences are even much higher if we separate the expenditures in financial and material. Due to the fact that between 30% - 46% out of total expenditures in rural areas represents goods and services produced in the household (in urban areas the share of these goods is maximum 10%), the gap in the financial expenditures are even much higher: during the time span 2000 – 2009, the highest differences in real terms between financial expenditures in urban as reported to rural areas was recorded in 2008, 358 lei (in the prices of year 2000. In the prices of 2008, the difference is 884,3 lei).

The disparity between expenditures in urban and rural areas is the result of incomes gaps. Testing the correlation between households' expenditures and incomes, we deduced that there is a statistically significant relationship between these two variables at the 99% confidence level. The equation (2) expresses the fitted model:

$$E = 75,0824 + 0,811866 \cdot I \quad (2)$$

where: E – household's expenditure, I – household's income. Then, every time the households' incomes will increase by 100 lei, the households' expenditures will increase by 81,1866 lei ($R^2 = 99,7574\%$).

Before proceeding to analyze the structure of expenditures, we will study the extent to which household can cover their current expenditures. The data shows us that there is no significant difference between urban and rural regarding this aspect. In general, in rural areas it is a little more difficult than in urban areas to cover the current expenditures, but the values are approximately the same. Considering the major differences in incomes and expenditures between rural and urban, the similarity in perceptions regarding the cover of current expenditures make us believe that rural households are deprived of certain goods and services.

The differences in the structure of consumption are very clear. In rural areas, the food consumption represents more than 50% out of total consumption, while the consumption of services hardly reaches to 20%. On the other side, in urban areas in the last years, the food consumption was around 40%, while the consumption of services reached 30% out of total consumption. In general, a higher share for food consumption represents a sign of low living standards. The Fig. 5 shows us that the rural households are especially deprived of services. In the majority of cases, the economic data have demonstrated that an increase in the incomes reduced the share of food consumption in total expenditures. In the last 5 years, a slowly reduction in the share of food consumption for rural areas can be observed, reduction which in our opinion was generated by the increase of incomes.

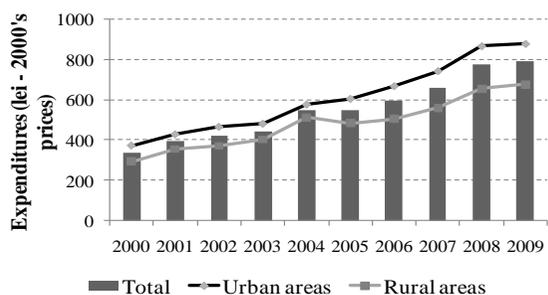

Fig. 4. Evolution of household's expenditures
Source: NIS and authors' calculations

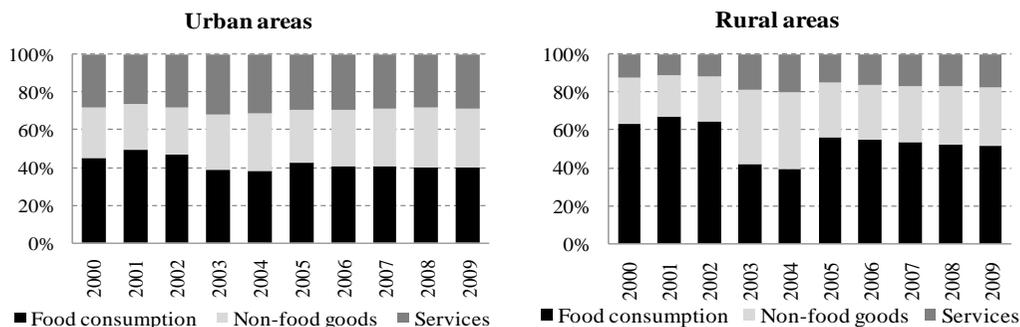

Fig. 5. The structure of consumption

Unfortunately, analyzing of which goods and services rural households are deprived, we find the highest differences in some of the most important services: health, education, cultural and recreational services. In their case the differences become more accentuated every year affecting the quality of human resource. We consider they have a negative long term impact on the development of rural areas, their evolution accentuating the gaps between rural and urban areas.

Analyzing the food consumption we have discovered also some differences between rural and urban areas. The first difference is that in rural areas the consumption of “inferior goods” - bread, corn, potatoes - is higher than in urban areas. In rural areas, the consumption of bread and corn is by 1 kilo/person/month more than in urban areas, while in urban areas the consumption of meat and fruits is 1 kilo/person/month higher than in rural areas.

The consumption of fruits records an interesting situation. In general, in rural areas, the consumption of fruits does not necessitate any financial expenses, while in the urban areas the majority of fruits consumed are bought from markets. In spite of that, the urban households are consuming more fruits than rural households. Unfortunately the opposite situation is observed in the case of alcoholic drinks: in rural areas the consumption of alcoholic drinks per persons is higher than in urban areas. Milk consumption has another interesting evolution. The rural households are considering milk as an “inferior good”, while for the urban households the milk is a “normal good”. A possible explanation is the fact that in the rural areas milk represents a common agricultural product consumed by households, while in urban area milk is less consumed.

Conclusions

As a result of our analysis we consider that in the Romania of year 2009 there are significant differences between urban and rural areas. First of all are the differences between the education level and consumption of educational and cultural services. These differences have a negative impact on the rural areas, the incomes gained by the rural households being considerably lower than the incomes obtained by urban families. As a result of income differences, the gaps in the expenditures between rural and urban households are increasing every year. We can see all this differences in the level of endowments with durable goods, in the structure of consumption and in the specific goods and services consumed.

The income differences determine the rural households to own and use less durable goods, to have the bathroom or the restroom outside the house in most of the cases, to pay for a holiday only occasionally, to spend less on health, personal care, education, water, sewerage, sanitation and utilities, to eat more bread, corn or drink more alcoholic beverages.

MODERN FACTORS THAT ENHANCE COMPANY'S FINANCIAL PERFORMANCE

Gruian Claudiu-Marian

West University of Timișoara

Faculty of Economics and Business Administration

Company performance varies among economic sectors, countries and regions. It is influenced by a very large number of factors. This study aims at identifying and analyzing the determinants that must be considered by company's management presently in order to face competition and achieve superior financial performance. The research methodology used is specific for the theoretic nature of the article and includes literature review, comparative analysis and synthesis. Results validate and argue as relevant modern factors that influence the performance of contemporary companies: organizational culture, corporate social responsibility, innovation, knowledge spillovers. Study limits refer to the fact that these four factors are not entirely responsible for modern business performance and future research should be done to develop an integrative point of view on overall performance determinants.

This paper is a dissemination of the results obtained by the author in the doctoral program "The financial performance of EU member states' companies", coordinator: Professor Carmen Corduneanu, PhD, carried out within West University of Timișoara, Romania, in the period October 2010- July 2012.

Keywords: financial performance, organizational culture, innovation, corporate social responsibility, knowledge spillovers

JEL code: D20, D23, L20, L25

1. Introduction

The financial performance of companies changes over time. Profits are different from one year to another and from one company to another. Some companies obtain increases in profit; others record decreases and some even losses. What are the reasons of these changes and what are the determinants of financial performance that influence it to be different in time and space? This article will try to answer these questions.

Company's financial performance is a fact. Analyzing and improving it is not just about indicators calculated based on annual financial statements, market data or by other means. This is the result of company's overall activity and it is influenced by many factors. Generally speaking, performance factors can be structured in: (1) factors of efficiency, that refer to economic, social and organizational efficiency, (2) internal environmental factors that refer to ownership, management, company size, complexity, technical endowment, location, human potential, informational and intellectual capital, financial position, organizational culture, etc. and (3) external environmental factors: economical, technological, political, demographical, cultural, scientific, organizational, legal, social, educational, environmental and others (Sima 2009). Among the many factors that can be analyzed, this research will focus on the modern ones, which have been conceptualized in the relatively recent period. These factors are: organizational culture, corporate social responsibility, innovation, knowledge spillovers and other advantages offered by business clusters.

2. Literature review

The studies that emphasize on the determinants of company financial performance include two dimensions: theoretical and practical. Theoretically speaking the factors influencing business performance are extremely numerous, but only a select few, considered more important, are empirically verified. In choosing a factor, besides the relevance criterion, the quantitative or qualitative nature is also decisive. Qualitative factors like organization culture are difficult to measure. Research will continue with a comparative study on theoretical and empirical evidence found in literature regarding the four modern performance factors stated above.

2.1. Organizational culture

Organizational culture is a performance determinant that has been intensely studied in the recent period. Although it existed in a certain form along with the establishment of first companies, it acquired more importance, only in the relatively recent period, amid ever rising market competition, the development of economic research and the growing importance of human resources in the new knowledge economy.

Organizational culture is an intangible factor of social and psychological nature, which leads employees to behave and act in a certain way. It arises along with the growth of company personnel because of each employee's personality and if not controlled can have a negative influence on performance. The technical side of organizational culture consists of a set of rules, procedures, decisions and recommendations. Through these techniques, company's management attempts to induce a positive attitude and behavior for company employees. Once a certain culture is implemented among personnel, it has a strong effect on new employees. It is therefore very important for it to be a positive and constructive one.

The components of organizational culture are very difficult to quantify. Denison and Mishra (1995), in their study, identified four dimensions of organizational culture: employee involvement, consistency, adaptability and mission, measures that, according to the results of their study, are positively correlated with various indicators of company performance. Another author (Sorensen 2001) reveals that a strong positive organizational culture increases company performance only in periods of economic stability and its influence is negligible during high volatility periods. Baer and Fres (2003), after developing several empirical studies, have found that a constructive organizational climate that positively affects performance should also encourage initiatives and sustain innovative employees by adopting and implementing their innovations. A company should also provide a psychological safety to employees in the sense that they should not suffer negative consequences if their innovations don't have the desired effect. A recent article (Skerlavaj et al. 2007) shows the positive influence of another element of organizational culture: employee attitude towards learning and training programs. Quoted researchers argue that this has a direct effect on company's non-financial performance and an indirect effect on financial performance.

2.2. Corporate social and environmental responsibility

Corporate social responsibility (CSR) refers to the fact that presently companies must contribute to the development of modern society. This concept is relatively recent, especially for our country. The main supporters of this practice are international institutions such as the United Nations, European Union, Organization for Economic Cooperation and Development, World Bank, the central government and local authorities. To encourage such practices some of the mentioned institutions have developed a set of principles and recommendations. Thus, companies wishing to be socially responsible must know and integrate these practices with their activities.

CSR practices are varied. However, what they have in common is their voluntary nature. Therefore an initiative may be considered as belonging to CSR if it is not taken in accordance with certain regulations or as a result of complaints or pressure from nongovernmental

organizations or consumers. Socially responsible practices concern the general welfare of the community and environment protection. Some examples of such practices are: reduced energy consumption and the use of renewable materials, improved production processes with few waste and chemical substance usage, removal of harmful products even if they are not illegal, the choice of ecologic materials, providing detailed information about products, implementation of social protection programs for employees (medical, psychological, recreational facilities), for people with disabilities, and others.

Responsible activities bring benefits for both community and company. Benefits are more noticeable, direct and immediate for the community, and harder to assess at company level. However theorists explain a series of advantages obtained by companies that invest in social activities. Such programs generate several benefits at company level, such as: (1) differentiation from competitors and high customer loyalty to the brand, (2) improved reputation, (3) increased sales and market share, (4) increased employee loyalty, (5) investments from individual and institutional investors concerned about sustainable development, and others. According to theory all these positive consequences of CSR practices have a positive effect on company performance. Empirical studies that explored the correlation between corporate social responsibility and financial performance had varied results. In a recent study (Garcia-Castro, Arino and Canela 2010) the authors conducted a critical review of the literature that empirically examines the correlation between the social and financial performance of the company. They argue that, despite the numerous studies (over 100) made in the last three decades, there is insufficient evidence to support this correlation because the obtained results are not similar. Thus several researchers have identified a positive correlation between the two characteristics and some obtained ambiguous results. A few studies have even found a negative correlation.

In another study (Margolis and Walsh 2003) the authors argue that out of the 127 empirical studies examined, 109 had social performance as an independent variable, and financial performance as dependent variable. Of these, most (54) validate the correlation between the two variables, 28 have identified an insignificant link, and 20 had conflicting results. Of the 22 studies that considered social performance as a dependent variable, most (16) confirmed the correlation between the two characteristics. Although the results are varied, there are few studies in which CSR practices adversely affect performance; therefore profits obtained after making socially responsible investments mostly cover their expenses.

2.3. Innovation

In a concise interpretation, innovation activities refer to the creation, adaptation and adoption of new products, services, processes, and their improvement (Iancu 2006: 12). Innovation is one of the key factors influencing the performance of modern companies, intensively studied and promoted presently, in the context of the fierce competition at microeconomic level, but it is also a priority direction for development at macroeconomic level, national and international. For example the well-known Lisbon Agenda, recently extended until 2020 but with broadly the same objectives, sustains innovation and has as main objective economic competitiveness growth.

Innovation is usually a distinct activity within a company. But there are companies that do not have such compartments in their organizational structure. An innovation decision is first necessary to initiate this kind of activity. For example smaller companies can not afford to invest in innovation due to the high cost of this activity compared to the funds they have at their disposal. The size of investment in innovation, in absolute amount, is usually proportional to the size of the company and inversely proportional to its sales if we consider the relative weight in turnover of R & D expenditure.

According to Kemp et al. (2003: 11) three elements of innovation can be identified: (1) innovation decision, (2) the intensity of innovation (how much to invest in innovation) and (3) the inputs of the innovation process, production process itself and the output which is actually the

outcome of the entire innovative process. Another description of innovation shows the following components: (1) product innovation, (2) process innovation, (3) marketing innovation and (4) organizational innovation (Gunday et al. 2008: 5).

The main indicators for assessing innovation correspond to its components: the existence of this activity in the company, the size of innovation expenditure, number of domestic projects, foreign or jointly developed and implemented projects, the number of new products introduced, the number of patents and others.

Empirical studies that verify the influence of innovation on performance at the microeconomic level generally have similar results, confirming the positive effect of research. McAdam and Keogh (2004) show that innovation is very important for company long - term economic development. It is a factor that explains differences in competitiveness between companies, regions and countries. Other authors (Gunday et al. 2008) measured the influence of innovation on three categories of performance: innovational, operational and market. They found that a correlation exists between innovation and operational performance, but have not identified a significant link between innovation and market performance.

The authors of a larger study (Kemp et al. 2003: 52) identified a positive impact of innovation on certain measures of performance of small and medium-sized companies. The study found that innovation leads to increased turnover, particularly for small business and increased employment, especially in medium-sized companies. A correlation between innovation and profitability hasn't been found.

2.4. Knowledge spillovers

Another factor affecting the performance of companies, particularly in industry, is geographical location. Although apparently it can be presented as an external environmental factor, the choice of company site is at the discretion of owners and directors (within the financial possibilities), being a company-specific factor in this regard. Presently, given the specifics of production activities, especially the advanced level of specialization, a large part of market goods, especially durables are manufactured by a group of interconnected companies. For example, automotive companies buy various parts, assemblies, tires, seats and other components from other more specialized companies and assemble them together with other components manufactured in own factories and sell cars under their brand name. Among these companies that are both producers and suppliers in the same time, certain cooperation relations and being established. Because of these ties they ameliorate their performance by improving delivery, product characteristics, working together even for innovations and changes that each brings to the product. All these advantages can easily materialize if the companies are located in the same region, city or industrial zone. As a result of these considerations industrial and commercial zones have been formed over time under the generic name of industrial or commercial clusters in which companies from similar sectors have developed. Good examples of such areas can be identified in the automotive, forestry and energy industries.

Although infrastructure has seen a continuous development in the recent decades the geographical distance between suppliers and producers is a disadvantage compared to competitors with better positioning. The main drawbacks are the additional costs of transportation, insurance, additional time required, customs charges and others.

Other advantages of interconnected companies' agglomeration are knowledge spillovers. These occur when a company obtains knowledge from another company, university or government agency, without paying for this benefit in a transaction brokered by the market (Maftai 2010: 1). Thus different product and process innovations of suppliers or competing companies helped make innovations and improvements within the company. The existence of clusters also favors the development of joint research and rapid correction of defective products that may occur.

With the emergence and spread of theories arguing the positive influence of business clusters on company's performance numerous empirical studies verified this correlation. In a recent study (Folta, Cooper and Baik 2006) the authors found evidence to support these theories. They found that companies located in industrial areas are performing better than companies outside clusters. Corporate performance increases with the development and expansion of their business cluster, but at a certain point, crowding a large number of companies with similar activities generates increased competition that makes the survival of all companies difficult. Molina-Morales (2001: 290) revealed a higher performance for companies located in industrial clusters, also identifying a greater capacity to absorb knowledge externalities in the case of companies with greater seniority. Another study found a positive influence of factors specific to business clusters (economies of scale, urbanization and the formation of company groups) on performance (Malmberg, Malmberg and Lundquist 2000). A more recent study (Gilbert, McDougall and Audretsch 2008: 414) shows that industrial agglomeration has a positive effect on the company's innovative edge and sales.

3. Discussion

Organizational culture is a strong factor that influences company performance. Its importance has intensified ever more in the context of the current competition between companies and the enhancing of human resources importance. It is relevant to note that the formation of an organizational culture is inevitable because this is often influenced by the personality of employees. Or, to remove the risk of string of unproductive attitudes and behaviors, management involvement is imperatively necessary. This can be done by implementing behavioral regulations, fair and proper procedures regarding discipline and various social activities for employees.

Social responsibility primarily involves additional costs for the company, consisting of both material costs and expenses for designing and implementing specific social activities. These, in a first phase, adversely affect company's financial performance as well as all other expenses. However, they sensitize consumers, making them feel obliged to support responsible companies, as long as their products have the same quality and price with those of competitors. The effects are generally positive; the growth in revenue generated by responsible activities is superior or at least equal to the expenses incurred. In addition, social responsibility on a long term helps keeping a positive perception about the company among consumers.

Innovation is crucial for the long term success of any company, regardless the size. However, most small companies can not afford to invest in innovation. Presently, given the literal explosion of knowledge and the existence of numerous research projects funded by various organizations or government, companies can be informed without costs about news and innovations in the their field of activity. Thus they can implement certain elements of novelty without having to finance research projects from their own funds.

Business clusters have advantages and disadvantages. Thus for a company that aims to increase its competitiveness and penetrate international markets, collaboration and knowledge spillovers in industrial agglomerations are very helpful. But for companies that aim to preserve a share of the local market and are satisfied with a certain level of results a relocation within business clusters is not recommended. This depends mostly on company's profile and objectives.

4. Conclusions

Presently, in the context of the fierce market competition, managers have to consider new factors that can enhance company performance. Besides the classic means meant to increase productivity, like investment in physical capital and other investments that help cost reduction, modern companies must invest in other key factors that affect company results.

These new factors, that have a positive impact on company's financial performance, are organizational culture, corporate social responsibility, innovation, knowledge spillovers and other

characteristics that are specific to business clusters. The first, third and fourth factors have a very strong human and managerial determination. They mainly include investments in human resources and are meant to increase process and product quality. This has a positive effect on competitiveness even if company products are more expensive than those of competitors. Innovative and high quality products also generate a large amount of value added and enhance company's financial performance.

Although theories about the benefits brought by the mentioned factors are not very recent, they are considered new in the present article because a relatively small number of Romanian companies take them into consideration in the management process. Among these companies the majority are subsidiaries of multinationals that apply the same strategies as mother companies and other economic entities owned by foreign investors.

Companies that aim long-term competitiveness and financial performance must include in their strategies measures concerning the development of human resources and insure a constructive organizational culture, a supportive environment and encourage innovation and knowledge exchange between employees and between the company and collaborators. All these internal efficiency measures can be doubled by socially responsible practices to insure the basis of a good perception among consumers and a long presence on the market.

This paper is a dissemination of the results obtained by the author in the doctoral program "The financial performance of EU member states' companies", coordinator: Professor Carmen Corduneanu, PhD, carried out within West University of Timișoara, Romania, in the period October 2010- July 2012.

THE FINANCIAL PERFORMANCE OF EUROPEAN COMPANIES: A COMPARATIVE APPROACH

Gruian Claudiu-Marian

West University of Timișoara Faculty of Economics and Business Administration

The present study empirically examines the financial performance of European companies and tries to identify the profitability differences that exist between: enterprises with same profile, economic sectors and between several countries from the European Union. Based on data of the year 2009, the newest available on the BACH-ESD database, three financial performance main indicators are being calculated, namely: Return on Assets, Return on Equity and Net Margin. Results are discussed and compared with the ones obtained in former similar studies and some conclusions are drawn. The most performing sectors are found to be mining, quarrying, professional, scientific and technical activities, utilities and IT&C. The sectors that perform the worst are transport and storage, agriculture, accommodation and food service. As shown in other studies the most profitable and competitive companies in the sample belong to the Nederland, Belgium and Austria and the least profitable ones are situated in Italy and Portugal. As a complementary useful result of the study, the average values obtained for the three variables, in the various sectors considered, can be utilized for future comparisons, for assessing the financial performance of companies that belong to same sectors as those surveyed.

This paper is a dissemination of the results obtained by the author in the doctoral program “The financial performance of EU member states’ companies”, coordinator: Professor Carmen Corduneanu, PhD, carried out within West University of Timișoara, Romania, in the period October 2010- July 2012.

1. Introduction

From the perspective of companies and their owners, obtaining profit is the ultimate objective and the main driver of company activity. Profit can be considered the result of all efforts made and the incentive necessary for sustaining further activity. Financial performance highlights the efficiency with which firms transform their revenue into income that can be afterwards distributed to shareholders. This mostly makes the difference between companies that are winners and those who are defeated in market competition. Companies that are not profitable usually end up being taken over by other more profitable ones or go bankrupt. However in terms of society as a whole, a very high profitability can signal a lack of competition in the market. Thus, if the profits outweigh by far the efforts made, the risks assumed and the value of introduced innovations, they might be the result of a lack of competition in the market, situation that adversely affects consumers and the general welfare of society.

The positive effects of financial performance are very numerous. Besides generously rewarding shareholders, profitable companies attract investments, from both foreign and domestic investors, and enhance the development of the sector in which they activate and of the economy as a whole. Profitability encourages companies to employ people, pay salaries and product goods and services. Profitable companies are those who pay high taxes and transfer a share of their profits to governments and allow means of living for country population. Financial performance is, in the

same time the result of a large variety of factors (Gruian, 2010) including: company productivity, efficiency, effectiveness, performing management, proper corporate governance, innovation and other external factors like: macroeconomic, monetary, fiscal and sectoral conditions. The present study tries to explore in terms of financial performance the differences between European sectors and countries. It will also identify the most profitable and unprofitable industries and analyze if there are common under-performing or over-performing sectors, or sectoral performances of different countries are complementary and one country excels where another fails to succeed. The research will start with a literature review; which will present results of similar studies and mostly utilized measures of financial performance. It will continue with the empirical assessment of variables. The obtained results will be discussed and some conclusions will be drawn.

2. Literature review

The competitiveness and financial performance of European companies are the subjects of numerous studies. Most of them are financed by the European Commission through its Enterprise and Industry Directorate General. Studies are meant to highlight the past and present situation of microeconomic performance in the EU and identify the factors that influenced the way competitiveness and profitability evolved in the past period.

A recent study (European Commission, 2009) analyses the competitiveness and profitability of EU companies considering a sectoral approach. It also identifies the main sectoral drivers of performance. The period considered is 1995-2005 and the data used in the profitability analysis is from Bank for the Accounts of Companies Harmonized (BACH) and from the US Department of Commerce, Bureau of Economic Analysis. The study also verifies the similarities and differences between the US and the EU companies. A slight difference between UE and US profitability, measured by Return on Assets and Net Margin can be observed in the considered period. The EU recorded a higher profitability growth due to the dramatic lowering of corporate tax rates across the region, whereas the US saw no significant reduction in its corporate tax rate (European Commission, 2009: 18).

Authors of the same study consider that among the EU countries there is a wide disparity between the most profitable sectors and the least profitable ones. The best performing sectors are business services, utilities, mining and quarrying and other commodity based sectors and some manufacturing industries, especially the manufacture of coke, refined petroleum and nuclear fuel and the manufacture of pulp, paper and paper products which add value to the commodity producing industries of mining and forestry. At the other end of the hierarchy we can find land and air transportation, activities that had a negative average of net margin in the considered period. Other low performing industries are several manufacturing sectors, wholesale and retail trade, constructions, etc.

The most widely used indicators of financial performance are Return on Assets, Return on Equity, and Net Margin. Return on assets (ROA) is one of the most utilized financial ratios. It evaluates the efficiency with which the assets are utilized. ROA is calculated as the ratio between net profit and company's assets, on the basis of Balance sheet information (Achim, 2010: 353).

Return on Equity (ROE) shows the efficiency with which the capital brought by investors is utilized for obtaining profit. This is also an often utilized profitability indicator utilized especially by shareholders and also named financial profitability (Colasse, 2009: 72). It is calculated by dividing the net result of the activity to company's equity. This indicator is important especially for investors, because it helps them compare company's results with those of competitors.

Net Margin (NM) or profit margin is a profitability measure that shows company's ability to transform revenue into profit and control production costs. It assesses the effectiveness with which profit is generated from the revenue through the value add management process (Bull, 2008: 24). NM is a very good indicator for comparing companies in the same industry and is

sometimes used to compare business sectors to observe the differences of profitability. Yet the value of the NM can differ very much depending on company's profile. Thus companies that belong to the wholesale industry can have net margins under 5% and be very profitable because of their turnover. On the other hand companies that belong to services, information technology or other highly innovative sectors, can have a net margin of over 25-30%.

3. Research methodology

3.1. Sample and data selection

For the comparative study we will use data from BACH-ESD, the European database of aggregate information on non-financial corporations. Data is provided by the Central Balance-Sheet Data Offices from eight countries of the European Union (EU): Austria (AT), Belgium (BE), France (FR), Germany (DE), Italy (IT), Nederland, (NL), Portugal (PT) and Spain (ES).

The sample provided by the BACH-ESD database contains a relatively large number of companies from each of the participating countries, thus the data provided has a high level of confidence and quality. The database has been used recently by many other authors (e.g. European Commission, 2009: 134; Busuioc, 2009 and others). The data is also rigorously organized and can be broken into categories including 13 private economic sectors according to the NACE rev. 2 statistical classification (classes A-N), excluding the financial intermediation class (K). The database also provides a number of 28 rates from companies' annual accounts that refer to financial structure, cash-flow and profitability. For the present financial performance comparative study we considered data from the year 2009, the newest available in the database. We compare all eight countries and all 13 business sectors. We also consider all the companies regardless of size.

3.2. Variable definition

The variables analyzed in the present comparative study are: Return on Assets (ROA), Return on Equity (ROE) and Net Margin (NM).

1. $ROE = \text{Profit or loss of the year} / \text{Capital and reserves}$

The ROE indicator corresponds to Rate no. 12, found in the Operating costs, earning and profitability rates section of the BACH-ESD and does not require additional calculations.

2. $ROA = \text{Profit or loss of the year} / \text{Total Assets}$

The ROA rate is calculated in the present study by multiplying Rate no. 12 (ROE) by Rate no. 22 of the BACH-ESD database, which is the rate between Capital & reserves and Total Assets.

3. $NM = \text{Profit or loss of the year} / \text{Net turnover}$

NM is obtained by dividing the ROA indicator, calculated above to Rate no. 16 in the Operating costs, earning and profitability rates section of the database (Net turnover / Total Assets).

4. Variable calculation and comparative analysis

The calculated variables are presented in Table 1 (ROA), Table 2 (ROE) and Table 3 (NM). Average values presented on the table margins are obtained as a weighted average (W.A.) of the three indicators presented for countries and sectors, considering the size of the Value Added (VA) in each country and sector. Thus the profitability of larger sector has a more important impact on countries' economy average profitability than the impact of a smaller one. The same rule stands for the average profitability of business sectors.

4.1. Return on assets

Table 1: Return on Assets, year 2009

Source: BACH-ESD database, authors' calculations

We analyze the ROA indicator first because it is the most appropriate for financial performance measurement. Unlike ROE, ROA considers all capital invested in the business, regardless its provenience. In the present case the value of ROA indicator varies from a minimum of -1.92% in the transportation and storage sector of the Austrian economy to a maximum of 26.89% in the mining and quarrying sector of the Dutch economy. Its values vary across countries and industries. The best values for ROA belongs mostly to the mining and quarrying sector, which had the best financial performance in the context of the economic and financial crisis that generated a strong growth of the raw metals demand and price. Thus The Nederland and other European countries like Belgium, Austria and Italy achieved a very high performance in the mining sector during the year 2009 due to these international conjunctures.

The second best performing sector was the one including professional, scientific and technical activities, which had an average ROA of 4.47% on overall. Best performing companies of this sector belong to The Nederland, Austria (which performed best in this sector) and Spain. Other sectors of the European with good results are utilities, information, communications and commerce. Average value of ROA for the companies included in the sample is 2.68%. This is a relatively low figure but it is acceptable considering the effects of the economic and financial crisis. We can also note that some business sectors were more affected by the crisis than others. The ones that had the lowest profitability are transportation and storage, agriculture, hotels and restaurants, real estate and even manufacturing. If we consider the overall performance of countries we can see that the most competitive ones managed to maintain the highest profitability levels. These countries are The Nederland, Austria and Belgium. Other countries with a lower level of competitiveness suffered dramatically low levels of financial performance (e.g. Italy and Portugal).

4.2. Return on Equity

Table 2: Return on Equity, year 2009

NACE CODE	NAME OF NACE SECTION	COUNTRY								
		AT	BE	DE	ES	FR	IT	NL	PT	W.A.

	Weighted average	11,79%	7,63%	8,01%	8,28%	8,46%	2,85%	19,17%	3,90%	8,32%

Source: BACH-ESD database, authors' calculations

The second indicator considered for the assessment of financial performance is Return on Equity. Even if we present it to be the second indicator of profitability, it is of most importance to shareholders because they are interested in how well company management has used their funds to make profit, and not directly interested of how efficiently managers used the borrowed capital. Values obtained for the ROE deepen the differences between the companies included in the sample. From a sectoral point of view the mining and quarrying industry leads by far with a huge profitability average of almost 80%. This is strongly influenced by the favorable international conjuncture of the mining industry and the high competitiveness of the Dutch mining sector. We do not exclude the fact that these results can be influenced by the variable sample of companies provided by the BACH-ESD database. Yet all European companies in the mining sector obtained very good results in terms of profitability, with the exception of Germany.

Consequent with the ROA results European companies had good financial results in terms of ROE in the utilities sector, information and communications and recorded low performances in transport and storage, agriculture and hotels and restaurants. A notable difference is observed in the construction sector, where the equity invested by shareholders represents a relatively low proportion in the total investment. This transforms the 3.04% economic profitability in a higher financial profitability of 12.19% for investors that activated in this sector.

Considering the overall countries' financial performance measured by ROE The Nederland and Austria are still the first two countries. At the other end Italy and Portugal are the worst performers with a ROE rate well below the 8.32% average.

4.3. Net margin

Source: BACH-ESD database, author's calculations

In terms of Net Margin the hierarchy of countries and sectors changes slightly. The sector that brings the highest profits compared to its turnover is the one that refers to professional, scientific and technical activities. Although profits in this sector represent a smaller proportion of companies' assets and equity, they represent a higher proportion of turnover. Thus if the turnover would be higher, this sector would have the biggest potential. The mining and quarrying sector also has a high profit margin, but this is still a modest figure compared to the very high performances in terms of ROA and ROE. This proved that the high performances of this sector were strongly based on the high turnover achieved. High performances can also be encountered in the real estate activities, another service sector that produces higher profits compared to turnover. Other performing industries are utilities, information and communications. Poorest results were obtained in the hotels and restaurants services sector, transportation, wholesale, retail trade and even manufacturing, sectors mostly influenced by the economic and financial crisis. If we consider the countries included in the sample, the best results in terms of NM were obtained by Belgium, followed closely by The Nederland. Poorest performing countries, consequent with previous results obtained in this study, are Italy and Portugal.

For a better understanding of study results we will also present them as diagrams (Figures 1, 2).

Figure 1: The financial performance of European sectors

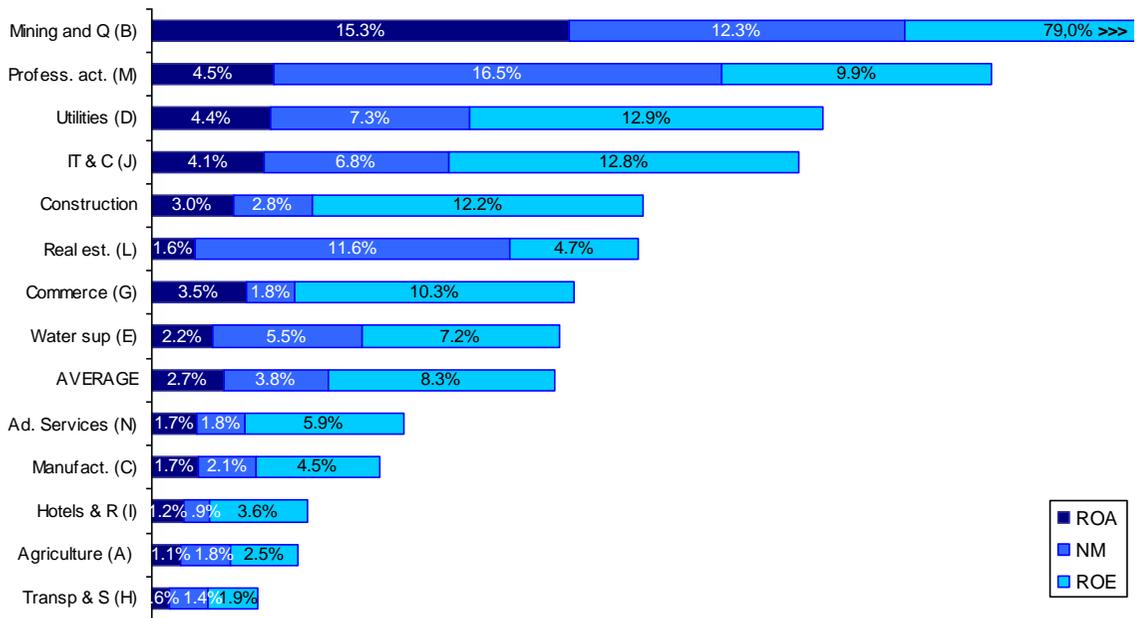

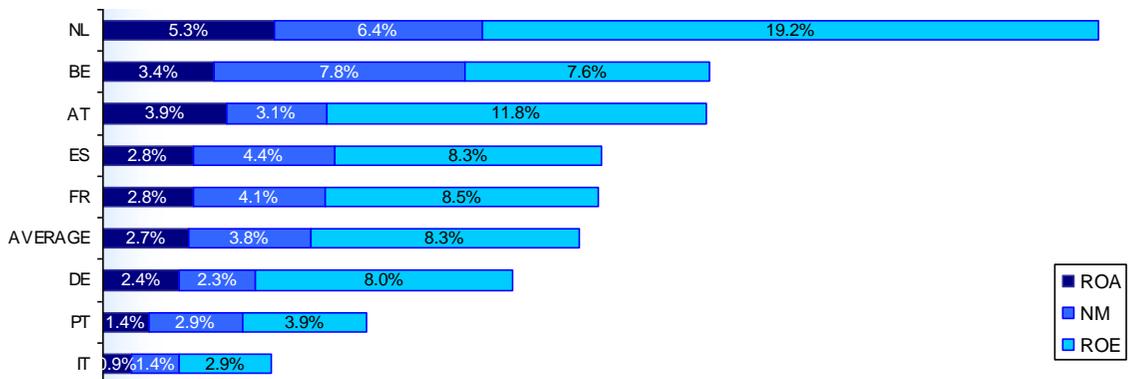

Figure 2: The financial performance of European countries

5. Conclusions, limitations and future research

Financial performance can be measured in various ways. In the present study we assessed it at a mezzo and macroeconomic level based on data from microeconomic level, more precisely, from the harmonized annual financial statements of a sample of European companies.

Several important differences have been identified between the thirteen non-financial economic sectors and between the eight developed countries considered. This article shows the strengths and weaknesses of the European economy. Thus as we can clearly see from the graphs above, the most performing sectors are mining and quarrying; professional, scientific and technical activities, utilities and IT&C. The sectors that perform the worst are transport and storage, agriculture, accommodation and food service activities. As shown in other studies the most profitable and competitive companies in the sample belong to the Nederland, Belgium and Austria and the least profitable ones are situated in Italy and Portugal. Yet the results refer to the average values recorded by countries' companies. One should consider that there are performing and underperforming companies in every country but averages values for the considered samples are the ones presented above.

Results can also be interpreted in the sense that some industries are more vulnerable in times of economic and financial crisis (transport and storage, agriculture, accommodation and food services, manufacturing). Moreover countries that are less competitive suffer stronger overall decreases in economy due to economic crises. These conclusions are also in line with other research on the same topic.

Present study also offers average national and sectoral rates for profitability measurement and comparison in the year 2009. These values can be used as reference points for other studies that have the similar topics.

This study also has some limitations. The accuracy and relevance of the results are limited to the quality and exhaustiveness of the data provided by the BACH-ESD database. More details about this database can be obtained from the internet link in the bibliography. Other limitations refer to the short period considered, of only one year and the influence of economic and financial conditions in the year considered. Future studies could consider a larger number of countries, a longer period of time and a more detailed classification of the economic activities. They could also try to examine in depth the factors that caused the performance differences.

This paper is a dissemination of the results obtained by the author in the doctoral program “The financial performance of EU member states’ companies”, coordinator: Professor Carmen Corduneanu, PhD, carried out within West University of Timișoara, Romania, in the period October 2010- July 2012.

A POSSIBLE MODEL FOR ANALYSING THE PRACTICAL NEEDS OF STUDENTS IN ECONOMICS-PRACTEAM MODEL

Hatos Roxana

University of Oradea, Faculty of Economic Sciences

Data presented in this paper are part of the activities of the PRACTeam project "Practice of students in economics. Inter-regional partnership between universities and the labor market" project co-financed by European Social Fund Operational Programme Human Resources Development 2007-2013 - "Invest in people! "Contract no. POSDRU/90/2.1/S/64150. Identifying the needs of practice activity had as research tools to focus group and questionnaires. Research subjects were third-year students who have completed the practical work of the three partner sites: Oradea, Timisoara and Suceava. The results obtained in this research were the basis for discussions during the workshop PRACTeam between student representatives, tutors and practice coordinators. Based on the central elements and highlighted problems were developed materials for both tutors and students.

The specific objectives of identifying needs for practical training were: to determine administrative and organizational elements deemed most appropriate for students in terms of practical training, identifying methods of communication between all stakeholders (students, coordinators and tutors of practice) the most suitable in terms of training students, identifying the strengths and weaknesses in relation to the conduct of practical training

Presentation integrates the results with emphasis on elements that can be improved, structured around the following areas: evaluation of the internship, access into the practice, conduct practical work (satisfaction with the relationship with the tutor, satisfaction with relationship with Coordinator of practice, student satisfaction with the activity, satisfaction with knowledge, skills acquired in satisfaction with the practice, satisfaction with communication with colleagues) positive, negative aspects, students' views on improving business practice.

Keywords: needs analyses, students, practice activity.

JEL:M53, M54

Introduction

According to the law "practice is the work of students, in accordance with the curriculum, which aims to verify the applicability of their theoretical knowledge learned in the training program."

Increase skill practice and increase the students' work skills leading to better employability of the labor market, with positive effects on employment, labor productivity and wage levels. This is possible by adapting to the needs of students as both supply and labor market needs.

Practical project's overall objective: "the students' work skills development economists during the practical training and internship, conducted in partnership inter-regional labor market between universities and business to improve integration in the labor market economists.

According to sociological theories, identifying needs involves collecting data on those in need, their environment, the problems faced and solutions to these problems. Needs analysis is part of needs with the needs assessment that involves synthesizing information obtained in the stage of identifying needs, setting priorities for the decider.

The data of this study were obtained by questionnaires and focus group and are the result of identifying the needs of students who have completed the practical training.

The results from this needs assessment were the basis for discussions during the Workshop PRACTeam presented student representatives, tutors and practice coordinators. Based on the central problems and issues that emerged were developed practice materials for both tutors and students.

Objectives

The specific objectives of identifying business needs for practical training were:

- Determination of the administrative and organization considered most appropriate for students in practical training,
- Identify methods of communication between all stakeholders (students, coordinators and tutors to practice) the most appropriate in terms of students in terms of practical training,
- Identify strengths and weaknesses regarding the conduct of practical training

Identify needs of students on practical training was conducted by:

Apply a third-year student questionnaire that followed the practice at each partner

3 focus groups with students in third year of study, one from each partner.

The 627 questionnaires were applied and interpreted as follows: 194 in Oradea, Suceava and 212 to 221 in Timisoara.

3 focus groups were organized as follows: 9 students in Oradea, Suceava 14 students and 12 students in Timisoara.

Although data analysis and processing of focus groups revealed that positive elements to exceed the negative ones in terms of practical assessment activities from students, to integrate the presentation of results with emphasis on elements that can be improved. structured in the following directions:

Evaluation of the practice activity -IDENTIFIED PROBLEMS

Regarding the assessment made by the students practice the majority stated that it reflects the efforts and results achieved by students, but there were exceptions, which showed the best responses in focus groups conducted with students. The most important aspect in this regard was the work of the teacher coordinator in situations where students were happy, practice managers were described as "objective" and constantly monitored the work of students, working with the tutor from the company where students have completed the practice.

1. Working poor or lack of collaboration between practice managers and practice tutors. "to be assessed correctly there must be collaboration with the supervisor of practice" (student-Suceava P2);

"nobody was interested in what and how we got the ratings firms. He put some questions and gave answers based on the verdict. Without actually knowing what you did in the internship. I had colleagues who did not practice at all, did the project as required for the project knew that he had done but did not practice. But he did not actually practice. Like any theoretical project. "(student P2-Suceava)

2. Low practice responsible involvement in the monitoring of student activity:

"Maybe teachers should call and check Since we oversee the teacher receives a bonus for that should make a bit of interest if all received money for work that. "(student P1-Timisoara)

3. Severity responsible practice and fairness of the practice of responsible in the evaluation process:

"I really did not seem right to me. Because the new area I had made a folder with a certain content. I scored a 10 and I did everything I had to do in that folder, and others who were not even a quarter of that file have taken all the same note. "(student-Univ. Oradea)

Access to practice unit

Access to practice facilities, reported students participating in the focus group

- personal relationships: "My mother knew someone from the Carpathian Bank but could not take me there and then spoke to someone at the Romanian Bank."
- Searching one: "I went to the bank that are in the area and I've got Banc Post card from them, was close to home and I went to ask them and I was accepted"
- With the support of other projects for faculty or students.

Carrying out practical work

Elements of communication-with peers, the coordinator, faculty tutor, networking, organization, administration, accumulation of knowledge, skills, strengths, weaknesses

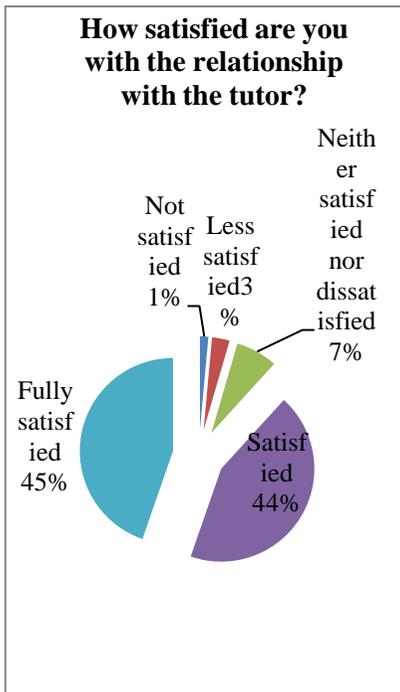

Fig.1. Satisfaction with the tutor relationship.....

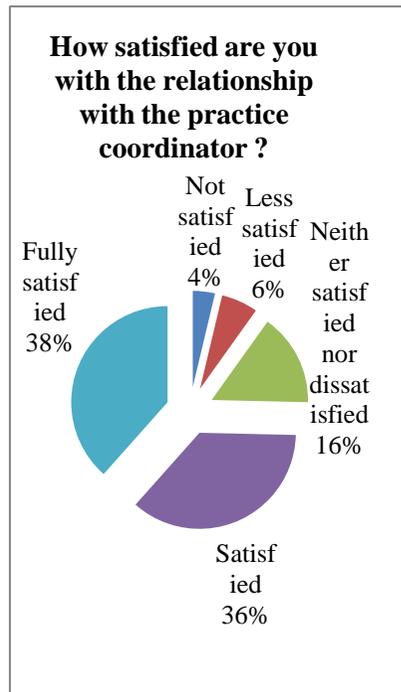

Fig.2. Satisfaction with the relationship with the coordinator of practice

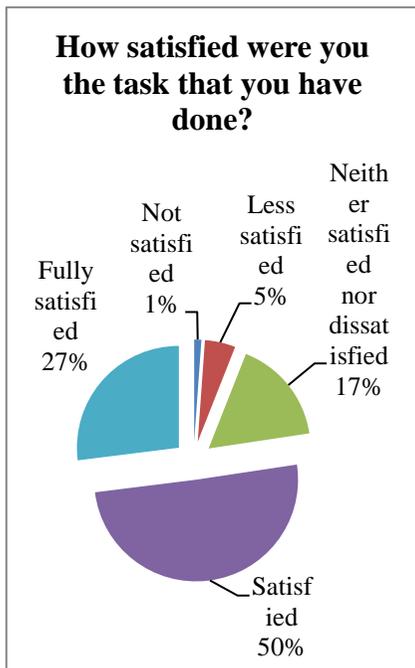

Fig.3. Satisfaction with work

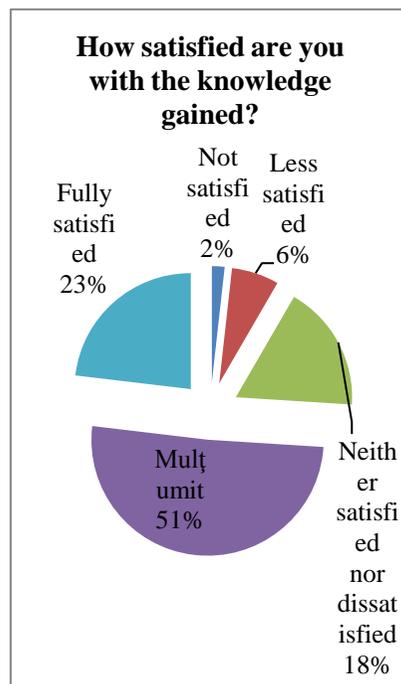

Fig.4. Satisfaction with knowledge gained

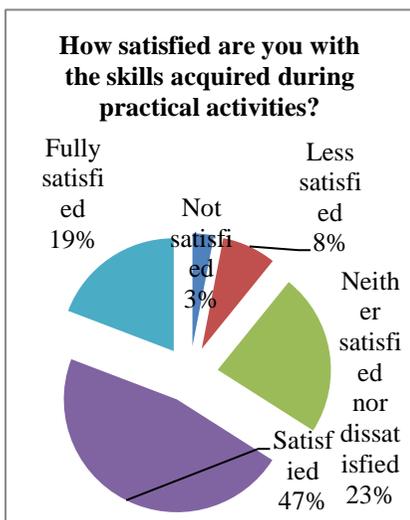

Fig.5. Satisfaction with the skills acquired during practical activities

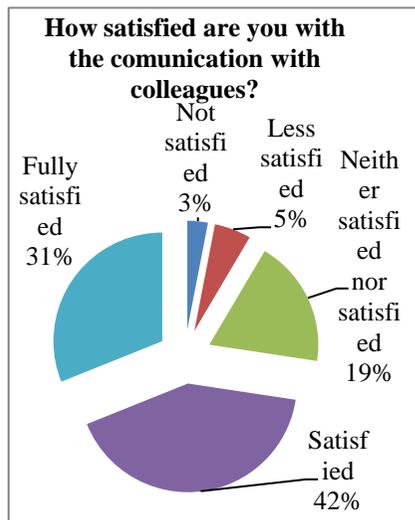

Fig.6. Satisfaction with the acquired during communication with colleagues

Positive aspects

The analysis of data on positive aspects, most responses were for knowledge / skills gained (321 responses) responsibilities (132 responses); familiar with teamwork (126 responses).

Negative aspects

In order of most responses to the negative aspects category, they were not given too much responsibility for me (114 responses), the indifference of our employees (129 responses); powers unite internship inefficient (80 responses)

Opinions on improving students' practical work

1. Practice calendar so as not to overlap with the holidays. Practice period: in this sense the most comments were related to students unable to participate during the summer because they are working or wish to do so. There have been several recommendations are to be held within three weeks during the semester or one day a week throughout the semester, there are more opportunities so that students can choose how to best address its needs.

2. Duration, the problem appears to be contradictory too much time considering some students and others as insufficient for a good education.

3. Compensation or reimbursement for transportation students: "Do not just give you interest if you are not rewarded, and even a symbolic thing, but to work at a restaurant ECTS simply take advantage of you, make you do all sorts of chores for which others get a lot of money and make you think that they do you a favor that they write a certificate at the end, "(student P1-Timisoara).

4. Contacting companies - units of practice by faculty representatives: "I think that would help us a lot and faculty if they conclude some contracts between companies and faculty, a kind of collaboration. [...] Should be appointed and companies from one person to take care of us that handle our training, "(student P2-Suceava)

5. Targets and a work plan to the student: "Companies that get students to practice have developed programs, objectives so that students learn something from practice." (Student P2-Suceava)

6. O. In addition to the recommendations of students explicit mention one aspect that I consider particularly important in the organization of the practice, as shown in group discussions: student involvement and accountability to the work that taken. As in all three partner universities have told students to focus group participants, students will learn during practice to learn, ask questions, to make the best of their respective actions.

The need for involvement / responsibility of students:

"and basically what I could do all day. I went to the office, if I wanted sitting on the mess, if I wanted I went to see how to make insurance ... Basically it was my decision. And many colleagues met with the thing: if you want something if they did not - not. And many do not drive had to go to practice: if you want go if no - no, not forcing anyone. So you must have a strong will that if you can go, even to go and learn to say "go, teach me, to twitch" (student-Univ. Oradea)

T. The need for involvement / responsibility of students:

"Q: And then what have to be changed in your opinion?

A: The attitude of the student. If the student wants he will find a certificate. "(student-P1-Timisoara

S. The need for involvement / responsibility of students:

"I think it depends on the objectives that we want have when we practice. It's not just blame the companies. It is also our fault, because if we do not want to learn as much, no interest no one in forced to do anything. I believe that is possible in Suceava.. If you are interested and want to do something - you can not just go on and on primary relationships. "(student P2-Suceava)

Conclusions:

- The needs of students identified by this study, come to once again emphasize the need for dialogue between the actors involved in the practice and pursuit of improving teaching practice in both the organization and in terms of content.
- The objectives of our project aims, through its activities to cover the practical needs of students so that results from this needs assessment were the basis for discussions during the Workshop PRACTeam with student representatives, tutors and practice coordinators participations. Based on the central problems and issues that emerged were developed practice materials for both tutors and students.

ANALYSE THE CAPITAL STRUCTURE AND PROFITABILITY OF AGRICULTURAL CORPORATIONS

Herczeg Adrienn

University of Debrecen Centre of Agricultural Sciences

Faculty of Agricultural Economics and Rural Development

Department of Accounting and Finance

For 21 years since the change in Hungary's economic system, the capital structure of agricultural enterprises notable modified. The regime change that passed off two decades ago did create significant alteration in the situation of agrarian sphere and it affected property and holding relations as well as internal and external market positions and therefore also the financing system of the sector. The present study discusses the capital structure of agricultural enterprises and analyses the connection between capital structure and profitability. Defining the optimal capital structure have for a long time been a focus of attention in many academic and financial institutions that probe into this area. This is comprehensible as there is a lot of money to be made advising firms on how to improve their capital structure. My empirical analysis is based on data containing 192 agricultural enterprises from Hungary between 2002 and 2009. I made regression analysis for an empiric proof of capital structure theories and cutpoint analyses to study the credit distributing phenomenon by Stiglitz since in the subject of the database I searched the significance of wontedness and slant that marked damage of normality at many factors, furthermore in many cases even the terms of a dispersion homogeneity were not certain. Because of repeated damages of the two modelled T-test, a specified comparison of distribution seemed to be expedient within the confines of a cutpoint analyses which I performed with the assistance of the ROPstat 1.0 statistic pack of programs.

I try to assess the reasons of the changes in the structure of resources of enterprises in order to find the determinants effecting the capital structure. Furthermore, I determine the capital structure with that profit running could be achieved in the most effective way. As a result of my review I can state, that the capital structure proportions take serious effect on the fluctuation of profitability and I defined a proportion of foreign capital and own capital which if reached or exceeded, may lead to operation producing deficit.

Keywords: capital structure, liabilities, Hungary, profitability, agricultural enterprises

JEL Classification: G320

I. Introduction

Analysis of capital structure of agricultural corporations is a key issue of economics and the effect of its fluctuation can be observed on several fields of the life of corporations. It yields influence shall I say the competitiveness of the sector, property status or financial and profitability situation of corporations, effectiveness of management, market value of the company as well as the expectable output rate of equity for owners. Though term of the analysis concerns years between 2002-2009, in the case of a research of capital structure - since these are long term decisions - particular changes of politics and economy in the last 1-2 decades shall not be forgotten in so much as Hungarian agriculture still carries almost all the weight of the agrarian crisis following the regime change.

The regime change that passed off almost two decades ago did create significant alteration in the situation of agrarian sphere and it affected property and holding relations as well as internal and external market positions and therefore also the financing system of the sector. As a result of the referred processes the capital status of agrarian sector passed through important changes since unfavourable turns of economics also reflect in the conformation of capital structure.

The main aims of my study are the followings:

- a) In the scope of a literature processing I lay and esteem the most important views, the dominant classical and modern theories of capital construction and definitions in connection with financing.
- b) As a main aim I study the analysis of fund- and capital construction of joint agricultural corporations running in Hungary in the period between the years 2002-2009. Within the scope of the analysis I enter into the following details:
 1. Analysis of the relationship between capital structure and profitability, revealing determining factors of profitability and defining their effects. In this manner, I am looking for the answer whether selecting capital structure should take effect on the fluctuation of profitability of corporations, and if so, how.
 2. Determining the capital structure with that profit running could be achieved in the most effective way. Analysing the connection of leverage and profitability, should there be a sort of equity proportion definable along which companies' profit running could be ensured.

II. Literature analysis

One of the most significant issues in corporate finance is responding "How do firms choose their capital structure?". Defining the optimal capital structure have for a long time been a focus of attention in many academic and financial institutions that probe into this area. This is comprehensible as there is a lot of money to be made advising firms on how to improve their capital structure.

There are many methods for the firm to raise its required funds, the most basic instruments are stocks or bonds. The mix of the different securities is known as its capital structure, so it can be defined as the combination of debt and equity used to finance a firm. And the target capital structure is the ideal mix of debt, preferred stock and common equity with which the firm plans to finance its investments. (Pataki, 2003) Every enterprises has liabilities that must be dealt with, regardless of the enterprise's incomes or revenue. These liabilities raise the fluctuation of revenue, the instability of revenues. The risk-raising effect of constant liabilities is called leverage. Two types of leverage can be distinguished, the leverage effect of constant expenses related to using assets is called working leverage or operating leverage (DOL). The risk-raising effect of constant expenses related to liabilities is called financial leverage (DFL). Using both types of leverage by an enterprise is called combined leverage (DCL). Firms tend to avoid the very high gearing levels, because of the financing distress risk. This could be induced by the requirement to pay interest regardless of the cash flow of the business. (Harris and Raviv, 1991)

There are many theories of optimal capital structure. The first breakthrough came with Modigliani and Miller's theorem, which specifies conditions under which various corporate financing decisions are irrelevant. MM Proposition I. concerns about the irrelevancy of the value to capital structure. MM Proposition II. implies that, the higher the debt-equity ratio, the higher the expected turn on equity. (Modigliani-Miller, 1958) Later Modigliani and Miller showed that when corporate taxes are included, the value of the levered firm is equal to the value of an unlevered firm plus the present value of the tax shields associated by debt. This third step in capital structure theory was first suggested by Baxter and later modified by others. In this way, bankruptcy costs are introduced. Now the value of the firm in bankruptcy is reduced by the fact that payments must be made to third parties other than bond- or shareholders. The next step in capital structure theory was the introduction of personal taxes in 1977. Miller showed that, a "nothing matters" situation arises when you combine corporate and personal taxes. Most recently, the assumption of comple contracts is relaxed. Instead, contracts are assumed to be oncomplete, i.e. they don't specify precise provisions for every conceivable future event. And apart from the

theoretical literature hundreds of papers try to empirically test all the different capital structure theories.

III. Research methodology

In the scope of my study calculations in connection with the analysis of fund- and capital structure of agricultural corporations are based on the Testwork database operated by the Research Institution of Agrarian Economy. For the sake of better comparability of the data, I drew into the analysis only those companies among corporate farms which appear in the testwork system under constant running every year between the period of 2002-2009. Accordingly there are 192 companies that match my conditions, of which a notable number could be classed in the plant producing group of GOFR. Besides, regarded to the size of the plant, around 85 percent of analysed companies come under the 2 largest size category defined by AKI with rates over 40 EUME (European measure).

I used regression analysis for an empiric proof of capital structure theories and *cutpoint analyses* to study the credit distributing phenomenon by Stiglitz since in the subject of the database I searched the significance of wontedness and slant that marked damage of normality at many factors, furthermore in many cases even the terms of a dispersion homogeneity were not certain. Because of repeated damages of the two modelled T-test, a specified comparison of distribution seemed to be expedient within the confines of a *cutpoint analyses* which I performed with the assistance of the ROPstat 1.0 statistic pack of programs.

IV. The results of the research

1. Capital Structure Attached to Profitability

In scope of relation analysis I looked into the factors defining capital structure, the existence of connection between index numbers describing it and the strength of this connection as well as how an existing connection could be described and expressed. I meant to test the correctness of the following pieces of hypothetical:

Hypothetical I.: *Rates of capital structure are in functional connection with the main parameters describing financial and income situation of agricultural corporations.*

Hypothetical II.: *A certain combination of chosen balance items (variants) could serve an explanation for the fluctuation of profitability indices.*

Thus I performed regression analysis of studied database on the base of two starting point. In one case I was trying to find the answer for what influence the capital structure indices, which may describe fund structure the best and are chosen by me, take on the financial and profitability situation of the corporation; whilst due to the second calculation I was looking for the answer for which of the variants filling a part in development of capital structure is in functional connection with the fluctuation of profitability indices.

Of the results of relation analysis for instance the connection between the profit in proportion with assets and funding items could be mentioned, which are described in table 1. It is clearly visible that profit in proportion with assets is in strong, negative connection with the proportion of credits lodged from owners in total capital; a change of 100 percent degree of that proportion would lower the rate of profit index by 27,3 percent degrees. Similar to credits lodged from owners, the studied index is also in a negative way of correspondence with proportions of long and short-term liabilities, however in the case of the latter the correspondence is not significant. Index number of fitting to the regression equation (R-square) is 0,41 that is to say the calculated model explains 41 percent of variance.

Results of further calculations also confirmed: fund structure proportions take serious effect on the variation of profitability. Symmetry of equity shows positive connection between profitability

indices and the fluctuation of liquidity, moreover the raise of foreign capital proportion on the whole goes together with the lessening of taxed throughputs.

2. Definition of Capital Structure Proportion Describing Effective Management of Agricultural Corporations

After having reviewed the connection of capital structure and profitability, in the followings I am looking for the answer whether in the studied 8 years should be a kind of capital structure considered to be general, due to which it could be stated that it couples to management producing profit or deficit instead. I plan to test the correctness of the following hypothetical:

Hypothetical: *According to joint agricultural corporations researched, (specifically to orientation of activity or to size in certain cases) a sort of proportion is detectable between foreign capital and equity as well as at credit files, to which its profiting connects.*

To confirm this hypothetical, conventional statistic methods were not adequate since according to several variants drawn in the analysis, tests of both normality analysis and scatter homogeneity marked damages of adapted conditions; this is why I searched my idea through outpoint analysis. I defined a proportion between foreign capital and equity which could be regarded as this: that proportion or a rate over it goes together with deficit in operation. I found that only 40 percent of corporations producing deficit and at the same time only 12 percent of those producing profit have leverage index over the rate 1,55. It also could be appreciated remarkable that almost 100 percent of corporations producing profit bear index numbers under 2,5 however, one out of five of those producing deficit have higher rates than this (table 2.) I performed the same statistic process in the consideration of the liabilities' proportion within fund construction and on this I

found that more than 60 percent of studied corporations producing profit operate credit proportion under 40 percent however, almost 70 percent of those producing deficit have rate proportion barely over this. Due to my results break-out possibilities for corporations already producing deficit are tightly limited, banks found granting credit to them is risky; moreover they have slight opportunity for development and by this flare and profiting operation by self strength.

V. Conclusions

Dealing with the theme of optimal capital structure is current. The decisions of it is critical not only because of the need to maximize returns, but also because of the impact such a decision has on an organization's ability to deal with its competitive environment.

Through relation analysis I prove: capital structure proportions take serious effect on the fluctuation of profitability. Symmetry of own capital (also proven statistically) shows positive relation of variation of profitability indices and liquidity, furthermore, raise of proportion of foreign capital couples with diminution of taxed throughputs: influence of its payable interest flow in taxed throughputs.

With the assistance of cutpoint analysis (also either specifically to orientation of activity and size) I defined a proportion of foreign capital and own capital which if reached or exceeded, may lead to operation producing deficit.

ABOUT OTHER KIND OF PRODUCTIVITY AND GROWTH (HOMO-SAPIENS TO HOMO-OECONOMICUS)

Jivan Alexandru

Universitatea de Vest din Timișoara Facultatea de Economie și de Administrare a Afacerilor

Part of a larger research, this paper ranges among the matter of ideas confrontation concerning the causes of the economic crises and those keys to be passed. Paper aims at finding and praising the defining elements of our economy, in the purpose of better understanding the nowadays crisis, and at presenting certain conceptually different approaches. In this purpose, analytical presentations are focussed on the specific realities of the economic life that are in position in the last centuries, which are considered to be favouring the arriving to the critical states in the last years and to be promoting those maintaining, or which allow explaining certain effects and tendencies.

The approach is made from the angle of the nature of the productivity that is had in view and highlighted in the market regulating mechanisms, and of the due growth. The paper is grounded on important analysis on the matter (including anterior researches of the author), but their dimensions does not allow their presentation in the abstract. Analysis starts from interpreting the very nowadays crisis, from different sites concerning the core (general) causes, by correlating with certain features of the industrialized consuming society. More recent references are made in the literature on the matter. Modern western economy is defined from the angle of focussing on material-quantitative productivity and growth. Analysis tries to explain certain effects concerning this kind of focus. Interesting effects and tendencies are noticed, that miss to the traditional approaches. Further on an opposed theoretic model is discussed. This is built and developed inside the service economy (on the case of two conceptually similar approaches, came from two different sources of economic thought in the field; original contributions of the author are involved). Adequately to the knowledge society, this last one is considered more favourable for homo sapiens, at least once the visible effects of the last two hundred years model are revealed, which are dominated by homo oeconomicus. This reference model being set up, a short foray is intuitively made in the perspectives of humanity on long run and on very long time, in the supposed maintain of the present economic model. In all those presentations and analyses, connections are made with other papers on the matter, in the purpose of more profound study.

The conclusions concern the practical possibility of the model opposed to the industrialist economic crisis. The details highlighted from the analysis of the conceptual comparison between models and prospections bring, in the final, at proposing solutions, grounded on fundamental requirements on the line of humanity's values, with didactic addressing to the young generation. The elements of contribution of the author are underlined in the presented matter.

Keywords: productivity, modern growth, economic crisis, knowledge society, service economy

JEL: A13, H49, I25

1. Introduction

The nowadays crisis looks like a systemic crisis of the whole life of humans that was (and still is) approached in the modern tidiness, just like in the times of industrialization.

It looks like humanity arrived to the limits of a way of living that proved itself to be destructive for the planet and for the living of our own species on a very long time.

That what is certain is that, for Romania, the crisis is total: Romanian scientific research rather does no more exists, that we are integrated in Europe on positions of a marginal country, that Romanians are importing the most of the apples and potatoes they eat, that our country is in

enormous debt to the foreign banks, that the Romanian education lost all its chances to come back to the performances it had two decades ago, that the health of the population is under the impact of certain decisions of the same (and rather generalized) principle of elimination (and not of construction) etc.

For the analysis of Romania's economy can be invoked the exceptional book of Marius Băcescu and Dionysius Fota (Băcescu and Fota, 2009).

In this paper we will bring the discussion mainly in the field of *service economy*: this was that what made possible the necessity of approaching productivity, efficiency and growth in widened horizons to be seen. It happened in the postmodern epoch, when the traditional view was replaced, by taking into account certain social aspects and other, more than the monetary narrow economic. For a Short Literature Review, please also see the chapter no. 4.

2. The crisis of the world as a capitalist extensity spread

In opposition with the well-known growing intensity by industrial means, that is usual and preached in the theories concerning the modern world, the consuming society meant rather a simple spread of a model – the capitalist one – as Issac Johsua shown (Johsua, 2006). In the chapter 7 „« Nouvelle économie » ou l'utopie du capital”, the author we cited spokes about “over-accumulation” of capital, meaning accumulating it in a rhythm that the economy cannot support, on a long run, the profit ratio anticipated by those who supply the funds. The financial capital of the world brought us in crisis, sais Issac Johsua. This research, published before the nowadays crisis, spokes about the generating conditions of what followed – as we have all seen. “The crisis of «the new economy» was not surmounted, but only stocked in the accumulated lack of equilibrium”, sais the author at pp. 240. The superficial character, from the economic point of view (founded on “moment solutions”, having beneficial results in the short run, but generating spread effects, including in the long run, aggravating effects) is exceptionally synthesised when Johsua shows that, in critical situations, “America rescued itself just as it lived: on credit. The pick up again was so realised, not by reducing certain anterior dysfunctions of the American economy, but contrary, starting from them, by increasing them.” (pp. 243).

The central goal on the market (and the criterion of “selection” by “competition”) is the gain, found in computed productivity. The method consists in cheating models of economy, by evading its genuine roles of *tool* for covering people's needs; and, by this, the economy is preached like a goal by itself; the slogans of liberty and of “fair competition” in the economy, but the economy that is producing those which are really *necessary* (economy that was dominant two-three centuries ago) is let in the outside of the efficiency: there is *else* that the market acknowledge and admits as rewarding and moneymaking; i.e. the gains are from winning in the “fair” competition, including the intense exploitation of the natural reserves, speculation etc.

A main result is that primary needs, as food, and flu and tuberculosis cure) are abandoned to the market laws, *at a subsistence level*: they are maintained in this way in the “poverty trap” (this matter is developed in our paper Jivan, 2008).

The existence of mass poverty also annulates or maintains to a minimal level the qualitative improving trends – which should be correlated with the increase in the price. The price increases very much, for relatively low improvements, for strictly opulent improvements, for advertising and mostly for good indicators established by the rate agencies (which are private firms and have private interests too); quality decreases for the low price levels – having as a unique alternative the total give-up to those supplies.

Prices are judged not in function of the quantities, but according to percentages of the revenues allocated to those buys. So, the situation (the current, given situation), of the existence of significant revenues above the fundamental needs (which can receive the most varied destinations, it is too little in the direction of improving or increasing alimentation) generates this marginal state of agriculture in the capitals beholders' economic action options. The issue of

sponsoring agriculture is a mechanism which is external to the market, from outside the free competition, which tries to correct a situation (fair from the market logics point of view), which risks leading to a dangerous diminishing of the agriculture weight in the entrepreneurs' options. The suppliers remain attracted – according to the market criteria, as well – by the luxury consumptions segment. Disequilibrium at the individuals' level results (Jivan, 2008). The optimizing system does no longer work, as well as the self-regulating mechanisms. A waste of values, of resources, of efforts result; this generates inflation.

3. Usual perceptions, including in the periods of crisis

It was shown (Jivan, 2010) how, in the traditional (classical) economic model, profit and interest are usually seen as varying with capital amount, economic growth being generated by material investment, which is about quantitative growth of tools, machines, money and other forms of capital employment for production which generates quantitative growth of production. But the economic growth can be better generated by growing returns: productivity and the quality of being lucrative are given by innovation, information, knowledge, science, brains, including the results of human capital formation and education; growth is varying with inter-relational growth and with intellectual factor. (Jivan, 1995).

The usual angle of approach and level of analysis is that of the accountants' books, as well as the source of data; but in the accountancy books of *business*, the place of such services may be less important than the place industry takes, even if the genuine essential generation of things has another logics (from Jivan, 2009). The understanding of the economists must go above the *businessmen's* reasoning.

Such a wrong approach is also in certain government policies concerning education and scientific research. Unfortunately they let us see the state of our country.

We discussed the materialist fallacy (classical, or Marxist); it is a big mistake to see mostly the expenditures in services (and blame them all as a whole), because of their immateriality – proving lack of understanding. We have also seen the consumption fallacy (Keynesian). They are as fallacious as any other exaggerations, like any speculating production, aiming exclusively to gain, with no respect for its environment (Mother Nature, social, moral environment). Any activity can be destructive (Jivan, 2010). But at aggregate economy scale (national, world-wide), useful performances are mutual, mostly, one way or another, at least by the mediation of the generalized market (see here our synthesis on the market as global servicing, in Jivan 1996).

Knowledge society implies an opened minded view and an interdisciplinary vision, which are superior to the narrow economic approach, including the care for the social problem, for the planetary environment and such like, among which moral-institutional aspects are also important. Even production and consume are replaced with “functioning” and with the creation of utility; and the place of immaterial activities is really central.

The choice between ways should not be a dilemma: the best permanent answer is *aurea mediocritas*, *the equilibrium* and avoiding any extreme and narrow view.

4. An opposite model

On the line of research opened by service economy, observations, critics and proposals were made at micro as well as macro-economic levels. Between those many research, we mention here only these realized by Jean-Claude Delaunay, Jean Gadrey (like particularly Delaunay, Gadrey, 1987 and Gadrey, 1992 and others), Jacques de Bandt (De Bandt, 1991), Orio Giarini (particularly Giarini, Stahel, 1993 and Giarini and Lauberge, 1997), André Barcet, Joel Bonnamy and many other authors (particularly the papers in *Revue d'Economie Industrielle* - no. 43, 1988). Jean Gadrey (Gadrey, 2010) criticizes the industrialized economy, speaking (at pp. 88) about the “double dictatorship”, (i) of the world markets (that are not regulated) and (ii) of the agricultural “liberal-productivist” politics. He requires a more complex analysis of the productivity of an

industrialized production process: not just the growing productivity of the modern tools and machines, but also the time of work consumed for their fabrication should supplementary be recorded as a cost; a cost that should not be ignored. He also proposes the deduction of the estimated value of the big damages involved by industrialized and chemical production (including in food) and long distances transport: those damages should diminish the pretended growth that modern industrialized productions pretend realize.

Gadrey argues (pp 85-86) that the usual theory of growth and productivity is interested only by the quantitative aspects, making no difference between an output that is protective for Mother Nature, not-polluting, ecologic, on one hand, and an output based on big consumes and waste of energy and less healthy for humans or even worse.

Gadrey speaks about the fact that an investing economic activity and a consuming one are considered to be „equivalent” in the numerical usual analyzes. There is a comparison made by quantitative criteria, with no respect to the qualitative and more profound aspects.

All those critics and recommendations are revealing critical aspects of the usual productivity and growth models. In contrast with the usual (growing, industrialist) model, he proposes, in his large-hearted approach, a new one, using a “new type” of progress, the true progress, profound, not just superficially quantitative and not only on the short run.

Another approach is that of *servicity*, proposed like an extension or even a rebuff to *productivity*, at *The 9th Seminar on the Service Economy* (PROGRES – Programme of Research in the Economics of Services, A.S.E.C) in Geneva, September, 6th -7th, 1993. Firstly included in a paper published in the review of *Services World Forum* (Jivan, 1993), the concept was later developed in other papers and books. The concept of *servicity* is grounded on the point of view in the modern marketing optics and on service economics.

The concept we call *servicity* would mean exactly the effective *intrinsic* productivity, the effects of human activity consisting in generating *general* and *absolute plusses*. It is in opposition with *computed* productivity, generating palpable *concrete plus* to the concerned individual, therefore *relatively* to a specific economic agent (with no concern with the rest of the world, with the ensemble)

Such approaches prepared the conceptual field for the European requirements of knowledge society and knowledge based economy, of more seriously taking into account the natural and social environment. Ulterior, the ideas were developed, and between the most recent exemplificative research we mention those on innovation, productivity and performance, of Faiz Gallouj (Gadrey and Gallouj, 2002, Gallouj and Djellal, 2010), Faridah Djellal (Djellal and Gallouj, 2008) and others.

As concerns the matter of indicators, between the preoccupations in the field, we limit us to mention only about the important European project known (shortly) under the name of Stiglitz – one of the two big Nobel Laureates economists who are mastering, together with Amartya Sen, those research, to what work numerous and other big specialists.

5. Long term prospects of humanity

Mankind should see that, in business practice, the narrow pursuing of the goals of profit (and calculated productivity growth) and the interest and gaining principles, brought us in the position of buying the water from stores (please see the developments of the matter in Jivan, 2011), and there already are first signs of buying also the air (another vital genuine resource) on the market in a foreseeable future. The bear conditions for life are *sacrificed for gaining more money*. In these conditions, mankind should apply another widening of horizons, like Marshall made (please also see our Jivan, 2011, where from is the presentation here): the impact of the activity of people on the environment, the impact on Mother Nature and, implicitly on its own future (on a longer time that market can appropriately manage) should be considered.

Humans can already see that the most important must be the *entire existent* (the notions of Nicholas Georgescu-Roegen can be used or Gheorghe Popescu's „the Joint Living Whole”, in Popescu, 2006), including the environment, and the *utility and costs*, for it, of the output, of the whole economic activity and of any human act. People should no more use only the individualist approach, and should take into account not only the economic actors (both buyer and seller), but also the others, directly involved and not involved, present and not present, the entire environment of the persons directly decisive in the trade, from the most comprehensive point of view: in the space as well as in the time dimensions. It includes the whole human society, Mother Nature, the Planet, the not-yet-born generations. And it takes into account different means and fields of action in the human society.

Centuries of industrialism and market domination passed and the effects of the market values (determined by short and medium interests and regulated on the long run only by mercantile criterion – costs, gain and profit) become to let be seen the planet destruction.

In such a widened approach, firstly the economic science (and, by time, all humans) should take into account the *costs and effects for all* the parts of the reality that are affected, even if they are active or passive parts, even if they wanted or wanted not to participate to the processes of humans' economy, even if they were not warned or they did not know at least that they are involved in the economic process and effects, even if they are present or not yet born.

Furthering what Marshall made, we could surpassed the strictly economic angle of perceiving reality, which proved already to be also too narrow: we should introduce a third category of time, for having a more complete comprehension of events, in space and also in the historic view. The short run and long run must be completed with the very long term, proving the historical capacity of perception of our human species. In the post-modern understanding of realities, humans must already have the clear-sightedness to accept that if the same way of living is persistently pursued, no chance will remain.

Georgescu-Roegen hardly tried to teach us about another kind of economics we should study, learn, teach and apply, but he was marginalized (Georgescu-Roegen, 2009) – may be precisely because of this attitude.

6. What can we, still, make?

In despite of the usual principles of competition (invocate also by the economic traditionalist approach – still dominant), the special human (superior to the strict economic and short run) principles are surviving, (even in poorness or in societies what are week from the economic point of view), like also a big enough number of their bearers and preachers. Their extension and spreading is not an exception, but a tendency, mostly in the knowledge society: it is and should be consistent with it.

The mercantile values represent just a tool and must remain a tool. In our times, *homo-sapiens* must now show his *superior knowledge and thinking*: superior and much more widen than the simple economic one. And must teach and *widen the mind of homo-oeconomicus too*. *This is the fight of our times*. The task is in the field of learning and of teaching the young generations, not in the spirit of private speculation, but in the team spirit of work, care and concern for the whole environment, as a common good for living. *A superior rationality must be put in*.

The economic functioning can be oriented on realizing the general well-being and on attending the interests of the whole *human* society, exactly and just by a well-considered and well-settled legislation – which points out the optimizing valences of the market mechanisms. (Jivan, 2009).

Science has the new task of knowing how and when the market mechanisms act in an improving direction: “how and when” means the legal *conditions* requested (*that society should settle*). A superior outlook upon the final (compensated) results of the efforts and effects of any human activities is necessary. Efficiency should not be no more narrowly limited by the economic criteria, but should concern the best for the person, for the society, for the world, balanced

between the present and the future. Taking into account the disequilibrium we spoke about, we propose analytical studies concerning a certain criteria system in the matter.

ECONOMICS ON THE ROAD TO THE DEVELOPMENT

Jula Octavian

Babes Bolyai University Faculty of Economics and Business Administration Department of Economics Cluj Napoca, Romania

The paper aims to stress if a certain economic model can lead towards economic development. We will try to understand and explain if certain economic measures taken by well developed countries can be used by emerging countries.

We will take into consideration along the public policies also the influence of foreign trade into development of different countries.

Is it possible that one country to have economic decrease and in the same time to have an important increase in the international trade? Seems like the answer in the case of certain Eastern European Countries to be yes.

Even so it is a matter of reestablishing importance of different fields in national economies in order to use the outcome in increasing the level of well-being of individuals.

International trade is maybe the most important tool to increase or decrease deficits. The international trade policy is usually influenced by the public and fiscal policies inside one economical area (national area).

If we analyze the world's area in which the international trade is having the highest impact on GDP we for sure might say that also those countries are experiencing a high degree of economic development. Also in respect to the public sector those countries are having high degrees of public deficit.

Government spending grows in open economies as a mechanism to compensate for the adjustment costs of trade openness. Small and open countries, which are affected intensely by world business cycles from which they cannot easily insulate themselves through standard macroeconomic policies, choose to maintain high levels of public consumption and transfers to protect workers in their losing economic sectors. High levels of spending are therefore understood nearly as a functional requirement for the maintenance of internal stability and peace. Moreover, high levels of government intervention are seen as a way of overcoming market failures in the provision of skills and infrastructures: they ease the transition of the unemployed to the more dynamic areas of production in countries that need to compete in world markets to survive.

Can we create a public policy that will support the development using the vehicle of exports? Can this be the solution for decreasing deficits and be a start for a new development even in conditions of economic crisis?

Keywords: economic systems, development, public policies

JEL Codes: B21, B22, E20, E30, E50

1. Public policies

What is more important in the development of one country? What should be the final goal? Our opinion is that the most important thing is the level of well-being of all citizens within a geographical and economic space.

This being said the next step that we should take into account is the size and shape of the economy defined as public or private sector. For sure if it would be to define the type of economy that will probably determine the highest benefit of its citizens the answer cannot be 100% public or 100% private. From the experience of the countries that are the most developed in the matter of the well-being of its citizens we can say that the wealthiest countries and the countries with the highest living hope are experiencing a mixture of public and private economy.

Of course the percentage of the national economy for those two major parts is very different from country to country. But what can be very obvious if we analyze the top economies is that the one's to have the minimum percentage of the public spending policy will direct those public investments exactly to those sectors of the national economy onto which the beneficiaries of this public sector are the highest in number.

We can make a comparison between the percentage of public spending in GDP and the real GDP per individual and also the living hope and the result will be striking.

For instance if we need to make a comment on the evolution of the public sector as percentage of GDP we can easy say that, with the exception of the periods in which the world has experienced the two World Wars the public sector has a big and huge increase into the last 100 years.

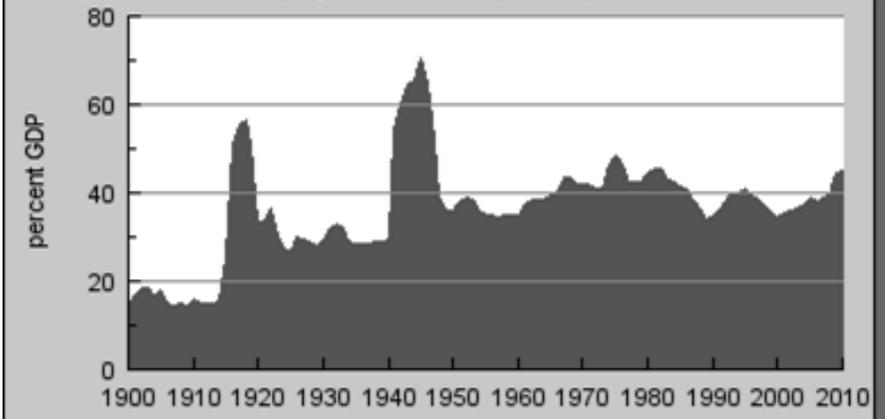

You can see below the example of UK public spending as percentage of GDP.

The analysis is providing the proof that the public sector basically doubled from 20% to 42-43% in 2010. This is also valid for USA. Why have I taken into account those two countries?

Well let me say that between the countries to have the highest living standard the two countries are considered to be the most liberal countries in organizing the economy

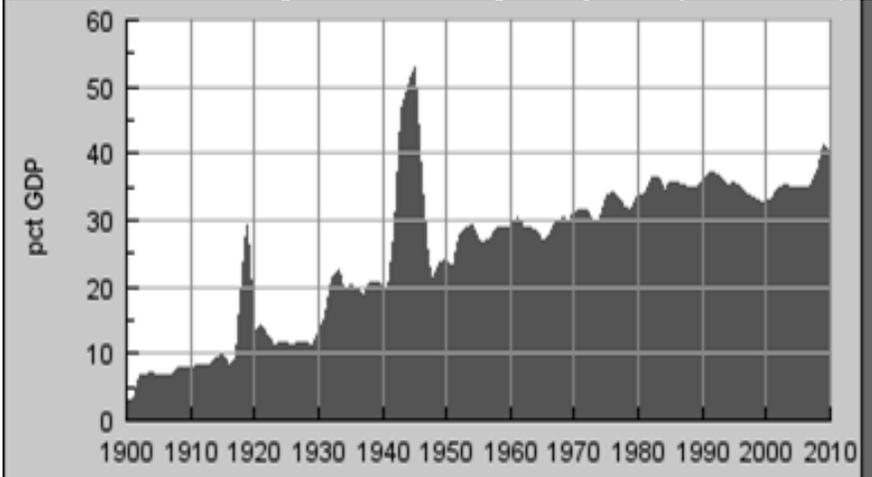

In the graphs below you can see the development of the public sector.

Graph 1. UK Public Spending as % of GDP – 100 years

Source: CIA factbook

Graph 2. US Public Spending as % of GDP – 100 years

Source: CIA factbook

And if we take into account only the last 10 years the increase is even higher. Why this happened?

Maybe from the need of governments to finance the budget deficits or maybe in order to try to try a new path of the national economies, a path that will lead to a higher dependency of the individuals to the national entities and also to ensure the power of national governments in respect to the irreversible process of globalization.

What about government failures? Can one government failure in public policy to redirect the investments into certain emerging countries? Our reply is yes. For instance if the public policy regarding education is not in close link with the labor force market that a public failure will occur. Usually the education field is one of the most conservative fields and this is why the link between the education and labor force market has a gap of at least 4-5 years. From where this gap comes? Well first we need to say that only a few countries have a national policy regarding education and only a few countries are trying to connect the education with the request of the economy. This is happening because the labor force market reacts quite rapidly at the changes of the economy. The companies, employers are requesting what is necessary and useful. Why the educational field reacts with a small gap? Because the specialization of individuals can take from 4-5 years and even more so we can speak about educational cycles.

Can this gap be decreased? Yes one possibility is to produce national educational programs even if this can seem a limit of the liberty of individuals. It is only a plan to reduce unemployment due to the linkage of education to economy.

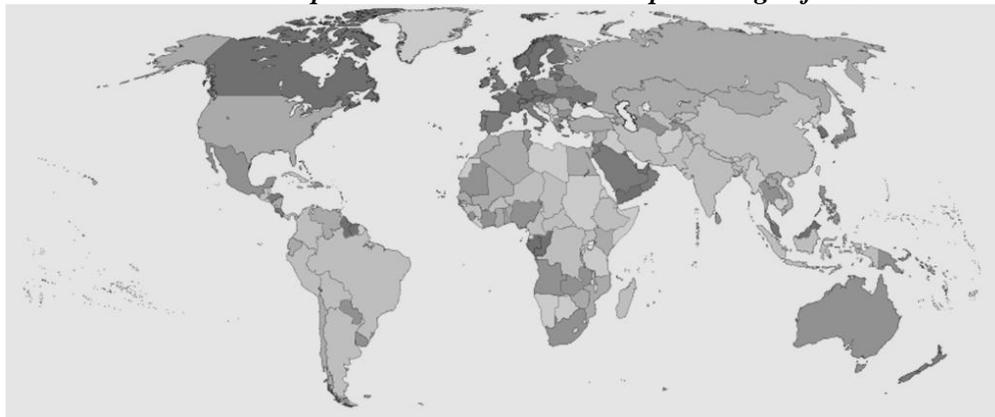

So if this is an example of governmental failure what can we put in balance in order to strive the economic development? Here can be the influence of fiscal public policies in sustaining the development of the national economies and one the possible ways is the policies in link with foreign trade.

2. International trade a tool to decrease/increase deficits

International trade is maybe the most important tool to increase or decrease deficits. The international trade policy is usually influenced by the public and fiscal policies inside one economical area (national area).

If we analyze the world's area in which the international trade is having the highest impact on GDP we for sure might say that also those countries are experiencing a high degree of economic development. Also in respect to the public sector those countries are having high degrees of public deficit.

There are situations in which a positive situation in respect to international trade can occur from the point of view of trade balance. It is possible to have a positive trade balance and still economic decrease. How this can be possible? Well in the situations of goods that have maximum imposed prices onto the domestic market, they are imported from the producers with a low cost and then re-exported to other countries in which the prices for those types of products are floating free. This is the case of medicines for example. What will happen with the profit taken from this business? It will be sent to the mother company so that the added value to economic development of that specific country will be basically 0.

The costs and benefits of international trade also depend on factors such as the size of a country's domestic market, its natural resource endowment, and its location. For instance, countries with large domestic markets generally trade less. At the same time, countries that are well endowed with a few natural resources, such as oil, tend to trade more. Think of examples of countries whose geographic location is particularly favorable or unfavorable for their participation in global trade. Despite the risks, many countries have been choosing to globalize their economies to a greater extent.

And this led to economic dependency in link with development and/or economic decrease. This is why so called new countries, emerging countries, have dwelt with the biggest problems in the last 2 years. If in the period of economic development the linkage with the most developed countries from the international trade point of view is a tool of economic increase for themselves, in the period of economic decreases this gap does not narrow but increase. And this because usually those countries to have such a large domestic market tend to develop first the domestic consumption with the domestic production and only after to extend again to other areas.

If we take into account the development of international trade in the last 10 years we are able to conclude that it will be an important tool for the future possible economic development and the globalization process of the last and future years will be the cause of increasing role of trade.

Graph 4 International Trade to GDP ratios – difference 1998-2008

Source OECD Factbook 2010: Economic, Environmental and Social Statistics

How international trade can be used in order to decrease the public deficit and what is the link with the public sector? In order to reveal the possibilities of using this vehicle of decreasing public deficit we must say that policies of investment into exactly those fields of economics that are destined to have the most important role in international trade must be made with priority.

One of the possible solutions can be either the public spending policy to create jobs in the fields that are providing goods with a high degree of manufacturing and also goods that are requested for export or some fiscal or environmental policies to diminish the amount of imports. This can become an important solution to equilibrate the trade balance and maybe for a short period of time to have also a trade balance surplus.

Of course increasing international trade is not always a positive solution for the future and sustainable economic development. If the goods that are exported are mainly material raw for a short period of time it is possible to equilibrate the trade balance, but in future this will lead in the end at a very high degree of dependency with other economies exactly onto those economic fields that have exported previously the material raw. So this is why our proposal was goods and services with a very high degree of manufacturing and to limit the imports, if possible, to material raw.

What we can outline also in the bases of the graphs presented above is that the countries to have the highest rate of economic development and well-being of their citizens are those to have a high percentage of international trade in the GDP. Of course it is not the only cause for economic development but it can be called the top of the arrow of the increase.

3. Deficits and economic development

Can we make a link between public deficits and possible economic development? In the days that we are live in there are two main paths that economies are following. There is the situation in which on country is deciding to cut down expenses in order to decrease public deficits and they are considering this as the best tool to fight economic decrease. But there are a few other countries to consider that increasing deficit and public spending higher than before will be the starting engine of the economic development.

We need to stress that the economic development of the future cannot be similar with the economic development that came after the big economic crisis from 1929-1933. First let us say, on the basis of data presented above that we had a period 1940-1944 with a huge spending from the public sector, coming not from economic but other reasons, so that the periods cannot be similar.

There two ways to understand this matter.

One is the Keynesian way that stresses that governmental spending leads to economic development and also it is one of the causes, and the other economists that are presenting the case vice versa. In their opinion the economic development will make the government to spend more than in early days. Our proposal is a mixture of those two ideas.

The public spending policy should represent a solution for the future economic development. Governmental expenditure is composed of current expenditure and development expenditure. The current expenditures of the government are to maintain basic services that the government provides to the public including the payment of salaries to the civil servants (this is the largest component of current expenditures). Therefore, these expenditures not only facilitate growth prospects but in part promote growth as well. The development expenditures on the other hand are allocated by sector to provide basic infrastructures (such as roads, railways, bridges, ports and airports) to facilitate movement of goods and services across the country. During the early stages of economic growth, these expenditures increased in tandem with economic growth. However, in the 90 s, the development expenditures in particular increased significantly to generate the growth of the economy.

4. Conclusion

Is it possible that one country to have economic decrease and in the same time to have an important increase in the international trade? Seems like the answer in the case of certain Eastern European Countries to be yes. What should be the solution? An analysis of the international trade

in close link with the public deficit and also with the economic sectors of the economy is necessary.

Public policies that will drive the production and trade, national or international, with goods that will be

Even so it is a matter of reestablishing importance of different fields in national economies in order to use the outcome in increasing the level of well-being of individuals.

Can we create a public policy that will support the development using the vehicle of exports? Can this be the solution for decreasing deficits and be a start for a new development even in conditions of economic crisis?

The reply should be definitely yes. The problem is the mean by which we can make this.

The public policies should be driven towards those fields that will be start engines for the future economic development. Our proposal is that those public policies that right now have as beneficiaries' individuals to experience decrease in their incomes should be left on the last place and to increase the governmental spending in the fields that will create jobs and economic outcome. We have as an example the public policies taken by Ronald Reagan in USA and we can be influenced by that. Maybe the investment into production of public goods can be a solution but also the investment on production plants to sustain also the increase of jobs and in the meanwhile an increase in the aggregate supply and not in the end an increasing competition on domestic markets.

Yes public goods production is important but maybe the number of individuals to benefit from such an activity is quite less than the beneficiaries of a production plant or even public services. It can be the case of a public stadium in comparison with public transportation. We must have the decision not only deciding by using the social outcome for the society but also considering the economic outcome, such as possible profit and jobs created.

Governments should take into account, and leave for the period of time after the economic development, to diminish the spending for social benefits and to increase the spending for investments in public sector. Of course this solution will not have the public support, maybe it will not have the same image impact in the society, but for sure it will have a higher impact of the economics of that society.

Also the way that taxes and subsidies are considered right now should be changed. Taxes on property must increase in the same time with decreasing taxes on production and direct labor. Yes the first ones are the most sure but they will not generate economic outcome. The solution can seem both liberal and social. Our proposal is to have a liberal solution for production and public field investment and a social solution for social problems of society. If there is an agreement between economists that public and private economy can and will live together maybe in future we will reach the conclusion that also liberal economics and social economics can be a part of the same market and for a single market.

During its 20 year history of market economy, Romania experienced the most severe downturn in 2009, which resulted in many cost, mainly because of the output loss. These conditions forced several firms to declare bankruptcy and to stop their activity. The aim of this research is to assess the relationship between the corporate default rates and the macroeconomic processes in the case of Romania for the period comprised between 2002Q1-2008Q4.

For this, based on the relevant literature, we ranked the potential explanatory variables of the default rates into seven groups: cyclical indicators, household indicators, corporate indicators, external sector indicators, price stability indicators and interest rates, loans to private sector and finally the capital market indicators. Some studies base their results only on accounting data, others only on market data. Our study focuses on both, since this seems to be an adequate approach in capturing most of the processes.

Similar to the banks' loan portfolio structure, we conducted analysis for five sectors: industry, construction, agriculture, services and the overall economy. For each sector the average default probability at time t is modeled as a logistic function of many general and sector-specific macroeconomic variables. The use of logistic regression was motivated by its ability to account for fractional data between 0 and 1.

We found that at least one variable from each group has a significant explanatory power regarding the evolution of the default rates in all five sectors analyzed. In some cases the sign of the variables was the opposite of what the economic theory would have suggested, but it has to be taken into account that Romania posted the picture of an overheated economy during the analyzed period. Another important conclusion was that many variables were significant through their lagged value, which indicates an even better supervision of the evolution of the specific variables. From all the variables, the volatility of the BET-C index proves to be the most important in predicting the evolution of the default rates, as it didn't proved to be significant only for the construction sector. The evolution of FDI and the volatility of the BET-C index proved to be very important in determining the evolution of the corporate default rates, as well. The first was a very important factor in the financing of companies, especially during the analyzed period, and the risk meter is something that never should be disregarded when it comes of analyzing default rates.

Keywords: corporate default rate, macroeconomic processes, economic imbalances, logistic regression, lagged effects.

I. Introduction

In conformity with a research made by the World Bank in 2001, in the period comprised between the end of the 1970s and the end of the 20th century there were 112 bank crises in 93 countries all over the world. Most of these crises caused significant economic downturns in developed countries, as well as in emerging economies (see Wolf, M (2010)). The crises had considerable costs, which affected the whole society (the economic growth remained under its potential level, most of the banks got into governmental property, therefore their debts became the nation's debt (1)). To avoid these costs, several researchers proposed the analysis of the effect of macroeconomic factors on the probability of default in the financial and corporate sector. The aim of this paper was to conduct such an analysis in Romania for the period comprised between 2002Q1-2008Q4.

II. Literature review

We ranked the potential explanatory variables of the default rates into seven groups: cyclical indicators, household indicators, corporate indicators, external sector indicators, price stability indicators and interest rates, loans to private sector and finally the capital market indicators.

Among the **cyclical variables** the most frequently analysed are the real GDP growth, the seasonally adjusted nominal GDP, the value of the GDP-gap, industrial output change and its seasonally adjusted change, the industrial distance to default and the economic activity indicator. Bonfim, D. (2008), Monnin, P. and Jokipii, T. (2010), Boss, M. et al. (2009) and Castrén, O., Déés, S. and Zaher, F. (2008) found significant the effect of the real GDP on PD, but at the latter authors robustness problems evolved. Ali, A. and Daly, K. (2010) found significant the effect of the nominal GDP, Bonfim, D. (2008) the effect of economic activity indicator and Hol, S. (2006) the effect of the GDP-gap on PD. Bos, M. et al. (2009) and Hol, S. (2006) proved the significance of the industrial production index, but the former discovered robustness difficulties.

The second category consists of the **money market indices**: consumer price index, short term/long term real and nominal interest rates, M1 money supply, average nominal interest rates, average lending interest rates for corporate bank loans. In Liu, J.'s (2004) research the average short and long term nominal interest rates, while in Boss, M. et al.'s (2009) investigation besides the short term nominal interest rates, the consumer price index influences significantly the PD. According to Hol, S. (2006) the money supply combined with firm specific financial indicators (2) are relevant explanatory variables of the PD. Finally, the last significant indicator of this group is the average lending interest rate for corporate bank loans analyzed by Bonfim, D. (2008). The next group is related to the **outstanding loans**: the growth rate of the loans and bank loans-GDP ratio. The former indicator was found significant on PD by Bonfim, D. (2008), and the latter one by Ali, A. and Daly, K. (2010).

The fourth category consists of the **capital market indicators**: the US treasury notes' yields with three and six months maturity, the real stock prices, the capital market index change, the S&P500's and some specific companies' yields and the slope of the yield curve. Castrén, O., et al. (2008) point out that the capital market indices and yield curve's slope (calculated as the difference of the long and short term yields) determines significantly the PD. In the study of Duffie, D. et al. (2006) the S&P500 and the Treasury notes' yield with three months maturity proved to be significant in relation with the PD.

Among the **household's indicators**, the consumption, consumption/GDP ratio, unemployment rate, employment rate, the annual growth rate of the disposable income and the growth rate of the household's income were studied. Boss, M. et al. (2009) found significant the unemployment rate in the case of a standard regression model, but in other model specifications their lags were also found significant in relation to the PD.

The indicators of the corporate sector include the Gross Fixed Capital Formation (GFCF), the average labor productivity, the real investments, investment in fixed assets, and the ratio of the

mentioned variables and real GDP. In this group there are also included the following: unit labor cost, real corporate debt and birth rate. In Liu, J.'s (2004) article the birth rate of the companies shows two opposite effects regarding the corporate default rates: on short term the growth of the rate decreases the value of the dependent variable, while on long term increases them. This relationship is examined with an ECM model, but the author did not find any explanations for the observed behavior of the dependent variable. Boss, M. et al. (2009) proved the significant influence of the unit labor cost and the investment in fixed assets/GDP ratio on the PD using a standard regression model. Both in the case of the unemployment rate, and also in the case of the unit labor cost their lagged values proved to be significant regarding the PD.

The last analyzed variable group is the **external sector**, which includes the real exports, the real exports to GDP ratio, oil prices, euro/US dollar real exchange rate and the exchange rate index. Boss, M. et al. (2009) found significant the lagged values of the real exports to GDP ratio, the oil prices and the real exports in explaining the evolution of the PD using different specifications of the standard regression model.

III. Methodology

For each sector the average default probability at time t is modeled as a logistic function of many general and sector-specific macroeconomic variables. The initial logistic regression equation can be noted as:

$$DR_{t,s} = \frac{1}{1 + e^{-X \cdot \beta}}, \quad (1)$$

where $DR_{t,s}$ denotes the sector-specific corporate default rates, X denotes the matrix of the explanatory variables, while β is a column matrix representing the coefficient estimates. The used methodology, based on the work of Papke and Wooldridge, mentined in the paper of Boss, M. et al. (2009) allows the estimation of the default probabilities directly but, in contrast to common logistic regression models, it explicitly accounts for fractional data between 0 and 1. The large number of analyzed macroeconomic variables indicated the use of a model selection process, which helped to find the optimal multivariate model. The estimated models were sorted by the value of the adjusted R-squared and the value for the quasi-likelihood estimator, according to Boss, M. et al. (2009).

IV. Data and macroeconomic dynamics

With the aim of better understanding some of the links between credit risk and macroeconomic developments at an aggregate level, we built up correlation matrices between a large set of macroeconomic variables and corporate default rates. These matrices may provide a guideline of the cyclical co-movement between default rates and other macroeconomic variables, which can later be used as explanatory variables under a regression analysis framework.

1. Data

The corporate default rates were given by the Romanian National Commerce Office, in quarterly data, for each industry.

The correlation coefficients were calculated for five sectors: agriculture, industry, construction, services and for the overall economy. The data used for the analyses refer to the period comprised between 2002Q1 – 2008Q4. For each sector we used both the general and also the sector specific, seasonally adjusted (3) macroeconomic variables. Furthermore, where it was indicated the quarter - on - quarter change of the variables was taken into account in order to highlight their dynamic effects on the default rates.

Further on we focus on presenting the most significant correlation coefficients for each group of variables (4) regarding the overall economy, industry and services, since these two sectors represent the most important parts of the economy.

In the case of the **overall economy** within *the cyclical variables* the change of the nominal GDP, within the *households* the gross average wages, within the *corporate sector* the nominal GFCF, within the *external sector* the loans lent by foreigners, within *the price stability and interest rates* group the interest rates for existing loans denominated in Euro, within the *loans to private sector* the outstanding loans to households and finally within the *capital market* the value of the BET-C index stood out from the rest of the variables.

For the **industry** sector within the first group of variables the change of the nominal GDP, within the households the gross average wages, within the third group the nominal unit labor cost index, within the fourth group the FDI, within the fifth group the inflation rate, in the penultimate group the outstanding amount of bank loans lent to the industrial sector, and finally in the last group the value of the BET-C index was the most significant.

For the **services** sector within the cyclical variables the change of the nominal GDP, from the households the gross average wages, within the third group the ratio of nominal GFCF and GDP, within the fourth group the FDI, within the fifth group yet again the inflation rate, in the penultimate group the outstanding amount of bank loans lent to the services sector, and finally in the *capital market* the value of the BET-C index proved to be the most correlated with the default rates.

2. Results for the econometric analysis

(Table nr. 1) presents the estimated coefficients and p values for each analyzed sector. For the overall economy six variables were found to be significant in explaining the movements of the corporate default rates. No variables from the external sector were found to be significant. Even though the theory suggests a negative relationship between default rates and real GDP, the results are contrarian with this. This shouldn't be a surprise in the case of Romania, as during the analyzed period a highly overheated economic activity was observable. Bonfim, D. (2009) highlighted a similar relationship between credit overdue and real GDP growth. This relationship implies that a period of robust economic growth is usually followed by an increase in the number of defaulted firms with a lag of 1.5 to 2 years. The positive relationship between the lagged private real consumption and the dependent variable, similarly to the real GDP, could be explained with an overheat of the private consumption. Furthermore, both increased volatility of the BET-C index and interest rates have a positive effect on default rates which is in line with the theory. Other significant variables were the lags of real labor productivity index and loans to households.

In the model built for the industry sector four variables were found to be significant in explaining the movements of the industrial corporate default rates. Unfortunately, no variables from households, corporate sector and loans to private sector were found to be significant. A general observation for this model can be that from every group of variables the lagged ones became significant. Our results regarding the relationship between the industrial default rates and inflation rate doesn't prove to confirm the theory, as the relationship between the lag of inflation rate and default rate is negative. Among the group of cyclical variables the lagged values of industrial GVA were found to be significant in explaining the industrial corporate default rates. In contrary to the theory, which indicates a negative relationship, in our model the relationship between the two variables is positive. The explanation could be the same as for the overall economy. From the group of foreign sector the lagged total FDI proved to be significant and its relationship with the corporate default rates is positive. From the group of capital market the lagged volatility of BET-C is significant.

In columns 7 and 8 we can see which macroeconomic variables were significant from different categories for the construction sector. In the case of this model there weren't significant variables from the group of price stability and interest rates. As we can see, the nominal GDP has a negative coefficient, this can be interpreted as when the value of the nominal GDP is decreasing (in other words, there is a recession), the value of the default rates is increasing. It can be seen that there is a positive coefficient for the change of the average unit labor cost in the industrial sector lagged with five periods. This may suggest that the increase of the unit labor cost in the construction sector will increase in five periods the default rates.

For the agriculture sector we can see that there weren't significant variables from the group of price stability and interest rates and from loans to the private sector. The real labor productivity lagged with three periods has a negative coefficient, this meaning that if the real labor productivity decreases in the agricultural sector, it will increase in three periods the default rate. It is interesting too that if the net average wages increase they will increase in a half year the value of the default rates as well. Furthermore, the table shows that if the RON appreciates against the EURO the default rates will increase again.

In the case of the services sector, it can be seen that there weren't significant variables only from the external group. The highest impact on the default rates are caused by the changes in private real consumption and loans to households, both posting a negative relationship. For the services sector, the contemporaneous value of the volatility of the BET-C index was significant, indicating a positive relationship. Furthermore, the results show that interest rates for EURO denominated newly issued loans increase the probability of default in the next period.

V. Conclusions

Our aim with this research was to assess the relationship between the corporate default rates and the macroeconomic processes in the case of Romania for the period comprised between 2002Q1-2008Q4. In our analysis we employed a total number of 81 variables, which were combined differently for the following sectors: agriculture, industry, construction, services and the overall economy. Furthermore, these variables were ranked into seven groups: cyclical indicators, household indicators, corporate indicators, external sector indicators, price stability indicators and interest rates, loans to private sector and finally the capital market indicators.

Summarizing the results group-by-group can give a comprehensive overlook of the results obtained. Regarding the cyclical variables the nominal GDP and the real GDP proved to be significant in explaining the corporate default rates, not just for the overall economy, but for certain sectors, as well. On the other hand, in two cases (Industry and Services), sector specific cyclical indicators (GVA) showed high explanatory power regarding the dependent variable.

Eventually, for the household sector the private real consumption and the gross and net average wages, for the corporate sector the average labor productivity and labor cost, for the external sector the RON/EURO exchange rate, Total FDI and real Exports to GDP ratio, for price stability and interest rates the inflation rate and both EURO and RON interest rates, for loans to the private sector both the outstanding loans to households and firms, and finally for the capital market group the volatility of the BET-C index and the level of the index shows high explanatory power.

Overall, at least one variable from each group has a significant explanatory power regarding the evolution of the default rates. In some cases the sign of the variables was the opposite of what the economic theory would have suggested, but it has to be taken into account that Romania posted the picture of an overheated economy during the analyzed period. Another important conclusion is that many variables were significant through their lagged value, which indicates an even better supervision of the evolution of the specific variables. From all the variables, the volatility of the BET-C index proves to be the most important in predicting the evolution of the default rates, as it didn't proved to be significant only for the construction sector.

VI. Notes

1. From the 112 mentioned bank crises in the case of 27 the fiscal costs exceeded 10% of that specific country's GDP. Furthermore, in the case of 47 states the cumulative output remained with more than 10% under the potential level in the following years.

2. For example: average cash amount/debt amount, average financial coverage indicator, average liquidity, long term value of the firm, average firm size.

3. We were seeking to use only seasonally adjusted data, but in some cases only seasonally unadjusted data was available.

4. The used macroeconomic variables:

- Cyclical indicators: Nominal GDP sa., Nominal GDP sa. (%), Real GDP sa., Real GDP sa. (%), GVA sa. Industry, GVA sa. Industry (%), GVA sa. Construction, GVA sa. Construction (%), GVA sa. Agriculture, GVA sa. Agriculture (%), GVA sa. Services, GVA sa., Services (%).

- Household indicators: Private real consumption sa., Private real consumption sa., (%), PCR/GDP sa., Unemployment rate sa., Gross average wages, Gross average wages(%), Net average wages, Net average wages(%).

- Corporate indicators: Nominal GFCF sa., Nominal GFCF sa. (%), Real GFCF sa., Real GFCF sa. (%), GFCF/GDP sa. (nom.), GFCF/GDP sa. (Real), Average real labor productivity nsa., Avg. real labor productivity nsa. (%), Labor cost index (industry) sa., Labor cost index sa. (Industry) (%), Labor cost index sa. (Construction), Labor cost index sa. (Construction) (%), Labor cost index sa. (Services), Labor cost index sa. (Services) (%).

- External sector indicators: Gross nominal exports sa., Gross nominal exports sa. (%), Gross real exports sa., Gross real exports sa. (%), Real Exports/GDP sa., Total FDI nsa., Total FDI nsa. (%), FDI abroad nsa., FDI in Romania nsa., Foreign FDI nsa. (%), Total FDI/GDP sa., Total FDI/GDP nsa., Loans abroad nsa., Loans abroad nsa. (%), Loans to Romania nsa., Loans to Romania nsa. ROMANIA'S ENERGY POTENTIAL OF RENEWABLE ENERGIES IN THE CONTEXT OF SUSTAINABLE DEVELOPMENT

Maghear Diana

University of Oradea Faculty of Economics

The concept of "sustainable development" and the necessity for its realization has gone a long way in order to be unanimously accepted. Over time many authors have written about the problem regarding resources depletion, about the effects of pollution and their economic, ecological and social aspects of it. From the observation of the pollution phenomenon and its implications and until this problem has been acknowledged and accepted by a large number of people this problem has been extensively described by various authors be they economists, ecologists, biologists or psychologists and discussed at multiple conferences conducted in order to find a solution to this problem.

În ultimul secol, folosirea combustibilor fosili (cărbuni, gaz, petrol) a avut efecte dezastruoase, catastrofale asupra mediului înconjurător, mai mari decât orice activitate umană din istorie. In the last century, the use of fossil fuels (coal, gas, oil) has had disastrous effects, catastrophic even on the environment, greater than any human activity in history. Dintre aceste efecte putem enumera: încălzirea globală, apariția ploilor acide, subțierea stratului de ozon, etc. Among these effects we can enumerate: global warming, the emergence of acid rains, thinning of the ozone layer, etc. Prin urmare, utilizarea unor resurse alternative de energie devine iminentă pentru lumea de azi. In consequence, the use of alternative energy resources becomes imminent for the today world. Printre aceste resurse se numără soarele, vântul, apa geotermală, biomasa, apa, etc, care au capacitatea de a genera energie alternativă și anume: energia solară, energia eoliană, hidroenergia, energia valurilor, energia geotermală, bioenergia (biocombustibilii), biodieselul, etc. Among these resources we can include the sun, the wind, geothermal water, biomass, water, etc., which have the capacity to generate alternative energy namely solar energy, wind energy, hydro energy, wave energy, geothermal energy, bioenergy (biofuels), biodiesel, etc. care au menirea de a reduce poluarea termică, radioactivă, chimică oriunde pe glob. that have the as purpose the reduction of the thermal, radioactive and chemical pollution anywhere on the globe.

Sursele de energie regenerabile sunt în mare măsură indigene, nu se bazează pe disponibilitatea în viitor a surselor convenționale de energie, iar natural or predominant descentralizată face ca economia respectivă să fie mai puțin vulnerabilă în fața alimentării cu energii volatile. Renewable energy sources are largely indigenous; they are not based on the future availability of conventional sources of energy, and natural or predominantly decentralized makes that the respective economy to be less vulnerable in front of the supply with volatile energy. Prin urmare, ele constituie un element cheie al unui viitor energetic durabil. Therefore, they constitute a key element of a sustainable energy future.

This paper is meant to highlight the need for achieving a sustainable development both in terms of the problem that humanity faces which threatens the entire ecosystem and namely the environmental pollution as well as the depletion of the conventional resources that are highly polluting, highlighting the energy potential that renewable energy resources Romania has. This issue will be extensively discussed in the thesis entitled "The necessity and importance of sustainable development of Romania. Case study on the use of renewable energies for heating the population in the western part of Romania" which I intend to realize and support at The West University of Timisoara, Faculty of Economics and Business Administration, under the guidance of Professor Doctor Laura Cismaș.

Keywords: Sustainable development, solar energy, geothermal energy, biomass, wind energy

JEL: O13, Q01, Q27

Energy production technologies that use renewable resources are in different stages of development and marketing. The energies produced from renewable sources in 1998, the U.S., 55% came from hydro sources, 38% from biomass, including municipal solid waste, 5% from the geothermal source, 1% from solar power, 0.5% from wind power. Renewable energy resources are available all over the globe and can be found in abundance. Renewable energy technologies generate relatively little wastes or pollutants that contribute to acid rains, urban smog, or to could cause health problems and do not generate additional costs for environmental remediation or for waste disposal. Energy systems' owners of based on renewable resources should not be concerned about the potential global climate changes caused by excessive CO₂ and other polluting gases. Solar energy systems, aeolians and geothermal energy (most of them) do not generate CO₂ in the atmosphere, but the biomass absorbs CO₂ when it regenerates and that is why the entire generation, use and regeneration process of biomass leads to global emissions of CO₂ close zero. At present there are already several regenerative energy technologies, alternatives to burning fossil fuels for energy production, namely hydropower, aeolian, nuclear, geothermal, solar energy conversion technology, biomass, etc. (Bucharest: Alpopi, Florescu, 2009)

Solar Energy

The sun is one of billions of stars, but also the energy source of all living beings on the entire Earth. The solar energy that reaches the Earth in 40 minutes would be enough energy to meet the need for an entire year of all mankind. The man uses to such an extent fossil fuel based material - oil and coal - that the reserves will be exhausted in the second part of the next century. In the past, there was the belief that nuclear power is an alternative solution, but its degree of nuisance value is demonstrated by the Chernobyl catastrophe of 1986 and again in Japan. It was demonstrated that the energy sources that could replace fossil fuels, solar energy offers the greatest safety and accuracy.

Anatoine Becquel discovered the possibility of generating an electric current under the action of light in 1893. Since then, the electricity produced by the photovoltaic technology was asserted from an economically point of view and not only.

Worldwide sales of photovoltaic systems reached in 1998 at 150 MW, after a decade in which they have increased by 15-20% per year. (Bucharest: Motoc, 2009)

Arriving at a sales turnover of approximately 1 billion dollars, the photovoltaic industry has set new standards, has entered new markets and has demonstrated its economic viability.

It is estimated that the transition period of energetics will end around the years 2100-2200, when it will reach a stage of stable energy sector, by making unlimited energy source.

Solar energy represents the most impressive and reliable source of energy. Within 20 minutes, the sun provides the annual equivalent of energy consumption of mankind. On the Romanian territory, on a horizontal surface of 1 m², we can annually capture a lot of energy every between 900 and 1450 kWh dependent of course on the season. The average daily radiation can be 5 times more intense in summer time than in winter. But even in winter time, during a sunny day, we can capture 4-5 kWh/m²/day, solar radiation captured regardless of the surrounding temperature. Solar panels and system components from the Viessmann offer allow the exploitation of the solar power in various fields of applications: the preparing of the domestic hot water, pool water heating, heat input for heating buildings, heating for technology processes. The premises for using solar energy for preparing the domestic hot water are particularly advantageous due to the continuously changing evolution of the requirement during a calendar year. The overlap of

energy necessary for preparing SCR (the so called solar coverage rate) with the available solar energy is higher than in the case for heating buildings. A properly sized system can cover 50-65% of the annual necessary of SCR, in summer the coverage is most often 100%. Modern solar thermal systems can be incorporated without difficulties in the building facilities and have an estimated lifespan of over 20 years, making it an ideal complement to the modern heating technology. Starting from the data available was made a chart with the distribution of solar radiation on the territory of Romania. The chart contains the average annual flow distribution of the solar energy incidents on the horizontal surface of Romania.

Source: Data calculated by the author based on the program RetSreen

Regarding solar radiation, monthly deviation values on the territory of Romania reaches maximum values in June (1.49 kWh / m²/day) and minimum values in February (0.34 kWh / m²/day).

Thus, solar radiation for Romania represents approximately 330 million GWh per year (namely, the theoretical potential of solar energy). The technical surface that can be arranged is of approximately 30% of the available constructible area. So, the available constructible surface in Romania is of about 630 km², of which solar collectors could be installed on an area of 210 km². Each square meter of collector from Romania produces approximately 440 kWh of electricity or 1440 MJ of thermal energy per year. In order to replace the total amount of solar thermal energy required for heating in Romania (62,000 MJ) with solar thermal energy it is necessary a surface of 43km² of collectors. This represents 20% of the total usable area of 210 km². (Bucharest: Afloare, 2009)

At present in Romania there are 100.000m² (0.1 km²) of collectors installed, which represents 0.045% of the useable area.

Wind energy

Aeolian energy is a renewable source of energy generated by wind power. At the end of 2006, the global capacity of wind generators was of 73,904 MW, these producing a little more than 1 percent of the world electricity needs. Although considered a relatively minor source of electricity for most countries, aeolian energy production has increased almost five times between 1999 and 2006, reaching a point that, in some countries, the share of wind energy in the total of

energy consumption is significant: Denmark (23%), Spain (8%), Germany (6%). (Bucharest: Dobrescu, 2009)

Wind energy is widely used today, and new wind turbines are being built all over the world, aeolian energy is the energy source with the fastest growing rate in recent years. Most turbines generate more than 25% of the time, this percentage increasing in winter, when winds are stronger. It is believed that the global technical potential of aeolian energy can provide five times more energy than is consumed now. This level of exploitation would require 12.7% of Earth's surface (excluding oceans) to be covered by parks of turbines, assuming the fact that the land would be covered with 6 large wind turbines per square kilometer. These numbers do not take into account the improving turbine efficiency and that of the technical solutions used. (Bucharest: Poenaru, 2009)

It was considered necessary and appropriate the approach of some activities addressing the revaluation of Romania's wind potential, by using appropriate means and adequate tools (measuring devices, appropriate software, etc.) starting from the wind data measured at 22 stations belonging to the NMA.

The distribution on the territory of Romania of the average wind speed reveals that the main area with wind energy potential is that of mountain peaks where the wind speed can exceed 8 m/s.

The second area with aeolian energy potential that can be used in a cost-effectively manner is the Black Sea seaside, the Danube Delta and the north part of Dobrogea where the annual average wind speed is around 6 m/s. Unlike other areas of aeolian energy potential exploitation in the area is favored by less wind turbulence.

The third area with a considerable potential is the Bârlad Plateau where the average wind speed is about 4-5 m/s. Favorable wind speeds are also reported in other smaller areas in the western part of the country, in Banat and the western slopes of the Western Hills. In the capitalization strategy of the renewable energy sources, the wind potential is of 14,000 MW (installed capacity), which can provide a quantity of energy of about 23.000 GWh / year. These values represent an estimate of the theoretic potential and must be nuanced depending on technical and economic possibilities of exploitation.

Geothermal energy

The direct use of geothermal energy is one of the oldest, most versatile and also the most common forms of using energy. (Writings reveal that the use of geothermal energy dates back over 2000 years).

At present, studies of the domain show that Earth's geothermal potential is of approximately 13,000 ZJ per year, of which approximately 2000 ZJ could be used to produce electricity, with the help of geothermal power plants. If we could get to use only 0.25% of this potential, we wouldn't need coal, plutonium, oil and gas for generating electricity. Currently, we use only 1% of the world's electricity necessary which is covered by geothermal sources, so use 0.0025% of the full potential. (www.energeia.ro)

The usage of the extracted geothermal energy used for heating is of 37%, 30% for agriculture (greenhouses), 23% in industrial processes, 7% for other purposes. From a number of the 14 geothermal wells drilled between 1995- 2000 to depths of 1500-3000 m, only two wells were unproductive, recording an 86% rate of success.

Five wells that are available have temperatures above 100° C. The national exploitable reserve is about 167 thousand toes / year low enthalpy resources, of which currently builds about 30.000 toes/ per year. The total installed capacity in Romania in the west and northwest part is 320 MWh (for a reference temperature of 300° C).

Biomass

Another way of producing electricity and heating domestic water is to use biomass. Biomass is a scientific term for living materials (any organic material derived from plants as a result of the photosynthesis process). The same term is used for products derived from living organisms (wood, harvested plants, parts of plants and other plant residues) and aquatic plants and animal wastes. According to the Directive RER-electricity, "biomass" is the biodegradable fraction of products, wastes and residues from agriculture (including animal and vegetable substances), forestry and woodworking, as well as biodegradable fractions of industrial and municipal wastes. Romania has a high biomass energy potential, which represents almost 19% of total primary resources energy consumption in 2000. Romania's potential in the production of green energy is of 65% biomass, 17% aeolian energy, 12% solar energy, 4% micro hydro plants and 2% voltaic plus geothermal 12.

Romania has important renewable resources distributed in different parts of the country but they are not exploited to their full capacity, with the exception of the hydropower resources.

On the other hand the policy regarding energy is mainly a national issue, because energy is considered a strategic asset, therefore the investments in this sector are much needed. In addition the EU's main instrument in fighting the weather changes is constituted by the climate policy, because this sector produces 80% of the total emissions of the greenhouse gases.

To these it can be added that the Romanian energy sector the majority of the existing facilities are outdated. Given this situation the investments in this large area were built around the 80's and the maximum duration of operation guaranteed of the electric power stations and the thermal ones is of 30 years. If we add the technical progress and the European targets for reducing pollution, we strongly believe that the use of renewable resources represent a necessity and at the same time a solution for many national and European or even global problems.

IS READY ROMANIA FOR EURO ADOPTION? FROM STRUCTURAL CONVERGENCE TO BUSINESS CYCLE SYNCHRONIZATION

Marinaş Marius-Corneliu

Academy of Economic Studies Bucharest, Department of Economics

Socol Cristian

Academy of Economic Studies Bucharest, Department of Economics

Socol Aura-Gabriela

Academy of Economic Studies Bucharest, Department of Economics

The objective of this study is to identify gaps between economic and commercial structures between Romania and the euro area and to explain whether the results obtained justify recently decision to delay euro adoption beyond 2015. According to theory of optimum currency areas, the existence of similar economic structures, increasing trade integration and synchronization of business cycles with monetary union will provide greater symmetry of shocks between Romania and the euro area. If the shocks are more symmetrical, then common monetary policy of the European Central Bank will act as a tool to neutralize the shocks in the case of Romania, and the euro adoption would have fewer adverse effects. To meet the research objective, we have structured this paper into three parts. In the first part we referred to the importance of the proposed theme in the economic literature. In the second part, we used several statistical methods to identify how divergent is Romania relative to the euro area economies. The results obtained show increasing divergence between economic structures until 2009 year using the NACE 6 methodology. In fact, Romania has the most divergent structure in EU-27 countries, being characterized by lowest contribution of services to GDP. However, structural differences do not constitute an obstacle to euro adoption, as long as Romania becomes more commercially integrated with other European countries. Thus, Romania is the seventh economy in terms of trade with the EU-27 (73.3% of exports and 74.3% of imports), and the degree of convergence between the structure of exports and imports have increased significantly compared with 2000 year. In the third part, we estimated the degree of synchronization of business cycles between Romania and the euro area, based on Hodrick-Prescott filter. Results showed an increasing correlation of business cycles as a result of increasing industrial activity and export synchronization.

Keywords: euro area, sectoral divergence, business cycle synchronization, Krugman index, Hodrick-Prescott filter

Introduction

For economies that decide to be part of a Monetary Union, the most important cost is giving up monetary policy and exchange rate for its own internal objectives. This cost can be illustrated from the situation of a country that is affected by a restrictive economic shock (for example, increasing internal production costs). If this country not adopted a common currency, would be able to depreciate the currency in order to enhance competitiveness and neutralization of shock would be achieved more quickly. Therefore, the economy will be affected by economic shocks which it will offset more difficult and the cost of adopting a single currency will be higher. According to the theory of optimum currency areas (Mundell, 1961), the single monetary policy

within the monetary union can substitute independent monetary policy if there are a similar shocks to the other member countries of the union. Otherwise, the single monetary policy of the European Central Bank will generate more asymmetric shocks in euro area. The risk of shocks asymmetry increases especially in economies with structural divergence relative to euro area country. Even in the absence of economic convergence, it can be advantageous to join a monetary union, if that economy has other mechanisms which substitute independent monetary policy and offset the consequences of an asymmetrical economic shock. The functioning of these mechanisms is ensured usually by the existence of labour market flexibility. As well, enhancing of the trade linkages with monetary union countries can counterbalance to some extent the lack of structural convergence. Thus, commercial integration is one of the main mechanisms for more synchronization business cycles. According to Frankel and Rose (1998), the membership of the monetary union lead to an increasing correlation of business cycles, following more trade linkages. The more the commercial and financial relationships between the economic agents which belong to two economies are stronger, the more their impulse to adopt a mutual currency is higher. These economists argue that divergent economies with the euro area countries could adopt the euro single currency without much loss. This is called the endogenous optimum currency area, which means that a country will better meet the criteria for euro adoption ex post than ex ante. However, Krugman (1993) endorsed that the increase of the commercial relationships between two economies did not also generate symmetric shocks between them, as each economy will specialize in producing the goods which it can make more efficiently, that weakens the synchronization degree between the economies members. Also, entering the monetary union strengthens the correlation of business cycles only if the increase in foreign trade integration boosts inter-industry and not intra-industry foreign trade. This assumption is called the specializing hypothesis within the theory of the optimum currency area.

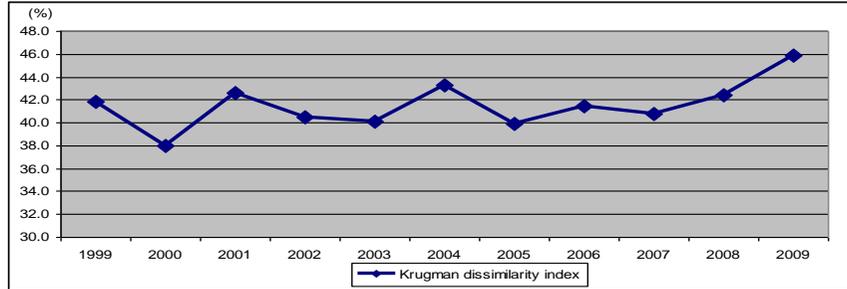

Sectoral divergence between Romania and euro area

If an economy has a sectoral structure (as measured by gross value added weights) less different than to euro area, then economic shocks will be more symmetrical and the costs of giving up the national currency will fall. The structure of the Romanian economy is very different from the EU members, and this situation will persist for a long time. Romania has a real urban distribution leads to a relatively low share of services in GDP achievement. Thus, despite high rates of economic growth by 2008, the share of services in GDP has not exceeded 50%, under a European average of over 70% of GDP. To highlight the differences between the sectoral structures of Romania and the euro area we used the dissimilarity index, proposed by Krugman, showing the distance relative between the economic structures of the Romania and the euro area.

$$\text{Krugman dissimilarity index}_{\text{RO/EA}} = \sum_{k=1}^n \text{abs}(s_{k,RO} - s_{k,EA}) \quad (1)$$

Where, s_k represents the share of sector k in total value added in Romania and euro area. The index takes value between 0 (perfect similarity) and 1 (maximum dissimilarity). The higher the index, the less similar are the economic structures of the Romania and euro area. In this paper, we have analyzed the degree of divergence between the economic structures of Romania and the euro area with 17 countries based on NACE 6 classification (Fig.no.1).

Figure 1. Sectoral divergence between Romania and euro area (NACE 6)

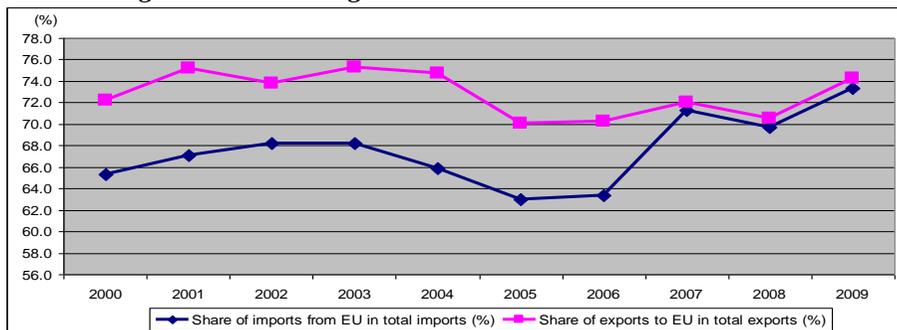

Data source: Eurostat (2011); our calculation

Romania has the most different structure of the economy compared with the euro area, following a relatively higher proportion of agriculture (over 4 times higher in 2009 year), industry (by about 10 percentage points over the reference in 2009), transport and trade (by about 4 percentage points higher in 2009), constructions (11% of GDP in 2009, compared with 6.3% in the euro area) and a lower share of the services sector (with 24 percentage points in 2009). The existence of a relatively higher proportion of industrial activity ensures a more rapid convergence process of the trade, since most of Romania's trade is made with industrial products. The contribution of agriculture to total gross value added decreased by half in 2009 compared with the year 1999, but this trend has not been accompanied by significant increase of labour productivity or exports. The boom of GDP in the period 2004-2008 was reflected at sectoral level by increase of the construction and trade shares, both leading to larger sectoral gap compared to euro area. The biggest differences between Romania and the euro area are in financial services and other services (including the public, education, health, etc.), Romania recording the lowest share of services in the EU-27.

Identifying the degree of trade integration

More than 85% of trade between Romania and the countries of the euro area is made with industrial goods, so that only the shocks which affect the industry in the euro area will transmit symmetrical/asymmetrical in the national economy. Consequently there will be a close correlation between developments in exports and industrial activity in the case of the two economies. Romania compensates the structural gaps of economy with a high commercial integration with the rest of the EU-27 countries, having the seventh share of imports and of exports with the EU-27. Accession to the European Union has generated increasing the share of exports at the level of 2004, while the share of imports increased by around 10 percentage points to 73,3% of the total in 2009, particularly as a result of the customs duties abolition and of poor competitiveness of agricultural and industrial goods produced (Fig.no.2).

Figure 2. Trade integration between Romania and EU-27

Data source: Eurostat (2011)

In the light of the adoption of the single currency becomes more important commercial integration with the euro area countries. In 2010, approximately 56% of exports and 53% of the imports were with these economies, but these values are declining compared to 2004, where approximately 60% of foreign trade was made with euro area countries. In 2010, five of the top ten countries of exports/imports destination were from the euro area (46.5% of total exports, i.e. 42% of total imports), demonstrating a high trade integration with the economies forming the core of the euro area. However, compared with 2004, the share of these economies in total exports was reduced by about 4.5 percentage points, due to the reduction of exports to Italy, with about 7.3% in 2010 (Table no.1).

Table1. The most important trading partners of Romania within the euro area

Data source: Department of External Trade, Romania

Given that about half of Romania's trade with EU-27 is done with the core of the euro area (Germany, France and Italy), then their macroeconomic developments will decisively influence the industrial activity and exports of the Romanian economy. Economic shocks that will affect these economies will be transmitted through trade in the Romanian economy and these will become more symmetrical. To show how sectoral and trade integration divergence between Romania and the euro area influence the nature of shocks affecting the two economies, we proceeded to determining the degree of synchronization of business cycles.

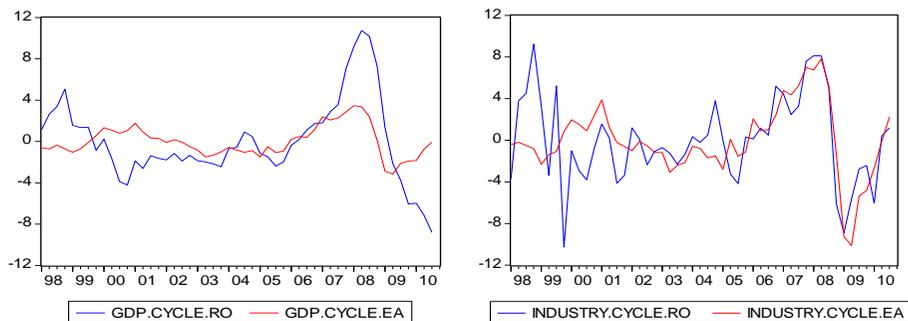

How correlated are business cycles between Romania and the euro area?

The economic literature does not use a single method to determine the business cycle and the correlation between them. In this study we have used the Hodrick-Prescott filter that has a number of limitations affecting the accuracy of final results. It uses an arbitrary choice of the smoothing parameter, being characterized by the lack of reliability of estimates at the beginning and the end of the sample. To determine the correlation between cyclical developments in the two economies have used the data series of GDP and of the gross added value of industrial activity, both being expressed in constant prices in the form of indices with fixed-base 2000 year. The variables used were seasonally adjusted using the procedure Tramo-Seats from econometric software Eviews 6, each including 51 quarterly observations from 1998:1-2010:3, data source being Eurostat. We determined the business cycle based on both real GDP and industrial activity, as in Fig.no.3. Romania has recorded larger cyclical fluctuations than the euro area, as in the case of emerging countries, evidence of high sensitivity of the national economy to internal and external capital flows. In terms of business cycle determined by the evolution of GDP (the first graphic of Fig.no.3), Romania produced below potential over the period 2000-2005, the economic evolution being less favorable relative to the euro area. Since 2006 there has been an overheating of the Romanian economy, which was reflected in inflationary gap increased from 2% to 11% in just five quarters. Part of this evolution was explained by the increase in industrial

activity (the second graph of figure below), which had also decreased the overall economy since Q2 2008.

Industrial activity has returned in the two economies at its potential level as a result of expansionist programs promoted in the euro area and of external demand increase. However, unlike the euro zone, the recovery of the Romanian industry has not generated improvement of the whole economy because were promoted a series of budgetary austerity measures have led to reductions in consumption and investment.

Figure 3. The business cycles in Romania and euro area

Source: Our estimations in Eviews 6

We have used Pearson correlation coefficient statistic to determine how much are synchronized the business cycles of the Romania and euro area. In the analysis we included Germany, because is the most important economy of the euro area (produces over 25% of euro area GDP) and is the main trading partner of Romanian economy. We found the degree of correlation between business cycles both for the whole period 1998-2010 Q3, but also for several sub-periods that correspond to the beginning of the period of economic expansion in Romania (2004 Q1) and of the first quarter of declining industrial production in Romania and in euro area (2008 Q2). The results obtained indicate that Romania has a similar correlation with Germany and with the euro area, because between these there is almost a perfect synchronization of business cycles. Romania recorded a higher correlation between business cycles based on industry than on the basis of GDP (except for sub-period (2004 Q1 -2008 Q2), as a result of trade interdependence with industrial goods. In fact, the economic crisis has spread through external sector, but this has ensured the return of Romanian industry at levels registered in 2007-2008. The maximum degree of correlation between business cycles (based on GDP) was recorded before the economic crisis (2004 Q1-2008Q2 sub-period), while between 1998 Q1-2003 Q4 Romania has characterized by a negative correlation with euro area /Germany (Table no.2). Return of Romanian industry since Q3 2009, but not recovery of the whole economy are reflected in the increasing correlation of business cycles based on industrial production (and not GDP) between 2004Q1-2010Q3 compared with 2004Q1-2008Q2.

Table 2. The correlation of business cycles between Romania and euro area/Germany

	Business cycles correlation (GDP)		Business cycles correlation (industry)	
	Romania and euro area	Romania and Germany	Romania and euro area	Romania and Germany
1998:1-2010:3	0.55	0.56	0.60	0.59
1998:1-2003:4	-0.40	-0.49	-0.11	-0.09
2004:1-2008:2	0.88	0.87	0.80	0.79
2004:1-2010:3	0.72	0.78	0.85	0.84

Source: Our estimations in Eviews 6.

Conclusions

The economic crisis was a test to euro adoption by Romania. Negative external shock has been transmitted in Romania through trade linkages and through foreign economic agents and monetary policy was not effective in neutralizing the impact of this shock. In other words, the economy could not benefit from an adjustment tool, like in situation in which it was part of monetary union. Romania has passed the test of the crisis (although he was the last of the new EU member states), but not by identifying other internal mechanisms for adjusting negative shock, but benefiting from an external channel adjustment (recovery of trading partner economies). However, this solution will not be available in all cases in which the Romanian economy will decrease. Therefore, the lack of internal solutions to neutralize the economic shock will extend their influence and will lead to higher costs of the euro adoption.

EUROPEAN AUSTERITY WITHOUT GROWTH? EUROPEAN GROWTH WITHOUT EUROPEAN DEMOCRACY? HOW EUROPEAN CITIZENS CAN REVIVE THE EUROPEAN PROJECT AND DEFEAT EUROSCEPTICISM

Montani Guido

University of Pavia, International Political Economy

The European project is facing a crisis. Citizens no longer understand what the EU is about. Young people and the new ruling class have forgotten the clear message of the European project launched just after the Second World War “No wars ever again among Europeans.” The founding fathers of the European Union are mentioned in history textbooks, but today Europe is felt as an irritating bureaucracy. In Europe, peace and economic stability are considered as a natural state, a gift from above. Why keep a useless EU alive?

The state of the European Union is swiftly degenerating. In almost all the member states, the anti-European forces are gaining ground. Populism is not a new ideology and is not necessarily European: let’s recall Peronism. In today’s Europe populism is the new manifestation of nationalism. In Italy the Lega Nord is in Berlusconi’s eurosceptic government. In France, the National Front is endangering UMP’s hegemony. In Belgium the rows between the Flemish and the Walloons threatens the state’s unity. In the Netherlands, Hungary, the Czech Republic, Austria and Finland, populist forces are either in the government or strongly influencing the government.

National-populism is different from the nationalism of the past. De Gaulle’s nationalism was an ideology founded on the “grandeur” of France’s history and on a certain idea of Europe, which was “l’Europe de patrie”, a kind of European unity accepting French leadership in world politics. Today national-populism is a form of micro-nationalism: it opposes the European project but without having a serious alternative. This is why populism is dangerous. Its real goal is not only the breaking down of the European Union but also the disintegration of the old nation states into micro-ethnic states, as what happened in former Yugoslavia.

* * *

European populism and euroscepticism are two faces of the same coin. Democratic pro-European parties cannot fight them successfully in the nation-states. Both are the product of the crisis of the European project. The crisis started at the end of the Cold War, because the European Union leaders failed to exploit the favourable occasion of the enlargement to complete the project of the founding fathers. We can recall a certain number of lost occasions. The Maastricht Treaty was an unsatisfactory compromise: a Monetary Union without an Economic Union and Political Union. The European Convention worked out a Treaty-Constitution without establishing a European government. Moreover it did not change the unanimity rule for the ratification process, even though the principle of the double majority of citizens and states was granted in the constitutional draft-project. So, when the French and the Dutch rejected the Treaty-Constitution with a referendum, nobody noticed that a “minority” of citizens voted against it, while a “majority” had already approved the Treaty-Constitution. Now we have the Lisbon Treaty, which is considered a substitute of the Treaty-Constitution. Meanwhile the political atmosphere has changed. The old generation of people who experienced the tragedy of the world war is no longer involved. The new ruling class is grappling with new problems: international terrorism, the difficulties concerning the enlargement, immigration, the challenges of global economy, the increasingly difficult Atlantic partnership, the inability of Europe to spur growth.

In this new political environment the European Union is considered as a set of institutions useful for national governments, but not for a long-term project which is worth achieving, the “first assises de la Fédération Européenne” as was stated in the Schuman Declaration. Moreover, the relative power between France and Germany – the old engine of European unity – has changed

dramatically. After the War, France was the only European state capable of taking the initiative to unite Europe and it did. Now, after its national unification, Germany is looking for a new world status, both from the economic and the political point of view, as its ambition to enter the UN Security Council shows. So, slowly but resolutely, the Franco-German engine of European integration has turned into a kind of *directoire*. Since the Lisbon Treaty did not solve the problem of the European government, France and Germany started to talk about the need for “European governance”, which according to Mr. Sarkozy and Mrs Merkel should be nothing but the European Council, where the main decisions concerning foreign policy and finances, are taken unanimously. The outcome of this project is that, when the financial crisis burst, the Franco-German *directoire* took the leadership, imposing intergovernmental solutions, outside the traditional “institutional triangle”: the European Parliament, the Council of Ministers and the Commission. According to the Treaty, these institutions must decide on the basis of the communitarian method: the European Parliament and the Council of Ministers co-legislate and the Commission executes (in such a case the Commission becomes the “government” of the Union). On the contrary, the *directoire* excludes the European Parliament almost completely from the decision-making process.

As far as the financial crisis is concerned, without entering into a pedantic account of the decisions taken, suffice it to say that the problem was thus conceived: how much should the virtuous states of the Union pay in order to avoid the failure of the vicious states, the so-called PIGS? In order to do that, the European Stability Mechanism (ESM) was established, thanks to a change in the Treaty, so that the finances put in the ESM will always be under the control of national governments. This mechanism, together with the European semester, should increase the respect of the rules of national fiscal policies and guarantee the necessary austerity. It is an improvement of the old Growth and Stability Pact (GSP). But it will also perpetuate conflicts among national governments. On the contrary, a solution in line with the European spirit, not requiring a change in the Treaty, was easily available: it would have sufficed to agree to an increase in the European budget (as much as the ESM) providing new “own resources” to the European Union. The Monetary Union is the institution which provides a crucial European public good: monetary stability. If the Monetary Union is in danger, because of mismanagement in some state, this state should comply with the rules agreed upon, but all European citizens, whatever their nationality, should contribute to rescue of the Monetary Union.

The *directoire* scheme is not only inefficient, since it produces weak and provisional solutions to European problems, but also unstable, because when the economy is concerned, Germany takes the leadership, but when the problem requires a military engagement – as has happened with Qaddafi’s Libya – France takes the leadership; it is undemocratic, because it discriminates small countries and excludes the European Parliament (therefore the citizens) from the decision making process: can European citizens or the European Parliament dismiss the *directoire*?; it is harmful, because it would feed the wrong belief that the EU is only an additional instrument for national governments and that greater political unity is not necessary. To conclude, the intergovernmental method and the will to establish a European *directoire* are the true causes of euroscepticism, the revival of nationalism and the rise of populist movements in Europe.

* * *

In spite of the EU crisis, the European project is not dead. The present ruling class is unable to have a “vision” for the future of the European Union, but luckily the original institutions created by Europe’s fathers are wiser. Jean Monnet said: “the life of the Institutions is longer than the life of men, and for this reason institutions can, if they are well planned, accumulate and hand down wisdom to several generations.” This is the case of the European Parliament, an institution already conceived with the ECSC. After its election by universal suffrage, in 1979, the European Parliament has become the only legitimate institution representing the will of European citizens. In fact, since 1979, on the occasion of every change in the Treaty, the European Parliament was

able to increase its power. Now, with the Lisbon Treaty, it also has the constitutional power to start the reform of the Treaty. Some recent events show that the European Parliament feels awkward with the increasing lordliness of national governments. It is worth recalling three recent initiatives.

A group of 97 MEPs, members of the EPP, the Greens, the ALDE, and the S&D, has created the “Spinelli Group” – a network open to contributions of civil society – on the basis of a “Manifesto” which states: “Unfortunately, whereas the formidable challenges of a manifold crisis demand common responses, drawn at least at European level, too many politicians fall tempted to believing in national salvation only. In time of interdependence and a globalised world, clinging to national sovereignties and intergovernmentalism is not only warfare against the European spirit; it is but an addiction to political impotence. ... Nationalism is an ideology of the past. Our goal is a federal and post-national Europe, a Europe of the citizens.” For the time being, the Spinelli Group has organised public debates on the occasion of European Council, proposing a “Shadow Council” as an alternative to the national governments point of view. Of course, its aim is to gain a wider consensus in the European Parliament and in the public opinion in order to relaunch the institutional reform of the European Union.

The second initiative is the reform of the electoral system for the European Parliament. The Constitutional Commission of the EP has already approved, on April 2011, the proposal of the federalist MEP Andrew Duff, to set aside 25 seats for candidates elected through pan-European lists presented by European political parties, starting with the next elections in 2014. This transnational constituency will oblige European parties to present prominent political personalities, well known all over Europe, and with the chance of becoming President of the European Commission, if he/she is elected and if his/her party or the coalition of parties obtain the majority of voters. Every elector will have two votes: one for the national list and one for the transnational list. According to Duff: “MEPs from all the main party groups have reached a strong consensus on the need to reform Parliament. Under the proposed scheme, the next European elections in 2014 will take on a genuine European dimension. The opportunity of using a second vote for transnational MEPs should galvanise voters who have come to recognise that national political parties no longer work to sustain European integration in an efficient or democratic way.”

The third initiative was taken by three MEPs – Jutta Haug (S&D), Alain Lamassoure (EPP) and Guy Verhofstadt (ALDE) – who launched the proposal “Europe for Growth. For a Radical Change in Financing the EU”. Lamassoure is also the President of the Budget Commission of the EP: this proposal should be considered as the necessary complement to the austerity plan of the Council. If the European economy is not able to grow, to create jobs and to compete in the global market, the austerity plan is certainly doomed to failure. As we have already noticed, at Maastricht the decision to create an Economic and Monetary Union (EMU) was made, but the reality is that only the M leg of the plan was built, the E leg was forgotten. Today we have one European currency for 17 member states, but 17 national financial policies. This asymmetric economic governance does not work, as the crisis of the sovereign debts has shown. The problem is: is an autonomous financial policy for the EU possible? In fact, the EU has its own budget, but its size is only of 1% of GDP and a great part of it is devoted to agricultural policy; moreover it is practically financed by national resources only. The result is that each state requires the “net return” from its payments to the EU, so that at the end of worn out debates among national ministers the European budget becomes an external support to national budgets. The crucial role of the European budget, which should be to provide European public goods, which are not feasible at a national level, is completely denied.

“Europe for Growth” proposes two ambitious goals. The first is to end the system of national contributions, going back to the original idea of genuine European resources. The present budget of the EU can be totally financed by 1% of VAT, a carbon tax and, if necessary, by a financial

transaction tax. The second goal is a public investment plan, financed entirely by Project Bonds issued by the EIB. The main reason for such a plan is that “in the last three decades the public investment ratio in the eurozone has declined by more than 1% of GDP. This trend has contributed significantly to making the eurozone a low-growth area. This trend should be reversed. This can be done by a new programme of project bond issues aimed at raising the public investment ratio in the eurozone by 1% of GDP. Since the eurozone GDP amounts to approximately €10 trillion, this means that the new yearly Euro project bond issue of €100 billion aimed at financing public investments should be undertaken.” One should notice that the size of this plan is three times the Delors Plan of 1993.

The three initiatives are crucial to change the outcome and the meaning of the next European elections in 2014. Since 1979 the turnout has continuously declined from one election to the other. The explanation is simple. Since there is not a clear European policy at stake and there is not a European government the citizens can choose, the European elections turn out to be a summation of national elections. The European Parliament is not considered a crucial institution for the future of the European citizens and, in effect, the European Council, i.e. national governments, takes the main decisions. But, if the citizens can choose, in the European constituency, a European leader who can also become President of the European Commission, and if the main European parties include a Plan for European growth, more public investments and more jobs in their programme, citizens could find a real interest in participating in the European elections. In such a case the newly elected European Parliament must keep the commitment made before the electors. A growth policy cannot be carried out without the active support of the citizens, civil society organisations, political parties and trade unions; in short, a European growth policy is impossible without European democracy.

* * *

The participation of citizens in the European project cannot be limited to European elections. In a democratic community citizens debate public issues daily and either support or blame their political parties and their government. But do a European public space and a European people exist? The fact that eurosceptics were of the opinion that a European public space and a European *demos* did not exist significantly affected the debate on the European Constitution. Now, the Lisbon Treaty offers the opportunity to overcome that criticism. One million citizens can take the initiative in inviting the European Commission “to submit any appropriate proposal on matters where citizens consider that a legal act of the Union is required.” Of course, also eurosceptic forces can exploit the European Citizens’ Initiative (ECI). Indeed every ECI will spur useful public debates in the EU and provoke a reply from political parties and European institutions. In any case, the ECI can be exploited for fostering European political unity. For instance, an ECI could invite the Commission to provide all the legal acts necessary to implement the proposal of “Europe for Growth.” This initiative can be supported not only by the main European parties, but also by trade unions, European business associations, local governments, civil society organisations and countless citizens.

In 1989, many citizens gathered together in the squares of Eastern European countries to claim democratic regimes. Today, Arabian citizens are protesting and fighting against their dictators. Every people should find their way and their means to affirm or to put forward more democracy. In the EU there is no dictator to be fought. The enemy of European democracy is intergovernmentalism with its ideological base: euroscepticism. If the proposed ECI is successful, eurosceptics will stop talking about the non-existence of a European *demos* and the way for transforming the EU into a true supranational democracy will be open.

TRENDS IN ROMANIAN TOURISM

Nagy Andrea

University of West Timișoara, Faculty of Economics And Business Administration

Tourism is an industry of the future, having the potential to provide significant revenues, and an industry of „beauty”, because it will protect, preserve and contribute to arranging the environment affected by other human activities. This is why it is very important to know the evolution of this underdeveloped field in our country. This paper is intended as a study on current trends in Romanian tourism without any claim of being an exhaustive research on the industry, describing the main indices of tourist traffic and their influence on Romanian tourism. Nowadays, we witness three main trends in Romanian tourism: sustainability, ecotourism and the increasing presence of cultural tourism. Ecotourism, as a form of tourism, has emerged from people's need to withdraw in nature, to visit and learn about the natural areas which have or have not a national or international protection status. Cultural tourism appears as a type of tourism clearly differentiated from other forms or types of tourism, particularly through motivation. It can be defined as a form of tourist mobility whose primary goal is broadening the horizon of knowledge by uncovering its architectural and artistic heritage and the areas in which it originates. Sustainability for tourism, as for other industries, has three independent aspects: economic, socio-cultural and environmental. Sustainability implies permanence, which means that sustainable tourism requires the optimal use of resources, minimizing the negative economic, socio-cultural and ecological impact, maximizing the benefits upon local communities, national economies and conservation of nature. Regarding statistical data, in what quantity is concerned, there is an increase in Romanian tourism, but in what quality is concerned there is a setback for tourism in the last years. This aspect should make public authorities take concern in improving the infrastructure and the quality of the touristical activity and in diversifying entertainment.

Keywords: sustainability, cultural tourism, ecotourism, trends, tourist traffic.

JEL:Code: O11

As the human society has developed, tourism as an industry grew on a very large scale, influencing today the contemporary world both on a geographical as well as on a socio-cultural and economic level.

Tourism as a social-economic activity that has gained a rightful place in all human activities, feels at the utmost the economic imbalances and social convulsions. Not incidentally, today, the largest tourism and tourist-sender and tourist-receiver countries are the overdeveloped ones, while countries with actual developing potential in tourism, where the economy is in transition, face difficult challenges both in terms of their own tourism and international tourism.

Romania's tourism potential is extremely high, but unfortunately not properly capitalized. Unlike neighboring countries, Romania has a high tourism potential both in the mountain areas as well as in the coastal areas. Thus, the seaside tourist resorts include Mamaia, Eforie Nord, Eforie Sud, Costinesti, Jupiter, Saturn, Mangalia, Vama Veche, Venus, and in the mountainous areas - especially in the Meridional Carpathians, but not only, there are true touristical treasures.

Travel and Tourism in Romania had a different journey for the past 10 years, expressed in international arrivals. Beside a slight increase in 1999 – 4,5 million tourists - arrivals have had a continuous decline until 2001 - 2002, when 1.5 million tourists arrived. This was also due to the global economic downturn after the events of September 2001, which negatively affected the entire world tourism. After this period there was an impressive growth in 2003, with more than 16%, reaching in 2004 6.7 million tourists, growth that was sustained also in 2005, the number of tourists increasing by 500 thousand over the previous year. The vast majority of international arrivals in Romania were from 2000, about 95% of visitors coming from the mainland. Of these, 75% - according to data from 2004 - are arrivals from five countries: Ukraine, Moldavia, Bulgaria, Hungary, Serbia and Montenegro. In 2006 the number of tourist arrivals was 6 million while in 2008 it rose to 8.8 million tourists.

This paper is intended as a study on current trends in Romanian tourism without any claim of being an exhaustive research on the industry. Tourism will become an industry of the future and will remain, certainly, an "industry of beauty" because it will protect, preserve and, at the same time, contribute to arranging the environment, affected by other human activities.

Sustainability, for tourism as well as for other industries, has 3 independent aspects: economic, socio-cultural and environmental. Sustainable development implies permanency, which means that sustainable tourism refers to the optimal use of resources (including biological diversity), minimization of the negative economic, socio-cultural and environmental impact, maximizing the benefits upon local communities, national economies and environment conservation. As a natural consequence, sustainability refers also to the necessary managerial structures for fulfilling these objectives. The purpose of sustainable tourism has to be subordinated to the national and regional economic and social development plans. The actions may cover economic purposes (increase of income, diversifying and integration of the activities, development control, enhancement and zoning), social purposes (decreasing the poverty level and the inequity of income distribution, the protection of the original socio-cultural heritage, the participation and implication of local communities), or ecological purposes (the protection of the functions of ecotourism, the conservation and sustainable use of biodiversity). Some specialists prefer to talk about the sustainable development of tourism, sooner than about a sustainable tourism, the first concept referring to all the aspects of development, while the other concept refers to some aspects and parts of tourism – such as long-distance air transportation that can simply not be sustainable, in what current technologies are concerned, even with the use of the best methods.

Touristic politic and plan implementation represents a big responsibility of the government and of the private sector. The private sector answers for establishing a tactic, planning and researching, forming the basic infrastructure, developing some touristic attractions, establishing and administrating the norms of offering services and facilities, establishing the means of administration and valuing the territory and of protection of the environment, establishing the standards for preparing and perfecting the field of tourism, sustaining health and public security.

The private sector answers for the development of housing services and operations of touristic agencies, the activity of commercial organizations with touristic characteristics, and it is based on infrastructure, development of certain touristic attractions and their promotion through specific marketing activities. The political devotion for touristic development in a planed and sustainable way is essential. Also, the nongovernmental organizations are involved in more and more aspects connected to touristic development.

Sustainable tourism in 2010 will develop the idea of satisfying the needs of current tourists and of the current industry and, at the same time, protecting the environment and future opportunities. It is aimed to meet all the economic, social, aesthetic needs etc. of the „actors” of tourism, maintaining cultural, ecological integrity, biological diversity and all the systems that sustain life. At a macroeconomic level, the concept of sustainable tourism has not yet had a major impact. A set of recommendations have been made concerning the development of tourism in protected

areas. The concept of sustainable tourism has now become much more popular at a microeconomic level through the alternative of green tourism.

Cultural tourism

Cultural tourism is a type of tourism that is clearly differentiated from other forms or types of tourism, particularly through motivation. It can be defined as a form of tourist mobility and its primary purpose is broadening the horizon of knowledge through the discovery of the architectural and cultural-artistic heritage and of the areas where they originate. Cultural tourism is a form of exploitation of human resources and therefore it may include urban and rural-ethnographic tourism. Cultural tourism directs to the notion of heritage, which represents tangible and intangible components of any society's identity, developed, and then transmitted and updated in the territory. The tangible heritage includes museums, monuments, architectural ensembles, art cities, villages with well-preserved traditions, archaeological sites, gardens, religious or military buildings. The intangible heritage includes festivals and cultural events, traditions and creative skills accumulated over time.

Tourist flows are characterized in cultural tourism by setting up a clientele of its own which can be specialized in a particular topic (able to walk distances to capture yet another impressive aspect of their passion), or be attracted to all that is cultural, or incidental, which is usually majoritary and consists of those who, being on vacation for rest and recreation, are visiting and sightseeing in the areas where they are. Another feature of the flows involved in cultural tourism is the membership of the participants in socio-professional categories or having a high or mid-level education: pupils, students, intellectuals, and therefore its collective character is uncertain. Predominant in the composition of tourist flows is the urban population.

Effectiveness of cultural tourism is the lowest among all types of tourism, but its development also presents a number of advantages, which means that the demand is stable and ignores trends, as was the case with spa tourism. Expansion potential is enormous, especially in the context of globalization, when exotic sites such as The Easter Island are no longer so distant.

Ecotourism

Ecotourism, as a form of tourism, has emerged from people's need to withdraw in nature, to visit and learn about the natural areas which have or have not a national or international protection status. Ecotourism has been defined as: "Ecotourism means the trip taken in most cases in developing countries to relatively undisturbed natural areas for study, leisure or voluntary assistance (voluntary) which considers the flora, fauna, geology and ecosystems of an area itself, as well as the people living in the surrounding area, their needs, their culture and their relationship with the earth" (Swanson).

With the worldwide development of ecotourism came the recognition of the benefits of this type of tourism as an optimal exploitation "mechanism" of touristical and landscape resources. These characteristics of ecotourism were the reason why the United Nations declared 2002 the "International Year of Ecotourism". The attention that this form of tourism has from the United Nations is based on the recognition of the potential that ecotourism as a sustainable development tool has, a tool that can lead to achieving the three main objectives of the Rio Convention, namely: biological and ecological diversity conservation; promotion of sustainable use of biodiversity by generating income, jobs and business opportunities in ecotourism; fair distribution of benefits from ecotourism to local people and communities.

National governments should involve managers of protected areas and tourism industry in developing and implementing plans for sustainable tourism. These should be part of national sustainable development strategies and should be included in individual management plans of protected areas.

The measures for protected areas include: transforming current unsustainable development to more sustainable forms; setting sustainable standards for new developments, particularly in sensitive environments; designation of areas for different degrees of travel based on carrying capacity of protected areas, including sanctuaries and quiet areas, as areas suitable for different levels of tourist use and development; reducing pollution and decongestion of holiday traffic; avoiding excessive tourism and recreation in protected areas; ensuring that tourism benefits local communities; providing support and resources through early implementation of plans; training managers of protected areas in sustainable tourism.

Pioneering schemes should be promoted in sustainable tourism, for example: loans, grants or tax concession for farmers and local communities to develop small businesses that use protected areas in an appropriate manner; administrative projects to show an innovative approach on tourism, appropriate for local economies; use of EU and national funds for tourism to encourage sustainable tourism in Romania.

Next we will present some statistics regarding Romanian tourism for 2008.

The category other cities has the main share with a number of 1531 units, while the seaside disputes places 2 and 3 with spa resorts. The number of units for the seaside in 2008 was 934, while for the spa resorts it was 382 units.

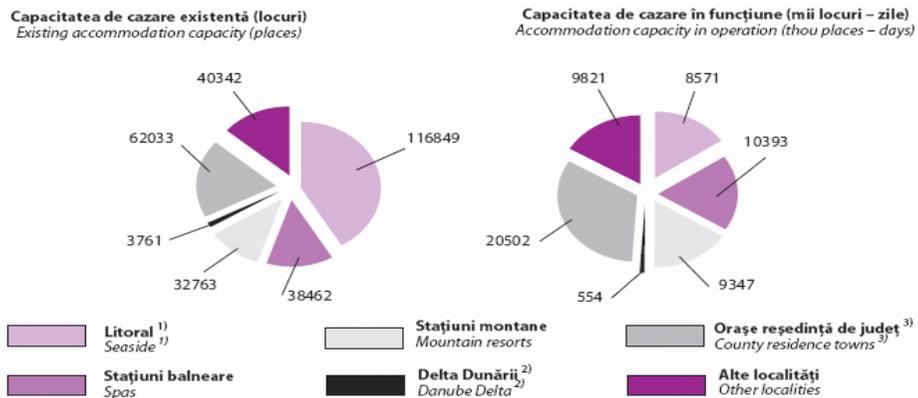

Fig.1: Existing accomm. capacity (places) and accomm. capacity in operation (thou places – days)

Source: Anuarul statistic al României, 2009

The Romanian seaside holds first place in terms of existing capacity, followed by the head towns of the counties and the spa resorts. Ranked lowest in this regard is the Danube Delta in terms of both existing capacity and operational capacity expressed in thousands of places-days (Fig. 1).

In the category of hotels, the highest rank is for the two-star and one-star hotels with an occupancy rate of 46.1% and 46.0%. The villas category is best represented by those not classified at a rate of 36.7%. Urban tourist pensions are best represented by five-star pensions, while the rural touristic pensions have a higher occupancy rate at five- and four-stars with an occupancy rate of 24.0% and 23.0% (Fig.2).

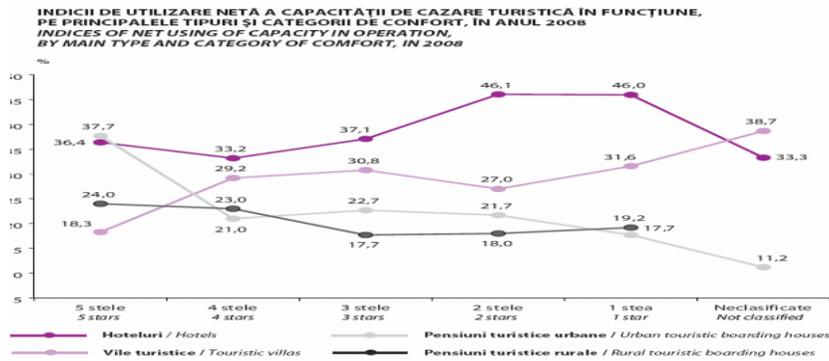

Fig.2: Indices of net using of capacity in operation, in 2008

Source: Anuarul statistic al României, 2009

The number of overnight stays has increased from 103,4% in 2006 to 112,1% in 2007 and to 112,8% in 2008 (Fig.3). This fact is mainly due to the increase of Romanian tourists' number of overnights from 105 % in 2006 to 114,1 % in 2007 and to 116,5 % in 2008. On the other hand, the foreign tourism, after an increase up to 103,5% in 2007, it decreased to 97,0% in 2008. 2005 is considered to be the 100% year.

Increasing internal tourism is due to the growth of the population's standard of living in 2008, the population assigning a rather high percentage of the family budget for consumption.

Alarming is the fact that the number of foreign tourists drops quite dramatically below the level of 2005 in 2008. As Romania is not labeled as a country with political instability, this decline may be due to the poor quality level of public service and to the rudimentary infrastructure.

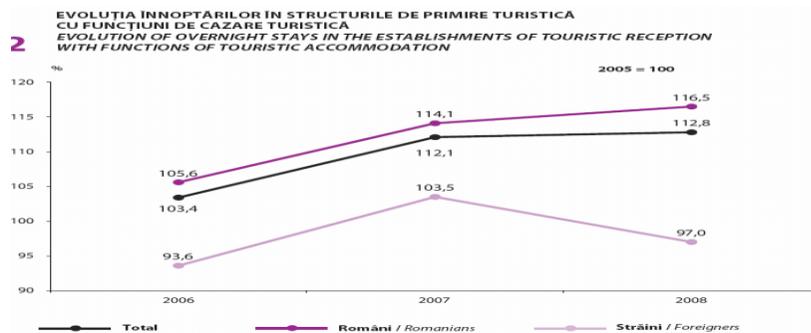

Fig.3: Evolution of overnight stays in the establishments of touristic reception with functions of touristic accommodation

Source: Anuarul statistic al României, 2009

In 2008, the number of overnights spent by category of comfort was the highest for the two-star category with 9.099 million overnights, followed by three-star hotels with 3.975 million overnight stays. What is striking is that the number of overnights in nonclassified accommodation structures is higher than the number of overnight stays in five-star categories. It seems that Romanians do not prefer high standards and settle for a lower level of travel services. Instead, foreigners are more demanding with comfort in the establishments of touristic reception and this can be best seen in five-star categories (Fig. 4).

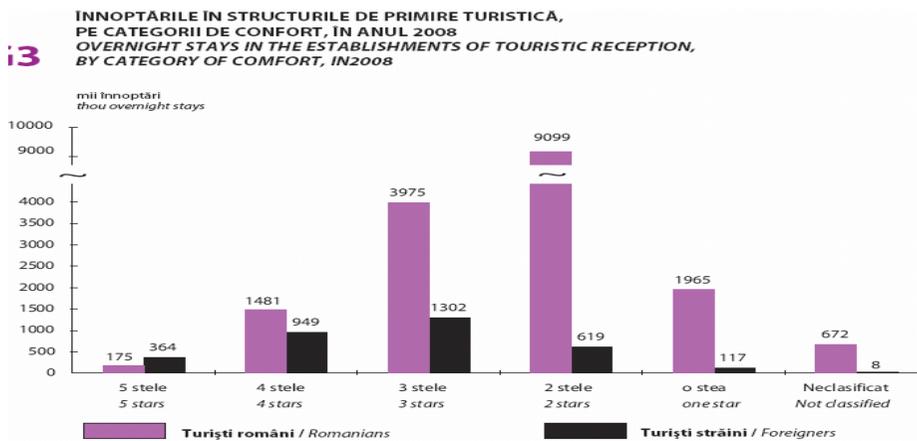

Fig.4: Overnight stays in the establishments of touristic reception by category of confort, in 2008

Source: Anuarul statistic al României, 2009

In terms of arrivals and departures of tourists at Romania's borders, there is an increasing trend of Romanian tourist departures abroad, meaning an increase from 6.5 million international travels in 2005 to 13,1 milion international travels in 2008. This upward trend is true for foreign tourists arrivals as well, meaning an increase from 5.6 million international travels in 2005 to 8,8 milion international travels in 2008. Unfortunately, as we have previously seen, foreign tourists do not stay a long period of time in Romania, fact demonstrated by the number of overnights spent by these foreign tourists.

In consequence, nowadays, we witness three main trends in Romanian tourism: sustainability, ecotourism and the increasing presence of cultural tourism.

Regarding statistical data, in what quantity is concerned, there is an increase in Romanian tourism, but in what quality is concerned (for example overnight stays) there is a setback for Romanian tourism in the last years. This aspect should make public authorities take concern in improving the infrastructure and the quality of the touristical activity and in diversifying entertainment.

KEY ASPECTS OF ANALYSIS ON THE IMPACT OF RECENT DEVELOPMENTS IN HEALTH SERVICES IN THE WESTERN REGION OF ROMANIA

Pitorac Ruxandra

The West University of Timisoara, Faculty of Economics and Business Administration

Toth Maria

The West University of Timisoara, Faculty of Economics and Business Administration

Jivan Alexandru

The West University of Timisoara, Faculty of Economics and Business Administration

The paper aims to establish the principal correlations and positions of the tertiary sector in the Romanian economy, for realistic assessment of the actions, decisions and developments in this field.

The research starts from the statistical analysis regarding the current condition and the importance of services, calculating dynamics and relevant percentages. It is also detailed the situation of health services in the western region. Its being inventoried some of the latest developments and of most impact, within them.

The effects of government policies are viewed from the angle of influence on economic activity, being performed a SWOT analysis adequate to the current situation. Attention is paid both to the direct impact, in the field, and the indirect one, in the economic life ensemble and society as a whole, short and long term.

The research results highlight the economic situation of Romania and the way in which economic activity is in close contact with the health system.

Keywords: Tertiary sector, medical services, health reform, economic development, sustainable development

JEL Codes: I18, R11

1. Introduction

Current economic theory recognizes the leading role that services play in economic and social progress. Their heterogeneity makes that, different services not to contribute equally to the economic growth, nor the magnitude and manner of involvement and action.

Central role in long-term evolution of the entire society, including the economic growth is detained by the knowledge intensive services (activities where the share is the intelligence factor, focused on high specialized qualification).

This paper examines some specific and general issues regarding the services in the Romanian economy, with particularization on the health services in Western Region, in the context of new health reforms.

2. Current state analysis of the tertiary sector in Romania

At the macroeconomic level, indicators are used to express both the size and the share of the attracted resources in this sector and the amount and the contribution of the effects produced by the activities of services to the general economic and social situation.

Based on analysis of dimensions and services sector interdependencies in the Romanian economy and society, it can track the current state of developments in this sector and effective strategies may be formulated for its future development.

Regarding the place of our services in the country's economy, a frame of employment can be extracted from the available statistical data, as shown in Table no. 1.

Table no. 1. Total employed persons in tertiary sector by type of activities (thousand persons)

Activities		1996	2000	2004	2008
I. Total employed persons		9379.0	10771.6	9410.4	9365.9
II. Total employed persons in tertiary sector (1), which:		2837.4	3149.0	3419.1	3670.9
1	Wholesale and retail trade; repair of motor vehicles, motorcycles and personal and household goods	771.7	887.8	953.0	1166.1
2	Hotels and restaurants	115.6	120.4	142.0	136.3
3	Transport, storage and communication	547.1	476.7	456.6	498.8
4	Financial intermediation	71.3	87.4	86.8	98.0
5	Real estate, renting and business activities	257.5	194.2	327.6	345.4
6	Public administration and defense; compulsory social security	125.1	405.1	411.2	396.9
7	Education	441.3	387.2	406.1	389.0
8	Health and social work	337.2	324.0	362.2	387.4
9	Other community, social and personal service activities	170.6	266.2	273.6	253.0

Source: Eurostat, accessed April 22, 2011,

http://epp.eurostat.ec.europa.eu/portal/page/portal/national_accounts/data/database

From Table no.1 we see that employment in the tertiary sector has increased during the analyzed period with 833,500 jobs. Within this, the number of people working in health and social assistance increased from 1996 to 2008 with 50,200 persons, the increase representing only 6.02% of the total growth above.

Table no. 2. Dynamics of employed persons in tertiary sector by type of activities

Activities	1996	2000	2004	2008
Total employed persons (thousand persons)	9379.0	10771.6	9410.4	9365.9
Total employed persons in tertiary sector (thousand persons)	2837.4	3149.0	3419.1	3670.9
Health and social work (thousand persons)	337.2	324.0	362.2	387.4
Dynamics of employed persons in tertiary sector (%) (1996 = 100)	100	110.98	120.50	129.37
Dynamics of employed persons in social work (%) (1996 = 100)	100	96.09	107.41	114.89
The share of employed persons from tertiary sector in total employed persons (%)	30.25	29.23	36.3	39.19
The share of employed persons from Health and social work in total employed persons (%)	11.9	10.3	10.6	10.55

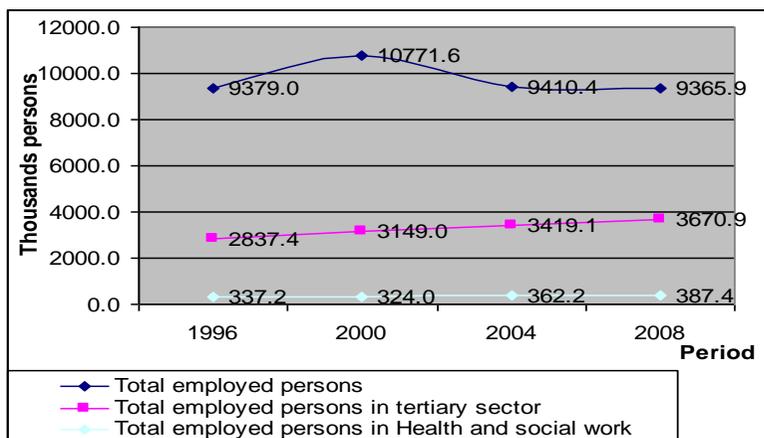

Source: Table no. 1

Analyzing the dynamics of persons employed in the tertiary sector (Table no. 2 - Dynamic calculated with a fixed base, the base year being 1996), it is noted that in 2000 there was an increase with 10.9% of the number of persons employed, in 2004 their number increased by 20.5% and in 2008 the increase was of 29.3%, compared with base year 1996.

Dynamics of persons employed in health and social care, calculated also with a fixed base, indicate a decrease of 4% in 2000, an increase of 7.4% in 2004 compared with the base year and in 2008 the increase was 14.8%.

The percentage of persons employed in the tertiary sector in total employment in Romania was 30.25% in 1996, and in 2008 it increased to 39.19%. In contrast, the percentage of employed persons in health and social care compared to the total persons employed in the service sector dropped from 11.9%, as being recorded in 1996, to 10.5% in 2008.

Dynamics of the number of employed persons in health and social care and the tertiary sector in total can be seen in Figure No.1.

Source: Table no.1

Figure no. 1. Dynamics of employed persons in tertiary sector

In what regards value data of services sector size and the gross domestic product at the national level (last years) as well as the contribution of services to the GDP creation, see Table no. 3.

Table no. 3. GDP and Services in Romania (dates from 2009)

GDP (mil lei – current prices)	PIB (mil lei – constant prices)	Services (mil lei – current prices)	Services (mil lei – constant prices)
491273	342176.35	246306.2	166069.67

Source: „, Statistical Breviary: Romania in Figures”,

<http://www.insse.ro/cms/files/publicatii/Romania%20in%20cifre%202010.pdf>; accessed April 16, 2011

And INS, <https://statistici.insse.ro/ipc/>; accessed April 17, 2011

Compared with the developed countries where the share of services in GDP creation is 60-70%, in Romania, as shown in Table no. 4, the percentage of services in GDP does not exceed 50%.

3. Medical services analysis in the western region in the context of new health reform

Medical services are part of the services dedicated to the population and are meant to maintain the health and vitality of the population, with direct effects on the living standards of individuals, but also in the functioning and development of the economic mechanism. (Jivan and Fruja, 2006: 96).

In Romania, in the last 20 years, the medical system has gone through various reforms. The new health reform was initiated in 2010 through the decentralization of hospitals, namely the public health units were transferred to the local administration. For the period 2011-2012, it was formulated the national strategy of streamlining the hospitals and health system.

The strategy stipulates measures to reorganize the Romanian health system for a sustainable financing, for remodeling the demand of health services and a strategy directed towards the human resources that states that it is wished to stop doctors leaving abroad. The problem that arises, concerns the realism of such decisions, in the conditions when they are strongly contested by civil society, by many professionals and service providers in the field and in the context in which it is avoided the debate in the Legislature (the adoption of reforming laws is based on the principle of government accountability in parliament).

The most drastic reform proposed through the Ministry of Health strategy was the one that began the cancellation and fusion of hospitals. This paper makes some specific references to the manner

in which this decision affected the quality of medical services in Western Development Region (Arad, Caraş-Severin, Hunedoara and Timiş).

Western development region's population, on July 1st 2009 was about 1,921,700 inhabitants, representing 8.95% of the Romanian population. This region is considered to be a growing region, with above average national economic performance, often in second place after Bucharest-Ilfov.

Table no. 4. Health units, 31 July 2007

Region / County	Hospitals	Polyclinics	Dispensary	Sanatoriums T.B.C.	Medical Offices
Western Development Region	47	4	31	2	89
Arad	12	-	2	-	35
Caraş-Severin	8	2	6	-	-
Hunedoara	11	1	18	2	1
Timiş	16	1	5	-	53

Source: Romanian Statistical Yearbook 2008, NIS, 2009

As shown in Table no. 4, in Western Development Region, on July 31, 2007, 47 hospitals activated that carried out ill treatment related activities. Starting with April 2011, according to an order given by the Ministry of Health, as part of "crisis measures" of the Romanian government, several hospitals have been abolished and readjusted (converted into alms houses).

The measure is questionable in terms of related operating costs, because the alms houses will have to be sustained by public funds). Thus, in West region, 11 hospitals were abolished and 10 hospitals were merged with larger hospitals in the region. Of 47 existing hospital on July 31, 2007, from this year, only 26 hospitals will be operating in the context of lacking personnel in hospital units and no hiring can be made because of restrictions imposed by the government.

Along with the abolition of hospitals its been declared (as motivation / logic support) the monitoring of the system's functionality, with the aim to apply an appropriate treatment to the patients and solve financial problems by attracting new funds to health system, according to Ministry of Health.

But the transition to the hospital closures and fusions was done without creating specialized ambulatory units in place of the abolished and with no investment made in road infrastructure by the Ministry of Transport. For example, in Caraş-Severin county, especially in winter, are encountered problems on the road, and the transport of patients to the hospital from Reşiţa is now carried out under the risks of delays caused by these roads.

It is foreshadowed, therefore, the practical impossibility of achieving the appropriate specialized medical services for the population in areas that will remain without hospitals because of the lack of the required centers for ambulatory medical services, of reduced number of medical establishments in general (abolition of the hospitals) and of the given infrastructure .

Critical comments made above with reference to the affected individuals should be extended over economic units in the area (where is working the population registered in the medical units abolished), with hard to predict impact in the domain of labor factor productivity in the long term.

Really positive main effects that could become apparent are that, by abolishing some hospitals will be made some short-term cost reductions (in near future), and through this project it could be covered the deficit of social centers that the Western Region has, this social sector will take over abandoned buildings.

The possibility of reducing costs regards especially those designed to provide management services by merging three or four hospitals. Their leadership will be provided by a manager or

specialized management firms (for couple hospitals at the same time), with effects in costs and in the leadership act (management, administration).

But these potential savings will have to be first validated in relation with the actual achievable functionality under the new conditions. Because the diversity and the increase of complexity can create management problems, which often counteract the positive effects. In addition, if we can be optimistic about professional management, not the same can be said about the "cost" changes, existing - by now - certain losses that can not be avoided or counteracted.

We take into account that the abolition deflected on certain hospitals where, in recent years were made significant investments and expenses; under new conditions, they will be practically lost (wasted utility, will be decommissioned, placed in conservation, abandoned, being performed in purposes from what those units are now diverted). Also, in conceptual and organizational point of view, many were small hospitals of local interest. It makes sense that, the abolition of all this means reduced capacity for the provision of medical services.

Specifically, hospitals abolished from the Western Region had made in the past years, investments in renovation and endowment with the appropriate equipment (from local communities). For example, in Buziaş (balnear resort from Timiș county), many tourists spend their holidays and in the local hospital where there is a double line on-call as well as specialists that provide quality medical assistance both to tourists and inhabitants. Instead of the abolished hospital currently does not operate even a balnear clinic.

The funds intended to a hospital will now be used by all hospitals belonging to one fusion, which constitutes a threat to the competitive spirit and hence of the quality and professional performance in the long term: Each hospital has allocated certain amounts of money for its functioning and the distribution is at different levels, depending on the number of patients treated and cured; certain hospitals may thus provide more financial resources than others. But under new organizational formula, these funds will be practically used by all hospitals participating to the fusion.

Table No. 5. Summary of SWOT analysis through abolition and merging of hospitals

STRENGTHS	WEAKNESSES
<ul style="list-style-type: none"> - cost reductions; - instead of abolished hospitals will operate retirement homes, orphanages (West Region has a deficiency of such centers). 	<ul style="list-style-type: none"> - staff reductions (regardless of the activity type); - loss of certain investment (converting them into useless); - loss of local interest services related to the abolished medical units
OPPORTUNITIES	THREATS
<ul style="list-style-type: none"> - possible modernizing changes in the hospital management. 	<ul style="list-style-type: none"> - lack of specialized health care insurance, due to increased distances, for patients, up to medical units and in deficient of road infrastructure in some areas; - for fusion, the funds destined to a hospital will be used by all hospitals that are part of the fusion; - possible management problems, quality being compromised.

Source: made by author

4. Conclusions

In conclusion to the shown above, it follows that funds savings are possible especially by reducing the number of salaries paid for management positions by the hospital), but which are also small in relation with the existing financial problems, and related destructive effects are so large, profound and extensive, including long-term that can not be justified.

The shown numbers demonstrate the strong entry of Romania in crisis, including services (economic sector had recorded the strongest increases in the economy after 1989). Maintaining services under 50% of GDP, with often falling trends proves not only the crisis but also the precariousness of the Romanian economy.

The Optical of the declared reforming measures is, in fact, a crisis one, but anachronistic through adequate perception of industry, applied on a domain which is not industry and where are some defining features that make measures inapplicable, of "labor productivity growth" available in industry (Gadrey, 1996). Ignoring these characteristics is paid dearly, unfortunately not by those who choose wrong (in our country, at least), but by the beneficiaries of the measures imposed by government and service providers in domain.

Romania must rely on its main assets: (i) educational level (still) high, which is an important opportunity to development of intensive services in knowledge (information services, research, health) and (ii) low cost of labor that, generally speaking, is a key attraction for foreign investors, both in services and in other economic sectors.

Unfortunately for the Romanian medical system - as well as other services - this factor (chip labor, low salaries that are paid to Romanians) is what determines the migration of qualification carriers and labor towards richer economies, in conditions of major progress in field in rich countries (Walker 2010).

Doctors leaving the country falls in the phenomenology known as "theft of gray matter" or "brain drain"(Christian Dustmann, Itzhak Fadlon and Yoram Weiss) and it is happening in terms of a lack of national policies and has all the economic, social effects, general, for the nation, especially we can not put any question that there is no need of the doctors that decide to leave the country, quite the contrary. Such negative phenomena are being encouraged by government measures such as those discussed in the paper (which is visible through actual developments in the recent months).

Before starting the health reform related to the hospitals abolishing, professional analysis were required (under conditions of knowledge of specific - including managerial - of the domain), in consultation with specialists, for finding (other) solutions to reduce costs, it was required including the detailed analysis of the economic situation and performance of hospitals proposed for dissolution. Thus, it was crucial to analyze the situation of hospitalized patients, of those discharged (treated case = case resolved), of the performance of medical staff in the Western Region and from other regions of the country (a non-political relevant economic analysis).

Such consultations and documented training would have provided a consensus, solutions quality and their applicability, as opposed to the measures taken against the will of those included in the process. Adhesion value (which is completely ignored in most measures of the current government) is one that can be found including in productivity and in cost reduction (in the case analyzed, unfortunately, it will be found in a negative sense, as the lack of adhesion).

THE POTENTIAL OF FEMALE ENTREPRENEURSHIP AS A REGIONAL GROWTH AND DEVELOPMENT ENGINE IN THE WESTERN ROMANIA

Pop CoHuț Ioana

University of Oradea, Faculty of Economic Sciences

Starting from the objectives, activities, and the results of the empirical, quantitative, and qualitative research carried out in the AntrES50 project, during the two years of implementation, in the Western Romania referring to the new businesses start up; business development; the motivation and difficulties of female entrepreneurs and potentially enterprising women; of their perceptions regarding the need for entrepreneurship education, the role of female entrepreneurship promotion and the impact of the successful models on new businesses start up – this paper presents directions of action meant to emphasize and support the potential of the female entrepreneurship in Romania, as a regional growth and development engine.

Key words: women entrepreneurship, new businesses start up, regional development

JEL Codes: B54, H81, M13, M21, R11, R28, R53, R58

REL Codes: 13C, 14D, 14 K, 16H, 18F, 18G, 20J

The potential of female entrepreneurship – as a research subject

The analysis of the potential of female entrepreneurship in Romania starts from the premise that encouraging and supporting new businesses is one of the most important economic and social activities due to the impact on economic growth, innovation, job creation and the rise of living standards (Brush Candida *et al.*, 2007). The literature in the field shows that women play an important role in the economic activity in many of the world's economies (Miniti *et al.*, 2005, apud Brush Candida *et al.*, 2007). According to Global Entrepreneurship Monitor (GEM, Reynolds *et al.*, 2003), women represent 33% of the total of those initiating a business, with variations from a country to another according to cultural factors, natural and industrial resources together with the policies meant to stimulate the entrepreneurship and the attitude and faith in the female entrepreneurship. Although the number of business women is increasing, the rate of female self-employment is systematically lower than that of men (Schmidt and Parker, 2003, apud Brindley Clare, 2007).

For Romania, studies show that for all the development regions, the most important problems in stimulating the spirit of female entrepreneurship are the low density of SMEs, the limited entrepreneurial culture, the reduced entrepreneurial spirit, especially among women and mainly in the rural area, the lack of programmes promoting entrepreneurship, especially female entrepreneurship, the lack of programmes supporting self-employment initiatives.

Taking into consideration these aspects, our research is trying to emphasise that through measures educating the entrepreneurial culture among women – as a determining factor of self-employment, the percentage of those setting up a business may increase significantly with a direct impact on the regional development. In our opinion, this aspect is significant, taking into account that we are referring to a single measure – that of educating and motivating the female entrepreneurial spirit which can, correlated with measures supporting the access to financing, improving the social assistance system and especially supporting children's raise and education (Brindley Clare, 2007), lifelong learning (Drumond, 2004), supporting the development of the

⁵⁰ AntrES – acronym project “*Antreprenoriatul și egalitatea de șanse. Un nou model de școală antreprenorială pentru femei*” (“*Entrepreneurship and Equality of Chances. An Inter-regional Model of Entrepreneurial School for Women*”- T.N.)

business (Brindley Clare, 2007), promoting the female entrepreneurship by successful business women, promoting good practices, determine the significant increase of this objective, underlying the still unexploited potential of Romanian female entrepreneurship.

Objectives and directions of action – aspects regarding the research methodology

Taking into consideration these premises, our research was delineated on at least three directions, of those mentioned above, that is:

- to ensure the female entrepreneurial education for the support of new business start up;
- to support the development of already initiated businesses;
- to promote and motivate the female entrepreneurship.

Our three objectives could be materialised by implementing the project “*Entrepreneurship and Equality of Chances. An Inter-regional Model of Entrepreneurial School for Women*” (acronym **AntrES**), implemented in the North-Western and Western Regions of Romania (counties Maramureş, Satu Mare, Bihor, Arad, Timiș, Caraș-Severin)⁵¹, which had as objectives, among others:

- *to provide training in order to acquire capabilities in the field of business start up; to provide training in the field of entrepreneurial culture formation and promotion, in order to improve the level of knowledge regarding a successful business initiation, organization, and working;*
- *to provide training for women in the field of business administration and development and to favour the improvement of the entrepreneurial spirit within the SMEs having women as managers or administrators;*
- *to promote and stimulate the entrepreneurial spirit among women so that they can behave as active entrepreneurs; to promote active learning, lifelong learning, including the e-learning methods and techniques; to promote the competition spirit by organizing contests and awarding the best business plans.*

AntrES project addressed a number of 1800 women of the six counties situated along the Romanian Western border, grouped into three target groups. The first target group is made up of 288 women, *SME managers, wishing to develop their business, from the counties situated along the Romanian Western border (Maramureş, Satu-Mare, Bihor, Arad, Timiș, Caraș-Severin)*. It concerns, at the level of each county, a number of 48 women managers who have been trained in the town where they work, as it follows: 24 at the territorial centre situated in the county capital city and 24 at the level of local centres (6 for each of the 4 local centres in each county), respectively a total of 288 women in all 6 counties. For this target group the project had in view the improvement of the intra- and entrepreneurial managerial skills in order to develop the existing business, to optimally use the opportunities existing on the market, the success factors increasing competitiveness, the management and marketing strategies etc. and the promotion of the adaptability, with effects on the performance, stability of SMEs and the employment level. The second target group is made up of 1440 women *wishing to start up their own business, in the counties situated along the Western Romanian border (Maramureş, Satu-Mare, Bihor, Arad, Timiș, Caraș-Severin)*. It concerns, at the level of each county, a number of 240 women, trained where they live, as it follows: 24 at the territorial centre situated in the county capital city and 72 at the level of local centres (18 for each of the 4 local centres in each county), 144 at the level of rural centres (12 for each of the 12 rural centres in each county), respectively a total of 1440 women from all the 6 counties. For this target group the project had in view the formation of entrepreneurial culture, the increase of the ability to transform business ideas into actual actions,

⁵¹ For more information, see www.antres.ro

by providing the necessary information regarding the business environment and the local existing opportunities, the drawing up of a business plan, the organization and carry out of a successful business etc. and by services supporting the initiation of a business, having as effect the generation of an increased number of businesses, both in the urban and in the rural areas. The third target group is made up of 72 women, last year students in Economics who have been trained to become coordinators in the entrepreneurial field and who currently have a job as rural coordinators in the project. It concerns, at the level of each county, a number of 12 women, selected from in the partner university centres, respectively a total of 72 coordinators at the level of the 6 six counties. For this target group the project had in view the acquisition of the coordinator skills in the field of business start up, the increase of these people's capacity to become promoters of entrepreneurship, as well as the increase of the awareness and promotion of the positive attitude to entrepreneurial culture and to offer services supporting the start up of a business.

Research study and results

To reach the three objectives mentioned previously, the activities carried out in the six counties in the implementation area on three levels: territorial, local, and rural, were channelled on the following directions:

1. The organization of courses in the Entrepreneurial school for women, *Start up of Business* – courses attended by a total number of 1512 women; the impact of these training activities in the entrepreneurial field on women wishing to start up their own business can be seen in the openness regarding the training activities, the avowal of the need for entrepreneurial education and counselling “*The courses of Entrepreneurial School have been for me the first encounter with economic theory... I have acquired a theoretical basis which, collocated with the already existing practice, form a solid basis for the business I want to start up.*” (Meluț Corina, Oradea, Bihor); “*... this course represented an important opportunity being provided with all the latest necessary information in order to start up a business. The form of presenting the information was clear, concise, and mostly accessible... the project team has had the highest contribution ... which provided the necessary counselling, during the entire learning process ... the knowledge acquired here will represent an important support in my future business. ((Roiban Roxana, Timișoara, Timiș); “... to accumulate new knowledge, to deepen new concepts, to better assess the qualities a female entrepreneur needs and, with the help of the business plan, to evaluate the business we wish to start up ... it has greatly facilitated the communication and interconnection among us...” (Vărguța Marta, Arad, Arad); the opportunity of training activities for personal development “*It has been an opportunity which helped us to make n important step for my professional development. I have discovered managerial qualities that I did not know I had (Tanko Erika, Satu Mare, Maramureș).**
2. The organization of courses at the Entrepreneurial school for women, *Business Development* – courses attended by a total number of 288 women managers of the six counties. The impact of the training activities on the women managers is also significant: personal development: “*... it helped me rediscover myself and develop professionally. These courses have taught me how to present myself professionally, my knowledge and experience acquired through practice*” (Dăncescu Livia, Oradea, Bihor); the opportunity to meet successful women managers and to share the

experience and difficulties of running a business “...the experts invited shared aspects from their own successful experience, which has been beneficial for me.” (Anton Maricica, *Timișoara, Timiș*); the desire to improve, motivation and reciprocal encouragement “....I have had the opportunity to learn new things, which are of real help to me both in running the business that I currently have and in assessing the business I want to set up. The use of action learning method allowed us to discuss with the other business women about the achievements and hardships we had encountered when running our businesses, to share our common experiences to the women wishing to start up a business” (Tașcă Carmen, *Arad, Arad*); “...the theoretical part and the practical studies, too ... have helped me involve and motivate the partners through a positive control of the business, each trying to understand that that the performance of a firm is not only revenues but other factors such as financial control factors, employees and generally the performance of the entire activity”. (Azap Mihaela, *Reșița, Caraș Severin*); “... women were poorly represented in the business environment, stimulating and encouraging through this course the women’s initiative regarding the development and initiation of their own businesses in order to acquire financial independence and to bravely enter the business world ...” (Laza Doina, *Satu Mare, Satu Mare*).

The integration of the *Action Learning* [1] method in the AntrES Entrepreneurial School, for both categories of courses – *Business Start up* and *Business Development*, had in view the achievement of the objectives proposed beyond the simple supply of a set of knowledge for the initiation, development or support of the business, by determining the change based on learning, in the real meaning of the word. The use of the action learning method “with and from the others”, by forming mixed sets (groups) – made up of women of all the three target groups: women managers of their own business wishing to develop it, women wishing to start up their own business and last year students in Economics, who have been trained and have become coordinators in the field of entrepreneurship; therefore, women with and without any entrepreneurial experience, in different stages of knowledge and understanding of entrepreneurship. Within these sets, women have been encouraged to discuss freely, based on the subjects suggested by the course book and applications, and also from the perspective of their own experience, being stimulated to share their own problems and to mutually give advice to each other, to ask and answer, being an inspiration for the others, mutually motivating, learning from each other. In completing and stimulating the use of this method, an external expert, preferably a well-known woman entrepreneur or a woman with well-known professional capabilities was invited for the subject tackled, at the level of that particular city or village, willing to share with the course participants her success story or her own experience in the field.

3. The organization of the contest “*My Business Plan*”, where all the 1800 trained women participated. The contest “My Business Plan!” was organized on three levels, in order to evaluate, select, emphasize, promote, and award the best Business plans made by the course attendants trained in the project. The contest was open to all the participants to the training activities from the target groups of the project, that is a total number of 1800 women. It took place in 2010 in three phases, thus: 1st Phase – Levels: territorial – selection / inter-regional – prize award; 2nd Phase – Levels: local

– selection / territorial – prize award; 3rd Phase – Levels: rural – selection / territorial – prize award. Each of the phases of the contest “ My Business Plan!” had 2 stages:

- *Highlighting the business plans* – a stage where all the business plans entered the competition, business plans made by the women selected in the target group in the Entrepreneurial school for women, a stage in which, after the Evaluation Commissions evaluated the business plans, 50% of the business plans from the urban areas were highlighted and 30% from the rural areas. The highlighting of the business plans was made by giving diplomas. The business plans have been promoted on the site of the project www.antres.ro in the section *AntrES Winners – The Presentation Catalogue of the Winners, 1st, 2nd and 3rd Phase*⁵², and through mass-media during the actions meant to ensure the visibility of the project, information and advertising regarding the project. As a result of this stage, a total number of 724 women from the three target groups of the project were highlighted and promoted, 387 from the urban area and 337 from the rural area, as well as the business plans made by them at the Entrepreneurial school for women.
- *Awarding the business plans*, a stage where only the business plans recommended in the previous stage participated. After the contest at this level, out of the 724 business plans highlighted and promoted, a total number of 408 business plans were recommended to be awarded. These plans entered the 2nd phase of evaluation, after which **111 women wishing to start up their own business were awarded**, with minimum amounts necessary to initiate the business (amounts ranging between 1000 and 2000 lei).

The impact of organizing this contest and the activity to promote the female entrepreneurship have determined then increase of the motivation among women wishing to start up a business, which has determined the setting up of total number of 180 businesses in the six counties where the project was implemented.

Taking into account the demonstrated impact on the female entrepreneurship of entrepreneurial education, of the models, of the learning from the other’s experience, success or mistakes, by using the *Action Learning* method , mainly characterised by *Learning with and from the others*, the AntrES Entrepreneurial School had in view – and we believe it succeeded – to help the women managers to better understand their business, to develop it and to become real *entrepreneurs*, the women wishing to start up their own business to give them the necessary courage and force to attract and mobilize resources in order to become entrepreneurs, and the young coordinators in the field of entrepreneurship to transform them into promoters of entrepreneurship from conviction and not from necessity.

This paper represents an attempt to contribute to the increase of awareness of the entrepreneurial potential in the Western Romania and not only, the encouragement of female entrepreneurship, an instrument to disseminate knowledge, information and practical experience resulted from this project.

This paper was made in the project “*Entrepreneurship and the Equality of Chances. An Inter-regional Model of Women School of Entrepreneurship*” (acronym AntrES), a strategic project co-financed by the Social European Fund, [Sectoral Operational Programme Human Resources Development](#) 2007-2013, “Investing in people!”, Priority Axis 3 “Increasing adaptability of workers and enterprises”, Major Intervention Domain 3. 1 “Promoting entrepreneurial culture”, Contract: POSDRU/9I/3.1/S/5 (grant value 12,500,104,00 lei), which took place between 5.01.2009 - 5.01.2011 under the coordination of the Faculty of Economics, University of Oradea, in partnership with: West University of Timișoara; “Aurel Vlaicu” University, Arad; North University of Baia-Mare; “Eftimie Murgu” University, Reșița; Commercial Academy of Satu Mare; Management Scientific Society of Romania and The National Agency for Equal Opportunities between Women and Men; website: www.antres.ro.

Notes:

1. According to the *Action Learning* method (“*Learning with and through action*”), the difference between *to know* and *to understand* is the following: *to know* means to be capable of doing it; *to understand* means to be capable of changing the reality that you understood. *Learning means Progress*, which in its turn represents our capacity to produce *the Change into better*. The use of the *Action Learning* method starts from the premise, widely accepted in the literature, that entrepreneurship is learnt to a higher extent through informal or non-formal means than through the formal education system.

THE DYNAMICS OF THE ROMANIAN UNIVERSITIES GRADUATES NUMBER IN THE 2005-2010 PERIOD

Popovici Adina

West University of Timisoara, Faculty of Economics and Business Administration

In the context of the European single market, where information, capitals, persons, goods and services circulate free and fast, where economic rationality is different at the global level from the national one, radical mutations occur in each member state's strategy with regard to the educational system. Therefore, the Romanian educational system, especially the Romanian higher education must correlate the graduates number with the Romanian and EU labour force requirements, and take into account the necessities imposed by the participation at international competition. On the other hand, a country's economic and social development level depends very much on its citizens' educational level, especially in nowadays knowledge-based society, which is a society of life-long-learning.

Key words: knowledge-based society, education, human capital, universities graduates dynamics, economic growth

JEL Classification: I21, I23, I25, J60

1. Introduction

In the actual knowledge-based society, the issue of economic education is more important than ever, but professional-economic elements remain the easiest to teach and to learn: that is because education in their direction does not need special efforts from individuals, being on a most „natural” line, from the point of view of the millenniums of surviving on this planet; there are not necessary special orientations and transformations of the human being, because they are not related to cultivation and to human personality development, but to *surviving*. They are consistent rather to what any living creature on the earth learns: they are in our instincts and need no special educative intervention. But for humans, the human superior ones are essential, defining for our specie (compared with other creatures). That is why the care for youth' education was mostly for cultivating the qualities that put and keep them over the animal kingdom.

Even in the modern times of market culture, teaching should contain all the components, in different proportions; by its nature, level and speciality, it should not be partial, simplistic or conducting young people to perceptions that could badly make them not human (non-superior) beings.

Throughout the modern history, all countries of the world have been focused on economic development. Contemporary world comes back to the real purpose of economics, the human being, assuring his welfare and security, both at individual and social level. Thus, it appears on the ideas level a new conceptual paradigm, that of human development, which accompanies and motivates the economic one. This new paradigm has obviously not manifested itself instantaneously, but has developed as a slow, difficult and deliberate process. The rapid rhythm of changes has convinced both the business people community, and the nations, that labour force flexibilization is necessary. Each sector of activity, including the agricultural one, needs a permanent qualification up-date, combined with the accumulation of action knowledge and competencies. This irreversible trend represents a proof of the increasing importance of some “intangible” points in the investments field – such as education – while the effects of the “intelligent revolution” are being felt. In this case, investment in education becomes a strategic investment. As Jacques Delors, the president of the International Commission for Education states: “*In the 21st century,*

educational systems must educate in an innovating spirit, promote the capacity of evolution, adaptation to a fast changing world, that each individual should be capable of assimilating” (Ciobanu 2003: 15).

2. The Importance of Human Capital Education

In this respect, Adam Smith – in his famous work “The Wealth of Nations” - observes that human capital is not just a form of capital, but also the most important of these; it represents the acquired or useful capacities of the members of the society, capacities which are in both the property of an individual, and in the welfare of the society he belongs to. *„The perfected skill of a worker may be considered as a tool which improves labour and which, even if it is costly, requires a certain expense, yet returns this expense as a revenue for him and the community he belongs to”* (Smith in Ciobanu 2003: 15). Practically, *the human capital* is composed of *the educational capital*, represented by the skills acquired by individuals during and outside the education process, and *the biological capital*, represented by the individuals’ physical skills, the most often synthesized by their health state. Human capital has developed itself as a concept in economy, where it is mainly regarded as “estimation of a person’s ability to produce income by labour” (Cismaş and Popovici 2009:57).

Education in a knowledge society will have a strong social goal. The new educational system must be an open one, conceived to assure equal chances of education for all the members of the society. The capable ones must have free access to studies, so that their social growth is allowed, irrespective of the origin, revenues and prior education. In a knowledge society, it is necessary that all educated persons systematically return to school; it is particularly the case of those with higher education. The continuous formation will become “an industry”, which might register a strong progress in the future. The educational title, the studies diploma will facilitate the access to the best work places and to the most promising professional carriers, only if it is given based on competence criteria, of capability and talent, and not on the criterion of welfare, being, in such case, a symbol of the social class.

Practically, this last key – requirement imposes that “the product” of education be an educated, efficient and cultivated person, irrespective of her social condition (www.realitatea.net).

An important motivation of individuals to invest in education is based on the idea according to which accumulated knowledge and competencies tend to lead to a growth in productivity and, implicitly, of the potential earnings. Another important reason for accumulating a high level of education is getting a higher stability on the labour market, which implicitly reduces the risk of unemployment. Educated workers have a higher rate of participation on the labour market, and the length of their active life is generally higher than in the case of the persons with a lower level of education (Suciu 2000: 31).

3. The Dynamics of the Romanian Universities Graduates Number in the 2005-2010 Period

Professional insertion of young people has lately become, both in Romania and in the European Union, a difficult process, which requires an increasing period of time from the moment of finalizing the last form of education, until the moment of finding a work place.

Today exist in the world about a billion young people with the age ranging between 15 and 24 years old, 85% of them living in developing countries. The participation rate on the labour market among young people has decreased at a world level from 59.3% to 54.4% during 2004-2010, mainly because of the prolonging of studies among young people. In the European Union currently live about 62 million young people, which represent 12.7% from the total population. According to the data supplied by the National Institute of Statistics, there is a decreasing trend with regard to the evolution of young population until 2025. This

evolution may be explained by the decrease in the birth rate, the increase of the period and level of education, the social mobility, women's emancipation. Regarding young people's unemployment rate in Romania, it was of 22.1% in 2010, a little higher than the average unemployment rate in the European Union (Table no. 1). This situation can be explained, on one hand, by the inexistence of a correspondence between the educational (too much theoretical) level and the requirements of the labour market, and, on the other hand, by the companies' desire to employ qualified labour force. The lower unemployment rate among young people with higher education, in comparison with other categories, as well as the fact that the smaller the necessary period for finding a work place, the higher the educational level is, brings an increasing importance to the diploma at the beginning of the career.

Table no. 1. Unemployment Rate among Young People less than 25 Years Old (in %)

	2005	2006	2007	2008	2009	2010

Source: <http://epp.eurostat.ec.europa.eu>

Spain registered in 2010 the highest unemployment rate, with a percentage of 41.6%, and Holland the lowest one. Employment rate among young people (15-24 years old) is much lower than that of the total population, because many young people are still included in the educational sytem and don't have a work place. On the other hand, the decrease in young people employment can also be determined by their migration abroad, the decrease in the birth rate and the black economy.

By analyzing Fig. no. 1, we may observe the doubling of the faculty graduates number, from 108,000 in the university year 2004/2005, to 214,000 in 2008/2009.

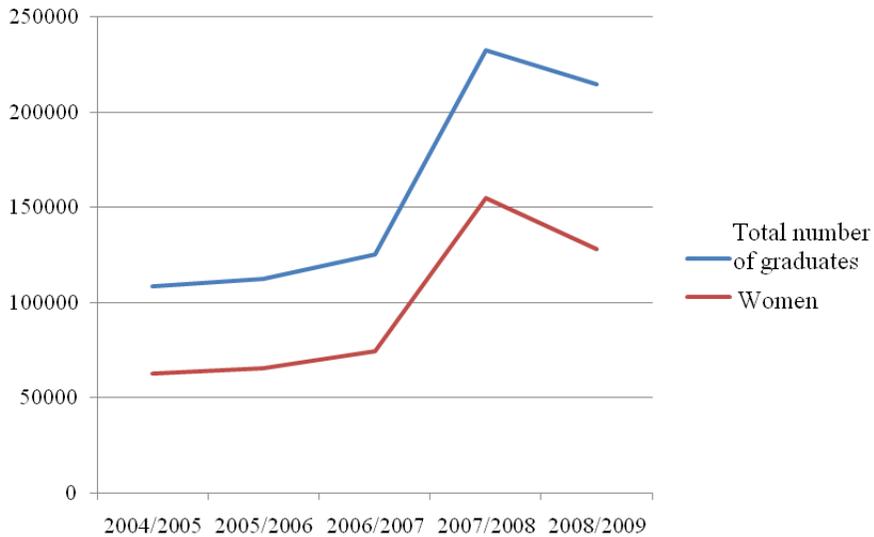

Fig. no. 1 The Evolution of Graduates Number

Source: Made by the author based on *The Statistical Annuary of Romania, 2010*, pp. 247

The number of women faculties graduates has registered an increasing trend in 2004-2009. This phenomenon may be explained by the increase in the educational supply from the private and state universities and of increasing qualficare requirements for obtaining a work place.

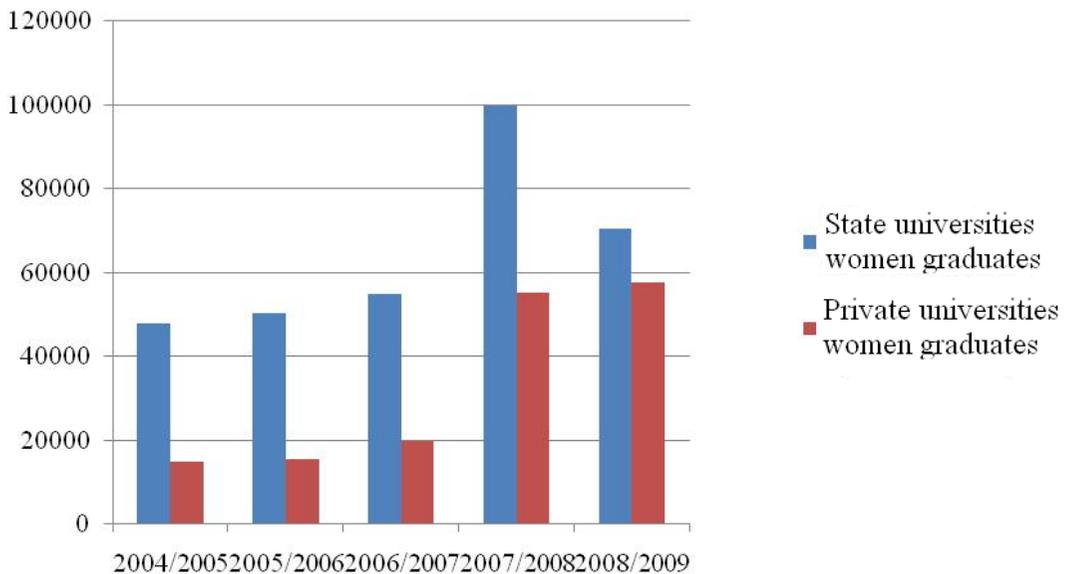

Fig. no. 2 The Evolution of Women Graduates Number

Source: Made by the author based on *The Statistical Annuary of Romania, 2010*, pp. 247-249

From 2004 to 2008, the women graduates number was increasing, but in 2009 it decreased, reaching 128.000 (Fig. no. 2). In 2009, the lowest difference between state faculties and private faculties women graduates was registered: about 13,000 women graduates. By analyzing Fig no. 3, we may observe that the number of state faculties graduates is higher than that of the private ones. This difference considerably diminished in 2008, when private faculties graduates represented 42% of the total graduates number.

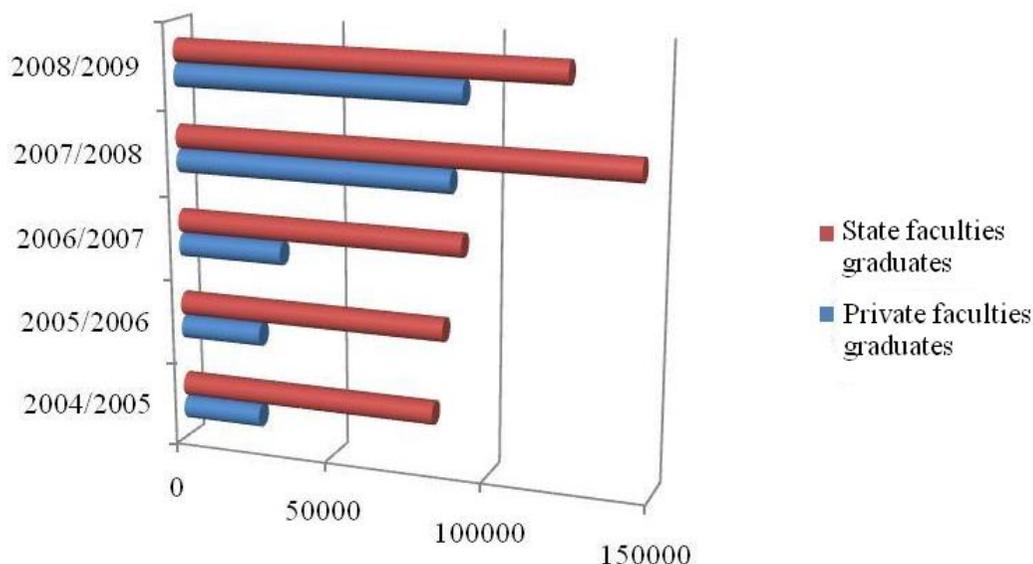

Fig. no. 3 The Evolution of Private and State Faculty Graduates Number
Source: Made by the author based on The Statistical Annuary of Romania, 2010, pp. 247

The number of a state faculty graduates increased from 80,000 in 2004 to 140,000 in 2007, but decreased in 2008 (Table no. 2). The biggest increase was registered in 2007, when the number of graduates increased by 50,000 persons compared with 2006. In 2008, the number of a state faculty graduates decreased at both the state faculties, and the private ones, but in a higher proportion in the first compared to the latter ones.

The structure by profiles of students (Table no. 3) was influenced by the requirements of the labour force market. Therefore, in the last years, the weight of students in the technical education decreased, the weight of students in the profiles increasing, both among women, and among men.

The change in the graduates' structure by profiles was mostly determined by their desire to earn more or by the possibility of obtaining a higher wage in a shorter period of time.

4. Conclusions

In the context of the European single market, where information, capitals, persons, goods and services circulate free and fast, where economic rationality is different at the global level from the national one, radical mutations occur in each member state's strategy with regard to the educational system. Therefore, the Romanian educational system, especially the Romanian higher education must correlate the graduates number with the Romanian and EU labour force requirements, and take into account the necessities imposed by the participation at international competition. On the other hand, a country's economic and social development level depends very much on its citizens' educational level, especially in nowadays knowledge-based society, which is a society of lifelong learning.

TRUST – A FACTOR OF PRODUCTION

Prunea Petru

University of Oradea, Faculty of Economic Sciences

The economic activity is more and more influenced by the condition and the evolution of some immaterial and non-financial elements which exist in a firm or a country. One of these elements - information - has unanimously been accepted as the 4th production factor. In this paper I try to demonstrate that trust too, has to be accepted as a production factor. Especially as it fulfils the fundamental conditions for this to happen : it is infinitely divisible and homogeneous and, thus, its marginal product can be calculated. In nowadays world, characterized by the apparently unstoppable expansion of the cruel individualism and of market fundamentalism, which have undermined the trust in the success of private initiative, producers increasingly need community, need another mode of involvement of the state in economy and they need another way of relating to each other. The costs resulting from the diminishing of trust have become so significant that their transformation into income is necessary, if we succeed in basing ourselves on trust in the economic process.

The 2007-2010 economic-financial crisis was determined by events which had taken occurred in the perimeter of trust. It has been explicitly stated that the loss of trust in the financial institutions and in the main instruments used by them is the decisive cause of this crisis. If we corroborate the level of approaching this problem and we refer to the situation in Romania, we can state that it has become common the fact that the main reason of the dramatic decrease of the economic indicators in the time interval mentioned previously, and the agony that this field is currently facing, is the loss of trust in the success of every business exclusively underpinned on economic reasons. Especially the change of the Fiscal Code, of the interest rate, of the employees and employers' behavior and orientation, including of those in the central bodies, have undermined the trust in the possibilities of reaching the objectives stipulated.

We appreciate that such a multi-factor approach is rational, taking into consideration the case in discussion, of the collapse of trust, for the economic activity is an integrant part of social life. As such, it can take place only if those carrying it out comply with numerous norms, rules, moral obligations, and social habits. In doing this, they get to support each other to such an extent so that they become a community based on mutual trust. Thus, they acquire, through informal impulses, the capacity to be part of groups and organizations and its result consist in improving the measured performance, obtained as a result of common work. The existence of group communities, without which there cannot be modern production, is unimaginable without a certain level of trust. Hence the need to obtain the production demanded by the market, in the conditions of efficiency imposed by it, makes it necessary to engage some expenses to cultivate and maintain the trust among the producers and between these and the consumers.

Due to these two reasons, one referring to the economic situation in our country and the other of scientific type, we believe that the problem of trust in the parts associated in performing the productive activity must be reconsidered in order to be rationally underpinned from a utilitarian perspective.

The premises to start from in the attempt to make another localization and disclosure of the role of trust in the realization of the economic activity are:

1. The way in which the realization of the economic activity is perceived and, then, the way in which this is actually realized carries the stamp of ideology and of the system of organization predominant in a country at a particular moment. Very rarely, there are cases when the economy and social life evaluate in different directions. The trust in the social players occurs when in a

community there is and manifests in space common moral values which can generate the expansion of the entire system of a rigorous and honest behavior. In economy, there is the need for a written moral code and for an unwritten moral code to stimulate loyalty, solidarity and, in the end, the trust among the common employees, in the managers, in the employees having supply – sales tasks etc., without which the development of the firms cannot be ensured. By wording this premise, one should not understand that we want to place the heaviest part of responsibility on the realization and manifestation of trust on the shoulders of institutions and markets. They interfere with the productive systems only to assess the effects that the trust carrying out the economic functions generated. The business community does count so much on rules and laws but a series of ethical habits and moral obligations mutually assumed by the members of a work staff. The content, the formulation, and pursuit of the way to acquire and apply these rules, norms, and habits have made the members of this community to trust in each other.

2. It is known that the competitive relationships in a market economy require firms to conduct a more active performance to diversify and modify their offers in terms of price level, quality, and performance of marketed products and services.

When there is no belief that these attributes of certain commodities available in stock and points of sale, could actually meet the projected needs of buyers, or that they contribute to the strengthening of the supposition that the act of exchange is not carried out in two parts mutually beneficial terms, those products will not sell, or this will be done with great difficulty. Competition will never be able to act as a strong motivational stimulus of development even when economic agents will appreciate that their freedom is in decline, when primary psychological rewards are felt unreasonably low, or when private information is distributed subjectively so that it creates unfair competitive advantages. We can say that today the ability to compete on the domestic and the foreign market of a firm and of a national economy is conditioned by a universal principle: high level of trust that prevails in that company. Economic counterperformances follow logically from the lack of confidence.

3. Capital, with its widely recognized hypostasis is the main component of production forces. It appears as a sum of money, means of production or as human capital. Today the relative importance of buildings, equipment, money has declined, whereas that of people skills and knowledge has increased. and pricepii people. Its latest hypostasis, also called human capital, includes as well, the ability of employees to work together in groups and organizations, not only the one to know how to operate the mechanisms, documents or securities. The employees' ability to associate depends on the extent to which they and their inclusive communities agree to conduct their business following certain rules and values and, consequently they get to be willing to subordinate individual interests to the general ones. Without such rules, some unwritten, like loyalty, honesty, responsibility, ability to inspire trust, people can not work together in a firm, acceptable in terms of efficiency. Without such values, the work of an employee becomes too costly because it imposes a requirement that they be replaced with formal laws and rules to be drafted, negotiated, adopted, required, sometimes forcefully. And when something like that cannot be obtained, it is substituted with ever increasingly large and comprehensive commercial contracts or with the sacrificed advantage to achieve production in large units, in favor of family or small business.

Thus, for the individual to have a genuine labour force in the circumstances of the current competition, he must also fulfil certain cultural and moral requirements, besides the professional ones. If the employee does this, he proves more reliable, and manufacturers can adopt new, more flexible forms of firms' organization, such as outsourcing, delegating responsibility to lower levels of the hierarchy, focusing attention towards the needs of the group that produces the goods or services in the firm. That is why in modern society, with the technical and technological model specific to present times, no one should dictate a unique form of organization of production, nor

be deprived of a high degree of trust and solidarity. These psycho-social attributes respond to the more general need to increase economic efficiency, which is imposed by the world population's growing number and by the shortage of energy and material resources existing on the planet. However, to properly exploit such resources is harder when employees feel a discomfort, an acute vexation, when they lack confidence in the rules, regulations, habits and moral obligations. Based on the aforementioned concepts, we strongly assert the belief that in today's circumstances the trust is an essential feature of private employment as a component of production forces. At the same time the emphasis and manifestation of trust require an exchange of information between the participants to the productive act. However, this human feature cannot be reduced to simple information, nor to the technical means it is transmitted through, including those relating to the fundamentals of certain employees' personalities.

Trust is necessary so that three of the four components of the productive forces could manifest themselves, namely: the element of capital, the labour force and the information. However, we believe that trust is a factor of production distinct from the four recognized, as the relationship between it and the possibilities of expression of the other three mentioned above is a one-to-one. Placing it on such a position reveals the great importance it has in reality. Moreover, the trust meets an undeniable economic function, as shown by the special relationship it has with the product of work. In its presence, the economic, financial and relational performances of the firm are growing while, if there is no trust, its income would rather be redistributed between the members of the firm and the members of society, than be increased by creating new value by working. In the absence of moral commandments, such as justice, honour, or faith, reason gives way to material pleasures so that the employees get to show self-cantered behaviour, to maximize their individual utility at the expense of the pursuit of group objectives.

The consideration of trust as an independent production factor can also be validated from a scientific point of view because it fulfills basic conditions in order to be appreciated so. Trust has an important economic value that is measured, divided, and homogenous. Thus, we can calculate its marginal product.

Although it has these obvious characteristics, we underline the fact that trust is a supplementary condition for increasing the economic efficiency besides the things obtained as a result of exterior coercions such as contracts or the provisions of commercial law. In case of studying them deeper, we will come to the conclusion that these are also sustained by trust, if not directly, then through other means, such as insurance policies, derivative securities or securitization of certain securities or transactions that allow hedging. The marginal product can be quantified by using the so-called transaction costs that are done when there is a lack of confidence in the manufacturing firms. The identifying of the appropriate manufacturer or vendor, as needed, the drawing up of a contract for the given situation, its negotiation and its implementation, the receiving and the quality inspection, and so on, generate higher or smaller costs depending on the extent to which the parties believe in mutual honesty. We must not omit the fact that in the situation where trust prevails, the parties do not think of short-term profit, because they are aware of the fact that recording a deficit during a certain period will be compensated later.

DETERMINANTS OF COMMUNITY PARTICIPATION IN ORADEA

Săveanu Tomina

University of Oradea, Faculty of Economics

The present paper is part of the research of the PhD thesis made by the author, having the following title: Community Participation in Oradea, registered at the University of Oradea - Faculty of Social and Human Sciences. The general objectives of the paper are the explanation of different types of citizens' involvement in the community life which they belong to, the investigation of the existing relationships between different types of participation and the identification of some social involvement stimulating mechanisms.

The citizens' political and civil participation, social responsibility, community spirit, civic activism together with other concepts from the civil society's rhetoric entered, together with intensifying the efforts for adhering to the European Community, the agenda of public debates, being the subject of numerous studies performed in this field. The need for a strong civic society, with interested and involved citizens in the life of the community which they belong to for social and economical development belong to the same discourse of the strong democratic society, being contended in the specialty literature, starting with Toqueville, Almond and Verba, to Putnam and many others. In parallel to the civil society's rhetoric and the analysis coming from this direction, are the studies and theories of community development, which on one side are based on development policies, regulations, institutional framework of development, but contain, mostly on the level of implementation of methodologies and aspects of citizens' involvement in evaluating the community problems, the deciding process in the actual implementation of solutions.

The present paper subscribes to the efforts of determining the factors which can increase the implication rates in the community life of the Romanians, having as an effect the production of different types of collective goods. Based on data obtained with the CEEX research, coordinated by Adrian Hatos, "Leaders, Participants and Viewers. Determiners of community participation in the urban Romania". The tested hypotheses in the research part, based on the results of different studies and theoretic approaches, derive from the general question of the paper: which are the factors that determine the community participation of the people living in Oradea. Thus, the participation variation is verified by: gender, age, social status, social capital, civic competence, leadership experience, participation opportunities. The main results suggest that community participation is explained by civic competence, well-being, bridging social capital, gender and age.

Key words: community participation, community development, civic activism.

JEL codes: D17, H41

1. Theoretical framework, work hypotheses

Regarding participation types in community, we can identify more types which sometimes, just like Marinetto (2003) and Kim and Bearman (1997) pointed out, depend, besides the citizens' motivations, also on the political or social environment in which participation manifests and on the political definition given to participation. These forms can cover a large spectrum of actions, from protesting the authorities' decisions, to participation at different public debates, associative participation for the community, volunteer work or helping actions or contributions to underprivileged categories. Thus, we can say that any action of the individuals for producing desirable collective goods is community participation and thus civic participation is a particular type of this kind of participation.

Following one of Marc Morje Howard's (2002) argument, developed by Hatos (2008), we consider that civic participation in post-communist countries is lower compared to Western countries because people here are skeptical when it comes to involvement in formal non-governmental organization, for different reasons (the memory of communist organizations, considering these NGOs as part of the western hegemonic system, inability of these organizations to meet the needs of the citizens or reduced access to these). Nevertheless, it is possible for the Romanians to avoid involvement in the classical organizations of the civil society, but to act through family networks or non-formal frameworks (like neighborhood) in ways that produce collective goods. This argument is supported by the data of our research, participation rates at different community activities being higher than belonging to an NGO, but this data has to be analyzed carefully because there is no direct correspondence between the two types of participation. A separate section from the analysis is going to be dedicated to testing hypotheses. One of these analysis highlights the civil society's limits and explains them through the low levels of social trust. Thus, the connections are made between social trust and low levels of civic participation, NGO memberships, weak social connections, corruption (Uslaner: 2003), (Badescu: 2002), (Howard: 2003). The lack of involvement is influenced by the lack of trust (both institutional and general) which was weakened by the communist party (Hann: 1996). The same arguments are used for explaining the decline of civic involvement from the western societies, even if the sources for mistrust are different (Putman: 2000).

Factors that explain low rates of participation in Romania are education, profession, gender, home environment, the participant's profile being a young male, from an urban environment, educated with previous experience in civic participation (CSDF: 2003). Previous involvement in organizations was analyzed in a different manner by Hatos (2008), the author analyzing the relationship between the present civic involvement and the activism in the communist period, demonstrating the existence of a positive relationship argued with the fact that the previous activism represented both a learning context of the abilities necessary for the success of the action and a framework for developing a specific social identity (Dodescu and Hatos: 2004).

Civic participation refers to the individual's action social oriented to the production of a collective good (Dodescu, Hatos, 2004). The problem of civic participation is found in the civil society's topic, complementary to the political participation of the citizens. It is usually measured (Badescu 2001, Uslaner 2003) by the participation and involvement rated in the classical types of civil society: non-governmental organizations. Association rates are the most frequently used indicators of civil participation, even if in order to produce collective goods there can be other involvement mechanisms as well. Collective actions, social movements and grass-root movements are aspects of the same problem, but are less operational. Community participation is a concept closer to the problem studied in this thesis, by integrating also actions of the social actors in the community to which they belong in order to solve some common problems.

D. Sandu (2005) defines community participation as being the process of involvement of the members of a community in actions "that follow the fulfilling of certain local needs, predominantly local and public or group type" (p.43). This participation is predominantly voluntary, but it can also be involuntary when it is not known who is going to benefit from this action or when there are some pressures to stimulate participation. Iuliana Precupetu (2003) analyzes both theoretically and by using empirical data, the connection between social participation, social capital and poverty. According to literature, the author presents a few factors that influence participation: civic competence (seen as the individuals' perception regarding their capacity of influencing the decisions of those in charge) and political involvement, cultural behavior, access to public facilities (well-being indexes), satisfaction regarding the possibility to be part of the social life, quality of the social and political environment, satisfaction regarding the possibility to be part of the decision making process at different levels and information.

Another factor that was highlighted by A. Hatos (2008) as having a role in explaining community participation is having a leading position, both before the revolution and after, both in the political hierarchy and the one from the field of work. By comparison analysis of the average scores of individual participation and having different leading positions, the author demonstrates the positive relationships between these, highlighting the strong connection between having a leading position by the members of the family for individual participation.

These relationships are tested in the present analysis, explaining the community participation rates of the people living in Oradea according to the available data, verifying the following research hypotheses: [1] A. Young people are going to participate more than older people; B. Retired people are going to participate more than mature people: they have more time, but may have problems that can affect their participation; [2] People with higher social status are going to participate more than those with a lower status. The status is going to be analyzed in two dimensions: educational level (number of completed study years) and well-being indexes (incomes per home, goods in home); [3] As social capital rises, community participation rises as well - social capital is measured according to its two distinct dimensions: belonging to social networks (intensity of the networks: time spent with friends and their density: number of friends) but also social trust; [4] Civic competence or the sense of personal efficiency raises the chances of participation. Civic competence is measure through the answers to the questions: to what degree do you think you can influence de decisions from the country of town); [5] They had leading positions that worked either as contexts for learning abilities and knowledges needed for a successful participation, or as instances for developing a specific social identity; [6] Participation is influenced by the context in which it occurs: the lack of contexts/ opportunities to participate has a inhibitive effect on it.

2. Data and methods

For the second stage of the CEEX project presented in the introductory section questionnaires were applied to a random sample of 461 people from various areas of the city of Oradea, in October 2007. The sample includes 50% men and 50% women, aged between 18 and 86 with a rather equal distribution according to category of age.

2. a. The dependent variable:

In our research community participation has been recorded through questions regarding participation rates to various activities on the level of neighborhood, as shown in chart 1.

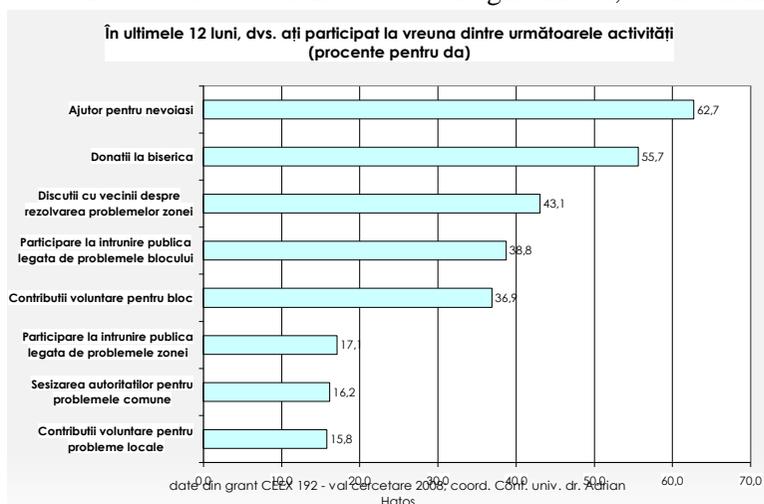

Chart no. 1 – Community participation forms and rates in Oradea

In order to analyze the determinants of community participation a summative scale has been created, based on these variables ($\alpha > .811$), with the minimal value of 0 and a maximal value of 8 activities for the respondents to participate, the average being 2.8.

2.b. Independent variables

The gender_of respondents is introduced in the analysis as a dummy variable with 1 as value for males. Age is a continuous variable measured used as such in the analysis.

Social status is measured on two dimensions: level of education measured in years of study on one hand and household assets on the other. The variable referring to years of study completed is the outcome of the recodification of the categorical variable 'last school the respondent graduated from', thus resulting the scale variable used. As for the economical status we have chosen as explanatory variable household goods that we consider relevant to exemplify household welfare in time. Personal income or income per household, beyond the potential errors resulting from calculations made in Ron or Rol (the questionnaire was applied in the transition period between the two systems of reference) is more variable in time and has a higher non response rate. In order to introduce household assets in the analysis we created as summative scale of assets.

Social capital was included in the analysis on several distinct dimensions: intensity of networks, their density and generalized trust. The intensity of networks to which an individual belongs is calculated by answers to the question: how much time do you spend with your friends with the following potential responses: weekly, a few times per month, a few times per year, no time at all that has been turned into dummy variables keeping the no time at all category as reference category. Density of networks is calculated through a scale of the extensive social capital built as an average value of responses to three questions: 'how many friends do you have?', 'how many friends do you have that you can borrow a small amount of money from?' and 'how many friends do you have that you can borrow a large amount of money from?'.

Personal effectiveness- or the civic competence was introduced in the analysis as an average scale of answers to the questions: 'To what degree do you think that people like you can influence important decisions regarding: the community/ the entire country?'. Positions of management were followed through responses to a set of 14 items for which a summative scale was designed by adding up the 'yes' answers after a dichotic recodification of variables.

	N	Minimum	Maximum	Average	Std. Dev.
age	376	18,00	86,00	42,5452	16,43470
most recent school graduated from measured in years of study	384	,00	8,00	4,5703	1,78191

Chart no 1. Description of independent variables

3. Analyses

3.a. The effect of context on community participation

One of the aspects that have been traced in the analyses was the actual participation according to opportunities available for each individual. This was possible due to the fact that one of the response options to the question was: *not applicable*. To this purpose two distinct scales were created: one of absolute participation and one of relative participation, the latter taking into

account situations where participation was not applicable. For absolute participation ($\alpha > .811$) we have built a summative scale of the cases in which participation to one of the activities in the list of variables was reported. The average value of the scale is 2.81 where a min. of 0 and a max. of 8 activities to participate in, with left inclination and a skewness value of 0.232.

For the scale of relative participation we have eliminated those cases where 'not applicable' was reported for each action. The difference between the distribution of relative participation and that of absolute participation is rather similar, with an average of 3.9 and a skewness value of 0.231. When comparing the averages of the two variables, there is a significant difference between them to be observed ($t = -29.61$, $p = 0.00$). Moreover, the dispersed distribution of the responses on this second scale makes it less suitable for future analyses, therefore it will not be used further here.

As a conclusion of the comparison between absolute and relative participation, it may be said that the people of Oradea participate in less than half (39.91%) of the activities they have the opportunity to participate so that the arguments that explain the lack of community activism through the absence of contexts in which citizens can get involved can be refuted to some extent. This is indicative only of the fact that the explanation of the low rate of community participation needs to be sought elsewhere and does not dismiss the creation of contexts for activism, at least as context for acquiring the knowledge and the abilities required by a rather successful participation. Consequently, for the available data, we dismiss *hypothesis no. 8* which maintains that community participation varies according to the context that enables or inhibits it.

3.b. Determinants of community participation

In this section, through multiple regression analysis we will outline the factors that explain community participation and the level to which they contribute to these explanations according to the formulated theoretical hypotheses.

COMMUNITY PARTICIPATION ABSOLUTE SCORE	B	S.E.	Beta
(Constant)	,280	,909	
gender of dummy respondent – male	-,688	,229	-,175
age of respondent	,004	,009	,030
most recent school graduated from measured in years of study	-,026	,071	-,023
scale of household assets	,221	,051	,283
scale of personal efficiency/ civic competence	,460	,165	,165
social capital_density	,019	,029	,040
free time spent with friends weekly	-1,180	,512	-,300
free time spent with friends one or twice a month	-,777	,498	-,187
free time spent with friends one or twice per year	-,116	,635	-,014
scale of generalized social trust	,288	,182	,094
absolute scale of holding a management position	,261	,062	,271
<i>Adj. R</i>	<i>0.188</i>		

** coefficients in bold represent significant effects for $\alpha < .05$

Chart no. 2. Regression chart for the community participation dependent variable.

The model explains 18% of the variation of community participation as absolute score. The gender of subjects, as well as their age, are predictors of community participation but contrary to hypotheses formulated based on other studies on the same topic. On the other hand, according to our data, women participate more, in other words, the female gender is a predictor of participation. In this case it is possible that the difference is in the distinct forms of participation analyzed: men are oriented towards other types of actions including civic and associative ones, while women are involved more in activities closer to the household.

In this model one of the factors that explains most of the variation is represented by the scale of goods, which is thus a good predictor of community participation in the sense that an increased level of endowment of the household enhances the increase of community participation.

Nevertheless, the second indicator of social status, education does not influence participation in the case of our sample. This conclusion points at the social structure of the current urban Romania where cultural and financial capital are not facets of the social status: there are wealthy people with no education, as well as poor people with education and as far as community participation is concerned financial aspects appears to be more important than the educational. Perceived effectiveness is also a factor that explains participation: the more a person feels that he/she can influence decision, the more likely is the person to participate in actions on the level of community. Here we can argue that strategies that stress *empowerment* have more chances to succeed, since the feeling of responsibility and that of effectiveness cumulated are important resources of community activism, as other studies have shown it (Dodescu, Hatos 2004). Also, our analyses confirm the significant role of social capital in explaining community participation: people who are part of dense social networks (have a large number of friends) participate more in the solving community problems. However, the intensity of relations (meeting friends on a weekly or monthly basis) has a negative effect on participation, thus supporting the theories of weak relations. Generalized social trust is not a predictor of community participation. Another factor that proves to be relevant in explaining community participation is represented by the issue of holding management positions, either in the professional or in the political life, before and after 1998. In other words, people who have or had management positions participate more in actions on the level of neighborhood. This is indicative of the fact that either acquiring the knowledge and the abilities of a successful participation or the creation of a role identity specific to social activists are important mechanisms in promoting participation.

4. Conclusions and discussions regarding community participation

As a conclusion, it can be said that as far as community participation in Oradea is concerned, the following hypotheses are confirmed or modified:

- People from wealthier social categories have a higher rate of participation;
- Density of social networks increases participation while their intensity decreases it;
- Women participate more in community actions than men;
- Older people participate more than young people but participation decreases with age;
- The level of education does not explain community participation;
- Generalized social trust does not explain community participation.

Generally speaking we may say that these results point to the fact that it is possible that on the level of the urban communities in Romania community participation has a distinct profile than civic participation traditionally measured as associative participation in NGOs. This could be the reason for not finding support for some of the tested hypotheses as they were formulated on the basis of analysis of associative participation. Consequently, we formulate the hypothesis that will be tested in the following sections, namely that in terms of adherents, community participation is highly different from associative participation.

THE FREEDOMS OF MOVEMENT OF THE SINGLE MARKET

Sirghi Nicoleta

Hațegan Camelia-Daniela

West University of Timisoara, Faculty of Economics and Business Administration

The European Single Market implies not only the free movement of goods and services, but also the free movement of production factors (the capital and the labor force). The liberalization of goods and services and of production factors movement has determined, on the short term, the appearance of some structural and specialization adjustment processes within the member countries, and on the long term a more efficient allocation of the production factors, an improvement of labor productivity and positive effects in the field of labor force employment. According to the neoclassical theory, the labor force migrates from regions with low wages and low profit rates, to regions having high wages and high profit rate. Thus, the production factors are used in a more productive way. According to this theory, the factors mobility contributes to the equalization of the wages and to a better factors allocation. Issues such as structural funds, persons' freedom of movement, convergence could be turned into advantages by any member state, and especially by a new member state. From an economic perspective, the causes of labor force mobility, as a production factor, are: the price differences (wage differences, profit rates differences, interest rates differences) – according to neoclassical theory; income difference, meaning saving excess or insufficiency for the capital, according to Keynes approach; differences in the level of economic development, determining unequal changes, according to the monetarists. Romania has become a European Union member at January, the 1st, 2007. The accession road has been a long one, full of challenges, issues, but also satisfactions. The 1st of January has not been the end of a process, but the beginning of a new period for Romania's present history. The author will try to emphasize the freedoms of movement of the Single Market. The humanitarian reasons also determine the migration of the population; these are the refugees, the asylum solicitors, the persons having temporary protection or persons accepted for other humanitarian reasons.

Key words: Economic Integration, Models of Trade with Imperfect Competition, Labor Market Interactions, freedom, movement.

1. Introduction

From an economic perspective, the causes of labor force mobility, as a production factor, are: the price differences (wage differences, profit rates differences, interest rates differences) – according to neoclassical theory; income difference, meaning saving excess or insufficiency for the capital, according to Keynes approach; differences in the level of economic development, determining unequal changes, according to the monetarists. According to the neoclassical theory, the labor force migrates from regions with low wages and low profit rates, to regions having high wages and high profit rate. Thus, the production factors are used in a more productive way. According to this theory, the factors mobility contributes to the equalization of the wages and to a better factors allocation.

The European Single Market implies not only the free movement of goods and services, but also the free movement of production factors (the capital and the labor force). The liberalization of goods and services and of production factors movement has determined, on the short term, the appearance of some structural and specialization adjustment processes within the member countries, and on the long term a more efficient allocation of the production factors, an

improvement of labor productivity and positive effects in the field of labor force employment (Wallace H., Wallace W. and Pollack M. 2005:201).

Through labor force freedom of movement, a more efficient allocation of this production factor is pursued. Among young people, we can talk about migration in the purpose of education and professional preparation: students or persons in professional preparation. Their migration should be temporary.

Among the migrants, we can also find those working in another country, being immigrant workers or international civilian servants. Other reasons for migration are the reunification and the formation of families, and also the freedom of establishment, in order to work, based on family connections, ethnic origin, entrepreneurs and investors, or pensioners. The humanitarian reasons also determine the migration of the population; these are the refugees, the asylum solicitors, the persons having temporary protection or persons accepted for other humanitarian reasons.

2. The labor force freedom of movement for the members

The Schengen Area: in order to stimulate the persons' freedom of movement, in June 1985 France, Germany and the Benelux countries signed the Schengen agreement. Italy joined in 1990, Spain and Portugal in 1991, Greece in 1992, followed by Austria, Finland and Denmark. The United Kingdom, Ireland and Sweden didn't sign this agreement. According to the Schengen agreement, the control to the internal frontiers of the EU are rarefied and then eliminated, while the controls to the external frontiers are intensified. There is a common policy concerning the visas granting, and the member states cooperate in the judicial and custom field. The labor force freedom of movement implies the following four essential rights: to present itself to a contest in another member state, to be free to move on the territory of another member state in this purpose, to be able to remain on the territory of another member state in case of employment, to be able to definitively live on the territory of another member state. As for liberal professions, they are free to settle down on the territory of any member state.

On December the 21st, 2007, the Schengen agreement was extended on the Czech Republic, Estonia, Hungary, Lithuania, Latvia, Malta, Poland, Slovakia and Slovenia. Romania and Bulgaria still have a lot to do to answer the security criteria of the European Union. Most probably, the two countries will join the Schengen space in 2011. Let's see now some of the consequences of labor force freedom of movement upon the Romanian labor market (Wallace H., Wallace W. and Pollack M. 2005:96).

The changes in December 1989 have brought more simple formalities, in order to obtain a visa for a West European country. Also, at the beginning of the 90, Romania has registered a strong emigration of German ethnics. Thus, from 1990 until 2002, the emigration, as well as the negative natural rise, contributed to the diminishing of Romania's population by 1 million persons, from 23 million inhabitants to 22 million inhabitants. Unfortunately, this movement has continued. The elimination of visas from January the 1st 2002, in the middle of Romania's negotiations for the EU accession, has determined an increase of the number of emigrants, phenomenon which has amplified after January the 1st 2007, when Romania has joined the EU. At this moment, it is estimated that in Romania live less than 20 million people (probably, about 18 million), while more than 2 million people work abroad (about 1 million Romanians are in Italy, 1 million in Spain, and other in Germany, France or the UK). We must start by saying that the Romanians' emigration, in order to find a better life, did not start in 2007, once the Romania has joined the European Union, nor in 2002, when the Romanians did no longer needed visas for the Schengen states. Even before 1989, there was an emigration movement, both legal and illegal, but having a reduce amplitude.

Attracted by big salaries and a better life, many Romanians, young for their majority, have chosen to leave their country and work abroad. They sent important amounts of money to their

relatives in Romania, allowing them a decent living. The Romanians work especially in constructions and agriculture (men), or as housekeepers and in agriculture (women). It is estimated that in agriculture, many of them work illegally. In 2005, the money sent back home by the Romanians living and working abroad has been of 4.14 billion Euros (5.6% of Romania's GDP). The Romania's spectacular economic growth of the last years has been supported, partially, by this important amount of money, sent home by the Romanians working abroad.

The consequences of emigration, for the destination countries, have been rather positive: the EU GDP has raised by 0.17% on the short term and by 0.28% on the long term; the inflationist pressures have diminished in the destination countries; the wages have dropped by only 0.08% due to immigration, while the unemployment has raised by only 0.04% (Sirghi si Vădăsan, 2010:19-25). In the departure countries, the consequences are more controversial on the one hand, the unemployment rate has diminished (only 4.1% in 2008), the pressure on the state budget has diminished as well; the emigration has allowed Romania, for instance, to avoid an economic and social crisis, of a huge amplitude, which could have endangered our integration calendar; the money sent back home have encouraged the consumption, as well as the real-estate sector, both contributing decisively to Romania's economic growth. But on the other hand, Romania is confronted to a lake of qualified labor force: 100 000 work places have not been occupied in 2008, and it is estimated that until 2013, this labor force deficit will reach 300 000 persons.

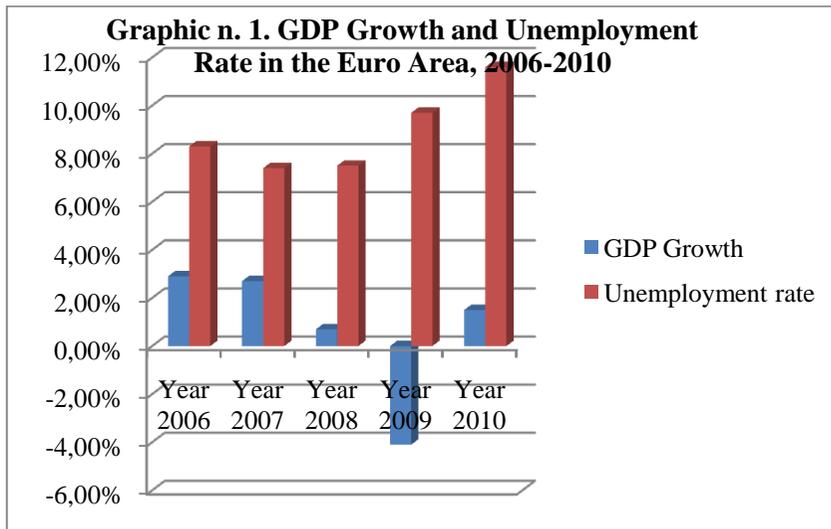

In the present, Romania is the country where investors are encountering the biggest difficulties in finding the needed personnel, with the needed qualifications. As a consequence, many investors have brought foreign labor force: only in 2008, 65 000 work licenses have been granted. Many of those workers come from China, Bangladesh, Republic of Moldavia or Ukraine.

After the integration in the European Union, 16 countries have forbidden Romanians' accession to their labor markets. Since January the 1st, 2009, 5 countries have eliminated these restrictions. By 2013, all EU countries will have to eliminate these restrictions. In this moment, Romanians are free to work in the following countries: Estonia, Finland, Poland, Slovakia, Czech Republic, Cyprus, Sweden, Slovenia, Latvia, Lithuania, Bulgaria, Spain, Denmark, Greece, Hungary and Portugal, while in the following countries there are still restrictions: Belgium (until 2011), Ireland (until 2012), Netherland (until July the 1st 2009), the United Kingdom (until 2011), Germany, France, Austria, Italy, Luxembourg, Malta (until 2013). The member states of European Economic Area (Liechtenstein, Island and Norway) have also maintained the restrictions until 2013.

An important step was the Referendum held in Switzerland, on February the 8th 2009. According to the result, and in spite of a very negative campaign, more than 60% of the voters were in favor of prolongation and extension of the Agreements with the EU, regarding the freedom of movement (including the free movement of Romanian and Bulgarian labor force). Following this positive result, in 7, maximum 10 years, Switzerland will eliminate any restriction.

The present crisis resembles to its predecessor, among other things, by the state interventionism, through money infusions, and through nationalisations.

Concerning the present crisis, the EU, are strongly affected. As one can see in graphic number 1, in the year 2009, the economic growth for both the Euro area negative (-4.1%), while the unemployment rate is sharply growing, to 9.7% .

Source: www.anofm.ro, www.insse.ro, ec.europa.eu/eurostat/

The forecast for 2010 is slightly optimistic concerning the GDP growth rate (+1.5%), but the unemployment rate will continue to grow, to more than 10% for both Euro area. The situation is worsening, and nobody can tell for sure when exactly the crisis will reach its end.

Which are the effects of Romanians' dismissing abroad? On the one hand, the labor force shortage will be reduced; the return of qualified labor force is a gain, but only on the long term. On the other hand, under the conditions of the resent crisis, and taking into consideration unemployment rise in Romania, their return will most probably represent, on the short term, a serious social issue, contributing to an even more higher unemployment rate. Also, the money delivery will decrease, by even 50%, making more difficult the life of those remained in Romania.

The global crisis has affected the EU, as well as Romania. On the Romanian labor market, since December 2008, one has registered an increasing unemployment rate: 4.4% at the end of 2008, 4.9% in January 2009 and 5.3% in February 2009. By the end of 2009, in an optimistic anticipation, the unemployment rate will reach 5.5% (Sirghi și Vădăsan, 2010:18-19). But this is not the only problem Romania's labor market has to face this year. In 2008, some 100 000 Romanians working abroad have lost their jobs, and some more 30 000 Romanians will lose their jobs this year. However, only 14% of them have the intention to come back to Romania in 2009. 33% will remain for 2 to 5 more years abroad, 15% will come back only after 5 years, while 29% have no intention of coming back.

3. Conclusions

As we all know, the first right of the European citizen is to be able to travel, work and live anywhere on the territory of the European Union. The Maastricht Treaty has legitimated this right in the chapter referring to citizenship. The freedom of movement and the equality of treatment, by forbidding any restrictions regarding the labor force for the European citizens have created fear among the "old" members of the EU, concerning massive migratory labor force flows, from the East to the West, in search for better salaries and better working conditions. As a consequence, fearing a massive labor force migration, from East to West, separated agreements have been negotiated, regarding the labor force movement after each candidate country will access the EU, a certain period of transition having been asked in order to liberalize the labor force circulation.

We consider that, in order to achieve the Lisbon objectives, it is imperiously necessary to insure the European workers mobility: the geographic mobility, as well as the professional mobility (the flexicurity). The last barriers elimination out of the way of the labor force freedom of movement has a particular significance. A transnational and European social dialog is necessary. In this context, right insurance during the stage of professional transition and, consequently, the social rights portability are extremely important. This is why, the increase of workers mobility is requested, by improving the way the supplementary pension rights are being gained and kept, and the regulation appliance regarding the social security systems is finalized.

A fundamental priority for the European Union is the development of a European policy concerning migration, which should complete the member states respective policies. In this purpose, the EU aims the accomplishment of a European pact regarding migration and asylum. Such a pact would emphasize a consolidated common policy regarding migration related issues, based, among others, on a more sustained dialogue with the origin countries. The European Union considers as objective the legal migration rise, including the labor force migration, as well as the application of a co-development policy, reflected by specific projects and supported at the European level. In this sense, it is necessary to continue the progress regarding the migration global approach. The cooperation and political dialogue with all the origin and transit countries must be consolidated, and partnerships concerning the mobility, the circular migration and cooperation platforms for migration and development must be promoted. As a general conclusion, we can say that EU membership could be an opportunity, but it depends on each member state to take advantage of it. One must also continue the actions related to the policies plan concerning the legal migration. In this sense, the migrants' rights issues must be rapidly solved, as well as the conditions regarding the highly qualified workers' entrance and stay, the persons detached within the same enterprise, the remunerated persons on probation, the temporary workers. The transition periods, applied to the workers from the new member states, should be eliminated.

IMPROVING THE ECONOMIC ACTIVITIES IN THE LESS FAVOURED AREAS OF ROMANIA

Tileagă Cosmin

“Lucian Blaga” University of Sibiu Faculty of Economic Sciences

Cosmescu Ioan

“Lucian Blaga” University of Sibiu Faculty of Economic Sciences

This paper deals with finding solutions for improving the economic activities in Romania's undeveloped areas, which still represent a major problem for this country's economy. During 1999 and 2009, these areas were considered tax havens, due to some facilities accorded by the Government and the EU(headage compensatory allowances⁵³, tax deductions, non-refundable funds). Many had the opportunity to invest in those regions, but no positive effect was to be seen. Tulcea County(Danube Delta area), coal mine regions, rural areas and the North-East area(Suceava and Botoşani county) are considered to be Romania's less favoured areas.

Keywords: less favoured areas, non-refundable funds, tax havens, economic growth, economic activities,

JEL clasification: E60

Introduction

Nowadays, every less favoured area from Romania represents a major problem for regional development, having a negative impact on Romania's economy. It is proven that long-term growth strategies for less-favoured areas require especially the development of infrastructure and national institutions, which kept those areas backwards. Since 1999, open trade between countries has been considered to stimulate the economic growth, both at national and regional level. This growth was often suppose to trickle down to less favoured areas. In other words, this was considered a process whereby the economic gains from economic growth would pass down throughout the entire society, eventually giving rise to development.

People living in less-favoured areas represent around the globe 40% of the rural population, suffering from chronic poverty. In what Romania is concerned, a study from 2010 reveals that closely 33% of the population of Romania is living with less than 200 Euros a month.

Less-favoured areas are defined as „remote regions with limited natural resource base, where problemes of chronic poverty and resource degradation tend to be the same. In the same time these areas have a limited agriculture potential, with poor infrastructure and service suport”.

However, it is necessary to distinguish the concept of less-favoured area with development potential. This area would be an ideal place where investment especially in infrastructure and tourism can be productive and sustainable.

A large number of implementing directives comprise the current classification of the LFA of each European Member State into three types:

-*Mountain areas*(rural areas around the Carpathian Mountains) where altitude, climate and slopes, reduce the chance of investments. The major problem for this areas still represents the process of deforestation, the lack of mountain resorts, and the lack of infrastructure.

-LFAs which are marked by poor soil conditions(especially low agricultural productivity), low population densities or even depopulation tendencies. In Romania Tulcea county(Danube Delta

⁵³ The objective of these schemes is to provide a reasonable level of income for farmers where natural production conditions are least favourable so as to conserve the countryside by the prevention of further depopulation of rural areas. Compensatory allowances are payable to farmers for the keeping of cattle, sheep and goats. (www.europa.eu)

area) could be considered an area with a low rate of investments, low soil productivity mainly because the Danube.

-LFAs which are related to small areas with specific handicaps relating to the environment, landscape development, low agricultural activity, low tourism development. This area in Romania may be found in the North-East of the territory, including Botoşani and Suceava county. This area represents a major undeveloped region of Romania, mainly due to migration to other countries or even in more developed areas of Romania.

To find solutions in order to develop the less favoured areas, some objectives must be established: finding an economic balance between regions, finding new ways to attract new investors, developing agriculture, industry and especially tourism to enhance the value of the local resources, inforce the cooperation between the regional areas.

Two important elements always play an important role for less-favoured areas: defected political institutions and poor infrastructure (poor infrastructure often implies a long transport duration or difficult communication between a LFA and other regions). These two elements are especially relevant because of their link to the effects on the economic growth. Moreover, the political environment has a strong impact on the economic growth of the less-favoured area, meaning that in Romania the funds accorded by the Government to regions are not equally distributed.

Less-favoured mountain areas, and rural areas

The less-favoured mountain areas, which represent approximately 29, 93% of Romania's territory are the homeplace for 2. 400. 000 romanians. The economic activities from these areas are mainly those related to the wood and furniture industry, agriculture and animal breeding. In the areas surrounding the Carpathian Mountains, due to the numerous protected areas, tourism is not well-developed, excepting the winter season when the winter resorts are full of tourists practising the winter sports.

A major problem for this area represents the process of deforestation, which causes numerous landslips and floods. It is well know that there is a lack of modern woodland planting that affects negatively the imagine of this area. Once a tree is being planted, it needs around 40 or 50 years to grow to maturity.

The forests offer important resources for the economy of this less-favoured area. Excepting wood, mushrooms, seeds, forest fruits, firtrees, mineral waters represent significant resources.

On a short term, tourism and especially mountains resorts should be considered strong points for developing the local economy, especially during the winter. In addition, due to the speed of falling waters coming from the mountains, hydro-electric power plants could offer to this area a new opportunity to attract new investors, becoming an area strong enough to generate new workplaces and greater amount of , , green-energy, , .

The less-favoured areas from the mountains (mainly the rural areas) in Romania are characterised by a scattered population and very low quality infrastructure – for example, only 33% of rural residents are connected to a water supply network and only 10% to a sewerage system, while only 10% of rural roads are considered of “adequate standard” with asphalt cover. The basic social infrastructure (health and education systems, finance) is much less developed than in urban areas. These factors have a negative impact on the quality of life in the rural areas, increase migration, create environment problems, hamper economic development and exacerbate health.

In what rural tourism is concerned, this represents a significant potential which is not sufficient valorised. The tourism sector in 2009 in the rural areas, showed an increase in the number of accomodation structures and accomodation capacity. The development of rural tourism in rural areas depends on the specific of each region, agricultural products, ethnographic regions and folklore. It also depends very much on the existence and especially the quality of the tourist pension, different types of recreation activities, practising agriculture and in some areas winegrowing and animal breeding. For example the specific tourism for Bucovina (North East

less favoured area) is religious tourism, in Maramureş it is the architecture and folklore, while in Transylvania the spotlight is the recreational and cultural tourism, food and wine. The mountain and forestry areas in Romania ensure the opportunities for practising tourism, in particular the so called eco-tourism which could be an alternative income, generating in this way different activities that could offer potential development, due to the unique landscapes, native hospitality, well-conserved traditions and food.

Noteworthy modernization, development and innovation are mandatory for Romania's tourism, together with creating modern and competitive tourism products. The main reasons why tourism is not that well developed in these areas are that there is a lack of organisation, promotion, information as well as qualitatively low tourism infrastructure.

The mountain and rural areas are affected by the significant lack of infrastructure which restrains both the economic development and the most important: the quality of life. The roads are the most important transportation routes, but the quality and development of rural road and traffic is a long way behind the European standard. The undevelopment of the road blocks the economic growth, and interferes with other difficulties concerning the medical and educational services. The road represents the key element for the economic development among the fields of human, social and economic development.

Water supply is another key for the quality of life, as well as in a direct relation to the development of economic activities in rural areas. As an interesting fact in the less favoured areas of Romania only 33% of the rural inhabitants have access to the public water network.

As opportunities for development it is important the exploitation of wood, not exceeding the annual operating capacity, exploiting accessory products (berries, herbs, mushrooms, pine cones), extend forestry product processing industry taking into account regional sustainable development, increasing mechanization of forestry products and create a system to record the number of the cutten trees.

Attracting investors requires a modern infrastructure, forest road development, execution of simple pathways for wood processing machinery. In addition, the mechanization of woodworking would be a step forward in what development of mountain areas is concerned.

North-East less favoured area.

The underdevelopment of this area appears to be correlated with rising unemployment, the prevalence of rural activities and failure to attract foreign investors. The North-East area is marked by the dependence on agriculture, and especially its proximity to other disadvantaged regions (Ukraine and Moldavia). It is the only region in the country with positive natural growth, the share of young population is high, and as positive aspects there is an effective education system in the large cities and skilled labor.

As weakness points, the rate of poverty is high along with the rate of migration to the outside region, there is a lack of openness to change and especially modernization, the crime rate is higher than in the developed regions. To these are added the aging population of the region, undeveloped spirit of entrepreneurship, poor business support infrastructure, poor implementation of product quality assurance system, the low level of industrialization of wood, insufficient promotion of the region's investment potential, lack of cooperation between universities and the poor quality of public services, the lack of specific knowledge in business development, namely the creation of new jobs.

From an economic perspective, there is already a development of the activities related to the exploitation and wood processing, good financial banking and insurance infrastructure, and a large number of specialists in forestry, trade and public services. The industrial structure is fragile mainly due to the usage of outdated technology, having a negative impact on productivity and economic efficiency.

In terms of tourism there is a high share of private ownership in the tourism sector, the existence of spa and national cultural centers, along with the existence of developing the religious tourism (the presence of monasteries), mountain sports (hiking, skiing, paragliding), and the existence of traditional folklore events of the region.

The road infrastructure is poorly developed between East-West areas of the region, there is also a low percentage of upgraded roads, together with the density of railway lines being unequal in accordance with the distribution of the electrified railways.

Furthermore, the small number of cities with natural gas distribution systems, underdeveloped telephone network in rural areas, poor infrastructure development for leisure activities and outdated water treatment and waste management systems, are the main things to be changed for developing this deprived area.

As geographical influence, the winter contributes to disadvantage the area as many investors fear the harshness of the winter cold weather (in transport, industry).

The North-East region may become a major area of concern for investors, EU supporting less favoured areas. There is a legislative framework regarding the development of this area, providing many facilities to investors, including potential experienced staff for research.

As opportunity, it should be taken into account the privatization and restructuring of state-owned companies, the legal framework of local government involvement in regional development is being favorable to this region.

Accelerating the economic recovery and sustainable development represents the key objectives to ensure the overpassing of the actual life condition. Development involves creating the necessary infrastructure to promote the business environment, supporting SME⁵⁴s, developing entrepreneurship, rural development.

In connection with development, the industrial potential should be reevaluated in order to promote existing and new branches of industry. Building up a business infrastructure should help the development of the profitable activities for the less-favoured areas, having a positive impact on the deprived area only with a strict control of the local authorities (in the occurrence of phantom companies without creating new jobs, or poorly paid) and support for access to new technologies, efficient and clean.

Therefore, to ensure the development of the region, it is required effective cooperative ventures to develop effective managerial skills and support technology development.

Although, being a less-favoured area with limited natural resources, human resource is considered a valuable treasure of this region.

Investing in human resources is a priority of any regional development strategy. Just by raising the educational standards and human resource training system, economic recovery could be achieved, raising the standard of living.

Priority strategic directions in the upcoming years should focus on upgrading old roads, upgrading rural telecommunications infrastructure, modernization of water systems, municipal waste by attracting European funding grants. economic growth is the most important indicator of the development of a region. In this way creating a competitive economy is a decisive factor in the evolution of an area or industrial enterprise.

There are assumptions that can form the basis for economic recovery, namely:

- existence of an industrial infrastructure in almost all sub-branches (machine building, chemical, petrochemical, food, textiles, medicines, wood, etc.);
- existence of a well-trained personnel.
- existence of companies in the industry, which benefited from consistent and fresh capital.
- dynamics of small and medium enterprises.

⁵⁴ Small and Medium Enterprises.

Tourism development in the NE disadvantaged

Tourism is a priority, and by the enhancement of existing targets, improving the quality of tourism services, responding to the actual requirements of customers, the image of tourism could be improved by creating a positive image of tourism in the area.

The region presents many opportunities for various and complex recreational activities: religious-tourism, supported by the existence of an impressive number of churches and monasteries, historical monuments throughout the region; cultural-historical tourism, the existing museums, famous castles and a great cultural heritage and folklore of the region. For the economic progress, namely tourism, following investment in tourism, agro-tourism support, upgrading roads in mountainous areas can sketch some results:

- Increase the number of visitors to the North-East region, and investing money in upgrading areas.
- Increase the volume of private investment in tourism.
- Increase the volume of requests for construction of vacation homes that bring additional revenue to local budgets.
- Creating a positive image that offers prospects for large-scale business and investment.
- Working with the media, advertising that will help promote the area.
- Improving the financial situation of the disadvantaged population.
- Scale applications for sponsorship grants for construction of new technologies in the health system.

Financial facilities given to the less-favoured areas.

To assist disadvantaged areas, the Romanian government has proposed that by 2013, these areas should be given various grants and tax breaks to help economic development.

For new investments made in a deprived area, investors can benefit from one or more of the following features:

- full refund of customs duties for machinery, equipment, equipment, vehicles (excluding cars), other depreciable assets which are imported to carry and operate investments in the area, as well as raw materials, spare parts and / or imported components necessary to achieve performance in the area
- exemption from profit tax during the lifetime of the deprived area
- financing special programs, approved by Government Decision
- finance companies investment projects, through co-participation of the state to the social capital
- discounted rates for car transport, inland waterways and rail
- reducing income tax by up to 50%.

These measures taken by the Government, aim at equalizing currently considered disadvantaged areas, with already developed regions of Romania.

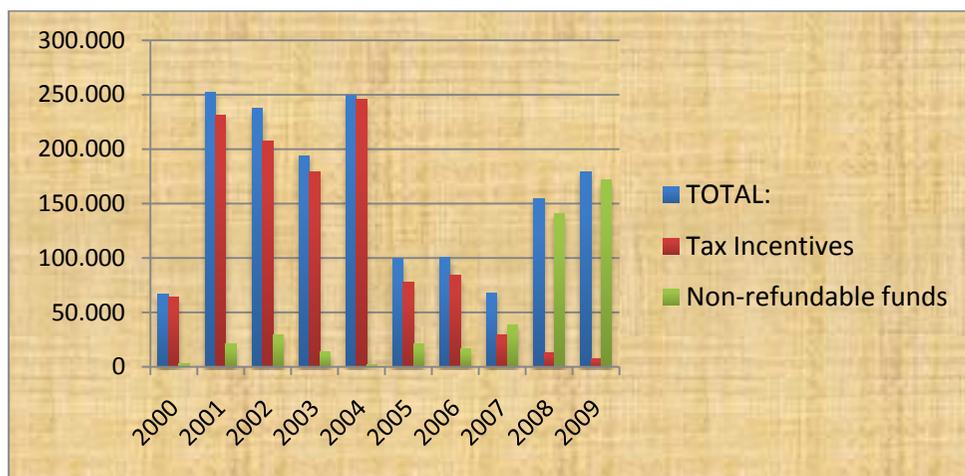

CASE STUDY: THE IMPACT OF STATE AID TO ROMANIA LESS-FAVOURED AREAS -ROMANIAN GOVERNMENT AND COMPETITION COUNCIL 2000-2009

Regional development policy is an essential component of the reform process in Romania, mainly aimed at reducing economic and social imbalances accumulated, preventing the emergence of new imbalances and support the overall sustainable development of all regions of the country.

Evolution of regional aid in Romania during 2000-2009(RON)

	2000	2001	2002	2003	2004	2005	2006	200	200	2009
--	------	------	------	------	------	------	------	-----	-----	------

								7	8	
TOTAL:	66.384	252.017	237.110	194.155	249.353	99.644	100.948	67.582	154.226	179.376
Tax Incentives	63.800	230.957	207.568	179.476	245.957	77.391	84.162	29.080	13.206	7.130
Non-refundable funds	2.584	21.060	29.152	13.719	2.098	20.944	16.655	38.502	141.020	172.246

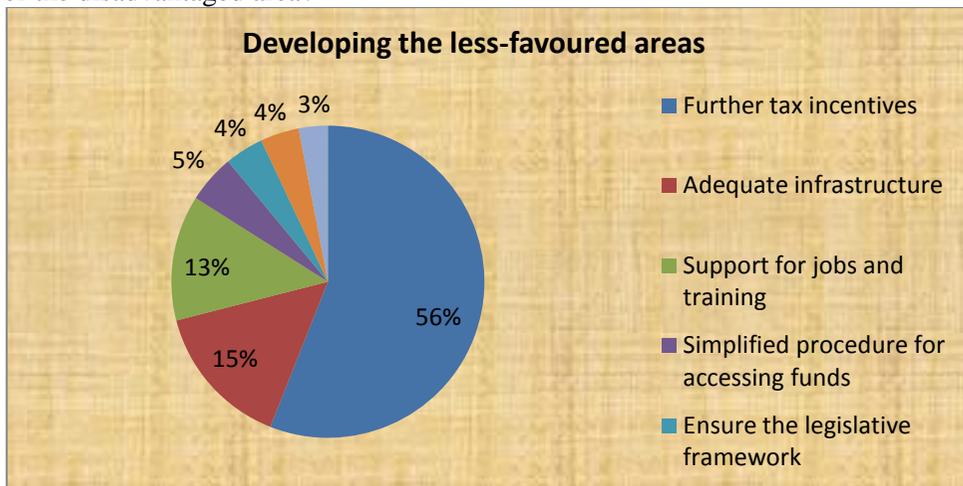

The general trend of decrease in the volume of such aid by 2008 is because the vast majority of aid was granted as tax incentives. Since 2007, new schemes have been initiated with the objective of regional state aid, in full compliance with EU rules. Also while checking operators in June 2010 (a total of 109 from disadvantaged areas), a study was conducted on two questions:

1. "What are the problems faced by the society?"

So it may be noted that the majority consider that there is a low demand due to the current crisis, followed by those who believe that there is a huge financial jam and the high prices of utilities.

2. "What measures do you think the state should take in order to raise the social-economic level of the disadvantaged area? "

Conclusion

Disadvantaged areas in Romania were considered tax havens, the ghost business having prospered without bringing any positive aspects to the less-favoured region. A 2010 study, conducted by Pro TV campaign, showed that 33% of Romanians live with a wage of about 200 euros per month. Between 1998 and 2010 there were approximately 160 cities declared disadvantaged, where many companies tried to move its headquarters to the enjoyment of the exemptions (about 6 billion RON). Companies wishing to relocate their headquarters in these areas had no such development project, creating a monopoly on the labor market, taking advantage providing extremely low wages for people who were willing to work.

Moreover, an investor from a deprived area is required to engage minimum 2 employees residing in that area, which would lead to lower unemployment in the disadvantaged region. State aid to disadvantaged areas led the companies to develop diversified economic activity, the population has become more responsive to the conversion process. Most companies have relied exclusively

on these grants from the government instead of continuing research and finding its own funds, tax incentives were an additional cost for Ministry of Public Finance, who had to make numerous tax inspection. For the best possible structural funds for the development of disadvantaged areas is recommended to promote information campaigns in both economic agents and local authorities. The authorities also need to simplify legislation for obtaining grants. Attracting investors outside the LFA can be achieved by creating industrial parks along with investment in local infrastructure.

Linked to the yield, most traders have noticed a decline in profit in 2005, the period during which state aid stopped, increases recorded in 2006 and 2007, followed by a period of declining profits, because of the decreased number funds granted. Migration factor (or even interregional migration in other European countries) resulted in a decrease of GDP especially the North-East region. However, there are positive signs, as investors obtained licenses in less-favoured areas, have created an estimated 44, 300 new jobs (Source: The Competition Council in the year 2009), representing about 5. 3% of the total unemployment number.

Less-favoured areas in Romania could easily disappear if the political factor would not have direct impact on the funds granted, only changing legislation and eliminating regional bureaucracy, would lead to an improvement in the economic situation of each region.

TRENDS OF EMPLOYMENT IN INFORMAL SECTOR IN ROMANIA DURING CRISIS; ECONOMIC AND SOCIAL EFFECTS

Vasile Valentina

Institute of National Economy-Romanian Academy

Pisică Silvia

National Institute of Statistics

The present paper emphasizes the size and trend of employment in the informal sector as affected during the recent years by the crisis and by showing the relation with informal economy. The paper is structured on three parts. The first part focuses on the concepts and methodology popular and recommended by the international organizations together with the ones applied for the estimations presented in the paper. It brings information on the conceptual framework endorsed by International Labour Office (ILO) on the 15-th International Conference of Labour Statisticians (15th ICLS) - on informal sector (which was subsequently included in the revised international System of National Accounts, SNA 1993) and employment in informal sector - and on 17th ICLS, on informal employment. Methods used for obtaining the estimates for Romania figures on informal economy and employment are treated. For the informal economy the method used by National Statistical Institute of Romania (INS) for estimating the underground economy and own calculations were used. For estimating the employment in informal sector a method developed by the authors was applied which consists, on short, on reconciliation between demand and supply available from statistical sources. Second part is dedicated to the analysis on the estimates produced, with observations on the trends induced by the crisis on informal economy and employment. The second also deals with several characteristics and dimensions of the employment in informal sector by gender and economic activities as well as the relation with several macroeconomic and social indicators. Finally, the third and last part proposes the direction of action and policies aimed to combat and reduce the informal sector and to transfer it into the "light", "visible" side, i.e. the formal sector.

Key words: informal employment, informal economy, economic crisis

JEL classification: E25, E26, G01

I. Theoretical and methodological considerations

Informal sector

Taking into account the importance of the role played by the informal economy for employment creation, income generation and poverty reduction, it is essential first of all to establish the content and meaning of the concepts used for defining employment in informal sector as against informal economy. Secondly, these considerations are necessary to better understand the characteristics and evolutions of both phenomena, i.e. informal sector regarded from the employment perspective as well as from the economic one. And again it is worth to clearly present the operational definitions developed for statistics applied on the informal employment and economy.

In January 1993, the *Fifteenth International Conference of Labour Statisticians (15th ICLS)* adopted an international statistical definition of the informal sector, which was subsequently included in the revised international *System of National Accounts (SNA 1993)*. Inclusion in the SNA of the informal sector definition was considered essential as this would make possible indentifying the informal sector separately in the accounts and, hence, quantifying the contribution of the informal sector to the gross domestic product (GDP).

As stated in the OECD Handbook, “the vast majority of informal sector activities provide goods and services whose production and distribution are perfectly legal. This is in contrast to illegal production. There is also a clear distinction between the informal sector and underground production. Informal sector activities are not necessarily performed with the deliberate intention of evading the payment of taxes or social security contributions, or infringing labour legislation or other regulations.”

At the Fifteenth International Conference of Labour Statisticians, the **informal sector** was characterized as „consisting of units engaged in the production of goods or services with the primary objective of generating employment and incomes to the persons concerned. These units typically operate at a low level of organization, with little or no division between labour and capital as factors of production and on a small scale. Labour relations - where they exist - are based mostly on casual employment, kinship or personal and social relations rather than contractual arrangements with formal guarantees”.

In order to obtain an internationally agreed on definition of the informal sector - acceptable to both labour statisticians and national accountants - the informal sector had to be defined in terms of characteristics of the production units (enterprises) in which the activities take place (enterprise approach), rather than in terms of the characteristics of the persons involved or of their jobs (labour approach).

For statistical purposes, the **informal sector** was defined as a group of production units which, according to the definitions and classifications provided in the United Nations System of National Accounts (SNA Rev.4), form part of the household sector as household enterprises or, equivalently, unincorporated enterprises owned by households⁵⁵ Within the household sector, the informal sector comprises:

- (i) "informal own-account enterprises" (i.e. household enterprises owned and operated by own-account workers, either alone or in partnership with members of the same or other households, which may employ contributing family workers and employees on an occasional basis, but do not employ employees on a continuous basis); and
- (ii) the additional component consisting of "enterprises of informal employers" (i.e. household enterprises owned and operated by employers, either alone or in partnership with members of the same or other households, which employ one or more employees on a continuous basis). For operational purposes, enterprises of informal employers may be defined, in terms of one or more of the following criteria: (i) size of the unit below a specified level of employment; (ii) non-registration of the enterprise or its employees.

Employment in informal sector and informal employment

The *15th ICLS* also defined the **employment in informal sector** as ”comprising all jobs in informal sector enterprises, or all persons who, during a given reference period, were employed in at least one informal sector enterprise, irrespective of their status in employment and whether it was their main or a secondary job,, (Hussmans R., 2004)

The Seventeenth International Conference of Labour Statisticians (17th ICLS) endorsed the definition of the informal employment which is a job-based concept as compared to the employment in informal sector which relates to the enterprise-based concept. Thus, the 17th ICLS defined **informal employment** as the total number of informal jobs, whether carried out in formal sector enterprises, informal sector enterprises, or households, during a given reference period, comprising (see the below diagram): cell 3 - own-account workers employed in their own informal sector enterprises; cell 4 - employers employed in their own informal sector enterprises;

⁵⁵ According to the SNA (Rev.4), household enterprises are units engaged in the production of goods or services which are not constituted as separate legal entities independently of the households or household members that own them, and for which no complete sets of accounts (including balance sheets of assets and liabilities) are available which would permit a clear distinction of the production activities of the enterprises from the other activities of their owners and the identification of any flows of income and capital between the enterprises and the owners.

cells 1 and 5 - contributing family workers, irrespective of whether they work in formal or informal sector enterprises; cell 8 - members of informal producers' cooperatives; cells 2, 6 and 10 - employees holding informal jobs in formal sector enterprises, informal sector enterprises, or as paid domestic workers employed by households; cell 9 - own-account workers engaged in the production of goods exclusively for own final use by their household, if considered employed. Cell 7 refers to employees holding formal jobs in informal sector enterprises⁵⁶

According to the diagram below, the coverage of different segments of informal employment, in relation with the concept applied, are:

- *Informal employment:* Cells 1 to 6 and 8 to 10.
- *Employment in the informal sector:* Cells 3 to 8.
- *Informal employment outside the informal sector:* Cells 1, 2, 9 and 10.

Conceptual Framework: Informal Employment

Production units by type	Jobs by status in employment								
	Own-account workers		Employers		Contributing family workers	Employees		Members of producers' cooperatives	
	Informal	Formal	Informal	Formal	Informal	Informal	Formal	Informal	Formal
Formal sector enterprises					1	2			
Informal sector enterprises (a)	3		4		5	6	7	8	
Households (b)	9					10			

(a) As defined by the Fifteenth International Conference of Labour Statisticians (excluding households employing paid domestic workers).

(b) Households producing goods exclusively for their own final use and households employing paid domestic workers.

Note: Cells shaded in dark grey refer to jobs, which, by definition, do not exist in the type of production unit in question. Cells shaded in light grey refer to formal jobs. Un-shaded cells represent the various types of informal jobs.

Methods for measuring the informal sector

The method chosen plays an important role in determining the size and characteristics of the informal sector in terms of employability. . Usually the indirect methods allow to capture the information on employment in informal sector while the direct methods on informal employment. Main **direct methods** as described in Chapter 10.3 Measuring the Informal Sector of the OECD Handbook already mentioned are:

Labour Force Surveys (LFS) - monitoring the number and characteristics of the persons in the informal sector and the conditions of their employment and work as can be achieved by periodically including a few additional questions pertaining to the informal sector definition in an existing labour force or similar household survey

Household Income and Expenditure Surveys - household income and expenditure surveys are a potential source of information on the demand by households for goods and services produced in

⁵⁶ Such cases, which are included in employment in the informal sector but excluded from informal employment, may occur when enterprises are defined as informal in using size as the only criterion, or where there is no administrative link between the registration of employees and the registration of their employers

the informal sector. They cannot provide information on the total demand for informal sector products, but only on household final consumption expenditure for informal sector products, which is only a part of the total demand.

Informal Sector Enterprise Surveys - an enterprise survey presupposes the availability of a sampling frame of informal sector enterprises or establishments. List frames are usually not available. Often, enterprise surveys can be conducted only following a census of informal sector units or a general economic/establishment census covering the relevant branches of economic activity and containing the items required for the identification of informal sector units.

Informal Sector Mixed Household-Enterprise Surveys - such surveys are the most suitable approach when the aim is to collect comprehensive data about the informal sector. These surveys can cover all informal sector entrepreneurs and their activities, irrespective of the size of the enterprises, the kind of activity and the type of workplace used, and irrespective of whether the activities are undertaken as main or secondary jobs. In particular, they can also cover activities undertaken inside the owner's home or without fixed location.

Modules attached to household surveys - attachment of an informal sector module to an existing household survey (such as LFS) means that the informal sector survey sample is obtained as a sub-sample of the base survey.

Integrated surveys - can be seen as special types of modular surveys. Integrated surveys are designed to meet several objectives at the same time, i.e. the collection of data about the informal sector and other topics, e.g. labour force, household income and expenditure.

A on the **indirect methods** used to measure the undeclared work (UDW) was presented in the Final report to the European Commission in December 2009 by a group of experts from GHK and Fondazione G. Brodolini. According to this report, *indirect or general methods* rely on comparisons of macroeconomic aggregates (such as national accounts, electricity consumption, cash transactions) in order to estimate the extent of UDW; the methods in this category are: (i) Discrepancy methods; (ii) Labour Input methods; and (iii) the Degree of Participation method.

Econometric approaches group together all the methods that produce a total quantitative estimate of the non-observed economy by means of a model; there are three distinct methods in this group: (i) the Monetary (Tanzi) Method; (ii) Global Indicators Methods (Electricity Consumption); and (iii) Latent Variable Methods.

Discrepancy method - comparing income and consumption – uses as approach for estimation: declared income which does not include income that has been concealed for tax reasons, whereas the estimate of consumption does. Thus, the difference between the two estimates can be attributable to tax evasion. Another popular application of discrepancy methods - recommended by Eurostat to ensure the exhaustiveness of national accounts - is to compare the findings of labour force surveys (LFS) with the recorded labour demand (e.g. based on company declarations to tax or social security authorities or national statistical offices).

Labour Input method - information on the supply side of the labour market – for instance the Labour Force Survey (LFS) – can register a part of the undeclared work because individuals are less motivated than enterprises to conceal the nature of their work. In this method, the above information is compared with information on the demand. It makes use of several statistical and administrative sources.

Degree of participation method - a well-established procedure does not exist. As a general framework, positive (negative) variations in labour force participation in the official economy are seen as negative (positive) variations in undeclared labour.

Monetary Method - Tanzi Method – based on following key assumptions: underground transactions are conducted only on a cash basis.

Global Indicators Method - Electricity Consumption - the difference between the growth rate of electricity consumption (a proxy for the growth rate of total economic activity) and the growth rate of measured GDP yields an approximation of the growth rate of unrecorded income.

Latent Variable Methods - MIMIC (multiple indicators and multiple causes) or DYMIMIC (dynamic multiple indicators and multiple causes) - based on following key assumptions: Undeclared work is an unobserved (or latent) variable that influences observed indicators and is determined by observed variables.

Estimation methods used for Romania

A. The trends of the informal economy were based on the estimates on share from GDP of the underground economy.

In Romania, the National Institute for Statistics (INS) estimates within National Accounts the non-observed economy (NOE), also known as underground economy, which stands for productive legal activities but deliberately concealed from public authorities for such reasons as to avoid the payment of income, value added or other taxes; to avoid the payment of social security contributions; to avoid having to meet certain legal standards; and to avoid complying with certain administrative procedures, such as completing statistical questionnaires or other administrative forms.

The **informal sector** consists (according to ILO definition) of productive units characterised by a low level of organisation, with little or no separation between capital and work, and by work relations based on kinship and/or social relationships, rather than formal contracts. These units belong to the household sector. The owners of such units are totally responsible for all financial and non-financial obligations undertaken for the production process. If the activity of these recorded units is deliberately hidden they enter in the sphere of economic underground.

For the identification of the NOE, the whole economy is split into two sectors: formal and informal. For **formal sector**, the estimation of the INS Romania consists of:

- under-reported value added by registered institutional units in the formal sector (non-financial corporations) because of the underground utilisation of labour;
- under-reported value added by registered institutional units in the formal sector (non-financial corporations) because of value added taxes evasion.

First the estimation of black labour is performed. The activities which are under-reported are evaluated based on estimation of input of labour, procedure recommended by SNA 93. Using this approach, it is possible to evaluate the irregular labour within the productive process and under-declaration of the production obtained by means of regular labour. The method used is based on the comparison between the labour force supply and demand in order to identify the persons who carry out a legal activity in a unit from formal sector, but are not declared to authorities.

Step two – the estimation for VAT evasion is made. In order to obtain gross wages which stay at the basis of GVA compilation, the obtained number of persons engaged in “black labour” is multiplied with the average gross salary, specific by each industry, obtaining Compensation of employees. Specific coefficients of Compensation of employees into GVA are used - (characteristic for the small enterprises from the respective branch of activity, identified based on Structural Business Survey - SBS) and the amount of gross value added is estimated.

Estimations are made for the VAT evasion. One part of the VAT evasion represents the VAT for underground economy already estimated using methods presented above, and other part represents the VAT evasion of reported turnover. For the whole VAT, the tax evasion is calculated by the difference between the theoretical VAT and the value received by the State Budget. Theoretical VAT is calculated for intermediate consumption, final consumption of households, final consumption of general government and GFCF based on rates of VAT by products, defined by the law. This fraud is included in output and GVA for each corresponding branch.

For the **informal sector**, the estimations are calculated for all activities performed by family associations and self-employed. Data on these activities are available from the Ministry of Public Finance. Out of the Romanian Labour Force Survey (AMIGO) information about the number of persons who work in family associations and self-employed are used. The estimations made are based on the principle according to which the incomes realised by non-paid workers (persons from family associations and self-employed) cannot be less than the average wage earned by employees in the same activity, from small units. The income declarations of the Ministry of Public Finance received from registered self-employed and family associations are compared

with the value of these calculations. As result of this analysis, the incomes are adjusted, and the tax evasion of the units registered within the informal sector is completely removed.

Another important type of non-observed economy is represented by the activities carried on in **units non-registered**. In this category are included: dressmakers, tailors, workers who repair cars, hairdressers, house painters, plumbers, teachers giving private tuition, people into house-rental during holiday time. For such activities a distinct valuation is undertaken using specific assumptions and available data sources from the statistical system. These data sources are specific to each kind of activity, as described above.

- **Hotels:** the basic assumption is that the number of non-registered tourists is equivalent to 1/3 of the total registered tourists. The average values of the accommodation for a night, considering a number of 15 holiday nights per year is, then, multiplied by the number of non-registered tourists. The result is considered as the output. The intermediate consumption is estimated by using the IC/registered output ratio of the formal sector.
- **Construction:** It is considered that 50% of the total self-employed registered in this activity carried out also a non-registered activity. This number is multiplied with the average gross salary of the construction activity and the result is considered as GVA. To calculate the production it is used the ration GVA/registered output of the small construction enterprises from the formal sector.
- **Education:** it is considered that a half of the pupils registered in the last year of the secondary school as well those from the last year of the high school took meditations. Their numbers are multiplied by the average value of a lesson, by the frequency of the lessons per week as well as by the number of weeks in a year.

B. Estimates on employment in informal sector are the results of own calculations based on the discrepancy method on labour input for employees as provided by the Romanian Labour Force Survey (AMIGO) for demand component and the Labour Cost Survey for supply component. Informal employment does not exist in public administration was the assumption used in terms of coverage on economic activities. For the non-paid employment the estimates provided by AMIGO; adjustment coefficients were applied by economic branches following an algorithm similar to the one used by National Accounts for estimating the labour from informal sector and non-registered units.

II. Employment in the Romanian informal sector and its impact on several economic and social phenomena

Informal economy and employment during crisis

The effects of the recent financial crisis were felt in Romania since the second half of 2008. The crisis has fuelled the economy. Hidden economy and evasion of tax or payroll taxes have become increasingly common. The private sector has limited the business and resorted to layoffs. In the budgetary sector the austerity measures aimed also to drastic reductions in staff and earnings. The measures taken for reducing earnings in the budgetary sector have influenced the private sector to taken similar action. Decreased purchasing power has led people to buy cheaper products that are often found on the black market where no taxes are paid. The shadow economy has taken on, with negative consequences for state revenues, thereby stimulating the continuation of the crisis. The estimates on informal sector evolution (*see Annex, Figure 1*) – expressed in terms both economic as percentage from GDP, and labour as percentage from total employment – show how informal sector spread widely after 2008. The share in GDP grew to 22.2% from 19.6% in 2008 (after a 21.0% in 2009). The share in employment was even higher - by 6 percentage points over the last two years (from 23.2% in 2008 to 29.2% in 2010). Even if of different amplitudes, both phenomena have similar trends with negative impact induced by the crisis.

Trends of the employment in informal sector

Since whether to include or not agricultural activities is controversial, the estimations were prepared in both versions (with and without the agricultural sector). In the following, the version including agricultural sector (TIA, total population including agricultural sector) was analyzed.

Estimations on employment in informal sector (*see Annex, Figures 2 and 3*) made as described above lead to emphasising several important observations. First of all, the phenomenon is widespread and if in 2002 the share of employment in informal sector in total population was less than a quarter (23.3%, similar to the share estimated for 2002, i.e. 23.3%), in the following years it recorded higher levels (25.7% in 2004, 24.2% in 2008), and falling in 2008 to 23.2%. But, after the emergence of the crisis, the phenomenon regressed significantly, and in 2009 it already exceeded a quarter (25.9%) of total employment and continued growing to 29.2% in 2010.

The second observation relates to the higher shares for male population as compared to female one, true for the entire period without any exception: e.g. 24.0% as against 22.5% in 2002 and 30.8% as against 27.4% in 2010.

Employment in informal sector (*see Annex, Table 1*) is more met in:

- agricultural activities (with shares below 38.5% until 2008 but reaching 39.0% in 2010) where most part is composed from elderly, persons with low education levels, who work in their own households mainly to produce for self-consumption (and less for market); the phenomenon is almost equally spread irrespective of gender; 2010 shows a migration to agricultural sector of the jobless population who remained without a work place due to dismissals in the non-agricultural activities as effect of the recent crisis;
- collective, social and personal services⁵⁷ (raising from 46.0% in 2002 to 50.4% in 2010) where mainly two categories of persons are identified - those who perform services that require a certain qualification (such as hairdressers, tailors, dressmakers, boots makers etc.) and those who have no qualification or only very low education levels and who, actually, perform only domestic activities (cleaning, laundry, ironing, cooking, baby-sitting or care services for elderly or sick persons, gardening, house painting etc.);
- real estate transactions – difficult to be identified as such for the period 2002 – 2006 because, according to Rev.1 version of CANE⁵⁸ the coverage was considerably higher also comprising renting and business activities, which were excluded in version Rev.2 of CANE – where during 2002-2006 more than a quarter of employed population was engaged in the informal sector; looking at 2008 – 2010 period the shares are significantly higher with a clear ascendant trend (from 42.3% in 2008 to 50.3% in 2010) but the phenomenon is observed exclusively for real estate transactions and presents deep gender disparities: the share for men rises 51.2% in 2008 and 62.5% in 2010 while for women 34.3%, respectively 38.1%;
- constructions (where data are comparable over time since the differences in coverage between the two CANE are insignificant), activities characterised by a constant increase over the entire period from 20.8% in 2002 to 36.6% in 2010;

In terms of employment, the informal sector absorbed workforce in every economic activity (*see Annex, Table 1*), with significant values in trade (18.2% in 2002, but 27.2% in 2010), hotels and restaurants (13.2% in 2002 and just over a fifth in 2010), mining (15.4% in 2002 significantly increased in 2010 to 23.5%), manufacturing (13.0% in 2002 to 12.8% in 2008 rising to 20.3% in 2010) etc.. Noteworthy is the growth of informal employment observed wherever the formal sector created a niche, leaving uncovered the populations demand, for inter-urban service

⁵⁷ Due to the differences between the two CANE (Classification of Activities from National Economy) versions (Rev. 1 and Rev.2) the coverage for collective, social and personal services is not fully comparable for period 2008 – 2010 with previous years.

⁵⁸ Classification of Activities from National Economy, harmonized with the corresponding European Classification NACE (Rev.1 until 2008 and Rev.2 from 2008 onwards)

transport, for instance. Following reduction, or interruption of the transport systems and the spectacular increase of the county's prices on rail transportation, many private companies transport networks emerged and developed rapidly in recent years. Therefore, the males employed in the informal sector in transport held significant shares for the entire period (16.2% in 2002, 19.2% in 2004, 14.7% in 2008 and highest in 2010 - 22.8%).

Services such as education and health deserve particular attention. Although the shares in total employment of the corresponding economic activity of those working in informal sector had a positive evolution by diminishing from 22.3% in 2004 to 17.0% in 2008 in the case of education and from 20.6% to 17.1% in the case of health, the year 2010 brought a negative impact, the shares increasing by about 10 percentage points as against 2008 (with levels of 27.8% for education and 26.5% for health). The existence and maintenance at close values – for the entire period – of the shares of employment in informal sector demonstrate the deficiency of the education and health care systems in Romania.

2010 marked a visible regress; estimates have shown major deteriorations in many economic activities.

In addition to those already mentioned, the situation recorded for activities (According to CANE Rev.2) in “Water distribution; sanitation, waste administration, decontamination activities” has to be commented, where the share of employment in informal sector grew to 42.6% (as compared to 25.0% in 2008), in “Activities of administrative services and activities of support services” where the regress was of 14.6 percentage points as against 2008 (40.3% in 2010 comparing to 25.7%) as well as in “Showbiz, cultural and recreation activities” where the gap against 2008 amounted to 18.6 percentage points (36.5% in 2010, 17.9% in 2008).

When looking at the distribution of employment in the informal sector by economic activities (see Annex, Table 2) is visible the strong share of the agricultural sector which absorbs an overwhelming part of the total employment in informal sector (59.8% in 2002 but decreasing year by year, in 2010 reaching the lowest level over entire period, i.e. 40.2%); a significant share is held by the manufacturing industry (oscillating between 11.2% in 2002 and 15.7% in 2004, in 2010 recording a share of 12.4%) and wholesale and retail trade (increasing from 7.3% in 2002 to 11.4% in 2010).

Given the controversial issue of whether including or excluding agriculture from the scope of the informal sector, there is a need to assess the size and structure of this phenomenon on the particular variant, only for the non-agricultural activities (TEA — total population excluding agricultural sector).

From this perspective (see Annex, Table 2, series on TEA) - i.e. the distribution of the population employed in informal sector economic activities - the informal sector operates at the highest level in manufacturing activities (29.6% in 2002, down to 25.7% in 2006 - version of CANE Rev.1 and Rev.2 version CANE: 21.4% in 2008 decreased slightly to 20.7% in 2010), more among women than men (with a gap of less than 5 points percentage in 2002, declined to less than 2 percentage points in 2010).

Similarly, trade activities are on the second place (around 20% for the entire period), but gender disparities disadvantage the women.

Third place is for construction activities, where the proportion of workers in the informal sector increased during 2002-2008 (from 9.9% to 17.4% in the total workforce engaged in informal activities), but decreased in 2010 (15.9 %). The overwhelming majority of those engaged in this activity are men (14.3% of men employed in the informal sector in 2002, but 26.4% and 24.1% in 2008 and 2010 compared to only 2.0 to 3.0 % of women, regardless of year). High values are found in transport, storage and communications, especially among the male population (decreasing from 10.1% during 2002-2008 to 7.6% for 2010 to rise to 8.3 %).

Again the education and health activities draw the attention by the amount of people involved in the informal sector, especially in the case of women where 1 in 10 persons are in this situation.

The level of informal employment for collective, social and personal services remains high, the proportion for women being of 11.0% in 2006 (the maximum during the analyzed time interval), respectively, 6.2% in 2008 (minimum) compared with 9.7% and 4.3% - the percentage of men for the same period.

Impact on several economic and social phenomena

Employment has declined. The employment rate of population (NIS, AMIGO) aged 20-64 years was 63.3%, decreasing by 1.1 percentage points compared to 2008 and among the lowest compared with other Member States of EU. In 2010 was noticeable the modification of the structure of the employed population between the two basic components: employees and non-employees. Structural changes in 2010 compared to 2008 occurred against the background of the movement towards agriculture, a phenomenon seen in the diminishing share of employees (with 2.5 percentage points) and increasing share of non-employees in agriculture (mainly self-employed and family workers) by 3.1 percentage points.

Unemployment has increased. ILO unemployment rate rose to 7.3% in 2010 from 5.8% in 2008. Registered unemployment rate (according to National Agency for Employment) has seen an upward trend (*see Annex, Figure 4*) by March 2010 (8.4% - maximum of three years), after reaching a minimum in the months May, June, July 2008 of only 3.7%.

Increasing unemployment was the direct result of the massive layoffs and drastic reduction of vacancies. The number of vacant jobs offered by employers in 2010 represented only a quarter of those corresponding to 2008 (*see Annex, Figure 5*).

The purchasing power of the population was reduced. Total household real income index (INS, Household Budget Survey (ABF) for 2010 compared to 2009 was of 93.8%. Real earnings fell in 2010 to 96.0% as against 2009 and to 94.5% as against 2008.

Economic progress has been affected. GDP decreased (*see Annex, Figure 6*) in 2009 compared to 2008 (92.9%), decrease that continued in 2010 (98.7% compared to 2009)- INS, National Accounts and own calculations). Population households actual individual final consumption index also showed a declining 91.3% in 2009 compared to 2008, and 98.0% in 2010 compared to 2009. Taxes on product were also affected; they have decreased in 2009 compared with the previous year to 87.5% and 96.0% in 2010 compared to 2009. Poverty has been exacerbated. At risk of poverty rate⁵⁹ increased to 22.3% compared with 21.7% in 2009 (but slightly below that of 2008 - 22.4%).

III. Policies aimed at stimulating employment diminishment in the informal sector

Policies and measures to lower and finally eliminate informal labour should be developed according to Romanian particularities. A prerequisite for such measures and policies to take effect is to build strong structures and tools to ensure their sustainability and independence, regardless of political changes. Otherwise, the risk that they remain only "on paper" and have no actual effect in reality is extremely high.

Policies should be focussed according to target populations.

One type of policy should be outlined for the group of people who are in this situation beyond their control and working in the informal sector because they have no other choice. This applies particularly to vulnerable groups on the labour market (with low education, low skills, no

⁵⁹ According to EUROSTAT and EU documents (list of structural indicators, list of social inclusion indicators), the indicator used to measure (relative) poverty is named "at-risk-of-poverty-rate", to reflect that the income is only one of the multiple dimensions of poverty (the monetary dimension). The indicator is calculated as the proportion of persons from households with a disposable income less than a threshold representing 60% of the median disposable income by equivalent adult in the total population. The change in time of this relative poverty measure expresses only the influence of the income distribution modification on the proportion of poor, but not the evolution (increasing or decreasing) of the welfare level.

opportunities for access to a minimum capital to allow a small business on their own, etc..) and even discriminated (at the extremes of the active working life - is considered too young or too "old"). For these groups of persons systems on social protection and assistance need to be improved, to encourage their employment in the formal sector through targeted grants, and a functioning system should be put in place for retraining and vocational conversion. Appropriate conditions should be created to enable mobility and labour deployment to regions where demand exists.

Another type of policy should be outlined for the second largest category, which is present within informal employment - the kind that has chosen this path. For them the objective is of identifying best practices and measures to transfer them into the formal sector. In this category are partly owners of non-registered units, with firms registered but having staff employed on the basis of unlawful agreements (without employment contract), those who under-declare incomes from profit, and unauthorized own-account workers or, again, those declaring only a small share of income. This category includes those who - employee and employer - in practice declared a low level of remuneration, part of the actual earning being paid "in hand". Their successful move from informal to the formal sector can be done only through appropriate incentive structures, so that the benefits of the formal sector should be obvious and desired.

One of the main courses of action to reduce and even eliminate informal labour is to reduce the tax burden, especially in sectors where informal work is manifested most actively: small and medium-sized enterprises, economic activities identified as having a significant share of informality. To this end, it is necessary to streamline bureaucracy and reduce the time lag for setting and registering an own-account activity, along with creating favourable conditions for obtaining credit.

Special attention should be paid to measures for improving labour legislation taking into account the practical realities, and allowing for a more flexible labor market:

- encouraging the creation of part-time jobs
- coverage of the diversity of employment agreements that are practiced, but are not recognized and atypical types of employment programs;
- facilitating access to training and education (for example, for those who want to continue their studies, improving the skill or expertise, etc.).
- facilitating the reconciliation of family and professional life (for those who care for children attending preschool or elementary school, elderly or ill relatives who need help, assistance and supervision, etc.).

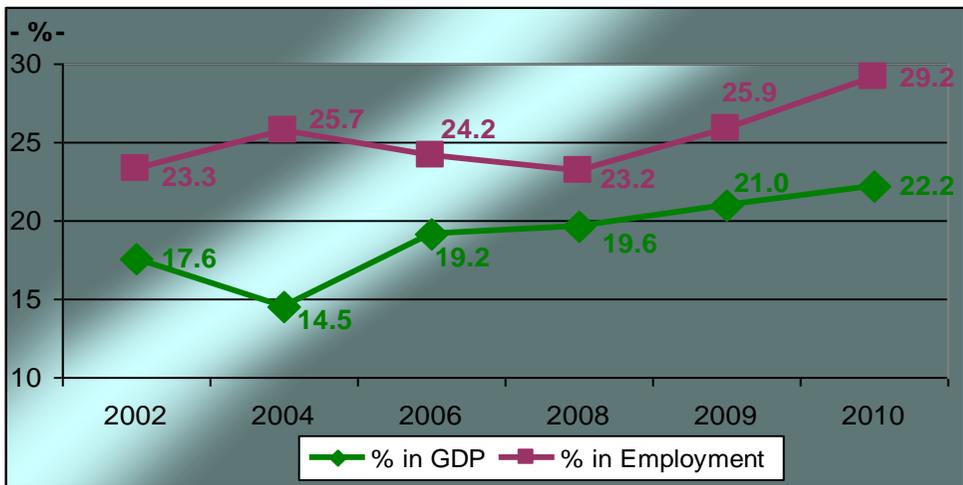

It is necessary to create structures for recognition and bringing into "light" services provided in households (home repair, fence, etc., baby-sitting, care of sick and/or elderly, performing household chores - cooking, cleaning, washing etc.) accompanied by the implementation of a benefit system in terms of tax reduction for households using/employing such services.

Strengthening cooperation between social partners is of great importance. Good coordination and collaboration among the partners will result in increased detection and reporting cases of fraud on the informal economy

Finally, in parallel with the political and economic measures, the mentality of individuals has to be changed, for both workers and employers, for the public in general. Information campaigns should be geared towards raising awareness of the risks that workers are subject to because of avoiding the declaration of work undertaken and income gained, to social stigma on informal work and those involved, from both sides - employer and employee. One key objective of the campaign should be aimed at removing deep-rooted distrust of ordinary Romanians in public institutions.

YOUTH LABOUR MARKET. MOBILITY, CAREER DEVELOPMENT, INCOMES. CHALLENGES AND OPPORTUNITIES

Vasile Valentina

Vasile Liviu

*Institute of National Economy-
Romanian Academy of Sciences*

This paper presents the main characteristics of the youth labour market, with a special view on mobility, career development and incomes. The paper is substantiated by and continues the researches of the authors on the topic of labour force mobility and on the one of adaptability, respectively on youths' behaviour on labour market (with particular consideration of young graduates) highlighting the factors that adjust choices regarding taking up a job, career advancement, labour motivation, professional and personal satisfaction opportunities which are provided by the labour market at local level, in country and abroad. Quantitative and qualitative indicators are presented about Romanian youths' labour market within the European context during the transition period. The impact of the crisis on youths' labour market is analysed, highlighting the challenges and opportunities, the particularities of the newly created jobs and especially the knowledge, skills and competencies requirements (KSC). The authors propose both the improvement of the systems of indicators for defining the potential and presence of youth on the labour market, the economic and social impact of external mobility of young graduates and an integrated scheme of policy measures for promoting adaptability and performance integration on Romanian labour market of youth. Particular attention is paid to presenting policy instruments for halting/diminishing the brain drain and brain shopping phenomena by promoting an attractive (professionally and monetary) supply for employment in Romania's local economy. The authors succeed in highlighting the functional links between the education market (labour force supply) and labour market (employment demand of the business environment) underpinning the requirement of integrated management of labour potential in the years preceding studies' finalization and up to the post-insertion years by multi-criteria analysis models and graduate career tracking programmes. Correlative measures are suggested for policies, procedures and monitoring instruments of youths' adaptability on labour market, as alternative to external migration/mobility for labour.

Keywords: labour market, education market, young graduate adaptability, labour mobility, career development

JEL classification: J40, I20, J61, I25

I. Introduction

Youth employment is much more volatile than the one of mature labour force. *Youth labour market is characterised by opportunities' deficit for decent employment, diminishing jobs, employment precariousness (increases in the number of part-time jobs, temporary employment) and wages' reduction.* Young people are faced also with increased difficulties on entering the labour market, considering that also during the economic expansion period there were already issues related to the creation of new jobs for them. The lack of employment perspectives in a decent job on entering the labour market affects/compromises their path on labour market and career development. Additionally, *unemployment among young individuals presents specific vulnerabilities – higher sensitivity to the variations of economic activity, difficulties in creating new jobs for youth, longer duration of the unemployment period, and easier entry on the informal*

labour market, which turns into a true refuge, particularly for graduates. Experts' estimations appreciate that an increase in total unemployment rate by 1 per cent is accompanied by an employment diminishment among youth of about 1.1 – 1.8 per cents, and Romania is one of the EU Member States with the highest unemployment rate of youth and its increase is expected (about 3 times higher than the general unemployment rate). The crisis “generates” precarious jobs for youth, which are weakly remunerated very often under their skills' level, triggering loss/depreciation of competencies, or long-term unemployment and discouragement, hence increased poverty incidence.

Considerable numerical and structural gaps are present on labour market between supply (outcome of education for vocational training) and demand (job requirements on the national labour market), which are amplified in some fields by the free movement of labour force (attractiveness of some better paid jobs, not necessarily in the same training field), so that a significant deficit emerges for skilled staff in fields such as constructions, industry, services, including here health care ones, while on the European labour market our citizens deliver preponderantly low/un-skilled labour.

On the education market, the curriculum adjustment and the range of skills on professions and fields of sciences has low flexibility, remaining behind as considered from KSCs demanded on labour market, and the link between school and business environment is erratic, punctual, or inexistent in most field (lack of cooperation for practice, internship, etc. and the system of scholarships provided by the business environment among graduates is strongly unbalanced tending to being inexistent). The difference between the demand on labour market and the supply of labour from among the graduates is strongly imbalanced, in most cases a period of training is necessary for labour market insertion of the graduates (either on the job or by courses provided by authorised institutions for adult education on the LLL market, and by courses of the National Council for Adult Training -NCAT).

In the current paper we intend to highlight the fault lines between the educational system and the labour market and to present an integrated system of instruments and support mechanisms for dynamic balancing of the labour demand and labour supply represented by the insertion of young graduates.

II. Literature review

Youth adaptability on labour market, their professional insertion and the KSCs deficit are issues widely debated by experts, particularly as outcome of the propagated effects on long term which they generate. Young people enter the labour market unprepared, without practical skills, their theoretical knowledge is either outdated or incomplete, and their basic competencies – generic and specific – are weakly developed (Vasile, V., 2009). The transition from school to active life and labour integration of youth represents an essential issue with a strong economic and social impact as it is also an important measurement of the external efficiency of the educational system (Vasile, L., 2011). The concerns in order to promote (performance) employment of youth, and the efforts of integrating young people on the local labour market were intensified during the period of crisis, and at EU level were realised a series of studies and researches of the various aspects regarding this issue (EU, 2011). Additionally *EU 2020*, integrates in the development targets both young generation's participation to education to a share of 40%, and a diminishment of early school leaving under 10%, which are performances difficult to reach by Romania (from 16 % in 2008 the intention is to increase to almost 27% in the case of the share of graduates of tertiary education aged from 30-34 years and also from 15,9% in the same year to reduce to 11,3% the rate of early school leaving). At the same time, EC, by “Youth on the move” proposes in 2010 a number of 4 priorities for lowering youth unemployment: support for professional insertion and career development; support for youth in risk situations; promoting a support social network and sustaining entrepreneurship and self-employment. Increased concerns are shown

also at national level by supporting the absorption of structural funds for priority objectives that support youth (adaptability to the labour market, post-doctoral studies, etc.), as well as by developing topical surveys (NIS, 2000, 2009). We still can remind the topical studies realised by various other institutions, based on projects financed with domestic funds, or international ones, yet these provide only for a partial, fragmented image related to the issue of youths on labour market (Nicolescu, L 2002, Săpătoru D Caplanova A & Slantcheva S, 2002)

As result, there is no relevant information source that would aid the education system to permanently adjust/adapt the educational profile to the requirements of the business environment (of the *graduate career tracking program at national level*), and the market allows just for punctual regulation on short-term by CVT courses especially, which does not solve the issue of the anticipative character of the educational system against the labour demand expressed by the real economy. The outcomes of the survey repeated in 2009, associated with the reform measures on both markets (education and labour) allow for formulating some conclusions/partial outcomes and may represent milestones for defining the framework for improving the communication relationships/channels between the two systems/markets. Moreover, **there are neither systematic studies nor even a national databank for monitoring the socio-professional insertion of graduates on labour market in the first years by highlighting the dysfunctions in forecasting educational content, and an adequate system of indicators that would allow for evaluating the impact of the university system on the Romanian economy and society is non-existent, as well.** Only fragmented studies are made at the level of individual universities, without an attempt of aggregating the outcomes. The requirement of such approaches and the first national initiatives were rendered concrete in developing a methodology and working instruments regarding monitoring studies of insertion on labour market for higher education graduates from Romania (MECT, 2008), which were applied for the first time by means of a pilot project initiated within SOPHRD (Damian, R.M., 2011). The questionnaire developed on this topic is applied to a restricted target-group represented by graduates of state- and private higher education institutions after one year, and then after five years since graduation, but only for the universities involved in the implementation of the study.

III. Youth labour market. Main characteristics and development

In the context of the economic transition process, the labour market from Romania was faced with important changes, shown in the diminishment of the active and employed population, in the increased unemployment among young individuals and growth of long-term unemployment, in the limited capacity of the economy to create new jobs and to ensure stimulative work remuneration in accordance with performance and importance of supplied work, by the lack of attractiveness of the jobs for young graduates, particularly for those finishing tertiary education. As result, labour mobility increased especially external mobility of workers, and the stock of migrant population is estimated currently to total almost 4 million persons (in the registered and unregistered economy).

Labour market reform and the changes in the human capital management model from Romania have known a sinuous development, much delayed as compared with the demands of the economic and social environment. This issue was left on a secondary plane, as it was considered that the regulations on the other markets will generate the required changes to ensure labour market functionality. **If we consider the requirements of an efficient labour market**, as support for sustaining competitiveness, we may appreciate that the labour market after two decades of reform/adjustment and a period of economic growth of about 8 years: a) *does not ensure an efficient allocation of human capital within the economy, nor its performance use*; b) *the remuneration system is rigid in relation to performance and work involvement*, and does not stimulate to a sufficient extent the additional effort, in particular for the public sector; c) *mobility on fields of activity is relatively low*, even for common professions of the national economy due

on one hand to the rigid recruitment and selection systems of the staff (the criterion of experience is defining in most cases), and on the other hand due to the high differences in the remuneration on branches and fields of activity (especially with respect to the bonuses and advantages system (bonus for the importance of the branch, stability bonus, etc.); d) *opportunities' equalities in career advancement and remuneration* albeit stipulated in regulation documents and development strategies of human resources, the practice shows frequently derails thereof. Hence, we cannot consider efficiency and flexibility on labour market as support factor of competitiveness (the seventh pillar "labour market efficiency", Global Competitiveness Report 2009-2010), and as positive input to increasing economic growth and sustainable human development, to retaining young graduates on the national labour market and decreasing migration propensity.

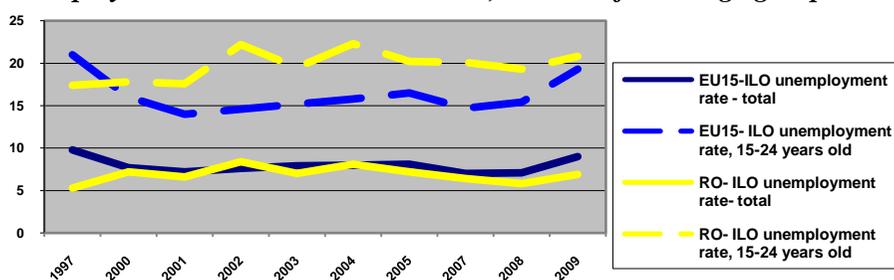

During the entire transition period is recorded a diminishment in the size of labour market associated with higher flexibility but on the background of increasingly stronger **de-correlation** under the quantitative and qualitative aspect between labour demand and supply, especially on the labour market segment specific for young graduates. Low concerns exist for the efficient allocation of labour force at local level, by stimulating through active measures internal mobility for labour. The concentration of investments in high-density population urban areas and the lack of instruments for supporting internal mobility for labour (living and/or transport conditions) triggered increasingly stronger decoupling under quantitative and qualitative aspect between demand and supply for labour at regional/local level. **Temporary migration for labour is preferred by working-age household members, particularly the young individuals aged up to 35 years, instead of territorial mobility of the household or commuting. Very often deficits are encountered on some markets and labour force surplus on trades/professions on others, the differences being covered rather by external migration flows (emigration of Romanians to Western Europe, Israel or Canada, and immigration from the East on the local labour markets, especially the ones in Moldova and in the central region of the country).** Unfortunately, to a large extent, such balances are made due to the informal market, the benefits being partial both for employees (wages but without social insurance), and employers (lower costs but without instruments for long-term incentives for performance and labour involvement), and also for the society (reduced contributions to social funds and unpaid taxes).

The crisis period generates significant changes on labour market, in the opinion of social partners, disruptions and atypical developments, non-performance and actual restrictions in the way of economic turnaround. The previous economic growth is proven as unsustainable and the Romanian economy drops by more than 7% in 2009 and yet another about 1.5% in 2010. The constriction of economic activity triggers considerable unemployment in the private sector but also personnel reductions in the public sector, but on administrative criteria of diminishing personnel expenditures (budgetary corrections are operated uniformly on ministries). The number of governmental agencies are reduced by half, yet ministerial structures increase, reductions are made in education, health care and research strictly on economic reasoning, without defining the medium- and long-term needs both for quality and efficient educational and health services, as well as for technological progress within the business environment, as solution for exiting the crisis and economic turnaround. The European principles of supporting continuing learning and stimulating the generation of RDI outcomes applicable within economy are acknowledged as necessary, yet unsupported in practice, employment is practically blocked by the lack of demand from the business environment and administrative layoffs within the public sector. Unemployment increases, the active measures on labour market are even more downsized (the level from the period of economic growth varying around 2% in total unemployment fund, for instance) and employees participation to CVT decreases dramatically (Romania was placed on the last position in the EU with a participation to CVT courses of about 1,3% in the last 2 years.

Unemployment among youngsters is higher than the average, about 2-3 times, and higher for men. Young people are predominant among unemployed who never worked and they represent a third of the long-term unemployed.

The youth labour market is different as challenges and restrictions, being more vulnerable to migration “attractiveness”. Young individuals represent the most mobile segment of migrant population, especially for external migration. Aspirations about incomes and professional career and the relative independence from family (single, or without children) make them be more open towards jobs at longer distances, if they satisfy expectations. On the other hand, the situation of youth on labour market is difficult as they are regarded a vulnerable group: they have more difficulties in finding a job due to lack of working experience (in Romania only a small share of the young are employed during their university studies and only few, by exception, during the period of upper-secondary studies). In the last years, e-jobs mobility and increasing part-time employment already during the period of study have attenuated the pressure on insertion unemployment rate.

ILO unemployment rate in Romania and EU, total and for the age group 15-24 years

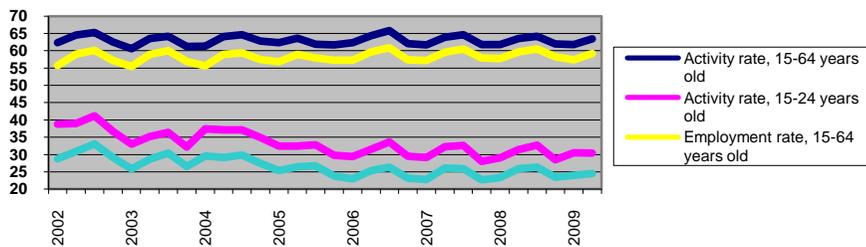

Sursa: Eurostat (2009), <http://epp.eurostat.ec.europa.eu/portal>.

The youths employment model is defined by the following *characteristics*: part-time jobs, contracts on determined periods of time, high mobility from one job to another in the first year after finalising studies, diminished wages towards the legal limit for the graduated level of studies, dual employment, or only within the informal economy, low perspectives of access to a career in the first years, practical competencies and skills deficits triggering inclusively employment in inferior jobs to the training received in school. All these aspects define a non-performance and weakly stimulating model for stability, career advancement and personal development. At an employment rate of the working-age population (15 to 64 years) of about 60% in Q3 2009, were employed 26% of the young individuals (15 to 24 years of age). The highest employment level is among graduates of higher education (84,6%) for the same period and decreases to about 45% for those with the lowest training levels (NIS, 2009). As fields, youngsters aged 15-24 years are employed preponderantly in constructions, trade, hotels and restaurants, and those from the age group 25-34 years of age in real estate transactions and trade. Men are best represented within all socio-professional categories, partially justified also by the fertile life span of women and hence the lower share of participation to labour market.

The activity rate and the employment rate for youths aged 15-24 years is lower than the national average, due to: reduced population cohorts (as result of demographic decline), to extended education period, to poor employment attractiveness provided by the market and to the national employment model which does not promote youth employment during the period of studies, save by exception.

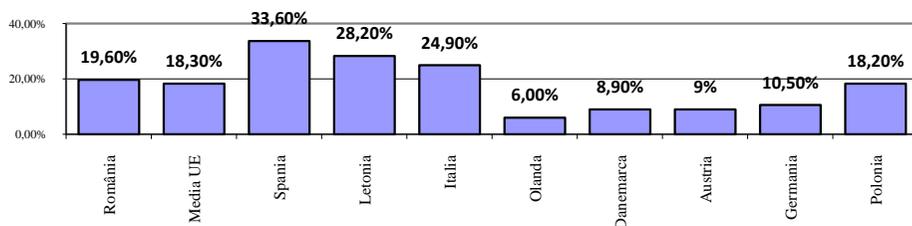

Youths activity and employment rate, 2002-2009

Source: *Labour force in Romania – employment and unemployment– Q 2, 2009, NIS*

Consequently, the two rates are placed about 20 pp under the general average. At the same time, against the Lisbon objectives, the working-age population employment rate in 2008 places Romania at a distance of 11 pp (70%), and for the women at a distance of 7,5 pp (60% objective). Secondary education graduates have an employment rate varying on averages around the national values, the employment rate in the rural area being in reversed proportion to the education level in the case of pre-university levels of study, and the opportunities provided by the rural area being in (paid or unpaid) activities developed in agriculture. Estimates (CEDEFOP, 2008) show that up to the year 2015, approximately 30% of the jobs shall require higher education and almost 50% at least upper-secondary education with a significant decrease of the jobs requiring a low skill level. Professional insertion of a graduate is strongly influenced by the attended school, the field of study, the economic development level of the region, the firms/companies in whom he/she effected internship or worked during studies, the recruitment firms where he/she sustained interviews, on the attended conferences and trainings, etc. Occupational guidance already during high-school of youngsters towards the professional profile and choice of university training in relationship to the intended trade/profession for career development, correlated with gained aptitudes and competencies, but also with the demand on labour market trigger a higher employment rate of graduates and less time searching for a job “adequate/corresponding” to individual aspirations. From this perspective, employment opportunity is in reverse proportionality to the sum of self-imposed restrictions of the graduate. This is also the reason why for young individuals (15-24 de year) the long-term unemployment rate (unemployment of 6 months or over) was, for instance in Q3 2009 of 10,4% , and the incidence of long-term unemployment among youths of 46,9% (at an average unemployment rate of 6,8% per total and of 22,3% among those aged between 15-24 years). Women have an unemployment rate by approximately 30% lower as compared with men. However, they register an enrolment rate in high-school, respectively tertiary education significantly higher than the one of men, a situation which explains the lower employment rate which is specific to them (Vasile V., 2009).

Share of the young unemployed at the half of the year 2009

Source: *Eurostat on-line database*

If we refer to action methods on the labour market, the youth is more incisive and resort to direct and modern methods in searching for a job, take more risks at an interview and the negotiation of working conditions and incomes. Between finishing school and taking up an activity at the first significant job, 74.1% have searched a job using active methods (direct contacting of employers or of the decision factors responsible with hiring 37.9%). The insertion rate of tertiary education graduates is lower against the average situation per total youth who are hired and particularly in the first year after graduation, due to the fact that an university graduate will search longer and have higher expectations with respect to the workplace – under the aspect of the professional profile of the workplace and of the provided remuneration level (very often much lower than graduates' expectations). Even though the state grants tax facilities on employing youths (for instance, the employer will receive for a 12 months period the minimum wage on economy) due to the complementary conditions (including the obligation to remain on the job for at least 2 years) and of the high mobility of youths in search for the right job corresponding to their professional aspirations, the share of those resorting to these facilities is very low. On medium- and long-term, job security for youths with tertiary education is relatively higher, but also the opportunities for mobility based on employment advantages are more. In general, young graduates are considered on insertion on the labour market as having the disadvantage of lacking experience, yet the advantages are net superior: potentially high productivity, adaptability and acceptance of novelty, theoretic knowledge, so as to be considered “relatively cheap”, as lack of experience diminishes the level of the insertion wage towards the minimum legal limits. The hampering lack of experience can be relatively easily dealt away with by training on the job, which depending on trade and skills level attracts lower or higher continuing training costs. Yet, these costs are absorbed on medium-term by individual outcomes and performance, if there is employment motivation. Job motivation and satisfaction are very important components for graduates and youths in general, and therefore they turn easier into unemployed and search for a relatively longer period of time an adequate workplace. Consequently, the unemployment rate for the age group 25-34 is closer to the average one, which leads to the idea that youths after graduation have a short period of feverishly searching a job, with frequent changes and alternating unemployment and employment periods, until succeeding to find a job or to migrate for employment outside the country.

IV. Ways of diminishing discrepancies between demand and supply on youths' labour market. Milestones for an integrated balance model for insertion employment

Youths on labour market remain a disadvantaged group, and as risk are considered: a) for the society as unemployment on local/national market and their migration as brain drain/brain shopping lead to waste of resources due to the non-valued investment in education done in the country and loss on medium- and long-term average of GDP and diminishment of natural increase; b) for the labour market, in event they fail to get employment according to their training profile and in a professionally and financially attractive job. The profile of the young worker is defined on a hand by education (knowledge and theoretic competencies, especially), occupational flexibility, availability for LLL and, on the other hand, the attitude (to work, job, professional career, status on labour market: employed, self-employed, etc.); geographic mobility. The size and balance on labour market are defined by the medium- and long-term trends: demographic decline by delays in family grounding and in the decision to have children, mobility for career and incomes – geographic or virtual – employment volatility, entrepreneurship development and self-employment, lower elasticity by unemployment, increase in the stock of incorporated education and permanent updating by LLL, gender convergence on trades, professions, specialisation fields, including at managerial level and presence in the political life, the interest for developing a successful professional career.

An integrated model for ensuring mobile balance on labour market presupposes at least three components: education for labour market as integral part of LLL, defining the business environment demand by means of KSCs and ensuring a social network of stimulating employment on local/national market. For each component a number of indicators for quantitative measurements can be defined and then weighted/adjusted with the qualitative variables resulting from dedicated surveys (graduated track survey and labour market for youth questionnaire). The selected variables were of 3 up to 6 for each component depending on the demanded training level for the job and scarcity of the specialists. In the case of a job for a tertiary education graduate, as minimum quantitative indicators were defined: a) for the education for labour market component were considered the number of graduates on specialties, the aggregated index of generic competencies and the KSCs index specific to the profession and hierarchical level of the job; b) for defining the labour demand within the business environment was considered the specific demand of similar jobs, workplace stability and the substitution index of the professional profile; finally, for c) social indicators of stimulation, at least at the comparative level of wages and additional wage packages can be considered the geographic indicator (defined by the rural/urban environment) and the local development level (GDP/area inhabitant or the development lag against the national average). Balancing the values of aggregated indicators on each component indicate the compatibility state and attractiveness of employment for youths, while the imbalance situations points out the migration risk – brain drain/brain shopping or the employment option by substitution (another professional profile but for which minimum competencies are proven for taking up the job). The job experience variable non-specific to young graduates and the advantages of the employer from insertion employment are considered in operating selection of equivalent candidates (IEN, 2010). Albeit in the incipient stage of developing and testing on youth market, this algorithm allows on one hand for guiding the educational system to curricula adjustment and focusing learning outcomes on KSCs demanded on labour market, and on the other hand in guiding employers towards recruitment from the local market or from the national/international market, as well as to the association with the development on variants of employment of the e-work type for some trades/professions and, respectively jobs. The current developments and dysfunctions on the youth labour market, particularly during the period of crisis when the volatility elements were more prominent, support the need of developing ex-ante and ex-post management mechanisms of potential (youth) labour force employment by combining counselling and professional guidance with internship periods and graduate tracking management, employer/alumni engagement strategies, industrial relations development and stimulative wage package, LLL, career development model, etc.

V. Brief conclusions

The labour market, respectively the business environment is more exigent in the case of the young labour force which enters labour market after graduation. Youths have more difficulty in finding a job corresponding both professionally and monetary, the reason why both employment fluctuations from employment to unemployment and vice-versa, and longer periods of unemployment are an important barometer of permanent education system's reform in Romania. Moreover, information about vocational training programmes or for on the job adjustment may provide information about dysfunctions and correlations' lack between the education system and demand on labour market, while the following might be considered as the most significant ones:

- Youths entering on labour market after graduation of secondary or tertiary education live preponderantly in the urban area, and men are more numerous; accessibility of higher education is better for those in the urban area, opportunities closer to the beneficiary and, very often, financial restrictions are the most important.
- The shares of their employment and unemployment against the age group to which they belong has not underwent significant changes, just as the passage rate to higher education which

improved but not to a significant share and, unfortunately, did not generate a proportional improvement of graduates' education quality, but to the contrary.

- Still the diploma is more important than proven skills and knowledge, in particular for the public sector. The business environment becomes gradually increasingly rigid from this viewpoint and requires evidence on hiring of professional competencies' certification, and in their absence, employment is made on a job requiring inferior training and/or the knowledge deficit is compensated by CVT on the job.

- The activity rate decreases, young individuals on one hand postpone entering the labour market, and pursue several educational tertiary paths (often in completely different fields) or continue their studies for masters/doctorate or, on the other hand after graduation (or early leaving) are active on the black market, or migrate for employment in low skilled jobs, inferior to gained education.

- The main reasons of early school leaving are still of current concern, respectively the high cost of schooling (especially for those from the rural area) and/or associated with the need of working for incomes (dependency on families with low incomes or other types of difficulties). An important reason of failing to finalise studies is represented also by the inefficiency of the evaluation/certification systems on graduation which consider inflexible evaluation schemes and less adjusted to the practical finality of education – knowledge verification instead of competencies certification, etc.

- The lack of a flexible, coherent and accessible to all system for continuing training, including by certification/continuation/ and/or transition from the formal to the informal and non-formal system.

- Another issue which is difficult to measure but is particularly relevant under the aspect of compatibility between education market and labour market, between the chosen profession and competencies for practicing this profession in performance conditions is represented by the analysis "first significant job" – under the aspect of professional profile and search duration.

- Finally, another important aspect of individual performance during active life is represented by the informal education related to the behaviour on labour market and professional development. The example of parents and extended family members may define to a significant share the labour market behaviour of young graduates and their professional path.

Failure to acknowledge such aspects in a systematic way and their analysis affect the feedback processes within the educational process, maintaining dysfunctions and gaps between education market and labour market, rendered concrete, finally, by loss of human capital, of investments in education, loss of potential value added as result of non-performance work or giving up work after graduation. The relatively high level of this youths' unemployment rate **emphasises the necessity of a closer link between the educational and vocational system and the labour market**. Finalising and applying methodologies of monitoring young graduates insertion for various educational forms (vocational, upper-secondary, tertiary) is a priority, just as the development of more flexible and efficient systems of organising internship for students. Last but not least, a more careful analysis is expected with respect to the competencies which Romanian employers regard as important for the success of their companies and the adjustment of the educational and vocational supply to them, periodical update of occupational and vocational training standards, and of the educational curriculum in close dependency to the change dynamics on labour market.

THE EVOLUTION OF ROMANIA'S LABOR MARKET, DURING THE LAST 20 YEARS

Vădăsan Ioana *

West University of Timișoara Faculty of Economics and Business Administration

Părean Mihai Olimpiu

West University of Timișoara Faculty of Economics and Business Administration

In this paper, the authors will try to analyze the evolution of Romania's labor market, in the last nearly 22 years. More precisely, we will analyze the evolution of the number of employees, the number of pensioners, and the number of unemployed workers, in the mentioned period of time, and we will draw some conclusions.

We consider that the dynamic of the labor market is an important indicator, showing both the economic situation, as well as its future evolution; this is why we have chosen to focus our study on it.

In order to do so, using the data published by the National Institute for Statistics, and the National Agency for Labor Force Employment, we have noticed worrying evolutions for Romania's labor market: a decrease in the number of employees, an increase in the number of unemployed workers and pensioners, as well as an increase in the number of those who, although able to work, do not have and do not officially look for a workplace. In fact, this is a limit of our research, because those persons either work (abroad, or on the "black" market), either do look for a workplace, but are not registered as unemployed workers. Another limit of our research is related to the insufficient explanations related to the evolution of the different indicators. But our purpose was to offer an overview of the labor market for the last nearly 22 years, and to suggest some measures to be taken in the future.

In order to do that, we have analyzed the evolution of the number of employees, the percentage of employees in the population able to work, the evolution of the number of unemployed workers, the evolution of the number of pensioners. Also, we have made a comparative analysis of the evolution of the number of employees and of the number of pensioners.

Through this paper, we have tried to draw attention upon the worrying phenomena taking place on Romania's labor market, as well as upon the fact that our country should take urgent measures in order to increase the number of employees in the economy.

Keywords: labor market, employees, pensioners, unemployed workers, Romania

JEL Classification: E24 Employment, Unemployment; E 26 Informal Economy, Underground Economy

Introduction

During the last nearly 22 years, Romania has gone through major and complex changes, economically, socially or politically. The labor market has been through many changes, as well. Phenomena like unemployment, unknown 22 years ago, have emerged.

But there have been other major changes. On Romania's labor force market, during the last 20 years, a constant and worrying decrease in the number of employees has been registered. If, in 1990, the number of employees was 8 142 000 persons, in 2010, the number of employees was 4 400 000 persons. And the decreasing tendency is, most probably, continuing in 2011, mainly due to the crisis. In the same time, Romania has registered an important increase in the number of pensioners (in 2009, the number of pensioners was with 56% higher than in 1990).

Many studies regarding the labor market have been done, and many will be done. In this paper, the authors tried to update the situation of Romania's labor market, analyzing the data available for 2010. Hereinafter, we will analyze the evolution, between 1990 and 2010, of the number of employees, the number of unemployed workers, the number of pensioners. Also, we have made a comparative analysis of the number of employees and of the number of pensioners.

The number of employees

In Romania the number of employees is continuously decreasing. The evolution of the number of employees is presented in Table 1.

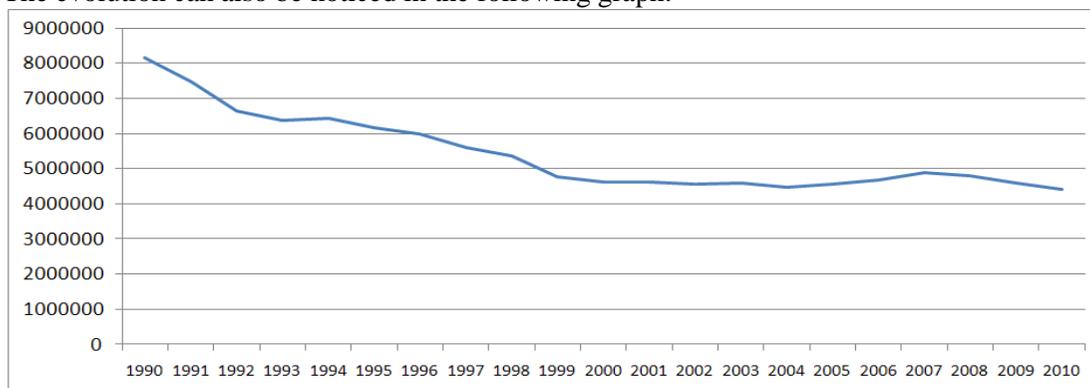

Table 1. The evolution of the number of employees in Romania, 1990-2010

Year	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999	2000
Nb employees	8142	7483	6627	6385	6438	6160	5939	5597	5369	4761	4623
Year	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	
Nb employees	4619	4568	4591	4469	4559	4667	4885	4806	4595	4400	

Source: National Institute for Statistics

As one can notice, the evolution is decreasing; in 2010, the number of employees represents only 54% in comparison to the year 1990.

The evolution can also be noticed in the following graph:

Source: realized based on data from the National Institute for Statistics

Graph 1. The evolution of the number of employees in Romania, 1990-2010

This worrying evolution has many causes:

- A pronounced aging population;
- High migration of the labor force (abroad migration, but also from the urban area to the rural area);
- Undeclared work;
- Economy's incapacity of generating enough work places, after losing traditional markets;
- The high number of retirements (anticipated retirements, illness-based retirements), during the last 20 years;
- Massive lay-offs, in many economic branches, during the last 20 years;
- Professional rigidity, difficult, sometimes impossible reconversion of the labor force.

The migration phenomenon is a complex one, taking into consideration the factors determining it and its consequences. Unlike the natural movement of population, the migration is more difficult to be statistically registered, in order to reproduce as accurately as possible the population's movements. For instance, during the 2002 census, one of the important indicators was represented by the population's residence change, in comparison to the birth county. This

indicator reflects the situation, at a given moment, of migrants, without indicating whether, in time, there have been other residence changes. The typology of those movements can be seen hereby:

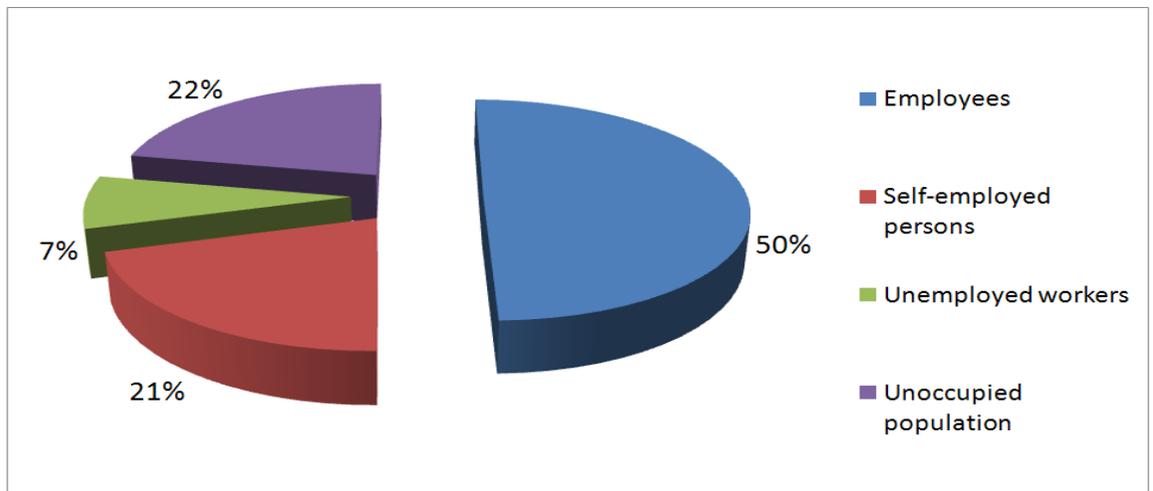

-Definitive movement (residence change);

-Temporary movement (no residence change). These movements can be seasonal or commuting. If we take into consideration destination, the migratory movements can be classified in internal and external movements.

If, until 1989, the most important migratory flow was determined by industrialization, the effect being a high rural exodus (the industrialization has overlapped the structural transformation of the agriculture, through cooperativization, which generated a boost of the labor force), after 1989, one has noticed a come-back flow for a part of the urban population, due to social issues generated by the economic reorganization.

After 1990, in Romania, the external migration has become a social undertaking phenomenon. During this period of time, migration had multiple forms: family reunification, ethnic migration, business migration, increasing students' international mobility, increased brain-drain (especially in the area of IT), or labor migration.

Another worrying phenomenon is represented by the increased percentage of those who, although being able to work, do not have and do not look for a workplace (according to official statistics). If we subtract the employees, the self-employed persons and the unemployed workers from the population able to work, the result is represented by over 2 million persons who do not have a workplace, and who, theoretically, are not looking for a workplace (graph 2).

Source: realized based on data from the National Institute for Statistics and from the National Agency for Labor Force Employment

Graph 2. The different categories of the population able to work

Based on graph 2, we can notice that, from the total population able to work (approximately 9 243 000 persons), some 50% are employees, 21% are self-employed persons, 7% are unemployed workers, and 22% aren't in any category. But where are those people?

Some of them are, most probably, abroad, working, others work on the "black" market, while others are looking for a job, without being officially registered as unemployed workers.

The number of unemployed workers

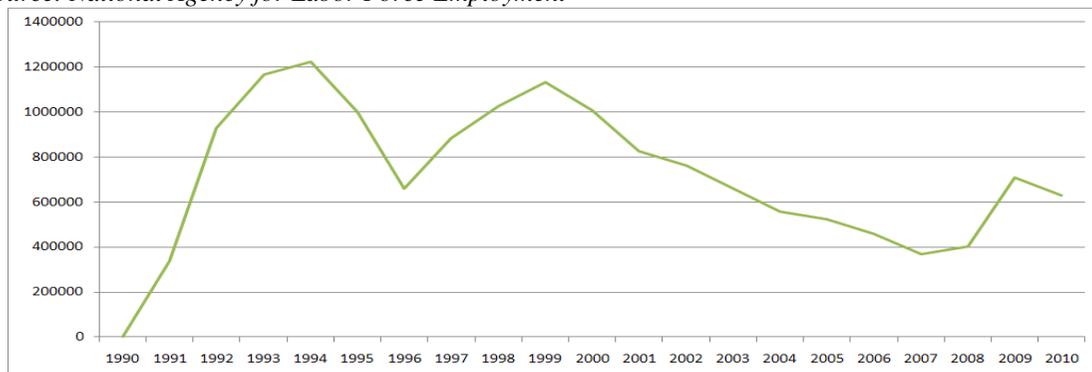

Before 1989, as it is well known, there was no unemployment. Not officially, at least, since every person able to work had the legal obligation to work. In fact, it was a hidden unemployment, taking into consideration the productivity of many employees.

The unemployment phenomenon became known in Romania starting with 1990, when the transition to a market economy has led to the closing of many enterprises. The evolution of unemployment after 1989 (table 2, graphic 3) is in tune with the reforms' evolution, and the Romanian economy's evolution.

Table 2. The evolution of the number of unemployed workers in Romania, 1990-2010

Year	1991	1992	1993	1994	1995	1996	
Nb unemployed	337440	929019	1164705	1223925	998432	657564	
Year	1997	1998	1999	2000	2001	2002	2003
Nb unemployed	881435	1025056	1130296	1007131	826932	760623	658891
Year	2004	2005	2006	2007	2008	2009	2010

Source: National Agency for Labor Force Employment

Source: realized based on data from the National Agency for Labor Force Employment

Graph 3. The evolution of the number of unemployed workers in Romania, 1990-2010

Thus, 1993, 1994 or 1999 have been the most difficult years of the transition, characterized by an increase in the number of unemployed workers (graphic 3). Also, 2009, characterized by a negative economic growth, due to the crisis, has registered an increase in the number of unemployed workers.

The emergence and the increase of unemployed workers can be explained by the followings:

- Non-adjustment of labor force professional qualification, to the demands of the labor market;
- Professional rigidity, difficult, sometimes impossible reconversion of the labor force;
- The closing, after 1989, of numerous enterprises;
- The reorganization that took place in the Romanian economy, during the last 20 years.

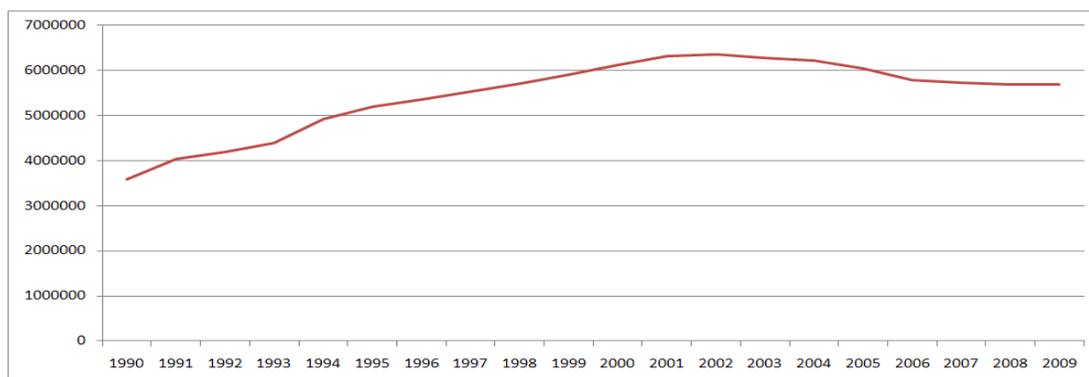

The number of pensioners

Another worrying evolution regards the definitive exit from the labor market, through retirement. Table 3 and graph 4 show that the number of pensioners has increased by 59% in 2009, in comparison to 1990.

Table 3. The evolution of the number of pensioners in Romania, 1990-2009

Year	1990	1991	1992	1993	1994	1995	1996	1997	1998	1999
Nb pensioners	3577	4034	4200	4392	4917	5187	5352	5524	5702	5894
Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Nb pensioners	6110	6311	6342	6274	6205	6042	5785	5726	5685	5689

Source: National Institute for Statistics

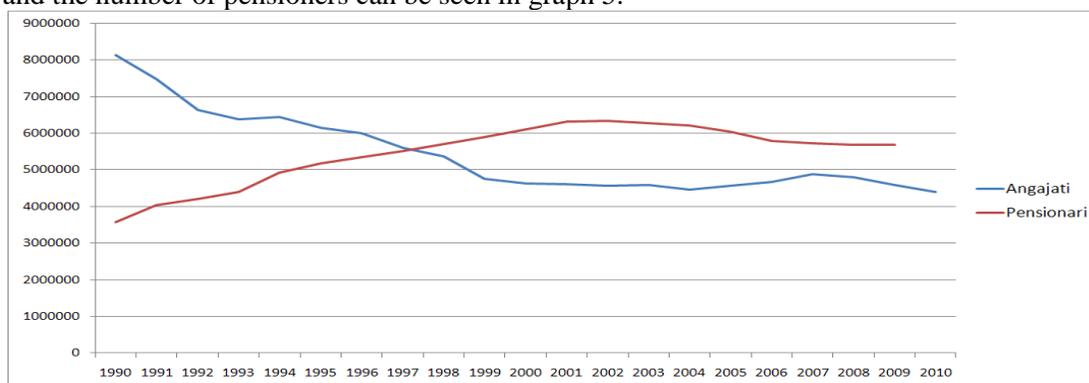

Source: realized based on data from the National Institute for Statistics

Graph 4. The evolution of the number of pensioners in Romania, 1990-2009

The increase in the number of pensioners has several explanations: mainly, the phenomenon of demographic aging, available everywhere in Europe; but, besides this, the situation in Romania has some particularities:

- The high number of retirements, immediately after 1989 (anticipated retirements, illness-based retirements);
- The difficult transition towards a functional market economy has led to the loss of workplaces for persons who were towards the end of their employment; because it has been impossible for them to find another workplace (due to the economic situation, and to their age), they have decided to retire;
- After Romania became a NATO member, in 2004, our country had the obligation of reducing its military body to NATO standards, as dimension and preparation; this led to a reduction, often by retirement, of the military personnel;
- The “baby-boom” generation, born after the Second World War, has reached the retirement age; this will lead to a new increase in the number of pensioners, thing that represents a major risk for the national economy.

But even more worrying is the proportion between the number of employees and the number of pensioners. If, in 1990, each pensioner was supported by 2.27 employees, in 2009, each pensioner is supported by only 0.81 employees. This inversion between the number of employees and the number of pensioners can be seen in graph 5.

Source: realized based on data from the National Institute for Statistics and from the National Agency for Labor Force Employment

Graph 5. The evolution of the number of employees and the number of pensioners in Romania, 1990-2009

This worrying phenomenon is an explanation for the deficit of the pension fund. Even more worrying is the fact that the “baby-boom” generation approaches or has already reached the retirement age, while, on the labor market will enter the generation born after 1989, characterized

by a decreasing birth rate. Which means an increased number of pensioners and a decreased number of those able to work.

Romania's population during the next decades will depend upon the parallel evolution of the birth rate and the mortality rate, as well as upon the level of net external migration (immigration and emigration). If the present values of fertility and of life expectancy remain constant, this would lead to a catastrophic acceleration in the demographic decline.

Conclusions

Romania's population is declining due to the constant reduction in the birth rate, to external migration and to the increase of general mortality; all these together lead to a demographic aging process, which has started to deepen after 2005, when the generations born after 1990 have entered the category of population able to work (15-59 years old). However, the increased dependence ratio of the elderly population will not be very high until 2027, when the "decreaser generations", born after 1967, will reach the category of those being over 60 years old.

In this moment, Romania has too few employees, taking into consideration the total population, and the population able to work. Also worrying is the fact that the economic growth period of time (2002-2008) has created relatively few working places (238 000). Within the next years, solutions are needed in order to bring the "black" labor market to the surface, for several reasons: those people must contribute to the state budget; they must benefit from the unemployment benefit, or medical health care services; they must benefit from a pension, after retirement. Romania must take the necessary measures in order to increase the labor force employment rate. Nowadays, the employment rate is 58%, while the objective of Europe 2020 Strategy is 75%.

THE SPECIFIC MARKET RESEARCH METHODOLOGY USED AT GENERAL MOTOR'S EUROPE

Zima Liliana Adela

The North University of Baia Mare , Faculty of Sciences

Toader Rita Monica

The North University of Baia Mare , Faculty of Sciences

As difficult as segmenting consumer markets is, it is much simpler and easier than segmenting industrial markets. Often the same industrial products have multiple applications; likewise, several different products can be used in the same application. Customer differ greatly, and it is hard to discern which differences are important and which are trivial for developing a marketing strategy. Making the research at General Motor's Europe I realized that the most industrial marketers use segmentation as a way to explain results rather than as a way to plan. In fact, industrial segmentation can assist companies in several areas like: analysis of the market, selection of key markets and management and marketing. In this study I tried to make a better understanding of the total marketplace, including how and why customers buy and to develop strategies, plans and programs to profitability meet the needs of different market segments and to give the company a distinct competitive advantage. The Marketing Plan is based on an Information System which can be interpreted in two different ways. In this case its singular form focusing on both formal and informal information system is appropriate. The investigation explains the environment of the European Business Team . The techniques used were: system maps, observations, interviews, questionnaires and company documents. The initial stage of exploring the situation starts usually with a dialog between the potential client - in this particular case the European Business Team – and the analyst. The vague impression is then given that not everything is running as it should be by the client. This was, however, not completely true in my case, as I had to go looking for problems. Preliminary investigations into product communication did show a feeling of unease between the departments. Having expressed the current situation of the European Business Team , I then chose three areas to study further. I had to confirm my choice to be able to grasp the complexity of the working environment

Key words: Marketing plan, market requests

M: Business Administration and Business Economics; Marketing ;Accounting

1.Introduction

It is necessary to complete the conventional fact-finding for any study. For this investigation I used a number of fact-finding techniques. Some fact-finding techniques were not appropriate for every individual, due to the working environment. Fortunately I was able to use a variety of techniques to cover all the information I needed. The assumption was made that the fact-finding, that I completed for the Corsa Team, was also appropriate for the other Business Teams. Observation was probably the most important method of fact-finding for this investigation. Observations included reading memos and messages via Lotus Notes and listening to conversations at meetings and group discussions. Also my interviews allowed two way communication , thus clearing up any misunderstandings. The company documents were used in conjunction with all the other fact-finding techniques to support the later stages of investigation In this study, I evaluated the specific modeling systems used at European Business team (EBT), part of General Motors Europe.

GME was established in 1986 and is a subsidiary of General Motors (GM), which was founded in 1908 by William Durant. Although GM is a well-known car manufacturer, it is not responsible

for manufacturing cars within Europe. This lies with GME. GME consists of Vauxhall, Adam Opel AG and Saab. To enable better co-ordination and to improve the competitive edge of the company, it was decided that the EBT should be located at Adam Opel AG in Russelsheim. This is due to the fact that Russelsheim is the headquarters of both engineering and design.

The EBT follows the organizational structure of GME. This comprises of detailed objectives and goals laid out in a company profile. The EBT, however, is situated at Adam Opel AG. Opel is differently structured and houses other company objectives, which have been formed through many years of existence. In general, the company works on the basis of primary objectives, such as producing cars with a high margin. However, employees have their own objectives, which are based on personal experiences.

2. Investigation

This part of the study discusses two chosen areas which are the Marketing Plan and Market Requests. The area of Product Communication was the subject of another study before.

Using the techniques of Soft System Method (SSM) I constructed root definitions and conceptual models in line with systems thinking. This is then followed by a critical examination of the current cultural situation in the organization.

2.1. Marketing Plan

The Marketing Plan is a document that explains the strategy the organization will use to market its product. The information it uses can be classified as strategic information. It includes information on future markets, on availability of raw materials and on product development, in order to plan for the future.

Its purpose is to force the EBT to use long-term thinking in the attempt to be on step ahead of the competition. In short, it is used to improve the position of the product in the market.

The Marketing Plan is divided into 3 major categories:

Analysis

- Information is gathered on the appropriate areas. This information is compared with previous analysis of market trends.
- There are two forms of analysis.

External

- Current market (size, growth, segments, needs and behaviour)
- Competition (both existing and new)
- Environment (inflation, unemployment, recession, legalities, politics, technology, sociodemographics and culture).

Internal

- Product, brand, capacity, distribution, people & financial resources.

Strategy

- Here is decided which direction will be taken to market the products. The strategy includes a set of objectives for the NSCs to follow. Other aspects are the allocation of resources and the positioning of the product.

Action Plan

- This is a detailed description of the actions needed to implement the strategy. It gives reference to the Marketing Mix (product, price, promotion, people and place), the financial evaluation, and the organizational issue within the EBT and other departments.

A Primary Task Definition and CATWOE of the Marketing Plan

Root Definition

The Marketing Plan is a system in which the Strategists and Marketing Line Managers transform raw data from several sources into a structured Marketing Strategy in the shape of a Marketing Plan for the National Sales Companies to follow. The Strategists and Marketing Line Managers are responsible to the Strategic Director of product Marketing.

The assumption is made that long term thinking improves the company's position and the company is better prepared than the competition. All this is done under the wider constraints of the economical situation, legalities and socio-and cultural demographics.

C - National Sales Companies ; **A** - Strategists, Marketing Line Managers; **T** - Raw data from several sources into a structured Marketing ,Strategy in the step of a Marketing Plan; **W** - Long – term thinking improves the company's position and the company is better prepared than competition; **O** - Strategic Director of Product Marketing ; **E** - Economical situation, legalities, socio-and cultural demographics.

2.2. Market Requests

This was an area of extreme controversy. The EBT experienced major problems with this issue. These problems include such things as disorganization and conflicts of interest.

Market Requests can be considered as another key task for the EBT. However, there are no guidelines set for the NSCs in the area of market Requests. There is no documentation for Market Requests and Market requests are normally done via Lotus Notes, telephone or fax.

Market Requests force the EBT to have direct contact with several other departments, in order to push the requests through. These departments include the Platform Business team (PBT) and Ordering Specification from the European Sales Operations (ESO).

Product Changes

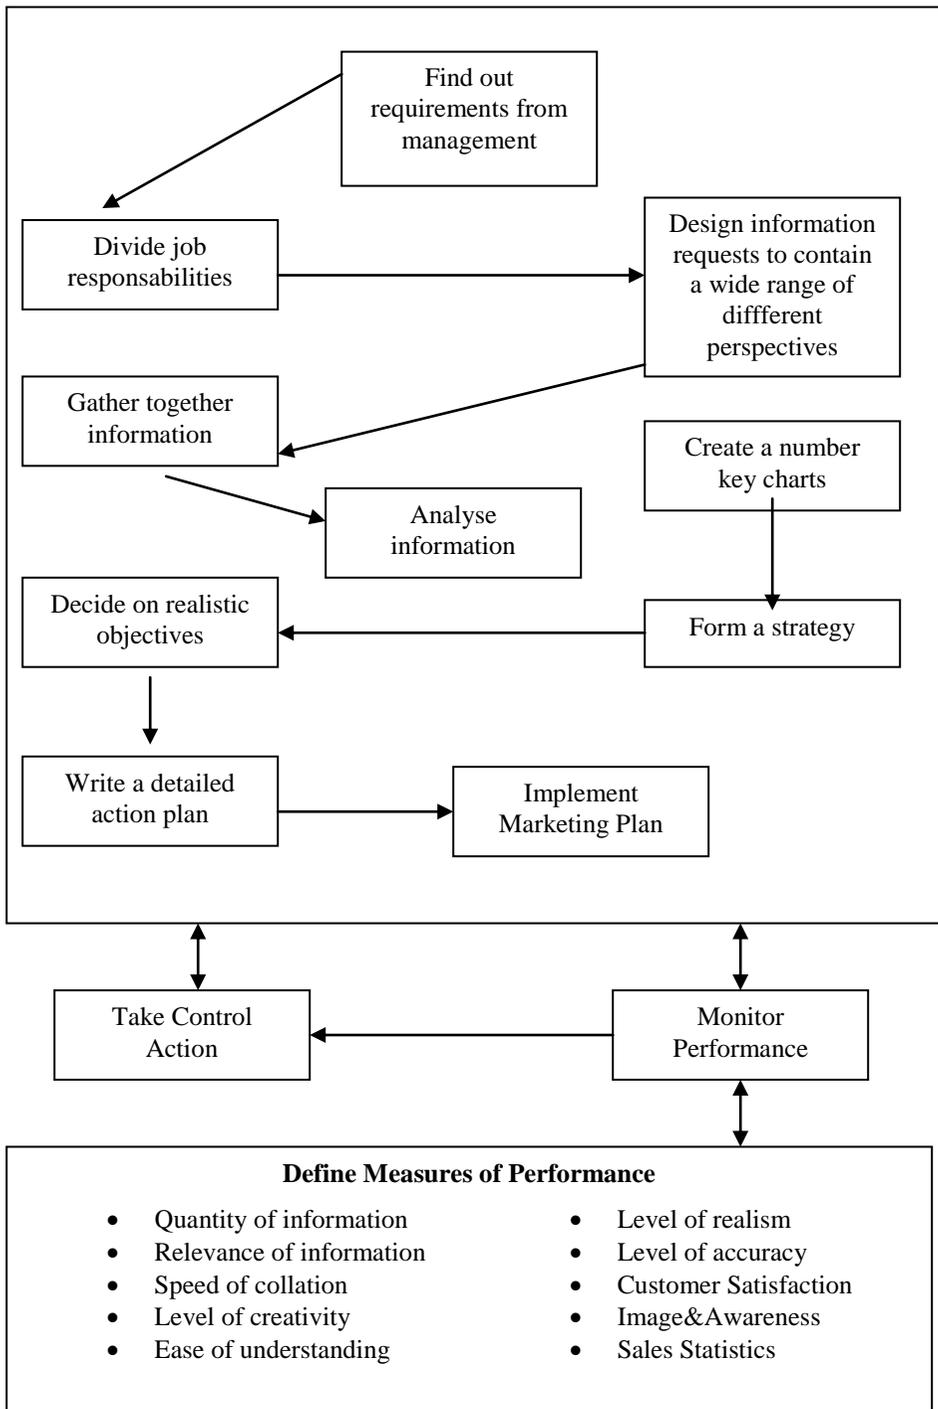

Market Requests are just one way of changing the product offer. Other procedures include quality improvements, continuous design improvements, supplier changes, life cycle changes, corporate mandate and government legislation.

A Primary Task Root Definition and CATWOE for Market Requests.

Root Definition

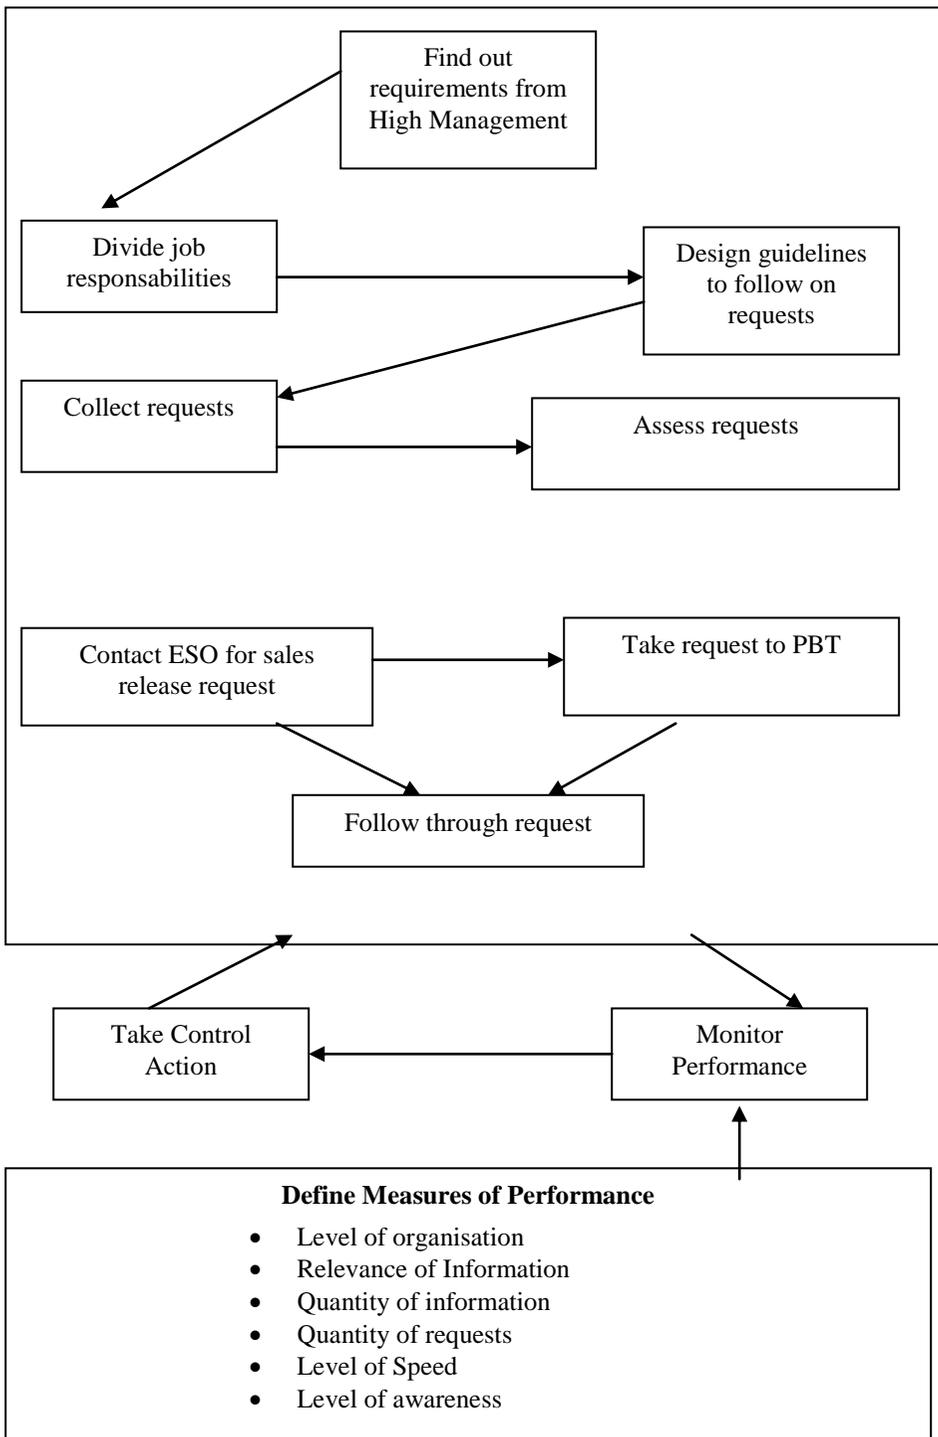

Market Requests is a system in which the Strategists, Marketing Line Managers, National Sales Companies, European Sales Operations and Platform Business team transform Market Requests into product change for the needs of the company as a whole. The Strategists and Marketing Line Managers, NSCs, ESO and PBT are responsible to high management. The assumption is made that this co-ordination of Market Requests improves organizational procedures and profit margins. All this is done under the wider constraints of technology, resources and raw materials, legalities and socio-and cultural demographics.

C -Company as a whole; **A**- Strategists, Marketing Line Managers ,NSCs, ESO, PBT; **T**-Market Requests into product changes; **W**-Co-ordination of Market Requests improves organizational procedures and profit margins ; **O**- High Management; **E** -Technology, resources and raw materials, legalities, socio-and cultural demographics

3.Conclusions

The company Adam Opel AG is extremely large and employs about 53,000 people. Within the company there are several major departments, such as marketing, personnel, distribution, technical design and production. All these departments have their own individual cultures, however in general they share a common “role” culture and a similar hierarchical structure. There are strict procedures, that need to be followed for every small task, such as ordering a new PC to moving a car from one department to another. The great differentiation to the company’s role culture lies in its information management. Due to the introduction of modern technology, such as telephones and Lotus Notes, the company allows unstructured and uncontrolled departmental interaction. For example, it is possible to get in contact with any department just as long as there is knowledge of a contact person.

The organization of company information is chaotic, as there is no centralised system where information is stored.

The EBT is a fairly new entity, with an organizational structure based on the idea of Japanese-type group culture. This type of culture has proved successful from a departmental point of view. However, Opel has a totally different culture. This culture is based on a system of hierarchy. In other words, one is horizontally structured (EBT), while the other (rest of Opel) is vertically structured. The EBT’s structure monitoring of performance, work patterns and even language is different to the rest of Adam Opel. In some cases, this makes acquisition of information and communication in general a problem.

SUB-SECTION: BUSINESS ADMINISTRATION

THE TOURISM BARRIERS OF THE DISABLED IN ROMANIA

Băbăiță Carmen Mihaela

University of the West Timisoara, Faculty of Economics and Business Administration

Nagy Andrea

University of the West Timisoara, Faculty of Economics and Business Administration

Filep Adrian Viorel

University of the West Timisoara

Faculty of Economics and Business Administration

This article seeks to address a very sensitive issue in Romania, the disabled tourism. The natural question is whether tourism can respond and meet the needs of such people. Internationally, the researches in detail about tourism for people with disabilities are limited in this direction, and those who exist are focused more on lack of physical access to certain services in the hotel units. As for the problems (barriers) that a person with disabilities may face when seeking to participate in the act of travel there were found numerous internal and external barriers in trying to participate in tourism activities

The study seeks to identify how normal people behave towards people with disabilities and aims to demonstrate the existence of correlations between the responses of the interviewees, which would lead to the presentation as close to the truth as possible of the results from the sample (section), transposed over the population from which the sample belongs and also lead to finding conclusions on which there could be made several proposals.

Keywords: tourism, disability, social tourism, attitude, internal and external barriers

Cod JEL: M10, L83

1.INTRODUCTION

Tourism in its current form appeared only in the XIXth century. Actions related to social tourism began in 1936, when the **International Labour Organization (ILO)** agreed that the on access to paid leave should be done by tourism (Convention No.52.). In essence, this agreement has also been mentioned in the **Universal Declaration of Human Rights** in 1948, stating that “everyone has the right to rest and leisure, including reasonable limitation of working hours and periodic holidays with pay”.

Thus we can say that tourism has emerged as a social practice due to the ethical demands of the representatives of employees, justifying the legitimacy of a specific right, so thus the right to travel, as an extension of the right to work, to rest and to take paid leave.

However, some social historians say that tourism has emerged a few decades earlier, with the opening of camps for disadvantaged children, as well as the opening of the twentieth century, youth hostels. The emergence of hostels and bed & breakfast accommodation system occurred in the late nineteenth century. At that time, most tourist facilities were the ones in the private sector or belonging to other organizations willing to improve tourist access to a much larger number of people and making a profit.

After the Second World War ended some social policies were implemented in several countries as subsidies for private housing, their renovation, modernization of equipment and infrastructure, and as well as aid to the population. Also, many associations have been created under different unions, travelling families , work councils, etc. all had as main objectives social development and expanding social tourism.

2. DISABLED TOURISM

This article seeks to address a very sensitive issue in Romania, the disabled tourism. According to the 448 / 6 December 2006 law , people with disabilities are those people who, because of physical illness, mental or sensory impairments, lack skills that prevent them from carrying out normal daily activities, requiring protective measures in support of recovery and social inclusion. The natural question is whether tourism can respond and meet the needs of such people. Internationally, the researches in detail about tourism for people with disabilities are limited in this direction, and those who exist are focused more on lack of physical access to certain services in the hotel units.

Very few studies have been published concerning the issue of tourism and people with disabilities (Burnett & Baker, 2001, Darcy, 1998, 2002). Some academics specialized on tourism were concerned with these problems in the late 1980s and early 1990s (Smith, 1987; Muloin, 1992), Smith's work being one of the few works published in a major tourism publication. Since then, academics in the field of tourism have been silent on this subject. Also referring to the disabilities literature which is characterized by the lack of consideration of those issues, identify one or two studies. Various studies are as well illustrated by the Canadian Tourism Commission (1997), Burnett and Baker's work (2001) in the U.S..

The broad spectrum of disability problem has become a field of study since the early 50s. Typically, these studies and debates related to persons with disabilities, in orbit around the **social model of disability**, emerged in Britain in 1976 from the activity against segregation by the Physically Unfit Union .

Disability is a generic term for diseases or disabilities, activity limitations and participation restrictions as defined in the international classification of functioning, and health disability adopted and approved by the World Health Organization to show the negative aspect of individual context interaction (Law 448 / 6 December. 2006, Art. 5, pct.16).

Researchers Hugh and Paterson (1997) say that the company creates an environment that does not take into account the needs of those with disabilities. They tried to make a clear distinction between those with impaired and those with disabilities. Such **disorders** refer to the normal functioning of the individual caused by mental or sensory dysfunctions and **disability** is the loss or limitation of opportunities to live normally in society on an equal level with others due to physical barriers. The fact is however that until nowadays a social model for people with disabilities wasn't treated in tourism literature.

3. OBSTACLES IN ACCESS OF THE PEOPLE WITH DISABILITIES

As for the problems (barriers) that a person with disabilities may face when seeking to participate in the act of travel there were found numerous **internal and external barriers** in trying to participate in tourism activities . These barriers can be classified as:

Internal barriers are obstacles that must be overcome before a person becomes active in terms of tourism and that the individual has the greatest control over these barriers. In this way people with disabilities should be helped through institutionalization at the recovery units. For example in Romania this aid is extremely small as about 3.62% of people benefit from institutionalization

External barriers - which may inhibit their journey, they may limit the options or reduce satisfaction. This category includes: *architectural barriers* such as stairs, toilet accessibility, accommodation, and *environmental barriers* difficult paths, tree roots or other obstructions outside, *means of transport*, especially the local variety of means of transport, which includes cars, buses and taxis ; *laws and regulations* that prohibit the people with disabilities to bring necessary equipment with them, *communication difficulties* both at home and at the receiving person, *negative attitudes* from service providers and *incorrect information*. Tourists with a disability must consider that foreign travel agencies must break down these barriers.

In 2002, Darcy reveals that **attitudes towards individuals with disabilities**, and research undertaken on this market segment, in particular, have evolved significantly in the last 25 years. Originally attitudes, regarding disability were conceptualized in a framework of personal tragedy, concentrated on individual helplessness. The person was treated as an unfortunate victim. Since then, the emergence of political movements for the rights of persons with disabilities have changed the overall impression of personal tragedy, to disability as a form of social oppression. The way in which disability is conceptualized and natural attitudes have a profound effect on society and people with disabilities. First of all, attitude influences individual behavior regarding people with disabilities. Understanding disability as an " abnormality" of a person rather than a social failure, it outlines behaviors that lead to isolation and marginalization. In many cases, certain behaviors are not intentional but rather are rooted in social practices "non-disabled". Second, attitudes form public opinions, attitudes which influence social and public policies, resource allocation and access to education, transportation, jobs, etc.. Finally, prevailing attitudes influence the perception of people with disabilities of themselves .

4. RESEARCH DIRECTIONS

The study seeks to identify how normal people behave towards people with disabilities and aims to demonstrate the existence of correlations between the responses of the interviewees, which would lead to the presentation as close to the truth as possible of the results from the sample (section), transposed over the population from which the sample belongs and also lead to finding conclusions on which there could be made several proposals.

Between the specific objectives we find: knowledge or the social prerequisites, psychological and cultural of the interviewees; discovering the causes that lead to negative feelings, on people with disabilities, eliminate the causes, proposed ways of intervention and trying to change the behavior of the normal people.

Knowing the psychological assumptions helps determine the way people act, understand the personal points view and also allows the identification of certain measures by which those with disabilities could be integrated and accepted in society.

Discovering the causes which lead in forming an opinion regarding people with disabilities could be one of the most important secondary objective, this objective is important because it may act directly on the cause and not on the effect that results.

Finally the directions of intervention in modifying behavior of the normal people towards people with disabilities should be materialized at the end of the present study. The modeling of the behavior occurs when the stimuli are identified, the basic behavioral processes are analyzed, the explanatory variables of behavior and behavioral response.

5. RESULTS INTERPRETATION

The research was conducted on the basis of a questionnaire. Sample size was 100 people chosen randomly. The sample was structured: 40% of them are under 24 years, 20% of people are between 25-30 years old, 8% of people between 31-35 years old , 14% between 36-45 years and the rest, 18% are people over 45 years. Of these 62% were women and 38% were male. Regarding the marital status of respondents 44% aren't married, 34% are married and the rest belong to other categories (divorced, widowed or living with partner).

The study was conducted by distributing questionnaires in urban areas, in Timisoara, and 62% of the respondents have completed either a college, a university or a post-graduate study, while 32% are high school graduates. We can say that the education level has a major influence in assessing the behavior of people with disabilities, in the knowledge that education is directly proportional to the positive responses in terms of acceptance, understanding and helping these people with disabilities. This can be observed from the study because the question of concerning "helping

people with disabilities", 94% of the respondents would be willing to help such a person and 72% of them, have done it already.

Regarding the attitudes of normal people towards people with disabilities in society, it is found that the opinions of those people are divided. On a scale containing five possible answers: from compassion, mercy, acceptance, restraint, and indifference it is found that compared to the normal version of acceptance chosen by 34% of respondents, there is a balance between compassion and restraint (16% of the responses for each question) and an imbalance between compassion and indifference, they have chosen 32% and 2% of respondents (an insignificant percentage). Because according to the glossary "compassion" is associated with a sense of understanding and sympathy to the suffering and misery concerning someone; positive feelings total overall 82% of responses, a sign that these people are understood and are given support from individuals.

Regarding the people's situation in Romania, it is not a very good one because the perception to the human rights of persons with disabilities knows negative aspects. To analyze the situation of peoples with disabilities in Romania there were developed three questions:

1. *"Do you think that there are respected the human rights of people with disabilities in Romania?": 68% consider that the right are not respected, 22% said yes and 10% of them do not know or are not interested.*
2. *"Do you consider that people with disabilities should receive certain gratuities?": 84%, have replied yes and 16% said that they do not.*
3. *"Should programs against discrimination of the disabled, be introduced in schools?": 62% said yes, 16% said no and 22% believe that these things must be learned at home.*

In conclusion, the Romanian society does not help people with disabilities in Romania and the fundamental rights are not respected. In principle these people would be helped by the state through the granting of gratuities and benefits. What is crucial is that programs against discrimination of the disabled should be introduced in schools, because it is known that the children's education must contain rules that causes them to act ethically and morally towards these people.

When asked "What do you think the integration of disabled people in society", the answers "very important" and "Important" occupy the largest share of responses 54% and 28%. We can say that 82% of the respondents believes that integration of persons with disabilities in society is extremely important and agree with this point of view, and consider that such people should not be marginalized.

Also on the problem in terms of employment chances of people with disabilities. In this sense 78% of people with normal capacity to work, inform that employers are reluctant in hiring these people. 80% of those surveyed said they have colleagues at work with disabilities and that there are no cooperation or social issues, but there exists a significant number of people who would not agree to collaborate at work with them, which is concerning because 14% of them answered like this

Regarding the participation of disabled people to the act of tourism, individuals answers were hopeful because even if, as the disabled are not accepted at work, the situation is different in a hotel, 92% of respondents would not be disturbed by the presence of people with disabilities in a hotel where they were individually penned.

When asked "What do you think about tourism products for people with disabilities?" being an open question, respondents were able to freely choose their answers without being restricted by answers.

The answers to the questions above are different and presented in a special way by each interviewee. The most frequent response was *"I have not heard about such products for people with disabilities"* Those who have heard and know these products are of the opinion that the number of products is very small compared to the number of people with disabilities, and that

these products are not known even by the recipients, and are difficult to obtain even if you belong in that category disabled. The most important thing about these products is that it gives people with disabilities the opportunity to socialize and integrate into the society.

Another view of respondents: state organizations, regional and local ones do not offer aid to the disabled.

Regarding the promotion of these products, media channels do not consider this as an important fact and do not promote them because they do not obtain financial benefits. Existing channels that promote such products are local ones but of no national importance.

Other opinions say that those people with disabilities should receive such products irrespective of destination, travel time or means of transport chosen, thus a social development of tourism and also building access roads and other facilities absolutely necessary for each hotel, motel, resort, tourist destination.

6. CONCLUSIONS AND PROPOSALS

Surrounded by negative attitudes, people with disabilities can internalize negative beliefs and attitudes. It is recognized that the nature and severity of disability can affect the scope of activities to which a person can participate, but may also influence how the tourist experience is formed.

After analyzing the data we can say that people with disabilities are accepted in society by all other categories of people by supporting the integration process, respondents have the opinion that this process is of great importance and that it should exist in any modern society; besides the fact that the states must be required to provide the disabled and give certain financial gratuities and psychosocial help.

Most people have the opinion that people with disabilities and people with disabilities face difficulties in finding jobs, qualified or unqualified. Their problems are accentuated and supported by the reluctance of employers, higher health costs and other types of insurances. In addition to these serious problems, these people are refused at interviews because of their condition. Although 86% of respondents would not be "bothered" to work with people with disabilities that is not reflected in obtaining a job, from the individuals concerned.

Granting help to such a person is a fairly widespread phenomenon in Romania, as reflected by the number of responses, which shows a great solidarity among people belonging to all social categories and more than 10% of respondents have in their families people with disabilities and face with all the problems that such a person may have.

The most important person's perspective refers to introducing these special programs against discrimination for people with disabilities in schools. These programs lead to changes in behavior and attitudes towards people with disabilities and disabled. Through these programs there are removed barriers of communication, the emphasis is on socialization and integration, on giving unconditional aid and late but not least social acceptance of each people.

The attitude of respondents should be improved and may even reach some collaborations, events, games and excursions for all people (including people with disabilities). These events have a crucial role in changing the negative aspects and strengthen the already existing ones.

Facilities for disabled people, should be necessarily placed in any institution, means of transportation, hotels, resort, and other accommodations and tourist destinations, etc. These facilities could be regulated by laws, governmental decisions and a supervision is required.

Tourism products for people with disabilities should be promoted on the channels known by the public, the number of products should cover as much of the total number of recipients. This can be done by organizing cyclical products or circuit ones so that in the course of two years all disabled people would enjoy a product of this kind.

START-UP FINANCING SOURCES: DOES GENDER MATTER? SOME EVIDENCE FOR EU AND ROMANIA

Bădulescu Alina

University of Oradea Faculty of Economic Sciences

Although financial resources are very important in SMEs in general, and for start-ups in particular, many entrepreneurs face numerous restrictions in finding sources for start-up financing. The present article aims to investigate the similarities or differences in start-up financing sources due to gender issues, otherwise to investigate if female entrepreneurs use (or have access) different financial sources in the early stage of their business.

As reported by the literature, access to finance is one of the most important issues for SMEs and nascent entrepreneurs. Moreover, among the main financial issues, the first one is the access to start-up finance (Schwartz, 1976; Carter and Cannon, 1992; Johnson and Storey, 1993; Koper, 1993; Van Auken et al, 1993; Carter and Rosa, 1998, FOBS survey 2005). In all sectors, women use for starting up businesses substantially less capital than men. Women encounter, more than men, credibility problems when dealing with bankers. This problem causes important effects concerning the performance, survival and growth of women-run businesses.

The present research focuses on revealing how male and female entrepreneurs face and solve the problem of start-up financing sources. The methodology is based on using the dataset "Enterprises managed by the founder - broken down by gender of the entrepreneur", available in EUROSTAT database. The data selected refers to the start-up financing sources available for European Union and Romania, regarding activities included in NACE: Industry and services excluding public administration and management activities of holding companies and 2005 as time of reference. The data were used to make some comparison between: male versus female entrepreneurs in EU; male versus female entrepreneurs in Romania; EU entrepreneurs versus Romanian entrepreneurs.

The main findings reveal that there are no significant differences between men and women concerning the start-up financing sources. The main sources are the internal ones: own fund and savings (ranging from 82% to 92%), and financial assistance from family and friend (ranging from 25% to 34%), both for male and female entrepreneurs, both for EU as an aggregate and Romania. Among the external sources, bank loans are the most important: they have been indicated by 17% of the females (EU) and 19% of the males, about 10 times more than the other external sources together: capital contributions from other enterprises and venture capital. There are no significant gender differences in EU case, and also there are not in the case of Romania. Apparently, gender does not matter about sources used for start-up financing. The most significant difference concerns the financial support from public authorities as financial source. The number of female entrepreneurs indicating financial support from public authorities as a source for start-up financing represents 6.18% in EU, versus 0.17% in Romania (36 times less in Romania than the EU average), while for men the figures are 4.85% in EU versus 0.30% in Romania (16 times less in Romania). This gap brings again in front of policy responsible the imperative of financially supporting nascent entrepreneurs, as the key to sustainable economic growth.

Key words: entrepreneurship, women entrepreneurship, financial sources for business start-up

JEL code: M13

Introduction

Entrepreneurship is widely considered as a driving force of economic growth, job creation and promoting innovations, and thus, an important focus of economic policies. As a result, the number and incidence of SMEs in the national economies are increasing constantly. Nevertheless, fostering entrepreneurship needs providing fair access to financing. Unfortunately, the access to finance is mentioned as one of the most important barriers (Hughes and Storey, 1994) and in the case of female entrepreneurs, the situation is even worse.

In this paper we are going to investigate the differences (if there are any) between female entrepreneurs and male entrepreneurs with respect to the sources of start-up financing, for EU and Romanian case. The paper is organised as follows: in the first part, we make a brief review of the literature; in the second part we present the methodology used, in the third part we emphasize the main results, and finally we conclude.

1.A brief review of the literature

Start up financing is a major problem for the nascent entrepreneurs, as banks, the most important lending supplier, are reluctant to involve in SMEs financing, for reason related to asymmetrical information - adverse selection and moral hazard. The financial problem is a constant of the entire life-cycle of the SME, but researches showed that the first stage of existence (from idea to start up and then, first steps to development) is more affected by financial restriction than following stages. Especially in the so-called "valley of death" stage, the problems are very serious and most starting entrepreneurs use their own savings, family and business angels support (see Badulescu and Badulescu 2010).

Theoretical explanations of the prevalence of the internal finance (personal savings or retained earnings) in the SMEs case are confirmed by recent European Barometer on Entrepreneurship (EC, 2009). According to this, across all EU Member States, a majority of interviewees agreed that it was difficult to start one's own business due to a lack of available financial support. In Greece, Bulgaria, Latvia, Slovakia, Spain and Romania, 90% or more of the respondents agreed (strongly agreed and agreed) with that statement. At the bottom of the ranking, people in Finland, Austria and the Netherlands agreed with the statement on a proportion of less than two-thirds (56%-63%).

Female entrepreneurs, more than males, face start-up financial difficulties. Start up finance is one of the most cited problems in the case of women entrepreneurs. For example, the most important problems facing women entrepreneurs are – in the opinion of the specialist agencies cited by CEEDR 2000 – as follows:

- Start up finance (indicated by more than 25% as a major problem);
- Finance for growth (indicated by more than 20% as a major problem);
- Discrimination by finance providers (indicated by more than 15% as a major problem). All of these are related to the access to finance.

Among the *four* areas of finance identified as posing problems for women by Carter, S. (2000) and then Carter, Anderson and Shaw (2001), the first one is access to start-up finance (Schwartz, 1976; Carter and Cannon, 1992; Johnson and Storey, 1993; Koper, 1993; Van Auken et al, 1993; Carter and Rosa, 1998, FOBS survey 2005). Irrespective of sector and location, *women start in business with only one-third the amount of capital used by men*. Women are more likely to encounter credibility problems when dealing with bankers. It is difficult to raise start-up finance. Some studies have shown links between low start-up capital and subsequent poor performance. Female entrepreneurs use substantially less capital at start-up than male owners, although intra-sectoral similarities demonstrate that gender was only one of a number of variables affecting the business financing process (Carter S. and Rosa P. 1998). The majority of women business owners have had to rely to a significant extent on self-generated finance during the start-up period of their business. Whilst many small businesses face difficulties in accessing the finance that they

need (particularly at start-up), organizations specialising in providing support for female entrepreneurs clearly feel that this is one area where their clients face greater difficulties than their male counterparts. Shaw, Carter and Brierton (2001) have found research that suggests women face more difficulty when seeking finance to set up and grow their business. They note that women use only one third of the starting capital that men do, irrespective of sector; on-going growth finance may be less available for female owned firms than it is for male enterprises, largely due to women's difficulty in penetrating informal financial networks. More women-owned businesses, for example, used family savings, household income, inheritance, grants and friends as sources of business finance. "In fact, Carter and Anderson (2001) found that women's personal savings constitute between 80% and 99% of initial capitalisation, compared to men where the figure is between 30% and 59%. Although this may seem admirable it can often have a negative effect on the business (Sannikova 2007).

Using a panel of 2000 Dutch start-ups (1994), Verheul and Thurik (2001, p. 14) found out that „female entrepreneurs have a smaller amount of start-up capital than their male counterparts, but that they do not significantly differ with respect to the composition of financial capital". Women start up their business with less capital than men, and this can be attributed to a direct effect („gender effect": men and women having the same characteristics but different with respect to the way of financing their businesses) and to an indirect effect („the female profile": differences related to business type, management and experience)(Verheul and Thurik, 2001). Smaller financial resources to start up business leads unfortunately to less business performance and growth (Welter et al. 2006).

2.Methodology

Aiming to reveal the similarities or differences between female and male entrepreneurs' start-up financing sources, in EU and Romania, we used the dataset "Enterprises managed by the founder - broken down by gender of the entrepreneur", available in Eurostat database. We select from this database the data regarding the start-up financing source available for European Union (aggregate changing according to countries available) and Romania. Available data refers to NACE: Industry and services excluding public administration and management activities of holding companies and to the year 2005.

First, we select the data for the EU, broken by the gender of the founder and manager of the firm and search to arrange the sources for start-up financing starting with the most important, e.g. more nominated by the respondents. Second, we did the same thing for the data available for Romania, sorting them by relevance. Third, we tried to make some comparison between:

- Male versus female entrepreneurs in EU
- Male versus female entrepreneurs in Romania
- EU entrepreneurs versus Romanian entrepreneurs.

3.Discussion and results

As the literature reported, and according to expectations, the main source for start-up financing used by women nascent entrepreneurs in EU are the own funds and savings. More than 4 out of 5 cited own funds and savings as a source for start-up financing, followed by the financial assistance from family and friends, reported by 3 out of ten women entrepreneurs. Far from these internal sources, the external sources are barely mentioned. Even we approach bank loans together - with and without collateral – they are mentioned by only 1 out of 6 of the respondents. If we approach separately bank loans without and with collateral, the third source appears to be The financial support from public authorities (mentioned by 6% of the respondents). Capital contributions from other enterprises and venture capital are nominated by only 1.34% of the women entrepreneurs. The complete picture is shown below:

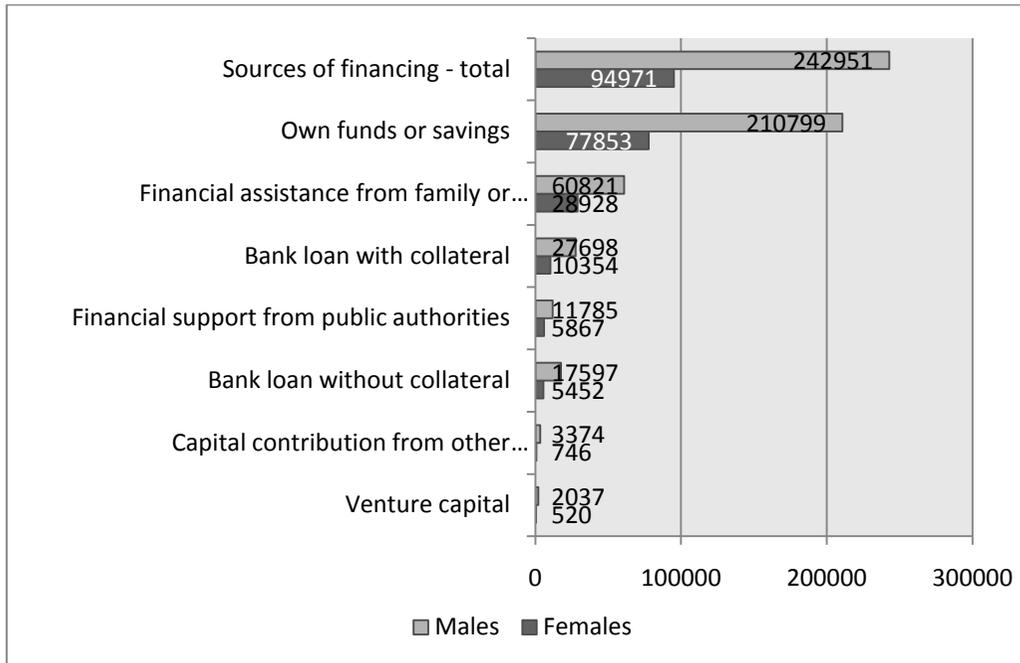

Chart 1. Sources for start-up financing, NACE industry and services, EU, males and females, 2005

Source: based on Eurostat database

Basically, the same ranking applies for men entrepreneurs. Own fund and savings, and financial assistance from family and friends are the first two sources for start-up financing. Own funds and savings are mentioned by 87% of the men (even more than the 82% in the case of women), while financial assistance from family and friends is mentioned by 25% of the men (less than the 30% indicated by women). This little difference can be attributed to the fact that men may have (or may consider that!) more personal money than women, so essentially the same money are, for men, own fund, and for women, family's money. It may be also an indication of the less effective networking in the case of women (explaining why financial assistance from friend is less important than in men's case. And also, do not forget that women have more women friends (with less financial resources) and men have more men friends. Bank loans with collateral are the third financing source. Together, bank loans (without and with collateral) are indicated by 18.64% of men (versus 16.64% of women). Financial support from public authorities (mentioned by 4.85%) and capital contributions from other enterprises and venture capital (mentioned by 2.23% of the respondents) are still marginal sources.

In the case of Romanian entrepreneurs, the picture is mainly similar, as expected. The main source is, far from the others, own funds or savings, indicated as financing sources by 90% of the female entrepreneurs and even more by male entrepreneurs. The second source is financial assistance from family and friends (indicated by 1 out of 3 entrepreneurs, males and females). Bank loans are indicated by 7% of the Romanian female entrepreneurs, and 9.24% of the Romanian male entrepreneurs (for comparison, bank loans have been indicated by 17-19% in EU case). Capital contribution from other enterprises and venture capital are almost not used as start-up financial sources. Financial support from public authorities is effectively non-existent, with 0.17% of the females and 0.30% of the male entrepreneurs indicating as a start-up financial source.

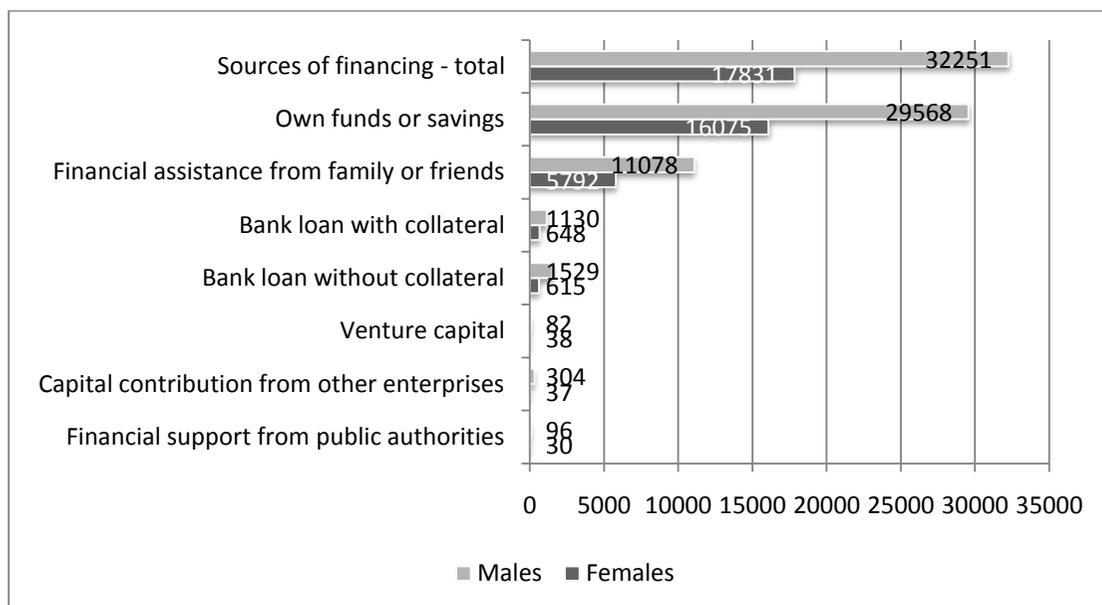

Chart 2. Sources for start-up financing, NACE industry and services, Romania, males and females, 2005

Source: based on Eurostat database

4. Conclusions and further implications

Main sources for start-up financing remain internal sources: own fund and savings, and financial assistance from family and friend, both for male and female entrepreneurs, both for EU as an aggregate and Romania, a new member state and still developing economy. Regarding the external sources, bank loans are the most important: they have been indicated by 17% of the females (EU) and 19% of the males, about 10 times more than the other external sources together: capital contributions from other enterprises and venture capital. There are no significant gender differences in EU case, and also there are not in the case of Romania. Apparently, gender does not matter about sources used for start-up financing. The access to external financial sources is restricted for entrepreneurs of both genders: only 1 of 6 nascent entrepreneurs has access to them. The complete picture and comparison are shown in Table 1.

Table 1. Sources for start-up financing: males versus females, Romania versus EU (2005)

Source for start-up financing	Indicated by ... % of the females (EU)	Indicated by ... % of the females (RO)	Indicated by ... % of the males (EU)	Indicated by ... % of the males (RO)
Own funds or savings	81.98	90.15	86.77	91.68
Financial assistance from family or friends	30.46	32.48	25.03	34.35
Bank loan without collateral	5.74	3.45	7.24	4.74
Bank loan with collateral	10.9	3.63	11.4	3.50
Capital contribution from other enterprises	0.79	0.21	1.39	0.94
Venture capital	0.55	0.21	0.84	0.25

Source for start-up financing	Indicated		Indicated		Indicated		Indicate	
	by ... % of the females (EU)	by ... % of the females (RO)	by ... % of the males (EU)	by ... % of the males (RO)	by ... % of the males (EU)	by ... % of the males (RO)	by ... % of the males (EU)	by ... % of the males (RO)
Financial support from public authorities	6.18	0.17	4.85	0.30	4.85	0.30	4.85	0.30

More than gender seems to matter the development stage and/or public involvement in policies and programmes fostering entrepreneurship. The most significant difference revealed by the data is related to the financial support from public authorities. The number of female entrepreneurs indicating financial support from public authorities as a source for start-up financing represents 6.18% in EU, versus 0.17% in Romania (36 times less in Romania than the EU average), while for men the figures are 4.85% in EU versus 0.30% in Romania (16 times less in Romania). Probably the gap is even bigger now, after implementing numerous European programmes in fostering women entrepreneurship.

After all, if gender does not matter, there other things that matters: entrepreneurship policies! Some further research can be carried out regarding other things that matter: economic sector can be one, so different NACE in the EU database are to be studied further. And further policies should be enforced to promote, foster and support (financially included!) entrepreneurship, as an important key to economic growing and social progress.

COLLATERAL'S IMPORTANCE IN SMES FINANCING: WHAT IS THE BANKS' RESPONSE? SOME EVIDENCE FOR ROMANIA

Bădulescu Daniel

University of Oradea Faculty of Economic Sciences

Petria Nicolae

"Lucian Blaga" University of Sibiu Faculty of Economic Sciences

Searching for funding, SMEs' managers face various obstacles arising from information asymmetry, lack of experience, severe market conditions, and insufficient or unsatisfactory collaterals for banks (OECD 2006; Bădulescu and Bădulescu 2010; OECD 2000 and 2004; Lin and Sun 2006; Toivanen and Cressy, 2000). The collateral issue is extensively discussed in literature – preventing moral hazard, the alignment the interests (Stiglitz and Weiss 1981:393-410; Chan and Thakor 1987:345-363; Jiménez and Saurina 2004), a means to discipline the borrowers behaviour (ex post) given the existence of a credible threat (Aghion and Bolton 1992:473-494), or even banking behaviour on the market (Manove et al. 2001:726-744, Argentiero 2009). In the same time we find that the perception of firms, revealed by National Bank of Romania (NBR 2010) survey data, show that banks still use the collateral as a measure of pressure, in special in crisis times. For an important part of managers, the bank increased the level of required collateral for existing, renewing or new credits, asking for new covenants, revealing a paradox of crisis time: while the bank loans remained the favourite method of external financing needs of business, the banks often reduce their availability. Although the bank loan remains the favorite mean to support the growth ambitions, the higher level of collateral or lending costs are seen as principal obstacles by the majority of manager in EU. According to NBR survey, the influence of risk factors related to collateral had a climax at the end of 2008 and 2009, when the banks have tightened the requirement for loan guarantee. Using National Bank of Romania (NBR 2010) survey data, we show that the banks still use the collateral as a measure of pressure, in special in crisis times. For an important part of managers, the bank increased the level of required collateral for existing, renewing or new credits, asking for new covenants, revealing a paradox of crisis time: while the bank loans remained the favorite method of external financing needs of business, the banks often reduce their availability. According to NBR survey, the influence of risk factors related to collateral had a boom at the end of 2008 and 2009, when the banks have tightened the requirement for loan guarantee. Following the European trend in straightening the credit conditions, Romanian market had a more pregnant evolution with a rapid deterioration of these conditions during the second and the third quarter of 2008. In general terms, the seeking for higher percentage of coverage with real estate collaterals, paradoxically, makes banks more vulnerable, given their pro-cyclical behaviour, feeding the real estate market crisis.

Key words: SMEs lending, collateral, credit standards

JEL code: G21

Introduction

This paper aims to emphasize the importance of collateral in credit risk management, how collateral influences market behaviour of banks and customers selection, but also the excessive focus on collateral coverage during crises times. In the first part, we will review the main theoretical approaches regarding the collateral and its importance for the credit risk management. In the second part we will emphasize the importance that SMEs give to the relationship with

financing institutions, and the expectations and obstacles in credit use as important mean for growth. We will detail Romanian experience starting from NBR surveys, and we show that banks' response to crisis in 2009-2010 was to restrain lending, to tighten credit requirements (collateral, costs and covenants) and to enhance caution to real estate market. Finally, we conclude on the banks' behaviour and responses and on the consequences of this attitude on the economy.

1. Overview on the banks' policy regarding collaterals required from SMEs

Focusing on value creation and based on accepted and controlled risks (OECD 2006; Pathrose 2005), banks are often reluctant to grant loans to SMEs. This fact is due to some reasons, such as:

- informational asymmetry, resulting from the lack of standardized financial information and statements provided by SMEs, adding the bank's limited knowledge about the company seeking a loan (Badulescu and Badulescu 2010);
- higher risks associated with SMEs lending, due to limited assets that can be used as collateral, low capitalization and vulnerability to market risks;
- besides the fact that small enterprise cannot provide adequate collaterals, they hardly convince the banks about their managerial and marketing abilities or technical skills, that are essential to generate adequate cash flows and a proper debt service.

On a first sight, the financing provided to SMEs – various, in small amounts and in a reduce typology compared to large companies – could involve lower cost of transactions; however, the situation is, in fact, different. The costs involved by the analysis of the application and disbursement of a loan are generally independent of the requested amount and usually comprises other fixed costs as legal taxes, costs to obtain risk information from specialized agency etc. (OECD 2006). In the case of small amounts, it is very difficult to recover a total cost, and the unique solution could be a strict control of them by standardizing the credit types, reducing the processing time etc. Implementing a scoring system can be a way to consistently reduce and uniform the transaction cost, but this step involves an important database for calibrating, major changes in borrower and lender mentality, and it shows real efficiency only for credit institutions with lots of loan application from SMEs.

Collateral impact on credit risk, and, in a macroeconomic perspective, on the supply of credit to the companies, in special for SMEs, is a topic attracting a constant and increasing concern in recent years. From the theoretical point of view, we find two alternative interpretations that lead, empirically, to different predictions. On the one hand, is the adverse selection problem faced by a bank in financing activity, and therefore, the security offered by debtors can help alleviate this problem (Stiglitz and Weiss 1981:393-410; Chan and Thakor 1987:345-363). Thus, low-risk borrowers are willing to offer a better guarantee, considering their lower risk as a signal for their capabilities fulfil its obligations under the credit agreement and, therefore, are less probability to lose the guarantee. The guarantee is interpreted as a signal that allows the bank to reduce or eliminate the adverse selection problem caused by the existence of informational asymmetries between the bank and borrower, when the loan was approved, (Jiménez and Saurina 2004).

On the other hand, is the opinion, that even there is a *ex ante* symmetry between debtor and creditor (for example, the bank knows the quality of the debtor and correctly predicts the role of loan), guarantees are designed to mitigate the moral hazard problem once the loan was granted. In this respect, the security engaged helps to align the interests of both, creditors and debtors, thereby avoiding a situation where the borrower makes less effort to ensure the success of the project for which funding was granted. Security becomes a means to discipline the borrowers' behaviour (*ex post*) given the existence of a credible threat (Aghion and Bolton 1992:473-494).

Starting from this view, we can expect to find a direct relationship between loan quality and/or the borrower, and the size of collateral, i.e. the assumption that the guarantee is a signal of high

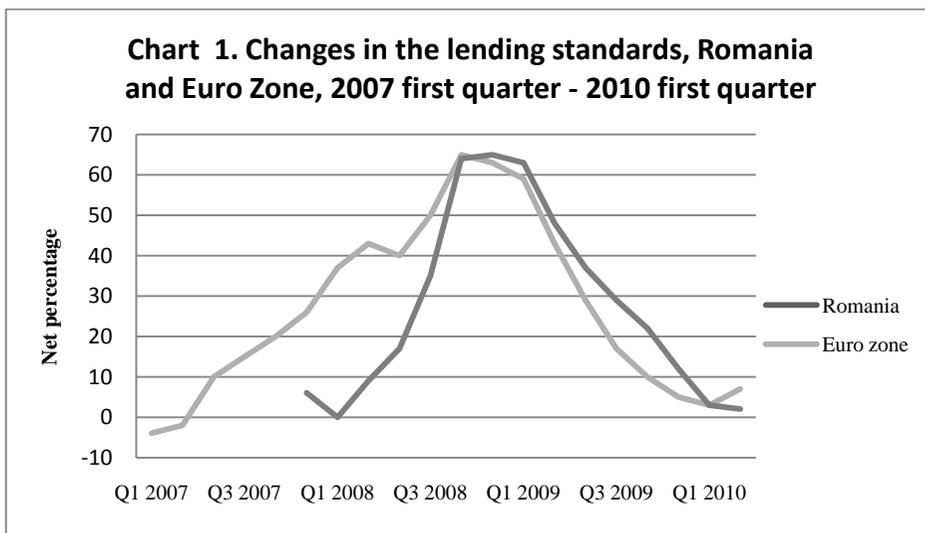

quality borrowers. However, this hypothesis is not agreed by the bankers, who tend to establish a direct relation between the level of credit risk and the volume of collateral.

2. Banks versus customers on SMEs financing. Evidence from Romania

For Romania, the analysis can be completed with another perspective, on the other part involved - the central and commercial banks, and we notice a pattern similar to the EU's one, but sometimes adapted to the specific conditions of the Romanian economy and its response to the crisis. According to the NBR quarterly survey on lending for non financial sector and population (NBR, 2010), lending standards have remained mainly unchanged over the first part of 2010. The degree of accumulated restrictiveness seems to be deemed sufficient in the current economic context, based on the fact that 2009 was characterized by a relatively continuous process of tightening of these standards (see note, NBR, February and August 2010).

According to these researches, the companies associated risks increased throughout the economy, particularly in the construction and real estate sectors and, as confirmed by above data at EU level, corporations have shown, for the first time in Romania last decade, a significant growth risks.

At the aggregate level, lending standards (internal lending norms guiding the credit policy of the credit institutions) were slightly tightened in the fourth quarter of 2009, but remained relatively unchanged in the first half of 2010. The recent developments and projections for the next period, shows that the degree of restrictiveness of credit standards seem to be sufficient in terms of risk aversion of banks in the current economic conditions. It notes, however, that neither the euro area cycle tightening of credit standards is not completed, the level of restrictiveness increased in the first quarter of 2010 (NBR, February and August 2010)

Sources: National Bank of Romania, Bank lending survey, February and August 2010, <http://bnr.ro/Studies-3215.aspx> și European Central Bank, The Euro Area Bank Lending Survey - April 2010, http://www.ecb.int/stats/pdf/blssurvey_201004.pdf?0bd480f0b472e26541e56c7c1a5f4dff

In structure, slight tightening of lending standards of banks in Romania doesn't concern the company size (SMEs. Vs. Corporations), but rather the criterion of maturity. However, the perception of risk to SMEs remains higher than corporate, explaining the reduce availability of bank loans for SMEs. Among the main factors which led banks to change lending standards (as the economic prospective, the risk associated with the industries) were the increasing share of nonperforming loans in the portfolio, the risk of required collateral / security (see Table 1).

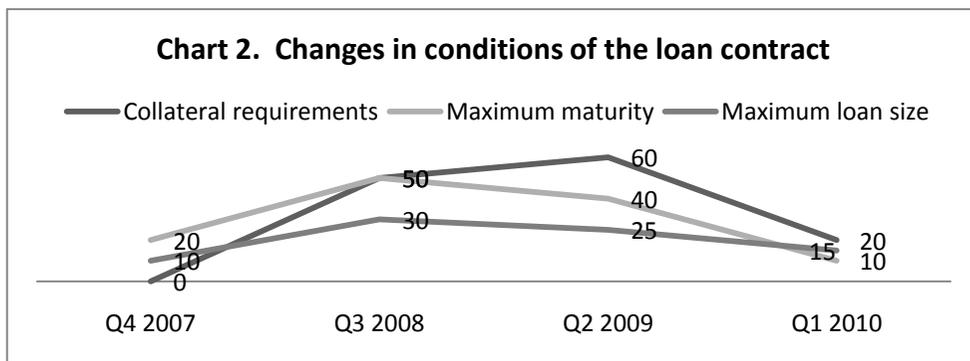

Table 1. The influence of risk factors related to collateral, by type of companies (net percentage)

Companies (loans)-period	Companies Total (%)	Large companies		SMEs	
		Short term loans (%)	Long term loans (%)	Short term loans (%)	Long term loans (%)
Q4 2007	20	50	60	40	40
Q3 2008	40	90	90	50	70
Q2 2009	80	60	50	60	60
Q1 2010	20	30	30	10	10

Source: National Bank of Romania, Bank lending survey, February and August 2010, <http://bnr.ro/Studies-3215.aspx>

Regarding the changes in lending terms and conditions (the specific obligations agreed between creditor and debtor in the credit agreement signed, i.e. interest rate, collateral, maturity, etc.), we notice a clear tightening in the second quarter of 2010, at the same pace as in previous quarters. Terms under review were mostly those related to collateral, given that over 75% of non-financial credit is collateralized. Frequently, banks alternate between increasing the costs or decreasing the maximum available loan.

According to reporting banks, the LTV (loan to value ratio, i.e. maximum share of credit in the amount of real estate collateral) for loans on the balance at the middle of 2010, secured solely by mortgages, stands at 87%. In the case of new loans granted in first part of 2010, banks had a more cautious attitude, the same indicator was 76 percent (NBR, February and August 2010).

Source: National Bank of Romania, Bank lending survey, February and August 2010

Conclusions

As conclusion, we can notice that banks still try to avoid moral hazard in the relationship with borrowers – i.e. SMEs, as that moral hazard can increase in crisis period. Banks have only secondary interest in the informational asymmetry issue. We also have found that the tightening of non-price conditions (i.e. collateral) has been used as a recovery practice in order to cover the macroeconomic or specific sectors risks increasing the size of collateral, often unrelated to individual performance of the companies. Moreover, increased propensity for real estate collateral, accompanied now by more pessimistic assessment of market value (see LTV development, specified above) seems to indicate an emphasis on limited perspective, only seeking for extended credit risk coverage, but ignoring the emergence of a new risk, the risk of collateral. It seems that the link between the bank propensity for fixed collateral and cyclicity of

real estate market (see Kim, Y.-J., Lee, J.-W 1999, FDIC, 1998) is not yet seen by the banks as a valid threat. The supervisory authorities' efforts to mitigate this pro-cyclical behaviour haven't got the desired effect.

Note: 1. Interpretation and presentation of answers was based on the *net percentage*, given the difference between the share of banks that reported tightening standards, terms and conditions of lending, and the percentage of banks reported easing of these, a positive short term balance indicates that a larger proportion of banks have tightened lending standards (NBR , February and August 2010).

THE BRAND EQUITY OF TOURISTIC DESTINATIONS – THE MEANING OF THE VALUE

Olimpia Ban

University of Oradea Faculty of Economics science

Luminița Popa

Simona Silaghi

University of Oradea Faculty of Economics science

In today's global economy, each place competes with other places for economic benefits. Destination has become a product that has to be promoted and sold in the most advantageous terms. The work below is an analysis of "brand equity" concept for touristic destinations, as found in the specific literature. Destination brands differ from product brands, major distinction being given by their stability/ instability. Brands of products are stable; this constant is maintained by the use of quality standards. Even in case of services, situation can be controlled, as quality standards could be perpetuated by a franchise system. Destinations are not depending on a single person, who decides, but a variety of them, economic agents, businesses, institutions and local population that can create/print form and structure changes of the destination.

The concept de brand equity applied for touristic destinations, is something relatively recent. The dimensions of a brand for touristic destinations are: awareness, image, loyalty, quality and value. All these dimensions build the branding equity of a destination. There is interdependency, between quality, image, loyalty and value. In order to determine the perception in regards to the quality of tourism services in Romania, in 2010 a comprehensive study was done among the inhabitants of Oradea city. Through this study we have pursued several objectives: to assess the importance of service characteristics, performance evaluation of tourism services in Romania, tourism personnel evaluation, in terms of evaluation and performance, perception of the quality-price ratio for Romania, compared with other tourist destinations. We call on the exploratory study conducted, as the value of the dimension- destination of the brand equity is given by the price-quality ratio. Using an explorative study on the market of Oradea city, it was highlighted the connection between perception of touristic services, estimation price-quality (value) and the loyalty potential of the foreign clients in proportion with the Romanian tourists, consumers of the Romanian touristic products.

Keywords: brand equity, destination, tourism, survey, Oradea

Code JEL: M21, M31

1. Introduction in the „brand equity” of a destination:

In relatively recent works, branding was treated as an essential subject (Aaker 1996), (Aaker and Joachimsthaler 2000), (Kania 2001). Modern branding appeared in the XIXth century and includes legal instruments as: logos, campaigns, identity systems, personality and the links between them. In tourism, branding is understood as being "(...) a unique combination of product characteristics and added values, both functional and non-functional, which have taken on a relevant meaning which is inextricably linked to the brand, awarenesses of which might be conscious or intuitive.(Morgan 1998: 140)"

Destination branding is even more recent. Among the first books that were exclusively dedicated to this subject, we mention *Destination Branding* (Morgan, Pritchard and oger Pride:2002), and also the published works in special number of the Journal of Brand Management (Hall:2002),

(Harrison: 2002) and (Morgan, Pritchard and Piggott: 2002). When talking about touristic destinations, brand equity is still a vague concept. The theoretical delimitation of this subject is still subject of changes. Brand equity is the process of not only establishing the characteristic of a brand, but also establishing the value of that characteristic. It comes from the financial evaluation literature of the 1990s (Barwise 1993). Aaker and Joachimsthaler (Aaker and Joachimsthaler 2000), both had an important contribution to the theoretical substantiation of brand equity. They launched the idea that the value of a brand is given by the: awareness of the brand, perceived quality of the brand, brand associations and loyalty for the brand. Hankinson completed the theory of brand value, by adding the concept of *brand network*, where the destination brand has four functions: (1) as a communicator, when the brand “represents a mark of ownership, and a means of product differentiation manifested in legally protected names, logos, and trademarks”; (2) as a perceptible entity “which appeal to the consumer senses, reasons, and emotions; (3) “brands as value enhancers,” that leads to the concept of brand equity; and (4) “brands as relationships, where the brand is built with personality and establishes a form of relationship with the consumer. (Hankinson 2004: 110–111), (Blain, Stuard and Ritchie 2005: 329).

Using the brand is one of the primary forms of product differentiation. The question is to what extent branding as part of marketing strategy can be used to create brand equity for a touristic destination that is not yet known, virtually the same time seeking notoriety and differentiation. There are opinions that say that this is possible. (Room 1992:13–21)

For a consumer, brand evaluation is simple. Brand equity value is given by the difference in price between a generic product and an equivalent one that “has a name”. This reference to generic products is increasingly difficult, as almost all generic products do not exist anymore. In regards to the touristic destinations, the brand equity evaluation method requires changes, as the comparison “on the shelves of a store” is not possible. In case of tourism destinations, the indicators used for assessing brand equity is: the number of tourists who choose a destination, the volume of expenditure made in that destination and the length of stay.

2. The dimensions of tourism destination brand

The experiential factor marks a significant difference between products and destinations. A destination cannot be tried, seen before purchase and consumption, therefore the idea of having a guarantee is excluded. The touristic product of a destination product is experiential by nature and it differs for each customer because of the internalization of the experience.

Novelty is essential to differentiate destinations. Tourist trip requires differences between place of residence and destination, among other destinations and chosen destination. This is why, in many promotional messages, the novelty is found even in the title or slogan. (Pride 2007)

A destination must be different from many points of view to worth the time and the money, but the novelty cannot be simply declared, it must be demonstrated -”novelty cannot simply declared, it must brand equity earned” (Cai, Gartner and Munar 2009: 54)

Novelty given by the destination is recognized in the perception of the consumers - consumers must be aware of the differences between their residency and other destinations. The dimensions of “destination brand” are different than the product brand, although mainly follows the same steps. Theorists and practitioners support the idea that places are being branded the same as products and services are. Kotler extended the concept of brand from products to destinations.

Konecnik and Gartner (Konecnik and Gartner 2007: 400–421) have proposed four dimensions that can be applied to destinations: **awareness, loyalty, image and quality**. Tasci, Gartner and So (Tasci, Gartner and So 2007) have added another one, **the value**, which we consider to be appropriate.

Different consumer segments evaluate each of these dimensions in different and significant ways.

- **Awareness** is an essential dimension of the brand. It is the first step in building brand equity. A place can be known in a certain context before it can be considered a potential destination. Goodall (Goodall 1993) identified four levels of awareness of a place: knowledge, familiarity, top of mind and dominant. Dominant has here the meaning of the spotlight for various reasons, it is what is called a "hot spot" and may be positive or negative in nature.

- **The image** is the dimension that attracted the most attention of researchers, there are a considerable number of articles on this subject. Initially it was thought that the image can substitute for the other dimensions of the brand, but this opinion has remained isolated. The roots of the brand are reflected in the destination image studies initiated since the 1970s (Hunt 1975) Creating a brand does not mean branding, though it's the base of the brand-building. Building the image is one step closer to the brand, but what still lacks is the **brand identity**. (Cai 2002)

Loyalty is given by repeat visit or repeat purchase.

- **Quality** is a subjective term, but can be operationalized through a series of scales. As an independent dimension (and not subject to image), it has been studied by many researchers (Fick and Ritchie 1991); (Murphy, Pritchard and Smith 2000). Quality is assessed from consumer's perspective, in fact the quality perception is evaluated. Quality is a key dimension of brand equity of a product and maintaining it is mandatory, this rule extends to the tourism destination as well. Establishing and maintaining a quality level for a destination requires controlling all products and services "supplied" by the destination and this is something very difficult to realize. On a tourist destination, the quality can be ensured only in regards to the common objectives such as museums, reservations etc. but it is perceived in regards to accommodations and individual services. The brand is a guarantee of quality (of a certain quality). Consumers expect and are willing to pay extra for the peace of mind that a brand is providing them. "At the Same Time, visitors can also expect to pay a premium for this assurance of quality and reduction of perceived risk." (Blain, Stuarda and Ritchie 2005: 330)

- The brand equity **value** is the most recently studied dimension and is seen as part of quality, **reflected in the price paid for a product**. The importance of price in the evaluation of BE was recognized by several researchers (Echtner and Ritchie 1993). However the price is not synonymous with quality. Value does not refer to quality or price, as much as it refers to favorable or not-favorable price-quality ratio. For example, a services package can be seen as valuable, not at the expense of the high quality services, but at the expense of quality-price ratio. Consumer segments related to mass tourism focus more on value, understood as "fair value for the money".

Operationalizing the dimensions by a scale of measurement is a necessary precondition in order to isolate the dimensions of the destination.

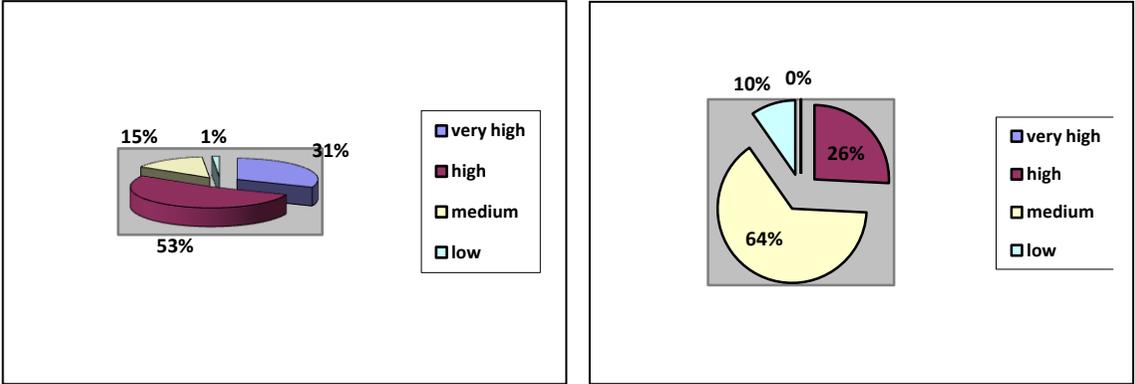

3. Research methodology and results

The research was conducted in two stages: March-April 2010 and March-April 2011.

The first phase was conducted in March-April 2010 on a sample of 1060 people from the population of Oradea city. The sampling method chosen was the stratification method (with a margin of error of 3%) and the used criteria was the age. After the criteria the distribution was chosen, as follows: 150 people aged 18-24 years, 234 people aged 25-34 years, 208 people aged between 35-44 years, 192 people aged 45-54 years, 152 people aged between 55-64 years, 124 persons aged between 65-80 years. There were investigated persons who benefited of accommodation at least once during the period 2007 - until the time of the survey. The purpose of the research was to investigate Oradea's population level of satisfaction in regards to the quality of tourist/guest services and the quality of tourism personnel services in Romania, and the results were presented in the paper "Guest services quality assesment in tourism, using an attributes scale" (Ban and Popa 2010)

The second stage of the research was conducted between March-April 2011 on a sample of 62 people, consisting of foreign tourists present in Oradea and the surrounding area, therefore active consumers of tourism services in Romania. The distribution of the sample, based on age criteria is as follows: four persons aged between 18-24 years, 6 persons aged between 25-34 years, 20 people aged between 35-44 years, 22 people aged between 45-54 years, eight persons aged 55-64 years, two persons aged 65-80 years.

The investigation on the price level perception of Oradea`s population, has produced the following results: more than half (52.6%) believe that the level of prices in Romanian tourism is high, while a percentage of 31.1% believe that the prices are prohibitively high. Summing up the percentages, 83.7% believe that the level of prices in Romanian tourism exceed far beyond what consumers are willing to pay. Only a percentage of 14.7% believe that prices are right, at a medium level, while only 1.6% of the respondents believe the Romanian tourism prices are low. Unlike the Romanian people, a percentage of 64.5% of the foreign tourists consider that the prices of tourism services in Romania are at a medium level and only 25.8% consider that the prices are at a high level. No foreign tourist investigated in this research considered that the price level is **very high**.

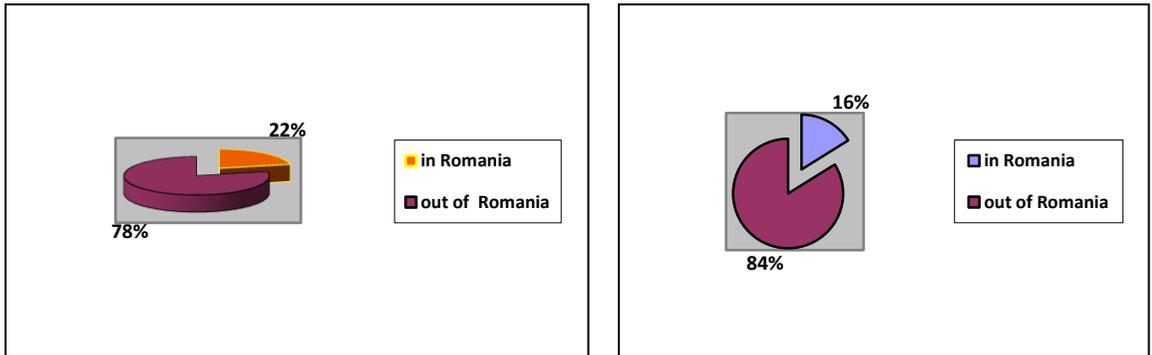

(produced by the authors)

**Figure 1 (a) Opinions of Oradea`s population in regards to the prices of tourism services
(b) Views of foreign tourists in regards to the prices of tourism services in Romania**

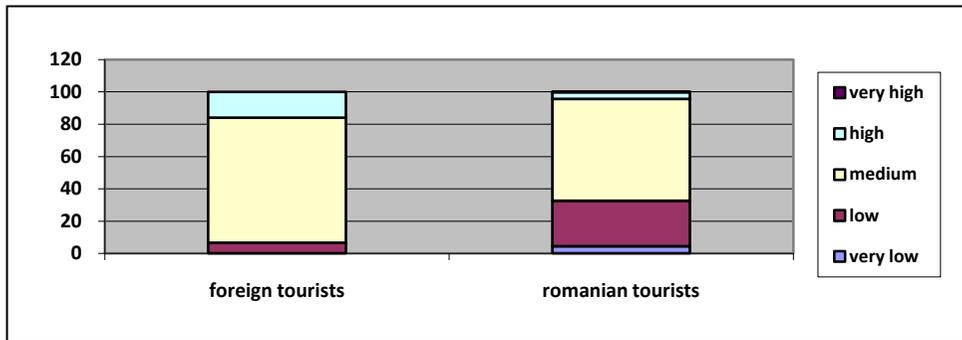

Any assessment of cost is directly or indirectly in relation to the perceived value of the product. Regarding the option for their future vacation destination, it is not surprising the relatively small percentage of those who chose Romania, but the fact that the values recorded for Oradea`s population and foreign tourists are close. The premise was that many more Romanians would choose Romania.

By using the SPSS software, was verified the type of link that exists between the desire of the foreign tourists to return to Romania (loyalty required by the brand equity) and their evaluation of the quality of tourism services in Romania. A positive correlation was identified, with a very high level of significance, which supports the idea that the choice of a tourism destination is based on the perceived quality of tourism services of that particular destination.

(produced by the authors)

Figure 3. Oradea inhabitants' opinions in regards to the quality of tourism services in Romania and of foreign tourists' opinions on the quality of tourism services in Romania

4. Conclusions

The increase of the brand equity of a destination is a natural goal. The dimensions of the brand of a tourism destination are: awareness, image, loyalty, quality and value. These dimensions are building the brand equity of a destination. Between quality, image, loyalty and value there is interdependence.

The exploratory study performed on Oradea's market highlighted the link between perceived quality of tourism services, "value for money" assessment of tourism services (the value) and the potential of customers' loyalty. The results of the study conducted on foreign tourists have shown that a perception of high or very high quality of services is directly related to the option of visiting Romania and hence a perception of a medium or low quality of tourism services is related to the intention of choosing another destination. The percentage of those who wish to return to Romania is low, only 16%.

The perception of poor quality tourism services is also related to the big picture, as the countries in Central and Eastern Europe are associated with inconsistent quality, poor service of bad quality, poor quality of accommodation (Hall, 1999).

The effort of changing the reality of tourism services in Romania has to be supported by the effort of changing the image-umbrella of an entire geographic region.

COMPARATIVE STUDY REGARDING OVERNIGHTS REGISTERED IN THE MEMBER STATES OF THE EUROPEAN UNION AND ROMANIA, DURING JUNE-SEPTEMBER 2009/2010

Borma Afrodita

University of Oradea Faculty of Economics

Second year PhD student at the University of Oradea, under the guidance of Prof. Alina Bădulescu, within the Doctoral Research Project entitled „Doctoral studies and phd candidates for a competitive research in a knowledge-based society,” (01.10.2009-01.10.2012), I chose the presentation of this theme because after studying a number of statistics presented by Eurostat (Statistics in Focus 53/2010, 6/2011, 19/2011 etc.) we could not ignore the alarming situation regarding the number of overnights registered throughout Romania, in comparison with the other Member States of the European Union. By choosing the following research theme: „Tourism and development in the euroregional context” I felt the need to find out more answers regarding the afore mentioned problem. In consequence I started to consult the statistics recorded in our country concerning the number of overnight stays registered in Romania during the period June-August 2009/2010, in order to check whether an error has sneaked in.

Metodologia de cercetare utilizată a constat în utilizarea site-ului insse.ro, în vederea culegerii datelor reprezentative pentru perioada iunie-septembrie 2009/2010, cu privire la numărul de înnopțări petrecute de turiștii români și străini în România. The research methodology employed consisted in the use of the insse.ro site, in order to gather representative data for the period June-September 2009/2010, regarding the number of nights spent by foreign and Romanian tourists in Romania. Pentru ca acest studiu sa fie și mai reprezentativ am stabilit principalele zone turistice ale României preferate de turiștii români și străini. For this study to be even more representative I have established Romania's main touristic areas preferred by Romanian and foreign tourists.

În urma datelor culese sa confirmat, din păcate, situația prezentată de Eurostat în tabelul de la începutul lucrării cu privire la numărul de înnopțări înregistrate la nivelul României. Following the data collected, unfortunately, it has been confirmed the situation presented by Eurostat in the table at the beginning of paper on the number of overnight stays registered in Romania. Conform datelor prezentate în acest tabel, România se situează pe ultimul loc la nivelul UE, înregistrând în 2010 un procent de doar 15% din totalul nopților petrecute de ne-rezidenți la nivelul țării noastre. According to the data presented in this table, Romania ranks last in the EU, registering in 2010 a rate of only 15% of total nights spent by non-residents in our country.

Am încercat de asemenea să găsesc răspuns la următoarele întrebări: I also tried to find answer to the following questions:

Care sunt zonele turistice preferate de români? Which are Romanians' favorite touristic areas?

În ce zonă turistică a României sa înregistrat cel mai mare număr de înnopțări al turiștilor străini? In which tourist area of Romania has been recorded the highest number of overnight stays of foreign tourists?

De ce numărul de nopți petrecute de străini în România este atât de mică? Why? Why? Why? Why the number of nights spent by foreigners in Romania is so small?

Care sunt principalele curențe ale turismului românesc? Which are the main shortcomings of Romanian tourism?

La ultimele două întrebări am încercat să răspund cu ajutorul unor experți în domeniul turismului, care consideră că deși curențele prezentate există de mai bine de 10-15 ani, demersurile întreprinse în vederea ameliorării acestora, se realizează cu pași de melc. For the last two questions I tried to answer with the help of some experts in tourism, who consider that

although there presented inadequacies exist for more than 10 to 15 years, the steps taken for their improvement are achieved with the slowness.

Uniunea Europeană, România, numărul de înnoptări, rezidenți, ne-rezidenți **Keywords**
Keywords: European Union, Romania, the number of overnights, residents, non-residents

Coduri JEL:

JEL Codes: A 12

1.Introduction

Conform datelor furnizate de Eurostat în lucrarea *Statistic in Focus 19/2011:1-2*, în vara anului 2010, turismul a înregistrat creșteri semnificative față de vara anului 2009, în majoritatea țărilor europene

The second research paper in the doctoral thesis, based on the theme „Tourism-regional development relationship in economic theory”, we considered analyzing the situations of the overnights registered within the EU member states, detailing the indicator for Romania, for the main tourist regions.

According to data supplied by Eurostat *Statistics in Focus 19/2011 work: 1-2*, in the summer of 2010, tourism has registered significant growths compared to the summer of 2009, in the majority of the European countries. (*Statistics in Focus, nr.19/2011*)

Table 1. Nights spent in hotels and similar establishments, non-residents and residents, in EU (June-September 2010 compared with the same period in 2009).

Both in summer 2009 and in 2010, 70% of the number of nights recorded in tourist reception structures (with tourist accommodation functions) in the EU, are held by five countries namely: Italy (18.3%), Spain (18.1%), Germany (12.9%), France (11.4%) and United Kingdom (9.6%). (Table 1).

2. Comparing the number of nights spent by resident and non-resident tourists at the EU level during June-September 2009/2010

Numărul de înoptări înregistrate de **ne-rezidenți** (2) în sezonul de vară (iunie-septembrie) din 2009-2010.

The number of overnight stays by **non-residents** (2) in summer (June-September) of 2009-2010. In Table 1, it can be observed that among non-residents' favorite destinations are Spain, Italy and Greece (in 2009 as well as in 2010) these take hold of almost half of all those nights recorded in the EU. Proceeding with the comparison of the two years (2009 and respectively 2010) can be seen that the number of overnights spent by non-residents recorded an increase in 2010 in all member countries, except United Kingdom.

Thus, in 2010, the most representative increases, of over 80%, are registered in Cyprus and Malta (89.7% and 96.4%) and the lowest increase, of only 15%, in Romania. (Statistics in Focus 19/2011: 2)

The number of overnight stays by **residents** (3) in summer (June-September) of 2009-2010.

Following Table 1, in terms of resident tourists, in 2010 can be observed an increase in the number of overnight stays from 2009 in most member states of the EU, except in the following countries: Romania (-14.8%), Cyprus (-10.7%), United Kingdom (-8.1%), Slovenia (-6.7%), Malta (-6.2%) and Italy (-2.9%). (Statistics in Focus 19/2011: 2)

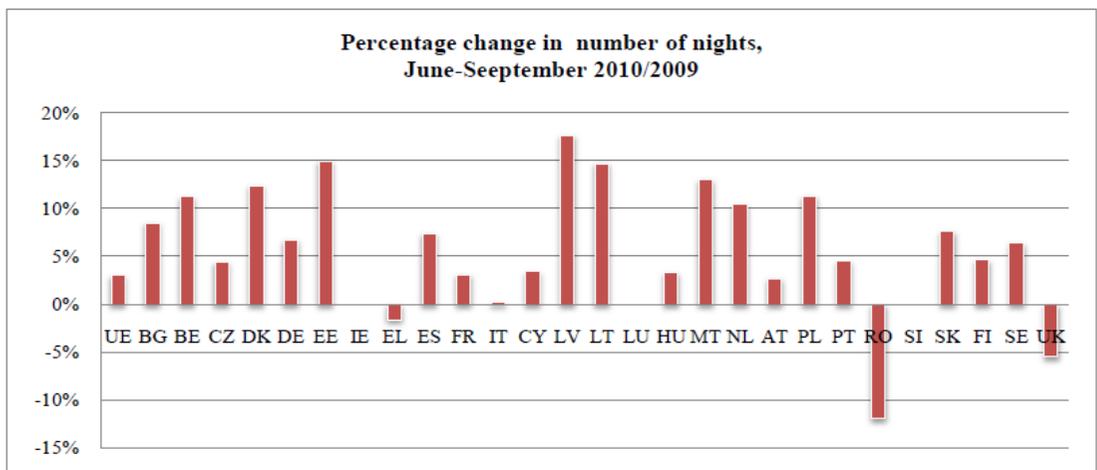

Figure 1. Procentage change in number of nights in hotels and similar establishments, June-September 2010 compared with the same period in 2009.

Source: made by author based on the data collected from the work Statistics in Focus, nr.19/2011:2 available on: http://epp.eurostat.ec.europa.eu/cache/ITY_OFFPUB/KS-SF-11-019/EN/KS-SF-11-019-EN.PDF

Comparing the summer months (June-September) of 2010 with those in 2009 has been registered a growth of 3% in the number of overnight stays (1) at European Union's level. The most significant increases were in: Latvia (+17.6%), Estonia (+14.9%) and Lithuania (+14.7%), while in Romania, United Kingdom and Greece can be noted a decrease in the number of overnight stays, compared to 2009, with: -11.9% (RO) -5.5% (UK) and -1.6% (EL) (Fig.1).

3.Comparing the number of nights spent by residents and non-resident tourists in Romania for the period June-September 2009/2010

România deține un potențial turistic bogat, reliefat prin două componente esențiale: Romania has a rich touristic potential, highlighted by two key components:

-*componenta naturală* , caracterizată printr-un relief variat, condiții climatice favorabile, peisaje pitorești, izvoare și lacuri cu rol terapeutic etc. *The natural component*, characterized by a varied landscape, favorable weather conditions, picturesque landscapes, springs and lakes with therapeutic effects etc.

-*componenta antropică*, caracterizată prin vestigiile arheologice, monumente istorice și de arhitectură, muzee, case memoriale etc. *The anthropogenic component*, characterized by the archaeological vestiges, historical and architectural monuments, museums, memorial houses, etc.

Among the most representative touristic areas of Romania are distinguished: (Monthly Statistical Buletin number 12/2009:95 and 12/2010:95).

-stațiunile balneare Spas resorts;

-stațiuni din zona montană Mountain area resorts;

-stațiunile din zona litorală (exclusiv orașul Constanța) Seaside area, excluding town of Constanța;

-Delta Dunării (inclusiv orașul Tulcea) Danube Delta area, including town of Tulcea;

-București și orașele de reședință de județ (exclusiv Tulcea) Bucharest and towns country residence, excluding Tulcea;

-Alte localități și trasee turistice Other localities and tourists routs.

O scurtă prezentare a acestor zone turistice. A brief overview of these touristic areas. (Romanian Tourism, 2010:7-8, Statistical Breviary)

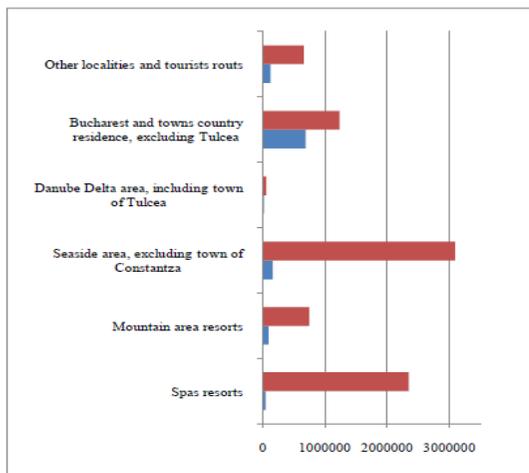

Stațiunile balneare se remarcă prin renumitele baze de tratament și zonele de agrement din stațiunile Băile Felix, Băile Herculane, Băile Tușnad, Călimănești-Căciulata, Covasna, Sovata, Vatra Dornei etc. *The spas* are distinguished by the renowned treatment facilities and recreational areas from the resorts of Băile Felix, Herculane, Tusnad, Călimănești-Căciulata, Covasna, Sovata, Vatra Dornei etc.

Zona montană cunoscută prin renumitele stațiuni turistice: Poiana Brașov, Sinaia, Predeal, Bâlea, etc., oferă numeroase posibilități de agrement, pârtii și instalații pentru sporturile de iarnă. *The mountain area* is known for its famous touristic resorts: Poiana Brasov, Sinaia, Predeal, Bâlea, etc. and offers many recreational opportunities, ski slopes and facilities for winter sports.

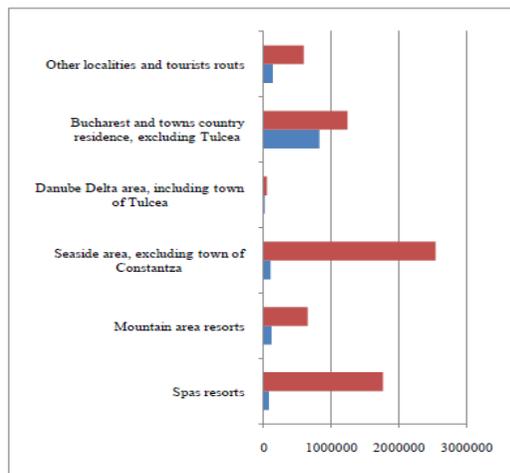

Litoralul românesc se întinde pe o lungime de 245km, cu Delta Dunării și cu complexul de lagune Razim-Sinoe în partea de nord, iar în partea de sud se întinde litoralul turistic propriu-zis pe o lungime de aproximativ 70km. *The Romanian seaside* has a length of 245km, with Danube Delta and Razim-Sinoe lagoon complex in the north and in the south part lays the touristic seashore itself over a length of about 70km. (Turismul României, Breviar turistic, 2010:6-8).

București, capitala țării, deține un potențial semnificativ în ceea ce privește dezvoltarea turismului de afaceri și cel urban. *Bucharest*, the capital of the country, has a significant potential in terms of tourism development and urban affairs.

În ciuda acestei oferte bogate turismul din România nu se bucură de o atenție mărită din partea turiștilor străini. Despite this rich offer tourism in Romania is not enjoying of an increased attention from foreign tourists. (Figura nr.2 și Figura nr.3) (Figure No. 2 and Figure No. 3)

■ - residents

■ - non-residents

Figure 2. Nights spent in hotels and similar establishments, non-residents and residents, in RO (June-September 2009).

Figure 3. Nights spent in hotels and similar establishments, non-residents and residents, in RO (June-September 2010).

Source: made by author based on the data collected from the work Monthly Statistical Buletin number 12/2009:95 available on site: http://www.insse.ro/cms/files/arhiva_buletine2009/bsl_12.pdf and 12/2010:95 available on site: http://www.insse.ro/cms/files/arhiva_buletine2010/bsl_12.pdf and from the document The attendance of tourist reception structures with accommodation functions during 1.I-30.IX.2010 :73-78.

From the data collected from the Monthly Statistical Bulletin 12/2009: 95, comes out that the summer season (June-September) of 2009, the overnight stays of the Romanian tourists in the tourist reception structures represent 88% of the total number of overnight stays, while the overnight stays of foreign tourists represented only 12%, data released by Eurostat and Statistics in Focus 19/2011 document.

In 2010, compared with the same period in 2009, the number of the overnight stays made by Romanian tourists represents 85% of the total number of overnight stays, while the overnight stays of the foreign tourists represented 15%, a very small percentage compared with other EU states.

From the two figures (Figure No. 2 and 3) comes out that the main destination of the Romanian tourists are the seaside and the spas. If we look at this issue in terms of foreign tourists we can see a shift towards business tourism, Bucharest and county seats are the main touristic areas that stand out. (Figure No. 2 and 3).

4. Conclusion - Which are the main deficiencies of the Romanian tourism?

This question was addressed to some of the most important investors and professionals in the country. http://www.financiarul.com/articol_53156/turismul-romanesc-prins-in-acelasi-cerc-vicios-timp-de-20-de-ani.html

Experts' answer:

Președintele Marshal Turism, domnul Ion Antonescu, afirmă că o primă frână a dezvoltării turismului este *nivelul ridicat al fiscalității*. Marshal Tourism's President, Mr. Ion Antonescu, says that the first brake of tourism development is the *elevated level of the taxation*.

Radu Enache, Președintele Continental Hotels și Joseph Goschi, Președintele Unita Turism afirmă că principalul factor negativ în dezvoltarea turismului autohton este *calitatea slabă a infrastructurii*. Radu Enache, President of Continental Hotels and Joseph Goschi, President of

Unita Tourism says that the main negative factor in the development of local tourism is *the poor quality of the infrastructure*.

Principala carență este Legea Turismului spune domnul Tinu Sebeșanu, directorul executiv al Trend Hospitality. *The main shortcoming is Tourism Law* says Mr. Tinu Sebeșanu, executive director of Trend Hospitality.

Doamna Lucia Morariu, Președintele Eximtur, consideră că principalele curențe ale turismului Românesc sunt *starea proastă a infrastructurii și slaba motivare a personalului care lucrează în acest domeniu*. Ms. Lucia Morariu, the president of Eximtur, believes that the main shortcoming of the Romanian tourism is *the poor state of the infrastructure and the feeble motivation of staff working in this domain*.

„*The prices on the seaside are a little too big for our taste. Prices are decisive in choosing travel destinations,*” says Detlef Höhne, product manager for Romania of the TUI. <http://www.gandul.info/financiar/grupul-tui-este-nemultumit-de-litoralul-romanesc-udrea-promite-sa-rezolve-o-parte-din-probleme-8047086>

„*Nu sa schimbat nimic în ultimii 10-15 ani*, este prima concluzie care poate fi extrasă din răspunsurile de mai sus. *Nothing has changed in the last 10-15 years*”, is the first conclusion that can be extracted from the responses above. „După zeci de ani de capitalism turismul românesc continuă să se afle la coada Europei în ciuda reliefului bogat de care dispune... Persistă o serie de probleme nerezolvate, devenite deja acute: starea jalnică a infrastructurii, fiscalitatea prea mare, lipsa unor strategii coerente e”” *After decades of capitalism Romanian tourism continues to be the tail of Europe*” and despite the rich landscape that has in its possession ... „*There are still a series of unsolved problems that have already become acute: the dilapidated state of the infrastructure, excessive taxation, lack of coherent strategy etc.. În interiorul acestui cerc vicios se află turiștii care se plâng de calitate slabă a serviciilor comparativ cu tarifele existente.... Inside this vicious circle are tourists who complain about services' poor quality compared to the existing rates.*” http://www.financiarul.com/articol_53156/turismul-romanesc-prins-in-ancelasi-cerc-vicios-timp-de-20-de-ani.html

Note:**1.Overnights:**

-It is the interval of 24 hours, starting at hotel time, for which a person is recorded in the tourist accommodation space and benefits of hosting in the account fee for the occupied space, even if the actual duration of the stay is less than the mentioned interval. Also taken into account are the overnights related to extra beds installed (paid by customers).

-It represent each night for which a person is registered in a tourist accommodation unit, whether or not physically is present in the room. (<https://statistici.insse.ro/shop/>)

2.Non-residents (foreign tourists). Țara de origine a turistului străin care înnoptează într-o unitate de cazare turistică, se stabilește după țara de reședință a turistului. Country of origin of the foreign tourist that stays overnight in a tourist accommodation establishment, it is determined by the country of residence of the tourist. (<https://statistici.insse.ro/shop/>)

3.Resident (local tourist). Tourists who travel within their own countries.

HOLON APPROACH IN NEED OF COMPANY RESTRUCTURING

Breban Ludovica

West University Vasile Goldis Arad Faculty of Economic Sciences Str.M.Gorki

Bochiş Leonica

The Body of Expert and Licensed Accountants of Romania, Bihor

Holon concept of systems theory and systems developed in after 80s of last century. The term holon (Greek: Hales = whole, derived from parts) was taken over by specialists in the field of systems, from the American Professor A. Koestler, who first used in the context of the systems division, talking about systems that operate in other systems. The holon is essentially an operating system under which one or more autonomous systems, integration.

The holon is integrative role that optimizes operation and results of embedded systems, limiting excessive generalization of the classical notion of system. This approach assumes that there are quite a few companies in the state of "vitality" or less and those who remain in a state of alert and that in most cases, even a viable business, reservations, or to increase the effectiveness of that maintaining this state requires some effort, area businesses in "difficulty" or "vulnerable" under these conditions is expanding.

KEY-WORDS: holon system, restructuring, analysis diagnosis, risk analysis, risk of bankruptcy.

JEL Classification: M – Business Administration and Business Economics; Marketing; Accounting

M1- Business Administration, M19 - Other

In our approach to implementing the elements of holon theory analysis of the vulnerability at the company will break both structurally as a productive enterprise, the autonomous subsystems (profit centers, strategic business units) and in terms of functional subsystems (management, supply, marketing, decision making, information, etc..).

This decomposition is done so by objectives system (Goal Analysis) and its behavior (Behavior Analysis). This vision corresponds to the holon concept systems approach that, in our view, combines and optimizes the criteria of division of the system, referred to (functionally and structurally). Holon system (Fig. 1) integrates, in general, more autonomous systems, which are always open for different holon components and functions as part of a general system components - the classic and the optimization does not only optimize system components and system integrator.

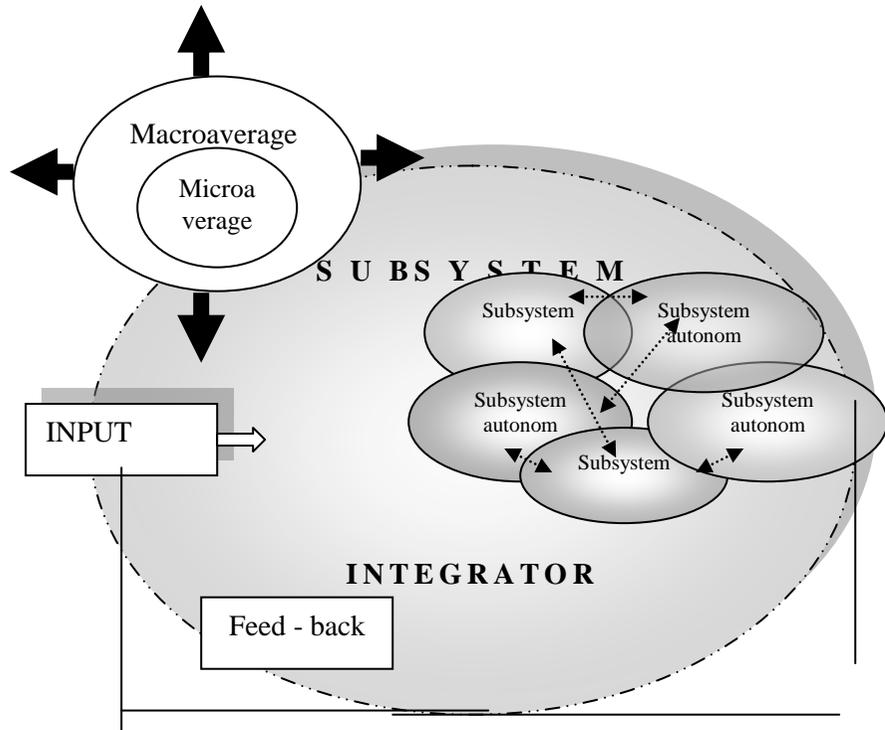

Fig. 1. Enterprise - a system open holon

Given the above, we define the firm as an open economic system that groups a set of subsystems, autonomous or not organized on economic, legal, technological and managerial, which are conceived and carried out a complex work in order to obtain products and / or services to market and aiming to maximize the final wealth for its owners.

Holon vision is therefore one that reconciles all the parties that compose it. Holon is a system of unique identity, self-contained, identifiable, is part of a larger system (holon system integrator), and in turn may consist of holosubsysteme.

The organization consists of Holons (holosubsysteme autonomes), in that they are able to develop and pursue their own plans and strategies, but which operate synergistically to achieve the overall objectives of the enterprise. The company's management holon represents a set of management processes and resources that work together on a specific organizational structure and the information derived to achieve the overall objectives of the company through control over resources and processes in holons.

Holosubsystems behavior is closely controlled by the system integrator Holon's top management down the organizational hierarchy based on well-defined procedures and integrated information technology.

Its role is essential, suggesting that each holon theory is composed of two parts: the information processing and physics processing. Holosubsystems control is achieved at the interfaces of interaction between them. While hierarchy is permanent system integrator holon, holonsystem structure is flexible and can withstand holon separation or integration of new others.

So, matrix-type organizational structures are themselves a consequence of the emergence of flexible management systems using an approach essentially holon. These systems, together with the integrated system will provide higher levels of analysis as the criteria for analysis will be

adapted to these levels and sublevels corresponding systems (autonomous or not) that make up the two systems analyzed.

Holon vision allows the new system more flexible, more efficient, less vulnerable and more adaptable influences disturbances within the system or the environment. The aim of our approach is more efficient and increase economic profitability of enterprises "sick" by their restructuring.

For a system should be restructured its analysis as a whole and on its components business or activities that may be relatively independent. This can be identified strengths, viable, the system integrator or its vulnerabilities, vulnerabilities arising either independent components of the system or those subsystems that are designed to integrate into the global enterprise.

Paraphrasing a famous specialist in systems (J. Gall, the Systemantics) we can say that if a company seems ineffective or even useless, does not mean that it is in reality but rather a component subsystems, even though they appear to work correctly, are in fact, bankrupt. This is because, as a system is more complex, with both possibilities and its failure modes are more complex.

To improve the activity of a business, you must first know, to investigate, to identify vulnerabilities. Role of system analyst can thus be limited to "radiography" of the situation, identify relevant activities and events to facilitate a critical analysis of how the current system operating in developing enterprise restructuring alternatives.

A restructuring can not be done without a system analyst and / or manager to have a systemic vision of the company. This involves, first, decomposition holosubsystem, system, correct identification of borders and the interactions between them and between the system and environment in which the company operates.

These elements are defined by the analyst depending on the objectives and goals holon system analysis. The analysis and description system analyst holon must take into account the need to increase efficiency and system performance objectives and their ability to adapt, self-directed learning model that simulates the operation of the system.

Practically, given the "uncertainty principle" which says that a system can be defined according to the analyst's vision, we intend to shape our vision for the company alongside the classical.

Thus, we address the enterprise as a holon, in which one can identify holosubsystems autonomous system integrator (company) with the role functioning and optimize their results, the final objectives of the integrated system itself depending on how it operates and the relationship between holosubsystem.

The main elements identifying the company as a system both holon as its subsystems can be grouped as follows:

1. Point stable, dynamic, progressive. Profit, turnover, market share,
2. Inputs of resources: raw materials, machinery, energy, human resources, information, etc.,
3. Outputs: products, services, work, money., Information,
4. Relationships: system - environment inter - systems, inter - subsystems, autonomous systems - sub-human, human - means of production, technological structure,
5. Transformation processes: production, managerial, informational, organizational,
6. Environment: economic, financial, social, political, legal, information.

From the point of view of the activity, system integrator of enterprise holon is a stochastic but productive autonomous systems that compose it deterministic nature.

Stochastic nature of the system integrator is given, on the one hand, the probably nature of the occurrence of events internal disrupters (inadequate supply, failure of production capacity, the correlation of structure and volume production with demand, wage claims, etc..) Or external (reduction of market segments, the emergence of substitute products, the emergence of new technologies, etc..), on the other hand the probably nature, namely how the managerial system,

the information - making and their subsystems have the ability to respond effectively and timely the internal or external distractions.

Moreover, restructuring is just one of the purposes of increasing the efficiency and effectiveness of enterprise response to environmental changes, that are correct delimitation precise knowledge of the status and operational characteristics of production systems, because they behave like deterministic systems.

The restructuring of production systems involves determining the productive efficiency of each system separately, and then the separation efficiency of the system integrator or settlement systems or by attaching another effective enough, the feasibility criteria, increase synergy and system-level holon entropy reduction of the company.

The restructuring of the management system involves a redefinition and a clear delineation of objectives and the overall system components, subsystems redesign management - organizational, methodological - the managerial and information - to make the decision to set goals and achieve an optimal and objectives of production systems.

Holon vision allows posting and even total replacement of the subsystem management - organizational or informational - not only decision-productive systems. If, for example, the restructuring would involve full or partial takeover of the firm by an enterprise (company) stronger and, in turn, has a holonic structure, it will be able to integrate productive business acquiree and its attachments may be extended or management or information system in order to manage, control and strategic focus.

This aspect constitutes an additional argument of the enterprise holon approach and way of accomplishing the work of its analysis of vulnerabilities.

In terms of behavioral structure, the holon system's internal connections, it is an open system with the management system that integrates it into the system and which receives inputs and disturbances in the environment, through influencing the information system - decision-making inputs into the productive.

In this case, due to interference of the management system, subsystem information - making and productive systems, those systems are considered automatic response block for the topping - the border into the system management subsystem, and the reception information and the disturbance occurs its information system - decision-making.

The holon is thus optimally adapted to an open architecture system, given the nature of self-management system on the productive systems are conventional adaptive automatic.

Holon of the restructuring approach is broader, including the companies with greater or lesser vulnerability and assumes that there are quite a few companies in the state of "vitality" or even less those who persist in a state of vitality and that in most cases, even a viable business, there are reserves to increase the effectiveness of maintenance in this state or that requires some effort, area businesses in "difficulty" or "vulnerable" under these conditions is expanding.

In this vision, our area of interest includes not only companies in difficulty (in the narrow sense) or vulnerable (difficulty in the broad sense) but can extend even to the components of viable but likely to become vulnerable in the future. In this vision, scope and scale of the restructuring process and the content and implementation modalities will differ from case to case.

In these circumstances, we believe that the restructuring should not be viewed as necessary only entities in difficulty (narrowly defined), but it has started long before undertaking to reach this situation, namely in the phase where the degree of vulnerability it requires.

It is not enough to fit difficult undertaking but it is necessary to identify the correct business vulnerabilities, their location and measurement system and future effects on the state enterprise - the pre-phase of the restructuring process.

They are different and the stages through which we continue in this work, since the results of this analysis depends on timing, scope and content of the restructuring process and hence protect the

interests of business owners and others interested in the smooth running of the company: stakeholders: employees customers, suppliers, banks, state, etc..

In the literature, "the health of the company" is assessed in two stages:

- Diagnostic Analysis (DA)
- Risk Analysis (RA).

In most cases the way of systematizing the results of diagnostic SWOT analysis, poor; to deduce how vulnerable it is undertaking, it appears paradoxical situation of making an "analysis" of the "diagnostic analysis".

Risk analysis methodologies, approaches in most cases, the state company at a time, finding opportunities or business risks, using qualitative and quantitative criteria - criteria that reflect vulnerability to synthesize enterprise.

For example, bankruptcy risk is analyzed by methods that aim to reflect the quality criteria and indicators, all enterprise system vulnerabilities, including those related to its relationship with the environment.

These methods, however, do not give a sufficiently well defined picture of the future business, especially in economies in transition, where the company's financial results are subject to great volatility over time, so that a company with a reduced risk of bankruptcy, measured when $t-1$ ", comes when the " t "have a very high risk of bankruptcy, and when" $t+1$ "to restore" smooth "or be on the verge of bankruptcy.

The causes of instability should not be sought only in business but also some shortcomings of the methods of measuring the risk of bankruptcy, some of these shortcomings were removed from scoring method.

Methods "traditional" bankruptcy risk analysis were processed and adapted and transition economies - that is applied to Romanian companies, leading companies already established methods with results (predictions) more or less successful in forecasting the likelihood of bankruptcy.

Not always, the same enterprise application of these methods give the same results, because the views and criteria of analysis, so that the vulnerability of the enterprise can be assessed differently from the application of various methods.

Without challenging theoretical and practical value of these models to analyze the risk of bankruptcy, we summarize their analysis and criteria we use in enterprise vulnerability assessment, consistent with the objectives of this paper.

The aim of this approach is therefore to delineate the object and research area and not to devise a new method for assessing the risk of bankruptcy, and later to measure the vulnerability of the company through the synthesis and breakdown of these criteria to locate vulnerabilities in the system Holon, holosubsystems and environment of the company, as its starting point in restructuring and improving economic performance - financial enterprise as a system holon.

Analyzing these methods can be easily drawn the conclusion that they operate with two broad categories of indicators, namely:

- Indicators that express the company's ability to generate profit, so the profitability indicators of the nature or yield (based on size of operations or financial profit);
- The direct or indirect indicators expressing the company's financial balance (indicators of liquidity, solvency, asset and capital structure, the rotation.

This mode of assessment can be argued, at least the following aspects:

- The result reflects the efficiency of production operations at both execution and at the managerial level to the lower peak.
- The financial result reflects the manner and efficiency with which financial resources are provided and managed the company as a result of policy and debt financing needs.

- Change in cash flow is an indicator that reflects the input and output of capital (own and attracted) and makes the financial balance at the same time is conditioned by how donors perceive the company's financial balance.

Change in treasury, provides, as mentioned, a perfect definition of the dynamic state of the enterprise, as reflected by FR and NFR, and asset size and capital structure, the rotation of operating assets and liabilities, while at the same time reflects a balance between receipts and payments respective operational and financial investment.

DISCUSSION AND CONCLUSIONS

It is imperative that when we talk about restructuring at the enterprise level, we know exactly what the restructure, which are viable activities, which are its vulnerabilities and are the major trends and opportunities in business, restructuring elements that give directions . Such an analysis, from our point of view, it is not possible without a systemic vision of the organization valences Holon.

For the enterprise as an economic system to function, it must be controlled, which requires communication. Information provided by the communication must be sufficiently detailed, accurate and timely, to be used as a basis for decision. Based on this information, the control system is achieved by two techniques holon technique feed - back (control reagent) and fast technique - forward (anticipatory).

In view of Holon, restructuring is a “modus vivendi” of businesses / companies, even those Romanian, whether initiated pre-or post - privatization, since any undertaking shall, under pressure from shareholders and other interest holders, to Standing focus attention on growth and business expansion.

If the pressure is manifested most active shareholders in the U.S. in recent years it occurs equally in Europe, and is expanding due to globalization, the economic world.

On the other hand, the competition always requires a rethink of the company's position on a “permanent competitive Sleep” and last but not least, the employees are interested in expanding in order to benefit as many opportunities to achieve career and personal safety jobs.

Surveys conducted in the U.S. and Britain have found that most companies are proposing an average growth rate of 15-16%, while average growth rate does not exceed 3%, it is clear that not all companies do this.

Development pathways related primarily to increase the share or market penetration of current business and business integration holon vertical and horizontal or conglomerate, including the expansion into other geographical areas (globalization).

Deemed essential that the restructuring process, even the Romanian enterprises to meet this feature of the process going and to take account of these phenomena.

These are just some of the reasons why, as in the preliminary phase, to measure its vulnerability - in which we presented in detail valences on systems design holon, holon characteristics and its pedagogical approach to business - using a holonic approach to process restructuring.

INVESTMENT STRUCTURE AND EVOLUTION IN THE CONTEXT OF ECONOMIC CRISIS

Codău Ciprian

West University of Timisoara

Faculty of Economics and Business Administration

The scope of this article is the evolution analysis of net investment in Romania between economic growth and international economic crisis. The analysis captures both the evolution of net investment by structure elements (buildings, outfits, other investments) and the structure and evolution of investments by sources of financing. Also there is an analysis of the foreign direct investment (FDI) share in the total net investment and the impact of the economic crisis on this share. The article aims to identify the main factors for the evolution of investments in Romania before the financial crisis and determine how the financial crisis influenced the structure and volume of investments in the national economy.

Most previous studies have focused either on a small part of the investments made in Romania (in most cases the FDI have been analyzed) or on the period of economic expansion without capturing the evolution of investment during the economic crisis. Previous research has highlighted especially the FDI influence on macroeconomic indicators of high importance for the economy (unemployment rate, GDP growth rate, etc.) with less focus on the factors influencing these investments and the close connection between the economic context (economy status) and the volume of these investments.

For the analysis of the investment evolution during the mentioned period statistical data was used that captured both the investment evolution trend and the changes occurred by the national economy stepping into recession amid the global financial crisis established. To get an overview of the situation it was considered a time interval that captured both the economic growth and the period after the onset of the economic crisis. Thereby information was obtained on the volume of net investment during 2000-2010, on foreign direct investment in the period 2003-2010 and their share in total net investment and also on the main sources of investment financing during the economic growth and the influence of the economic crisis on the structure of these funding sources.

The analysis of this information and results allowed drawing conclusions on the impact of the economic crisis on the volume and structure of investment in Romania, on the main sources of financing used by investors in times of crisis and regarding main courses of action to stimulate investment activity in order to re-launch economic activity.

Keywords: *Net Investment, Romania during crisis, foreign direct investment (FDI), sources of investment founding, investment evolution*

JEL code: *D920*

Introduction

Internationalization and globalization of economic affairs, of industrial production, of the movement of financial capital, determines the investment activity to become of global nature, with implications for all national economies and the entire global economy.

Investments are the material basis of social and economic development of any country. They provide quantitative and qualitative growth of fixed capital, increase in technical and economic efficiency of existing capital, but also create new jobs.

There are three major areas of traditional investment opportunities (except gold, art works and goods), namely: fixed interest securities, companies' shares and capital goods and real property. Net investments represent expenditures for construction, installation and assembly works, equipment and transport means purchasing, and other expenses for creating new fix assets for developing, modernizing, rebuilding the existing ones, as well as the value of services related to the transfer ownership of existing fix assets and lands (notary duties, commissions, transport, loading and unloading expenditure) etc..

Net investments comprise the following structure elements: construction, outfits (with or without assembly), geological and drilling works, other net investment. Depending on the source of financing, net investments can be classified as: investments financed from own funds, investments financed from internal and external loans, investments financed from the state budget and local budgets, investments financed with foreign capital, and investments financed from other sources.

Foreign direct investments are considered paid-up capital and reserves falling to a non-resident investor owning at least 10% of the subscribed capital of a resident enterprise, the loans between the investor and the company he invested in, and profit reinvested by him.

There are three types of foreign direct investments, namely:

- Greenfield - creation of enterprises by or with foreign investors (Greenfield investment);
- Mergers and acquisitions - full or partial takeover of enterprises by foreign investors from residents;
- Business development - increasing holdings of foreign investors in foreign direct investment enterprises.

Whether we consider a period of economic expansion or recession, investments are the main engine of economic growth and development or, as the case may be, of revitalizing economic activity in times of recession and financial crisis. In Romania's case, with an emerging economy, investments have a decisive role in ensuring the modernization of economic activity as a prerequisite to adapting technical and economical conditions of passage of the national economy to a market economy, our country's participation in international economic relations in conditions of competition and competitiveness.

Investment Evolution in Romania

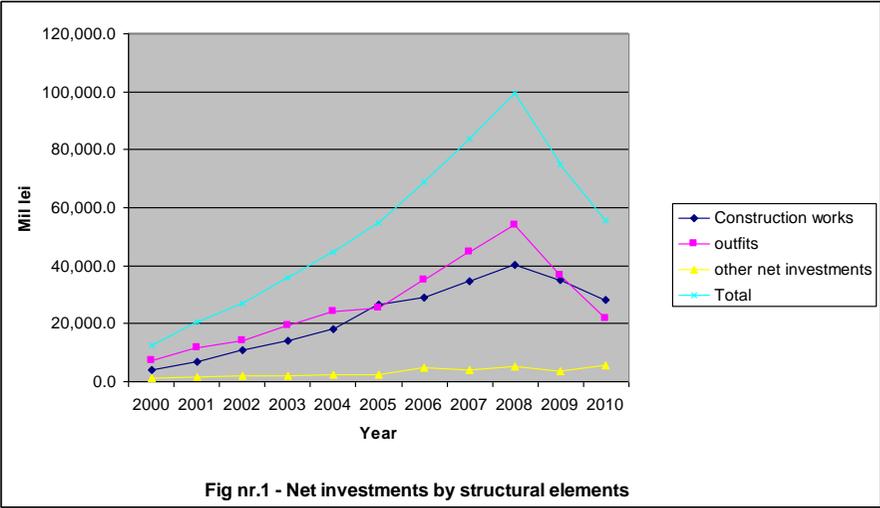

Tracking the investments history in the national economy over the past 20 years, four periods of the economy can be defined. Overall, investments in the national economy grew approximately three times in the last 20 years, from about 7 billion dollars in 1990 to around 19 billion dollars (55.6 billion lei) in 2010. GDP has seen a similar evolution, increasing four times in the same period.

- the first stage was represented by a period of investment decrease (1990-1992)
- the second stage is represented by the period 1993 to 1999, during which investments have had a tendency of stagnation or slight increase
- the third stage covers the years 2000 to 2008, a period of strong increase of investments in the national economy, from 12.5 billion lei in 2000 to about 99.5 billion lei in 2008, thus resulting in an increase of about 8 times compared to 2000
- the fourth stage is the period of economic recession and covers the period from 2009 until present day, during which investments have dropped almost to half of the level recorded in 2008

The purpose of this study is the period between the years 2000 to 2010, that is stages three and four of those mentioned above. More specifically, this period includes an exponential growth in

the volume of net investments stage, from a level of approximately 12.5 billion lei in 2000 to a peak of about 100 billion lei in 2008.

The evolution of total net investments and on structure elements is shown in the chart below:

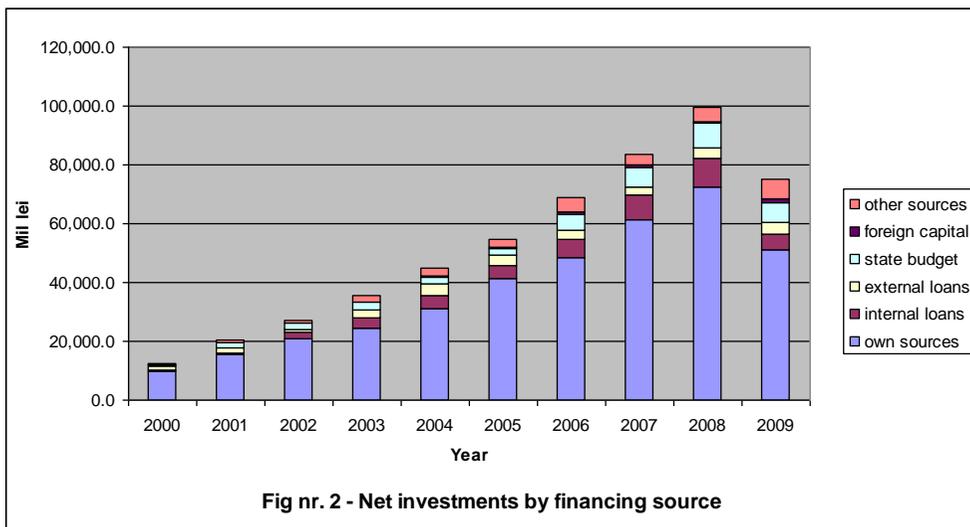

Looking at the chart above, some important ideas about the evolution and structure of investments in the analyzed period can be stated, namely:

Firstly, we can see that the net total investments grew rapidly in the first years analyzed and slower in recent years. Thus in 2000-2001 there was an increase of over 60% of net investments, from 12.5 billion lei to about 20.5 billion lei. In the following periods (2001-2002 and 2002-2003), increases were approximately 30% over the base year. Growth during 2004-2006 was approximately 25% compared to previous years, and growth during 2007-2008 was approximately 20% annually. The maximum total net investments was achieved in 2008, their value being about 99.5 billion lei.

Secondly, it should be noted that, in the last two years of analysis, amid the financial crisis took place a drastic decrease in the volume of annual net investments, a decrease which meant in 2010 a net investment value of approximately 55% lower than the peak year 2008.

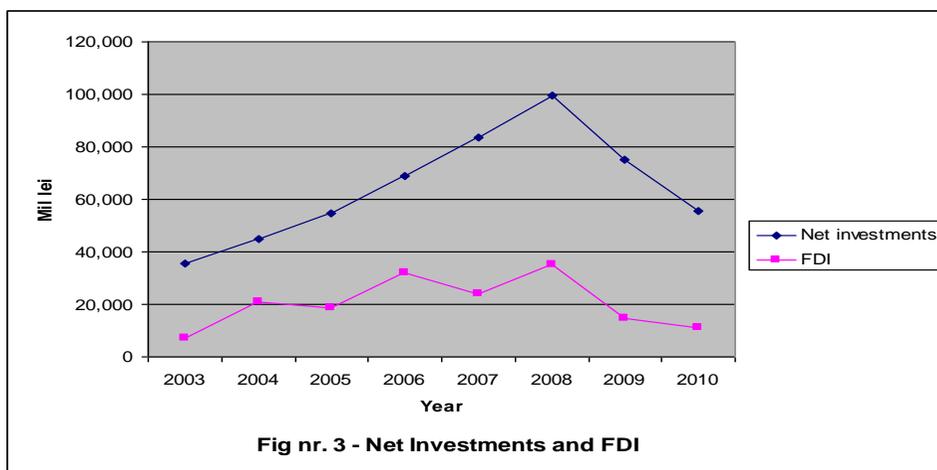

Thirdly, the structure analysis of investments in the analyzed period allows observing the fact that, except for the years 2005 and 2010, the main share of total investments was represented by equipment (including means of transportation).

Another classification of total net investments of special importance for understanding their evolution in the analyzed period is represented by total investments division based on the funding source. This classification allows us to identify the main sources of financing preferred by investors in economic growth period and how these preferences have changed in the context of financial crisis. This information can be summarized in the chart below:

As can be seen looking at the chart above, the main share in financing of investments is from own sources, which represents approximately 70%-75% of the total net investments made annually, with a general downward trend during the analyzed period, from 77.5% in the first year of analysis to about 68% in 2009. The only source of financing which had a steady upward trend (as a percentage share in total investments) the entire period of analysis is represented by the state budget. Thus, if during the first year of analysis investments financed from the state budget accounted for only 3.4% of total investments, in the last year of analysis they have reached about 9% of total investments, representing the second most important source used by investors to finance investment projects. An interesting situation occurred when financing through loans. Thus, if in 2000 foreign loans represented approximately 12% of the total financing sources, and domestic loans only 3.5%, at the end of the period, the relation between these two forms of financing has been reversed, thus domestic loans in 2009 represented approximately 7.5% of total investments and external ones have dropped over 50% in 2009, reaching a level of about 5% of total net investment.

Another very important aspect for understanding the evolution and structure of investments in economic growth and then in recession is the foreign direct investments' analysis both as evolution and as a ratio compared to net investments. The period considered for this purpose includes the years between 2003 and 2010 and is briefly presented in the chart below.

Foreign direct investments have had an oscillating evolution throughout the period analyzed, both in volume and as a ratio towards the total net investments. The maximum level of direct foreign investments was achieved in 2008 when FDI reached approximately 35 billion lei (9.5 billion Euros), a year in which the total volume of net investments also reached the maximum level of 99.5 billion lei. The establishment of the financial crisis caused a significant decrease in the level of FDI, in 2010 reaching about 11 billion lei, which represents a decrease of approximately 70% compared to the 2008 level (35 billion lei).

Largest share of FDI in total net investment was recorded in 2004 and 2006, when FDI accounted for about 46% of the net investment volume in the national economy.

Results and Conclusions

The analysis of the evolution of investments in the national economy during the strong growth in national economy and changes occurred with the establishment of the global financial crisis and Romania's entering into a recessionary phase allows the following observations and conclusions: Firstly, the evolution of net investments in the national economy is similar to the evolution of main macroeconomic indicators during the analyzed period (unemployment rate, GDP, industrial production, trade, etc.), namely growth until 2008 and a sharp decrease in 2009 and 2010 due to the financial crisis. Therefore, net investments have suffered a strong correction in the two years of recession, materialized in the decrease of more than 50% of net investments, thus reaching the level registered in 2005.

With regard to financing sources, it appears that the only source of financing which had a significant and positive trend as a share in net investments is represented by the state budget. This is because since 2007, Romanian investors have benefited from non-reimbursable European funds accessed through various operating programs and following which, during 2007 to 2010, total funding of about 38.7 billion lei were accessed, the total value of projects funded through these funds being over 60 billion lei.

The investment category that has had one of the most extensive movements during the analyzed period is represented by foreign direct investments. In the period 2003-2008, foreign direct investments increased about five times, and during the two years of recession they have fallen by about 70% compared to the maximum level of 2008. This significant increase in FDI in the period of expansion is based on the convergence of several factors such as: cheaper labor force in our country compared with Western countries that have led some multinational companies to open offices in Romania, Romania's accession to the EU on January 1, 2007, the improvement of living standards made Romania become an attractive market for major retailers in the EU, etc. Given the close relationship between FDI and the national economic situation, we anticipate that they will resume their upward trend only when the national economy will also take an upward trend thus determining foreign investors to regain confidence in the national economy.

THE SIX SIGMA SYSTEM IN RELATION TO THE BUSINESS' STRATEGY AND PRIORITIES

Now more than ever, corporations the world over are scrambling to redefine the processes, techniques, and strategies they need to survive in an age of uncertainty. Businesses today seek an effective corporate performance measurement system to maximize the bottom line. With the advent of the Internet, ongoing globalization, and standardization in management systems, business leaders must focus on how to measure performance to monitor their continued viability and success. Many existing performance measurement systems were designed to support business practices and to monitor progress. With shrinking margins and competitive pressures, however, corporate performance measurement systems must do more than monitor. They must identify opportunities for optimizing profitability and growth, without pitting one against the other. The idea is to use performance measures to add value, instead of simply measuring for a formality. The Six Sigma method is not only a trendy "new solution", it is not a business whim linked to a single method or strategy – the study trying to draw attention to the fact that Six Sigma is a flexible system to improve the management and the performance of companies. The research paper seeks to demonstrate that the Six Sigma method refers to both the passion for customer service and a drive for new ideas, and to statistics and processing numbers, finding application in the fields of marketing, services, human resources, finance and sales, as well as in production and engineering.

Key words: Six Sigma method, quality, performance measurement, profitability, growth

JEL: M10, L21, O43

Introduction

In any industry, organization, or daily process, when one doesn't know what one doesn't know, it's going to cost him. For too many organizations the costs (often hidden) of defects and waste in the way they operate are huge. Having processes in which errors occasionally occur may not seem such a big deal. But when one considers how many errors may be lurking in company-wide processes, the monetary impact on the overall productivity, customer satisfaction, and profitability multiplies dramatically.

The Six Sigma approach to managing is all about helping a manager identify what he doesn't know as well as emphasizing what he should know, and taking action to reduce the errors and rework that cost him time, money, opportunities, and customers. In other words, Six Sigma translates that knowledge into opportunities for business growth.

1. What is Six Sigma?

A way to define the Six Sigma method is as a general effort for „changing organizational culture” to drive the company towards better customer satisfaction, profitability and competitiveness. The Six Sigma scale and flexibility - as a way to improve performance – is, however, best reflected by its definition as „a comprehensive and flexible system for achieving, sustaining and

maximizing business success. Six Sigma is driven only by close understanding of customer needs, disciplined use of facts, information and statistical analysis, and special attention paid to management, improvement and business process modeling ”(Pande, Neuman, Cavanagh, 2009)

Many companies believe that dealing with errors is just part of the cost of doing business. But not every manager has to accept that faulty logic. With Six Sigma, the manager can eliminate most errors, reduce the costs, and better satisfy the company’s customers.

Six sigma is a statistical concept that measures a process in terms of defects. Achieving six sigma means the processes are delivering only 3.4 defects per million opportunities (DPMO) - in other words, they are working nearly perfectly.

Sigma (the Greek letter σ) is a term used in statistics to represent standard deviation, an indicator of the degree of variation in a set of measurements or a process. In its business use, it indicates defects in the outputs of a process, and helps us to understand how far the process deviates from perfection. A sigma represents 691462.5 defects per million opportunities, which translates into a percentage of non-defective outputs of only 30.854%. That’s obviously really poor performance. If we have processes functioning at a three sigma level, this means we’re allowing 66807.2 errors per million opportunities, or delivering 93.319% non-defective outputs. That’s much better, but the company is still wasting. The Six Sigma methodology collects data on variations in outputs associated with each process, so that it can be improved and those variations reduced, being a statistical concept that measures a process in terms of defects - at the six sigma level, there are only 3.4 defects per million opportunities.

Sigma Level (Process Capability)	Defects per Million Opportunities
2	308,537
3	66,807
4	6,210
5	233
6	3.4

Figure no.1. The sigma conversion table

We can see from the conversions above that the sigma scale is exponential. It may seem like three sigma is good enough. After all, if there are 66,807 defects out of a million, that means that 933,193 things went well—93.319% perfection. The question is, how many customers can any business afford to lose? How much money can any company afford to lose because of mistakes? Why accept it as normal to be running processes at only three sigma or four sigma when, by changing the way one manages the processes, they could get a lot closer to six sigma and all the resulting benefits.

Six Sigma uncovers the layers of process variables - in data terms - that one must understand and control to eliminate defects and wasteful costs. It’s a management approach that aims to achieve the apex of quality by measuring, analyzing, improving, and controlling processes to root out defects and boost bottom-line results.

Six Sigma is about practices that help the company eliminate defects and always deliver products and services that meet customer specifications. The sigma level of a process is calculated in terms of the number of defects in ratio to the number of opportunities for defects. Six Sigma is also a philosophy of managing that focuses on eliminating defects through practices that emphasize understanding, measuring, and improving processes, money and customer satisfaction. The central idea of the Six Sigma approach is that if one can measure the defects in a process, one can systematically figure out ways to eliminate them, to approach a quality level of zero defects. So, in short, Six Sigma is several things:

- A statistical basis of measurement;
- 3.4 defects per million opportunities;
- A philosophy and a goal: as perfect as practically possible;
- A methodology;
- A symbol of quality

2. TQM to Six Sigma

Many people associate Six Sigma with the quality movement. How does Six Sigma differ from the “quality” programs the company may have already experienced? No understanding of the quality movement would be complete without mentioning the visionary W. Edwards Deming, best known for helping the Japanese revitalize their industries after World War II. His approach was radically new and had significant impact on the evolution of quality and continuous improvement programs in organizations around the world. It is fair to say that Deming’s management approach, which came to be known as Total Quality Management or TQM (though Deming didn’t like that term), has changed the way thousands of companies conduct their operations. Total Quality Management (TQM) approach focused on the organization as a system, with an emphasis on teams, processes, statistics, continuous improvement, and delivering products and services that meet and exceed customer expectations. Six Sigma is a disciplined extension of TQM.

By the mid-1980s, the extent to which corporate management was focusing on quality was significant; businesses adopting TQM underwent a major paradigm shift, a transformation of “unlearning” everything previously believed about business to create better products and services.

They began to understand that quality did not require higher costs but more efficient and reliable processes that delivered defect-free outputs and that they had to focus on process improvement and customer satisfaction. TQM is an excellent foundation from which to build toward the next level of quality management, represented by the Six Sigma approach.

But Six Sigma is far more than the latest “quality” trend. The proof? Companies that have implemented Six Sigma have achieved outstanding financial results and developed a disciplined, pragmatic plan for improved financial performance and growth. Companies such as Motorola, Texas Instruments, IBM, Allied Signal, and General Electric have successfully implemented Six Sigma and reduced costs literally by billions of dollars. More recently Ford, DuPont, Dow Chemical, Microsoft, and American Express have started working on instituting the Six Sigma methodology. But it’s about more than money.

Jack Welch, the CEO who started Six Sigma at General Electric, called it “the most important initiative GE has ever undertaken,” and said that Six Sigma is “part of the genetic code of our future leadership.” Six Sigma was also conceptualized as a quality goal in the mid 1980s at Motorola because technology was becoming so complex that traditional ideas about acceptable quality levels were inadequate. As the number of opportunities for defects increases, the percentage of perfection must rise; so, in 1989 Motorola announced a five-year goal—a defect rate of not more than 3.4 parts per million - six sigma. This initiative challenged ideas of quality in the U.S. and changed the concept of quality levels. It was quickly no longer sufficient to measure quality as percentages (defects per hundred opportunities). Now the bar was raised, to measure defects per million or even per billion.

„Six Sigma” is everything but a simple concept, Six Sigma is a system that encompasses many concepts, tools and principles. The examples derived from the experience of several successful companies that have implemented the Six Sigma method reflects several benefits which attract companies towards implementing this method: it generates lasting success, provides a

performance target for each, added value for customers, accelerates the rate of improvement, promotes cross-sector learning and exchange of experience, and implements strategic change.

3.The Six Sigma Methodology – the DMAIC approach

The Six Sigma methodology uses statistical tools to identify the vital few factors, the factors that matter most for improving the quality of processes and generating bottom-line results. Six Sigma statistical tools work like magic to uncover what one doesn't know. Yet no one has to be a statistician to use them: you focus on selecting tools, using them, and analyzing data and let the specific software do the calculations.

The five-phase process of DMAIC uses a collection of tools and is a logic filter which leads to the vital few factors affecting the outcomes of the process:

Define - Determines the project goals and deliverables to customers (internal and external).

Measure - Identifies one or more product or service characteristics, maps the process, evaluates measurement systems, and estimates baseline capability.

Analyze - Evaluates and reduces the variables with graphical analysis and hypothesis testing and identifies the vital few factors for process improvement.

Improve - Discovers variable relationships among the vital few, establishes operating tolerances, and validates measurements.

Control - Determines the ability to control the vital few factors and implements process control systems.

In other words, the Define phase sets the targets for the Six Sigma project, the Measure and Analyze phases characterize the process, and the Improve and Control phases optimize the process and then maintain it.

Process variation exists in every transaction, department, and business unit. From the micro to the macro perspective, using Six Sigma methods allows you to define goals and set specifications, measure process characteristics and estimate baseline capability, analyze the variables and identify the vital few factors, improve the process, and control the vital few factors and implement process control systems.

Using the DMAIC approach, one can dig out waste and return hidden dollars to the company's bottom line.

We should note that Six Sigma methodology is not rigid. Approaches vary, sometimes significantly. One of the variations is in the phases: some approaches use all five of the phases listed above, while others do not include the Define phase.

Six Sigma professionals recognize that this approach is a kind of roadmap for improvement, and it doesn't matter if it's called DMAIC, MAIC, PCOR (from the Air Academy - prioritize, characterize, optimize, and realize), GETS (from GE Transportation Systems - gather, evaluate, transform, and sustain).

The point is that this is a set of tools aimed at helping managers and employees understand and improve critical processes.

Six Sigma is based on a few key concepts: Defect; Variation; Critical-to-quality; Process capability; Design for Six Sigma. Six Sigma focuses on defects and variations. It begins by identifying the critical-to-quality (CTQ) elements of a process— the attributes most important to the customer. It analyzes the capability of the process and aims at stabilizing it by reducing or eliminating variations.

Vital few factors are those that directly explain the cause-and-effect relationship of the process output being measured in relation to the inputs that drive the process. Typically, data shows that there are six or fewer factors for any process that most affect the quality of outputs in any process, even if there are hundreds of steps in which a defect could occur - the vital few. When

one isolates these factors, it becomes clear what basic adjustments are needed to be made to most effectively and reliably improve the outputs of the process.

Simply put, Six Sigma management is about tying quality improvement directly to financial results. The Six Sigma goal is to link internal processes and systems management to end consumer requirements. Six Sigma is a scientific approach to management, driven entirely by data. The Six Sigma methodology eliminates the use of opinion - "I think," "I feel," or "I believe." Six Sigma drives the organization to a more scientific means of decision making by basing everything on measurable data.

4.Focus on Engaging People and Changing Processes

Another thing to know about Six Sigma is that it doesn't rely on the latest program fads or "magic pills" to fix organizations. It relies on old-fashioned hard work coupled with factual data and a disciplined problem-solving approach. It affects every aspect and level of an organization - from line workers to middle managers to CEOs - to transform the company's people and its processes.

The question is "What can the process deliver?" Process capability can be seen as a statistical measure of inherent variation for a given event in a stable process. It's usually defined as the process width (normal variation) divided by six sigma and quantified using capability index (Cp). More generally, it's the ability of the process to achieve certain results, based on performance testing.

As the first step in that transformation, the Six Sigma mindset considers the company and its people as assets, rather than as costs (liabilities); they are as much an asset as any piece of capital equipment, and they represent an investment with extraordinary potential for return.

Shifting the perspective on people from liabilities to assets (or investments) is fundamental to Six Sigma. Once thinking in terms of "human assets," it's equally important to realize the underlying monetary value of rooting out wasted materials and steps in processes, as this is critical to unlocking the hidden return on the company's investment in people. And that's also another aspect of the Six Sigma approach to managing. The fact is that work gets done through processes executed by people; both successes and problems are usually the result of what lots of people do, not just one person. If one doesn't pay careful attention to both people and processes, improvement will not happen.

An easy way to understand the concept of human assets is to calculate their individual return on investment (ROI). For example, if an employee costs the business 50,000 a year and his / her activity produces revenue of 100,000, the employee has covered the costs and raised an additional 100% - the profit or return. So, the annual ROI for that employee is 100%. By calculating employee ROI, one can focus on making the most of them as assets invested in the business. By changing the way we look at processes, by understanding the vital few factors that cause waste, error, and rework, we can improve the ability of our processes to deliver higher quality to our customers and to lower costs. Once we know which vital few factors to focus on, we can make improvements that deliver dramatic results.

And by putting employees to work at solving process problems with proven statistical tools, the manager can eliminate not only errors, but also inaccurate speculation about why processes don't work. Again, instead of opinion, the manager arms himself and his people with quantifiable information - based on facts, not hunches and guesswork. When he knows the facts, he is in a position to fix the problems permanently and gain long-term benefits. In other words, he has leveraged the power of knowledge to transform performance.

5. Conclusions

Six Sigma at many organizations simply means a measure of quality that strives for near perfection. Six Sigma is a disciplined, data-driven approach and methodology for eliminating defects (driving toward six standard deviations between the mean and the nearest specification limit) in any process - from manufacturing to transactional and from product to service.

Yet, Six Sigma is not another quality program. Businesses exist for one purpose - to profitably serve customers. So it follows that any problem-solving initiative should do the same. Six Sigma uses the company's resources to fix identifiable, chronic problems. It proves its value by connecting outcomes to the company's bottom line. Quality programs lay a valuable foundation in creating a quality mindset. Six Sigma is not theory. It's a practice of discovering the vital few processes that matter most. It defines, measures, analyzes, improves, and controls them to tie quality improvement directly to bottom-line results. Six Sigma is an active, involved effort that puts practical tools to work to root defects at all levels of the organization.

It is also no theoretical exercise. Since the success of Six Sigma is directly linked to monetary outcomes, it generates real-world results. It uses the most readily available resources in an organization - its human assets. That means that positive, tangible results consistently show up wherever and whenever people are engaged in implementing the method.

Six Sigma is not a training program. Of course, practitioners are trained in the methodology to ensure correct implementations and results. But Six Sigma is a business strategy that fosters a cultural shift at all levels. Permeating departments, functional groups, and all levels of management, Six Sigma changes the outlook and practices of everyone in the organization. From workers on assembly lines and bookkeepers in accounting to operations managers and human resource personnel, training exists only to instill the method, facilitate transformation, and get financial results by attacking chronic defects with proven statistical tools.

Six Sigma actively links people, processes, and outcomes in a rigorous, adaptable way to get you the results you're looking for. No matter the industry, business, product, or service, as you apply Six Sigma, you'll see the tangible results on your projects.

Six Sigma helps the company and the manager to identify what they don't know, indicates what they should know, and helps them reduce defects that cost time, money, opportunities, and customers.

THE ROLE OF THE SUSTAINABILITY REPORT IN CAPITALISTIC FIRM

Gazzola Patrizia

Insubria University of Varese – Italy, Faculty of Economics

Meo Colombo Carlotta

Pavia University – Italy, Faculty of Economics

The aim and the central topic of this research is the understanding of the importance of Sustainable growth strategy approach as a driver to achieving top-line growth and bottom-line results.

The main contributions of this line of research are to demonstrate the idea that the sustainability report is an instrument for social interaction and social cost/benefit analysis and to show that such an instrument can describe, comment on and sum up the firm's own behaviour aimed at sustainable growth.

The work integrates the CSR management literature with a large body of research in accounting and finance.

This study draws from theoretical research about the nature of the corporation, its role in society and contributions by recent research on corporate social, environmental, ethical responsibility and accountability.

Our research demonstrates that the economic existence of the capitalistic firm as a producer of economic and financial values must be appreciated, in terms of the sustainability of the development path of the firm, and evaluated by a wide range of social performance measures of outcome or benefit.

It also shows how the Sustainability report emphasizes the link between firm and territory, and affirms the concept of the firm as an entity that, by pursuing its own prevailing interests, contributes to improving the quality of life of the members of the society in which it operates.

This paper contributes primarily to the academic debate by reviewing past attempts to theorise CSR and stakeholder dialogue, identifying gaps and weaknesses, and proposing the Sustainable Growth implementation processes for the creation of value. It also highlights the relationship between CSR activity and corporate image and performance.

The research shed light on aspects of CSR activity for which little is known and much less is being understood; namely, the channels and the mechanisms through which the CSR impact is perceived and realized for creation of value.

Carlotta Meo Colombo (3) considers the capitalistic firm as Business Value-Creating Organizations and Patrizia Gazzola (1-2;4-6) considers the Sustainable Growth implementation processes for the creation of value.

Keywords: Sustainable Growth, Creation of Value, Sustainability Report, Performance, Stakeholders.

JEL codes: M14, M41

1. Introduction

Strictly speaking, firms are traditionally considered as systems for the creation of economic and financial value for their shareholders, and their performance – profit and the value of capital – is measured by a coherent system of monetary values.

Nevertheless, if we do not limit our view to simply the shareholders but consider instead a vast group of stakeholders, we must then also broaden our notion of the production of sustainable value in order to include both the social value and the environmental value.

In effect, the firm sets a system of objectives for itself which is centered on its sustainable growth, but, at the same time, develops a strategy for achieving a multi-dimensional growth that encompasses the economic, social and environmental dimensions.

This implies intense social managerial actions based on transparency, growth of reputation, dialogue with the stakeholders, continuous research and development in all sectors and processes; these actions require effective communication instruments, primarily in the economic crisis (Iamandi, Constantin and Jodes 2010: 963-969)

In this sense the sustainability report, as far as it certifies the ethical profile of the firm and legitimizes the latter's social and environmental role, emphasizes the link between firm and territory, and affirms the concept of the firm as an entity that, by pursuing its own prevailing interests, contributes to improving the quality of life of the members of the society in which it operates and that can, in all respects, represent a means for the creation of sustainable value.

2. The overall fitness of the capitalistic firm as a system that produces “value”

Despite the differing perspectives from which the firm can be viewed, we believe it is appropriate to accept the basic thesis that considers the capitalistic firm, or *Business Value-Creating Organizations* (BVCO), as an autopoietic production, business and profit-oriented organization (Mella 2007: 413- 421, 2009), whose fitness resides in its capability – or efficiency (**Beer 1981**) – to produce adequate levels of economic and financial values through a network of specialized organs and processes (Alter and Hage 1993).

We propose the following basic Hypothesis:

- a. a condition for the creation and survival of a *capitalistic firm* is that the entrepreneur succeed in developing a portfolio of businesses with sufficient return to acquire and maintain invested the capital necessary to activate and continually renew the productive and economic processes and the investment cycles;
- b. the overall fitness of the firm, which guarantees its autopoiesis, is revealed by *financial measures of performance* that denote the efficiency and effectiveness in the production of shareholder value in terms of return and capital gains;
- c. the overall fitness includes the *productive* and *economic* fitness, indicated by a system of performance measures that denote the economic and productive efficiency revealed in the production of *economic values*;
- d. the autopoiesis of the firm, when viewed as an economic social actor, depends on its capacity to earn the appreciation of the stakeholders who are not components of the organization but who gain external advantages, individual or social, from its existence (Toffler 1985).

As a social unit, the firm must produce social shared “value” (Harrison and St. John 1998) in the broader sense that its economic existence as a producer of economic and financial values must be appreciated, in terms of the *sustainability* of the development path of the firm, and evaluated by a wide range of social performance measures of *outcome* or *benefit*: the efficiency of materials; technical innovation; energy efficiency; community relations; eco design; product recyclability; and employee relations.

The attainment of perceived levels of social performance produces reputation, brand and confidence, so that the environment itself sets the conditions for the firm's legitimation and

consent, which favours autopoiesis and thus a lasting existence for the enterprise as a social unit as well as an organizational type (Gazzola and Pellicelli 2009).

This implies, on the one hand, the organizational ability to recognize the set of relevant stakeholders as well as to identify their expectations and, on the other, the capability to communicate the global “value” produced in terms of social benefits and prevented damage to the physical environment.

3. Performance measures for Capitalistic Firms as systems that produce “values”

There are quite a number of financial performance indicators; however, we feel that only a limited number are sufficient to express the fitness of the capitalistic firm as a system for producing values, according to the basic thesis at the end of the preceding section (Mella 2005: 25-52).

The most concise performance indicator is the return on equity, *roe*, defined as the ratio between the net income R and the equity E during a period T: $roe = \frac{R}{E}$.

This indicator is particularly significant in that it expresses, in extremely concise form, the capacity of the firm to satisfactorily remunerate those who have invested equity in it, guaranteeing a return that is sufficient to maintain the capital’s integrity, both in monetary terms (preserving its purchasing power), financial terms (financial return, interest, dividend and capital gains at least equal to that obtainable from investments with similar risk conditions), and real terms (capacity to renew investments at the end of their cycle) (Ruefli, Collins and Lacugna 1999: 167-194).

If *roe* is a relevant measure of performance for shareholders, the most important performance indicator for the *financial transformation* is the return on investment, *roi*, which is the ratio between the operating result, OR, and the invested capital, IC, over a period of time T: $roi = \frac{OR}{IC}$.

It is important to observe that *roe* depends directly on *roi* by means of the well-known general law of returns (Modigliani and Miller 1958: 261–297):

$$roe = [roi + (spread\ der)], \text{ where } spread = roi - rod, \text{ and } der = \frac{D}{E}$$

This previous Modigliani-Miller relation clarifies how the firm’s general *financial* performance, indicated by *roe*, is a function both of *economic efficiency*, expressed by *roi*, and the capacity of the firm to acquire a financial structure, expressed by *der*, that permits it to take advantage of the *financial leverage* effect in the presence of a differential in returns indicated by the *spread*.

From *roe* and *roi*, we can derive other concise indicators of financial fitness that refer to the firm’s ability to meet the expectations of investors: the *economic value added* (EVA), the *dividend on equity* (*doe*) and the *economic value of the firm* (EVF).

EVA can be defined through the following equation:

$$EVA = IC (roi - coi),$$

in which *cost of invested capital* (*coi*) – or also *capital cost rate* (*ccr*) or *weighted average capital cost* (*wacc*) – represents the *cost of investment* and is determined by the following expression:

$$coi = \frac{rod\ D + roe^* E}{IC} = rod \frac{D}{IC} + roe^* \frac{E}{IC} = wacc$$

Thus, while *roi* is the *return on investment*, *wacc* represents the part of this return that is needed to pay the interest on the Debt, at an average cost equal to *rod*, as well as to guarantee the shareholders a proper return equal to their opportunity cost, *roe**.

The spread ($roi - coi$) thus takes on the meaning of *overall financial performance* (which is independent of the scale of the investment), whose absolute value is instead represented by the EVA, taking into account the amount of IC (Stern and Hutchinson, 2004).

In general shareholders, being holders of pure investment equity, compare their satisfaction not so much on the basis of the indications from *roe* as on

$$d_{oe} = \frac{R}{E} d = \frac{DIV}{E},$$

where d is the average dividend rate that would guarantee a self-financing adequate for the firm's growth.

The EVF is defined as the level of capital capable of producing a net result equal to that effectively achieved by the firm as a financial transformer, R , under the assumption that this capital was invested with a satisfactory return equal to roe° , which is considered acceptable to shareholders.

Since by definition $EVF * roe^\circ = R$, and $R = roe E$, with roe equal to the effective financial return, through substitution we obtain:

$$EVF = \frac{roe}{roe^\circ} E.$$

From the preceding performance indicators it follows that the fitness of the firm is linked to its capacity to produce:

a roe which is not below the minimum or fair roe^* necessary to satisfy shareholders, thereby creating value;

a $roi > roi^* = coi$. If this *second condition* is met, then $EVF > E$, thereby achieving the financial integrity of the equity capital invested by the shareholders.

This shows the relevance of human capital and intangible assets in capitalist production and the need for:

- *creativity*, by which products and processes are continually innovated (Christensen 1997; Deephouse 1999), thereby favoring applied scientific research and technological innovation (Von Hippel 1995);
- *intelligence* in understanding internal and external processes, in order to rationalize the technical processes of production;
- *organizational learning* and the formation of learning organizations to the competitive challenges through new work rules (Schmitz Jr 2001)
- *management control* (from the Decision Support System to Just-In-Time) (Wilcox and al.);
- *a good reputation* for the firm in its environment (Carter and Manaster 1990: 1045-1067).

According to the concept of sustainability – originally introduced in the 1987 Brundtland report, *Our Common Future*, which was commissioned for the United Nations – whose central principle is “*development which meets the needs of the present without compromising the ability of future generations to meet their own needs*” (WCED 1987), we propose the following Hypothesis: the capitalist firm, as a social unit, must produce social shared “value” (Harrison and St. John 1998), understood in the broader sense that its economic existence as a producer of economic and financial values must be appreciated, in terms of the *sustainability* of the development path of the firm, and evaluated by a wide range of social performance measures of *outcome* or *benefit*: the efficiency of materials, technical innovation, energy efficiency, community relations, eco design, product recyclability, and employee relations.

4. From the corporate balance to the sustainability report

The system of values achieved by the corporation as a system of economic transformation is reflected in the corporate balance which translates the values produced into performance indicators in order to assess whether or not the economic-financial objectives of the business and profit organization have been achieved.

Due to the fact that the system of economic and financial values in the balance derive only from monetary exchanges and reflect only the conditions of productive, economic and financial efficiency, the balance that contains such values has three limits with regard to the information it conveys.

In the first place, it is not able to express the conditions for long-term success that derive from the non-monetary ties to the social environment.

Secondly, the traditional corporate balance cannot account for the ethical values and other intangibles which are fundamental to the success of the enterprise in creating economic values.

Thirdly, the statement of produced values does not provide sufficient indications of the ability of the firm to expand in a way compatible with the environmental resources and the social values.

In order to evaluate the overall impact of the firm's activity on the collectivity (Hill and Jones 1992) it is necessary to come up with a document that supplements the traditional corporate balance, which is called the sustainability report, since its objective is to indicate the value created by investments in the social field and, more generally, the results of the firm's social and environmental policy.

Thus, the sustainability report represents the means by which the firm describes, comments on and reports its role and behaviour with regard to sustainable growth, and through which the firm's social actions toward its stakeholders is made visible and transparent.

The sustainability report, providing information on corporate policy with regard to the Corporate Social Responsibility (CSR) (Blowfield and Murray 2008), promoting an image that gains the consensus of the collectivity and enhances the reputation of the firm, and ensuring greater trust by the stakeholders (Zadek 2001), thus shifts attention from the creation of *economic and financial values* by the productive organization to the creation of *social and environmental values* by the organization as a social agent.

It is for this reason that the sustainability report is the fundamental instrument to ensure the public's appreciation for the social activities of the firm (Griffin 2008), enhancing its reputation in order to create the value of the firm as an actor in the social context as well as to engender trust, which in turn represents the basis for improving the firm's economic and financial transactions and, as a result, making the production of values more efficient. (Kerr, Richard and Chip 2009).

In order to enhance its reputation (Figge and Schaltegger 2000) and trust, which are the fundamental elements for the production of value by the firm, it is thus important for the firm to be able to demonstrate, by means of the sustainability report, the extent and limits of its own CSR.

From this perspective a comprehensive relational process and a continuing dialogue with the social agents become essential elements for creating a relationship of trust with the stakeholders and a context of shared values.

The sharing and pursuit of objectives by means of the trust that is generated through the development of long-lasting relations leads to the spread of a culture (Kotter and Heskett 1992) of shared responsibility. This culture is the condition for the organization's success as well as a source of long-term competitive advantage, which are useful and effective elements for the creation of value in the organization (Mankelov 2006).

5. Sustainable growth and the “Triple Bottom Line”

The firm, as a social agent, must base its growth on ethical behaviour (Dyrud 2007: 36-44) which involves safeguarding as much as possible the environmental conditions that will be “passed on” to the future generations. Thus the firm must compete on the social and environmental (Freedman and Jaggi 2009) front as well as the economic-financial one.

In fact, in developing its strategies the firm must take into account the concept of *sustainable growth*, which defines the ability of the present generation to achieve a type of growth that, while satisfying the needs of the present, does not compromise the ability of future generations to satisfy to their own needs.

Sustainable growth represents a necessary condition to obtain medium- to long-term success (Clarkson 1995), managing its businesses so as to improve its economic results (Heal 2008) but at, the same time, safeguarding the natural environment and promoting social justice.

The corporate balance - as clearly shown in the “*Sustainability Reporting Guidelines*” in the “*Global Reporting Initiative*” (www.globalreportinginitiative.org) - cannot by its own nature identify and point out the many ways in which firms influence the environmental and social ecosystems they operate in, beginning with the use of human, natural and capital resources and the creation of value.

The European Commission has asked all the large firms listed in the Triple Bottom Line Reporting (Elkington and Fennell 1998) to communicate their economic, social and environmental performance to the shareholders, supplementing the economic aspect of their management with the social and environmental ones, to the benefit of the relationship with its stakeholders and the markets.

Economic prosperity, environmental quality and social justice are the pillars on which the creation of corporate value is based, according to the “triple bottom line” (Warren 1999).

6. Conclusion: The communication of the social and environmental commitment to create value

The creation of social value for the firm is necessary to maintain an effective process for the creation of economic and financial values (Siregar and Bachtiar 2010: 241 – 252).

The sustainability report represents the instrument for monitoring, financial accounts preparation and communication regarding the responsible management approach to achieve a sustainable growth that respects the shared values of the context in which the firm operates.

In order to measure social (Kaplan and Norton 1992) performance (Clarkson 1995) it is necessary to insert indicators (EEA 2001) into the sustainability report that allow the stakeholders to measure the firm’s capacity to create well-being for the collectivity (Zakhem, Parker and Stoll 2007) and to demonstrate the firm’s social utility by indicating, from both an internal and external point of view, its capacity to achieve social and environmental objectives.

A firm that focusses not only on the quality of the product but also on the safety of its employees, the social impact of its activities and the use of ethically-correct procedures is creating value (Zadek, Pruzan and Evans 1997) by gaining the trust of its workers, the market and its collectivity of reference.

In conclusion, the sustainability report can be viewed as a means for giving value to the firm, since it permits the firm to monitor and prepare the financial accounts for the process of responsible management between the firm and its interlocutors in order to increase its economic advantage and at the same time its social legitimization.

CODES AND PRACTICES OF IMPLEMENTATION OF CORPORATE GOVERNANCE IN ROMANIA AND RESULTS REPORTING

Grosu Maria

„Alexandru Ioan Cuza” University of Iasi, Romania Faculty of Economics and Business Administration

Corporate governance refers to the manner in which companies are directed and controlled. Business management was always guided by certain principles, but the current meaning of corporate governance concerns and the contribution that companies must have the overall development of modern society. Romania used quite late in adopting a code of good practice in corporate governance, being driven, in particular, the privatization process, but also the transfer of control and surveillance of political organizations by the Board of Directors (BD). Adoption of codes of corporate governance is necessary to harmonize internal business requirements of a functioning market economy. In addition, the CEE countries, the European Commission adopted an action plan announcing measures to modernize company law and enhance corporate governance. Romania takes steps in this direction by amending the Company Law, and other regulations, although the practice does not necessarily keep pace with the requirements. This study aims on the one hand, an analysis of the evolution of corporate governance codes adopted in Romania, but also an empirical research of the implementation of corporate governance principles of a representative sample of companies listed on the Bucharest Stock Exchange (BSE). Consider relevant research methodology, because the issuer of the Codes of CG in Romania is BSE listed companies requesting their voluntary implementation. Implementation results are summarized and interpreted at the expense of public reports of the companies studied. Most studies undertaken in this direction have been made on multinational companies which respects the rule of corporate governance codes of countries of origin. In addition, many studies also emphasize the fair treatment of stakeholders rather than on models of governance adopted (monist/dualist) with implications for optimizing economic objectives but also social. Undertaken research attempts to highlight on the one hand, a misapplication of the principles of corporate governance in Romania at present, but also a lack of transparency in the dissemination and publication of information. They should promote a Board of Directors determined and would allow stakeholders access to information about the company. Research results can provide a basis for reconsidering the CG policies in Romania.

Keywords: Corporate Governance, Governance Code, Corporate Governance Principles, Annual Report, Governance models

JEL: G34, M14, M48, N40

In Europe, the first corporate governance code was issued in 1992 Cadbury Code (Sir Adrian Cadbury was Chairman of the Board of Cadbury Company for 14 years). This was the basis for the Code of Corporate Governance and the London Stock Exchange has held *three basic principles of corporate governance* (Cadbury 1992: 16), namely: *transparency, integrity and responsibility*. Later, as a result of financial scandals that have destabilized the operation of the British system, to reconsider the importance of corporate governance; quality of implementation of recommendations contained in the Cadbury Code was discussed in a series of progress reports issued in the coming years.

In the EEC, information on "Corporate Governance in Europe" published in June 1995. Changes and improvements to the Codes of CG occur throughout this period so that in March 2010 adopted the Code „*ecoDa Corporate Governance Guidance and Principles for Unlisted Companies in Europe*” issued „*The European Confederation of Directors' Associations (ecoDa)*” (ECGI). This Code of CG includes a set of 14 principles that focus specifically on the protection of minority shareholders in the face of possible abuses by controlling shareholders. CG system in Europe is considered an insider system (Clark 2007: 10), characterized by the presence of active shareholders within the corporation and is in direct business relationship with the entity. Therefore, concentrated ownership is associated with the control, mission management stakeholders seeking interest groups, to increase added value for them. In addition, business strategy proclaims active involvement in the long term, the stakeholders.

In **Romania**, the need to implement the rules of CG was determined by the privatization process which required companies to improve management practices, on the one hand, and the transfer of control and surveillance of political organizations by the BD, on the other hand. With the advent of the first law of privatization (in 1991) empowered the State Council was replaced by Annual General Meeting (AGM) and was established and BD. CG implementation rules was a way to harmonize internal business requirements of a functioning market economy.

Codes of Corporate Governance in Romania

The first Code of CG in Romania was issued in June 2000 by the International Center for Entrepreneurial Studies and was the target of public companies listed on BSE. Code rules have not been so well received by the market on the ground that they had particular regard to the protection of minority shareholders. Subsequently, in 2008 issued the Code of Corporate Governance of BSE, which comprises 19 principles, namely:

- I: Companies will adopt *clear and transparent structure* of corporate governance that will adequately disclose the general public;
- II: Companies are obliged to respect *the rights of shareholders* and ensure their fair treatment;
- III: Companies will make every effort to achieve *an effective and active communication* with shareholders;
- IV: Companies are driven by a BD that *meets regularly* and makes decisions that allow them to fulfill their duties of an effective and efficient manner;
- V: BD is *a company responsible for its management and functions as a collective body*, based on an accurate and complete information;
- VI: The structure of a company's BD will ensure *a balance between executive and non executive members*, so no one person or group of people can not dominate, in general, the CA decision;
- VII: A sufficient number of BD members will be *independent directors*, meaning that they have or recently had, directly or indirectly, any business relationship with the issuer or persons involved, of such importance as to influence their objectivity views;
- VIII: BD has a membership that ensures its ability to *monitor effectiveness, analyze and evaluate the work of directors* as well as fair treatment of shareholders;
- IX: Election of Board members will be in a formal, rigorous and transparent;
- X: BD will assess whether it is possible composition of a Nominating Committee consisting of its members and composed mainly of *independent directors*;
- XI: Companies will provide the services of managers and executives with *a good professional and ethical profile* of a reliable remuneration policy, consistent with the strategy and long-term interests of these companies;
- XII: Corporate governance structures in place to ensure that *an adequate and continuous periodic reports on all important events on the company*, including financial situation, performance, ownership and direction;

- XIII: BD will adopt strict rules to protect society's interests in the areas of financial reporting, internal control and risk management;
- XIV: BD will take appropriate operational solutions to facilitate proper identification and resolution of situations in which a director has a material interest *in its own name or on behalf of third parties*;
- XV: BD of members will make decisions in the interests of the company and will not take part in debates and decisions that create *a conflict between their personal interests and those of society or of a subsidiary company controlled*;
- XVI: BD will determine, after consultation with the structures of internal control, approval and implementation procedures for transactions with the Company or *its subsidiaries parties*;
- XVII: Administrators and managers will maintain the *confidentiality* of documents and information received during their term;
- XVIII: Corporate governance structures must know and recognize *the legal rights of interested third parties* - stakeholders - and to encourage cooperation between this company and to create prosperity, jobs and businesses to ensure sustainability of financially sound;
- XIX: Where to adopt *a dualist management system*, the previous principles are properly applied, adjusting the dual system of uniform provisions in full conformity with the objectives of good corporate governance, information transparency and investor protection and market.

The situation presented, it appears that the 19 principles 14 principles aimed, directly, BD, powers and functions, with emphasis on the independence of non-executive managers. This situation is surely The World Bank made recommendations for our country as a result of a study undertaken for the period 2001-2006 in 17 countries in transition (McGee 2008: 22-51). The study focused on changes in practices CG, is analyzed how to comply with its principles. The results of the analysis revealed that Romania was ranked five, along with Bulgaria and Slovakia in terms of CG principles.

In these circumstances, the World Bank recommendations across Romania have followed two major directions:

- need to increase the role of BD and the need for the introduction of specialist committees to advise the board;
- meetings of the AGM of listed companies to take part and have their external auditors provide explanations on how shareholders have met the obligations set out in the investment contracts.

Based on these recommendations, but also fund measures to modernize company law and enhance corporate governance in CEE, announced by Directive 2006/46/EC (Directive 2006/46/EC), national legislation is amended in line with requirements EU to improve disclosure on corporate governance practices applied in companies. Short-term priorities of Community action in this area have included targeting: confirm *the collective responsibility of directors and improving information on applied corporate governance practices in companies*. According to the plan of action, members of the administrative, management and supervision of a company must act within *the powers* conferred upon them by law. Also, companies whose securities are admitted to trading on a regulated market and which have their registered office in the Community are required to submit *an Annual Statement on the CG* when the company applies the corporate governance provisions other than those set by national whether these provisions are set directly into a corporate governance code under which the company or any corporate governance code which the company may decide to apply.

For the system of corporate governance adopted to contribute to improving the company's value creation potential, it is not sufficient to cover only the concern of *legal and financial dimension* CG (separation property or function of the management), it is important *managerial dimension* of

value creation is an effect of applying *a set of skills* in a context based on discipline and accountability.

In this regard, the Companies Law no. 31/1990 made some changes, of which the most important concerns about the GC:

- By constitutive act or decision of the AGM may provide that one or more members of the BD *must be independent*;
- GM may decide to create *independent advisory committees* charged with conducting investigations and making recommendations for the board, in areas such as audit, remuneration of directors, managers, auditors and personnel management functions, committees will submit to the board regularly Reports on their activities;
- at least one member of each committee created to be *independent non-executive directors*; *audit committee and remuneration* shall consist only of *non-executive directors*;
- constitutive act may stipulate that companies stock is managed by a *Directorate (Managing Board) and a Supervisory Board* (the dual system of administration); Managing Board exercises its functions under the control of the Supervisory Board; Supervisory Board members *can not be simultaneously members of the Directorate and can not aggregate membership of the supervisory board of the company's employee*.

We note that the law requires companies are joint stock companies to create *advisory committees be independent*, or to use the dual system of administration, implicitly assumes an independent board, that the Supervisory Board.

In line with good governance practices reconsideration has been changed and the basic rules which guide companies currently in Romania, namely with the adoption OMPF 3055/2009 included is a new section (Section 11) for *internal control*, believed, moreover, *a pillar of corporate governance*. In that legislation insisting on *internal control purposes*, namely to ensure consistency of objectives, identifying key success factors to the entity's management and communication, real-time information on performance and future prospects. Whatever the nature or size of the entity, efforts to implement sufficient internal controls related to the application of *good practices*. In addition, a new statement included in national legislation provides that a separate section of the management report will present information on *corporate governance*. Aunt companies whose securities are admitted to trading on a regulated market will include information on the CG section to a statement will refer to: *corporate governance code that applies to the entity or who voluntarily decided to apply; since, according to national law, the entity is removed from the code of corporate governance that apply or who chose to apply; an explanation of it on the parts of code that do not apply and the reasons for not applying*.

BSE's Corporate Governance requirements. Case Study

Therefore, in accordance with the Code of the CG BSE in 2008, companies whose financial instruments are traded on a regulated market operated by the BSE will adopt and comply with a *voluntary basis*, the Code of Corporate Governance issued by BSE. In this sense, "issuers" are required to enclose the Annual Report, starting with the year 2009, "*Corporate Governance Compliance Statement*" – "*Comply or Explain Statement*" (CES). This statement is designed based on the 19 principles included in the BSE Code of Governance which in turn are developed 38 recommendations, according to the Corporate Governance Code Guidelines prepared by the Institute of CG of BSE, which provides suggestions implemented according to best practice internationally.

"*Comply or Explain Statement*" even start with the last principle stated in the Code of CG, namely: "*The issuer is administered under a dual system?*" Therefore, we believe that as accounting, is considered the going concern basis on which other principles are based, as in the

GC, if that principle in mind, a lot of other principles and recommendations should be easier to comply. Further, the “*Comply or Explain Statement*” required by BSE calls for issuers to develop a CG Regulations to be posted on their websites CG defining structures, functions, powers and responsibilities and leadership BD executive. In addition, the annual report should contain a separate section for CG to be described all the relevant events related to the CG, recorded during the previous financial year. Also require issuers to post on the BSE website updated memorandum, indicating the list of board members are independent members, members of executive management and the specialized committees and CV for each member of the BD and the executive management. Recommendation No. 8 “*Comply or Explain Statement*” requires that every issuer to disseminate in a section on its website on shareholder rights and the rules and procedures for participation in the AGM.

The main “concern” of CES balance between executives and aimed at non-executive (independent), so that no person or group of people can not dominate the decision making process of BD. It also recommended that the activity was BSE, BD to have the support of independent advisory committees to examine specific topics and advice on these topics BD (it is the Audit Committee, Remuneration Committee and Nomination Committee). CES concludes with the question: “*Issuer activities on social and environmental responsibility of the company?*” We see therefore that the emphasis is increasingly more on corporate social responsibility, both by government to assist all stakeholders, but also by a positive attitude towards society and environment in general. Romania’s attitude and, in particular, the Exchange regarding the requirements of increasingly stringent on the CG follows, of course, bringing the European and international practices in this area.

To demonstrate that the adoption of codes and practices are the results of CG in Romania, we conducted a study of companies listed on BSE in category I and II (total of 65 companies).

Among *the most important findings*, we report:

- only three of the analyzed companies are managed under *a dual system of administration* (Carpatica SA, OMV Petrom SA, Prodplast SA);

- six companies have published “*The Comply or Explain Statement*” for the year ended December 31, 2010 (Azomureş SA, BRD GSG SA, Ropharma SA, Aerostar SA, Altur SA);

- 23 of the 65 companies analyzed, *the offices of president and general manager of BD* are owned by the same person;

- 21 companies make *no claim related to the CG*, just over 15 companies information to shareholders, while other companies (CEMACON SA, Comp SA, Farmaceutica Remedia SA, TMK Artrom SA, Terplast SA) presents only the information contained the opposite association GC Code requirements;

- 8 companies *have adopted codes of their CG* and post CG information in a separate section on their websites (Alro SA, Antibiotice SA, Azomureş SA, Transelectrica SA, Ropharma SA, Transgaz SA, Altur SA, Carpatica SA).

Reported findings from the study conducted lead us to conclude that *the principle of transparency* in our country - entered the first principle of CG Code: Cadbury Code - still more to the statement included in state codes CG. Consequently, the analysis that the other two basic principles of GC - *integrity and responsibility* - become quite difficult, as long as the dissemination and disclosure, which should promote a determined BD stakeholders to allow access to information about the company is limited.

Conclusions

Even if the failure of principles and recommendations contained in different codes GC is still punishable by law, however, compliance has the effect of self discipline listed companies. If we consider the governance model adopted at the continental level in terms of study undertaken on the 65 companies listed on BSE, a weakness for 50% of the companies reviewed is that they are governed by the model tier (in a single Council meets both executive and non-executive managers), without the position of President to be separate from that of Managing Director. This does not just *increase the power improperly President-General Manager*, administrators can not take action only in a collegial manner. On the one hand, it is considered that directors should be an overall responsibility; on the other hand, their power could only peer, without being able to work towards disapproval of the conduct of the President. So long as *personal interest* overshadowing corporate social responsibility, investor confidence is destroyed and thus require reconsideration of the principles of CG, especially in terms of improved quality and transparency of financial reporting. We believe that restoring investor confidence in capital markets may be the consequence of a high degree of stringency *of corporate governance rules*. Negative findings drawn from the study may be the consequence of the adoption of a voluntary code CG. Imperative and mandatory adoption and implementation of codes of good practice could be a solution.

As political power, economic power must be limited by *separating the executive managers of non-executive managers*, and by dispersing ownership. Any shareholder has the tendency to abuse its power of control and lack of separation of the two categories of managers will lead undoubtedly *to a concern for personal interest, let alone the interests of the company*. In this respect, the dual structure of governance (either by separating the office of President of the General Manager, either by separating the Executive Board of Supervisory Board), that the legal obligation to publish the mode of remuneration of managers, the presence of independent directors, *transparency* in dissemination and publication of information in order to be allowed access to all information about the company stakeholders is a plurality of conditions for effective governance of companies, which will lead undoubtedly to optimize their economic and social objectives.

HOW COULD HOSPITALS ACT IN AN AGEING SOCIETY?

Leuca Mirela

University of Oradea Faculty of Economic Sciences

The demographic changes are of great importance for all European societies. Their impact and effects have multiple, deep facets. Each European healthcare and welfare system will be facing considerable changes in the new demographic context. The hospital sector plays an important role in each health system. This paper focuses on the impact of the demographic changes on hospitals, presents and analyzes statistical data for the German hospitals sector in order to underline the importance of the older age groups for the number of the hospital inpatient cases, the provided range of medical services and disciplines and for the hospital disease costs. The paper also reveals main findings from 30 interviews conducted in 2010 with German health experts (from hospitals, health insurance companies, universities, institutes and regional healthcare policy makers) that accepted to answer questions referring to the demographic impact on the German healthcare system and hospital sector. The results of the interviews show that hospitals will have to act and react to the demographic changes. German hospitals might play different roles in the healthcare service provision for older people when engaging in new models of integrated care that will have to be developed. Processes, structures, human resources expertise, hospital service provision and medical departments will undergo major changes in response to the demographic challenges. Networks, centres of excellence for older persons and integrated care will probably be indispensable structures of the German healthcare system in the future. Strategic partnerships with pre- and post-hospital healthcare service providers are considered to be top priorities for German hospitals when facing the demographic challenge. Central case management and process optimization can be essential factors of success in the hospital care of the older, multimorbid patients. Acute geriatric medicine will be a main quality feature for the hospital care of older patients not only in the German healthcare system.

Keywords: hospital care, ageing society, hospitalized elderly patients, demographic challenge, expert interviews.

JEL Classification Codes: I11, J11, M10.

I. Introduction

The demographic changes and their impact on society, on economic, healthcare and social systems have become the topics of an increasing number of publications in many European countries. Since the beginning of the third millennium there also have been many important contributions from the Commission of the European Communities, the European Parliament, the Council of the European Union, the European Economic and Social Committee etc. regarding the demographic changes and their multiple, complex effects. One of these contributions was the *Communication* from the Commission of the European Communities (2001: 4) referring to *the future of the health care and care of the elderly* in the European Union under following conditions: “[...] access to health care for all, a high level of quality in health care and [...] financial viability of health care systems”. Other activities of great importance (for the present and future demographic situation) have been referring amongst others to the “*common commitment by the Member States to combat neurodegenerative Diseases, particularly Alzheimer’s*” (Council of the European Union 2008a) and the “*public health strategies to combat neurodegenerative diseases associated with ageing and in particular Alzheimer’s disease*”

(Council of the European Union 2008b). In a recent, very important contribution, the European Economic and Social Committee (2010) pointed in detail at the amplitude of the demographic effect on healthcare and welfare systems in their recommendations meant to promote healthy ageing at both national and European level. Main aspects underlined by the European Economic and Social Committee refer amongst others to the necessity for “financial sustainability” of the welfare and healthcare systems, for developing “patient-centred”, “integrated” and “personalized” healthcare services and also for more intensive human resources training in geriatric medicine, and thus in the age-specific healthcare problems and needs of the older population (European Economic and Social Committee 2010: 5-6, 10); the Committee also grants local networks a major role in ensuring the coordination of the service provision for the older people in the future (European Economic and Social Committee 2010: 10-11). The demographic impact on the health care system has many facets and describes many changes. For example, there is a large body of studies revealing the benefits of geriatric medicine; in this context, the “European silver paper” published by Cruz-Jentoft et al. (2009: 54-55) recommends that *specialist geriatric care should be available for all hospitalized older people in Europe*. The hospital sector plays a very important role in every health care system, so that this paper focuses on illustrating and analyzing possible (realistic) future scenarios for hospitals when facing the demographic challenges. These scenarios represent future developments for German hospitals as expected and illustrated by 30 German health experts. Statistical data is presented to underline the importance and amplitude of this topic before the main findings from the expert interviews are being revealed.

II. Selected data on German hospitals

The latest diagnosis data for discharged (hospital) inpatients provided for Germany by the Federal Statistical Office (Statistisches Bundesamt 2011) show that the age group 65+ years accounted for about 43% (44%) of all hospital primary diagnoses (of the cumulated diagnosis group of *Diseases, injuries and poisoning*), whereas the age group 70+ years accounted for 34% (35%). Combining population with hospital diagnosis data for the year 2008 (as in figure 1 presented), one can notice that (when not considering the age group less than 1 year) only the older age groups (beginning with the age group 60-65 years) determined disproportionately high numbers of inpatient cases (as represented by the cumulated number of all inpatient diagnoses); the percentages of the number of the discharged (hospital) inpatients in the older age groups (in the total number of discharged hospital inpatients) were even up to 3 times higher (for the age groups 85-90, 90-95 years) than the percentages of the population of these age groups in the total German population.

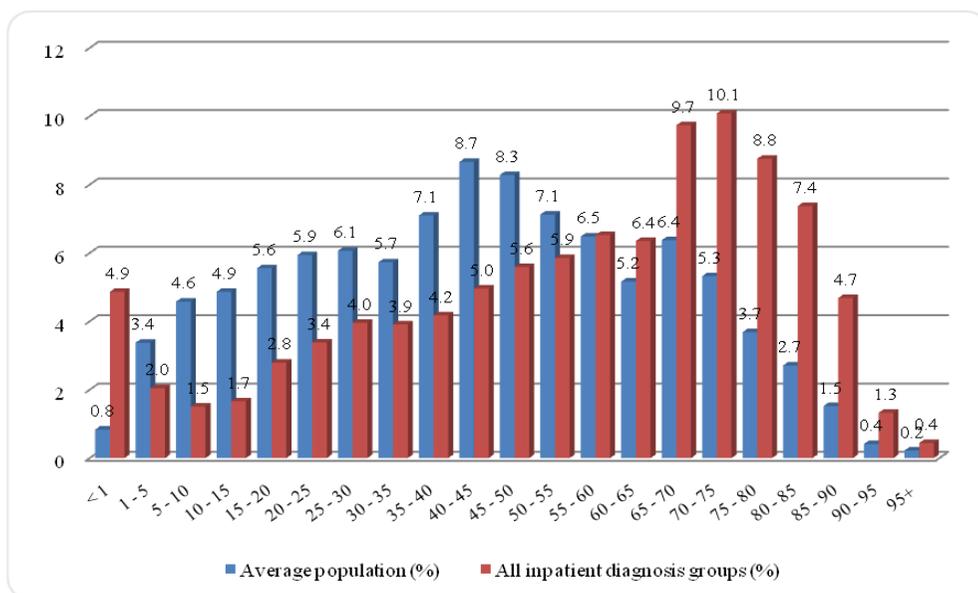

Figure 1: The percentage of the age groups in all inpatient diagnosis groups and total average population in Germany - 2008

Source: author's own calculations based on the available statistical data from Statistisches Bundesamt (2009, 2010b): diagnosis data – Statistisches Bundesamt 2009: Worksheet 2.1.1.1; demographic data – Statistisches Bundesamt 2010b: 44.
 Explanation: age group $x - y$ implies at least x years and less than y years.

Computations based on the hospital primary diagnosis statistics (Statistisches Bundesamt 2009, 2011) show that compared to 2008, in 2009 the number of the discharged inpatients increased by 1.6% in Germany, whereas the age group 70+ years accounted for almost 90% of this percentage growth. The association between the number of hospitalizations for specific groups of population and the hospital disease costs provided by the Federal Statistical Office (Statistisches Bundesamt 2010a: Worksheet 5.4) shows that 42% of the total discharged inpatients (representing the age group 65+) accounted for almost 49% of the total hospital disease costs. Comparing the hospital disease costs for the years 2006 and 2008 (Statistisches Bundesamt 2010a: Worksheets 4.4, 5.4), one can notice that the age group 65+ years contributed with 107% to the percentage growth (of 4.8%) of the hospital disease costs in 2008 (and the hospital disease costs decreased for the age groups 15-30, 30-45 years); further calculations based on the statistical data provided by Federal Statistical Office (Statistisches Bundesamt 2010a: Worksheets 4.4, 5.4) show that the hospital disease costs accounted for about 26% of the total disease costs in 2008 and their increase (in 2008 compared to 2006) contributed with 17% to the percentage growth (of 7.5%) of the total disease costs.

Source: table structure (diagnosis groups, age groups) adapted from Statistisches Bundesamt (2009): Worksheet 2.1.1.1; data in table 1 represent author's own calculations based on the available statistical data from Statistisches Bundesamt (2009, 2010b): diagnosis data – Statistisches Bundesamt 2009: Worksheet 2.1.1.1; demographic data – Statistisches Bundesamt 2010b: 44.

Explanation: age group $x - y$ implies at least x years and less than y years.

Analyzing the data from table 1, one can notice the high values of the age-specific number of inpatient hospital cases for *diseases, injuries and poisoning* per 1000 inhabitants in the older age groups; the age-related profile of the number of inpatient hospital cases per 1000 inhabitants (per age group) presents a continuously (remarkably) rising slope beginning with the age group 60-65 years and ending with the age group 90-95 years. The higher age groups (65+ years) are characterized by high(er) age-specific number of (discharged) inpatient hospital cases (per 1000 inhabitants) of diseases of the circulatory system, of the digestive system, of the respiratory system, of the musculoskeletal system and connective tissue, of injuries, poisoning and certain other consequences of external causes (when not taking into consideration the first two age groups) etc. Calculations based on the available statistical data (Statistisches Bundesamt 2010a: Worksheet 5.3) show that in 2008 the highest hospital disease costs were generated by the diseases of the circulatory system (18.4% of the total hospital disease costs), followed by neoplasms (13.5%), mental and behavioural disorders (11.1%), diseases of the musculoskeletal system and connective tissue (10.1%), injury, poisoning and certain other consequences of external causes (10%) and by diseases of the digestive system (8.6%) etc. The analysis has so far underlined the importance of the older age groups for German hospitals (in terms of number of discharged inpatients and disease costs) and some of the age-related diagnosis groups which are expected to grow in the future as direct consequence of the demographic changes. In addition, the expert interviews will reveal future scenarios for the German hospital sector facing the multiple facets of the demographic challenge.

III. How are health experts estimating the impact of the demographic challenge?

With the support of the top management of the German hospital Klinikum Ingolstadt, 30 German health experts (in management positions of non-profit, private and public hospitals and clinics, including also networks of such institutions, experts in health economics from German universities, experts from institutes and health insurance companies and regional healthcare policy makers) accepted in 2010 to answer specific questions referring to the demographic challenge and impact on the German healthcare system, especially on the hospital sector. The main findings of these interviews which are to be presented in the following concentrate mainly on main developments in the German hospitals as expected by experts in the changing demographic context. The multiple facets of the demographic challenge for the German healthcare system (as resulting from the conducted expert interviews) will affect also hospitals considerably (and they already do). The experts have mentioned amongst others following priorities for hospitals from the perspective of the demographic changes: closer networking with the out-patient healthcare sector, completion of strategic partnerships with pre- and post-hospital

care facilities, increase / improvement of the old age medical expertise of the hospital personnel, adaptation and optimization of the hospital admission process, adaptation of the hospital structures to the needs and problems of the older, multimorbid patients and cross-sectoral case management. Experts consider that networks and centres of excellence for older people will represent indispensable structures with precise task sharing and governance in the future of the German health system – hospitals will also have a clear role in these new healthcare structures. A higher degree of cooperation between hospitals and nursing homes, rehabilitation facilities and other post-hospital care service providers is expected to be achieved in the context of a more intensive focus of the German health care system on preventive measures and out-patient healthcare services and of a more intensive connection between the different sectors of the healthcare system. Some experts mention structural changes that would aim at the avoidance of (unnecessary) hospitalizations of older persons especially at the interface between nursing homes / rehabilitation facilities and hospitals. A concrete example refers to the health care service provision for the older persons in nursing homes that could be ensured by a special nursing home physician (as integral part of these facilities). The interviews have also revealed the fact that experts consider that hospital admission criteria will become stricter and more accurate; at the same time it could be expected that the control of the necessity for inpatient treatment would become more intensive. Most of them also emphasize the need for hospitals to concentrate more on the specific needs and problems of the older persons when deciding about their process structure, service activities and offerings, hospital architecture, service provision and human resources expertise. With regard to the hospital process structure, some of the experts point to the importance of the hospital admission process as it marks the beginning of the activity of the central case management and can influence considerably the hospital care- and post-hospital-pathway; geriatric screening and assessment are considered to be indispensable elements of the hospital admission process in order to guarantee an early detection of the geriatric patients and an evaluation of the age-specific health care needs and necessities; from the point of view of these experts, the hospital admission process is to be closely and tightly connected with the hospital discharge management in order to trigger the discharge preparation (including the post-hospitalization care) in due time and thus avoid delayed discharges and “bed-blocking”. Experts consider that the hospital processes must be designed and structured in a manner that ensures the optimization of the hospital length of stay of the older patients and must thus contain inter- and multidisciplinary structures and elements (including social care); more than else should hospital processes in ageing societies be transparent, accomplishable, well synchronised and adequate to the age-specific problems and needs. Transparency implies also on time availability of patient data and information, which plays a major role beginning with the hospital admission process (and often even before the hospital admission). The optimization of the hospital length of stay, continuity of care and avoidance of hospital readmissions imply (often) a tight cooperation and connection with post-hospital healthcare service providers; in this context the experts emphasize the need for more patient-centred, integrated (health)care. Experts also consider that new models of care have to be established and expect hospitals to engage themselves in these future healthcare structures (some of them especially for the healthcare of the older, multimorbid persons) – hospitals could be both partners and initiators in healthcare networking with service providers of other sectors of the German health system. Experts also have mentioned the strong belief that hospital processes will have to be more intensively accompanied by the hospital employees (and thus more labour intensive) due to the increased health care needs and problems of older, multimorbid and often chronically ill patients. As the DRG-system is not accounting for the differences regarding the labour intensity of physicians and nurses for older, multimorbid and younger patients, the demographic changes will determine an increased need for hospital personnel resources that is not additionally gratified. More than that, the present and future

situation on the labour market represents another problem for the hospitals. The demographic ageing of the population implies not only a higher number of older patients, but also more older employees; in this situation experts expect hospitals to develop adequate human resources development plans, innovative ideas for committing the personnel, the redefinition of labour division between the hospital professionals etc. In this setting, demographic-oriented human resources management should emphasize also the importance of team structures, broad qualification of the hospital employees, personnel training / formation in age-related diseases and characteristics and constant knowledge adaptation and transfer (age-relevant expertise). The need for more geriatric know-how and expertise (including high age healthcare characteristics, needs and problems for all hospital professionals) and for an increased deployment of physical therapists are considered to be self-evident by many experts, thus they have underlined the necessary financing (financial resources) of (for) the hospital personnel training and development and also for the higher labour intensity in the hospital service provision (generated for example by additional services provided by employees such as physician therapists). Many of these experts consider that the acute geriatric care represents an indispensable quality feature for the future hospital care of older persons. Experts have emphasized the fact that that hospitals without such departments will still have to guarantee and ensure the expertise for the hospital care of the older, multimorbid persons. The problem with the acute geriatric services in hospitals is their present financing in the DRG-system: there is no special gratification for hospital geriatric services except the gratification of the geriatric early rehabilitative complex treatment (integrated in a small number of DRGs), but the geriatric early rehabilitation represents only one part of the acute geriatric medicine. Under these circumstances German hospitals would provide the older, multimorbid patients with acute geriatric services with no additional financial resources. Other expectations from the acute geriatric medicine refer to benefits that would decrease the follow-up costs for the German health system (in terms of multiple, repeated investigations, medication, care costs etc.) The geriatric structures (for example the acute geriatric medicine departments in hospitals, out-patient geriatric services, geriatric day hospitals etc.) and expertise are still underdeveloped in some parts of Germany. A positive example supporting the development of acute geriatric departments can be seen in Bavaria, which enlarged its existing geriatric program with focus on geriatric rehabilitation by having adopted and implemented a new program for acute geriatric medicine, which contains quality requirements for the acute geriatric medicine departments in the Bavarian hospitals (Bayerisches Staatsministerium für Umwelt und Gesundheit 2009). Regarding the range of provided services (medical departments and disciplines), experts consider that hospitals will have to expand towards the age-related diseases and focus more and more on old age surgery and medicine. At the same time, the hospital service provision is expected to be characterized by a higher degree of care and sustainability. These are main findings from the interviews with the German health experts that show some of the complexity degree, amplitude and broadness of the demographic impact on German hospitals.

IV. Concluding remarks

The hospitals will be facing many challenges determined by the demographic changes. The statistical data and the main findings from the expert interviews show that hospitals will have to account more and more for the needs and problems of the older, often multimorbid patients. More than that, hospital processes and structures, the range of hospital services and medical departments, the expertise of the hospital employees will undergo considerable changes in response to the future demographic situation. Many of the findings are relevant not only for German hospitals, but generally for hospitals in ageing societies.

PROBLEMS AND CHANCES AT THE INTERFACE BETWEEN HOSPITAL CARE AND GERIATRIC REHABILITATION

Leuca Mirela

University of Oradea Faculty of Economic Sciences

Fastenmeier Heribert

Klinikum Ingolstadt

Available statistical data offer valuable information on recent demographic changes and developments within European healthcare and welfare systems. The demographic evolution is expected to have considerable impact upon various, major aspects of the economic and social life in all European countries. The healthcare system plays an important role especially in the context of ageing societies, such as Germany. This paper focuses on the evolution of the prevention or rehabilitation service sector during the last years in Germany, analyzes the specific characteristics of the elderly patients being cared for in these facilities and underlines important aspects at the interface between (acute) hospital and geriatric rehabilitative care. Networking, integrated care services and models will be of even greater importance in the future demographic setting generating (most probably) increasing numbers and percentages of elderly, multimorbid hospitalized patients. More than this, the cooperation at regional level between acute geriatric hospital departments and geriatric rehabilitation facilities has become a mandatory quality criterion in the Free State of Bavaria. This paper presents and analyzes issues referring to a precise cooperation model (between acute and rehabilitative care) recommended for implementation even by the Free State of Bavaria while emphasizing several examples of good practice that have guaranteed the success of this cooperation model. The analysis of the main causes leading to longer length of stay (and thus “delayed discharges”) for the elderly patients transferred to geriatric rehabilitation facilities within the reference model for acute-rehabilitative care provides important information and points at the existing potential for optimization in the acute hospital setting. Vicinity, tight communication and cooperation, early screening, implementation of standard procedures and case management are some of the activities that have contributed considerably to the improvement of the hospital length of stay and transfer management for elderly patients benefiting from (follow-up) inpatient geriatric rehabilitation services. The presented facts are important not only for the German health setting.

Keywords: acute-rehabilitative care interface, demographic impact, process optimization, care networking, geriatric patients.

JEL Classification Codes: I11, J11, M10.

I. Introduction

An increasing number of publications have picked out issues referring to demographic changes and their impact on healthcare and welfare systems as a central theme. The expected increasing number of elderly inpatients in German hospitals emphasizes the need for detailed analyses with regard to the specific needs of the elderly, (often) multimorbid hospitalized patients; one of these specific needs refer to the benefits provided by geriatric rehabilitation services. The fragmentation of the service provision in the German healthcare sector implies a separation of the acute hospital care from the geriatric rehabilitative care, and thus the existence of an interface between these different healthcare sectors. This paper focuses on the analysis of recent developments in the rehabilitative care sector in Germany and of possibilities for its integration

with the acute hospital care illustrating opportunities and benefits resulting from strategic partnerships and cooperation between hospitals and geriatric rehabilitation facilities by means of a best practice model (from the Free State of Bavaria).

II. Selected data on German hospitals and prevention or rehabilitation facilities

Data analysis and calculations performed on statistical data (Statistisches Bundesamt 2006, 2007, 2008, 2009c, 2011c: Worksheet 2.1) have indicated following evolutions for the German inpatient prevention or rehabilitation service sector during the time period 2005–2009: the number of facilities, established beds and average inpatient length of stay decreased (by respectively 2.4%, 1.7% and 1.1%), whereas the bed utilization rate, number of inpatient care days and cases showed a positive trend (with percentage increase of respectively 11.2%, 9.3% and 10.6%); in addition, the direct inpatient admissions from hospitals increased by 15.9% (and to about 36.7% from the total number of the direct inpatient admissions to prevention or rehabilitation facilities in 2009), whereas the direct discharges (transfers) from these facilities into (to) hospitals increased by 4% (accounting for a relatively stable percentage of about 2.0 - 2.2% of the total number of discharges from prevention or rehabilitation facilities in the selected period of time). When focusing on the evolution of geriatric departments in prevention or rehabilitation facilities during the time period 2007-2009, the calculations performed on the available statistical data (Statistisches Bundesamt 2008, 2009c, 2011c: Worksheet 2.1) have indicated positive evolutions for the main analyzed indicators, such as: number of departments (+10.0%), establishes beds (+11.1%), inpatient care days (+13.7%), inpatient cases (+16.2%), accompanied by a decrease in the inpatient length of stay by 2.2%; at the same time, the number of direct inpatient admissions to geriatric departments increased by 16.9%, whereas the direct inpatient admissions to these departments from hospitals by (only) 11.2% (accounting in 2009 for 79% of all direct inpatient admissions to these departments, compared to 83% in 2007); in addition, the direct discharges (transfers) from these departments into (to) hospitals increased by about 11.2% (accounting for about 10.2–11.2% of the total number of direct discharges from these departments in the analyzed period of time). As a very high percentage of inpatient admissions to geriatric departments in prevention or rehabilitation facilities represent transfers from hospitals, we consider that it is important to point at the evolution of the inpatient hospital cases for specific age groups, as these evolutions are of high importance in the context of present and expected demographic changes. We analyze in this paper the interface between inpatient hospital care and inpatient geriatric prevention or rehabilitation services so that we will focus on the age group 70+ years according to the reference age in the definition of geriatric patients from the new program for acute geriatric medicine adopted in the Free State of Bavaria (Bayerisches Staatsministerium für Umwelt und Gesundheit 2009: 3). In 2009, the age group 70+ accounted for about 33.6%, respectively 35.0% of the inpatient hospital cases according to the hospital diagnosis statistics (Statistisches Bundesamt 2011a: Worksheet 2.1.1.1), respectively DRG-statistics (Statistisches Bundesamt 2010a: Worksheet 2.1.1.1) in Germany; comparing the statistical data available for 2007 and 2009 (Statistisches Bundesamt 2009a, 2009b, 2010a, 2011a: Worksheet 2.1.1.1), one can notice that the percentage increase in the number of inpatient hospital cases of the age group 70+ of almost 10% (according to both hospital diagnosis and DRG-statistics) accounted for about 80%, respectively 90% of the cumulated increase in the hospital inpatients (according to the hospital diagnosis statistics, respectively to the DRG-statistics). Considering some of the expected demographic effects (population decrease, considerable change of the population age structure), one could expect an increase in the hospital inpatients of the older age groups (and of the high-age related diseases) and thus an increase in the geriatric patients benefiting from geriatric rehabilitation after/during hospitalization. The statistical data available for 2009 referring to inpatients discharged from prevention or

rehabilitation facilities having a bed capacity of more than 100 (Statistisches Bundesamt 2011b: Worksheet 2.1.1.1) show that the age group 70+ accounted for about 26% of the discharged inpatients; the highest percentage of the primary diagnoses for this age group referred to diseases of the musculoskeletal system and connective tissue, followed by diseases of the circulatory system, neoplasms and injury, poisoning and certain consequences of external causes in prevention or rehabilitation facilities (see figure 1). The data in figure 1 point at differences in the importance of selected diagnosis groups between the older age groups discharged from prevention or rehabilitation facilities (expressed as percentage in the total number of inpatients in the respective age groups), such as for e.g. for the neoplasms (decreasing with age) or for the diagnosis group referring to injury, poisoning and certain other consequences of external causes (increasing with age).

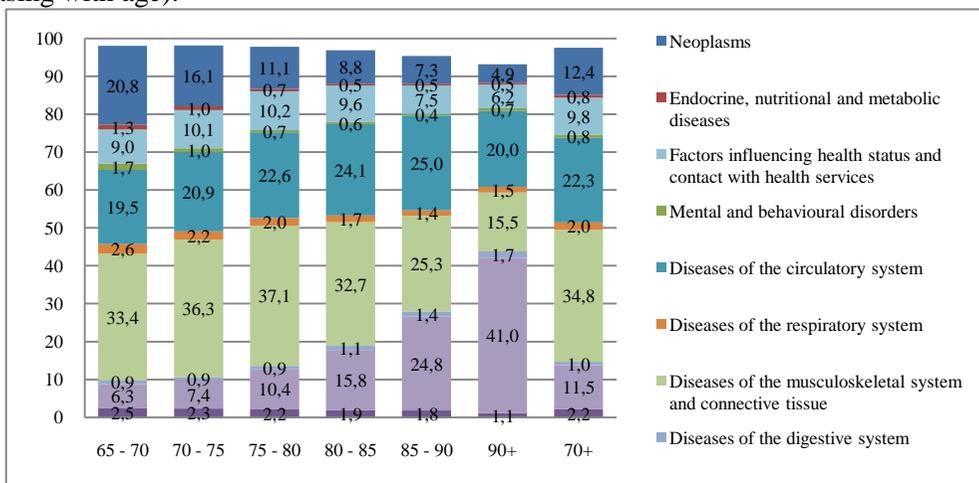

Figure 1: Percentage of the number of inpatient cases of a specific diagnosis and age group in the total number of inpatient cases of the selected age groups discharged in 2009 from prevention or rehabilitation facilities with more than 100 beds (%)

Source: authors' own figure and calculations based on the statistical data from Statistisches Bundesamt (2011b): Worksheet 1.1.1.1.

Explanation: age group $x - y$ implies at least x years and less than y years.

* - only facilities with more than 100 beds.

The analysis of statistical data has so far indicated the importance of transfers from acute hospital care for the geriatric medicine departments in prevention or rehabilitation facilities; more than that, geriatric rehabilitation plays an important role as it can significantly contribute to avoiding hospital re-admissions and nursing home placement of the elderly persons (as long as possible). The mandatory quality criteria of the new program for acute geriatric medicine in the Free State of Bavaria point at the necessity for acute geriatric departments (in hospitals) to cooperate at least with one regional geriatric rehabilitation facility and underline the importance of establishing care networks for the elderly persons, the acute geriatric medicine being an important, integral part of these networks (Bayerisches Staatsministerium für Umwelt und Gesundheit 2009: 8).

III. Identifying optimization potential and best practice for hospitals at the interface with inpatient geriatric rehabilitation facilities

How can a connection, (more precisely) an interconnected model of care between acute hospitals and geriatric rehabilitation facilities emerge in the present German healthcare setting? The German Subsidies (and Funding) Law is in this context problematic, as a general “merger (fusion)” of rehabilitation facilities with acute geriatric hospital departments (and even hospitals) and the follow-up out-patient care cannot take place in publicly-subsidized institutions (hospitals). In this situation, one alternative could consist in finding reliable partners that provide

inpatient geriatric rehabilitation services (and that could also provide geriatric rehabilitative day care and out-patient care) and that are ready to engage themselves in establishing geriatric rehabilitation facilities on the premises of hospitals. At this stage, it must be clarified whether the initial location of the geriatric rehabilitation facility (in Bavaria most of them being located in the Bavarian Alps in an idyllic position) can be changed when considering procedural and structural requisites and whether there will be a sufficient large incentive for the inpatient rehabilitation service providers to establish (move) their facilities in the vicinity of the acute care hospitals. The demographic changes facilitate such interconnected models of care (with one major advantage consisting in the provision of acute care and geriatric rehabilitation services within a campus structure, close to domicile) for the elderly persons in the context that an increasing number of this age group (with geriatric multimorbidity) is expected to be admitted to hospitals and benefit from acute geriatric medicine and geriatric rehabilitation services in a setting compatible with their social environment, domicile and actual home. One should also not underestimate the “marketing-effect” of such models of care that allow regular visits from family members during the hospital and geriatric rehabilitation facility stays (thus supporting the continuous contact of the elderly, often multimorbid patients with their social environment). The vicinity between the two institutions provide further benefits (for patient transfer, service provision etc.) when the building structures are connected. It is obvious that not only the patients and their families, but also both healthcare service providers (and partners) must and do benefit from such cooperation models. The acute care hospital may follow further objectives, such as: achievement of a better (hospital) inpatient length of stay management (process optimization, process duration reduction etc.), better treatment result for elderly patients, unique market positioning, ensuring care continuity, quality, uniformity and support within the network of care for the elderly population, the avoidance (decrease) of (in) hospital re-admissions, improve patient satisfaction and enhance patient loyalty, brand building and enhancement, establishment of an important, indispensable care structure within a network of care for elderly persons etc. At the same time the geriatric rehabilitation facility in the vicinity of the acute care hospital may aim at achieving following objectives: continuous, high bed occupancy and utilization rate, ensuring high (optimal) number of inpatient cases, improvement of the patient transition process between acute care and geriatric rehabilitation, high degree of reliability regarding the rehabilitation potential of admitted patients, that should and do benefit from the provided inpatient rehabilitation services. As shown in the specific case of the selected German acute care hospital having developed this kind of strategic partnership (the so-called “Ingolstadt-Neuburg acute-rehabilitative care cooperation model”) has continuously been expanded and intensified thus generating process optimization (also process duration reduction) in the acute care hospital, higher number of admissions in the geriatric rehabilitation facility and better transition from acute into rehabilitative care. The analyzed German acute care hospital has been characterized by large and increasing numbers of elderly hospitalized patients who often need follow-up inpatient (geriatric) rehabilitative services after the acute hospital stay. This specific acute care hospital (like many others) anticipates a significant increase in the number of inpatients that will follow this treatment (and care) process. The length of stay analysis conducted on all transfers from the selected German acute care hospital to geriatric rehabilitation service providers during one year (before process optimization) revealed a very high percentage of cases (more than 65%) with hospital length of stay over the average inpatient length of stay as published in the annual DRG-catalogue for Germany (and thus generating too high costs). The major causes for the high degree of “delayed discharges / transfers” to geriatric rehabilitation facilities that were identified within the conducted analysis revealed not only suboptimal internal structures and processes, but also potential for optimization in the cooperation with the geriatric rehabilitation facilities and in the communication with the agents and companies responsible for processing the approval forms for inpatient geriatric

rehabilitation services. In this context, based on the conducted internal analysis, following aspects need to be mentioned:

- *when referring to the causes related to human resources know-how, internal structures and process organization in the acute care hospital:* duration of the application process (for inpatient rehabilitative care) too long, inappropriate timing of filling in the application forms (often after having exceeded the average inpatient, catalogue-length of stay), insufficient know-how for justifying the need for inpatient rehabilitative care, incomplete (and late) identification of patients that could benefit from inpatient geriatric rehabilitation services etc.;

- *when referring to causes related to capacity and admission times limitations of the geriatric rehabilitation service providers:* high bed capacity fluctuations in geriatric rehabilitation facilities (leading to transfer problems and delays for the hospitalized elderly patients), limited admission hours/days in these facilities etc.;

- *when referring to the communication with the companies/agents responsible for processing the approval forms:* degree of further enquiries, declined applications and successful objections, (sometimes) human resource shortage (leading to long processing times) etc.

Since this analysis many activities have been performed in order to minimize waste and improve the situation. A recent analysis in the selected German acute care hospital showed that many of the implemented measures (early screening, standard procedure for filling in the approval forms, specific employee training, targeted case management etc.) led to better results. The very early, coordinated participation of the rehabilitation facility (by embedding the rehabilitation partner in the acute clinical process) and the tight communication between the two partners guarantee uninterrupted, high-quality care. The extension of the admission hours/days of the geriatric rehabilitation facility emphasized the willingness to cooperate and adapt on both sides. The basis for these activities is established via a cooperation treaty that provides the appropriate legal basis. One should not be surprised that this established (specific) networking model at the interface between acute care and geriatric rehabilitation (the so-called “Ingolstadt-Neuburg acute-rehabilitative care cooperation model”) is being recommended for implementation by the Bavarian State. This kind of strategic cooperation (for establishing care structures within networks of care for the elderly population) will become integral part of hospitals and rehabilitation facilities and thus indispensable when considering the expected demographic changes and the major factors that determine and control considerably the profitability and sustainability of hospitals and geriatric rehabilitation facilities – processes, structure, attractiveness of the medical care and treatment, “safety-thinking” and social environment of the patients. Both the increasing specialization of medical disciplines, complexity of technical requirements and the increasing financing difficulties emphasize the fact that this kind of cooperation is not only of great importance, but even inevitable - the specialization degree has become too high and the labour market too tight, so that single inpatient healthcare service providers are not able to provide and ensure comprehensive medical care without cooperating. In order for this cooperation model to be successful, the process structure of (between) the partners must be synchronized; the collaboration between the partners plays also a considerable role. Different healthcare service suppliers are also active with different priorities and needs in this context. A question that should be taken into consideration when referring to such cooperation model is whether this kind of strategic partnership could be even further expanded (intensified) in terms of establishing and developing a medical holding company (under a common corporate link). Such structural developments could determine the establishment of more efficient cost structures in areas that are not assigned exclusively to medicine. In addition, the existing interface between acute hospital care and geriatric rehabilitation would become smoother and one could further consider integrating the so-called “low-care-department (area)” between the acute clinical and rehabilitative care. Such a construct could serve patients waiting for the approval to be

transferred from the acute care hospital into the geriatric rehabilitation facility: these patients could get accommodation in this department (area) and thus already benefit from the services, competence and expertise of the geriatric rehabilitation service partner (provided in advance). This care construct would create the interface between a “low-med-” and “high-care-” department (area), which would ensure that patients could be treated in the transitional phase (between acute hospital care and geriatric rehabilitation) according to advanced concepts of care. When establishing such a care setting, it would be of great importance for the acute care hospitals and geriatric rehabilitation providers to persuade the health insurance companies to remunerate both (hospital and geriatric rehabilitation) services together by means of a complex flat rate. It seems that health insurance companies have already started (in 2011) to search for partners who are able to provide such concepts.

IV. Concluding remarks

Both the demographic changes and the increasing financing difficulties emphasize the need for analyzing, optimizing and monitoring internal processes and structures related to the transition of elderly patients between the acute hospital and geriatric rehabilitative care. The presented facts and figures from the German acute care hospital reveal clear potential for internal optimization and for optimization at the interface between hospitals and geriatric rehabilitation facilities. The presented model of acute-rehabilitative care emphasizes opportunities and benefits resulting from the vicinity and the tight cooperation between acute care hospitals and geriatric rehabilitation facilities. This model does not only guarantee high-quality care for elderly patients, but also generates economic advantages for both partners.

OUTSOURCING STRATEGIES. HOW TO FORMALIZE AND NEGOTIATE THE OUTSOURCING CONTRACT

In the globalized economy multinational firms have given rise to local firms able to produce at a low cost and at acceptable quality levels. A growing number of firms have outsourced production and manufacturing activities of all types to these firms, not only to reduce production costs but also to make their organizational structures more streamlined and flexible. Outsourcing decisions, which originally were limited to production which had a modest technological content and was of marginal importance for the business in question, is increasingly adopted for activities which, requiring core competencies or belonging to the core business, were considered inseparable from the organization and thus not outsourceable. Gradually an outsourcing strategy has developed which has found it convenient to outsource even core competencies and functions, such as specialized manufacturing, which require a particular technology, marketing, product design, and the search for know-how (Prahalad and Hamel 1990: 79-91).

Such an outsourcing strategy has a number of advantages, among which quality improvement, a greater focus on managing other core competencies, a greater flexibility and leverage regarding resources, along with the possibility of entering new markets, even ones with a high rate of development.

This article analyzes the fundamental stages for an outsourcing strategy. It will demonstrate how, in order to achieve an outsourcing strategy, it is necessary to include outsourcing in the general strategy, gather suitable information for choosing the outsourcer, negotiate the contract with the supplier, choose the type of relationship to have with the supplier, and, finally, plan the transfer of activities and functions from the outsourcee to one or more outsourcers or providers.

Keywords: outsourcing, outsourcing decision, strategic perspective, outsourcing contract, contract negotiation, outside information, organizational culture.

JEL Codes: M10, M19, L20, L21, L24, L26

1. Introduction. The object of outsourcing

Outsourcing functions, processes and activities, normally carried out inside the firm, through outsourcing contracts – by repurchasing through supply contracts the products or results of certain activities by firms delegated for such activities – is not a new phenomenon.

Starting from the early '80s, the use of outside suppliers has taken on new features. In the global economy, in many countries still referred to as the “Third World”, multinational firms have set up local companies able to produce at low cost and at an acceptable level of quality “(1)”; these firms have been handed production and manufacturing activities of all kinds by a growing number of firms, who are motivated by the possibility of reducing manufacturing costs as well as of streamlining their organizational structure.

In recent years outsourcing strategies have undergone a profound evolution, moving from simple forms of production contracts involving third parties to agreements that entail several

strategically important functions: from technological innovation to logistics, customer relations to post-sales services.

The outsourcing decision is not limited to marginal production with a modest technological content but is increasingly extended to activities that require “core competencies” that are part of the “core business”, activities which, until that moment, were considered an inseparable part of the firm and thus not outsourceable.

2. Outsourcing as a strategic perspective

Today firms consider outsourcing from a long-term, and thus strategic, perspective, whose aim is the outsourcing of functions and processes through a network of stable agreements with specialized outsourcers who take on the role of providers, with or without exclusivity.

Quinn and Hilmer have clearly summed up the four main advantages of outsourcing from a strategic perspective (Quinn and Hilmer 1994: 43-55):

1. maximizing the yield from internal resources by concentrating investments and effort on what the firm “does best”;
2. creating or protecting the competitive advantages by developing and strengthening the “core competencies” and building barriers against present or future competitors who might try to enter the firm’s areas of interest;
3. providing incentives to investments in the outsourcers’ technology and know-how, their innovations and skills, and their specialized activities, which the outsourcee can maintain in-house only through continual investments and innovation;
4. reducing the risks in rapidly changing markets and in the presence of fast-evolving technologies; an outsourcing strategy transfers outside the firm the risks from technological change and R&D costs, thereby shortening the production cycles and making the response to customer needs faster and more flexible.

Today the tendency is to achieve global sourcing and offshoring; that is, outsourcing that involves outsourcers located in countries other than that of the outsourcer.

With the decline in transport costs and the development of the merchant marine and container ships, globalization has begun to separate the “geography of production” from the “geography of consumption” (Mella 2007: 12).

Global outsourcing and offshoring are processes that best illustrate this tendency.

Outsourcing is transforming production from a relationship involving the supply of materials, components and services into a network of competencies involving research and development and planning.

Outsourcing has entered into new fields, from customer service to R&D to the study of new business models, even health care services.

Along these lines Champy writes, in his introduction to Koulopoulos and Roloff’s book: “*The forces of globalization have finally kicked in. ... Material and product sourcing move between multiple countries as a function of price, quality, and speed. And customers are everywhere expecting to be served with consistent quality and price, independent of location. The Internet has made markets global, even for the smallest company. In fact, information technology is the great enabler of those changes*” (Koulopoulos and Roloff 2006: 1-5).

3. The phases of the outsourcing strategy

An initial interesting model for the outsourcing decision – developed with reference to the industrial services sector, though of general validity – is presented by Kumar et al. (Kumar, Aquino and Anderson 2007: 323-342). After a preliminary brainstorming process on the fundamental internal and external variables that can influence the outsourcing decision – a

process which involves all the organizational levels of the outsourcing firm – the risks of outsourcing are then considered (Pellicelli 2008).

Jennings proposes a more general model according to which the outsourcing strategy can be outlined in the following phases (Jennings 1996: 393-405). (Table 1)

Table 1 – The phases of an outsourcing strategy.

PHASES	PRINCIPAL ACTIONS
<p>1. The objectives. Allocate outsourcing as part of the general strategy. Assess whether or not outsourcing is a feasible strategy for the organization, taking into account its current strategic objectives.</p>	<ul style="list-style-type: none"> • Define the long-term strategy for the function to be outsourced. • Consider the impact of the outsourcing decision on the chances of achieving the organization’s mission and strategies, including costs, quality, flexibility and time frame. Consider the changes in the business environment that would entail a change in strategy.
<p>2. Which activities to outsource. Collecting information. Collect and analyze information about the products/services to outsource and those than can be produced in house.</p>	<ul style="list-style-type: none"> • Identify the products/services to outsource and the expected performance levels. • Give a clear definition of these products/services. Identify the “core” competencies. Determine the current costs of the products/services to be outsourced and estimate the potential savings from outsourcing. • Obtain references about the supplier.
<p>3. Choosing the outsourcer. Set evaluation criteria to identify a group of potentially reliable candidates.</p>	<ul style="list-style-type: none"> ▪ Identify the number of suitable suppliers in order to have a vast and rational choice. ▪ Document the technical and managerial capacities of the candidate firms, their organizational cultures, and the potential fit (degree of integration with the outsourcer).
<p>4. Negotiating the contract. Aim for a contract that strictly establishes the services required and at the same time is flexible enough to permit the addition of future services as a response to unforeseen events.</p>	<ul style="list-style-type: none"> • Negotiate a fair and equitable agreement. • Specify the performances expected from each partner, how these should be measured and remunerated, and how any controversies that may arise are to be settled. • Clearly specify contingency clauses and how any subcontractors are to be managed.
<p>5. Transferring the outsourcer’s activities and functions to the supplier. Preparing a plan to transfer the outsourced activities to the supplier.</p>	<ul style="list-style-type: none"> • Set up a temporary working group to control and organize the transfer. • Actively involve those employees whose activities may be affected by the transfer. • Ensure that the managers of the functions or of those parts of the organization outsourced are actively involved in the decision-making process
<p>6. Choosing the appropriate outsourcer-supplier relationship</p>	<ul style="list-style-type: none"> • Buy the market, ongoing relationship, partnership, strategic alliances, upstream integration.

Source: adapted from Jennings 1996: 393-405

4. The objectives: what place in the general strategy?

Successful outsourcing starts with the clear definition of objectives and a clear assessment of how these can be satisfied by the outsourcer. Many failures are due to unrealistic or wrong expectations (Allen and Chandrashekar 2000: 5).

In general, there is more than one objective, and the first phase in the decision-making process involving whether or not and how to outsource starts by defining which processes or functions should be kept inside the firm.

For example, one objective of outsourcing can be to support a phase of strong growth, and thus it may have a temporary horizon; or it can signal the start of a new strategy. In addition to investments, developing the necessary production capacity takes time. If the firm has entered a phase of fast growth then outsourcing will allow it not to lose the opportunity to gain market share, develop its own business, and increase supply without additional fixed costs.

Especially when we are dealing with the outsourcing of Information Technology, the “business recovery” objectives should be evaluated, thus considering what the impact could be on the firm’s activity if the supply of a particular strategically-relevant product/service were interrupted or did not respect the agreed-upon specifications.

5. Gathering internal information and the choice of activities to outsource

According to Prahalad, firms should outsource only those processes and activities they know well; he asserts that they should not outsource to resolve problems they are unable to solve internally (Prahalad 2004).

Moreover, they should not hand over entire functions, which constitutes the “brute-force approach”. For example, a firm could hand over a sales activity but should maintain data analysis activities in-house (Prahalad 2004). It is not always necessary to transfer an entire function. Maintaining part of the activities of a function in-house reduces the risk of choosing the wrong supplier and allows the firm to transfer at a later date the entire function if expected performance is below expectations. For example, a firm can transfer the active invoicing cycle and wait to transfer the passive cycle, which in general is more complex.

The decision as to which functions to transfer is always the result of a comparison between advantages and disadvantages, many of which are common to the various functions and activities, while others are specific.

Bragg offers several general suggestions regarding specific functions and activities, such as those which are listed below (Bragg 2006: 160-180).

A. Credit collection. The risk is that the supplier may be too aggressive in his approach to the debtor and the creditor firm can lose the customer.

B. Salaries and contributions. This is the function which, more than any other, is outsourced. If the firm has several operational units spread out over several geographic areas in which the outsourcer is present, then the latter can assure the necessary services with greater uniformity and timeliness.

C. Computer services. The main advantage of outsourcing this service is the reduction in capital investments in computers, investments which will have to be made by the supplier, who may even buy the computers from the outsourcee, thereby freeing up liquidity. Outsourcing this function can also lead to disadvantages that cannot be ignored. Bragg presents some of these in detail (Bragg 2006: 164-166). In particular, Espino-Rodriguez et al. have examined the outsourcing strategy in computer systems in the hotel sector by constructing a theoretical model which, when applied to that sector, shows how outsourcing does not lead to an effective

strengthening of the capacity to manage the resources used in computer systems and in information technology (Espino-Rodríguez and Gil-Padilla 2007: 757-777).

D. Customer service. The main advantage derives from the outsourcer's experience in responding to the customer requests and in managing complaints; if the outsourcee is a prestigious firm it can contribute to the outsourcer's reputation.

E. Planning and R&D. Transferring the personnel to an outsourcer with high qualifications (higher than those of the outsourcee) would streamline the function and, if this is carried out by a highly specialized team with great potential, could provide better results in terms of innovation and patents. The advantage of turning to a supplier is decisive when the firm has a request from a customer which it cannot meet in the short term due to a lack of resources (human and financial).

Nevertheless, even this form of outsourcing entails serious risks. The idea of the "outsourcing-offshore" is "synonymous to cost cutting", but firms who go this route often forget to do so in a way that increases their capacity to compete.

Wrong outsourcing choices have also caused a diminishing of the firm's capacity to compete and led to their decline (Bettis, Bradley and Hamel 1992: 7-22; Brown and Wilson 2005: 30-34). This means that the firm must be able to identify which activities to outsource without risking negative effects on their capacity to compete. Quinn and Hilmer have listed three classes of strategic risks firms can face when they outsource: 1) the loss of critical capacities or competencies; 2) the weakening of their capacity to coordinate more than one function; 3) the loss of control over the supplier (Quinn and Hilmer 1994: 43-55).

Kearney's study on the reasons that make outsourcing a problematic choice highlights that the main fear of the outsourcee is the loss of control over the outsourcer, in particular the risk it will be less able to protect its intellectual capital (Kearney 2005: 1-97).

6. The gathering of outside information and the choice of outsourcer

Gathering information on the potential outsourcer can start by contacting firms that have had dealings with the outsourcers: individual firms or associations of firms that can serve as references for the outsourcing candidates.

The technical possibilities of producing the product/service and management's capacities are the most important criteria for choosing among the outsourcers. There is a clear relation between the risks faced by the outsourcee and the supplier's capacities: the greater the latter, the fewer the risks for the outsourcee.

According to Stacey, during the implementation of the outsourcing this information must be shared and periodically discussed with the outsourcer (Stacey 1998: 24-27).

A particular aspect to consider is the size of the outsourcer: whether the outsourcer is a large or small firm. The answer depends fundamentally on the type of activities and the volume of services to outsource. In general a large outsourcer, one who can guarantee the desired volumes and quality, is preferred to a small firm, which must be the object of constant and costly controls on the part of the outsourcee.

It must be pointed out (Bragg 2006: 30-34) that the supplier can also be a large firm that produces for its own market but, since it has excess production capacity, is willing to also produce for other customers; it may be a good idea to make use of this willingness in order to outsource modest volumes of activities.

To decide which supplier to outsource an entire function (or part of a function) to, there is need for an accurate knowledge of the potential outsourcer which identifies its objectives, including how it operates to achieve its profits and to compete with its rivals.

It should always be remembered that organizational culture may be at the basis of outsourcing choices. An example of how an organizational culture may condition the choice of outsourcing strategy is Codelco, a Chilean copper mine reputed to have one of the best managements despite being partly state-run. Codelco had to decide which functions to keep in-house and which to outsource. The problem was how to create an outsourcing strategy in a sector such as mining, which traditionally invests little in information technology. The greatest problem was management's resistance due to a culture based on centralization (Upton, Staats and Fuller 2007). Table 2 presents information that is useful for evaluating the potential of outsourcer candidates.

Table 2 – How to evaluate the potential of the supplier. Some of the possible questions to ask firms that can provide references for previous experiences with the supplier.

1. How did the supplier manage the transfer (transition) of the functions from the outsourcer to its own organization?
2. What is the level and quality of the resources employed?
3. How would you describe the services provided by the supplier?
4. How was the transfer of personnel to the supplier's organization managed?
5. What were the differences in pay and benefits for the transferred personnel?
6. What was the level of responsibility given to the employees transferred to the supplier compared to the previous level in the outsourcing firm?
7. What is the quality of the supplier?
8. How and to what extent did the supplier respond to indications of defects from its own personnel?
9. What is the level of technology adopted by the supplier?
10. To what extent does the supplier use sub-contractors?
11. How did the supplier deal with any conflicts with the firm?
12. How did the supplier manage any contract renegotiations?
13. How detailed is the calculation of costs (invoicing) by the supplier?
14. Did the supplier share with the firm any cost economies not provided for in the contract? If so, in what way?
15. To what extent did the costs charged by the supplier meet the firm's expectations? Were there any economies with respect to the costs when the production occurred in-house?
16. How did the supplier manage the services not included in the contract and to what extent did it take account of the related costs?
17. How were any problems not touched on in the previous questions managed by the supplier?
18. Would you use the supplier's services again? Why or why not?

Source: Bragg 2006: 32.

The geographical distance between outsourcee and supplier can be important in some cases, and become a determining factor when emergency actions are required, when the outsourcee has several business units spread over several geographic areas where the outsourcee is not present and would thus be forced to turn to sub-suppliers from a local firm, and when transport times are such as to compromise the rapid buildup of inventories in certain geographic areas with regard to sectors having strong sales volatility.

Even the age of the outsourcer candidate is of great importance.

In general, new firms are flexible, offer better services and frequently innovate, but they are also the most vulnerable. Those who have been in the market for some time can have greater financial stability but are often slow to innovate and are not very flexible.

7. The contract negotiation

There are different procedures for drawing up the contract, the most frequent of which we will now summarize.

After having chosen a group of potential outsourcers the firm sends each a “Request-For-Proposal” (RFP), in which some information are requested as: information on the firm and sector, activities to outsource, recourse to sub-suppliers, length of contract, transfer of personnel (Bragg, 2006).

The information obtained from the RFP is only the starting point for the selection of the outsourcer and stipulation of the contract.

The contract must be specific enough to clearly regulate every key aspect and at the same time flexible enough to allow the parties to face the consequences of unforeseen events without conflicts arising.

In particular, the contract must define the evaluation criteria for the performances and what will occur if these criteria are not fulfilled. It must establish whether or not the supplier can, in turn, use sub-suppliers. Many contracts provide for arbitration in order to resolve disputes.

In order to effectively start the negotiation the firm must understand where and to what extent the supplier earns a profit.

Even if the fundamental parameter for outsourcing is not price, if the competition among suppliers is effectively arranged then the prices offered are low and the margins reduced.

There are various tactics potential outsourcers can adopt to win the contract.

Frequently the contract contains only those clauses relating to the essential services in the platform of basic services, and additional costs are incurred for each contingency service not included in the platform. The firm responds by trying to broaden the platform and clearly defining the prices for the contingency services.

At other times the supplier renounces profits for an initial period, offering modest prices, only to ask for price adjustments later on when the outsourcee has reduced its capacity to backsource, having given up carrying out the outsourced activities. In order to make it less convenient for the outsourcer to rescind the contract, the supplier imposes high penalties for withdrawal. The outsourcer, in turn, can respond by imposing short-term contracts with low penalties for an early withdrawal.

Arjun and Subhajt, after demonstrating how widespread and serious the controversies are, especially in offshore outsourcing, present the results of a comparative analysis of the procedures adopted by a sampling of firms in order to evaluate risks and of the policies adopted to select the offshore partners.

Moreover, the authors recommend undertaking preventive due diligence for each phase of an outsourcing agreement (Arjun and Subhajt 2007: 21-46).

When the outsourcing concerns the production of goods or the supply of services, firms often turn to pilot programmes, where the supplier identifies a limited group of customers and agrees on a period of time – which can vary from 30 to 90 days – during which the customers use the service according to the agreed upon standards.

The supplier that wishes to purchase the services to give back in outsourcing generally supplies the services during this trial period at zero cost, or at a very low cost.

8. The transfer of activities and functions to the outsourcer

A plan agreed upon by the two parties – linked to the outsourcing contract – establishes the time frame and mode for the transfer of the outsourced functions.

The preliminary information for the outsourcer's personnel and the latter's involvement is important in this phase. Often there is recourse to a project team whose aim is to manage the transfer.

For simple activities, such as maintenance, the transition can be swift. However, this is not the case for complex activities. Too fast or hurried a transfer may not allow the outsourcer sufficient time to thoroughly learn about the activity to transfer.

The firm that turns to outsourcing generally starts by outsourcing a function (or part of a function) that has a modest impact on its economic results and on the organization, in order to reduce the negative impact of performances that do not meet expectations.

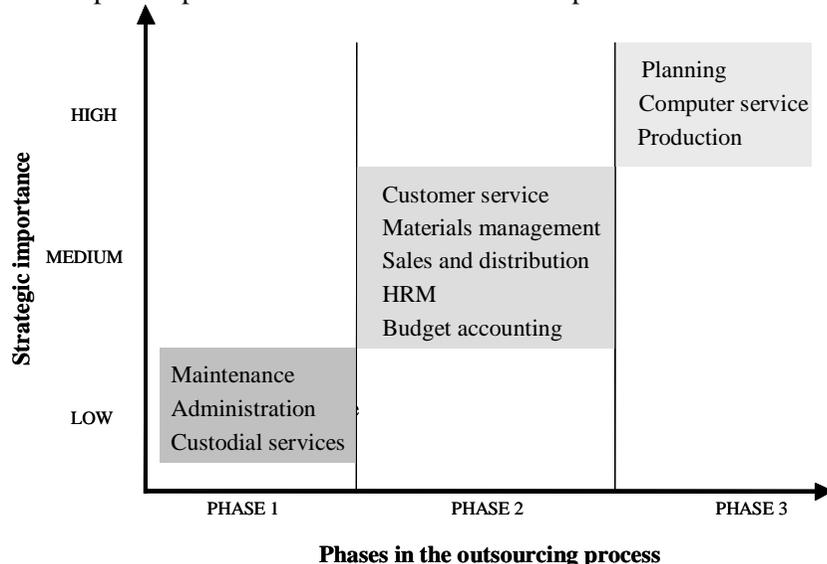

Figure 1 – Time frame for the outsourcing of various functions. Source: Bragg 2006: 30.

There are various approaches in this regard. Following Bragg, an initial approach is to follow the proper procedure regarding union relations by informing the personnel as soon as possible that the firm is considering outsourcing options (Bragg 2006: 32).

In any event, the communication must provide the personnel with valid and convincing reasons for outsourcing since deciding whether or not to outsource a function or activity in any case represents a negative assessment of the personnel who are involved in those functions and activities, which could spur the best employees to leave the firm.

Thus the firm should inform its employees only after the specifics of the contract have been defined.

The difficulties with this way of communicating are evident: 1) it is difficult to hide the selection process from the potential suppliers; 2) there are also negative effects on employees involved with those functions not being outsourced, since the suspicion may arise that the firm is hiding from them decisions that concern them.

The most complex phase is deciding which persons will be transferred to the outsourcer and with what responsibilities and salary.

It is important that: a) meetings be frequently held among the “key personnel involved”, and at least once a year for those in charge at the highest levels; b) periodical meetings be maintained

even when there tend to be no more problems; c) the persons in charge of communications not be replaced.

9. The choice of relationship to have with the supplier. Forms of direct control over the outsourcer

After deciding to outsource, the problem arises concerning the type of relationship to have with the supplier.

If we limit our attention only to typical outsourcing, then we can distinguish between the following forms: a) outsourcing as a partnership, with direct control over the outsourcer in the form of corporate or formal control; b) the outsourcing of supplies without direct control in the form of a partnership.

The first alternative is preferable when the objects of outsourcing are the strategic functions and activities that fall within the core competencies and the core business; since the outsourcer outsources those functions and processes which are vital for its survival, the firm faces the risk of seeing its organizational structure weakened, so that it is natural that, where possible, it tends to acquire or maintain control over the outsourcer.

In order to maintain control over the outsourcer, the outsourcing firm can enter into an outsourcing relationship in one of the following ways:

A) Setting up a fully-owned company to carry out the outsourced activities. . This is the preferred alternative for banking and insurance groups that are outsourcing complex functions, such as management control, auditing, and the assessment and liquidation of damages.

B) Hiving off, or transferring a business while maintaining total or legal control; this solution leads to the same results as the previous one, but has the advantage of simplifying even more the transfer of assets and personnel as well as creating a better market image.

C) Acquisition of an already-existing company or participatory control in this company; this solution differs from the previous ones in that the outsourcer outsources activities through a supply contract with an outside supplier but, in order to gain control, purchases – in one of the many forms possible – the company in question. The main advantages of this alternative are that it obviates the need to form a new organization – as the outsourcer's organization is still active – as well allows for full control (acquisition) or participatory control (share ownership).

D) Participation in strategic alliances where there is close and wide-ranging interaction among the partners, even in the form of consortiums or joint ventures, following a tendency that has become more marked in recent years. This solution is practicable especially for the outsourcing of functions that require specialized competencies which are jointly carried out by several co-venturers – research and development, advertising, etc. – with the agreement to jointly use the results obtained. Together with the advantage of producing a streamlined outsourcing with limited costs there are those deriving from a limited control and the lack of a need to outsource internal organizational structures.

In recent years new tendencies have emerged in relations between the firm that outsources without formal corporate control and its supplier.

1) Long-term relations. The average length of outsourcing contract has noticeably increased.

2) Greater cooperation. The supplier, even if not subjected to corporate control, tends to become more and more a partner, since the costs incurred by the supplier can also be considered as costs for the outsourcer and the innovations introduced by the latter can translate into future outsourcings of production lines to the supplier. Thus a lengthy and stable collaboration is in the interests of both sides.

3) A large reduction in the number of suppliers. This tendency is common to all sectors and has given rise to considerable risks for the buyer, who can find himself in an undesirable and at times dramatic position of dependence.

4) Greater use of EDI (Electronic Data Interchange) and of other communications technologies.

5) Agreements for the gradual reduction of costs (and thus prices) by the supplier.

6) Agreements for the improvement in the quality of products by the supplier which represent components for the buyer.

7) Supplier involvement in the development of new products.

Obviously the type of relation depends on the market structure and on the types of supplies provided by the supplier.

Table 3, adapted from Cohen, Agrawal and Flaherty, summarizes the characteristics of five types of possible relation between buyer and supplier in an outsourcing context, listed in order of intensity (Cohen and Agrawal 1996; Flaherty 1996: 26).

Table 3 – The characteristics of the different types of relations with the supplier.

“Buy market”	the “On-going relationship” ^(II)	Partnership	Strategic Alliance	Upstream integration
<ul style="list-style-type: none"> · Arm’s length^(I). · Clear definition of components. · Interaction via computer (EDI). · Many agreements with competitors. 	<ul style="list-style-type: none"> · Medium-term contracts. · Some information sharing. · Good relations with management · Some agreements with competitors 	<ul style="list-style-type: none"> · Long-term contracts. · Vast exchange of information. · Trust among partners. · Agreements of limited importance with competitors. 	<ul style="list-style-type: none"> · Long-term relations. · Full sharing of information and programmes. · Large scale trust and fusion among cultures. · No agreements with competitors. 	<ul style="list-style-type: none"> · Control of supplier’s capital. · Full sharing of information and programmes. · A single culture. · No agreement with competitors.
<p>(I) Simple agreement between buyer and seller, who have no other type of relation. (II) “On-going relationship” indicates relationships with several suppliers. On a case by case basis the firm chooses the one more suitable for its supplies.</p>

If the outsourcing relationship creates strong uncertainty regarding the buyer’s important objectives, then the relations with the supplier should be very close. In order to reduce uncertainty some firms adopt vertical integration, others strategic alliances. To find the best solution Pyke suggests going back to examining the four main objectives of operational management – costs, quality, delivery and flexibility – citing the example of a clothing company whose main competitive factor is its high product quality (Pyke 1998). Uncertainty about maintaining the quality of the fabric, which is vital for its strategic objectives, suggests it move to a close relationship with its suppliers along the lines of a strategic alliance.

10. Conclusions

Once the firm has decided on outsourcing and the activities that will be involved it must plan its implementation. The most important and complex phase is the choice of supplier, especially if the firm already has a network of relations with outside suppliers, each of whom is specialized in a particular area.

The most important and necessary phases of an outsourcing strategy are the decisions about the objectives to achieve through an outsourcing strategy and the activities to outsource.

In the first phase the firm must assess whether outsourcing is a feasible strategy for the organization given its current strategic objectives. Jennings identifies the following necessary steps (Jennings 1996: 393-405): 1) define the long-term strategy for the function to be outsourced; 2) consider the impact of the decision to outsource on the achievement of the mission and strategies of the organization, including costs, quality, flexibility, and the meeting of deadlines; 3) consider changes in the environment that require a change in strategy.
