From the point of view of auditing environmental information, more than half of the analysed companies have not audited the supplied environmental information, which raises a question mark with regards to the objectivity of such information.

A RETROSPECTIVE OF EVALUATION MODELS ON INTELLECTUAL CAPITAL

Ienciu Nicoleta Maria

Babeş-Bolyai University, Faculty of Economics and Business Administration

In the classical theory of economics, capital is one of the three factors of production, in addition to land and labor, and refers in particular to buildings, equipment, and machinery etc., used for the production of other goods (the term physical capital is also used by the specialized literature) (Brătianu & Jianu, 2006). The present study intend to bring to the forefront the main evaluation methods for intellectual capital, as proposed, supported and criticized at the same time by researchers and practitioners. The study offers response to the following research questions: Which are the advantages and disadvantages of the intellectual capital evaluation methods? And what are the main studies approaching the subject of intellectual capital evaluation at international level? The collection and analysis of intellectual capital evaluation models and the non-participative observation are the main instruments used to bring to the forefront the main international existing evaluation frameworks. The information sources representing the base for these researches are especially constituted by articles published in specialized magazines, both from accounting and economics fields, specialized works relevant to the reference field, legislative documents, official documents, press releases and other documents issued by various national and international bodies. The most representative studies bringing to the forefront the evaluation of intellectual capital are the ones elaborated by Mouritsen et al (Mouritsen et al, 2001), Manea and Gorgan (Manea and Gorgan, 2003), Tayles (Tayles, 2002), Tayles et al (Tayles et al, 2007). The presented approaches offer a general idea on the range of methods, disciplines and operational specializations existing for the evaluation of intellectual capital. Only one of them - Balanced Scorecard – is largely used, while the rest of the methods remain too theoretical or too poorly developed to be universally accepted. We believe that the efforts from the regulation and standardization bodies in the view of intellectual capital evaluation are too small, despite the fact that community shows an increased interest in this sense, many companies being tempted to build their own system of evaluating performances with regards to intellectual capital.

Keywords: intellectual capital, evaluation models, companies, Balanced Scorecard, international level

JEL Classification: M49

1. Introduction

The use of the term „*capital*” alongside with „*intellectual*” evidences the presence of such a capital, different from the financial and physical capital (Peltoniemi, 2006). This concept („*intellectual capital*”) has been initially and soundly defined and argued for by Thomas A. Stewart, one of the editors from the famous American *Fortune* magazine. According to him, intellectual capital is that intangible capital representing the sum of everything each employee knows to do in a company and which can be used for developing its competitiveness (Stewart, 1997). The evaluation of intellectual capital became an important research field for practitioners and researchers ever since the 90s. The epistemological proceedings on the problematic of evaluation can be grouped into two large categories: the positive / regulatory approaches according to which the whole can be best understood by dividing it into isolated pieces and by summing up afterwards the knowledge obtained about each piece; and the interpretive / constructive approaches according to which the whole can be best understood by first hand experimentation, intuition and empathy. The evaluation of intellectual capital is part of the

positive / regulatory theories of knowledge (Curaj, 2008) despite the fact that many researchers today give a distinct importance to interpretive theories or approaches.

By means of the present study we have intended to bring to the forefront the main evaluation methods for intellectual capital, as proposed, supported and criticized at the same time by researchers and practitioners. The study offers response to the following research questions:

-Which are the advantages and disadvantages of the intellectual capital evaluation methods?

-What are the main studies approaching the subject of intellectual capital evaluation at international level?

2. Analysis of Literature

In order to reflect the status of knowledge in this field, we have analyzed the content of the main articles published in ISI⁶⁷ listed international journals for the period between 2000 until present days: *Accounting and Business Research (ABR)*, *Accounting Horizons (AH)*, *Accounting, Organization & Society (AOS)*, *Accounting Review (AR)*, *Australian Accounting Review (AAR)*, *European Accounting Review (EAR)*, *Management Accounting Research (MAR)* and *Asia-Pacific Journal of Accounting and Economics (APJAE)*, BDI⁶⁸: *Accounting, Auditing & Accountability Journal (AAAJ)* and *Critical Perspectives on Accounting (CPA)* and national BDI journals: *Journal of Accounting and Management Information Systems (JAMIS)*, articles approaching the evaluation of intellectual capital by means of various methods or models. From the articles approaching the theme of intellectual capital having been published in the previously mentioned BDI indexed and ISI listed journals, the evaluation models like Skandia, Sveiby, Roos, TBIA, are approached but in a very small ratio, of 4%. The most representative studies bringing to the forefront the evaluation of intellectual capital are the ones elaborated by Mouritsen et al (Mouritsen et al, 2001), Manea and Gorgan (Manea and Gorgan, 2003), Tayles (Tayles, 2002), Tayles et al (Tayles et al, 2007), which approach models like Skandia, Balanced Scorecard, Sveiby, Roos, TBIA.

3. Research Methodology

With regards to research currents, the present work is included in the main research current, with a positive, constructive intent. The collection and analysis of intellectual capital evaluation models and the non-participative observation are the main instruments used to bring to the forefront the main international existing evaluation frameworks. The information sources representing the base for these researches are especially constituted by articles published in specialized magazines, both from accounting and economics fields, specialized works relevant to the reference field, legislative documents, official documents, press releases and other documents issued by various national and international bodies.

4. Research Results

The main methods for evaluation of intellectual capital, proposed, supported and at the same time criticized by researchers and practitioners can be split up into two main categories: generic and individual models. As part of generic models, we would mention: the BSC Model (balanced scorecard), the Performance Prism, the knowledge assets map model, the added value approach, the market or value based approach, Tobin's q model, the Baruch Lev method – association of incomes with assets, the intellectual capital's added value coefficient.

1. The BSC Model (balanced scorecard). In 1992 Robert Kaplan and Davi Norton (Kaplan and Norton, 1992) have launched the BSC model, which has evolved from status of

⁶⁷ ISI listed journals = journals included in the Web of Science: Science Citation Index Expanded, Social Sciences Citation Index s and Arts & Humanities Citation Index

⁶⁸ BDI journals = journals indexed in international databases

evaluation program to a strategies implementation instrument. It represents a set of cause-effect relations amongst the results evaluation instruments and the performance levers from four points of view: financial measures, customer related measures, internal process related measures and measures lied to improvement and development. Presently, Kaplan and Norton underline the significance of visualizing the causality relation between the measures and the objectives seen as strategic maps, representing in fact communication instruments visualizing a company's strategy, the processes and systems required for the implementation thereof. Although Kaplan and Norton consider that each company must chose their own measures, many have criticized the BSC model, deeming it to be limited, because it does not take into consideration the relations with vendors and other important stakeholders.

2.*The Performance Prism*. The main advantage of this model consists in the fact that it addresses all users – not just investors but also customers and other intermediates, employees, suppliers, communities, etc. by adopting two methods in this respect: it considers the requirements of users and what the company wishes from its users. The model's flexibility makes it applicable to any company or organizational element. The attention towards non-corporal levers makes the model useful for companies trying to evaluate their intellectual capital. It also creates a map of various interacting areas of performance, explaining particularly the fact that each of the 5 faces of the prism should be covered in a so-called success map, thus avoiding the limitation, often criticized, of the BSC model.

3.*Knowledge Assets Map Model*. This model approaches the company from the point of view of knowledge assets, being based on the interpretation of the company's intellectual capital elements as a sum of two organizational resources: *stakeholder type resources and structural resources*. The model has been especially created to help entities identify and evaluate intellectual capital and its contribution to the creation of value. Once identified, the important elements of intellectual capital can be easily integrated into more comprising models such as the performance prism.

4.*Added Value Approach*. This evaluation technique has been suggested by Robinson and Kleiner (1996) and it has a framework from two perspectives. The first one utilizes the concept of value chain belonging to Porter. From an industrial perspective, the basic premise is the fact that raw material enters in one end of the chain and, as passing through the processes that will eventually convert it into finished products, value becomes added to it. Production is not the only involved function, raw material having to be purchased and finished products marketed and sold. The entire procedure must also be managed and administered. The key point is that all these internal functions must serve the company's general purpose, that of creating value for its customers. The second part of the framework makes reference to the theory of the economic value added (EVA), rooted in the enterprise finances and developed by Stern Stewart, a New York consultancy company. If the capital entry following any project is larger than the capital cost, then the company should continue that project. The basic objective of EVA is to develop a performance measure that could control the ways in which value can be added or lost within the company.

5.*Market Approach or Value Based*. A simple way to calculate the value of intellectual capital of a company is by considering the difference between its market value – number of issued shares, multiplied by the share's market value – and the net value of its assets. This can be done with a minimum of information and the difference between the indicators is often used as a clue showing that a company more elements of intellectual capital than presented in the annual statements.

6.*Tobin's q model*. The "q" element, proposed by the economist James Tobin represents the ratio between the company's market value and the cost for replacing its assets. In case the later is smaller, then the company records a higher yield than normal. The technological

assets and human capital have been traditionally associated with high q values. One might claim that Tobin's q method is highly more accurate than the method based on value because it rather uses the replacement cost than the historical cost. However, finding these replacement costs is much more difficult than the simple reduction to a balance sheet. The model also presents several disadvantages, just like the other models, because it uses market value as a key measure. Tobin's q model cannot offer an exact figure for the individual intellectual assets. Their actual value consists in analyzing the trends; a decreasing q implies that the company does not manage its intellectual assets in an efficient way or that the investors' attitude has changed.

7.Baruch Lev Method – association of incomes with assets. Baruch Lev, professor at Stern School of Business, New York University, has proposed a method that associates the incomes with the assets generating the incomes. The method uses both gains and assets as data sources and does not focus exclusively on assets. By associating assets with gains, companies could obtain a turnover they can use to make comparisons with other companies or merely to indicate whether their incomes from intellectual assets are decreasing or increasing. However, like some of the previous methods, it leads to a single figure for intellectual assets and does not consider individual components.

8.The Intellectual Capital's Added Value Coefficient. This method calculates the difference between sales and all inputs, divided by the intellectual capital, which is estimated as the total labor expenses. The higher the rate the more efficient the company in utilizing its intellectual assets. The main advantage of this approach is simplicity. Also, a company would be able to inefficiently utilize its labor resources, but that aspect might be covered by a more efficient use of other resources leading to a similar ratio.

Certain companies, in particular the Scandinavian ones, have developed their own evaluation methods. They assume at least a part of their consultancy income and therefore have a commercial interest in promoting their models. In other parts, the development and use of intellectual capital models is purely occasional. Continental Europe is probably the most advanced in this area, unlike USA and Great Britain, which show less advancement. The countries from the Pacific coast, such as Australia and Japan have recently shown significant progress on proposing intellectual capital evaluation models. Hence, among the individual models, we would mention: the Skandia Navigator Model, the Ericsson "cockpit communicator" Model, Celemi's Model for monitoring non-corporal assets (Sveiby), Ramboll's holistic Model and the IQ Company Model proposed by Bates Gruppen, which models we will detail as follows:

1.The Skandia Navigator Model. Of all intellectual capital evaluation systems, the Skandia Navigator model, developed in 1994, is probably the most familiar, even though it is applied exclusively by Swedish companies. This model presents four main dimensions of activity: financial dimension; customer dimension; process dimension and renewal and development dimension. In the center thereof lies the human dimension leading the entire model. There is a big resemblance to the BSC model. Indeed, Sveiby (1998) sees the Navigator as a combination of BSC and Celemi's non-corporal assets monitoring. Edvinsson claims that the Navigator model can be regarded „as a house”. „*The financial dimension is the roof, the customer orientation and process dimension are the walls, the human dimension is the soul of the house, and the renewal and development dimension represent the foundation. With such a metaphor, renewal and development become the critical bottom lines for sustainability*" (Edvinsson, 1997). Edvinsson compared intellectual capital with a tree. The ripe fruit resulting from seasonal efforts can be noticed in its corona – the annual financial report. „The human nucleus" from the trunk is protected by the bark of customer relations and working routines. Research and planning, which is needed for the tree to survive droughts and cold, is given by the root and its interaction with soil. In a reality marked by the

quick and whimsical changes of business environment, the roots area is where the most important activities bearing fruits in the future can be encountered (Curaj, 2008). The value scheme developed by Skandia contains both financial and non-financial elements combined, with the purpose of highlighting a company's market value.

2. *The Ericsson "Cockpit Communicator" Model.* Ericsson, the Swedish telecommunications company, has developed a commercial product called "cockpit communicator", also based on the BSC model - Balanced Scorecard, having five perspectives extremely similar: innovation, employees, process, customers and financial. Each perspective is represented by an aircraft cockpit and each having its own indicators. Monitoring the relevant entries for each indicator, the communicator suggests actions that can match the company's strategies.

3. *Celemi's Model for Monitoring the Non-corporal Assets (Sveiby).* An international professional training consultancy company, Celemi, monitors three large groups: customers (external structure); people (competence) and the company (internal structure). The three key indicators are being monitored within each group, specifically development / renewal, efficiency and stability, each with its own performance indicators.

4. *Ramboll's Holistic Model.* Just like for other northern models, Ramboll's holistic model includes key fields where certain performance indicators are being managed. These key fields lead to three sets of results – customer, employee, and company – and all three combine to create financial results. The key fields are: values and management, strategic processes, structural resources as well as consultancy services. For example, the performance indicators for human resources are: personnel structure, personnel turnover and development of competences. These key performance indicators (KPI) are then divided. The ones related to creating competence, for example, are comprised of additional expenses, except salary, for professional training, amount spent on attending courses and amount invested in the employees.

5. *The Company IQ Model, proposed by Bates Gruppen.* Bates Gruppen is a Norwegian branch of Bates Worldwide and is part of the Cordiant Communications Group. Bates Gruppen has recently suggested a method which includes exclusively non-financial evaluation models. The Company IQ Model allows a company to compare its intellectual assets with those of a similar company. This method is more than an evaluation system; it requires the company to identify highly valuable assets, unique capabilities and intellectual related elements. While calculating its IQ, a company can discover it produces goods and supplies services which are similar to a competitor or contain features of low value for the customers. This will provide the company with a complete list of indicators, thus allowing it to take measures towards having a direct impact on its abilities to maximize profit.

Even though the previously presented types of models have been the subject of debate in time, we often ask ourselves „*Why is it so difficult to evaluate intellectual capital?*” The first reason is of historical nature. Accounting rules, although revised regularly, have been initially intended for certain assets like technical tools and factories - corporal elements representing an income source in the industrial age. Secondly, certain intangible assets are difficult to evaluate. Creativity, for example, lies at the core of a knowledge creation process, but remain an unpredictable process which can generate results in a similar unpredictable way. This aspect leads us to the third reason: the idiosyncrasy of intellectual capital. That which is valuable for a company can be useful for another company, various evaluation systems resulting, making difficult the comparison between companies and sectors.

5. Conclusions

Intellectual capital can ultimately have two dimensions: a static and a dynamic character, explained as follows (Meritum, 2002): „*Non-corporal resources belonging to a company, as*

static notion, can be evaluated at any moment. Hence, employees competences (human capital), intellectual property rights (structural capital) customer satisfaction or vendor agreements (relational capital) can be included in this category. Non-corporal resources can also be analyzed from a dynamic perspective. Companies develop activities in order to purchase or manufacture in-house non-corporal resources, in order to sustain or improve the existing ones and to evaluate and monitor them. These dynamic activities involve as such an allocation and use of resources which are not always expressed in financial terms, and therefore, can or cannot appear in financial reports.” The dynamic nature of intellectual capital means that its composing elements do not have an independent value, but gain one if included in a system. In other words, the elements of intellectual capital and especially the interaction between them generate value in a company. For example, a company can have good programming skills allowing it to create software. However, the company might have a small value unless it has a powerful distribution network, loyalty and devotion from its employees and a powerful trademark. This dynamic combination of non-corporal elements is often the recipe for the success of companies such as Microsoft, where the value of intellectual capital represents more than the sum of its individual elements.

The presented approaches offer a general idea on the range of methods, disciplines and operational specializations existing for the evaluation of intellectual capital. Only one of them - Balanced Scorecard - is largely used, while the rest of the methods remain too theoretical or too poorly developed to be universally accepted. We believe that the efforts from the regulation and standardization bodies in the view of intellectual capital evaluation are too small, despite the fact that community shows an increased interest in this sense, many companies being tempted to build their own system of evaluating performances with regards to intellectual capital.

THE DEPRECIATED REPLACEMENT COST – REPRESENTATION OF FAIR VALUE IN ACCOUNTING. TENDENCIES AND PERSPECTIVES IN THE ROMANIAN ACCOUNTING PRACTICE

Manea Marinela – Daniela

*Faculty of Economics Sciences, Department of Accounting and Finance,
“Valahia” University of Târgoviste, Romania,*

Post-doctorate researcher at “Alexandru Ioan Cuza” University of Iași

The Romanian accounting system has gone through a radical reform in the last years, but the preoccupations for improving and developing Romanian accounting still continue. In order to preserve the general objective of rendering available to financial managers and analysts a common internationally agreed framework for drawing up and presenting financial statements, accounting professionals have the duty to contribute to the elaboration of accounting policies capable to transform accounting in an essential leadership instrument. Under these circumstances, there is the attempt to identify a dialogue form between accounting norms and policies, between the freedom to choose accounting procedures and the obligation to provide users with credible relevant information. The present work aims to make a thorough analysis of fair value adjustment – version of the depreciated replacement cost – which is specific to specialized corporal immobilized assets seldom commercialized on the market, by starting from the approaches and concepts existing in specialized literature, while afterwards it will carry out a comparative study between normative provisions and the concrete reality of Romanian accounting practice. Aware that fair value adjustment represents the profession of assessment experts, the presents work aims to present the potential models for quantifying fair value, which is an useful information basis for accounting professionals who have one more instrument at their disposal, for effectively and practically applying IRFS norms.

Keywords: device method, cost method – capacity, wear and tear, life span, reproduction cost.

Classification J.E.L.:M41

I. Introduction

Currently, national destinies are strongly influenced by the forces of the world global competition [1], so that the decisions of management, investment and of financial nature have international implications. Since most of these decisions are based on accounting information, it is necessary a good knowledge of national and international accounting norms, so that business can go well. Thus, it can be witnessed a transformation of the accounting system, which has to insure to information users – investors/shareholders, creditors, a.s.o. – clear, credible and internationally comparable sources, so that their decisions are based on strong grounds. In the past, at a global level, there were two opposed accounting traditions: the Anglo-Saxon one, which is in the interest of investors and has the main objective of comparing financial performances, and the continental one, which is controlled by the state and oriented towards all the partners of an entity – fiscal administration, creditors, employees, owners, a.s.o. While the continental system agrees with the measurement at a historical cost, the Anglo-Saxon one proposes the adoption of fair

value. For those specialized immobilized assets, such as the equipments seldom commercialized on a market, of which too little information is known, fair value is estimated by measuring the **depreciated replacement cost**. The approach based on cost is founded on the statement that a prudent and informed purchaser would pay for an asset at most the purchasing and the production cost of a replacer with the same use; it is all about the current amount of money necessary for building up or buying a new substitute with the same use. If the immobilized asset is not new, from the gross current cost shall be deducted all the depreciation forms which had been attributed to it by the assessment date. In its simplest form, the cost method can be represented in the following way:

Gross cost – Depreciation = Value (called net replacement cost)

According to Valuation Standards, the starting point in adjusting value through the approach based on cost is either *the gross reproduction cost*, or the *gross replacement cost*, or a combination between the two.

Given that the reproduction cost is the current cost involved with reproducing an identical copy of an asset, by using the same materials or similar ones, and since market conditions contribute to analyses over some similar but not identical assets, we agree with the international regulator who opted for the adjustment replacement cost. When it comes to the approach based on cost, the assessment expert compares the immobilized asset with another one which may replace it.

II. Research methodology – presentation of methods

The most used method for determining the replacement cost for assets such as specialized equipments is the **device method**; at the same time, for the similar installations and equipments, of various dimensions, it is used when it come to the valuation of net replacement cost also the **method cost-capacity**.

II.1 The device method, also known as the **summing up method**, involves “breaking” the analyzed immobilized asset in components and valuating the cost of all its individual components, so that the sum of the components will reflect the *new cost* of the whole. The components cost involves not only *direct costs*, represented by those expenses related to materials, employees and by those ordinary expenses corresponding to the purchasing and installing of the asset, in order to bring it to the estate of functional use, but also by *indirect costs* normally required by the purchasing and installing of an asset, which are not generally included in the invoice issued by the seller.

The information about the cost and reference materials, necessary for adjusting the replacement cost, will make up a data basis rendered available to the specialized assessor and should contain: catalogues of producers and dealers, price lists and equipment specifications; specification manuals of manufacturers; price lists of manufacturers; price lists of sellers; published price guide books a.s.o. The materials may be obtained from: producers and sellers; dealers of new and used materials; exhibitions and show rooms; published price guide books, invoices from customers; newspapers; auctions; older files and registers; universities; public libraries; computer data bases; internet; by telephone, letter or personal contact; various free publications related to equipments such as Yellow book, local newspapers or news publications within the field. In particular circumstances, for instance when an equipment is produced abroad and the local dealer cannot be found, it is preferable to contact the technology or the maintenance department of the customer, since customers have to buy spare parts from somewhere. When the information cannot be obtained in this way, then it shall be contacted the consulate of the country where the equipment was produced. It results from here the need for a data basis at the disposal of the assessor, complete and permanently updated, which can be a working instrument for founding and upholding a relevant and credible assessment of value.

After establishing the gross replacement cost, the specialized assessor shall deduct *all the depreciation forms* attributable to the asset, in order to measure **the net replacement cost**. For mobile goods, there are involved all the wear and tear forms: physical, functional, economical. Depreciation represents the loss of value from various reasons, including factors of a *physical and functional type, of exploitation and economical depreciation*.

Wear and tear represents the loss of value or usability of an asset, caused by use, deterioration, exposure to various atmospheric agents, overuse and other similar factors. When an inspection is carried out for classifying an asset, it is necessary to pay a great attention to the latter's physical state. As a technique of quantifying wear and tear, it can be reminded the analysis *age/life span*.

If speaking about the concepts which can be used during the analysis, there can be reminded: *chronological age; effective age; normal useful life span; useful life span left; physical life span; physical life span left; economical life span; economical life span left*.

In relation to the indicators presented, from a strictly conceptual point of view, the wear and tear degree can be calculated by using of the following formulas:

$$WT_f (\%) = \frac{V_{cron}}{DVF} 100; WT_f (\%) = \frac{VEf}{DVUN} 100; WT_f (\%) = \frac{VEf}{VEf + DVUR} 100.$$

Functional depreciation represents the loss of value or usability of an asset, caused by inefficiencies or non adequacies in the quality of the asset, when the latter is compared with a replacement asset which is more efficient and/or less expensive and produced with modern technology. In other words, the loss of value is caused by conditions inherent to the asset, so that the excess of capacity represents a potential form of functional depreciation. The quantification of functional depreciation is based on at least two ways:

- the first one is represented by *the difference between the gross reproduction cost and the gross replacement cost*, being used for measuring functional depreciation caused by the *costs of excess capital*;

- the second one is the consequence of the functioning of some assets such as machines and equipments with exploitation expenses which are bigger than their modern substitutes and is also known as technological depreciation, its measurement being provided by *the absolute annual measure of surplus exploitation expenses of an asset, updated at an adequate rate during the useful life span left* (penalty for functional depreciation from exploitation).

Economic depreciation, also called external depreciation, represents the loss of value or of the full usability of an asset, caused by factors which are external to it, such as: the increased cost of raw materials, labour force or utilities (but without the corresponding increase of the selling price of the product); the low demand registered for the product in question; increasing competition; environmental law, a.s.o.

Among the ways of estimating economical depreciation, there can be found:

- *disutility method* (expressed in percents);

- *the method of updating/capitalizing additional expenses caused by external factors*, which is similarly applied in the case of the calculi relative to the measurement of functional depreciation from exploitation.

Example no. 1: The object of the analysis is a plane YR PMS, type AN 2, fabricated in 1998 in Ukraine and purchased again by the Romanian company SC ARIPI AURII SA. According to the owner's statements, it results that the plane AN2 is used only for irrigations and fertilizations in agriculture, there being carried out in time all the periodical revisions; it can be noticed at the same time that a capital reparation of the plane has not been yet carried out. There is known about the plane the following information: AN 2; developed for agricultural works; the technical condition of the plane requires capital reparations at the cell, airscrew, envelopes.

Specification	U/m	Cell	Motor	Airscrew
Fabrication date		1998	1997	1995
No. of functioning hours since the plane was put in use (Vef)	Hz	2.000	847	4.500
Hours of flight remaining by the time the plane is out of use	Hz	14.000	5.353	3.500
Total hours of flight (DVUN)	Hz	16.000	6.200	8.000

In order to estimate the fair, market value of the plane at 31.03.2010, the society resorts to the services of a specialized assessor. Taking into account that the type of the plane assessed is no longer fabricated in the present, and that the types of planes fabricated are different from the type of plane assessed, both from the point of view of the construction and from the point of view of the technical-functional characteristics, it will be used the method based on for assessing fair value. The main elements of the plane – cell, motor and airscrew – are used according to different rules, so that in estimating the degree of wear and tear the starting point will be the percent value of each component, that is: 75% for the cell, 20% for the motor, 5% for the airscrew. At the same time, in order to calculate functional depreciation, it is also necessary to know the reproduction cost estimated by the assessor, which is, on the basis of the information available, of 168.000 €.

In order to determine the replacement value of the plane, it has been used *the method based on gross replacement cost*, the value of the plane being determined by diminishing the updated value (again), according to the formula:

$$V_{ap} = [V_o x (1 - U_f)] x (1 - U_m) \quad (1) \quad \text{where:}$$

V_{ap} - updated value, calculated by updating the entrance value,

U_f - wear and tear,

U_m - obsolescence generated by functional non adequacy.

It is first adjusted the measure of the wear and tear, according to the formula:

$$U_f = \frac{\sum_{i=1}^n u_i v_i}{\sum v_i}, \quad \text{where } u_i = \text{physical depreciation of the component } i \text{ calculated with the help}$$

of the formula:

$$u_i (\%) = \frac{VEf}{VEf + DVUR} 100$$

v_i = percent value of the component in respect to the total value.

It is determined the wear and tear on groups of components, such as it follows:

$$U_c = \frac{2.000}{16.000} = 12,50 \%; \quad U_m = \frac{847}{6.200} = 13,66 \%; \quad U_e = \frac{4.500}{8.000} = 56,25 \%.$$

The wear and tear for the whole plane will be:

$$U_f = \frac{(U_c x 75 + U_m x 20 + U_e x 5)}{100} = 14,92 \%$$

The obsolescence which underlines the depreciation of the plane as a consequence of technical progress, both from the perspective of the cost reduction and from the perspective of new types of planes fabricated, is expressed by means of the relation:

$$U_m = 1 - \frac{C_0}{C_1}, \quad \text{where}$$

C_0 = initial cost of the plane, C_1 = reproduction cost.

The initial cost of the plane estimated in € is of 155.000 u.m.; for such types of assets, the wear and tear is generally between 1 and 10%.

$$U_m = 1 - \frac{155.000}{168.000} = 7,7 \%$$

The determination of the value of the plane – net replacement cost, is made by replacing the data in the following formula (1):

$$V_{ap} = [155.000 \times (1 - 14,92\%)] (1 - 7,7\%) = 131.874 \times (1 - 7,7\%) = 121.720 \text{ €}$$

II.2 The method cost-capacity is used for measuring the net replacement cost for similar installations and equipments, of various dimensions, precisely for pointing out the reality according to which the costs of similar installations or of equipment parts of different dimensions vary exponentially, according to dimension. Below it is presented an example of how the net replacement cost is calculated according to such method.

Example no. 2: In order to determine the replacement cost on the basis of the *method cost-capacity*, let us consider the following information about a manufacturing installation: date of the net replacement cost measurement – 31.03.2010; date when the installation is put into function – 31.03.2004; total estimated life span – 20 years; capital repair carried out in March 2006 has reestablished 80% of the normal life span; the production capacity projected is of 16.000 t/year; the current and future capacity exploitation is of 15.000 t/year; the exploitation expenses for fuels bigger than a modern substitute, with 12 tones of gas-oil at year, at a price of 5.000 lei/t; the quota of income tax is of 16%; the selling price of a modern installation substitute of 19.000 t/year is of 2.100.000 lei; the exponent factor is 0,7; the updating rate is of 13%.

The following steps are carried out:

a) *determining the replacement cost on the basis of cost-capacity method:*

$$\frac{C_2}{C_1} = \left(\frac{Q_2}{Q_1} \right)^X, \quad \text{where}$$

C_2 - not known replacement cost of the asset undergoing valuation;

C_1 - known replacement cost of capacity Q_1 ; Q_2 - capacity of the asset undergoing valuation;

X - exponent factor, which expresses the fact, acknowledged through detailed analyses, that not all cost elements of an asset vary directly proportional with their dimension.

$$\frac{C_2}{C_1} = \left(\frac{16.000}{19.000} \right)^{0,7}; \quad C_2 = 2.100.000 (0,8421)^{0,7} = 21 \times 0,88665 = 1.861.965 \text{ lei}$$

b) *determination of the wear and tear by taking into account the following parameters:*

- total life span estimated – 20 years;
- reestablished life span, capital reparation – 20 years x 80% = 16 years;
- number of years from the capital reparation – 4 years;
- useful life spam left (DVUR) – 16 years - 4 years = 12 years.
- effective age (Vef) – 20 years - 12 years = 8 years.

$$U_f = \frac{VEf}{VEf + DVUR} 100 = \frac{8}{20} 100 = 40\%. \text{ The wear and tear is } 1.861.965 \times 40\% = 744.786$$

c) *determination of functional depreciation:*

- surplus exploitation expenses 12 tones x 5.000 lei/t = 60.000 lei/year
- net surplus exploitation expenses 60.000 (1 – 0,16) = 50.400 lei/year
- the updating factor is of 5,9176
- net updated surplus exploitation expenses 50.400 x 5,9176 = 298.247 lei

d) *determination of economical depreciation*

$$D_e = \left[1 - \left(\frac{15.000}{16.000} \right)^{0,7} \right] 100 = \left[(1 - 0,9375)^{0,7} \right] 100 = (1 - 0,95582) \times 100 = 4,42\%$$

The replacement cost is established as it follows:

Gross replacement cost	1.861.965 lei
Wear and tear	744.786 lei
<u>Functional depreciation</u>	<u>298.247 lei</u>
Cost after physical, functional depreciation	818.932 lei
Economical depreciation (4,42%)	36.197 lei
Replacement cost	782.735 lei

III. Results of the research

Our attempt of presenting the working steps for measuring fair value have had the objective of realizing the possibility of applying these concepts also by accounting professionals, and not only by assessment experts. The main results, and respectively, limitations emerging from the research carried out, are:

- although international norms make no reference to the way fair value is measured when there is not enough information on the market about its estimation, by means of the adjustment techniques previously presented and used by valuation standards, it can be measured such an aggregate;
- the concepts and adjusting techniques applied are familiar to accounting professionals from Romanian entities;
- and, although it is possible for accounting professionals to show opposition to adjusting and applying the analyzed instruments, which constitute the profession of assessment experts, still, any future expert will also resort to and use the techniques presented, also due to his role in an entity.

IV. Conclusions

The detailed presentation of the methods for adjusting the depreciated replacement cost – together with the concrete examples offered, constitutes an additional working instrument rendered available to accounting professionals, who therefore have one more element for applying the provisions of the IRFS norms. Although they are borrowed from valuation, such norms can be applied also by other professionals than the assessment experts, by observing the working stages already mentioned. Adjusting fair value in the form of the depreciated replacement cost will no longer represent in the future only the profession of assessment experts. Although the latter are the main persons to have at their disposal a mix of information which they afterwards submit to adjustment for estimating fair value, we anticipate a greater openness of accounting professionals towards putting in practice IRFS norms. This is also a result of the fact that Romanian entities, under the current circumstances of deep economical crisis, will no longer afford to resort, whenever they have to establish fair values for patrimonial elements, to external assessment experts, not to mention that is also less probable for them to constitute a distinct

valuation department which involves considerable costs. There are nonetheless some limitations such as: the lack of motivation of accounting professionals to measure fair value, also as a result of fiscal limitations restraining the practices agreed by international norms. We consider that Romanian entities will manage to line up with international accounting practices in measuring fair values, even if they will have to overcome some limitations and constraints.

THE PLACE OF THE EMERGING ECONOMY OF ROMANIA INSIDE THE EUROPEAN UNION ECONOMIES IN TERMS OF FTSE CRITERIA

Mardiros Daniela

University "Alexandru Ioan Cuza" of Iași Faculty of Economics and Business Administration

The importance of this research lies from the need to know the economies developed, emerging and frontier of the European Union and the mode of their manifestation according to the market indicators. Consequently, we had in mind a presentation of the economies in the categories mentioned above framed in terms of market criteria used by FTSE Group, a provider of stock market indices and associated data services. Using data from a series of reports published by FTSE we made an analysis of how each of the considered economies and in particular Romania, acts according of these. Was taken into consideration criteria as: market and regulatory environment (formal stock market regulatory authorities actively monitor market; fair and non-prejudicial treatment of minority shareholders; non or selective incidence of foreign ownership restrictions; free and well-developed equity market; no objections or significant restrictions or penalties applied on the repatriation of capital; free and well-developed foreign exchange market; non or simple registration process for foreign investors); custody and settlement (settlement-rare incidence of failed trades; custody-sufficient competition to ensure high quality custodian services; clearing & settlement; stock lending permitted; settlement-free delivery available; custody-omnibus account facilities available to international investors); dealing landscape (brokerage-sufficient competition to ensure high quality broker services; liquidity-sufficient broad market liquidity to support sizeable global investment; transaction costs-implicit&explicit costs to be reasonable and competitive; short sales permitted; off-exchange transactions permitted; efficient trading mechanism; transparency); derivatives (developed derivatives market). The final part of the paper is reserved to the understanding of the mode in which each of the considered economies of the European Union, including Romania and regardless of what category they belong (developed, emerging or frontier economies) behave in relation to the above criteria used by the FTSE in relation with the market quality. In terms of research methodology, this took into account the data collection through the observation method. This method use, as research tool, the observation guide. We have also had regard to the proper definition of the concepts and their operationalization in order to bring to the fore a number of relevant indicators for the economies of the European Union.

Keywords FTSE group, emerging market, frontier market, market criteria

Jel classification G10, O 52

This paper has, as main goal, to present certain matters related to Romania's position as frontier economy, inside the European Union economies according with the FTSE classification in terms of Global Equity criteria. These was structured into five groups in the following manner: first reveals aspects looking Market and Regulatory Environment, the second is about the Custody and Settlement, Dealing Landscape make the object of the third group, and the elements considered by the fourth and fifth group are making reference to the Derivatives and, also, to the market size. Are also fallowed, through the present paper, the extent to which the developed, emerging and frontier countries of the EU meets or not the presented criteria.

1. The types of promoters of the EU economies and the assessment criteria promoted by FTSE Group

Generally speaking, Emerging Markets (EMs) was previously defined in the economic literature as nations with social or business activity in the process of rapid growth and industrialization which increase their number from 28 in 2006 to over 40 in 2010. Due to their faster development and to their openness towards the realisation and adaptation at the new demands of the free market, to the foreign direct investment attraction and to the technology transfer, these economies are becoming major players on the global economy arena which tend to change the global economy's orientation. As a result, a number of bodies and international publications (FTSE group, MSCI Barra, S & P, The Economist, etc..) manifests a continuing concern for how these economies evolve and classifies them according to a number of criteria, each considered of maximum relevance for each mentioned group or publication. Thus, the FTSE group, created in 2002 as a British provider of stock market indices and associated data services identified in 2010 a number of 48 emerging markets, MSCI Barra established for May 2010 the existence of 21 emerging markets, S & P established in December of that year 19 countries with the title of emerging markets and Dow Jones increased this number to 35 in May 2010. Besides the emerging markets encountered on the European plan also exist the notion of Frontier/Secondary Emerging Markets (F/SEMs) which is an economic term commonly used to describe a subset of emerging markets (Ems). Frontier markets (Fms) are investable but have lower market capitalization and liquidity than the more developed emerging markets. The frontier equity markets are typically pursued by investors seeking high, long term returns and low correlations with other markets. The implication of a country being labeled as frontier is that, over time, the market will become more liquid and exhibit similar risk and return characteristics as the larger, more liquid markets represented by the developed emerging markets. The ensemble of the market economies met in the European Union area is complemented by the developed markets (DMs) which are those countries that are thought to be the most developed and therefore less risky in terms of investing. To be more specifically, we can say that through investment we understand the commitment of money or capital to the purchase of financial instruments or other assets so as to gain profitable returns in the form of interests, dividends, or appreciation of the value of the instrument (capital gains) (Sullivan and Sheffrin 2003: 271). After the identification of the categories of markets which manifest their action in the economic zone of the European Union the present paper expose the mode in which the promoters of this area economies are positioned in relation to a set of indices calculated by FTSE Group and which are integrative part of the FTSE Global Equity Index Series (GEIS). These indices are based on certain *criteria* created on the beginning by the FTSE group from a number of 25 new frontier markets, which has been screened using its established country classification methodology that assesses markets against the size requirements, basic governance and market infrastructure elements required by international institutional investors. Presently, the indices are calculated in real-time and are designed to be used as the basis of financial products such as *ETFs* (an investment fund traded on stock exchanges and which holds assets such as stocks, commodities, or bonds, and trades close to its net asset value over the course of the trading day), *mutual funds* (a professionally-managed type of collective investment scheme that puts money from many investors to buy stocks, bonds, short-term money market instruments, and/or other securities), and *derivative products* (as form of alternative investment it represent a financial instrument whose value depends on other, more basic, underlying variables (Hull 2006: 1) such as: the price of another financial instrument (the underlying asset) (McDonald 2006: 54), interest rates, volatilities, indices, etc., the most common derivatives being swaps, futures, and options). The identification of the origin of the criteria is followed by the presentation of the ones used by the FTSE group for a market. These are: there must be a formal and independent stock market authority that actively monitors the

market; there should be no objection to or significant restrictions or penalties applied on the repatriation of capital and income; transparency; there should be market depth information, visibility and a timely trade reporting process and a requirement of international price dissemination; settlement (there should be a rare incidence of failed trades); clearing and settlement period shorter than T+7 (and greater than T+1). For a better understanding we present the mentioned criteria (detailed in Table 1) with the specification that to describe the country's status are necessary to be verified: all the criteria (for the developed markets), 15 criteria (for the advanced emerging markets), 9 criteria for the secondary emerging ones and 5 criteria for the markets of frontier.

2. Developed economies, emerging and frontier of the EU in terms of FTSE criteria

As we can observe, the FTSE group uses the criteria grouped in Table 1 for the European Union's economies which was divided, for greater granularity into developed, emerging (advanced or secondary) and frontier economies. Regarding these types of economies in the *developed ones* we can talk about Belgium, France, Germany, Italy, Netherlands, Denmark, Ireland, UK, Greece (possible demotion from Developed to Advanced Emerging according to the FTSE list for March 2011), Portugal, Spain, Austria, Finland and Sweden; the *emerging group* includes Czech Republic (promoted in September 2010 from Secondary Emerging Economy to Advanced Emerging Economy), Poland and Hungary, as Advanced Emerging Economies); the *frontier group* is formed from Cyprus, Estonia, Lithuania, Malta, Slovakia, Slovenia, Bulgaria and **Romania**. Making appeal to each criterion specified in Table 2 we made, further on, a synthesis of the mode in which, each country from the EU which belongs to one or another of the previously mentioned categories of economies are situated according to the quality market criteria promoted by the FTSE group (Table 1-3). We made in this purpose a presentation of the criteria which must be taken into consideration followed by the precision of the accomplishment or of the existence of certain restriction related to the respective criterion.

Table 1. The position of the UE developed economies in relation with the FTSE criteria

Developed economies
Belgium, France, Germany, Italy, Netherlands, Denmark, Ireland, UK, Greece, Portugal, Spain, Austria, Finland and Sweden
1.1. Formal stock market regulatory authorities actively monitor market
1.2. Fair and non-prejudicial treatment of minority shareholders
1.3. Non or selective incidence of foreign ownership restrictions
1.4. Free and well-developed equity market
1.5. No objections or significant restrictions or penalties applied on the repatriation of capital
1.6. Free and well-developed foreign exchange market
1.7. Non or simple registration process for foreign investors
<i>All countries pass the 1.1.-1.7. criteria excepting France, Germany, Italy and Sweden which are restricted to the 1.2. criterion</i>
2.1. Settlement - Rare incidence of failed trades
2.2. Custody-Sufficient competition to ensure high quality custodian services
<i>All countries pass the 2.1. and 2.2. criteria</i>
2.3. Clearing & settlement - T +3 or shorter, T+7 or shorter for Frontier
<i>All countries has T+3 at that criterion only Germany has T+2</i>
2.4. Stock Lending is permitted
<i>Only Greece is restricted at this criterion</i>
2.5. Settlement - Free delivery available
<i>Only Spain is restricted at this criterion</i>
2.6. Custody - Omnibus account facilities available to international investors
<i>Only Greece is restricted at this criterion</i>
3.1. Brokerage - Sufficient competition to ensure high quality broker services
<i>All countries pass the criterion</i>
3.2. Liquidity - Sufficient broad market liquidity to support sizeable global investment
<i>Only Belgium, Denmark, Portugal and Austria are restricted to this criterion</i>
3.3. Transaction costs - implicit and explicit costs to be reasonable and competitive

Developed economies
<i>Only Ireland and UK are restricted at this criterion</i>
3.4. Short sales permitted
<i>Only Greece, Portugal and Spain are restricted at this criterion</i>
3.5. Off-exchange transactions permitted
<i>Only Greece is restricted at this criterion</i>
3.6. Efficient trading mechanism
<i>All countries pass the criterion</i>
3.7. Transparency-market depth information/visibility and timely trade reporting process
<i>All countries pass the criterion</i>
4.1. Developed derivatives market
<i>All countries pass the criterion</i>
5.1. Market capitalisation \$mn (as at 31 st dec. 2009)
<i>Belgium 364,742; France 1.960,403; Germany 1.292,355; Italy 655,848; Netherlands 558,281; Denmark 140,391; Ireland 61,291; UK 2.796,444; Greece 112,632; Portugal 98,067; Spain 1.297,227; Austria 114,076; Finland 178,838; Sweden 363,085</i>
5.2. Total number of Listed Companies
<i>Belgium 187; France 941; Germany 704; Italy 291; Netherlands 121; Denmark 196; Ireland 55; UK 2.179; Greece 285; Portugal 48; Spain 3.435; Austria 97; Finland 128; Sweden 260</i>

- realized by the author on the FTSE's data

Conclusions

Regarding the EU economies as expected, these accomplish, generally speaking, all the criteria promoted by FTSE. Exception to this rule makes *France, Germany, Italy* and *Sweden* which are restricted to the „fair and non-prejudicial treatment of minority shareholders criterion”; *Greece* which is restricted to the „stock lending is permitted”, „short sales permitted”, „off-exchange transactions permitted” and „omnibus account facilities available to international investors” criteria; *Spain* restricted to the „free delivery available” and „short sales permitted” criteria; *Belgium, Denmark* and *Austria* restricted to the „liquidity - sufficient broad market liquidity to support sizeable global investment” criterion; *Ireland* and *UK* restricted to the „Transaction costs - implicit and explicit costs to be reasonable and competitive”; *Portugal* restricted at „liquidity -

sufficient broad market liquidity to support sizeable global investment”” and „short sales permitted” criteria. For the emerging countries, all of them pass the criteria specified by the FTSE. As component of the economies classified like frontier markets, *Romania* pass with succes both the criteria taken into discussion for these categories of economies (formal stock market regulatory authorities actively monitor market, no objections or significant restrictions or penalties applied on the repatriation of capital, settlement - rare incidence of failed trades, clearing & settlement - T +3 and transparency - market depth information/visibility and timely trade reporting process) but also and other criteria which belongs to the advanced emerging economies or even to the developed economies such as (non or selective incidence of foreign ownership restrictions, free and well-developed equity market, Custody-Sufficient competition to ensure high quality custodian services, Brokerage - Sufficient competition to ensure high quality broker services, Efficient trading mechanism).

THE IMPACT OF IFRS ON REPORTING FOR BUSINESS COMBINATIONS: AN IN-DEPTH ANALYSIS USING THE TELECOMMUNICATIONS INDUSTRY

Carrara Mario

The mandatory use of IFRS by all publicly listed companies in the European Union created challenges for accounting and reporting of business combinations, goodwill impairment and disclosures for these items. Major issues are allocation of amounts to goodwill and specific intangible assets arising from acquisition. This study presents an in-depth exploration of compliance with IFRS 3 and IAS 36 using content analysis methodology of annual reports of eight European telecommunications that were chose because the industry is well known for significant acquisitions involving intangibles. The results show only partial compliance with little change over the four year period since mandatory IFRS adoption. While results cannot be generalized outside this group, the in-depth analysis yielded important insights for continued research using broader research methods.

Key words: IFRS, business combinations, goodwill, content analysis, annual reports, listed companies

JEL codes: M41, M21, G34

Since the beginning of the corporate form of business organization, companies have found it beneficial to combine operations for several economic and business advantages. A major feature of globalization in recent years has been cross-border expansion and acquisition of subsidiaries in different countries. As such combinations become more complex, financial reporting issues become more complex and become more important for the global macro-economy (e.g. see Márquez-Ramos 2008). As a result, policy makers and standard setters have been active in developing reporting mandates, standards and guidance. One of the most significant events of recent years is the requirement of the European Union (EU) in 2002 to mandate that all companies listed on a public exchange in Europe must follow International Financial Reporting Standards (IFRS) for public financial reporting beginning in 2005. While this mandate is much broader than business combinations, virtually all publicly held companies are consolidated groups that result from business combinations and the mandate applies only for the consolidated group level reports. The European Commission was clearly motivated by a desire for consistency in financial reporting, comparability, and transparency. Article 1 of its Regulation 1606/2002 states: This Regulation has as its objective...to harmonising the financial information presented...in order to ensure a high degree of transparency and comparability of financial statements.

Approximately coinciding with the EU mandate, the IASB adopted IFRS 3 and amended IAS 36 in 2004. IFRS 3 addresses, among other things, the allocation of purchase price on acquisitions especially allocation to previously unrecorded intangible assets and residual amounts to unallocated goodwill. IAS 36 as amended focused on asset impairments, including impairment of unallocated goodwill. IFRS 3 and IAS 36 address many of the inconsistent and contentious issues of financial reporting for business combinations, attempting to provide standardization, accountability and transparency throughout all countries adopting IFRS, including the EU. Business combinations are one of the primary areas addressed by the International Accounting Standards Board (IASB) in IFRS 3 and IAS 36 in which the board seeks to provide significant and reliable information, especially for unallocated goodwill, for which there has been considerable creativity in the past (Forbes, 2007). Surveys of investors indicate the investors believe IFRS 3, especially, has a real impact on how they perceive companies and make their investment decisions because complying with IFRS 3 provides more transparency about companies (PricewaterhouseCoopers, 2006).

Despite discussions both extolling and questioning the virtues of mandatory adoption of IFRS, specifically with respect to business combinations, only recently there have begun to be research studies about whether the mandatory use of IFRS has achieved its purported objectives. The only study with which we are familiar that directly addresses issues of business combinations in Europe is Paananen (2008) who examined information provided about initial recognition of goodwill under IFRS3, although there have been other studies, discussed and cited below, about IFRS adoption in general. This study explores the extent to which European companies are complying with the mandate to report using IFRS with respect to business combinations and how the level of compliance may have changed in the years following the mandate. Thus, this study adds to this small but growing body of research literature with an in-depth examination of financial reporting of business combinations by European companies in the telecommunications industry for four years after mandatory adoption.

Telecommunication companies are used for the study because there have been several significant acquisitions in the industry and telecommunications companies have significant intangible assets that must be considered in allocation of purchase prices. The research method is content analysis in which there is an in depth review and analysis of financial reports for the companies chosen before 2005 and for the period 2005 through 2008. Remaining sections next discuss issues related to financial reporting of business combinations and subsequent impairment testing and present two research questions. Then we present prior research on the issues. Then we present the research methodology. Finally, results are presented followed with a concluding discussion.

1.0. Financial accounting and reporting for business combinations

Accounting and financial reporting issues for business combinations can be categorized in two broad general topic areas, although there are overlaps and any categorization has the risk of being over simplified: First are issues related to measurement and disclosures of items related to the combination itself. These include measurement of identifiable intangibles assets arising from the combination, i.e. intangible assets not previously recorded and unallocated goodwill arising from the acquisition. Second are issues related to measurement and disclosures of asset impairments. While impairment is not limited to business combinations, a major portion of the accounting and reporting issues are related to goodwill.

As a result, we have formulated two research questions to guide this study:

Q1. To what extent has the mandatory adoption of IFRS been followed by telecommunications companies' compliance with measurement and disclosure standards for items directly related with business combinations.

Q2. To what extent has the mandatory adoption of IFRS been followed by telecommunications companies' compliance with measurement and disclosure standards for goodwill impairments. Prior research on these topics has been limited. There have been several studies of IFRS adoption in general, many prior to the mandatory adoption requirement of the EU (e.g. Street, Bryant and Gray 1999; Street and Bryant 2000; Street and Gray 2001 and 2002, Glaum and Street 2003; and Hodgdon et al. 2009) which all indicated a low level of compliance despite statements of the companies and their auditors that statements were in accordance with IFRS. The only study of business combinations in a European setting was that of Paananen (2008) who measured the volume of information of goodwill under IAS 36 for companies in France, Germany, and the United Kingdom and found a low level of compliance. Sevin et al. (2007) and Shalev (2009) examined goodwill disclosures for U.S. companies under U.S. GAAP, finding sporadic and limited compliance with standards. All of these studies were broad-based examining large groups of companies and thus, though, did not examine in depth the issues of individual companies. Despite the interest in individual companies expressed above, there have been no substantial in-depth studies of companies. Therefore, this study takes a first step in the study of individual companies.

1.1. Measurement and reporting issues from business combinations

When businesses combine, many complex accounting and reporting issues arise. Prior to the mandatory adoption of IFRS in 2005, European companies were subject to local country accounting standards which varied widely. One of the primary motivations for the 2002 mandate was to eliminate the inconsistencies of the many different standards that were being used in Europe before 2005. IFRS standards are generally more stringent and in particular require substantially more disclosures than many if not most local European countries' accounting standards (Jermakowicz and Gornik-Tomaszewski 2006). The accounting standards of most individual European countries, especially on the continent of Europe, are based on the interests of many stakeholders while IFRS are motivated primarily by interests of investors. This difference in focus has major impacts on valuation methods as well as a major increase in disclosures (Jermakowicz and Gorkin-Tomaszewski 2006, Ernst & Young 2006). Some European companies voluntarily adopted accounting standards of other countries, notably U.S. GAAP, primarily because they were listed, or sought listing on stock exchanges in the U.S. Street and Bryant (2000) observed when examining IFRS compliance in general, before mandatory adoption that a listing in the U.S. did not seem to affect compliance with IFRS. In our in-depth analysis, we also examine the extent of multiple listings and the impact on compliance with IAS 36 and IFRS 3.

1.1.1. Allocating the cost of a business combination

As business combinations and the environment in which they occur have become more complex, the issue of how to allocate the acquisition cost to various items has taken on greater importance and thereby the interest of standards setters, companies and their auditors. Prior to mandatory adoption of IFRS and issuance of IFRS 3, most if not all accounting standards used by European companies involved some type of an allocation of the acquisition cost to specifically identifiable assets and liabilities of the acquired company; the remainder remained as unallocated goodwill. Assets and liabilities of acquired companies were typically measured at fair value. In some situations, though, the full fair value of acquired assets was not recognized, but instead only the percentage of ownership was applied to the excess of fair value over book value. In some countries, the write-down of assets is viewed as conservative and goodwill along with other assets were written down to lower amounts or written-off. Accounting standards of some countries required reporting of contingent liabilities while others did not. Goodwill has been a major issue in accounting and reporting of business combinations for many years in many

countries (e.g. see Ma and Hopkins, 1988; Johnson and Petrone, 1998; Fontanot, 2003; Gaughan, 2005). There is general recognition that value of a business as a whole is greater than the aggregation of individual assets less liabilities, and this difference is called goodwill in general terminology, although the term “goodwill” was not found in financial reports themselves. Two major issues are the subsequent treatment of unallocated goodwill in following years, discussed shortly, and to what extent other intangible assets must be separately identified in order to leave unallocated goodwill as truly a residual that cannot otherwise be attributed to an asset. Traditionally, little effort was made to separate unallocated goodwill from other intangibles arising from the acquisition that were not previously reported on an acquired company’s financial statements, e.g. brands, customer lists, self-developed patents and the like. Because traditionally all intangible assets including unallocated goodwill were amortized or written off, there was little perceived need to make such a separation. With the adoption of IFRS 3, and a similar standard in the U.S., goodwill would no longer be amortized but instead subject to impairment testing as discussed below.

IFRS 3, paragraph 45, states that intangible assets must be recognized separately from goodwill in business combinations when they meet the definition of intangibles in IAS 38 and their fair values can be measured reliably. This requirement, contrary to much of traditional practice, provides a clear instruction for companies to reduce amounts of unallocated goodwill and increase amounts allocated to previously unrecognized intangible assets. Caldwell (2006) indicates that such increased allocation to specific intangible assets is occurring, although at a glacial pace. Not only is such allocation difficult and tedious, companies have little incentive to make such allocations because, among other reasons, increased amounts allocated to other intangibles lead to lower reported income because such intangibles must be amortized while goodwill is no longer amortized with the adoption of IFRS. (For more discussion see, for example, Jetuah , 2007; Deloitte Touche Thomatsu, 2004; PricewaterhouseCoopers, 2004, and similar professional sources). Traditionally, European companies following local accounting standards had a wide variety of approaches for accounting for unallocated goodwill after a business combination, and in some cases could choose among alternatives. Such provisions are too numerous to present here. (For a comprehensive discussion see Carrara, 2007, pg. 94.) Briefly, the most common treatment was amortization over periods not to exceed five years or 20 years. Write-off of unallocated goodwill against reserves or current year’s income is permitted in some situations and various choices of impairment testing were permitted. IFRS 3 eliminated amortization of goodwill, instead requiring impairment testing (discussed shortly). Thus, IFRS 3 establishes a motivation that might be viewed as contradicting the board’s desired end result to allocate amounts to specifically identifiable intangible assets arising from the acquisition. A requirement to identify as many intangible assets as can be reliably measured would lead to lower future net income as the intangible assets are amortized thus motivates companies to “err” on the side of continuing recognition of as much of the acquisition cost as unallocated goodwill which will no longer be amortized. Therefore, a major element of this study is to examine the portions of acquisition costs allocated to goodwill before and after mandatory adoption of IFRS, and over the subsequent four year period.

1.1.2. Disclosures related to business combinations

Traditionally, European companies were subject to few disclosure requirements and disclosure requirements are not consistent among countries (Jermakowicz and Gornik-Tomaszewski 2006, Ernst & Young 2006). IFRS 3 sought to achieve greater transparency and accountability by imposing extensive disclosure requirements. These are too numerous to list here, but are presented in Appendix 1 along with results of the study. Briefly, they include details about the nature of the transaction, amounts of acquired assets before and after acquisition, description of

determination of goodwill and intangible assets included or recorded separately, profit impacts, and reconciliation of unallocated goodwill to evaluate changes during the year. One of the objectives of this study is an in-depth assessment of the extent of compliance of each company with respect to these disclosure requirements since 2005 and changes over time.

1.1.3. Other issues

Other issues are apparent from the mandatory adoption of IFRS and issue of IFRS 3 that cannot be addressed by this study. For example, the choice of accounting method, purchase or pooling of interests (also called uniting of interests) is now largely irrelevant because IFRS prescribe that all business combinations shall be reported using the purchase method. Identifying whether an activity is indeed a business combination for financial reporting purposes and identifying the acquiring entity also present challenges. We must assume that these issues are adequately resolved, apart from disclosures, because we do not have access to the internal documentation of the company and its auditors. Similarly, measuring the cost of a business combination also presents challenges that we cannot address apart from disclosures because of lack of access. (For more discussion of these issues see, for example, Epstein and Mirza, 2005; Deloitte Touche Tohmatsu, 2004, and similar educational and professional items published by various sources.)

1.2. Impairment testing of goodwill

The requirement for impairment testing has been a part of accounting tradition in most countries for many years, although not always formalized and traditionally often a term other than “impairment” was used. For example, a notion has existed in many countries for some time that assets should not appear on a balance sheet at greater than a recoverable amount, “recoverable amount” defined in various ways. With respect to unallocated goodwill, impairment testing could be triggered by a specific event, or be required annually. Traditionally unallocated goodwill has often been subject to impairment testing even if it was being amortized so that impairment testing and amortization are not alternatives. After considerable discussion and debate, the IASB in IFRS 3 specified impairment testing exclusively, referring to IAS 36 which was amended. IAS 36 applies to assets in addition to goodwill, but the focus of most discussion is on the impact of IAS 36 on impairment testing of unallocated goodwill. (For more discussion of impairment testing see, for example, Carrara, 2008; Carlin, Finch, and Guy, 2007; Wines, Dagwell, and Windsor, 2007; Ernst and Young, 2007; International Accounting Standards Board, 2004; and similar sources.)

1.2.1. Impairment testing based on Cash Generating Units

Traditionally, impairment testing of goodwill was based on the aggregate amount of unallocated goodwill on the balance sheet. One of the most significant elements of IAS 36 is the requirement that companies now must define cash Generating Units (CGUs) within themselves, the smallest identifiable group of assets that generate cash inflows that are largely independent of other groups of assets that generate cash inflows. Unallocated goodwill must be assigned to each CGU and impairments tests conducted for each CGU. While there are guidelines for defining CGUs, management discretion remains. In order to assess goodwill impairment, the companies must determine recoverable amounts from each CGU and compare the recoverable amount with the carrying value of the net assets of the CGU. If the recoverable amount of the CGU is less than the carrying value, any deficiency first reduce unallocated goodwill. Any remaining deficiency reduces other assets. IAS 36 specifies two approaches to determine the recoverable amount of CGUs: First, the fair value less cost to sell is based on a sale of the CGU in an existing market. Second, the value in use reflects the present value of future cash flows. IAS 36 provides specific guidance for both approaches, especially determining cash flows and appropriate discount

factors. (Carrara, 2008; Carlin, Finch, and Guy, 2007; Wines, Dagwell, and Windsor, 2007; Ernst and Young, 2007; International Accounting Standards Board, 2004; and similar sources). The assignment of unallocated goodwill to CGUs and use of CGUs to assess impairment represents a significant departure from almost all accounting traditions and can be expected to represent a significant challenge for first time adopters of IAS 36 beginning in 2005. Therefore we do an in-depth analysis of annual reports to explore companies' identification of CGUs and impairment testing.

1.2.2 Disclosures related to impairment tests

Traditionally, disclosure requirements for asset impairments varied substantially among countries and in general were not extensive (Jermakowicz and Gornik-Tomaszewski 2006, Ernst & Young 2006). The IASB sought to increase transparency and accountability and allow users of financial reports to make independent reflections on the impairment process by requiring a wide range of information be disclosed for each CGU that has a substantial amount of unallocated goodwill. Disclosure requirements of IAS 36 vary depending on which approach is used to measure the recoverable amount; disclosures are more extensive for the value in use approach than for the fair value approach.

As above for disclosures of business combinations, the disclosure requirements are too extensive to list here and are presented in Appendix 1 along with results of the study. In general, the requirements require disclosure of assumptions and approaches used to determine fair values and costs to sell if the fair value approach is used; and assumptions about the amount and duration of cash flows, growth rates, and discount rates if the value in use approach rate is used. As with disclosures about measurements for business combinations, another objective of this study is to assess compliance with disclosure requirements of goodwill impairment tests for each company.

1.3 Compliance and enforcement

It is meaningless to speak about high quality financial reporting and transparency as envisioned by the IASB and the European Commission unless effective and consistent application of IASs and IFRSs is ensured (Whittington 2005, Daske et al. 2008). Positive economic consequences of IFRS adoption can occur only in countries with strict enforcement regimes (Daske et al. 2008). The level of compliance is as important as the standards themselves (Hogdon et al. 2009). Such compliance is viewed as narrowing the information gap between informed and uninformed investors and consequently increasing capital market efficiency (Healy and Pelapau 2001, Ball 2006). IFRS implementation is viewed as the "Achilles heel" of IFRS (Ball 2006) because partial compliance with IFRS may lead to uncertainty about the real economic situation of an entity. In this study we explore enforcement, or lack thereof.

2.0 Method and company selection

This study uses a pattern model of explanation that does not contain general theories in explanations but seeks to observe specific occurrences in the context of the systems in which they occur in order to provide explanations for the occurrences (Ryan, Scapens, and Theobald, 2002). Content analysis methodology is well suited for this type of pattern study because it allows in-depth examination and analysis of specific occurrences in the context of the systems in which they occur, i.e. the extent of proper application of IFRS 3 and IAS 36 in preparation of published annual reports of the eight companies studied.

2.1 Content Analysis

Content analysis involves objective and systematic analysis of communication media, in this study published annual reports, in order to extract data, count observations for further analysis

including statistical analyses, and form qualitative assessments. (For more discussion of the content analysis research method see, for example, Carney 1972, Krippendorf 1980, and Steenkamp, 2007.) Content analysis is especially useful for this study because if applied properly it is:

- Systematic and covers all aspects of the issue uniformly throughout the text analyzed.
- Objective because all content is considered alike and impartially collected.
- Manifest because all content is taken at face value without interpretation.
- Informative because it reveals trends and characteristics not otherwise observable

Because of the mass, complexity, and sometimes chaotic nature of the content. Content analysis allows deeper analysis of situations than other methods. In this study we read thoroughly the content of all annual reports of the eight companies for the years 2005 through 2008, 32 annual reports total, in order first to assess for each company, to the extent possible, the compliance with measurement aspects of IFRS 3 and IAS 36. In addition we examined all disclosures in order to determine whether the companies had adequately disclosed all mandatory items required by IFRS 3 and IAS 36. Content analysis allows quantitative analysis of data extracted from the analysis. In this study we examine the level of compliance with IFRS disclosure requirements for both IFRS 3 and IAS 36 using a comprehensive disclosure index. This index includes all disclosure requirements of each standard. This index enables the quantification of the level of compliance with a compliance ratio that takes values from 0 (no compliance) to 1 (full compliance). Specifically, in order to score companies, the so called dichotomous approach is used (Cooke, 1989; Street and Bryant, 2000; Glaum and Street, 2003; Jahangir, Kamran, and Darren 2004; Akhtaruddin, 2005; Hassan et al, 2009) in which if a required item is disclosed, it is scored as 1 and if not disclosed it is scored 0; if an item is not applicable for a company, it is marked as “NA”. Then, the level of compliance for each company is calculated as the ratio of the total items disclosed to the total number of applicable disclosure items as follows:

$$LC_{i,t} = \frac{D_{i,t} = \sum_{j=1}^n d_j}{A_{i,t} = \sum_{j=1}^m a_j}$$

Where,

LC_{i,t} = The total Level of Compliance score for firm i in year t $0 \leq L.C. \leq 1$

Di,t = The total number n (0, m) of disclosed items d for firm i in year t

Ai,t = The total number m (3, 58) of applicable disclosure items a for firm i in year t

Following Glaum and Street (2003), the disclosure index is based on a checklist developed by the audit firm Deloitte (2008). In order to ensure the completeness of the index, items are compared with similar checklists of the other three major audit firms and with Ntzanatos (2008). During the period under examination (2005-2008) no amendments to the two standards occurred and no company adopted optionally the amendments of IFRS 3 and IAS 36 before their mandatory adoption on 1 January 2009.

2.2 Company selection

For this study, we selected eight European telecommunications companies. The telecommunications industry was chosen because companies have been active in business combinations in recent years. In addition, telecommunications companies tend to have relatively large unrecorded intangible assets related to brand, customer lists, licenses, etc. As a result they have been reputed in the media to have paid large amounts to acquire companies in the same

industry so that examining goodwill and intangible assets from the combinations allows a focus on the research objective. This group of eight companies is admittedly a convenience sample and generalizations cannot be made outside of this group. Nonetheless, the small sample permits an in-depth analysis that would not be possible otherwise. Moreover, the companies are large enough to be significant on European stock exchanges and thus provide insight into the behaviour of large European companies with respect to IFRS adoption. The companies and some descriptive data are presented in Table 1. The data as of the end of 2005, the first full year of this study is designed to give a view of the size and significance of the company with respect to total assets, equity, revenues, net income, cash flow from operations, and number of employees. The exchanges on which the shares are listed also give some indication of the significance. [Table 1 about here]

3.0 Results of content analysis

In order to assess the two research questions, we first explored annual reports to first examine accounting and reporting treatment for combinations before 2005 and then in each of the subsequent years. After examining the materiality of goodwill, we explored the measurement issues of allocation of purchase prices to goodwill and other intangibles and then explored measurement issues related to goodwill impairments. Afterwards, we examined the disclosures about measurement issues related to both topics to determine if they comply with the requirements of IFRS 3 and IAS 6. As will become apparent, it is not possible to make a clear distinction between measurement and disclosure issues, but we have done so to the extent possible as a means to organize our findings. Finally, we explore issues about stock exchange listings and auditor choice.

3.1 Goodwill as a percentage of total assets: materiality and trends

One of the first issues to be considered in an in-depth analysis is whether the carrying amount of unallocated goodwill on companies' balance sheets is material enough to warrant concern and further in-depth analysis. Among other things, the materiality of goodwill is closely related to the volume of disclosures mandated by IFRS 3 and IAS 36. The issue of materiality is particularly broad and uncertain because there is no objective method of measuring it (Hoogendoorn, 2006). As a consequence, in many cases both Assistant Lecturers and users of financial statements use "rules of thumb" in order to determine whether an item or an event is material or not (Shalev, 2009).

In this study, we first base the materiality of goodwill on IAS 1, Paragraph 29, which specifies that an entity shall present separately items of a dissimilar nature or function unless they are immaterial. Consequently we initially assume that if companies recognize goodwill as a separate line item on their balance sheets or elsewhere in the explanations of financial report items, the amount is material and subject to the disclosure requirements of IFRS 3 and IAS 36. As a further examination of materiality we have considered reported unallocated goodwill as a percentage of total assets for each company for each of the years examined as shown in Table 2. This table shows that goodwill is material by virtually any "rule of thumb", ranging from lows of 12 percent and 14 percent to highs of 51 percent and 58 percent of total assets. For some companies, goodwill is the largest single asset. Moreover, of primary interest for this study, unallocated goodwill as a percentage of total assets is not decreasing, contrary to the objectives of the IFRS 3 that unallocated goodwill should decrease as increasing amounts are allocated to specifically identifiable intangible assets arising from acquisitions. All companies showed an increase in goodwill as a percentage of total assets from 2005 to 2008 except Vodafone which showed a decrease from 59 percent to 40 percent. Some companies showed very small year-to-year decreases, but an overall increase for the four-year period.

[Table 2 about here]

3.2 Accounting and reporting issues directly related to acquisitions

Research question 1 states:

Q1. To what extent has the mandatory adoption of IFRS been followed by telecommunications companies' compliance with measurement and disclosure standards for items directly related with business combinations.

It relates specifically to amounts allocated to specific intangible assets arising from acquisitions and the remaining unallocated goodwill. IFRS 3 clearly took a position that amounts reported as unallocated goodwill should be limited to items that cannot be identified or measured reliably while items such as brands, trademarks, customer base, etc. should be identified and reported separately. The clear expectation of IFRS 3 is that amounts reported as unallocated goodwill would decrease while amounts allocated to specifically identifiable intangible assets would increase. Therefore, our primary criterion for assessing the compliance with measurement and reporting requirements of IFRS 3 is the relative amounts allocated to specific intangible assets, amounts that remain as unallocated goodwill, and the trend over time.

3.2.1 Business combinations before 2005

Examining the annual reports of the eight companies for various different years before 2005 shows, as expected, a wide variety of practices all of which are generally sketchy and inadequate from which to make assessments and lacked transparency. In general, information presented is limited to the purchase price, the percentage of equity shares acquired, and amount of goodwill. On average 75 percent of the purchase price was remained unallocated goodwill. Only Telenor and France Telecom provided information about purchase price allocation and allocated small amounts to intangible assets that were not previously reported by the acquired company. Vodafone indicated that many of its acquisitions were driven by the aim to acquire trademarks and customer bases of other companies, but the financial statements do not show amounts allocated to such intangible assets. (For more details and illustrations see Carrara 2008.)

3.2.2 Accounting and reporting for business combinations in years beginning in 2005

The examination of annual reports for 2005 onward showed the eight companies began to present more comprehensive information about business combinations than in previous years, yet several significant failures to comply with the intentions and requirements of IFRS 3 are evident. Notably the IASB in IFRS 3 clearly expects companies to allocate more of the amounts of purchase prices to identifiable intangible assets not present on financial statements before combination and thereby reduce amounts allocated to goodwill.

3.2.3 Accounting and reporting for business combinations in 2005

As shown in Figure 1 for acquisitions in 2005, based on aggregated information for all companies there would seem to be some progress in the direction desired by the IASB: on average the amounts of unallocated goodwill at acquisition declined from the average before 2005 of 75 percent, but still remain relatively high at 60 percent. Amounts allocated to specifically intangible assets not previously reported on financial statements are 45 percent of the amounts allocated. Other amounts were allocated to assets existing before acquisition and to liabilities.

[Figure 1 about here]

As shown in Table 3, though, examining each major acquisition in 2005 individually indicates wide variation among companies in amounts allocated to goodwill. A few acquisitions with very low and negative goodwill distort the aggregate average. Amounts of unallocated goodwill by other companies remain high, often almost the entire purchase price. Percentages allocated to specifically identifiable assets remain low with two anomalies of 98 percent and 354 percent of the purchase price, the latter because large amounts were allocated to both liabilities and reduction of other assets, distorting the aggregate average. Some of the companies indicate substantial increases in customers, new market entry, etc., but do not allocate amounts to customer lists, brands, trademarks and the like. Relatively large amounts are identified merely as other intangible assets with no description. Companies give only vague comments such as future profits, synergies and growth to describe what constitutes unallocated goodwill. It is apparent that the reporting of business combinations in 2005, while providing more information than in years before mandatory adoption of IFRS, is not achieving the expectation of the IASB to increase accountability and especially increase transparency.

[Table 3 about here]

3.2.3 Accounting and reporting for business combinations in 2006

Examination of annual reports for 2006 shows, as presented in Figure 2, on average the aggregate amount of purchase prices reported as unallocated goodwill has increased to 63 percent compared to 60 percent in 2005, while the percentage allocated to specifically identifiable intangibles has decreased to 29 percent from 45 percent, the opposite direction expected by the IASB.

[Figure 2 about here]

Looking at individual companies' reporting of acquisitions in 2006, as shown in Table 4, provides additional perspective. One significant anomaly, Telefonica's acquisition of Colombia de Telecomunicaciones with percentages in hundreds of percentage points, is distorting aggregate amounts and Telefonica did not provide explanation for the anomaly. Even among other acquisitions by other companies, there are wide variations in amounts allocated to goodwill from as low as three percent to over 100 percent. Most companies seemed to report percentages of unallocated goodwill consistent with patterns in years before 2005. Amounts allocated to previously unreported intangible assets varied from a low of two percent to a high of 93 percent. Most of the allocations to previously unreported intangible assets, though, were relatively low and did not appear to reflect the objective of IFRS 3 for companies to allocate more of acquisition costs to specific previously unreported intangible assets and less to unallocated goodwill. Elisa, Telenor, and TeliaSonera notably allocated amounts to specific previously unreported intangible assets as required by IFRS 3. France Telecom allocated amounts to trademarks, licenses, and customer base for one acquisition. France Telecom, however, did not show all the allocations of purchase price and did not provide reconciliation of amounts allocated as it had in the previous year; it was not possible to analyze all of the allocations of France Telecom. Deutsche Telekom did not provide full details about its acquisition of Polska Telefonia and we were required to make educated assumptions to complete our analysis. Companies continued to give vague comments to explain unallocated goodwill, i.e. future synergies and profits. In general, there was no apparent increased compliance with measurement aspects of IFRS 3 for these eight companies from 2005 to 2006. A notable step towards accountability and transparency, though, is Telenor's aggregation of acquisitions that the company states are individually immaterial showing detailed information about the acquisitions in the aggregate.

3.2.4 Accounting and reporting for business combinations in 2007

Examining aggregate amounts for 2007 as shown in Figure 3 shows a continuing pattern of relatively large amounts on average, 68 percent, continuing to be reported as unallocated goodwill. A substantially increasing percentage being allocated to previously unreported identifiable intangible assets, increased to 44 percent in 2007 compared to 29 percent in 2006, suggesting that companies are increasing amounts allocated to other intangibles as expected by IFRS 3.

[Figure 3 about here]

When looking at details about specific acquisitions in 2007 as shown in Table 5, there was a notable absence of very large amounts allocated to specific items compared to the previous two years. It is not possible to know whether this absence of large anomalies results from a difference in the nature of the transactions or from improved financial reporting of the companies. Companies notably show more information about amounts allocated to specific intangibles with a notable decrease in amounts identified as “other intangible assets”. In general, percentages allocated to intangible assets show an increase from the previous two years. With the exception of France Telecom, percentages reported as unallocated goodwill show decreases from the previous years. These two findings suggest the companies are reporting amounts in the direction expected by IFRS 3. France Telecom notably did not provide details about allocations and amounts that were provided did not reconcile mathematically. Likewise information about one of the acquisitions of Telecom Italia did not reconcile mathematically and was sketchy. Telenor continued to report an aggregate of acquisitions that are individually immaterial. Descriptions of amounts reported as unallocated goodwill remain vague with comments about future profits and synergies. In general, we noticed a suggestion of a small trend towards compliance with measurement expectations of IFRS 3 with a continued long ways to go.

[Table 5 about here]

3.2.5 Accounting and reporting for business combinations in 2008

Looking at Figure 4 for acquisitions in 2008 shows that the aggregate of amounts reported as unallocated goodwill remains in the same percentage range as the previous years, in the 60 percent range. The percentage of amounts allocated to identifiable previously unreported intangible assets, though, has reverted to the mid 20 percent range of 2006.

[Figure 4 about here]

Looking at the details of each acquisition in 2008 suggests that some patterns may be emerging. More of the eight companies are identifying specific previously unreported items of intangibles, rather than “other intangible assets”, as receiving allocations of acquisition costs. The percentage amounts allocated to intangible assets emerging from acquisitions remain low, though. France Telecom has made remarkable progress in reporting amounts allocated to specific previously unreported intangible assets as well as other details about its acquisitions. Elisa has joined Telenor in reporting aggregate information in detail for acquisitions that are individually immaterial. Amounts reported as unallocated goodwill remain relatively high with vague descriptions about future profits and synergies. In general it appears there is slow continued progress towards meeting the measurement requirements of IFRS 3 with respect to greater amounts allocated to identifiable intangible assets and lower amounts allocated to goodwill.

3.3 Accounting and reporting issues directly related to impairment testing

As discussed in detail above, the IASB made substantial changes in requirements for impairment testing of goodwill compared to its previous standards and those of almost all local countries' accounting standards. Two major elements are defining cash generating units (CGUs) and specifying methods by which the impairment of a CGU is assessed, and then any impairment of goodwill.

3.3.1 Specifying CGUs

The clear intent of the IASB in requiring impairment testing by CGU was to expose more amounts of unallocated goodwill to potential impairment by minimizing the impact of aggregation on impairment. Previously, when unreported goodwill as a whole was subject to impairment tests, the impairment of goodwill related to specific operating units could be avoided because the goodwill in the aggregate was not materially impaired. In providing guidelines on how companies should define CGUs, the clear implication was that CGUs should be small enough to represent realistic units in order to limit aggregation as a means to avoid impairment testing and write-down of unallocated goodwill with resulting negative impact on reported income. In this study, we examine annual reports to discover how companies have defined CGUs and draw inferences about the appropriateness of the definitions.

Table 7 shows CGUs by company as determined from information in 2005 and 2006 annual reports. Only Telenor and France Telecom described that the combinations of CGUs for which impairment tests were made is based on independence of cash flow generating activity. Vodafone had only four CGUs despite having nine segments, and TeliaSonera has four CGU despite having 10 segments. The standard specifies that the highest level for a CGU is business segment; therefore, Vodafone and TeliaSonera must have combined segments to determine CGUs. Telefonica did not provide information about CGUs. These results suggest at best a half-hearted attempt to comply with IAS 36 and based goodwill impairment testing to different levels from those expected by the IASB.

3.4 Compliance with disclosure requirement for business combinations and goodwill

As discussed in more detail above, one of the most important elements of IFRS 3 and IAS 36 was imposition of a substantial number of disclosure requirements. In order to examine the extent to which companies complied with disclosure requirements of each standard, we tabulated the number of companies complying with each standard as shown in Appendix 1. This analysis shows that all or nearly all companies either complied with a specific requirement or failed to comply with a requirement; there was little variation in the number of companies complying with each standard. This analysis indicates that all of the companies were having the same difficulty complying or choosing to ignore the same requirements. It is important to note that the disclosures that require merely reporting basic data that are readily available, e.g. name of acquired company and basic information about the acquisition, are those with which all companies comply. Disclosure requirements that require extensive analysis and description are those with which there is substantial non-compliance. It is important to note that we did not detect any substantial increase in the number of companies complying with specific disclosure requirements over the four year period.

As discussed in detail above, we also computed disclosure indexes and compliance ratios for each company for each year. Figures 5 through 12 show compliance ratios by company by year and by standard with line graphs for each company. Analyses of each company show that some companies have indeed improved over time, notably TeliaSonera and Telenor. Vodafone has consistently had high compliance ratios. Some companies, notably France Telecom and Telefonica show a decline in compliance and low levels of compliance. The overall picture, other

than the three companies mentioned, is one of partial compliance and no indication of improvement.

3.5 Effect of stock exchange

As indicated above when we provided basic descriptive material for the companies involved in Table 1, we included stock exchange listings. Six of the eight companies have multiple listings. Only Elisa and TeliaSonera are not listed in the U.S. TeliaSonera does file Form 20 with the Securities and Exchange Commission, though, presumably because it has other securities in the U.S, a fact that we did not investigate. There is no apparent indicate effect of the multiple listings, and in particular listing in the U.S. on the type of information presented. The only detectable effect is the listing of Telenor on the Oslo Stock exchange which is noted for rigorous enforcement of accounting requirements [a source will be cited here]. Telenor throughout this analysis has shown a fairly high degree of compliance with both the requirements and expectations of the IASB in IFRS 3 and IAS 36.

4.0 Concluding discussion

This study has provided an in-depth analysis of compliance with IASB standards related to business combinations and goodwill impairment by exploring eight European telecommunications companies using content analysis methodology. While results cannot be generalized outside the eight companies, the insights obtained would not have been possible with broader-based research methods that did not explore as deeply. The findings indicate that at best there is only partial compliance with IASB standards and only limited improvement at best over the four year period. Among the most important findings is the fact that companies continue to report relatively large amounts of unallocated goodwill upon acquisition despite the clear expectation of the IASB that amounts allocated to goodwill will decline as larger amounts are allocated to specifically identifiable previously unreported intangible assets. There is a detectable increase in identification of amounts allocated to specific previously unreported intangible assets upon acquisition, e.g. customer bases, licenses, trademarks and brands, etc. But no detectable increase in the overall amount of such assets is apparent. Similarly there is little compliance with standards relating to goodwill impairment, notably assigning goodwill to appropriate CGUs. Moreover, there is at best only partial compliance with disclosure requirements of IFRS 3 and IAS 36.

The partial compliance with standards of the IASB has several implications, one of which is the future viability of the Board itself. Potentially of greater importance, though, is audit failure in which the audit reports indicate fair reporting and compliance with standards when there is obvious lack of compliance. Potentially of even greater importance, yet, is the lack of enforcement mechanism to assure compliance. The only detectable enforcement that was detected is that of the Oslo Stock Exchange as evidenced by Telenor's high level of compliance. All of these issues remain as issues for further research and the findings of this study provide bases for that research.

Table 3. Telecom Companies reporting of acquisitions in 2005

Company and acquisition	Percent acquired	Acquisition price ¹	Percentage allocated to				Goodwill	Comments
			Pre-acquisition assets (adjusted to fair values)	Liabilities, minority interest and similar items	Pre-acquisition other net assets	Intangible assets from acquisition		
Deutsche Telekom subsidiary acquired Telekom Montenegro	76.5%	147	122%	-53%	69%	14%	17%	Did not present adequate details to make allocation; required educated guesses. No explanation of amount allocated to "other intangibles" Report says that gives foothold into region, but no other details about individual intangibles to which acquisition costs allocated and what constitutes goodwill
Deutsche Telekom subsidiary acquired Alubra Telecomunicaciones	100%	36	278%	167%	111%	0%	-11%	Very sketchy details; educated guesses required. Negative goodwill of €4 million not explained. Negative goodwill increased net income.
Elisa acquired Tikka Communications	100%	37.3	82%	-20%	63%	18%	19%	The entire increase in intangibles from acquisition is allocated to the customer base. ??? Goodwill is attributed to synergies in the fixed network business.
Elisa acquired Saunalahti	100%	374	28%	-30%	28%	24%	78%	Amounts allocated to customer base and brand exceed total increase in intangibles; apparently acquired intangibles were deceased Company emphasizes significance of brand and customers and intent to develop further but allocates only 25% to these items. Relatively large 78% allocated to goodwill described as being attributed to synergies in network capacity and mobile communications business.
France Telecom acquired parent of Amena	79.4% of parent owning 98% of Amena	6,687	75%	-89%	-14%	46%	67%	Allocated amounts to trademarks, licenses, and subscriber base; nothing to other intangible assets. Description says that customer base is major impetus but only 33% allocated. No details about two-thirds allocated to goodwill.
Telecom Italia acquired Liberty Surf Group	100%	268	49%	-47%	2%	5%	93%	Liberty Surf is a major French provider; description emphasizes that number of customers increased substantially, but only 5% allocated to the customer base. No explanation for large percentage of 93% allocated to goodwill.
Telecom Italia acquired Elefante TV and Delta TV	100% each	128	2%	-33%	-31%	98%	32%	Description states that now cover 70% of Italian market thus large amount allocated to frequencies and broadcast rights. Also states the importance of the Elefante brand, but nothing allocated to brand. No explanation of goodwill.
Telefonica acquired Cesky Telecom	69%	3, 662	118%	-75%	43%	32%	25%	Did not identify which "other intangibles" received allocations. Trademark and customer list are described as driving forces, but nothing allocated. No explanation for 25% goodwill
Telefonica acquired Radiocomunicaciones Móviles S.A. and	100%	837 (total)	84%	-85%	-2%	10%	92%	No explanation to the intangible assets recognized (reported as "Other intangible assets"). Nothing allocated to the customer base, despite these acquisitions provided the group with 20 mln new customers. No explanation to

Company and acquisition	Percent acquired	Acquisition price ¹	Percentage allocated to					Comments
			Pre-acquisition assets (adjusted to fair values)	Liabilities, minority interest and similar items	Pre-acquisition other net assets	Intangible assets from acquisition	Goodwill	
Telefónica Móviles Chiles S.A.								the allocation of 92% of the purchase price to “Goodwill”.
Telenor subsidiary acquired DATC and UCOM (Thailand)	75% and 86.2%	333.4	69%	-407%	-338%	354%	84%	Does not identify pre-acquisition values for intangibles arising from acquisition thus likely distorting extremely large percentage to intangibles from acquisition. Amounts identified for customer base, concession rights, trademarks, software and roaming agreements,

Table 3(Continued). Telecom Companies reporting of acquisitions in 2005

Company and acquisition	Percent acquired	Acquisition price ¹	Percentage allocated to				Goodwill	Comments
			Pre-acquisition assets (adjusted to fair values)	Liabilities, minority interest and similar items	Pre-acquisition net assets	Intangible assets from acquisition		
Telenor acquired Bredbandbolaget	100%	566	18%	-34%	-16%	17%	99%	Does not identify pre-acquisition values for intangibles arising from acquisition. Allocated amounts to customer base, trademarks, software and other intangibles. The company emphasizes the benefit of a common Nordic platform but allocates only 17% to intangibles. Goodwill is explained as anticipated profits and synergies with no additional discussion to explain or justify large percentage.
Telenor acquired CyberCity	100%	166	21%	-33%	-12%	32%	81%	Does not identify pre-acquisition values for intangibles arising from acquisition. Allocated amounts to customer base, trademarks, and software. No explanation of amounts allocated to intangibles and goodwill.
TeliaSonera acquired Volvik (now Chess)	100%	235	35%	-34%	1%	6%	93%	The company strengthened its position in Norway and emphasized growth potential in home markets, but allocated only 6% to subscriber contacts. No justification of 93% allocated to goodwill.
Vodafone ² acquired Clear Stream	100%	2,795	36%	-48%	-12%	40%	72%	Reported amounts to license and spectrum fees and to other intangibles, but did not show beginning balances. Goodwill is explained. Goodwill is explained as profits and synergies from acquired company.
Vodafone ² acquired VemFin	99%	2,126	23%	-24%	-1%	41%	60%	Reports amounts allocated to license and spectrum fees but does not show beginning amounts of each. Goodwill is attributed to synergies and profits of acquired company.

¹ In millions of Euros. Approximate exchange rates on transaction dates for non-euro currencies.

Table 4. Telecom Companies reporting of acquisitions in 2006

Company and acquisition	Percent acquired	Acquisition price ¹	Percentage allocated to				Goodwill	Comments
			Pre-acquisition assets (adjusted to fair values)	Liabilities, minority interest and similar items	Pre-acquisition Net Assets	Intangible assets from acquisition		
Deutsche Telekom subsidiary acquired Gedas group	100%	300	114%	-114%	0%	31%	69%	Company emphasizes technical expertise and specialized customer base, but allocates little to intangibles. No explanation of amounts to intangibles from acquisition and no explanation of large amount allocated to Goodwill.
Deutsche Telekom subsidiary acquired Tele-ring	100%	1,300	43%	-11%	32%	18%	50%	Company says assembled workforce value included in goodwill because intangible asset criteria not fulfilled; synergies included in goodwill because included in negotiated price. No additional explanation for amounts.
Deutsche Telekom subsidiary bought Polska Telefonia	48% to bring total to 97%; now must consolidate	1,600 in 2006; 1,800 previous, total 3,400	42%	-31%	11%	39%	50%	Information inadequate to understand allocations; we used informed guesses. No explanation of benefits of combination, allocations to new intangible assets nor goodwill
Elisa acquired Lounet	80%	9.2	108%	-28%	80%	17%	3%	Intangible assets from acquisition allocated entirely to customer base. No explanation for relatively large amounts allocated to pre-existing assets.
France Telecom acquired Diwan Group	99.5%	39 in two stages	n/a	n/a	n/a	n/a	120%	No details about allocations in 2006 other than to goodwill and intangibles although required and provided details in 2005. No explanation of large percentage of goodwill
France Telecom acquired Jitco, holding company for Jordan Telecommunications (JTC) and share directly in (JTC)	100% of Jitco and directly or indirectly 51% of JTC	?			?	?	?	Conflicting amounts of acquisition prices given in different parts of annual report. Reported amounts allocated to goodwill and to trademarks, license, and customer base; cannot determine percentages. Did not give amounts for other items other than deferred tax liability. Did not give information about other items allocated. No explanation for amounts allocated to goodwill.
Telefonica acquired O2	100% in two stages in 2005 and 2006	26,135	63%	-30%	33%	31%	36%	Described how amounts measured for licenses, customer base, and trademark but did not give amounts allocated to each item.

¹ In millions of Euros. Approximate exchange rates on transaction dates for non-euro currencies.

Table 4 (Continued). Telecom Companies reporting of acquisitions in 2006

Company and acquisition	Percent acquired	Acquisition price ¹	Percentage allocated to				Goodwill	Comments
			Pre-acquisition assets (adjusted to fair values)	Liabilities, minority interest and similar items	Pre-acquisition net assets	Intangible assets from acquisition		
Telefonica acquired Colombia de Telecomunicaciones	50% plus one share; committed to purchase remainder	578	424%	-456%	-32%	1%	131%	Apparent non-compliance with IFRS on computing acquisition price did not include commitment to acquire minority interests. No explanations of large percentages allocated to assets and liabilities, and very small amounts to intangibles, as well as no explanation of relatively large goodwill.
Telenor acquired Vodafone Sweden to become Telenor Sweden	100%	946	106%	-42%	64%	33%	3%	Allocated amounts to customer base, roaming agreements, and software; did not allocate anything to "other intangibles". Very small percentage to goodwill.
Telenor acquired Mobil63 Serbia to become Telenor Serbia	100	1,482	31%	-2%	29%	12%	59%	Allocated amounts to customer base and roaming agreements; did not allocate anything to "other intangibles". No explanation for large amount to goodwill
Telenor acquired various companies, individually immaterial	various	290	36%	-33%	3%	24%	73%	Allocated amounts to customer base, licenses, contracts, technology, trademarks, and software; did not allocate anything to "other intangibles. No explanation for large percentage of goodwill
TeliaSonera acquired Xfera	100%	152	350%	-328%	22%	0%	78%	Some adjustment amounts to net assets not clear. No allocations to intangibles even though Xfera has existing 3G network. No explanation of goodwill.
TeliaSonera acquired NextGenTel	100%	250	51%	-39%	12%	9%	79%	Allocated 10% to customer base even though second largest in Norway; nothing to "other intangibles. No explanation for large amount to goodwill.
Vodafone ² acquired Telsim	100%	3764	14%	-10%	4%	34%	62%	Allocated amounts to licenses and spectrum and about 30% to "other intangibles" Goodwill is assigned to Eastern Europe, presumably a CGU. Goodwill is attributed to profits and synergies. Most of the goodwill will be tax deductible

Figure 1. Allocation of Acquisition Cost in 2005

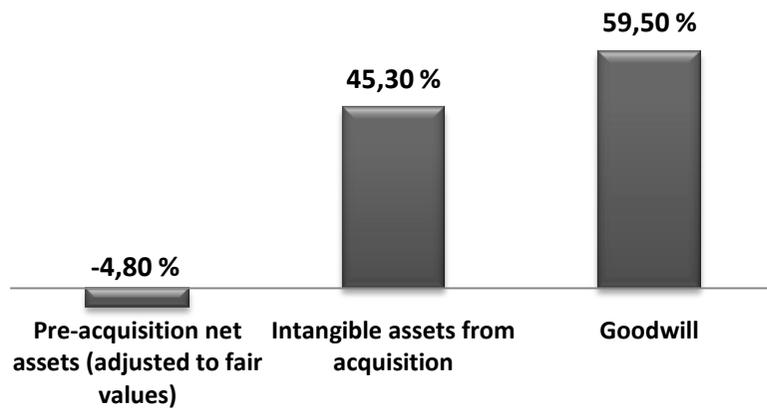

Figure 2. Allocation of Acquisition Cost in 2006

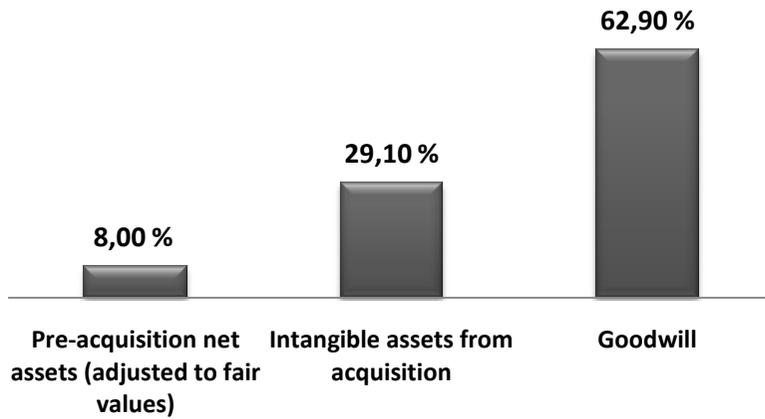

Figure 3. Allocation of Acquisition Cost in 2007

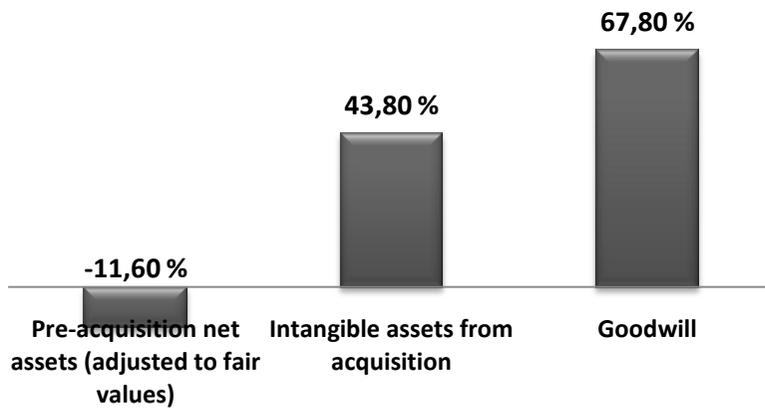

Figure 4. Allocation of Acquisition Cost in 2008

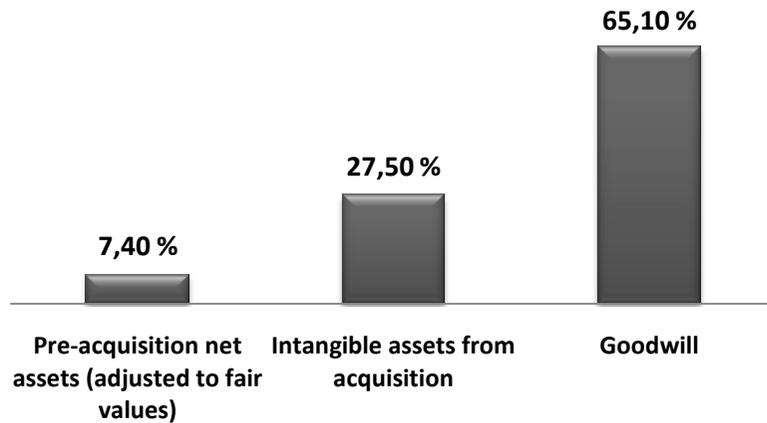

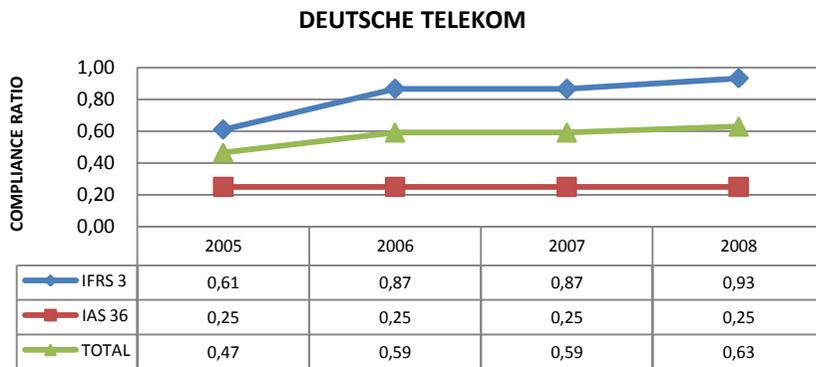

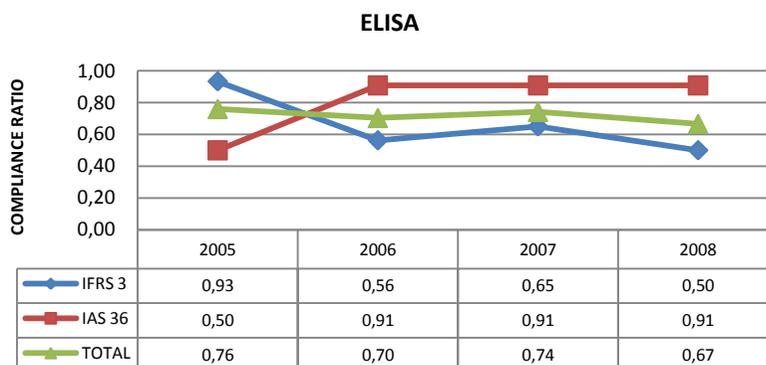

Figure 5. Level of Compliance by year and Standard of Deutsche Telekom

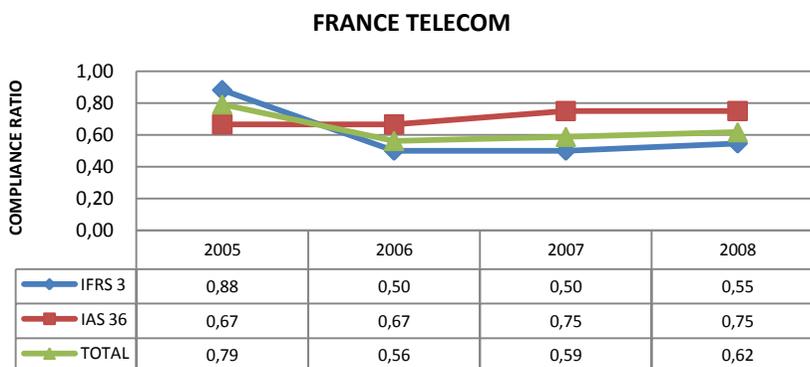

Deutsche Telekom presents a high level of compliance with IFRS 3 disclosure requirements and an extremely low ratio for IAS 36 disclosures. The IFRS 3 disclosure ratios are steadily improving throughout the four year period while the IAS 36 ratios are steady at 0.25. In all of the four years, the company discloses only some of the specified information about the bases on which its CGUs' recoverable amounts (value in use) are determined. Moreover it does not disclose any information about the sensitivity tests it should perform.

Figure 6. Level of Compliance by year and Standard of Elisa

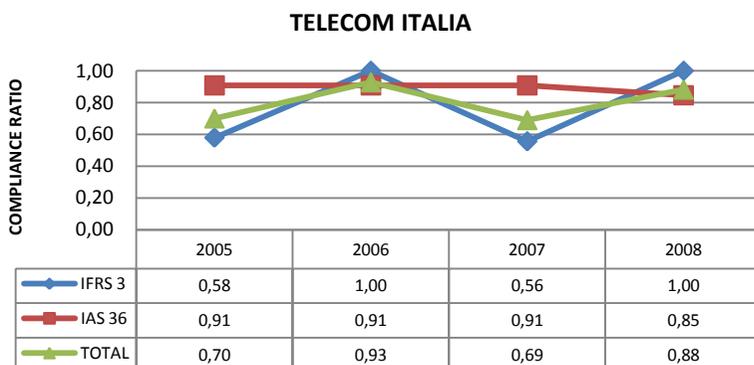

During the first four years of IFRS implementation, Elisa improves considerably its level of compliance with IAS 36 disclosure requirements (from 0.50 to 0.91) while it deteriorates its level of compliance with IFRS 3 requirements (from 0.93 to 0.50). The main reason that leads to the improvement of IAS 36 ratio is the improvement of disclosures about sensitivity tests. The main reasons that lead to the deterioration of IFRS 3 ratio are: 1) disclosures about profit or loss included in acquirer's results, 2) disclosures about the revenue and the profit or loss of the combined entity as though the acquisition date had been the beginning of the period, and 3) disclosures of the factors that contributed to a cost that results in goodwill recognition.

Figure 7. Level of Compliance by year and Standard of France Telecom

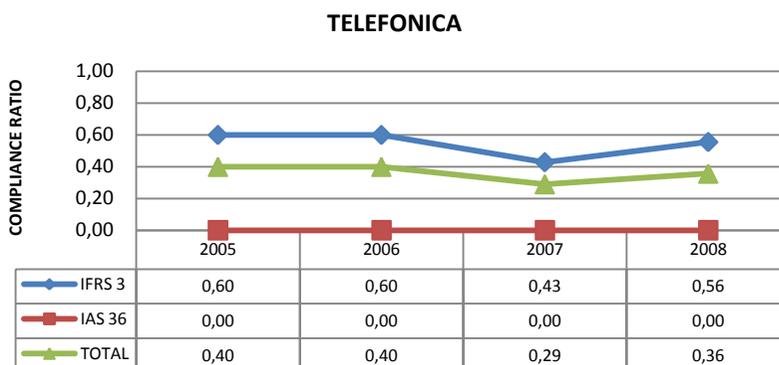

In 2005, France Telecom interestingly presents a better level of compliance with IFRS 3 disclosure requirements than in the three following years. The main reasons for the low level of compliance with IFRS 3 requirements are disclosure items about the revenue and the profit or loss of the combined entity as though the acquisition date had been the beginning of the period and the factors that contributed to a cost that results to goodwill recognition. By contrast, the company presents an improved ratio for IAS 36 disclosures throughout the four years. The main reason of the improvement is located in disclosures about the sensitivity analysis.

Figure 8. Level of Compliance by year and Standard of Telecom Italia

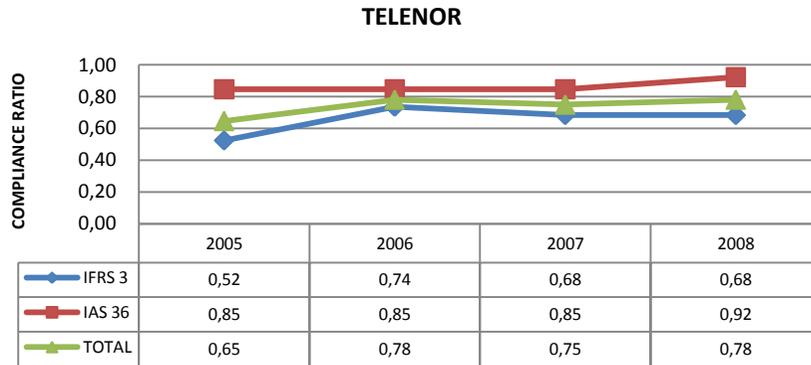

Telecom Italia presents substantial variations in IFRS 3 compliance ratios among years. On the one hand in two years it complies with all applicable disclosure items and on the other hand in two years it complies only with half of them. This variation can be attributed to the lack of acquisitions in these two years and hence it is subject only to the basic quantitative disclosure items IFRS 3 mandates. For IAS 36 disclosure items, the company shows a high level of compliance throughout the four year period.

Figure 9. Level of Compliance by year and Standard of Telefonica

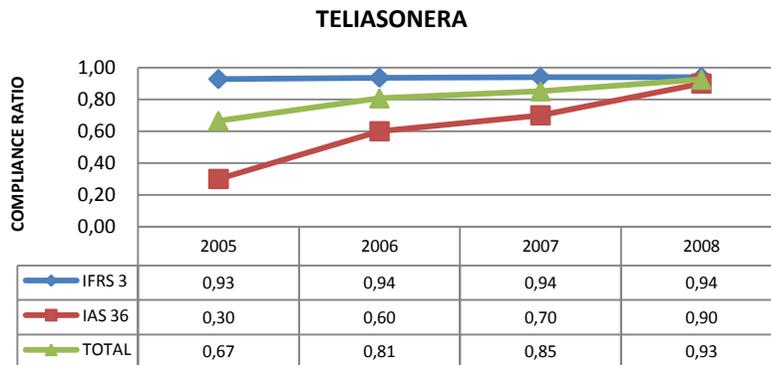

Telefonica does not disclose any information mandated by IAS 36. Moreover it also presents a relatively low level of compliance with IFRS 3 disclosure requirements. The main reasons for such low levels are lack of: 1) disclosure requirements about the profit or loss included in acquirer's results, 2) disclosures about the revenue and the profit or loss of the combined entity as though the acquisition date had been the beginning of the period, and 3) disclosures about the factors that contributed to a cost that results in goodwill recognition.

Figure 10. Level of Compliance by year and Standard of Telenor

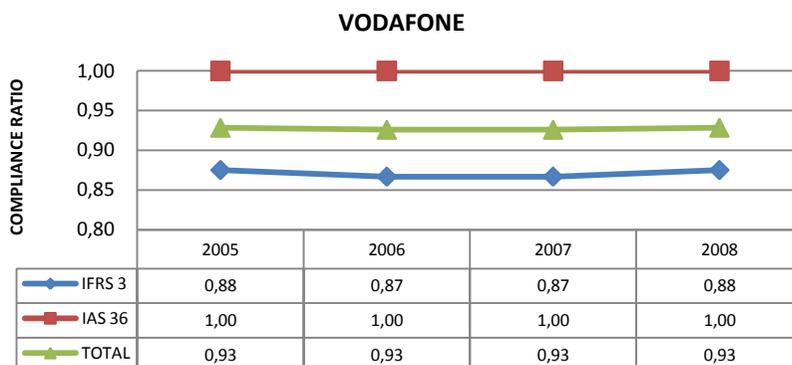

Telenor presents an improvement of its level of compliance during the first four years of IFRS mandatory implementation. Specifically it highly complies with IAS 36 disclosure requirements, while its ratio is lower for IFRS 3 requirements. The main reasons for the lower level of compliance with IFRS 3 requirements are related to disclosures items about the revenue and the profit or loss of the combined entity as though the acquisition date had been the beginning of the period and on the items, and the factors that contributed to a cost that results in goodwill recognition.

Figure 11. Level of Compliance by year and Standard of Teliasonera

Teliasonera presents the most substantial improvement over the four years. The overall level of compliance is 38% higher in 2008 than in 2005. This improvement is attributed to IAS 36 disclosures ratio which increased from 0.30 in 2005 to 0.90 in 2008.

Figure 12. Level of Compliance by year and Standard of Vodafone

Vodafone is the only of the eight companies that presents consistently strong positive compliance ratios. In all four years the company's level of compliance with IAS 36 disclosure requirements is 1. Also IFRS 3 compliance ratios are high. In general Vodafone has the highest total disclosure ratio among the eight companies (0.93).

RECENT DEVELOPMENTS OF THE FINANCIAL REPORTING MODEL: THEORETICAL STUDIES IN REVIEW

Matiş Dumitru

Babeş-Bolyai University, Faculty of Economics and Business Administration

Bonaci Carmen Giorgiana

Babeş-Bolyai University, Faculty of Economics and Business Administration

Our paper analyzes the manner in which the financial reporting model evolved towards fair value accounting. After a brief introduction into the context of financial reporting at international level, the analysis focuses on the accounting model of fair value. This is done by synthesizing main studies in accounting research literature that analyze fair value accounting through a theoretical approach. The analysis being developed relies on literature review methodology. The main purpose of the developed analysis is to synthesize main pros and cons as being documented through accounting research literature. Our findings underline both the advantages and shortcomings of fair value accounting and of the recent mixed attribute in nowadays financial reporting practices. The concluding remarks synthesize the obtained results and possible future developments of our analysis.

Keywords: fair value, accounting research literature, mixed attribute, pros, cons.

JEL Code: M41.

1. Introduction and theoretical background

Questions regarding the identification of the most adequate values for assets and debts evaluation, and the manner in which changes that occurred in these values should be reported, are directly linked by other considerations connected to the nature and goal of the financial reporting (Gwilliam and Jackson, 2008). In the extreme case of economical models that target general equilibrium, when all information is embedded in the individual prices of assets, the fact that traditional financial reporting (in regard to the balance sheet and the profit and loss account) has a reduced, but not inexistent role is unanimous accepted (Barth and Landsman, 1995; Beaver and Demski, 1979; Walker, 1988).

In a real environment, one that assumes the imperfections of available information and a degree of uncertainty, financial reporting has the potential in playing a series of roles, both in retrospective - in terms linked to stewardship*****, contract signing capacity, employee selection, resource consumption decisions, distribution, etc.; and in perspective - in terms referring to the anticipation capacity or to the, value, moment and probability of future cash-flows. In this context, the conceptual framework outlined by various accounting standard setting bodies such as the Financial Accounting Standards Board (US), the International Accounting Standards Board, and the Accounting Standards Board (UK), represents their attempt to offer, or at least to articulate, their own vision on a normative accounting foundation, and to identify a series of qualitative characteristics belonging to a “better” financial reporting in terms of relevance, credibility, etc. (Gwilliam și Jackson, 2008). In the US, recognizing assets and debts

***** An additional role of accounting given that the market is not perfect and complete; a series of big entities entrust their assets and decisions to managers, having an informational advantage in terms of the degree of the decisions' adequacy; however it is difficult to conclude if a manger took some decisions that are inconsistent in relation to the shareholders goals; in other words, the shareholder cannot be certain if he “acquires” the decision he wants; accounting information can be useful in offering necessary incentives for diminishing the effects of the managers private information, and in supporting the company's' value growth

at fair value seems also to be favored by the Securities and Exchange Commission. In a report made for a Congress of the SEC (SEC, 2005), we can observe two major benefits of imposing fair value accounting for financial instruments. The first one would be the reduction in use of transactions structured in purely accounting ways by focusing on the exploitation of opportunities generated by managerial earnings created by the “mixed attribute” model - partially historical costs, partially fair values. The second one refers to fair value accounting of financial instruments which would lead to a reduction in the complexity of financial reporting, consequence of mixed attribute. Evidently, as the SEC report noted, there also are costs that are associated to the use of fair value.

A key aspect is the possibility to evaluate elements of financial statements at fair values, especially in the case of those financial instruments for which there aren't any active markets. Although market value is the recommended evaluation for fair value, the FASB adopted the term of “fair value” instead of market value, so that to underline the estimations of value necessary for financial instruments which are not traded on active markets. Both the FASB and IASB recommend, through the conceptual framework, the consideration of the cost/benefit report between relevance and credibility, when determining the optimum evaluation method for certain elements, analyzing if that evaluation has enough credibility to be recognized in financial situations. For investors, the assumed cost of fair value evaluations consists in the possibility, that one or more financial instruments might not be evaluated precisely enough to help them in their estimations regarding the financial position of the company and its potential to generate future benefits. This relevance cost is the consequence of the fact that in the absence of active markets for certain financial instruments, the management of the company must use fair value in its estimations, which leaves room for subjectivism and manipulation. Evaluating the costs and benefits of fair value accounting in the case of financial reporting, costs which affect investors and other users of accounting information in specific reporting systems is a difficult task (Matiş and Bonaci, 2008). The remainder of our paper is organized as follows: some research methodology aspects are discussed, the main part of the paper deals with analyzing theoretical studies in the area of fair value accounting in order to synthesize pros and cons being documented through accounting research literature, and finally we conclude upon the developed analysis by also formulating some future developments that might complement our study.

2. Research methodology

Our paper uses literature review methodology in order to develop a critical and evaluative account of what has been published within accounting research literature on fair value accounting by only considering studies that develop a theoretical approach. Therefore, the purpose of such an analysis in the area of literature review studies is to summarise, synthesise and analyse the arguments of studies being analyzed. Besides developing a summary of sources in the approached area, the employed research methodology imposes a certain organizational pattern that combines both summary and synthesis. More precisely, our analysis of each considered study covered the following aspects: question formation, identification of the relevance, assessment of quality, evidence summarization and interpretation of findings.

3. Developing the analysis and interpreting results

There is a myriad of arguments that can be invoked in the favor of implementing fair value, such as the comparability of market values, the credibility of the information provided by market prices, the conceptual benefits of market based evaluation of financial instruments, and the accounting of risk coverage managerial decisions. Information aggregation refers to fair value in the sense of correspondence between reported (supplied) and demanded information, in this case the aspect of credibility seeming to be the main argument with the potential to limit the

implementation of fair value evaluation in future projects of accounting regulatory bodies, especially in the case of balance sheet recognition. The accounting research literature documents the preference of investors for the use of fair value as standard for financial reporting, generating a superior level in information comparability. The level of relevance obtained through use of fair value is also superior to the one of the historical costs, due to the fact that management bases its decisions on fair values, as investors do, while in fact even the managements' evaluation should rely on the obtained results, but expressed at their fair value (White, 2008). Although these arguments are extremely powerful, a series of problems emerge when referring to accounting practices, especially in terms inked to evaluation credibility. This is also true when referring to theory related aspects, mainly in terms of changes taking place in fair values and their reporting. Therefore, starting from questions that regard the reporting method for gains and losses reflected in the profit and loss account, are induced by varieties of complex aspects, which derive from different conceptions regarding what in fact is the "result" and from various perspectives on the nature and goal of financial reporting. Even if we considered a perfect environment as Hicks (1946) did, starting from the premise that at any moment given in time all cash-flows and actualization rates are known (although in the case of a partial equilibrium model these certainties become variables), a variety of result ratings can be derived from the base distinction between the results calculated as difference between net assets in two different moments (this is the main approach in accounting referential), and the result representing a sustainable value in future time frames (Gwilliam and Jackson, 2008). A series of queries are linked to the manner in which information regarding these gains and losses should be presented, referring specifically to the necessity of separation - whenever possible - of temporary gains and losses, and to achieving a distinction between gains and losses generated by management and ones generated by other causes.

We could state that the role of financial reports is to offer users, i.e. stakeholders, the possibility to evaluate the success of a company or even its management. In this context, a question arises: How should the recent earnings generated by owning shares in international oil and gas companies be reflected in accounting? The high demand on the market was further accentuated by the Middle East crisis, fueling an increase in oil and natural gas prices during 2003-2006, the price of a crude oil barrel rising from 25\$ (2003) to 70\$ (2006) (NYMEX - New York Mercantile Exchange). Therefore, we face yet another important question: to what extent should these earnings be attributed to activities performed by the management of these companies? (Gwilliam and Jackson, 2008).

The main discontents regarding aspects that affect the credibility and comparability of information supplied by using fair value for financial instruments are comprised in opinions of practitioners. They express their concerns regarding the fact that estimations using fair value in the case of similar financial instruments can vary significantly in practice; that the management has an exaggerated power of decision and influence - by choosing entry market data that will be used in the evaluation, when the prices themselves are nor offered by the market; that certain shades of assumptions used in estimation models can have significant consequence; and that verifying the prices determined using unobservable data will be extremely difficult (Reinhart, 2008). One of the main adversaries of fair value is Alex J. Pollock (American Enterprise Institute), who considers that applying fair value accounting can create various excesses within the market, both pessimistic and optimistic, through the reported results and implicitly through the capital, which in the present state of the global economy does nothing but to fuel panic. From the point of view of the derivative, when these are not traded, Pollok considers that fair value evaluation creates an opportunity for a manipulation of the system. From his somewhat ironical perspective, fair value accounting represents "the last invention of metaphysical accountants in

their search for the only true way of bookkeeping”. The arguments stated by Pollok address a series of problematic aspects that still require refining from the point of view of fair value.

For example, he mentions the situation in which the fair value of the debts of an entity decreases (which might happen due to the fact that the bonds market observes a worsening in the credit position of that entity), a case in which although the entity owes the same amount to its creditors - by the recognition of a smaller debt amount by its’ creditors - fair value evaluation would assume recognizing in return the diminishing of the debt in correspondence to an income, thus generating a “profit”.

Financial analysts also have their critics concerning the fair value concept, accentuating their role of functioning in a real world, where they have to offer decisional support to investors by operational systems and arbitrary rules of scientific models, and it is clear that the more instable entry data is, the more the analysts’ role diminishes. A compromise is therefore needed, between the utopist goals of a perfectly-transparent and efficient market and the real world, based on human actions and inefficiencies. If the general public is unable to understand or face the torrent of short term oscillations of asset prices, the net effect of fair value accounting could generate nothing but fear, anxiety and systemic instability. On the other hand, we are aware that losses, gains and volatility result from market behavior and not from financial reporting. Using fair value is also not enough, because there is a need for additional information regarding risk exposure, models and assumptions used in estimations (especially in the case of less active markets), and also regarding the changes in factors that can induce the modification of fair value (White, 2008). Radical attitudes are not useful to anyone. Instead, what would be of great use, is a collaboration based on individual experiences, so that the concept of fair value could be improved, thus becoming closer to the great goal of solving evaluation problems that have been troubling the accounting community for a few decades. Abacus published in 2008 a special issue dedicated to fair value, in which there are reproduced papers presented at the September Siena Forum in 2007 (the central theme of this forum was also fair value and conceptual framework). The respective papers cover a large number of matters concerning fair value evaluation, various initiatives of international organisms - especially IASB and FASB, etc. all of these needed for the development of a common conceptual framework. The majority of these papers resort to theoretical studies, meticulously processing the subtleties of the provisions of the regulations in cause. Following the Norwalk agreement from 2002 - through which IASB and FASB decided to strengthen their relations and to create a convergence plan for the standards they emitted - the events developed rapidly. Whittington (2008) evokes the strong affinities between the IASB and FASB conceptual framework, and the existence of important differences at the level of details. An important similar aspect between the two frameworks is the lack of an evaluation treatment, aspect which makes both frameworks incomplete (Whittington, 2008). We could say that there is still an “inheritance” of interests and some unsolved debates dating back from the 70’s when the regulating organizations fought each other on the matter of inflation accounting, trying to come up with a solution that would satisfy both the users of accounting information and the persons responsible with the preparation of financial situations. Also, the pressures and controversies from that period are also responsible for the importance of decisional utility - especially in the case of investors from the capital markets - the center of the objective of financial statements. This was a major step at that time, making the transition from the traditional vision - which stated that accounting has legal goals, which are linked to the responsibility of managers towards the shareholders - to the decisional utility, as a possible extra benefice. Later, there were opinions that considered the focus reorientation as exaggerated, according to current revisions of conceptual frameworks. Whittington (2008) and Ronen (2008) include in their works various discussions regarding the current state of provisions regarding fair value and conceptual framework, and the measures that need to be taken in this matter. Bradbury (2008) and Turley (2008) comment on their opinions,

The effects of this situation would be felt in multiple countries and regulations. For example, according to UK regulations, even though the reevaluation of long term debts was not allowed, it was always permitted for a company financed through bonds to refinance them in a manner that would allow any change in value reflecting interest rates changes to be incorporated within the profit and loss account once refinancing takes place, despite the fact that - ignoring transaction cost - the cash flow could not have been affected at all.

Creating a hybrid accounting system in which historical costs accounting is combined with the fair value one, or, in other words, a dual accounting system, is also analyzed by accounting research literature, which identifies a series of disadvantages generated by distortions of the reporting systems' coherence, thus facilitating the recognition of gaining resulted from managerial decision and embellishment of financial statements (Barlev and Haddad, 2004). Using market based evaluations can create problems for hedge operations regarding cash-flows, generating a context in which double attribute issues, therefore affecting the information provided by fair-value (Gigler et al., 2007; Shin, 2007). When assets are evaluated at values provided by the markets, and debts are not evaluated at fair value, the possibility of a significant distortion in the financial statements focused on equity is created. In this case, there are two possible outcomes: overrating or underrating that value (Wallace, 2008), depending on the interests of the distortion. Using the mixed attribute model leads to new information, this in turn can be misleading for its respective users, and reporting for hedge operations is difficult and opaque (White, 2008). Barlev and Haddad (2007: 495) succeed in underlining the connection between international accounting harmonization and the fair value accounting paradigm, by starting from the premises of the accounting comparability used in defining international accounting harmonization, the supporters of which consider necessary the elaboration of a unique set of Generally Accepted Accounting Principles – GAAP. These principles would lead, in their opinion to a complete “harmonization” at international level. They also bring to our attention the existence of a second requirement necessary for reaching a “complete harmonization”, i.e. a common denominator in the evaluation, recoding and reporting of transactions, assets, debts and equity, thus considering feasible the option of fair value paradigm, unlike the historical cost one. The concept of fair value has the capacity to offer that needed common denominator, which is necessary for the comparability of accounting information. This denominator acts like a catalyst during a harmonization cycle: fair value spreads international accounting harmonization, which in turn generates more useful information that could be beneficial for the efficiency of global markets, the final consequence of these results being increases in the quality of fair value that was evaluated in this manner (Barlev and Haddad, 2007: 498).

We conclude our analysis by stating that our findings could be completed by developing a similar analysis on studies in accounting research literature that have an empirical approach to fair value accounting and its implications.

PROFESSIONAL JUDGMENT UNDER IFRS IN EX-COMMUNIST COUNTRIES: CASE OF ROMANIA

Megan Ovidiu

West University of Timisoara, Romania

The accounting rules from each country evolve in time in order to respond the social, cultural and economical environment needs. After some communist countries (as Romania, Bulgaria, Poland, Hungary, Czech Republic, Slovenia, Estonia, Lithuania, s.o.) joined the European Union an important number of local companies became to apply accounting regulation according with International Financial Reporting Standards (IFRS).

This paper surveys the theoretical and empirical literature on the possible risks for companies' management from ex-communist counties by applying (mandatory or voluntary) International Financial Reporting Standards reporting regulation and professional judgment.

Under the pressure of economic globalization all the ex-communist countries ware obliged to adopt International Financial Reporting Standards in the field of accounting. The main objective of this paper is to find out from the experience of different companies who already adopted IFRS which are the risks related to professional judgment application under IFRS on the financial statement users.

As research methodology we integrated theoretical and empirical studies from accounting and law (especially from Romanian experience) in order to contribute to the cross-fertilization of our field of interest.

As final results of our paper we find that the biggest risk of applying professional judgment prescribed by IFRS in ex-communist countries is to appear different creative accounting techniques which influence in a negative way the decision-making process for the financial statements users. During worldwide financial crisis the majority of Romanian companies tried to use in the most appropriate way the professional judgment in order to arrange their financial reports and to save company's money (in relation with local government) or to show higher performance (in relation with financial institutions) for the fund-raising process

We identified several motivations including the existence of tax levies based on income, confidence by shareholders and workers in management that is able to report stable earnings and psychological expectations relating to increases or decreases in anticipated income.

Keywords: professional judgment, IFRS, globalization, creative accounting, risk

JEL Codes: M41 - Accounting

Introduction

For several decades we observe that in many key industries companies from ex-communist countries as Romania, Bulgaria, Hungary, Czech Republic or Poland increasingly are confronted with worldwide competition. They have responded to this challenge with strategies of globalization. As a result, not only the leading companies now operate on a global basis with subsidiaries in all important regions even in central and south-east European countries. The pressure to globalize is also felt by many focused small and medium sized enterprises that are suppliers of components or specialized services to the giant multinational companies. Globalization, which characterizes the economic world, led to the necessity of understanding and comparison of the financial information of different corporations and also to present the fair view of businesses.

After some communist countries joined the European Union an important number of local companies became to apply accounting regulation according with International Financial Reporting Standards (IFRS). Ex-communist countries accounting developed remarkably in the last fifteen years, as shown by the flow of accounting literature in this field at national and international level. This development is mainly the result of preparations for EU accession by increased needs for attracting foreign investments, of achieving international comparative analyses, of expressing rules for determining results, of providing minimal accounting information to players on European and international capital markets, as well as of harmonizing and subsequently converging national, European and global accounting standards. In this way the accounting rules from each ex-communist country evolve in time in order to respond the social, cultural and economical environment needs (Ineovan, Hategan, Megan and Schmidt 2001: 8).

Globalization strategies are not restricted to operating and investing activities but increasingly also involve financing. Foreign listings (excepting companies from ex-communist countries) are not new to US multinationals or many of the large European companies being traded at home as well as on other major European and Asian stock exchanges (such as London, Frankfurt, Paris, Tokyo). New in recent years is that an increasing number of European companies are applying for listing on US stock exchanges notwithstanding the fact that complying with Securities and Exchange Commission (SEC) requirements puts quite a burden on them.

Accounting information plays a crucial role in those processes. For globalizing companies accounting reports are a vital means of internal communication between managers and employees from different national backgrounds. The correct application of accounting policies regarding the subsidies is required mainly by the existence of a manual of accounting procedures and policies within each entity (Hategan, Imbrescu, Pavel 2010: 344). Even though the core concepts of accounting are not very different internationally, we observe differences in rules and differences in the application of those rules that hamper internal communication. This problem traditionally was overcome by internal accounting guidelines that were mainly based on the national accounting rules of the parent companies. In view of adhering to the European Union, many east-European ex-communist countries understood the necessity to line-up with accounting standards in the Union and increased its efforts for adapting to these requirements. A great weight in the decision for reforming the east-European accounting national systems in that past period was represented by the necessity to take certain measures for helping these countries and its economies to develop and integrate themselves among the E.U. countries. Thus, at national level it has been perceived that the accounting harmonization process: will create the premises for attracting direct foreign investments, will reduce costs for these companies looking for financing on international capital markets for preparation of accounting information, will create a benefic frame for development of capital market in our country, will reduce commercial barriers and those related to international monetary cash-flows.

Risks of using professional judgment in ex-communist countries

Various researchers have examined the professional judgment and the issue of management motivation towards creative accounting behavior for East-European companies. We identified several motivations including the existence of tax levies based on income, confidence by shareholders and workers in management that is able to report stable earnings and psychological expectations relating to increases or decreases in anticipated income.

Tax is mentioned as a significant motivator also by many authors (Niskanen and Keloharju 2000: 443-452). In countries with highly conservative accounting systems as ex-communist countries the 'income smoothing' effect was particularly pronounced because of the high level of provisions that accumulate. Another bias that sometimes arises is called 'big bath' accounting, where a

company making a bad loss seeks to maximize the reported loss in that year so that future years will appear better.

Healy examines managers' earnings manipulations motives where executive compensation is linked to income measurement. Other authors discuss about managers' motivations to reduce the perception of variability in underlying economic earnings of the firm (Trueman and Titman 1988:127-139).

Kamin and Ronen observe a difference in motivation between managers in owner-controlled and management-controlled firms. Owners who wish to retain control of a sizeable stake and who are therefore not interested in immediate exit strategies are less likely to be motivated to manage earnings.

Other motivations for creative accounting discussed by some authors include those provided when significant capital market transactions are anticipated, and when there is a gap between the actual performance of the firm and analysts' expectations. A variant on income smoothing is to manipulate profit to tie in to forecasts. Fox reports on how accounting policies in some companies from ex-communist countries are designed, within the normal accounting rules, to match reported earnings to profit forecasts. When these companies sell products a large part of the profit is deferred to future years to cover potential upgrade and customer support costs. This perfectly respectable, and highly conservative, accounting policy means that future earnings are easy to predict. Company directors may keep an income-boosting accounting policy change in hand to distract attention from unwelcome news. Collingwood reports on how a change in accounting method boosted a company's quarterly profit figure, by a happy coincidence distracting attention from the company slipping back from being the largest company in the industry in the USA to the number two slot.

Creative accounting may help maintain or boost the share price both by reducing the apparent levels of borrowing, so making the company appear subject to less risk, and by creating the appearance of a good profit trend. This helps the company to raise capital from new share issues, offer their own shares in takeover bids, and resist takeover by other companies. If the directors engage in insider dealing in their company's shares they can use creative accounting to delay the release of information for the market, thereby enhancing their opportunity to benefit from inside knowledge. It should be noted that, in an efficient market, analysts will not be fooled by cosmetic accounting charges. Indeed, the alert analyst will see income-boosting accounting changes as a possible indicator of weakness.

Another set of reasons for creative accounting, which applies to all companies, arises because companies are subject to various forms of contractual rights, obligations and constraints based on the amounts reported in the accounts.

To discover and confirm the hypothesis regarding the implications of creative accounting on ex-communist countries companies, at the beginning of the year 2010 we performed a survey in an ex-communist country (Romania) on a non-representative sociological sample of 70 Romanian companies, which applied accounting standards in compliance with IFRS.

Based on this survey we received answers from the heads of financial-accounting departments regarding a series of questions about Romania applying the IFRS.

The main questions regards the application of professional judgment in a creative way by Romanian companies. By these questions we tried to question financial controllers from Romanian companies about their experience in applying professional judgment in a creative way and they were able to conclude that a significant proportion of all categories of companies employ creative accounting techniques to some extent. We examined some particular aspect or technique of creative accounting. All tend towards the conclusion that creative accounting using that particular technique does exist. Based on our survey, we registered the following results:

Q1. Do you think the accounting regulations according IFRS allow you to apply creative accounting for tax purposes?

61,4% thinks that the new accounting regulations allow to apply creative accounting for tax purpose; 10,0% didn't recognize the creative accounting concept and 28,6% are irresolute regarding that subject.

Q2. Which are the main reasons for applying creative accounting?

38,6 % think that the main reason is taxation, 24,3 % think that the reason is access to bank funds, 22,9 % think that the main reason is the interest of managers, 8,6 % think that the main reason is the interest of stakeholders, 5,7 % think that the main reason is the better presentation for exchange market.

Q3. Which are the techniques of creative accounting?

The surveyors answers were: exploitation of professional judgment (40%), IFRS flexibility (25,7%), manipulation of balance sheet amounts (11,4%), artificial transactions (10%), lack of detailed accounting regulations (7,1%), reclassification of debts (5,7%). The potential for creative accounting in Romania and for sure also in other ex-communist countries is found in few principal areas: regulatory flexibility, a lack of regulation, exploitation of professional judgment, the timing of some transactions, the use of artificial transactions and finally the reclassification and presentation of financial numbers.

According Largay, Mulford and Comiskey even in a highly regulated accounting environment such as the E.U., a great deal of flexibility is available.

Romanian accounting practice accounting regulation often permits a choice of policy; for example, in respect of asset valuation (IFRS and EU Directives permit a choice between carrying non-current assets at either revalued amounts or depreciated historical cost). Business entities may, quite validly, change their accounting policies. But in practice such changes may be relatively easy to identify in the year of change, but are much less readily discernible thereafter.

Other areas are simply not fully regulated. For example, there are very few mandatory requirements in respect of accounting for stock options. In the majority of countries, accounting regulation in some areas is limited: for example the recognition and measurement of pension liabilities and certain aspects of accounting for financial instruments.

Other problem is the character discretionary and nondiscretionary elements of the bad debts provision. For that the accountants must apply professional judgment and the relativity may introduce some manipulations of result for the period.

On the other hand our research found a sort of managers acknowledged manipulative behaviors and short-term orientations for their mandate for companies where the managers are not stakeholders.

The company's' artificial transactions can be entered into both to manipulate balance sheet amounts and to move profits between accounting periods. This is achieved by entering into two or more related transactions with an obliging third party, normally a bank. For example, supposing an arrangement is made to sell an asset to a bank then lease that asset back for the rest of its useful life. The sale price under such a 'sale and leaseback' can be pitched above or below the current value of the asset, because the difference can be compensated for by increased or reduced rentals.

Reclassification in balance sheet and presentation of financial numbers are relatively under-explored in the literature. The firms may engage in balance sheet manipulation to reclassify liabilities in order to smooth reported liquidity and leverage ratios. A special type of creative accounting relates to the presentation of financial numbers, based on cognitive reference points. As explained by Niskanen and Keloharju "the idea behind this behaviour is that humans may perceive a profit of, say, 301 million as abnormally larger than a profit of 298 million". Their

study has indicated that some minor massaging of figures does take place in order to reach significant reference points.

As we can see from our empirically research even though manager's motivation for creative accounting may be established and accepted in practice. Respected financial professionals, demonstrate that it's a lot harder to manipulate cash-flows, but the interest of management can be very strong in that manners to "make-up" other face for their company (Megan, Schmidt, Cotlet 2010: 512).

All of the creative accounting behaviors identified in this study was identified through careful analysis of the answers of financial controllers and of financial statements. Some of the manifestations were easier to identify than others, but all should be observable by a reasonably well informed user of the financial statements.

Conclusions

In Romanian accounting practice as in other ex-communist countries there are some unusual features of environment that merit special attention. The audit report qualifications are common, even in respect of major listed companies. The majority of qualifications in Romanian companies are oriented on fix assets valuation and to accrued expenses to avoid local taxes or decreases of profit for managers' bonus. In these conditions we ask: if the creative accounting behavior is so obvious, can it properly be classified as creative accounting at all? However, the extent to which users of the statements actually do observe such relatively clear examples of creative accounting is uncertain. It has been observed that analysts' reports in Romania usually fail to mention the existence of audit report qualifications, special authorizations from CNVM (National Securities Commission) or other manifestations of creative accounting practices.

Regardless of creative accounting techniques we can suggest some recommendations to combat creative accounting.

Romanian accounting regulators who wish to limit the opportunities in which creative accounting can be used could consider the possibility of approaching separately the diverse situations that allow the application of creative accounting:

The first step towards the reduction of possibilities to use creative accounting is to be made by the Romanian regulators (Finance Minister or National Securities Commission) and consists in the continuous development of a conceptual framework in the line of professional work. In this way, the objectives of financial information will be clarified and priorities clearly established. In these new conditions the orientations to design accounting rules have a double function, firstly they affect accounting standards-setters but they also establish general criteria which are useful to professionals in that they allow a more profound understanding of accounting legislation, which facilitates the analysis of complex cases and lays the foundations of a professional opinion about accounting practices.

The second step: in the field of election of an accounting method over another creative accounting could be reduced by reducing the allowed accounting criteria or clearly specifying the circumstance in which a method should be applied. It can also help to require uniformity in the use of accounting methods. Today, in Romania the accounting criteria can be changed if it is explained in the Annual accounts' report and the impact of this change is quantified in the result of the company. If the change of criteria is forbidden, when a company chooses criteria, because with it achieves the image that is needed for that financial year, the same criteria will have to be used in future circumstances.

The third step: limitation of financial managers potential abuse using their own opinion could be moderated by using two methods. The first method consists in designing accounting norms which minimize the use of subjective opinions. For example, accountants in the United Kingdom tended to use the extraordinary section in the profit and loss account to include accounts avoiding its

inclusion in the ordinary profit. The Accounting Standards Board (ASB) in the United Kingdom responded by abolishing the category of extraordinary accounts.

The second method is that auditors must intensify their role in the identification of bad estimations. When completing auditing reports, these professionals must evaluate if there have been accounting manipulations of the annual accounts. In this area, it is worth mentioning the existing debate around the responsibilities assigned to the auditing function. Audit expectations gap, is the concept used to describe the difference between what is expected from auditors and what is actually established in current legislation. We sustain the opinion that the auditing function should include the evaluation of internal control systems of the company to identify in a preventive manner the cases of creative accounting, or in extreme cases of fraud which can be extremely dangerous for company, for their financial statements users and for the society.

Many managers argue the artificial transactions by invoking the concept of "substance over form", by which is the economic substance and not the legal form of the transaction what determines the accounting substance.

As we have seen in accounting literature creative accounting is perceived as a characteristic of the Anglo-Saxon approach to accounting, very flexible and with scope for different opinions, much more than the continental European model, which traditionally is more rigid and with detailed accounting norms. In any case both approaches have potential for the reduction of the possibilities to control creative accounting. The continental European model facilitates the reduction of the possibilities to abuse the election of an accounting policy and the manipulation of accounting estimates. The Anglo-Saxon model drives towards the use of 'substance over form' and revaluations.

By applying IFRS and EU Directives the Romanian accounting is in the last years much more closer to Anglo-Saxon approach and the risks of bad presentation of financial information by financial statements is higher and the difference between financial accounting and tax accounting become to be deep.

For this reasons Romanian accountants have to accustom with ethical behavior and CECCAR (The Body of Expert and Licensed Accountants of Romania) make big efforts to develop this concept in our profession. On the other hands the Romanian regulator have to anticipate and action to reduce the techniques of creative accounting. In the last years with the assistance of professional auditors Romanian accounting tend to became more correct and true fair-view oriented. Without this features Romania will lose at the level of credibility with direct effects on foreign invests or country image.

This article covers the budget's functions, providing a double reading, both theoretical and practical, as it intends to perform a theoretical synthesis of the ways in which the budget is used and implemented in the case of a public cultural institution. The article is intended to answer the following research question: which are the ways of using the existing budget that may exist within a public cultural institution? The source of this research is the authors' interest for the control of the organizations in the cultural field, which has led to the formulation of the following practical questions: which are the proper instruments for the control of such organizations? And mostly, which are and which could be the budget's functions – a central controlling instrument?

We have focused our attention on a case of exhibition organizing public institution, the type of organization which crystallizes in an exemplarily manner the particularities of cultural organizations as well as any control decelerators which may occur.

At a first stage of our research, we have made two interviews with the Museum's financial manager in charge of the exhibition organization. The first interview was based on a grid regarding the administration system in general and the administration instruments privileged within the organization. In the light of this interview and of the research literature for the control of this type of organization, we have focused our attention on the issue of the budgets' role. The second interview focused mainly on budgets. At a second stage of our research, the analysis of internal documents allowed us to identify better the elaboration of a cultural organization's budgets and to discover the similarities and singularities as compared to the budgets of the companies outside the cultural sector.

In a paradoxical manner, the article ends with the advantage of using an instrument based on a „rigid” framework and coded within the cultural organizations analyzed, while having a creative and progressive trend.

Key words: *budget, control, cultural institution, administration instruments, budget's functions*

Jel codes: *M41*

Introduction

This article covers the budget's functions, providing a double reading, both theoretical and practical, as it intends to perform a theoretical synthesis of the ways the budget is used and implemented in the case of an exhibition organizing public institution, provided that such institutions have particular specific budget functions. Likewise, the theoretical framework for the analysis of previously raised issues seems to be that of controlling the cultural organizations, stressing their strong institutional dimension, certain particularities which have a translation in terms of control.

Similarly, we have expected the budget's administrative and legal dimension to occur expressively in the field study. We have focused our attention on a case of exhibition organizing public institution, the type of organization which crystallizes in an exemplarily manner the

particularities of cultural organizations as well as any control decelerators which may occur. During our study, we have paradoxically found that the budget's administrative and legal dimension was much behind, as compared to other functions of the budget, which were close to those applicable in private companies. This finding lead to a rethinking of the theoretical framework, able to act as support of this study: consequently, the budget's functions are indicated without being expressly limited to a type of organization. Moreover, should the administrative budget issue be evoked, it shall be based mainly on the synthesis of the budget's theoretical functions in private companies.

Consequently, the theoretical framework of research, described in the first part of the article, provides a synthesis of the ways to use the budgetary instrument.

This theoretical framework is used, in the second part of the article, as support for the study of an exhibition organizing public institution, which allows the blending of theory and practice.

The functions of the theoretical budget adapted to the public cultural organizations?

The theoretical framework acting as support of the field study is based on a synthesis of the functions which the budget may fulfill within an organization. The problem of their adaptation to public cultural organizations is raised.

According to its initial resource monitoring and controlling function, the administration control deals with efficiency and efficacy issues, both for the means used as well as for the results obtained. (Anthony 1965: 79). For this purpose, as it is based on a resource allocating mechanism, assumed as related to the institution's strategy, and, as it allows to reach the objectives, the budget may seem like one of the central control instruments. The administration control related specialized literature refers to a very large scale of the budget's use. Actually, beyond the resource provision and allocation function which constitutes the basis of the budgetary approach, the budget fulfills various functions, related to specific contexts and institutional mechanisms. The specialized literature identifies four large types of use of the budget, existing in public or private organizations. These are provided in table 1 below and shall act as analysis framework for the development of our research which consists in the budget's ways of use in public cultural institutions, in general, and in exhibition organizing organizations, in particular.

Table no. 1: Various functions of the budgetary system

Allocation functions - resource allocation, achievement control and provision function	Administrative functions - the function of resource allocation and distribution in budgetary lines
Cohesive and social functions - coordination, communication and motivation function - interactive and learning function	Political functions - the internal or external function of action motivation and negotiation support

Some of the budget's ways of use may provide a rather "technical" or "mechanical" reading corresponding to the allocation and administrative functions. Others may have a more "behavioral" nature corresponding to social and cohesive functions, on the one hand, and to political functions, on the other hand.

Allocation and administrative functions

Allocation functions and administrative functions are considered successively. The allocation functions have been mostly studied in the context of private companies. Therefore, the budget has been long time described within these organizations as a resource allocation, provision and

diagnosis mechanism (Bouquin 2001; Gervais 1997 ; Hofstede 1977 ; Simons 1990, 1995). Simons (1995:59) describes budgetary systems as being the “formal informing systems which the managers use to monitor organizational results and to correct the differences from the provided performance standards”. It consists in continuing to have a strictly technical use of budgets, by comparing the data provided to the achievements.

Likewise, another function assigned to the budget, except that this time it pertains to the public sector, is the budget’s administrative and legal function. It has constituted the main object of the studies performed in museums. Chatelain (1998) mostly analyzes the possibility of eliminating the budget’s too administrative and legal character generated by the state’s attributive sequence, in order to use the budget as a real administration instrument. He also observes that artistic and cultural organizations tend to overcome the structure’s rigidity, by proposing budgets per functions and services. Besides these functions pertaining to the technical field, the budget has more behavioral dimensions.

Cohesive, social and political functions

One may distinguish cohesive and social functions, on the one hand, and political functions, on the other hand. Numerous researches in the field of administration control, in general, and of budgets, in particular, have considered the cohesive and social aspect of the budgetary systems. More precisely, these studies have focused on the budget proposed as a motivation and participation instrument (Hofstede 1977), a communication and coordination instrument (Bollecker 2002), a cohesion and social practice instrument (Busco, Riccaboni & Scapens 2006 ; Villesèque-Dubus 2007), or a learning or interactive practice instrument (Abernethy & Brownell 1999, Hugues & Nahapiet 1980; Simons 1995).

At the end of these theoretical functions of the budget, an issue is raised regarding the adaptation of some of these functions mentioned in the researches made in the private sector companies, in the case of public cultural organizations. Some of the particularities of these organizations, irrespective of their legal statute, may constitute control theoretical obstacles and may be less compatible to extended uses of the budget as an administration instrument.

An adaptation in the case of public cultural organizations

The study of the budgetary functions within public cultural institutions should first be seen in the general context of the cultural organizations’ control. Due to their cultural purpose, these organizations may actually have some inherent difficulties regarding the management within the public and non-profit sector, in general, and its control, in particular. We shall now see that, among cultural organizations, the exhibition organizing organizations seem to be favorable to a control study, especially regarding the budgets’ issue.

Control and cultural organizations

The existence of cultural objectives makes it possible that the mission of a cultural organization is never restricted to generate a profit. The situation of cultural organizations has common points with that of the assembly of organizations in the public and non-profit sector, which has consequences from the point of view of control. Here are several examples as illustration. Therefore, the definition and measuring of performance (Demeestère, 2002, Drucker, 1990) are problematic within these organizations. Another example is that of cost calculation which is problematic in the public field, especially due to the difficult valorization of resource consumption and to the multitude of potential interpretations of the production notion (Burlaud & Simon, 2000). Likewise, it is equally difficult to define and measure the production of non-profit organizations (Le Duff & Papillon, 1997). Yet, there are various researches which imply that, despite their cultural specificity, they are “administered” and, most of all, controllable (Agid &

Tarondeau, 2006; Amans, 2003 ; Bonnafous-Boucher, Chatelain-Ponroy, Evrard & Mazallon, 2003 ; Chatelain, 1996; Evrard & Chiapello, 2004 ; Gombault, 2000, 2003; Tobelem, 2005).

Budget and exhibition organization

Due to their own creation activity, which is not equally advanced in all the cultural organizations, they are directly confronted to the potential contradiction between control and art. And there is also the possibility of observing an interesting tension between their creative dimension and the rigid and coded framework of budgets. In this respect, we have stated in the introduction that the exhibition organizing public institutions crystallize in an exemplarily manner the cultural organizations as well as any control decelerators which may occur. Therefore this type of institution seems quite adapted to a control study, especially on the budgets' issue. Consequently, the following statements identify some of the issues raised by the control of these institutions which involves a strong component: "artistic creation". An important issue in the field of control is that of provision: how to provide the resources required for the production whose result is not always known and on which basis is it possible to create a norm, knowing that the creation idea is based on the hypothesis that the norm is not preset (Chiapello 1997)? To what extent could there be a voluntary increase of tasks in order to obtain more subventions?

Another point refers to Baumol's law (Baumol & Bowen 1966) and the explanation proposed for the rise of production costs in public cultural organizations. This law, although contestable from several points of view, is used by interested organizations to justify the rise of the budgets required (Farchy & Sagot-Duvaurox 1994).

All these questions and issues lead us to the exploration of the control system of an exhibition organizing institution, and especially to the focusing on the budget's way of use.

The functions declared in a museum

An experimental study has been performed in a public institution, a museum, subordinated to the Ministry of Culture. The purpose of this study was to observe the control system of this institution and, more precisely, to check on the way of using a control system.

The study of the "Museum" organization

First of all we shall brief both the company's characteristics, hereinafter referred to as the "Museum", and the research protocol. Further on, we shall introduce and analyze the control system, by means of the projects implemented in this organization.

Case overview, characteristics and experimental approach

The organization studied is a public institution, a museum, subordinated to the Ministry of Culture. Its purpose is to develop cultural democracy, contributing thus to the access of all types of exhibitions and cultural events. Our study focuses on the main activity of this organization, which is the appraisal of the exhibitions. Exhibitions generally make the object of a single display. At a first stage of our research, we have made two interviews with the Museum's financial manager in charge of the exhibition organization.

The first interview was based on a grid regarding the administration system in general and the administration instruments privileged within the organization. In the light of this interview and of the research literature for the control of this type of organization, we have focused our attention on the issue of the budgets' role. The second interview focused mainly on budgets.

At a second stage of our research, the analysis of internal documents allowed us to identify better the elaboration of a cultural organization's budgets and to discover the similarities and singularities as compared to the budgets of the companies outside the cultural sector.

Among these documents there are the budgets of “exhibition expenses”. The budgets of “exhibition expenses” summarize, for each exhibition, the rental costs for location and equipment, the technical personnel, the exhibition’s insurance, promotion and marketing. Firstly, these documents have been analyzed from the point of view of their conception and then, for their use. They have equally served as support for a third interview with the institution’s manager, which has allowed the development of various aspects. Finally, the third stage, based on the analysis of documents and interviews, has consisted in the interpretation of our initial question which has been, from an experimental perspective, the description of the budgets’ functions and mechanisms in cultural organizations.

A project controlled and indicator based organization

The administration of the analyzed company, through its public character, is very much based on the implementation of the so called primitive budgets. These budgets are generally established in the beginning of a calendar year and approved by the main credit release authority. They may be adjusted during the period provided that there are changes at the same period. The exhibition budget is established by the person responsible with its elaboration within the institution, responsible both for the programming administration as well as for the administration control, with the participation of the entire personnel. Its elaboration starts with the establishment of the budgets individually prepared for each type of exhibition and continues with the aggregation of all the established budgets.

This control way per product or service could be assimilated to an administration control per project, where each exhibition relates to a different project. In this respect, it relates to the control methods which are more transversal and functionalist and it exceeds the fundamentals of the administrative budget.

Due to its public institution statute, to its functioning method through voted budgets and to the allocation of public resources, the Museum seems more of a mechanistic nature, rather than organic or adhocratic, according to Burns and Stalker (1961) or Mintzberg (1982). Nevertheless, the latter have stressed the interest of using organic or adhocratic structures within the contexts dominated by the strong need of creativity. In this respect, Chiapello (1997) states that they may correspond to cultural organizations.

Moreover, although using a rather formalized system, the company is based on a scoreboard which only includes a few indicators. Among these indicators, there is the cashing from tickets’ sale (at sale points) and especially from the hall occupation, the main indicator.

The budget, an instrument of exhibition organization

In culture, and especially in the public sector, the budget has a special role. Indeed, the study performed in the “Museum” institution proves that the budget fulfills all the previously underlined functions (table 1), but with different degrees of importance. For example, surprisingly, the budget’s administrative role reappears in this organization when traditional relative functions of the provision and diagnosis are highlighted. In addition, the budget’s social and cohesive dimensions seem to be present as much as the political dimension which is very important in this organization.

Allocation and administrative functions

While we can expect a very administrative and legal use of the budgetary instrument in the analyzed organization, this research results in a clear exceeding of the budget’s administrative version (and of the primitive budgets’ overview), as compared with the diversified ways of using the budget. In the so called classical ways of implementing the budgetary systems, it is normal to consider three main stages: the completion, the guiding and the post-assessment (Bouquin, 2001).

In the analyzed organization, the completion is essential and exerts a double role. It also has a strategic role to the extent to which it is the departure point of the annual programming, therefore of the products. Thus, on the occasion of this completion stage of the budget, the company's programming strategy is veritably defined: the selection of exhibitions, the selection of the hall display. Afterwards, this completion stage allows the establishment of the estimations which serve as basis for the finance request and which shall allow the achievement of the respective products. In this way, it exceeds the resource allocation mechanisms as it is an occasion of thinking the strategy and debating its subject. The estimations are established and voted in two stages: the vote of the primitive budget first goes through a budgetary orientation debate regarding the strategy and secondly, the budget is validated by the main credit release authority. The guiding stage is daily administered by the financial manager of the exhibition who makes sure that there is no exceeding of the chapters.

The post-assessment stage, i.e. the diagnosis stage, is mainly subjected to a double control, that of the administration board and that of the credit release authority which is the main subsidizer of the organism. A third control is added, which is performed upstream by the financial manager of the exhibition.

The modifications occurred at the time which affect the budget are therefore voted again, thus generating a budgetary review. In this respect, the budget exceeds its administrative character in order to become an administration instrument (Chatelain, 1998b).

Cohesive, social and political functions

In the investigated case, the budget equally fulfills a learning and organizational integration function. Yet, they seem to remain on a secondary plan regarding a function which has a function with a more political character highlighted in the interviews performed. First of all, regarding the specific learning aspects or the budget's integrative aspect, the latter's conception involves the sharing of the estimations based on discussion and consultation. In this case, learning occurs by implementing corrective actions from one period to another, but differentiated by the possibility of disposing of the supplementary budget. It is based more on the effects of the experience and socializing, generating the control informal systems. (Bollecker 2002). Moreover, the interactions observed are beyond the organization's framework for financial partners. Actually, the budget provides support for communication regarding public subsidizers: all the subventions are budgeted and the budget is submitted to the subsidizing organisms. Consequently, the budget helps to communicate and prove the necessity of programming related financing. The budget therefore exceeds its "technical" framework in order to legitimate the action taken and to fulfill more political functions (Covaleski & Dirsmith 1986). Eventually, the interaction between the budget and the environment appears as one of the main functions of the instrument, which may be explained through the institutional framework: the budget's dimensions regarding the external image presented, the budgetary information serving essentially as an external political plea (Covaleski & Dirsmith 1983).

Conclusions

This organization includes the budget's functions mentioned in the specialized literature. Nevertheless, some of these functions seem to be more developed than others. Therefore, if the budget's administrative and legal function seems to be withdrawn, the resource allocation, the achievement provision and control functions are explicitly presented. This last function makes sure that there is no "sideslip" and that the budget is complied with. One of the main limits of the instrument within the estimation's dimension relates to the difficulty of providing accurate estimations in the area of artistic creation. In addition, monitoring allows the limitation of budgetary exceeding, but it does not authorize multiple or frequent revisions, to the extent to

which the state makes fixed commitments. In this respect, the budget as an allocation, estimation and achievement control instrument may include a part which lacks flexibility, even if the possibility of making a revision is considered. Similarly, if the cohesive and social functions are not fully exerted, political functions are yet important: in front of external partners, the budget appears as a legitimating and negotiating instrument. Finally, the budget's rigid character is exceeded by the organization: it allows a better negotiation and, paradoxically, the earning of a financial margin. This research has allowed the highlighting of the budget related functions in the exhibition organizing institutions and, for this purpose, it has contributed to the enrichment of the theoretical framework of the control of cultural institutions and of the budget. The generalization of the results of this study would be premature as they are generated by a unique study, intended to focus, through the interview, on the financial manager of the exhibition. The budgets' replacement would be necessary in the control system of these organizations, raising thus the issue of their place as compared to the other control instruments, such as the scoreboard. Eventually, besides the issue of the creative activities' control, it would be interesting to add a question regarding the generalization of the studies' results in the framework of the organizations situated beyond the artistic and cultural sector.

The present paper starts out from the challenge regarding auditor tenure launched in 2010 by the Green Paper of the European Commission “Audit Policy: Lessons from the Crisis”. According to this document, the European Commission speaks both in favor of the mandatory rotation of the audit firm, and in favor of the mandatory rotation of audit partners. Rotation is considered a solution to mitigate threats to independence generated by familiarity, intimidation and self-interest in the context of a long-term audit-client relationship. At international level, there are several studies on auditor rotation, both empirical (e.g. Lu and Sivaramakrishnan, 2009, Li, 2010, Kaplan and Mauldin, 2008, Jackson et al., 2008) and normative in nature (e.g. Marten et al., 2007, Müller, 2006 and Gelter, 2004). The objective of the present paper is to perform a critical and comparative analysis of the regulations on internal and external rotation in force at international level, in the European Union and in the United States of America. Moreover, arguments both in favor and against mandatory rotation are brought into discussion. With regard to the research design, the paper has a normative approach. The main findings are first of all that by comparison, all regulatory authorities require internal rotation at least in the case of public interest entities, while the external rotation is not in the focus of the regulators. In general, the most strict and detailed requirements are those issued by the Securities and Exchange Commission from the United States of America. Second of all, in favor of mandatory rotation speaks the fact that the auditor becomes less resilient in case of divergence of opinions between him and company management, less stimulated to follow his own interest, and more scrupulous in conducting the audit. However, mandatory rotation may also have negative consequences, thus the debate on the opportunity of this regulatory measure remains open-ended.

Keywords: independence, financial audit, familiarity, rotation

JEL Classification: M40

1. Introduction

The Green Paper of the European Commission issued on the 13th of October 2010 “Audit Policy: Lessons from the Crisis” launches a number of 38 questions, among which one regarding the long-term audit-client relationship: „From the viewpoint of enhancing the structure of audit markets, do you agree to mandatory rotation and tendering after a fixed period? What should be the length of such a period?” The European Commission speaks both in favor of mandatory firm rotation, and in favor of the mandatory rotation of audit partners, for the benefit of objectivity and dynamism on the audit market. Starting from this issue re-launched by the European Commission, authors considered appropriate the critical and comparative analysis of the normative framework on auditor rotation at European, international and North-American level. The paper is structured as follows: first of all, the most relevant previous studies on auditor rotation are analyzed; second of all, the research design is explained; third of all, the relevant regulations to be found at European, international, and North-American level are presented, while in the last section of the paper, authors analyze critically and by comparison the identified regulations and present arguments against and in favor of mandatory auditor rotation.

2. Literature review

Numerous studies on auditor rotation have been recently carried out. For instance, Lu and Sivaramakrishnan (2009) investigate the effects of mandatory audit firm rotation on companies' investment decision and auditor choice in a capital market setting. Li (2010) tests the association between auditor tenure and conservatism and concludes that tenure imposes threat to auditor independence especially in smaller firms or firms weakly monitored by their auditors. Kaplan and Mauldin (2008) examine by experiments the impact of audit firm versus partner rotation on non-professional investors' independence-related perceptions. Their main conclusion is that by comparison with audit partner rotation, audit firm rotation does not strengthen independence in appearance among non-professional investors. Another study recently performed in Australia by Jackson et al. (2008) reaches the same conclusion, namely that mandatory firm rotation is not to be desired, because it does not enhance independence and audit quality. These studies are empirical in nature, but other researchers chose a normative approach, such as Marten et al. (2007), Müller (2006) and Gelter (2004), who investigate auditor independence regulated at international, European and North-American level, inclusively aspects regarding the auditor rotation.

3. Research design

The present paper has a normative research approach. The normative endeavor requires the analysis, explanation, and improvement of existing norms, as well as the development of new norms (Ionaşcu, I., 2007). The contribution to knowledge brought by this type of endeavor is validated by the acceptance of the interested parties (in case of auditing, the Chamber of Financial Auditors of Romania, audit companies, other accounting professionals, public interest entities, national and private companies, academic environment etc.). In the spirit of the normative approach, authors perform a comparative analysis of the regulation existing at European, international and US level with regard to auditor rotation. The relevant regulations are identified and their divergent and common points are analyzed. Moreover, the initiative of the regulator to introduce rotation is justified from the perspective of the role rotation plays in safeguarding auditor independence.

4. Normative framework regarding the internal and external auditor rotation

4.1. EU Regulations

Article 42 (2) of the Directive 43/2006 require the Member States to ensure that the statutory auditor or the key audit partner(s) responsible for carrying out a statutory audit rotate(s) from the audit engagement within a maximum period of seven years from the date of appointment. Their participating again in the audit of the entity is allowed after a period of at least two years. In the particular case of the auditors of public interest entities, the Directive requires internal mandatory rotation, namely the rotation of the key partner(s) that audit(s) such entities. Member States shall allow the audit firm to continue to be the statutory auditor of that entity, on the condition they impose the change of the key audit partner(s) who is/are associated with that firm.

Initially, the proposal for amending the Directives 78/660/CEE and 83/349/CEE published in 2004 set a rotation interval of maximum five years for the key audit partner responsible for carrying out the statutory audit. Moreover, it was proposed that the statutory auditor or the key audit partner responsible for carrying out the statutory audit on behalf of the audit firm is bound from taking up a key management position in the audited entity before a period of at least two years has elapsed since he resigned from the audit engagement.

The Recommendation of the Commission from May 2002 specifies internal rotation as safeguard to reduce independence risk if the collaboration of the key personnel with the client company is

long enough to create familiarity or trust. It is even stated that in order to mitigate familiarity or trust threats to independence, the rotation of the engagement partner or other key audit partners of the engagement team within a reasonable period of time cannot be replaced by other safeguards. However, the European Commission admits that in certain situations, the internal rotation of the engagement partner and of other key partners is not possible, due to the size of the audit firm. This is the case of a sole practitioner's practice or of an audit office where the daily relationship between a limited number of Audit Partners is too close. In such situations, other safeguards are to be implemented within a reasonable period of time. If no appropriate safeguards can be identified, the statutory auditor should consider whether he/she should continue the audit engagement.

At the level of the European Union, the mandatory internal rotation alone is stipulated as safeguard to ensure independence. However, the Directive 43/2006 mentions in case of auditing public interest entities the possibility that a Member State requires the change of the audit firm also, if that state considers it appropriate for achieving the set objectives. Therefore, if the client company is a public interest entity, the solution of the external rotation is alternatively regulated. Recently, the Green Paper of the European Commission issued on the 13th of October 2010 "Audit Policy: Lessons from the Crisis" states that the periodical rotation of key audit partners in accordance with the 8th Directive does not suffice for completely eliminating familiarity threats. This is the reason why the European Commission suggests to consider the mandatory rotation of audit firms and not only the rotation of the audit partners. In order for this measure to really be efficient, it is considered necessary that regulations on rotation, if adopted, to clearly stipulate the compulsoriness of rotating both firms and partners. Such regulations would thus prevent partners changing audit firms only to "take along" certain clients.

4.2. International Regulations

The IFAC Code of Ethics (IFAC – International Federation of Accountants) does not comprise regulations regarding the external rotation of the audit firm, but mentions only the internal rotation as safeguard in relation to the threats posed to independence by self-interest and familiarity. In the general case, the rotation of the senior personnel of the engagement team is a possible solution to reduce the risk of such threats (paragraph. 290.150, 2010). In the particular case of public interest entities, the key audit partner should be replaced after seven years the latest. Only after a period of two years, in which the individual shall not be a member of the engagement team or be a key audit partner, that person can be again involved in the audit process of that entity (paragraph. 290.151, 2010).

The IFAC Code of Ethics also mentions situations that do not allow following these periods. For instance, it is permitted for key audit partners to continue to be part of the engagement team, if their involvement is particularly important to audit quality and if unforeseen circumstances outside the firm's control take place, which prevent internal rotation. In such a situation, it is necessary that the threat to independence is or reduced to an acceptable level by applying appropriate safeguards (paragraph 290.152, 2010).

Another situation regulated by the IFAC Code of Ethics in paragraph 290.154 is when an audit client becomes a public interest entity at a certain point during the collaboration with the auditor. In this circumstance, when determining the timing of the rotation, one should consider the length of time the key audit partner has been involved in auditing that entity. If when the client becomes a public interest entity, that individual was a key audit partner for five years or less, he may continue to serve the client in that capacity for seven years less the period of time already served. If that person served as key audit partner for six or more years, he/she may serve as audit partner for a maximum of two additional years before being replaced.

It may also happen that internal rotation of key audit partners is not an achievable independence safeguard due to the limited number of persons within the audit firm who have the necessary knowledge and experience to serve as a key audit partner. In such a case, paragraph 290.155 of the IFAC Code of Ethics stipulates that if an independent regulator in the relevant jurisdiction has provided an exemption from partner rotation in such circumstances, it is allowed that an individual remains a key audit partner for more than seven years, provided that the independent regulator has specified alternative safeguards (such as an independent external review).

4.3. US Regulations

In the United States of America, mandatory external rotation was in the focus of US regulatory authorities, as shown by the study of the General Accounting Office carried out in 2003 and required by Section 207 of the Sarbanes-Oxley Act (SOA) for analyzing the costs and benefits of such a legislative measure. However, there are detailed regulations only with regard to internal auditor rotation.

The Code of Professional Conduct of the American Institute of Certified Public Accountants (AICPA) mentions in paragraph ET §100-1.26 (r) as example of safeguards implemented by the firm the rotation of senior personnel who are part of the attest engagement team. Section 203 SOA, subsection (j) is more specific, since it regulates the mandatory internal rotation after five years. A firm is not allowed to provide audit services to an issuer if the lead (or coordinating) audit partner (having primary responsibility for the audit), or the audit partner responsible for reviewing the audit, has performed audit services for that entity in each of the 5 previous fiscal years of that entity.

The regulations of the Securities and Exchange Commission (SEC) on partner rotation (namely CFR § 210.2-01 section (6)) are quite detailed. Any audit partner who performs the services of a lead partner or concurring partner for more than five consecutive years is not considered to be independent. A period of maximum seven consecutive years is foreseen by SEC for (1) providing more than ten hours of audit, review, or attest services in connection with the annual or interim consolidated financial statements of the issuer; (2) serving as the lead partner or concurring partner in connection with any audit or review related to the annual or interim financial statements of a subsidiary of the issuer whose assets or revenues constitute 20% or more of the assets or revenues of the issuer's respective consolidated assets or revenues. CFR § 210.2-01 also establishes a cooling-off period of five consecutive years, over which that partner is not allowed to serve as lead partner or concurring partner or a combination of these. For the other services which can be carried out for a maximum period of seven consecutive years, the cooling-off period is of only two years.

An exemption from these rules regarding internal rotation is stipulated for audit firms with less than five clients that are issuers and less than ten partners, on the condition that PCAOB (Public Company Accounting Oversight Board) conducts a review at least once every three years of each of the audit client engagements that would result in a lack of auditor independence because of the prolonged period of collaboration of the auditor with a certain client.

5. Critical and comparative analysis

By comparison, the regulation authorities at all levels (international, European and North-American) require the internal rotation at least in the case of public interest entities, while the external rotation is not to be found in the center of the attention of the regulators. The most strict and detailed requirements are those issued by SEC. They stipulate the rotation of the lead partner and concurring partner after a period of five consecutive years, while being prevented for other five years to serve that client. According to the regulations at European level, the partner can be responsible for the statutory audit at a certain client for at least seven years from the appointment

date, period after which their participation in auditing the entity after a time frame of two years is allowed. In this respect, the European regulations are identical with those available at international level. Another common point between the European and the international regulations is represented by the fact that both normative frameworks consider the possibility that the requirement of the internal rotation cannot be followed due to the size of the audit firm.

The purpose of the regulations on internal, namely external auditor rotation reside in the wish of the regulator to protect auditor independence from the familiarity threat. Familiarity and trust in the client-company are caused by a long-term relationship between the financial auditor and the audited entity. Such a relationship over several years leads to a relationship of trust between the two parties. Therefore, it is possible that because of familiarity, auditor independence is threatened, because his/her objectivity is compromised, and he/she is not able anymore to identify some relevant aspects for the audit opinion which would normally come out.

Other independence risks in this context are those generated by self-interest and intimidation. Financial auditors can be considered economic agents, whose decisions are driven by their own interests. If reporting an error is correlated with the decrease of the turnover, their availability to report that error decreases. Moreover, if an audit contract is not prolonged the auditor loses future economic advantages (quasi-rents according to DeAngelo, 1981). The client can exert pressure over the auditor by threatening he will not prolong the audit contract and thus auditor independence can be compromised. External rotation is an independence safeguard for these threats posed by self-interest and intimidation. If external rotation were mandatory, according to Marten et al. (2007), the auditor will be much less capable of facing eventual pressures from the client, and not prolonging the contract will have reduced economic consequences.

On the other hand, one can argue that a long-term relationship between the financial auditor and the audited company is beneficial, because the auditor, due to a thorough knowledge of that company and its activity, can perform a more efficient and more valuable audit. Moreover, the literature on the topic (see Müller, 2006) considers the efficiency of a first audit engagement is more reduced than the efficiency of subsequent audits. Moreover, the costs of the subsequent engagements are lower than the cost of the first engagement, because auditor's efforts of adapting and familiarizing with the processes and activities of the audited firm already have been made. Table 1 briefly presents the arguments for and against the compulsoriness of auditor rotation in accordance with the ideas of Marten et al. (2007) from the perspective of the influences it has on audit quality, understood by DeAngelo (1981) as the ability of the auditor to detect errors.

Table 2: Arguments for and against the compulsoriness of auditor rotation

Arguments for	Arguments against
A long term relationship increases the risk that the auditor anticipates the results of the previous financial statements instead of identifying new changes in the audited firm.	The experience, the knowledge and the deep understanding of the structures of the audited company are lost.
The increased trust of the financial auditor in running the company makes him/her perform fewer audit procedures or to perform them less strict.	Since the new auditor must adapt to and get familiar with the client-company, there is the risk that in the first years of the engagement, he/she ignores some errors, because he/she does not know the client well enough.
If the auditor is convinced by the management's integrity, he/she will ignore errors, will overlook them or will	In the first audit engagements, the auditor is more dependent on the information provided by the client and it

underestimate them.

In case of tenure, there is the risk that the auditor identifies with the problems of the management and does not act with professional skepticism anymore.

By changing the auditor, there is more room for innovations in selecting and applying audit methods, while trust in management limits creativity.

Audit procedures are more difficult to be foreseen by the client.

Aware by the fact that his/her activity might be checked by future auditors, the auditor will work more conscientiously.

Mandatory rotation increases competition on the audit market, because more audit engagements are available, which has a positive effect on audit quality.

is more difficult to him/her to check their correctness.

Rotation prevents the development of audit plans over several years.

Because not all areas can be intensively audited, there are some aspects which are not audited within the first engagements.

Auditors are less motivated to invest in resources specific to the client and its economic branch, because rotation reduces the economic life of such assets.

Through rotation, the auditor is less motivated to invest in economy and efficiency (for instance in persons and in technological innovations).

The competitiveness incentives are lower, especially because efficient auditors do not receive the maximum possible profit from their engagements, since rotation temporally limits the demand for their audit services.

Made by the authors, in accordance with Marten et al. (2007)

6. Conclusions

Following the research performed, we can conclude that all the regulatory authorities, both the international and the European and North-American ones presented rotation as a solution to the threats generated by a long-term relationship between the financial auditor and the client company. Essential is the distinction between the internal rotation (of the persons involved in the audit and active in the mandated audit firm) and external rotation (of the audit firm). The internal rotation is stipulated by all the regulatory frameworks presented, while the external rotation, although over the years it was of interest for the legislators, is not regulated. The strictest regulations on internal rotation are those of the North-American space, which are also the most detailed ones. The European and international regulations overlap to a great extent.

Despite of the state of facts regarding the regulations, auditor rotation is still a debated topic. The critical analysis performed in this paper presented some of the arguments in favor of this solution, but also some of its possible undesired negative effects it may have. Thus, the mandatory rotation makes the auditor less resilient in case of divergent opinions between him and company management, less stimulated to follow his own interest, and more scrupulous in performing audit works, knowing his work will be controlled by the following auditor. On the other hand, by setting mandatory rotation, the knowledge and experience gathered over numerous audit engagements can be less capitalized, while the motivation to invest in resources that are specific to the client and its industry, and the incentives for competitiveness are lower. Thus, the debate on the opportunity of the rotation remains open-ended.

EVIDENCE FROM THE GERMAN CAPITAL MARKET REGARDING THE VALUE RELEVANCE OF CONSOLIDATED VERSUS PARENT COMPANY FINANCIAL STATEMENTS

Müller Victor-Octavian

Babeş-Bolyai University, Faculty of Economics and Business Administration, Cluj-Napoca, Romania

Financial statements' main objective is to give information on the financial position, performance and changes in financial position of the reporting entity, which is useful to investors and other users in making economic decisions. In order to be useful, financial information needs to be relevant to the decision-making process of users in general, and investors in particular. Hence, the following question arises logically – which of the two sets best serves the information needs of investors (and other categories of users), respectively which of the two sets is more relevant for investors? Of course, the possibility of both sets at the same time best serving the information needs should not be ruled out. In our scientific endeavor we conducted an empirical association study on the problem of market value relevance of consolidated financial statements and of individual financial statements of the parent company, searching for an answer to the above question. In this sense, we analyze the absolute and relative market value relevance of consolidated accounting information of listed companies on the Frankfurt Stock Exchange (one of the largest three stock markets in the European Union) between 2003 and 2008. Through this empirical study we intend to contribute to the relatively limited literature on this topic with a comparative time analysis of the absolute and incremental relevance of financial information supplied by the two categories of financial statements (group and individual). The results obtained indicate a statistically significant superiority of the relevance of consolidated statements (in detriment of individual ones). However, we could not statistically prove a superior value relevance of information provided together by consolidated and parent company financial statements as opposed to consolidated information. On the one hand, these results prove the importance (usefulness) of consolidated financial statements especially for investors on the capital market, and on the other hand, they question the necessity of publishing parent company financial statements.

Keywords: Consolidated Financial Statements, Parent Company Financial Statements, German Capital Market, Market Value Relevance

JEL Classification: M40, M41

I. Introduction

Financial statements' main objective is to give information on the financial position, performance and changes in financial position of the reporting entity, which is useful to a wide range of users in making economic decisions. In order to be useful, financial information must be relevant to the decision-making process of users in general, and investors in particular, meaning that it must have the capacity to influence their economic decisions. In fact, relevance constitutes one of the main characteristics of financial information quality (Francis et al. 2004: 968). Moreover, in the exposure draft regarding the improvement of the Conceptual framework, IASB and FASB named relevance and faithful representation as the two fundamental qualitative characteristics of financial information (QC2). Therefore, in order to make assessments on the quality of information of financial statements, it is absolutely necessary to quantify this relevance (capacity to influence) of financial information.

An appropriate environment to perform such a measurement is the capital market, where investors' decisions (as users of financial information) are reflected directly in the share price of the reporting entity. In this context, market value relevance is measured by the ability of financial information to capture or summarize information that influences share prices (Francis and Schipper 1999: 325). According to the same authors market value relevance means the existence of a statistical correlation/association between financial information and prices or returns, and also the fact that this information explains market prices to an extensive measure, starting from the presumption of the efficient market in which prices reflect the available information (Francis & Schipper 1999: 326).

Financial information is supplied mainly through financial statements of entities (listed on the capital market). As most listed companies (on the large European stock markets) own one or more subsidiaries, they are obligated (by accounting legislation and stock exchange regulations) to prepare consolidated financial statements for the group they own, besides their individual financial statements. Thus, parent companies are obligated to a dual reporting materialized in two sets of financial statements – one at individual level, the other at group level. Therefore, the following question arises naturally – which of the two sets best serves the information needs of investors, respectively which of the two sets is more value relevant. Of course, the possibility of both sets at the same time best serving the information needs is not ruled out.

Considering all these aspects, we set to carry out an empirical association study on the problem of market value relevance of consolidated financial statements and of individual financial statements of the parent company, searching for an answer to the above question. In this sense, we pursued an analysis of absolute and relative market value relevance of consolidated and parent company accounting information of listed entities between 2003-2008 on the Frankfurt Stock Exchange (one of the largest stock markets in Europe).

II. Literature Review

Concerning the empirical research that has approached this matter, there are only a few studies which could be identified in the international literature. In general, they bring evidence in favor of the superior relevance of consolidated financial statements (Harris et al. 1994, Niskanen et al. 1998, Abad et al. 2000) respectively evidence for the lack of relevance increment of individual financial statements of the parent company (Niskanen et al. 1998, Goncharov et al. 2009).

In their study, Harris et al. (1994) compare the value relevance of accounting measures for U.S. and German firms matched on industry and firm size. One of their conclusions based on their empirical findings states that the explanatory power of accounting data is increasing in the level of consolidation and that unconsolidated data perform poorly relative to the consolidated data. Niskanen et al. (1998) examine the information content of consolidated versus parent-only earnings, using accounting and market data from Finnish firms. Their results show that consolidated earnings are a significant incremental explanatory variable for stock returns, while parent-only earnings are not, thus indicating that consolidation improves the information content of earnings, and that the requirement to disclose parent-only earnings should be based on arguments other than their value-relevance to shareholders.

Abad et al. (2000) investigate the value relevance of consolidated versus parent company accounting information on a sample of Spanish firms listed on the Madrid Stock Exchange. The authors use the Edwards-Bell-Ohlson valuation framework to generate the results. The empirical findings show that, from this valuation perspective, consolidated information dominated parent company (non-consolidated) information. Finally, Goncharov et al. (2009) examine the possibly different economic functions of company and group accounts using a large number of accounting and market-based metrics from a sample of German companies. Their analysis indicates higher

value relevance, predictive ability, and timeliness of group accounts as compared to company accounts. Furthermore, they could not identify an incremental usefulness of single accounts.

III. Research Methodology

In this empirical research we followed the analysis of market value relevance of consolidated and unconsolidated accounting information on companies on the Frankfurt Stock Exchange for the period 2003-2008. The main criterion for the selection of companies is the belonging to the extended version of the main index (DAX 30), which is the HDAX 110. This index includes companies from the DAX, MDAX and TecDAX. We excluded financial and insurance companies from the sample because their structure and accounting practices differ significantly from those of non-financial companies (Hellström, 2006: 335). As well, to eliminate composition differences of the sample from one year to the other (which would affect comparability of results in time), we excluded companies that have not been listed on the stock exchange for the whole analyzed period. At the same time, to increase the homogeneity of the sample and to use the same time span (31.03 – 30.04) to determine average share price, companies with closing dates different from 31.12 were excluded. Therefore, after going through these steps, the final sample is made up of 35 companies, respectively 210 firm-year observations.

Consolidated and individual financial information (group equity, parent company equity, group earnings, parent company earnings, number of shares) was collected manually from the annual reports for the 210 year-observations of the complete sample, after being previously downloaded from the official web-sites of the respective companies. Share prices for the sampled observations were also collected manually from the finance.yahoo.com database. For the development of the study, we computed average closing share prices for 31.03 – 30.04 of each year, thus neutralizing possible daily fluctuations of the prices, caused by factors that are not linked to the financial information published in the annual reports.

For the purpose of this study, we formulated the following two hypotheses concerning the relevance of consolidated and parent company financial statements:

Hypothesis 1: Information supplied by consolidated financial statements are more value relevant than information supplied by individual financial statements of the parent company.

Hypothesis 2: Information supplied together by consolidated financial statements and parent company statements are more value relevant as opposite to information supplied only by consolidated financial statements.

In order to empirically test the research hypotheses on the market value relevance of information supplied by consolidated and parent company financial statements, we developed four econometric valuation models which measure the degree of association between share price and accounting information supplied by financial statements (equity and net income). The basis for this models is the Ohlson (1995) valuation model, which expresses share price as a function of current accounting value of equity plus discounted value of future (abnormal) results. To compare relevance in absolute values of information supplied by consolidated financial statements, respectively by parent company financial statements, the following empirical models were elaborated:

$$\text{Model 1: } Pit = a0 + a1 * pBVit + a2 * pEit + \varepsilon it \quad (1)$$

$$\text{Model 2: } Pit = a0 + a1 * cBVit + a2 * cEit + \varepsilon it \quad (2)$$

Where

Pit	=	share price of company i in year t
pBVit	=	book value of parent company equity/share of company i in year t
pEit	=	parent company net income/share of company i in year t
cBVit	=	book value of group equity/share of company i in year t

$$cE_{it} = \text{group earnings/share of company } i \text{ in year } t$$

In order to make inferences regarding incremental utility of information supplied by consolidated financial statements we developed a model to include both categories of information:

$$\text{Model 3: } Pit = a_0 + a_1 * pBV_{it} + a_2 * \Delta cBV_{it} + a_3 * pE_{it} + a_4 * \Delta cE_{it} + \varepsilon_{it} \quad (3)$$

Where

ΔcBV_{it} = difference between group equity and parent company equity/share of company *i* in year *t*

ΔcE_{it} = difference between group earnings and parent company earnings/share of company *i* in year *t*

A fourth empirical model was developed to verify the second hypothesis, regarding the market value relevance superiority of information supplied (together) by consolidated and parent company financial statements as opposed to consolidated information. This is based on model 2 and also includes information supplied by parent company financial statements:

$$\text{Model 4: } Pit = a_0 + a_1 * cBV_{it} + a_2 * \Delta pBV_{it} + a_3 * cE_{it} + a_4 * \Delta pE_{it} + \varepsilon_{it} \quad (4)$$

Where

ΔpBV_{it} = difference between parent company equity and group equity/share of company *i* in year *t*

ΔpE_{it} = difference between parent company earnings and group earnings/share of company *i* in year *t*

We statistically measured the explanation power of these models quantified by adjusted R². As a general rule, the greater the explanation power, the higher the value relevance for the accounting information associated to the particular empirical model.

IV. Results

In order to test the hypothesis regarding the superior value relevance of consolidated financial statements (as opposed to parent company financial statements), we firstly compared the absolute value relevance of information supplied by the two types of financial statements, based on two regression models (Table no. 1 and Table no. 2). By comparing the explanatory power (Adj. R²) of the two models for the whole analyzed period (2004-2008), the superiority of the value relevance of information provided by consolidated financial statements clearly stands out. Concerning the coefficients of the two regressions, they are significant (and positive) at 0,001 level. At the same time, the estimated coefficients have values of variance inflation factor (VIF) under 5, indicating the fact that there are no worrying aspect regarding the effects of multicollinearity between explanatory variables of the model.

Table no. 1: Empirical results for model 1

Sample		Characteristics			MODEL 1	
		α_0	pBV	pE	F	Adj. R ²
Frankfurt n= 192	Alfa	22.105	0.772	3.784	26.758	22.50%
	t	6.561****	3.841****	4.554****		
	VIF	-	1.13	1.13

Table no. 2: Empirical results for model 2

Sample		Characteristics MODEL 2				
		$\alpha 0$	pBV	pE	F	Adj. R ²
Frankfurt n= 192	Alfa	18.682	0.34	4.282	93.017	50.30%
	t	8.262****	3.252****	7.459****		
	VIF	-	1.873	1.873		

Made by the author

In the second stage we considered testing the relevance difference between group financial statements and parent company financial statements (that is incremental Δ Adj. R²) to see if it is statistically significant. Therefore, based on models 1 and 3 (Table no. 3) we checked the level of statistical significance of changing the explanatory power of model 1 after introducing supplementary variables corresponding to consolidated information from model 3, and concluded that the relevance surplus is statistically significant at 0,001 level (Table no. 4). Consequently, the first hypothesis regarding the superiority in terms of relevance of consolidated financial statements is statistically confirmed.

Table no. 3: Empirical results for model 3

Sample		Characteristics MODEL 3						
		$\alpha 0$	pBV	Δ cBV	pE	Δ cE	F	Adj R ²
Frankfurt n= 192	Alfa	17.465	0.355	0.408	5.012	3.523	46.899	50.90%
	t	6.418****	2.137**	3.335****	6.485****	6.491****

Table no. 4: Comparison between explanatory power of model 1 and model 3

Adj. R ²	Model 1 PFS	22.50%
Adj. R ²	Model 3 CFS*	50.90%
Δ Adj. R ²	(M3-M1)	28.40%
Sig.		0.000

Made by the author

To continue, we tested regression model 4, developed to verify the hypothesis regarding the superiority for the capital market of information provided (together) by consolidated financial statements and parent company statements as opposed to consolidated information (Table no.5).

Table no. 5: Empirical results for model 4

Sample		Characteristics MODEL 4						
		$\alpha 0$	cBV	Δ pBV	cE	Δ pE	F	Adj. R ²
Frankfurt n= 192	Alfa	17.099	0.356	0.76	5.347	1.287	48.063	50.80%
	t	6.411****	2.207**	0.382	6.844****	1.931*		
	VIF	-	4.504	3.97	3.508	2.342		

This is based on model 2 (consolidated information) and also includes information offered by parent company financial statements. The comparison between the explanatory power of the two models (Table no. 6) reveals a superiority of model 4 (based on dual information) of 0,5% for the whole sample. However, this difference is not statistically significant at least at 0,1 level. This result does not allow, in our opinion, a confirmation of the second hypothesis regarding the superior relevance of dual reporting as opposed to consolidated financial reporting.

Table no. 6: Comparison between explanatory power of model 2 and model 4

Adj. R2	Model 2 SFC	50.30%
Adj. R2	Model 4 Dual	50.80%
Δ Adj. R2	(M4-M2)	0.50%
Sig.		0.133

Made by the author

V. Conclusions

In this study we investigated using econometric regression models the absolute and relative market value relevance of consolidated financial statements for companies listed during 2003-2008 on the Frankfurt Stock Exchange. For this purpose we focused on the „confrontation” regarding the value relevance between consolidated and parent company financial statements. As expected (and in accord with previous empirical studies, for example Harris et al. 1994, Niskanen et al. 1998, Abad et al. 2000, Goncharov et al. 2009), the results have shown a statistically significant superiority of the relevance of consolidated statements (in detriment of individual ones). Moreover, we could not prove from a statistical point of view a superior value relevance of information provided (together) by consolidated and parent company financial statements as opposed to consolidated information. These results prove, of course, the importance (usefulness) of consolidated financial statements especially for investors on the capital market. They also question the necessity of publishing parent company financial statements (according to national regulations) as long as they present consolidated financial statements. As a matter of fact, in the USA the obligation to publish parent company financial statements was eliminated since 1982. We consider that these conclusions are valid not only for large European capital markets, but also for emerging capital markets (such as the one in Hungary, Romania, Bulgaria).

In the end, some aspects regarding the limitations of this study should be mentioned, as well as the perspectives of future empirical research. First, it is possible to raise the problem of sample representativeness (and implicitly of the results obtained) for the German capital markets. In this respect, future research could extend the analysis (and the sample) to other capital markets in Europe, as well as to companies that are not included in the main index of the stock market they are listed on. Second, the obtained results are based only on testing linear price level regression models. Future research could employ nonlinear models, for example logarithmic models (see Hellström, 2006) respectively return regression models (see Bartov et al. 2005). And third, the present study investigates relevance and therefore usefulness for decision making of consolidated financial statements only from the point of view of the investors on capital market. So, a future research theme less approached until now (see Goncharov et al. 2009) would be to investigate the relevance of financial statements from the perspective of other categories of users (for example financial institutions in their role as creditors).

HOW TO BETTER MEET OUR STUDENTS' LEARNING STYLE THROUGH THE COURSE RESOURCES

Mutiu I.Alexandra

Babes Bolyai University Faculty of Economics and Business Administration

Moldovan Georgeta

Babes Bolyai University Faculty of Economics and Business Administration

Publishers of the course resources for business higher education are willing to help professors and instructors to develop the learning process. An important part of the learning process is affected by the each student's learning style. Our paper focuses on how meeting students' learning styles can be done through the course resources we use. The scope of the paper is to identify a way to link students' learning preferences with the available course resources. The literature on this topic is limited, the interest in research being focused less on resources used and their useful diversity. We heavily relied in our research on the preliminary results of a market research study conducted by the Higher Education Group from Harvard Business Publishing among instructors who use resources from Harvard Business School's library. The research methodology is based on the case study method. We tried to recommend a treatment to our students and then analyze the effect of the applied treatment. The main instruments used are the VARK test followed by tailored recommendations for each student. The first conclusion of the research is that identifying the learning styles is extremely useful for students in terms of learning process. Knowing and exploiting their particular learning style helped students to maximize their learning. The second conclusion is that recommending resources based on learning styles is useful because it really helps students to learn in their own styles. The results of our paper show, firstly, that learning process could be facilitated by professors' directly identifying students' learning styles. Secondly, our findings underline the importance of having a diversity of resources available for our students, and to be able to offer them a constructive solution regarding their learning styles. Moreover, our contributions are reflected in the methodology we used in linking the learning styles with the course resources and in building our personal approach in issuing our students individual recommendations on study strategy based upon their learning styles.

Key words: learning process, learning styles, VARK test, course resources, identify students' learning styles

JEL classification: M49

1. Introduction

Teaching is defined as building a bridge from the subject taught to the student learning (Engel, cited by Gardner and Jewler, 2006: 64). Based on this idea, the bridge is the teaching process, which includes both a learning process and knowledge transposed via textbooks, articles, case studies, videos, and other media.

One of the crucial elements of the learning process is the learning style which may be defined as the tendency to adopt a particular strategy in learning. (Pask, et al., 1977). The term "learning styles" refers to the concept that individuals differ in regard to what mode of instruction or study is most effective for them. (Pashler *et al.*, 2009: 105)

Learning styles are characterized as cognitive, affective, and psychological behaviors that indicate how learners perceive, interact with, and respond to the learning environment (NASSP, 1979). The physiological dimension views learning as it relates to biological characteristics of an

individual; for instance, what senses (auditory, visual or kinesthetic) are used in learning (Drago and Wagner, 2004: 2). The learning style has its roots in the human representational systems, which comprises the basic five senses: visual, auditory, touch, taste and smell. Individuals have a preference for one of these systems, and communication to these people can be improved by relating it to their unique models of the world (Fatt, 2000, 34). Some cognitive styles and dispositions do seem to influence how and what students learn...some individuals seem to learn better when information is presented through words (verbal learners), whereas others seem to learn better when it's presented through pictures (visual learners). (Omrod, cited by Pashler *et al.* 2008:106). A short description of these learning styles is given below (extras from Fleming and Mills, 1992, p.140-141):

- *The visuals (V)* prefer to learn from maps, spider diagrams, charts, graphs, flow charts, labeled diagrams, and all the symbolic arrows, circles, hierarchies and other devices, that instructors use to represent what could have been presented in words.

- *The aural (A)* perceptual mode describes a preference for information that is "heard or spoken." Students with this modality report that they learn best from lectures, tutorials, tapes, group discussion, email, using mobile phones, speaking, web chat and talking things through. It includes talking out loud as well as talking to oneself.

- The preference for *read and write (R/W)* is for information displayed as words. Many academics have a strong preference for this modality. This preference emphasizes text-based input and output - reading and writing in all its forms. People who prefer this modality are often addicted to PowerPoint, the Internet, lists, and words, words, words.

- *The kinesthetic (K)* modality refers to the "perceptual preference related to the use of experience and practice (simulated or real)." Although such an experience may invoke other modalities, the key is that people who prefer this mode are connected to reality, "either through concrete personal experiences, examples, practice or simulation".

Since the learners could have different representational systems, they will prefer different resources to learn. As a consequence, the students' learning styles determine the resources they can best use in the learning process.

Literature is not much concerned regarding the topic of the resources used within the classroom in business schools. In 2010, the Higher Education Group from Harvard Business Publishing ran a market research project among instructors which use resources from Harvard Business School's library. The Group invited instructors to submit the syllabi they use in their courses in order to understand the future needs in teaching and curriculum development. The preliminary results were shared among the instructors who responded the Group's request and they are not available to the public. Since we submitted our Accounting for Managers' syllabus, we received the preliminary results of the research.

The final database includes 771 course syllabi submitted by 601 faculties from 457 universities. Participating regions were: Western Europe (14 countries), Australasia (11), Central/South America (11), Africa/Middle East (7), Eastern Europe (2) and North America (3). By tenure, 33% are full professors, 28% adjuncts, 22% assistant professors, and 17% associate professors. By educational level, 52% are MBA syllabi, 28% are undergrad syllabi, 9% Executive Education, and 11% other. By discipline, the largest are: Marketing (23%), Technology & Operations Management (17%), Finance (12%), and Organizational Behavior (11%).

An analysis of the resources used in the learning process reveals that from the total analyzed syllabi an average* of:

- 43% represents book chapters (of which 49% are assigned at the undergraduate level and 39% at the master level)
- 32% cases (of which 32% are assigned at the undergraduate level and 33% at the master level)

- an average of 24% articles (of which 17% are assigned at the undergraduate level and 27% at the master level)
- 2% media (equally distributed among the undergraduate and graduate levels)
- *percentage totals do not sum to 100 due to rounding, and to the exclusion of the “Executive Education” and “Other” categories.

Moreover, the research results reveal how many syllabi assign at least one mandatory reading or homework from the following product types or learning resources:

- 74% to book chapters at the undergraduate level and 77% to book chapters at the graduate level
- 92% to cases at the undergraduate level and 97% to cases at the graduate level
- 54% to articles at the undergraduate level and 73% to articles at the graduate level
- 23% to multimedia resources (same percentage both at undergraduate and graduate levels)

The preliminary results indicate to us that a lot of resource types, from textbooks, articles, and case studies to videos and more are used in courses. Good questions can rise from here: What type of resources should students use? Do they have enough physical time to investigate all the resources available? Or maybe some of the resources are redundant and therefore a lot of time might be wasted in reading the same things expressed in different words.

The scope of this paper is to identify a way to link students’ learning preferences with the available course resources. Moreover, we want to emphasize the necessity of building or providing different types of resources based on students’ varying learning preferences.

2. Methodology

VARK is a questionnaire that provides users with a profile of their learning preferences (Fleming and Mills, 1992, p.140-141). The acronym stands for visual, aural, read (and write) and kinesthetic which represent the physiological dimension of the learning style.

We tried to use VARK questionnaire in order to link the students’ learning style with the course resources. The steps of our methodology are:

I. Applying VARK questionnaire

We applied VARK questionnaire to two online MBA classes in an American University, in the Accounting for Managers course. A total of 34 students were investigated from different areas of US and with different backgrounds.

The VARK test was introduced as a mandatory assignment called *“The VARK Questionnaire - How Do I Learn Best?”* in the first week of each course, graded with 2% of the final grade.

Students were informed that the scope of the VARK is to determine what type of learner they are and then they can choose the learning methods that fit their learning style. They were asked to take the test at <http://www.vark-learn.com/english/page.asp?p=questionnaire> for free.

The VARK test employed by us was recommended as a good one by the literature: (see also the work of Drago and Wagner, 2004) and also by the American Accounting Association (AAA) members in one of the debates during the Annual Meeting in San Francisco, USA, in 2010.

Once the students got their scores, they were asked to submit them in order to receive from us individual recommendations on how to study more efficiently than they did previously.

II. Tailor individual recommendations for each student based on the resources we had.

The resources recommended to be used in the course were a textbook, PowerPoint presentations, narrative slides, video presentations, quizzes (standard and enhanced), and case studies. Some of the resources like PowerPoint presentations, narrative slides, video presentations, and quizzes

(standard and enhanced) were available online for free, and the rest of them: textbook and cases studies had to be purchased by students.

The content of the course was structured based on the textbook's chapters and for each chapter a case study was assigned as a mandatory assignment, besides problems and exercises.

Generally speaking, for each week students were asked to read one or two chapters, do the problems and exercises assigned and then solve the case study assigned. The syllabus was designed to guide students in how to learn efficiently. Thus, recommendations on how to read the textbook, how to solve the problems and exercises, and how to deal with the case studies were given in the syllabus.

In order to maximize the outcome of the learning process, and to make it more efficient, we recommended students to use only those resources that fit better their learning styles. Moreover, we gave them detailed instructions on how to use the resources indicated.

For example, we present here the recommendations we gave students with a certain approach for learning:

We recommended those who feel comfortable with the *read/write learning strategy*, to learn Accounting for Managers using the following steps, in this order:

1. *“Read the chapter and take a notebook in which to write main ideas, concepts, or to draw a chart.*
2. *Analyze the case study. I would recommend you to take a sheet of paper and a pen and write down the important ideas and useful data. After you have fully understood the case, open an Excel file to solve it.*
3. *Do the problems assigned (if any). You can use the same strategy I recommended for case studies.*
4. *Then, take the quizzes. I recommend you to check the book/notes before answering the questions, which will help you to consolidate your knowledge”.*

Students with a preference for *visual learning* received recommendations as follows:

1. *“Start your learning by reading the chapter first: read, underline the sentences you consider important, make notes on the book (not separately in a copybook), and look at graphs, charts and tables. You need to “photograph” all the information available and so you will feel more comfortable doing this.*
2. *Watch the PowerPoint presentation for each chapter*
3. *Take the quizzes. I recommend you to check the book before answering the questions, which will help you to consolidate your knowledge.*
4. *After this, it is time to do the problems assigned (if any) and to analyze the case study. Write down (using a pen or an Excel file) the given information and then start to solve the problem”.*

For students with *aural preference* for learning we recommended the following:

1. *“Start learning by listening to the Narrative slides (you can find them on the Web Links area). They will help you to get familiar with the main objectives of the chapter and introduce you very well in the topic.*
2. *Read the book chapter to receive more details regarding the topic.*
3. *Listen the video presentation (you can find them on the Web Links area)*
4. *Do the problems assigned (if any) and analyze the case study.*
5. *Do the quizzes.”*

For the *kinesthetic learners* we recommended:

1. *“Read the chapter and take a notebook in which to write main ideas, concepts, or to draw a chart.*
2. *Analyze the case study. I would recommend you to take a sheet of paper and a pen and write down the important idea and useful data. After you fully understood the case open an Excel file to solve it.*

3. Do the problems assigned (if any). You can use the same strategy I recommended for case studies.

4. Then, take the quizzes. I recommend you to check the book/notes before answering the questions, which will help you to consolidate your knowledge.”

But students with a single learning preference are only few of the total number of students. For those who have more than one learning preferences, called multimodal learners, we combined our recommendations written above for individual learners.

III. Evaluate the results

At the end of the course we asked students to give us their feedback regarding the recommendations based on their learning style identified with the VARK test. Our message to them was:

“I would really appreciate if you can give me your feedback regarding the VARK test. I am interested to know if you did you use my recommendations. And if so, were they helpful? If not, please indicate to me the reason(s). More, I would like to know your perception about learning based on these recommendations.

If your feedback is positive I will continue to give these instructions to my future students. But if you consider that those recommendations didn't help you much, please let me know what the reasons are. I really don't want to bore my future students with something useless.”

Feedback was not graded and no points or other benefits were given to students as a compensation for their feedback.

3. Results

The structure of students per learning styles is presented below:

Learning styles	V	A	R/W	K	Percentage in total	Total
One learning style (OLS)	0	3	6	4		13
<i>percentage in OLS</i>	<i>0.00%</i>	<i>23.08%</i>	<i>46.15%</i>	<i>30.77%</i>		<i>100.00%</i>
<i>percentage in total no of students</i>	<i>0.00%</i>	<i>8.82%</i>	<i>17.65%</i>	<i>11.76%</i>	<i>38.24%</i>	
<i>(first preference)</i>						
Multimodal learning styles (MLS)	V	A	R/W	K	Percentage in total	Total
V (2nd preference)	0	0	1	3	19.05%	4
A (idem)	0	0	1	1	9.52%	2
R/W (idem)	1	3	0	5	42.86%	9
K (idem)	0	0	4	0	19.05%	4
<i>percentage in MLS</i>	<i>4.76%</i>	<i>14.29%</i>	<i>28.57%</i>	<i>42.86%</i>	<i>90.48%</i>	
more than 2 equal preferences				2	9.52%	2
<i>total MSL</i>					<i>100.00%</i>	<i>21</i>
<i>percentage in total no of students</i>	<i>2.94%</i>	<i>8.82%</i>	<i>17.65%</i>	<i>26.47%</i>	<i>55.88%</i>	
<i>more than 2 equal preferences</i>					<i>5.88%</i>	
<i>total no of students</i>					<i>100.00%</i>	<i>34</i>

Table 1. Structure of students per learning style

Out of the total number of students, 13 persons (38 %) have one predominant learning style. 23% of them have a preference for aural learning, 46% have the kinesthetic learning preference and

30% have the read and write (R/W) learning style. As we can see, a strong proportion of the students with one learning style has the read and write learning style.

Out of the total number of students, 19 persons (56%) have a multimodal learning preference. Most of them have the read and write component as a predominant learning style. The second dominant learning style was the kinesthetic component. As it is presented in the table above, 4 students have as first preference the R/W learning style combined with the kinesthetic component, 5 students have as first preference the kinesthetic learning style combined with a R/W approach, 3 students have the kinesthetic and visual learning approach, and only one student has the kinesthetic and aural preferences for learning.

Based on the individual learning styles, we issued recommendations for each student, as we presented in the methodology. We provided the recommendations in the first week of the course in order to help students to learn more efficiently. All the students took the VARK test and submitted their results via the e-learning platform.

At the end of the course, students were asked about their feedback related with VARK test. In this way, they were asked to answer the next main questions: did you use the recommendations? Were they helpful? Also, they were asked to write their perception regarding this test.

Out of the 34 students, 9 students didn't send their feedback (26% of the total no of students). Therefore, we got the feedback from 25 students.

Regarding the first question: did you use the recommendations? 23 students (92% of the respondents) answered affirmatively. Same percentage of the students found the recommendations helpful and contributing to their learning. Moreover, some of them wrote that they didn't hear about the existence of the learning styles so far. Their perception about learning based on VARK test's results varies from "the perception of my own self" to the "very useful".

Overall, their feedback strongly encouraged us to use the VARK test in the next classes.

We've presented further parts of the feedback received to emphasize the impact the test had on our students:

"I just wanted to Thank you for your feedback on the VARK score. This is the first time I have actually had this type of analysis done and appreciate your feedback greatly. After receiving your feedback, I actually implemented this into my regular study habits in medicine, along with accounting as well. I try to write separate notes in a notebook now and read them aloud to myself and it definitely has helped me improve my understanding of the concepts I am learning about. Just wanted to say thank you for this advice, as it has helped me not only in your course, but with others also." (Student with R/W and aural learning preferences)

"I feel the VARK test has shown me which areas I should focus on and what I already do when studying or reading. Furthermore, I do see the VARK test as an important part of this course, especially in the beginning. I have never had a test like this where it displays results regarding what kind of reading and studying suits your style. I found them to be very helpful, because I have never seen recommendations as such, and I have found myself doing more of the things the VARK test recommended. I fully recommend you use it for your next batch of students as it can have a lasting impact not only on this course, but future courses ahead. Thank you for a wonderful class and your help thus far!" (Student with kinesthetic learning preferences)

"Concerning the VARK test, You made some excellent suggestions to my learning style. This tool was very helpful to me because when I am studying, it gives me a technique to learn the most material and retain the material and also to understand concepts instead of just memorizing. I am also studying for USMLE and have used some of your recommendations and have been very

productive in my learning. I think this is great for students to use because it helps you to study smarter not harder.” (Student with R/W and visual learning preferences)

“I did find the VARK test interesting. At this point in my education experience, I have found some good techniques that help me to learn, and I think they follow the guidelines of what I learned from the VARK test, so I can't say I changed anything based on this. However, I did find it interesting and it was a nice intro to see that you actually cared about my learning.” (Student with kinesthetic learning preference)

“I liked the overall test, because the test gave me a perspective of my own self that I thought I would not realize on how I learn school/college/university work load materials. After reviewing the score in those categories, and after reading your suggestions or recommendation based on my score, some parts did help me, for example, I thought that I follow through by simple observation and then performing them along with practice, I eventually get better in performance. Little did I know, that I learn even better from just reading/writing along with some parts of your recommendation... The test is just ideal for your understanding, not an in-depth quality per say, on how your students learn their course material either in your class or others.” (Student with R/W and kinesthetic learning preferences)

4. Conclusions

The results of our research reveal the following two main conclusions:

The first conclusion is that identifying the learning styles is extremely useful for students in terms of learning process. Knowing and exploiting their particular learning style help students to maximize their learning. This conclusion can be depicted from the feedback received.

The second conclusion is that recommending resources based on learning styles is absolutely necessary because it really helps students to learn in their own styles. But this conclusion involves the existence of myriad resources, so they can be suitable for each possible learning style.

The results of our paper show, firstly, that the learning process can be facilitated by professors' direct efforts in identifying students' learning styles. Secondly, it underlines the importance of having a diversity of resources available for our students and to be able to offer them a constructive solution regarding their learning styles. Moreover, our contributions are reflected in the methodology we used in linking the learning styles with the course resources and in building our personal approach in issuing students' recommendations.

CONCEPTUAL DELIMITATIONS OF CONTROLLING

Nedelcu Șerban

Universitatea „Babeș-Bolyai” Facultatea de Științe Economice și Gestiunea Afacerilor

Since the practitioners of controlling in Romania only know the toolkit they use and not the theoretical elements as well, what is needed in this case is a conceptual delimitation so that controlling would be better implemented, and improved with various elements of the economic environment. In practice, inside various linguistic areas different problems of communication may occur very often in regards to the use of different concepts that may be misunderstood. Therefore in the Romanian research area it becomes imperative to try and clarify the existing issues and to intensify the research in this field. Studying the evolution of the concept we observe that the need for its implementation is primarily experienced at the practical level of the companies, to be then followed by a debate in the specialized literature. The internationalization and the fierce competition that the Romanian companies are confronting on the economic market represent the decisive factor in adopting the concept of controlling. This article is part of the research conducted for my doctoral thesis, "Controlling in heterogeneous economic environments", under the coordination and supervision of Prof.Dr.Dumitru Matiș

Keywords: Controlling, Management Accounting, Management Control, Accounting, Internal audit

JEL Code: M49

1. Controllingul - a new concept in the Romanian economic environment

„Controlling” represents a new concept in the Romanian economic environment, being implemented successfully in very few companies. Unlike the German space where controlling is very well represented both at a practical level and in the academia, in Romania controlling can only be found at a practical level, and the specialized literature is restraint, almost absent. As the study conducted by Christoph Binder/Utz Schäffer in 2004 showed, out of the 92 Faculties of Economic of the German area there were 72 controlling departments.

When attempting to identify in the specialized literature a basic and unitary definition of controlling one learns that such an endeavour remains fruitless (Roso, Vormweg și Wall 2005: 67-84). Peter Preißler claims that ”Everyone has its own opinions on what controlling means or should mean, but everyone else thinks to something different.” (Preißler 1997: 12)

To define the concept of controlling one needs to specify that it has its origins in the anglo-saxon word „to control”, that means *to order, to direct, to regulate, to supervise, to keep within limits, to lead in order to anticipate*, and not *to check*, being associated to the idea of coherence. This explains the polyvalency of the modern term *controlling*. The term has its roots in the English „counter-roll”, and the French „contre-rol”, that means to verify a current state based on a past state (nominal).

2. Controlling-ul – Science of administration

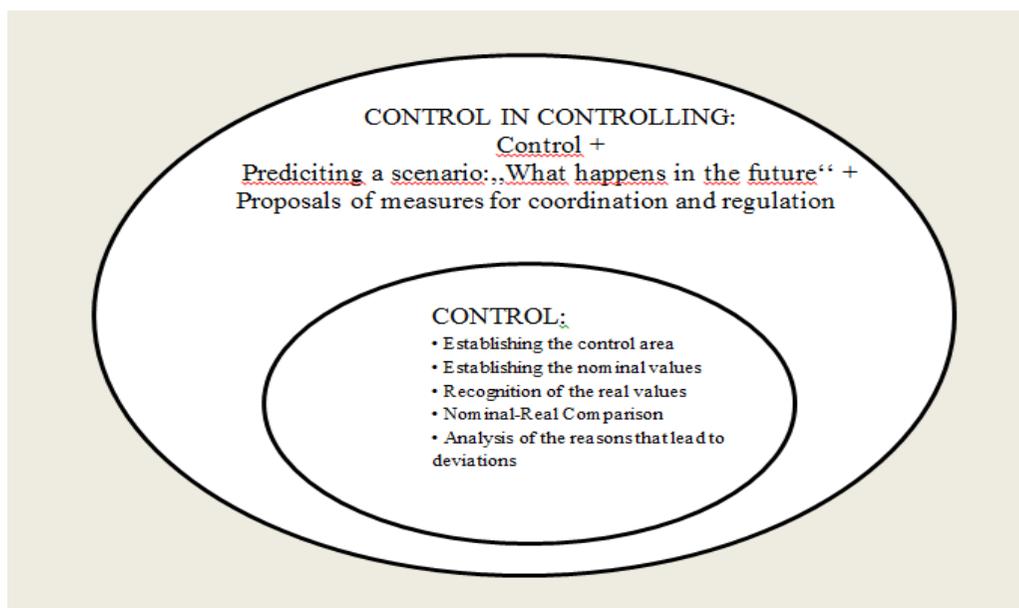

Since Controlling represents along with Accounting, Management and Human resources a „Management science” one has to make the distinction between *Management control* and *Controlling*. An expression that comes from the American environment emphasizes that Management is not administration and that the English „control” does not cover the content of the French „controle”. The cultural differences and similarities represent a decisive factor when

comparing the two concepts. According to AFNOR (Association Francaise de Normalisation) controlling is the verification of the conformity of initial data followed by a reasoning. The English controlling is done *before* the completion of the activity while the French one is done *after* the completion of the activity. According to the French accounting plan the Management Control represents the set of provisions taken in order to periodically provide the leaders and those responsible of the process the digital data that characterize the evolution of the company, thus offering the possibility to compare these data with the old ones and the ones to come and, if needed, to motivate the leaders to initiate the appropriate corrective measures (Braescu, 2007: 25-36). In Horvath's view controlling is conceived as a management subsystem that coordinates the planning and the control and also provides information to the management.

2.1. The control concept in controlling

In the Anglo-American space controlling has been highlighted as being „Management Control“, together with planning and coordination, and is conceived as representing a Management subsystem. „Management Control is the process by which managers influence other members of the organization to implement the organisation's strategies“ (Anthony și Govindarajan 1998: 6). If a Controller represents nowadays a supervisory or control body, the concept of controlling does not prioritize the control. Controlling is not control. The controller also controls, but a person that controls is not a controller. In Robert Anthony's vision the Controller is responsible for tracing and operating the system of the Management control.

Figure nr.1 Placing the concept control in controlling

Source: Eschenbach and Siller 2009: 37

Another conceptual delimitation of controlling ought to be made in regards to the internal audit that represents a verification of the activities completed in the past by persons that were directly or indirectly dependent on the area of responsibility. The internal audit can be accomplished by persons from inside or outside the economic entity and may have a regularly temporary character or not.

2.2. Controlling, Internal Audit and Accounting

Some of the most important differences between the internal audit and controlling are illustrated in the below table. Nota The internal audit and the controlling represent along with the supervisory bodies and the external audit the elements of the supervisory bodies. (Schneider 2000: 68).

Tabel nr.1 Delimitating controlling from the internal audit

Criteria	Internal audit	Controlling
The issuer	Supervisory Board, Leadership	Management at all levels
Scope	Selective based on issues	Selective based on necessity
Main goal	Control and supervise	Completing the management
Operating time	Ex-post	Ex-ante, ex-nunc
Regulations	Specific to the audit, based on the audit codex	Does not exist
Tasks	Protection of equity	Increase of equity

Source: Eschenbach and Siller 2009: 65

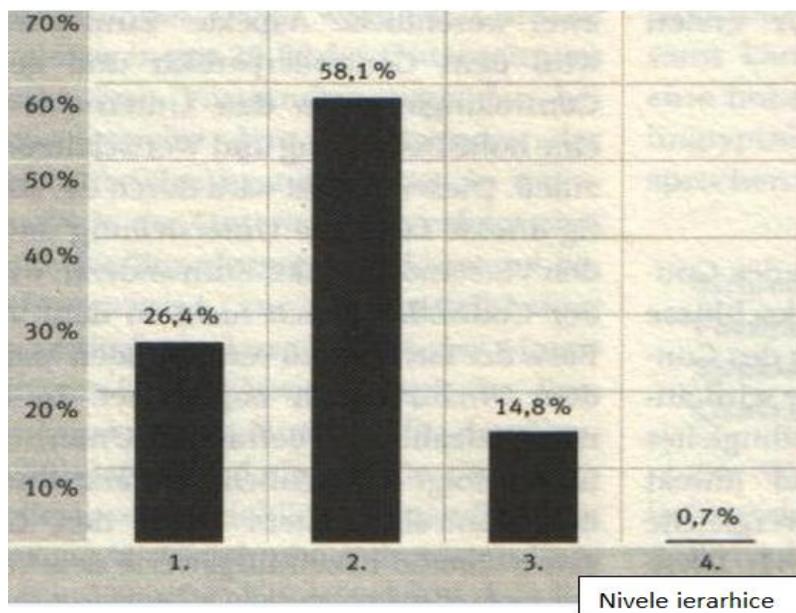

Because the controlling was born „when it became necessary, because of the large volume of accounting involved, or advantageous for other reasons, to separate the accounting functions from the secretarial and financial functions of the corporate business’’(Jackson 1949, Pag.9), delimitating it from the general accounting becomes necessary.

Both the internal and the external accounting are in a harmonization and integration trend due to the international standards of financial reporting. For a controller the internal accounting holds the first place (Horvath&Partners 2009: 34), but they both represent the sources of collecting information that is to be processed by the controlling. If the internal accounting is oriented both to the past and the future by providing only information, the controlling is oriented exclusively to the future by having a role of interpreting and capitalizing the information.

By becoming an open concept controlling has extended beyond the goal of managerial accounting and came to be considered a constitutive element of the management process (Roso, Vormweg and Wall 2005: 75). The German concept of controlling focuses on a guiding system, while the American managerial accounting „is concerned with the operative satisfaction of managerial information needs(Roso,Vormweg and Wall 2003:61).

Accounting Management is usually associated with the financial accounting unlike the controlling that has an affinity toward the management(Hoffjan și Wömpener 2005:50). In the study below one can notice that in 85% of the situations the controller (the coordinator of the Controlling department) holds the first two levels of the hierarchy inside a company.

Figure nr.2 Controller in the hierarchy inside companies

Source: Weber, Hirsch and Spatz 2007: 25

In the German speciality literature the concept of „Accounting management“ is used seldom as it is considered a synonym for the concepts of „cost accounting“ or „controlling“. The usage of both these concepts in different economic areas has led to a high sensitivity in delimitating them. Although the position of „controller“ was born in the USA, the concept of controlling under this title can be encountered only in the German space. During the last decade the controller became the internal consultant of a company and holds the role of assuring the rationality in the profitable leading of the company.

Among the decisive factors in defining the two concepts there are the economic and social situations, the political context, the influence of other countries, the cultural and academic factor. Due to the internationalization of the economic relations the usage of the concept „managerial accounting“ increased, both at the practical level and in research.

3.Conclusion

The development of conceptual conventions in order to avoid the negative consequences of using the terms in an erroneous manner needs to be encouraged, being necessary intense studies in the field of Comparative Management Accounting, whose research promoting is represented by the studies conducted by Alnoor Bhimani. The development, presentation, and conceptualization of controlling represents a continuous debate in the German academic field. The attempts of defining controlling have not succeeded so far to establish a unitary and well delimited concept, the research in this field being characterized by a cyclical nature. This article is part of the research conducted for my doctoral thesis, "Controlling in heterogenous economic environments", under the coordination and supervision of Prof.Dr.Dumitru Matiș.

The present study has as main objective to reflect the state of literature regarding free cash flow, and to withdraw the main pro's and con's in order to create an objective image upon this indicator. The main idea generating this research was the growing interest on cash flow reporting. As many say, "Cash Flow is King", while in Anglo Saxon countries the interest of investors and analysts is concentrated on operating cash flow, as the most important indicator of the probability of bankruptcy. In this context, voluntary additional reporting, like free cash flow may come either as an aid in providing the fair view or as an opportunistically reported figure. Throughout the paper, the intention was to provide answers to three main research questions: "What are the definition and calculation method of free cash flow? Why is there an interest in free cash flow reporting? What is the impact of free cash flow on the agency theory?" In order to provide relevant conclusions, four international data basis were used, and related articles and studies were extracted. The results proved that there is no generally accepted definition and computing method, while the format depends on the end-user of the report (shareholders, investors, analysts, bankers, a.s.o.). As stated below, this aspect generates confusion and lack of comparability, giving room to creative accounting techniques. Moreover, the interest on free cash flow reporting is connected mainly to liquidity assessment, company valuation and investors' choice. Still, in the context of agency theory, results show that in presence of high free cash flow, managers tend to make investment choices that satisfy their personal interest and that generate low efficiency and profitability for the company. The contribution to current state of research is providing a literature review study, focused on a comparative approach, as well as on underlying an objective image upon a debatable financial indicator and accounting report.

Keywords: free cash flow, reporting, management, agency theory, creative accounting.

1.Introduction

In a fast moving and transforming reality, information is the essential instrument for a manager, investor, or regulations setters. The financial strategy of any company cannot be set without taking into account the cash flow evolution. Alongside the balance sheet and profit and loss account, cash flow statement is one of the instruments for assessing the performance of a company. It gives valuable information upon the liquidity of the company, illustrates very well the difference between profitability and liquidity. Based on it, the managers can take action in due time, to control possible future problems that could lead to bankruptcy, or decide to continue cash-rich activities.

The current format of the cash flow statement is the result of a rather recent process. The national differences are reduced by the growing influence of the International Accounting Standards Board. Still, the first draft of the "funds statement" was published in 1976, by the International Accounting Standards Committee), which was followed by the revised cash flow statement (IAS 7), coming into force in 1994. Since then, it has been the cause of ongoing debates upon the best

presentation method and the effect of the allocation choices of the components. The interest upon this statement rose mostly in Anglo-Saxon countries, where the capital market is the main external financing source the investors being mostly interested in the benefit of dividends, but also where main financial scandals outlined the implications of creative cash flow.

Apart from the mandatory reporting, especially in the Anglo-Saxon countries, managers also voluntarily report other information related to the cash flow, like the so called “free cash flow”, a most debated notion. **The present study has as main objective to reflect the state of literature regarding free cash flow, and to withdraw the main pro’s and con’s in order to create an objective image upon this indicator.** In order to achieve the main objective, the secondary goals are to answer to the research questions stated below.

2. Research Methodology

In order to create a data base of relevant studies, four international sources were chosen: Ebsco, Science Direct, Wiley and Emerald. The research process started by selecting all the articles containing the words “cash flow”, in their title, keywords or abstract, issued after 2000. The result was of 1,168 articles from Ebsco database, 976 from Science Direct, 536 from Wiley and 141 from Emerald database. After assessing their relevance and connection to the accounting field, as well as the availability of the full text (Cluj-Napoca, Central University Library access), the final sample consisted out of 239 articles (162 from Ebsco, 36 from Science Direct, 10 from Wiley and 31 from Emerald). The main ideas and hypotheses related to free cash flow were identified, through analysis, synthesis and generalization processes. The main opinions presented, based on which the concluding remarks were constructed, were from studies concentrating on the indicator of free cash flow while being representative for the type of issues raised by accounting and financial specialists.

The main areas identified try to give response to the following **research questions**:

Why is there an interest in free cash flow reporting? What are the definition and calculation method of free cash flow? What is the impact of free cash flow on the agency theory?

3. Developing the research process

What are the definition and the calculation method of free cash flow?

There is a diversity of opinions in defining this notion. Adhikari and Duru (2006: 311-322), consider cash flow to be the amount of cash available to shareholders, without reducing the business value. They calculate this indicator by deducing from the operating cash flow the amounts needed for capital expenditures, in order to maintain the production capacity of the company. They acknowledge also the possible definition relating to free cash flow as the cash remaining at the managers’ free choice, obtaining the final value by deducing from operating cash flow the amounts needed for capital expenditure, dividend payment and loans reimbursement.

Roger Hussey & Andra Ong (2005: 268) define cash flow as a measure of the amount of cash available for dividend payment, financial debts payment and for development of the company. Artiachea, Leea, Nelson & Walker (2010: 31-51), consider free cash flow an assessment of the company’s liquidity, while a high figure indicates a financial capacity of investing in sustainable projects, without sacrificing the claims of third parties. PhD. Prof. Ioan Batrancea (2008, 135-136), describes free cash flow as “money put aside”, being in fact cash generated by the company for its shareholders, after paying financial debts and performing necessary development investments.

Kousenidis (2006, 645:653) considers free cash flow to be the operating profit after tax payments, after non cash adjustments, and investments in current and long term assets. The appropriate definition is considered to be the cash generated by the company, available for all the parties insuring the capital of the company (equity and financial debt). The same calculation

principle is adopted by Nick Antill & Kenneth Lee (2008, 19), except for the non-cash elements, replaced solely by depreciation.

Hackel, Livnat & Rai (2000: 1-24) assess free cash flow to be the operating cash flow, after deducting capital expenditures, acknowledging potential errors arising from not separating the investments needed for maintaining current growth rate, from excess investing, depriving the shareholders from deserved "reward". Robinson, van Greuning, Henry & Broihahn (2009, 250-251) have the same vision, considering free cash flow as the operating cash flow exceeding the capital expenditure amount, while accepting also the extended formula taking into account non-cash adjustments. S.H. Penman (2001) also sees cash flow as generated by operational activities, after deducing investment cash flow. He also states the fact that low free cash flow could indicate future significant increase (when used to finance investments). Jones & Sharma (2001, 18-39), define free cash flow as the cash collections from customers, minus payments towards suppliers and cash outflows related to investments, while finding in certain conditions a statistically significant connection between free cash flow and earnings management. Mulford & Comiskey (2005: 345-376) consider free cash flow the antidote to earnings management, and admit that the definition depends on the users: cash flow available for dividend payment, for loan reimbursement and interest payments.

To conclude, there can be said that there is no unanimous definition and way of calculation, which is where the danger of opportunistic management may arise, as almost all specialists admit.

Why is there an interest in free cash flow reporting?

There are opinions stating that companies choosing to report free cash flow, do this in order to improve the image of their performance in the eyes of the analysts and investors (Adhikari & Duru, 2006), by proving that most of the companies studied had low profitability and high leverage. Others (Fuller & Blau, 2010) state that companies would report free cash flow so as to signal future dividend payments, observing that mostly medium performing entities adopt this kind of reporting. Mulford & Comiskey (2005, 345-376), believe this increasing interest in reporting the indicator is a result of a growing attention from investors towards cash flow in general. The same opinion was stated by other specialists, like David Henry (2008), or Robinson, van Greuning, Henry & Broihahn (2009, 250-251) and J.E. Ketz (2003: 236-237).

Still, the creative accounting techniques must be considered, and so some researchers associate free cash flow reporting to manipulative intentions of managers. J. Edward Ketz (2003: 236-237) draws attention on the free cash flow multiple possibilities of reporting, leaving the possibility for managers to choose the one favoring the company's figures. He provides the example of deducing the amount of free cash flow from earnings adjusted, leaving it with significant influence from potential earnings management or relying on the freedom of choice permitted by IAS 7 and including components in operating cash flow to boost its amount. Jones & Sharma (2001: 18-39), prove that for companies not reporting their cash flow on quarterly basis, there is a statistically significant positive relation between free cash flow amount and earnings management.

What is the impact of free cash flow on the agency theory?

Most of the studies focused on this issue rely on Jensen's (1986, 323-329) research that proves that if free cash flow amount is significant, managers will follow their own interests and engage in high investments with low profitability. Brush, Bromiley & Hendrickx (2000: 455-472), state that through high free cash flow, managers achieve their personal interests, without implications of capital market or existing shareholders. After studying 3.320 financial reports, concluded that free cash flow only leads to increasing turnover and profitability in cases of companies with low free cash flow and without strong corporate governance, companies with no free cash flow and most importantly, companies with shareholders involved in management. Zhang (2009, 507-541)

thinks that managers tend to invest in excess when free cash flow is available, where there is weak corporate governance and no monitoring system, which can be mitigated by increasing financial debt, which restricts access to cash flow. Wei & Zhang (2008: 118-132) sustain this idea by proving that excess investment of free cash flow is a result of cheap internal sources, not to expensive resources from capital markets. Consistent with Jensen theory, Freund, Prezas & Vasudevan (2003: 87-106), demonstrate lower future performance for companies with high cash flow. Also in accordance, Nwaeze, Yang & Yin (2006: 227-265) prove that free cash flow in large amounts facilitates for managers discretionary management of investments, financial debt and dividend payments.

4. Conclusions and further research

By summing up the ideas discovered in relevant literature, we can find answers related to the research questions. However, to the first research question, the answer is that there is neither a generally accepted definition, nor a common way of calculation. Throughout the diversity generated by the existing opinions and practices, still there is one way of calculation preferred by analysts. It starts from operating cash flow, from which investing cash flow is deducted, the result being adjusted by interest payments and dividends paid. This option is not affected by accruals, thus falls off the influence of earnings management, while the result is the residual cash flow, over the break-even level, required for maintaining/increasing current production capacity.

The reason behind voluntary reporting of free cash flow is the intention of providing **positive signals** to the investors and analysts regarding the performance of the company, the potential of paying dividends and sustaining further investment. Still, the issue of manipulative free cash flow reporting is too be consider, while results prove that it might hide other flaws, mostly in profitability.

Potential creative accounting techniques should be considered when analyzing free cash flow. The growing interest in cash flow reporting was generated mainly by notorious financial scandals and frauds resulting from earnings management, but also is specific to countries with capital market as main external source of financing. All these aspects put cash flow reporting on a high place in the eyes of investors or banks, and raised the interest in free cash flow reporting.

In the context of **agency theory** the research work proves that managers tend to put their own interest first, by engaging in projects that would generate personal benefits. Moreover, due to cheap internal financing sources, managers tend to overinvest, with low profitability or value added.

Another outcome of the current study is a synthesis of main positive and negative aspects related to voluntary free cash flow reporting, provided in the table below:

Positive outcome	Negative outcome
Applicability in: <ul style="list-style-type: none"> - Liquidity analysis; - Company valuation process; - Determining potential personal future gains for investors; - Stating most relevant covenants in loan contracts; - Countervailing earnings management; - Managers' incentives. 	<ul style="list-style-type: none"> -Reasons for issuing the report may be to hide other financial problems; -Low comparability due to diversity in reporting not standardized yet; -Negative implications in the context of agency theory: stimulates managers to invest in low profitability projects, or in their own interest; - Potential manipulative choices, deriving from high diversity of defining and computing methods.

Table 1: Pro's and con's regarding voluntary free cash flow reporting. Source: authors 'projection

The further research perspectives are numerous. They derive mostly from the variety of reporting methods, leading to low comparability but also from the connection between positive free cash flow and earnings management. Finding a unanimously accepted format is a goal for many researchers and presents interest to standard setters and should start from finding the most relevant format for end-users (investors, bankers or analysts)

The current study contributes to the research area by providing a synthesis of most relevant studies preoccupied by free cash flow reporting, putting aside the main issues surrounding this financial indicator, providing grounds for further study, deriving from each of the research questions stated.

CASH FLOW REPORTING AND CREATIVE ACCOUNTING

Negrea Laura

Babes-Bolyai University, Faculty of Economics and Business Administration

Matiş Dumitru

Babeş-Bolyai University, Faculty of Economics and Business Administration

Mustaţă V. Razvan

Babeş-Bolyai University, Faculty of Economics and Business Administration

Within the wide field of creative accounting, the main preoccupation of researchers surrounded earnings management. The current study comes to acknowledge that creative cash flow may distort the assessment of financial performance and should therefore, become a subject of the same interest for analysts and investors, as earnings management is. In order to reach the objective proposed, there are two hypotheses formulated, to be validated within the research: H1: Creative accounting distorts cash flow reporting within the boundaries of current regulations. H2: Real activity manipulation alters significantly the operating cash flow. The steps followed were analyzing the accounting standard related to cash flow statement, IAS 7, in order to uncover issues not taken into account, or options of allocation provided for accountants, which could lead to opportunistic choices and lack of comparability. The relevant literature was reviewed, so as to identify the opinions of accounting and finance specialists related to this subject, the results of their scientific process. The final step was a synthesis of relevant results and observations, which lead to the acceptance of the hypothesis of the research. Moreover, several techniques were identified, both related to creative accounting and to real activity manipulation, influencing mainly the figure reflecting operating cash flow, and thus the image on the potential of business continuity. Main conclusions were that the techniques applied were within the limits set by the standard: opportunistic allocation of dividends and interest collected or paid misallocation of certain activities like sale of receivables, but mainly recording nonrecurring events into the operating cash flow, without separate notes of information or adjustments. Real activity manipulation should also be considered as it is even more difficult to detect, unless analysis is also performed on notes to financial reports and the figures within the profit and loss account. The contribution of the current study is providing a synthetic argumentation to why cash flow should be analysed in the context of creative accounting, reviewing methods and techniques that distort significantly the results of operating activity, providing basis for further study related to the impact of such practices on forecasts of cash flow and predictability of bankruptcy.

Keywords: operating cash flow, creative accounting, nonrecurring activity, IAS 7, financial performance

1.Introduction

Creative accounting and the multiple accounting reporting manipulation techniques have been subject to extensive research and study. Recent financial scandals have put under suspicion the quality and accuracy of financial reporting. Most of the studies seem to concentrate, however, on earnings management as the focus for accounting manipulation. An example is the study of Pablo Fernandez (2008) considering that “Cash flow is a fact. Net income is just an opinion”. Like others (Sharma D., Iselin E., 2003, Verbruggen S., Christaens J., and Milis K., 2008), he considers earnings to be a result of various accounting hypothesis, affected by manipulative options (revenue recognition, capitalization of expenses, depreciation method, etc.).

For this reason, the opinion that cash flow statement is less a subject of opportunistic management, is widely accepted. This conclusion has led to lower interest on potential creative cash flow.

The second issue leading to the present study was the decreased comparability of cash flow statement given the freedom of choice related to operating cash flow reporting (direct versus indirect method, allocation of components between the three types of cash flow). This concern generated the idea of potential opportunistic choices.

In this context, the object of the current study is **to determine whether creative accounting could affect cash flow reporting to such a degree as to distort and corrupt the assessment of financial performance**. In order to reach a conclusion, the study is intended to discover the validity of the following hypothesis:

H1: Creative accounting distorts cash flow reporting within the boundaries of current regulations.

H2: Real activity manipulation alters significantly the operating cash flow.

2. Research Methodology

The first step was to identify the relevant international standards related to cash flow reporting, and the options left for accountants. The main concerns identified were related to operating cash flow and the lack of clear allocation principles for some of its items, as well as the differences between direct and indirect method of reporting (both allowed by the standard - IAS 7).

We have then reviewed relevant literature, mainly articles debating various issues on cash flow reporting, going through approximately 200 studies selected from international data bases. The main ideas and concerns related to creative cash flow have been selected, and afterwards synthesized.

The third step was following the principles of deductive analysis, the general issues being identified, as well as the way they fold on existing regulations, and the impact on cash flow reporting.

3. Creative cash flow within the boundaries of current regulations.

The operating cash flow is the key indicator of the company's liquidity and the capacity to sustain main business. It is no surprise, then, why it has proven to be main target of creative cash flow reporting. Like Mulford C.W and Comiskey E. E. (2005, p. 19) state, creative reporting refers to the steps followed in order to create a distorted image on operating cash flow, by supplying deceiving signals on the financial health of the entity.

The effect of misplacing items within the report

One of the first observations was the flexibility of the standard, allowing some items to be allocated so as to boost operating cash flow, being misplaced between operating, investing and financing cash flow.

Mei Luo (2008: 422-423) is preoccupied with what he calls "unusual cash flow". He detects various cash outflows included into operating flow, like restructuring the activity or research and development, but more related to the investment activity. This misallocation influences the forecast of analysts, expecting these outflows to be recurrent (since they are reflected into the operational section), thus the future results would show an increase instead of maintenance of operating cash flow. Another issue debated by Mei Luo but also by others, is the sale of receivables, that influences positively the operating cash, being actually in substance a cheaper way of financing the activity, and that should be reflective in the financing section. Neil Weiss and J.S. Yang (2007: 2-4) criticize the flexibility of the standard, which allows two choices of allocating interest and dividend payments (either operating or financing cash flow), affecting the comparability of financial reports. Like Mei Lou (2008), they underline the distortion of

perception created by the sale of receivables, similar to a bank loan, but actually boosting operating cash. Weiss and Yang (2008) observe the option permitted by IAS 7 to reflect dividends received as operating (instead of investing) cash flow, thus offering the possibility of big multinational corporations to “play” with high amounts, requiring dividend collection from subsidiaries in order to increase operating cash result.

Nonrecurring elements reflected as recurring through lack of informative notes

A large part of related literature is preoccupied with nonrecurring cash flow, reflected as recurring. Since operating cash flow is “the star”, reflecting the sustainable on-going part of cash, analysts and investors usually predict constant evolution, unless other information is provided, related to changes in activity, increase in production capacity or reduction of activity. Companies may intentionally leave the impression for some transactions with positive result, to be recurrent or assess the ones with negative cash as nonrecurring.

Mulford C.W. and Comiskey E. E. (2005: 211-212) state that current accounting standard does not define the term of “nonrecurring cash flow”, probably considering the end-users will be able to recognize it, if case. They have observed examples where, even if the cash flows are actually recurrent, their value is nonrecurring, inconstant, or may derive out of other activities than the operational ones, considered in theory as recurrent. The two specialists select out of the financial statements analyzed a few examples of nonrecurring elements included into operating cash flow: advance payment of stock, restructuring payments towards suppliers, inflows generated by discontinued activities, inflows and outflows from litigations, collecting business insurance policies, etc. They recommend extra attention to the notes added to financial statements, and to complete the process by also analyzing the profit and loss account. B. Elliot & J. Elliot (2008: 657) assess that the standards should impose a separate reporting of the cash flow necessary for assuring the maintenance of current business capacity from the one necessary for extending the business, because the lack of this information distorts the image upon future performance.

Direct versus indirect method of reporting operating cash flow

IAS 7 offers the possibility to accountants to state the operating cash flow either through the indirect method (deriving from profit and loss figures, adjusted for noncash elements and changes in working capital), or the direct method (reflecting main inflow sources and outflow destinations) of reporting. Since the indirect method is deducted from the results from profit and loss account, it is obvious that the effect of earnings management leaves marks on the statement of cash flow. Like Anne Britton and Chris Waterston (2005: 161) state: if cash flow reporting is wanted, there should be only one method, the direct method. This would avoid confusion in the minds of end-users that may have difficulties in reconciling operational net income to cash flow.

Moreover, the cash flow statement could become an efficient instrument in detecting creative accounting techniques applied to accrual figures. Howard Schilit (2003, 203) noted that by comparing operating cash flow to earnings, we should find warning signals in case of high discrepancy. A high net income, opposed to a negative or low cash flow should generate suspicions on the quality of incomes and the potential too high operating expenses. A high value of operating cash flow, though, in the context of low profitability, is another warning that should lead to thorough analysis. C. W. Mulford and E. E. Comiskey (2002) propose a series of actions to be followed in order to correctly compare operating cash flow and income. The authors even recommend new indicators like „adjusted cash flow”. In order to reach this figure, cash flow must be adjusted for nonrecurring events. In this respect, a few elements must be isolated, like cash flow from discontinued operating activities, tax payments that can be classified to financing or investing activities, transactions related to assets held for transaction, capitalized expenses included into period’s operating expenses or other significant isolated events leading to changes in operating assets or liabilities.

4. Real activity manipulation of operating cash flow

Cash flow management is necessary in order to provide the liquidity necessary for business continuity. The managers must supervise the cash collecting systems as well as the current assets management (transformation of receivables and stock into cash). Reider and Heyler (2003: 35-38) define the objectives of an efficient cash control: To insure the availability of cash in accordance with payments; To identify the cash excess in order to invest it so as to generate profit; To account all transactions in order to insure the correct recording of data; To control the cash flow so as to avoid theft or fraud.

Although, this is all true, there are some decisions of cash management that may opportunistically favor the cash flow of a certain period. In this respect, Divesh S. Sharma (2001: 11-12), one of the advocates of the utility of cash flow reporting, underlines certain manipulative management activities like intended delay in payments towards suppliers (translated in increase in cash flow), or stock reduction under normal level, all generating additional operating cash. All these action may signal a company under financial stress. Other types of manipulative actions are artificial increases in investing or financing cash flow meant to cope with the lack of operating results, which could be a sign of probable bankruptcy. Howard Schilit (2002: 199-203), points out the managers that in the context of insufficient operating cash flow necessary for business continuity decide to take measures like fixed assets sale, increase bank loans or excessive stock reduction. G. J. Benston (2006, 478-480), analyzes the reasons behind the bankruptcy of Enron. He noted the artificial increase in operating cash flow by masking a huge bank loan behind a gas delivery contract, or starting up affiliated companies contracting loans, the figures in cash finally helping the ones of Enron through consolidation of financial report. Hugo Nurnberg (2006: 217) identifies another real activity manipulation. He observes how operating cash flow is boosted not through collections related to sales of goods and services or better cost control, but through sale of existing business lines or is diminished not due to payments to suppliers, but to business acquisition. In these cases, at first, the investing cash flow is affected through one time figure, but post-acquisition data influences operating cash flow, including receivables and stocks transformed into cash, from the acquired business. Nurnberg noted examples of such opportunistic decisions, clearly related to the improvement of operating cash flow, in order to fulfill a certain level of financial indicators so as to have access to bank loans, to influence the result of company valuation process or to achieve the objectives set by shareholders.

5. Conclusions and further research

Following the steps proposed of the current research process, we have encountered reasons to clearly validate both of the hypothesis assumed: *H1: Creative accounting distorts cash flow reporting within the boundaries of current regulations. H2: Real activity manipulation alters significantly the operating cash flow.* By reviewing relevant accounting and financial studies, we have identified clear ways of manipulating the image of a company's liquidity, thus reaching the conclusion that creative cash flow exists and its detecting plays an important role in determining the accurate financial performance and the probability of bankruptcy, since almost all applied techniques affect the operating cash flow, the fundament of business continuity.

We reflect below, main manipulative actions discovered, affecting operating cash flow, within the limits set by IAS 7:

Method	Technique
<i>Creative accounting</i>	Allocating dividend and interest payments to financing rather than operating cash flow;
	Allocating dividends and interest received to operating rather than investing cash flow;
	Reflecting sale of receivables to operating activity (rather than

	financing), without even related explanatory notes
	Recording nonrecurring cash flows into operating cash flow, without additional notes reflecting the lack of continuity;
	Misplacing investing flows or hiding financing inflows into operating activity;
	Using indirect rather than direct method of reporting operating cash flow;
<i>Real activity manipulation</i>	Excessive sale of stock or unnecessary discounting of receivables;
	Intentional delays in payments towards suppliers;
	Forcing investing or financing activity to cope with lack of cash, with positive impact on future operating cash flow;

Tabel 1. Methods and techniques of cash flow manipulation. Source: authors' projection

The contribution of the current study is a synthetic argumentation to why cash flow should be analysed in the context of creative accounting, reviewing methods and techniques that distort significantly the results, providing basis for further study related to the impact of such practices on forecasts of cash flow. Having in view that a wide majority of researchers consider future cash flow as the best indicator of the probability of bankruptcy, and although current net profit is the basis of such estimation, we have to admit that current cash flow provides significant additional information. The intended future research of the authors' is actually determining potential manipulation techniques applied by Romanian companies, by analyzing the financial reports made public by listed firms. This will be performed by applying the check list proposed by C.W. Mulford and E.E. Comiskey, in their 2002 research work, "The Financial Numbers Game. Detecting Creative Accounting Practices".

A NEW APPROACH OF CONCEPTUAL FRAMEWORK FOR GENERAL PURPOSE FINANCIAL REPORTING BY PUBLIC SECTOR ENTITIES

Nistor Cristina Silvia

Babes Bolyai University, Faculty of Economics and Business Administration, Cluj Napoca

The importance of accounting in the modern economy is obvious. That is more elevated bodies of the European Union and elsewhere dealing with the organization and functioning of accounting as a fundamental component of business (Nistor C., 2009).

The mission of the International Federation of Accountants (IFAC) is to serve the public interest, strengthen the worldwide accountancy profession and contribute to the development of strong international economies by initiating and encouraging the professional standards of high quality, the convergence process these international standards and to discuss issues of public interest which is extremely relevant international experience of (IFAC, 2011).

Currently, the concepts related to financial reports in public sector are developed by IPSAS references. Many of today's IPSAS are based on international accounting standards (IAS / IFRS), to the extent that they are relevant to the requirements of the public sector. Therefore today's IPSAS are based on concepts and definitions of the IASB's conceptual framework, with changes where necessary for public sector specific approach.

Thus this study present this brief draft statement under discussion by the leadership of IFAC in collaboration with other organizations and groups that develop financial reporting requirements of the public sector. Then, we highlight the importance and the degree of acceptance of the project which results from comments received. On the basis of combining qualitative with quantitative research seeks to demonstrate the necessity and usefulness of a common conceptual framework of the International Accounting Standards (in this case the Public Sector), starting from their emergence from presenting their bodies involved in the foundation, the content standards, experience of different countries. The results have direct implications on Romanian public accounting system, given that the reference of the international implementation and reporting is an actual goal.

The study is primarily addressed to graduate, doctoral students, professors and researchers working in public sector accounting. The study aims at presenting the acceptance of the theme subject for discussion by the IPSASB. It is addressed also to all those interested to know the current evoluția development of International Public Sector Accounting.

JEL: M40, M41

Introduction

When IPSASB (International Public Sector Accounting Standards Board) initiated the first program, chose to begin by developing a core set that can be reliably adopted by those entities that have problems with financial reporting.

Many concepts, definitions and principles have been considered and integrated in IPSAS as IAS / IFRS has been developed them. However, until now, these concepts, definitions and principles were not explicitly identified or detailed. In several countries, national standards bodies have defined a conceptual framework adapted to local institutional and political system. An important part of the published work of these bodies is dedicated to the conceptual framework. The Council considers that it is time to develop a conceptual framework for general use international financial

reporting (financial information) for public entities. IPSAS will support the conceptual framework to be applicable in different states and different jurisdictions regardless of political system or type of regim. It should take into account: a) socio-cultural traditions b) form of government c) mechanisms for service delivery exists in many jurisdictions that adopt IPSAS.

The IFAC has released international public-sector accounting standards for all public-sector entities, whether they are national central governments or local governments since 2000 (Oulasvirta, 2010). The most IPSAS published until now are based on International Financial Reporting Standards (IFRS) - developed by the International Accounting Standards Board (IASB). This consultation document resulting from the first phase of the Council activity wants to develop a conceptual framework of the general purpose financial reporting and address the following issues:

- The role and authority of the conceptual framework;
- Objectives of financial information;
- The scope of financial information;
- Qualitative characteristics of information contained in financial reports for general use;
- Nature of the entity to submit financial information.

Brief History of Conceptual Framework for General Purpose Financial Reporting by Public Sector Entities - Consultation paper

In July 2006 it has been established a collaborative project between the IPSASB and representatives of standards bodies implementare national of Argentina, Australia, Canada, France, Israel, Malaysia, Italy, Netherlands, New Zeeleandã Spain, South Africa, Switzerland, United Kingdom, USA. Also participating were FEE (Federation des Experts Européens Comptables), IASB, TFHPSA (Task Force on the Harmonization of the Public Sector Accounting) and Eurostat. In March 2007, the IPSASB noted the progress and current status of the project including the initial issues such as objectives, the scope and qualitative characteristics of information have been prepared by the subcommittees.

In March 2008, the IPSASB make a review of the consultative paper on the first project, from 2007, joining the four chapters that were previously separate. These are: the objectives of general purpose reporting them financially, the scope of general purpose reporting them financially, qualitative characteristics of financial information included in the general purpose reporting entity financially and reporting. In September 2008, is approved for public comment and consultation the document - Conceptual framework for financial reporting for general use, used by public sector entities. The elements are: the objectives for financial reporting, qualitative characteristics of information included in the general purpose financial reporting, the reporting entity. This consultation paper is open until 31 March 2009.

In May 2009, began analyzing the 55 responses received for the first phase of the conceptual framework of IPSAS. Analysis of these responses continued throughout 2009 until April 2010. IPSASB also considered necessary to achieve a new draft consultation on the definition and recognition elements (second phase of the project). Then came phase three of the project document was a first measurement. In September of that IPSASB continued its efforts on three phase of the project and agreed that the next stage of development to produce a new draft consultation document. In April 2010, were discussing issues that have emerged from analyzing the responses. Further problems were discussed on two three phases of the project. In November 2010, was approved ED (Exposure Draft), which will end on June 30, 2011.

Document Highlights

The role and authority of the conceptual framework. The conceptual framework defines the concepts underlying the financial information on public sector entities adopt accrual accounting.

The conceptual framework does not define any new obligation on the financial information of public sector entities which are compliant to IPSAS and will not invoke IPSAS existing rules. However, if the situation is not covered by IPSAS standards or other documents issued by the Council, the conceptual framework is a relevant reference in the search for solutions.

The objectives of financial information are defined by users of financial statements in general, according to information needs. Users of these reports can be recipients of services, providers of resources or services concerning specific parties. A summary of their information needs was conducted. It appears that in many countries, legislative power is the main user of these reports. The financial information set by a public sector entity must provide users with adequate information entity.

The scope of financial information defined transactions, other events and activities that can be taken into account in the general purpose financial reports. Financial reporting should be large enough so that the general financial report of an entity to take account of financial or non-financial items in the past, present or future, to be understood and to provide financial data.

Qualitative characteristics of information contained in financial reports for general use. These qualitative characteristics are attribute ensures the interests of users of the information contained in financial reports and make general reference to the objectives defined for financial information. Qualitative characteristics of financial information provided in reports on the general use of public sector entities are: relevance, reliability, understandability, timely availability, comparability and verifiability. General purpose financial reports are also subject to general constraints relative importance, cost and the appropriate balance between qualitative characteristics.

The nature of the entity that presents a conceptual framework to the financial information is not intended to designate parts of government or public sector entities. The nature of relations between the legislative and executive and financial information on the consequences of these relationships are raised equally.

Research methodology

The main objectives in our paper are: the conceptual history of public sector accounting, analysis and presentation of a consultative paper: Conceptual framework for reporting them financially in the public sector - in September 2008, detailed analysis of the received 55 responses. From the methodological point of view, a qualitative research is conducted, based on books, articles, publications and electronic resources of the Internet, but also a sustained quantitative study being empiric. These want to submit proposals for public response and interest in this problem. We have completed these steps:

- Documentation on the responses of 55. We looked at only 54; one of the answers can not be accessed.
- Analysis and interpretation of responses, through a content analysis will build a database of answers given by respondents. By quantifying 1 (Yes) and 0 (N) will determine acceptance or denial of each view (N = 9) under discussion. We must mention that, if a respondent did not respond to a View, in our analysis we considered that View is accepted, receiving a value. We went on the premise that if he did not agree, say so.
- Once this database we conducted an analysis on the country areas, the degree of acceptance and category of respondents.

Scientific research method in this paper contribute to its efforts to deepen the knowledge of character back (required by the theoretical research done) and by the prospective (given by empirical research). IPSASB accept comments on all issues raised in the consultation document in this regard subject to debate nine key issues. As a rule on respondents answers is argument for or against. If a negative response is required proposing new solutions.

Responses are required on the following issues:

1. Authority conceptual framework - the conceptual framework will establish new mandatory requirements for financial information in the public sector, which comply with IPSAS. The selection of accounting principles applicable in certain situations that do not comply with IPSAS, public sector entities will refer to the definitions, recognition criteria, valuation principles and other concepts identified in the conceptual framework that could be applied.
2. General purpose financial reports - are designed to meet the needs of general information for a wide range of potential users.
3. Users of general purpose financial statements (general purpose) - to identify common information needs of potential users of general purpose financial statements reports, these users are identified by: recipients of services or their representatives; taxpayers or their representatives; other parties, including interest groups and their representatives. Legislative power is one of the most important users of financial reports generated by public sector entities.
4. Objectives of Financial Reporting - by public sector entities are to provide useful information for users of the reports by: evaluation; taking responsibility for resource allocation decisions in politically and socially.
5. The scope of financial information. Area of financial information includes financial and non-communication of data: economic resources; effect of transactions, other events and activities that alter the economic resources, rights to these resources during the period, including incoming and outgoing numbers, and financial performance; compliance by the reporting entity laws or regulations applicable to the adoption and approval of budgets and justification taxes and fees; the information the prospective financial and other information on future activities. The field also includes financial information, providing explanatory documents: a) The main factors affecting the entity's financial performance, achievement of service delivery and other goals that may have an influence on future performance. b) The assumptions underlying them financially in the reporting of information presented in general purpose and key uncertainties.
6. Evolution of the scope of financial information. Financial reporting must evolve according to the information needs of users and in accordance with financial reporting objectives.
7. Qualitative characteristics of information in general purpose financial reports. These features are: the relevance, which includes the value of confirmation, the predictive value or both; true image, obtained by describing fair, neutral and without significant errors intelligibility; comparability timely dissemination of financial information; check constraints. The relative importance is achieving a balance between cost and quality characteristics.
8. Features of the reporting entity. A reporting entity is mainly characterized by the existence of users who require general purpose financial reporting. A public sector entity may carry out financial information may have its own legal entity or other organization.
9. Entity composition of a group of financial disclosures. A reporting entity has the power to govern the financial and operational strategies of other entities (criteria laid value) and can benefit from the work of others.

IPSASB accept comments on all issues raised in the consultation document in this regard subject to debate nine key issues. As a rule on respondents answers is argument for or against. If a negative response is required proposing new solutions.

Results

Relative to the political map of states can be distinguished in the total number of countries on every continent, who have contributed to improving the conceptual framework (Figure 1).

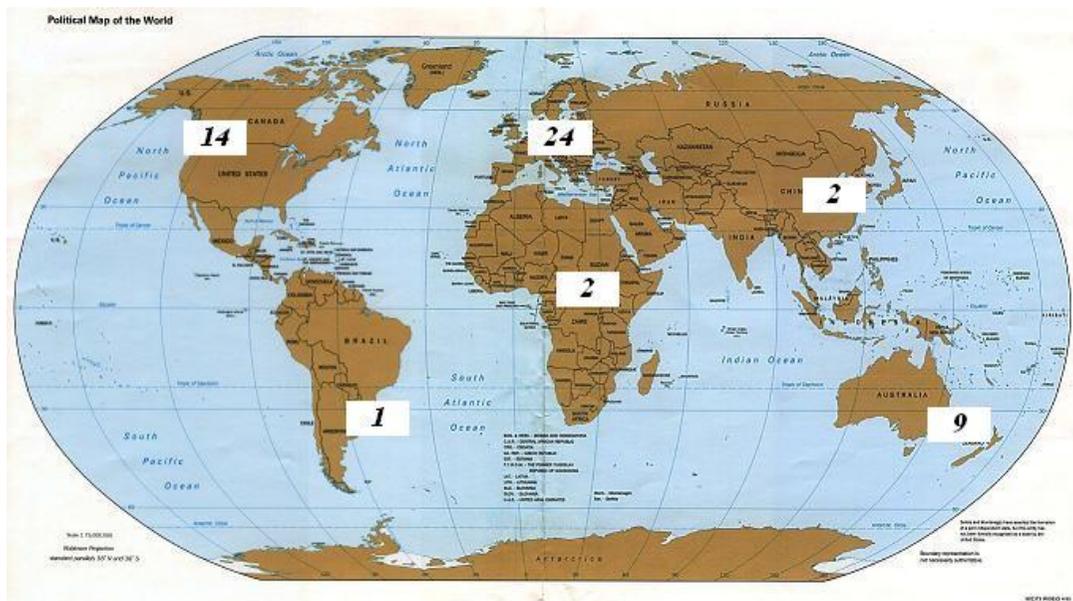

Figura 1. Country situation
Source: Own processing

The degree of acceptance of the 9 hypotheses (view) discussed is as follows (Figure 2):

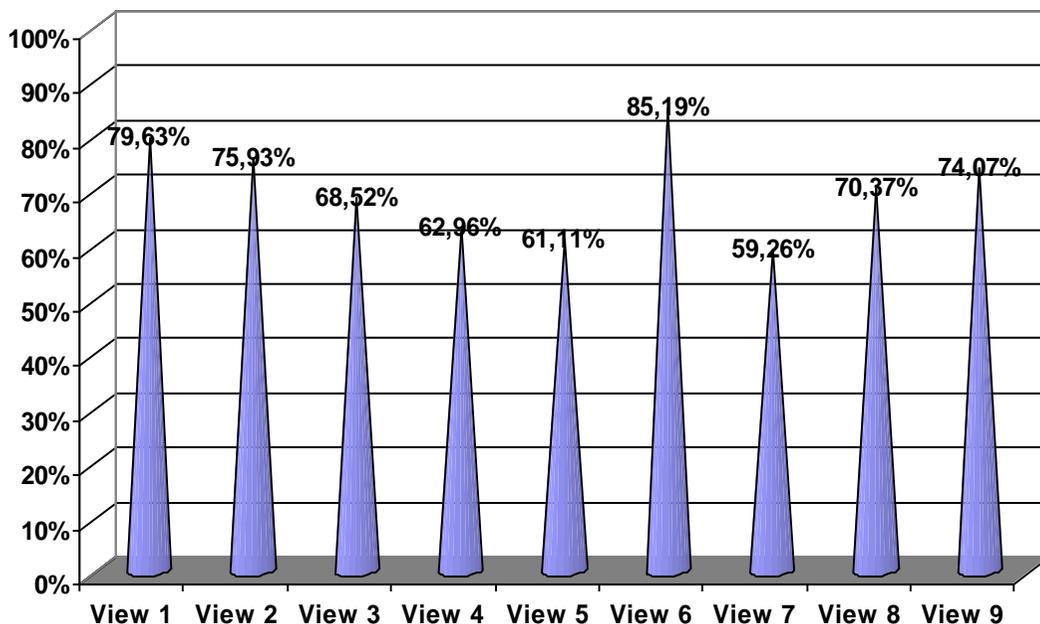

Figure 2. Acceptance degree
Source: Own processing

Overall, respondents supported referential in excess of 50%. View 6 - Evolution of the scope of financial information appears to be the most acceptable, since the few exceptions. Users agree that the scope of information includes financial information that must constantly evolve to

successfully meet the needs of users. In contrast, the subject 7 - Qualitative characteristics of information in general purpose financial reports were proved to be the most problematic situation. Most raises doubts that these quality characteristics suitable for the financial statements are not equally suited to all information in the public sector. It is clear that qualitative, adequate financial statements are equally suitable for any information on the proposed scope of the consultative document. This is illustrated by the confirmation in paragraph 4.28 of the consultation document where the quality of "verifiability" is often referred to as "affordability" in the context of qualitative information and perspective: it seems to be more than a difference in terminology. Another example: it is not clear how the quality of the "exact representation" can be applied to prospective financial information, which is not part of the financial statements.

Conclusions

IPSAS conceptual framework is found to be a controversial issue worldwide. The most frequent comments were made on the basis that IPSAS not quite explicitly defined terms used, such lines were deployed to put in place smoothly each of the nine hypotheses are preliminary abortive. From our point of view, we consider that provides a broad basic approach is correct in terms of accounting approach, but focus and retouching can head to the precise details, accurate and to the point of each element independently. Ideas drawn from the consultation document have been accumulated in strengths and drawbacks in the approach.

Following the study, we identified the following strengths of the consultative document: Consultation Paper is well written in a manner intelligible to users of financial information, are the best international practices for public sector entities, financial reporting purposes is well defined, IPSASB have taken into account in an active general purpose financial reporting. Disadvantages may be considered: the objective of the IPSASB project should not interpret the IASB, the idea that there is a potential risk and misleading public sector entities, differential treatment for public-private partnership is a controversial subject, raising many misunderstandings among users, so it is an acute need for better specification of the characteristic features of each sector, IPSASB should make a clear distinction between users of public sector financial reporting.

Future research

IFAC Board established the Council for International Accounting Standards for Public Sector - IPSASB in order to produce high quality standardized accounting to be used by public sector entities around the world for general purpose financial statements. Thus, development of accounting standards which recognition and implementation will be extended on a scale as to be geographically located in a continuous ascent. IFAC is trying to deliver some quality accounting standards for public sector in a way more obvious to all. And comments relevant IFAC can not change what has been specified or not mentioned at all. As for the future research, we believe the focus should be on highlighting all the uncertainties and to not attempt to provide remedies in the area of concern. In the hope of new works to treat more seriously as possible and improve the issues highlighted point here, we conclude that the IPSAS should take into account to optimize current criticism in the comments and congratulations to animate quality of the following future projects.

INTERNATIONAL AND EUROPEAN ACCOUNTING CONVERGENCE-AN ESSENTIAL PART OF THE INFORMATION TRANSPARENCY “PUZZLE”

Popa Anca Sabina

”Babes-Bolyai” University, Cluj-Napoca, Romania, Faculty of Economics and Business Administration

At the level of this article, I have tried to highlight both the distinctive features of the concepts of international accounting standards, international and european accounting convergence, aspects of transparency in presenting economic and financial situations, and the interferences that characterize them, taking into account the fact that we can not talk about a specific line that can separate practically the processes these concepts involve, processes conducted at the economic entity level, by default processes involving long-term value creation.

Keywords: IFRS, IAS, convergence, economic and financial situations, economic entity

Jel codes: M41; F15; O19; M48; G11

Introduction

At the level of this article, I have tried to highlight both the distinctive features of the concepts of international accounting standards, international and european accounting convergence, and the interferences that characterize them, taking into account the fact that we can not talk about a specific line that can separate practically the processes these concepts involve, processes developed with significant implications at the economic entity. Below I intended to highlight some theoretical aspects related to the mentioned concepts. In essence, this article is meant to highlight the framework related to the concept concerning strengthen the credibility of information provided by senior management, related to homogenization, harmonization, alignment to economic and financial reporting at european level and why not at worldwide level in the attempt to ensure transparency relative to economic transactions and information provided by entities through financial reporting and beyond. In essence, at the economic entity level, concepts such as credibility of information provided by senior management, mixing, harmonization, alignment to economic and financial reporting at european level and why not at worldwide level in the attempt to ensure transparency relative to economic transactions and information provided by entities through financial reporting and beyond, contributes to an increased level of internal control within each entity, a better knowledge of their activities conducted under conditions in which they are perceived through the standardization process either european or global default leading to a better corporate governance implemented within the entity, with tangible results. In my opinion, the alignment to financial reporting standards leads to a more transparent way of activities undertaken by an entity, much more transparency concerning economic transactions, to a more realistic perception of the business environment in which the entity operates, and by default to a pro-active attitude concerning information used to support decision-making, namely internal and external environment of the entity.

Research methodology

In this article we used the comparative method relative to different perspectives and approaches to define the concepts mentioned.

Non-participating observation stands to support a short theoretical analysis in terms of interference and interdependence between internal control and corporate governance.

Regarding the typology of research, in this paper, I used a qualitative research. To achieve the objectives of this article, I used a range of research techniques, namely: the study of bibliographic references, information gathering, processing information, establishing correlations between them, selection and synthesis of information.

1. International and European accounting convergence-historic landmarks

In March 2001, the International Accounting Standards Board: IASB has become a foundation, organized in accordance with the American standardization body model (FASB). The foundation is composed of four elements:

- meeting managers (trustees);
 - the standardization body itself, the IASB, which incorporates the activities of international harmonization of the old body: International Accounting Standards Committee: IASC
 - a committee of interpretation, the interpretation of international financial reporting: International Financial Reporting Interpretations Committee: IFRIC
 - an Advisory Board of normalization: International Accounting Standards Advisory Council: IASAC.
- International Accounting Standards Board: IASB has full responsibility for development and publication of international accounting standards. They are called international financial reporting standards (International Financial Reporting Standards: IFRS). Nowadays, the general term accredited is international accounting referential, IFRS, which includes:
- International Financial Reporting Standards (IFRSx) developed by the IASB;
 - International Accounting Standards (IASx) which have supported and will support a review process by eliminating alternatives, redundancies and conflicts in their content, and those that did not required such an improvement or it was not imposed, at least for now, their removal;
 - new interpretations: issued by the IFRIC's Committee or its predecessor, Standing Interpretations Committee: SIC, they (especially the latter ones) are subject to deletions and revisions, when reality requires it.

Given the ambitions of the European Union on the adoption of international accounting referential, it is important not to lose sight of the major implications of such an option. Such adoption has brought and brings continuously fundamental changes in the area of reflection of professional accountants in the old continent. Challenges entail the disruption for those quartered in their sophisticated traditions. It is even greater as some European countries (in fact, most of them) were and still are carriers of an accounting model away from Anglo-Saxon philosophy, model which inspires the work of the international standardization body. The hallmark of these developments is in accordance with the accounting's attached target, even by international conceptual framework: providing information on the needs of investors, in substantiating their decisions on the purchase, storage or sale of financial securities held by them. From such an objective results automatically the primacy given to the balance sheet versus the other financial statements. In this report of forces places the obvious increasingly application of the principle substance over form and the appeal to a rating system based on fair value. Regarding the balance, the patrimonial balance loss of speed is obvious in favor of a structure to better express the economic and financial reality.

Increasingly appeal to fair value measurement system, does not mean abandoning historical cost and prudence, but at least reduce the presence of these accounting principles in the accounting message, leaving a closer criterion balance between relevance and reliability of the information. Fair value is primarily a market value, which means that assets and liabilities should be valued on an efficient market. Often, fair value is calculated based on models that call for updates on current values of expected cash flows of the concerned enterprise.

Appropriate training in letter and spirit of assimilation of the IFRS is absolutely necessary and it will decant values. Formulators, users and auditors of accounts should prove a great capacity for

interpretation and of wisdom, especially since these new “products” for normalization, which we call the IFRS standards and IFRIC interpretations, lead to the use of a non-negligible dose of estimation, meaning approximation, so subjectivity. The assimilation of international standards, requires the need for a national comparison between the national referential and the one “produced” by the IASB. (Feleagă L. and Feleagă N. 2006: 37-38)

2.The framework of international accounting convergence

In its first years of existence (2001-2005), the international body on normalization the IASB accomplished three major tasks:

- build a "stable platform" to include performant standards;
- mounting a strong framework for convergence of the national standards with international standards;

- mounted a flexible framework for achieving convergence to international standards (IAS / IFRS) with the american ones (U.S. GAAP). At the time when the EU decided to adopt IAS / IFRS, we can say that very often this situation has been presented as a european response to U.S. dominance concerning rules (U.S. GAAP) in view of the global financial markets. Clearly, such a statement deserves to be nuanced. For specialists, it is easy to see that Europe nowadays exerts a smaller influence on the work of international standardization body than the United States of America, even if in the old continent was decided to adopt the international referential. On the other hand, the highest altitude in the evolution of global accounting is the convergence between the two internationally recognized accounting referentials: IFRS and U.S. GAAP. On September 18, 2002, the two bodies on normalization (IASB and FASB) have agreed on a timetable and a method for convergence. It's about the Norwalk Agreement. However, so far, neither the IASB nor the FASB did not respond to questions about governance model. Given that, the IASB has chosen a policy of convergence of the IFRS referential with the (U.S. GAAP), it received a significant aid from the European Commission. Concerning the "stable platform", it should be noted that, since its first engagement, the Council of the international body focused on the practical implications of the European Commission's proposal that from 1 January 2005, all listed companies in EU financial markets to adopt the existing package of international standards reviewed, plus the new standards (IFRS). The Council also decided that only those standards developed and published until 2004 (inclusively) to be implemented in 2005. Standards developed and published after that date must be applied in 2006 or later. Concerning the reviewing process, the IASB aims required to eliminate the options (alternatives), redundancies and conflicts arising in the standards' content. In order to achieve convergence, the championed project for improvement advocated for the implementation of the best practices worldwide. The project also received the endorsement of a wide range of “actors” of the financial markets, securities' commissions of specialists, accountants, national normalization bodies, Advisory Council for normalization, of the representatives of the general public. Finally, the project has excluded a number of options contained in the IAS, because their existence and led to elements of uncertainty causing reduction of comparability.

Completion of the improvement project has been achieved in December 2003. Along with this project and to guide first-time adoption of International Financial Reporting Standards (that aims IFRS 1), it was necessary to finalize the work on four projects of a new type of standards (International Financial Reporting Standard: IFRS), the first two because of previous lack of a standard capable to constitute itself a departure guide and the other two, for achieving greater convergence between the two accounting systems-worldwide oriented (the international one and U.S one.). That's how the trailblazer IFRS 1 is followed by IFRS 2.(Feleagă L. and Feleagă N. 2006: 39)

3.Aspects pro international accounting convergence

By listing the european companies on U.S. financial markets, listing accepted by the positive signal received from the international accounting referential on these markets, investors will do their capital investment in hope of outstanding performance. Normally, financial statements prepared in accordance with international standards and accepted by the American securities (Securities and Exchange Commission: SEC) had to be pulled through the filter of convergence. An example of this is the case of clusters. By developing standards FAS 141 "Clustering" and FAS 142 "Goodwill and other intangible assets", adopted by the FASB on 29 June 2001, creating a revolution in practice, as a result of acceptance as the sole method of group purchasing and especially by changing the regime concerning goodwill impairment, swiching from the application of a damping based system to a system based on impairment testing whose result was making a call for a more flexible policy used each year. As a result, international standardization body, the IASB, was determined to rethink such a problem. IAS 22 had been undergone to several improvements. Before switching to the referential based on IFRS this standard had the following elements of content. There were accepted two significantly different methods of accounting for business groups: the pooling of interests and the union of interests and the method of acquisition. As was demonstrated by financial analysts and other users of financial statements that using two different accounting methods for similar transactions largely affects the comparability of financial data. Moreover, some specialists have found that the differentiation between the methods of accounting for such transactions concerning achieving a "desirable"result may pave the way for" tuning" the image of the company. In addition, IAS 22 offered two possibilities for applying the method of acquisition: the identifiable assets and liabilities could be assessed initially using either basic accounting treatment or an accepted alternative treatment. The benchmark treatment, identifiable assets and liabilities were recognized, being initially measured as the sum of fair values, taking into account the limit stake obtained by the buyer and the previous accounting values regarding the acquisition,and also taking into account the limit stake owned by the minority shareholding. By using alternative treatment, identifiable recognized assets and liabilities were measured initially at their fair value at the acquisition date. It is obvious that, given that similar transactions are accounted by using alternative methods,the usefulness of the information will be affected both by the lack of comparability, and by the credibility. Instead of IAS 22, which became obsolete, the international body develops and requires to listed european companies in the IFRS system to apply International Financial Reporting Standard 3, cut by the american thinking, so filtered through convergence. Among many changes brought to the new standard, it's essential to point out the following two:

Accounting Method

In accordance with IFRS 3, all clusters that fall within its scope will be accounted using the purchase method.

The subsequent accounting of the goodwill

In accordance with IFRS 3, goodwill acquired as a result of clustering will be evaluated after initial recognition at its cost, less accumulated losses from depreciation. Accordingly, goodwill is not amortized but will be verified annually or whenever there are signs that it has suffered an impairment loss. It is known that, in accordance with IAS 22, goodwill had to be amortized systematically over its useful life. IAS 22 provides also the criticizeble presumption that the useful life of goodwill may not exceed 20 years from the date of the initial recognition. From the foregoing it appears that companies have a greater flexibility so that could afford to amortize goodwill over the most convenient term for them, which led to the practice of creative accounting phenomena. Thus, entities that had a financial situation which shows a state of "good health " were tempted to retain the shorter amortization period to discard as soon as possible from this

source of future expenditure. On the other side, entities with a poor performance or even poor results preferred to choose, rather, long periods in order to spread depreciation over an extended period of time. (Feleagă L. and Feleagă N. 2006: 40)

4.Aspectes against international accounting convergence

The impact of the cultural factors is an essential vector concerning the analysis of social systems changes. Culture influences both norms and values of these systems and the behavior of groups in interaction or within systems these and also influences the relations between systems. Differences between national accounting systems are often regarded as cultural differences. This qualification can lead to confusion, since it assumes that there are needed different accounting systems from one country to another. Accounting pressures have changed once with the phenomena of economic globalization. In essence, no country can claim to have a perfect accounting referential. The United States is the country which has the longest tradition concerning the accounting normalization. It has the most important accounting standardization body, characterized by a very high level of professionalism. But even U.S. accounting rules point out compromises between different interests. Turning to the details of these rules, it appears that many of these "compromises" are far away from creating an unanimous framework among the american accountants. In order to be efficient, this huge effort should be continuously done by the international body :IASB. It has gained its legitimacy through the efforts of the representatives of many countries and by the appeal to strict international procedures. The accounting system of a country it's in essence as a social construction depending on the nature and trends of society. Beyond this aspect, the accounting system of a country depends on the emergence of particular phenomena and also on the exchanges the country develops with other countries. Specialists in the field claim that the big companies of any country, large groups and multinational companies are attracted to the magnet of globalization. What is sad is the fact that small and medium-sized enterprises have little chances not to be "crushed" by this giant "mixer". (Feleagă L. and Feleagă N. 2006: 41)

5.Conclusions

The need for a single accounting "language" in transmitting accounting information, the international accounting practice of the last period, in line with the current context of globalization emphasize through the experts' assertion in the field the following significant advantages relative to the adoption of a common "language" in transmitting financial and accounting information namely:

- development of large corporations;
- group of companies' expansion;
- global integration of capital market;
- development of financial instruments;
- single market in Europe, including with regard to accounting;
- impact of different accounting standards on the profession.

These factors are closely correlated with the increase registered on the capital markets in the recent years and the increased interest shown by companies to obtain financing in these markets. By switching to the application of IFRS, companies will adopt a global financial reporting language that will allow them to be perceived correctly, regardless of users. Many european companies have already found that the adoption of IFRS brings them access to international capital markets, can reduce their costs and can more easily conduct international transactions. Communication in a unique language provides a greater level of trust and leads to increased opportunities for access to capital markets. It also allows multinational groups to apply common accounting principles in all branches, which can optimize internal communication and quality

reporting to top- management. At the same time, the application of IFRS may facilitate purchases and sales processes by providing a higher level of trust, relevance and consistency of accounting perception.

AN INVESTIGATIVE STUDY REGARDING SMES SPECIFIC ACCOUNTING POLICIES

Popa Dorina Nicoleta

University of Oradea, Faculty of Economics

Beleneși Mărioara

University of Oradea, Faculty of Economics

Meșter Ioana Teodora

University of Oradea, Faculty of Economics

In this paper we intend to continue the research regarding the enterprise accounting policies and the manner in which these are perceived by the practitioner accountants, Assistant Lecturers of financial statements. This time, in order to carry out the research, we made up a new questionnaire applied to the same sample, containing a number of 100 SMEs in Bihor County, selected according to the criterion of the average number of employees and that of the level of net turnover at the end of 2008. Continuing previous conducted research we have investigated this time the specific accounting policies of the sampled SMEs from Bihor County and the way these policies are understood by practitioners and implemented in order to prepare financial statements. Surprisingly, we have found that only 93.33% of the respondents agree that the elements presented in the annual financial statements of the entity are evaluated in accordance with the general accounting principles stipulated in Order 3055/2009, according to the accrual accounting. Half of the people interviewed had in view all four qualities of accounting information (intelligibility, relevance, credibility, comparability) in drawing up the annual financial statements, and most of them (56.67%) are not aware of the possibility to use a significance threshold (10%-15%) of the total value of that particular category of assets, liabilities, expenditure, income and results for an as faithful as possible presentation of information in the balance sheet and in the profit and loss account.

Key words: accounting policies, financial reporting, disclosure, SMEs

JEL codes: M41, M10, C81

1. Introduction

Our research hold forth to initiate a questionnaire based research in order to see the main perceptions of the accountant working in a small or medium sized enterprise, on accounting policies and their utility in providing the faithful image given by the accounting. The central objective of our research is to determine the degree of sensitivity regarding the formulation of written accounting policies by the Bihor county SMEs and the setting up of a manual of accounting policies and procedures at a certain entity level. We used directly applied questionnaires, on selected SMEs. Within each firm, we wanted to ask a person from the accounting department or from the management team to fill the questionnaire. Almost in all the cases the respondents belong to the accounting department, in most of the cases being the chief accountant or the firm's economic director. The structuring of the questionnaire was made on 3 essential levels: 1. general information about the respondent; 2. questions testing the managers or the accountants' perception on the enterprise accounting policies; 3. personal data about the respondent. In total, the questionnaire had 30 questions out of which, 11 require answers from a scale from one to five, varying between strongly agree (5) to strongly disagree (1).

In this paper we intend to continue the research regarding the enterprise accounting policies and the manner in which these are perceived by the practitioner accountants, Assistant Lecturers of financial statements. This time too, in order to carry out the research, we made up a new questionnaire applied to the same sample, containing a number of 100 SMEs in Bihor County, selected according to the criterion of the average number of employees and that of the level of net turnover at the end of 2008. Continuing previous conducted research we have investigated this time the specific accounting policies of the sampled SMEs from Bihor County and the way these policies are understood by practitioners and implemented in order to prepare financial statements.

2. Literature review

Several researchers (Hagerman & Zmijewski, 1979; Zmijewski & Hagerman, 1981; Francis, 1987; Leftwich, 1981; Gopalakrishnan, 1994) have been trying to explain the motivation of the managers in choosing the accounting methods and why the capital market reacts to the accounting changes imposed. In the literature regarding accounting policies, the researchers have used the following perspectives in order to identify the determinants of the accounting policies: the opportunistic behaviour, the efficient contacting and the perspective of the information.

On the other hand, in other studies (Tarca, 2002; Gernon and Meek, 2001; Saudagaran, 2001; Schipper, 1999; Nobes, 2000) the impact of international harmonisation pressures on companies' choices of accounting policies is investigated. Demands for greater comparability in reporting have arisen from increased international business activities and greater participation in global financial markets. Companies may seek more harmony in their reporting if they expect greater comparability to have more benefits than costs. If a company selected policies that were consistent with IFRS, then it would increase comparability of reporting with other companies using IFRS. An interesting research is presented in Gietzman and Trombetta (2003) study regarding disclosure interactions: accounting policy choice and voluntary disclosure effects on the cost of capital. In their research the authors considered how disclosure of accounting policy interacts with subsequent choice over voluntary disclosure of a non-financial performance metric. Other previous research works (Myers and Majluf, 1985; Healy and Palepu, 2001; Lang and Lundholm, 2000; Paprocki and Stone, 2004; Levine and Smith, 2006) build their study on investigating or examining choices of critical accounting policies, testing whether the quality of critical accounting policy disclosures is significantly associated with a proxy for information asymmetry. Critical accounting policies are the three, four or five policies that are very important to the portrayal of the company's financial condition and results and that require management's most difficult, subjective or complex judgments often because they require estimates about the effect of matters that are inherently uncertain. Such disclosures are intended to reduce information asymmetry.

Domestic accounting literature is mainly preoccupied with the conceptual aspects of the accounting policies and the analysis of the motivations leading to the selection of a certain policy by the management of enterprise. Authors like Duțescu (2003), Feleagă and Malciu (2002), Cernușca (2004), Diaconu (2004), Bunea (2006) are preoccupied in their research with the meanings of defining the concept of accounting policies as well as with the essential estimation criteria of accounting choices. Thus, according to Bunea (2006), if we make a review of the opinions regarding the content of the concept of accounting policies, in order to identify its nucleus, we will notice that it does exist and it is made up of an objective – restriction, represented by getting in the financial statements a superior quality piece of information, useful to different categories of users, but also from the estimation policies binomial – drafting and presentation policies of financial statements. Feleagă and Malciu (2002) are more incisive when referring to the delineation between the accounting policies and the estimation techniques: *„actually different accounting policies represent the same set of events in different ways or*

different aspects of the same set of events; on the contrary, the estimation techniques are used to get to the events that must be presented.” Cernușca (2004) considered that accounting policy requires licit and concerted actions supported by the research of the objectives suggested by the managers of the enterprise, but it can also be the expression of some implicit accounting options. The enterprise management, through the accounting policy it draws up, sets up certain objectives regarding the size of the result. The accounting policy chosen by the enterprise management has consequences on the determination of the size of result, represent a true decision of strategic management.

There are not many studies in the Romanian accounting literature preoccupied in investigating or exploring different aspects of SMEs concerning financial reporting, accounting regulation, disclosure of information or analyzing the used accounting policies. Nevertheless, it is worth mentioning the studies conducted by Deaconu *et al.* (2008), Pășcan, Neag and Virag (2009), Neag, Pășcan and Mașca (2010), Briciu, Ivan and Groza (2010). While authors like Deaconu *et al.* (2008) are mainly interested in analyzing the future accounting regulations for SMEs in the context of adopting at European level the IFRS for SMEs, Pășcan, Neag and Virag (2009) and Neag, Pășcan and Mașca (2010) focused on studies concerning financial statements or different accounting requirements for small or micro entities in Mureș County. Briciu, Ivan and Groza (2010) are concerned in aspects of development SMEs analyzing the role of accounting software and the way it encourages this segment of market.

3. Research methodology

The methodology used in the current paper is the human behaviour research methodology, whose methods are the interview, the questionnaire, the survey, the laboratory studies, the experiments etc. Regarding the investigation of the perception of the Bihor county SMEs Romanian accountants on the necessity to set up written accounting policies at the enterprise level, we used a questionnaire based survey. Thus, the empirical research was based on a pilot study constituted on a questionnaire applied in the territory. We wanted in this way to take the pulse of the population studied which is constituted of Bihor county SMEs, sampled according to size criteria: the net turnover reported at the end of 2008 financial year and the average number of employees reported at the end of the same period.

The central objective of our research is to determine the degree of sensitivity regarding the formulation of written accounting policies by the Bihor county SMEs and the setting up of a manual of accounting policies and procedures at the level of an entity. Within each firm, we wanted to ask a person from the accounting department or from the management team to fill the questionnaire. Almost in all the cases the respondents belong to the accounting department, in most of the cases being the chief accountant or the firm's economic director. It is important to emphasize the fact that in our research we have used the aleatory sampling procedure. The structuring of the questionnaire was made on 3 essential levels: 1) general information about the respondent; 2) questions testing the managers or the accountants' perception on the enterprise specific accounting policies; 3) personal data about the respondent.

4. Descriptive statistics and results

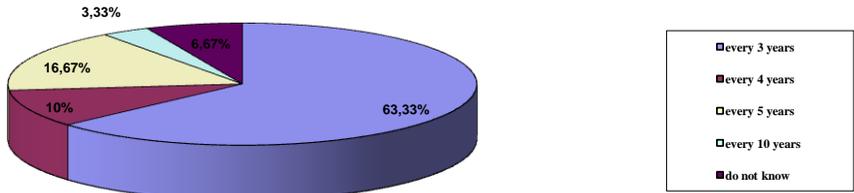

Out of the 17 enterprises which have not filled in our questionnaire, 7 have been found in a difficult financial situation, meaning insolvency and 10 enterprises expressed their clear intention not to fill in the questionnaire. Out of the total of 83 questionnaires processed, in a number of 80, the general information section was filled in, but only 77 mentioned the name of the entity where the subjects work as well. We consider that is worth mentioning that out of the total of the answers received, a number of 65 subjects have declared that they have more than 5 year experience in making financial statements, these having a weight of more than 85% of the total of

the sample, the rest having 1 to 5 year experience. Out of the 83 people interviewed, 66% were females and the distribution on age groups was the following: 41% were between 25 and 34 years old, 39% between 35 and 44 years old and the rest – over 45 years old. Regarding the subjects’ professional qualification, the distribution of the sample showed that 44% of respondents are chartered accountants that have also economic college education, 7% of respondents are certified accountants with college education and 5% have economic average education.

Our attention was focused on the 24 questions in the second part of the questionnaire, those regarding the enterprise specific accounting policies, as they are provided in Order 3055/2009.

The first 3 questions tackle the problem of presenting the accounting information in the financial statements and only 93.33% of the respondents agree that the elements presented in the annual financial statements of the entity are evaluated in accordance with the general accounting principles stipulated in Order 3055/2009, according to the accrual accounting. Half of the people interviewed had in view all four qualities of the accounting information (intelligibility, relevance, credibility, comparability) in drawing up the annual financial statements, and most of them (56.67%) are not aware of the possibility to use a significance threshold (10%-15%) of the total value of that particular category of assets, liabilities, expenditure, income and results for an as faithful as possible presentation of information in the balance sheet and in the profit and loss account. Out of 83 people interviewed, only 53.33% are aware of the fact that when entering into management the purchased tangible assets are evaluated at the purchase cost and 3.33% are not aware or have a vague opinion about the fact that the depreciation policy is based on the detailed depreciations periods used for each tangible asset and the depreciation methods correspond to the manner in which these tangible assets are used and they start producing effects the moment they are used. As a depreciation accounting method used to recover the input value of the tangible assets, 95% of the entities prefer the linear method, 1.67% use only the accelerated method and the rest apply the accelerated method for machinery and means of transport and the linear method for the rest of the tangible assets.

In accordance to the provisions of OMFP 3055/2009 *re-evaluations must be carried out with sufficient regularity so that the accounting value of the tangible assets do not substantially differ from that which would be determined by using the equitable value on the date of the balance sheet. The equitable value of the tangible assets is generally determined starting with their market value.*” As it results from figure 1, 63.33% of the interviewed companies have in view the re-evaluation of the tangible assets every 3 years, 10% every 4 years, 16.67% every 5 years and the rest either uses a too high interval of re-evaluation or they are not aware of this aspect.

(Source: authors’ calculus)

Figure 1. The distribution of answers in the sample regarding the time interval of the tangible assets’ re-evaluation

Regarding the significance threshold established for the recording of differences in the assets' re-evaluation, an important percentage (18.33%) of the people interviewed are not aware of its percentage or the usefulness of its usage, 40% apply a percentage of 5%, 38.33% use a significance threshold of 10%, a company 15%, and another only 1%. The following table (*Table 2.*) presents in a grouped manner the distribution of answers regarding the accounting policy of tangible assets in sample, noticing that only 86.67% of the respondents are aware of the fact that the modernization expenditure and capital repair services are included in the accounting value of tangible assets if these increase productivity or the life of the asset.

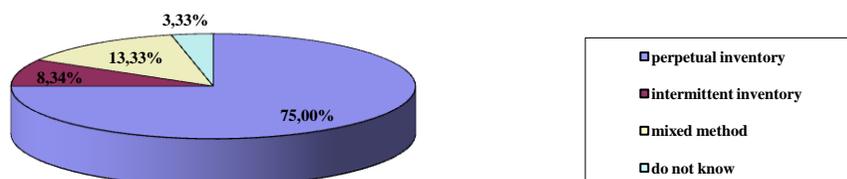

Table 2. The distribution of answers regarding the accounting policy of tangible assets in the sample

Nature of problem investigated	Answers			
	Correct	Vague	Incorrect	Total
Evaluation of purchased tangible assets	53.33%	0%	46.67%	100%
The depreciation policy is based on the depreciation periods and methods corresponding to each asset, starting to produce effects the moment they are used	96.67%	1.67%	1.67%	100%
Inclusion of modernization expenditure and capital repair services in the accounting value of the tangible assets – capitalization of costs	86.67%	1.67%	11.67%	100%
Estimation and creation of provisions when there are litigations with the suppliers or lessors/lessees of an asset at the end of the financial year	75%	8.33%	16.67%	100%
Essential changes regarding the evolution of litigations occurred between the closure date of the financial year and the date when the annual financial statements are subduced to approval are considered “an event subsequent to the date of the balance sheet, requiring accounting adjustments”	90%	3.33%	6.67%	100%
Evaluation of asset at the lessee in case of a financial leasing contract	18.18%	0%	81.82%	100%

(Source: authors' calculus)

From the analysis of data presented in the table above, it results that many of the prepares of financial statements do not abide by the principle of prudence and that of financial year independence in presenting the accounting information for a quite low percentage (75%) resort the estimation and creation of provisions for litigations when they deal with this kind of situations. Moreover, 10% do not follow the evolution of these litigations and if an essential change occurs between the closure date of the financial year and the date when the annual financial statements are subduced for approval to the Annual General Meeting, they do not consider it as “an event subsequent to the date of the balance sheet requiring accounting adjustments”. Less than a quarter of those interviewed evaluate the asset sampled in financial leasing (the case of the lessor) at the value of the minimal leasing payments, the rest of them considering the equitable value, the cost or the minimum between the equitable value and the

value of the leasing payments more appropriate. The following 6 questions concern the inventory accounting policy. Three quarters of the analyzed enterprises prefer the perpetual inventory method as an accounting method used for the stock valuation, 8.33% intermittent inventory and 13.33% use the mixed method, according to the following figure:

(Source: authors' calculus)

Figure 3. The distribution of answers in the sample regarding the accounting method used for inventory valuation

The organization of inventories is made according to the quantitative-value method for raw materials, consumables, finished goods and other inventory goods. The global-value method is used for merchandise. Only 78.33% of the respondents agree with this provision, the same percentage being recorded also in the case of acknowledging in the profit and loss account of the period of the loss from the depreciation of the hardly marketable stocks when re-evaluating them (see Table 4.).

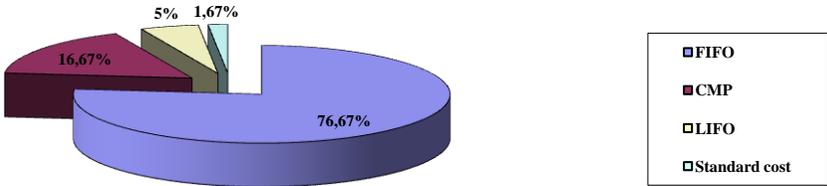

Table 4. The distribution of answers regarding the accounting policy of inventory in the sample

Nature of problem investigated \ Answers	Correct	Vague	Incorrect	Total
The use of quantitativ-value and global-value methods for the organization of inventory management	78.33%	8.34%	13.33%	100%
Re-evaluation of hardly marketable inventories and acknowledgement of loss from their depreciation in the profit and loss account of the period	78.33%	8.34%	13.33%	100%
Evaluation and presentation of inventories in the balance sheet	16.67%	0%	83.33%	100%

(Source: authors' calculus)

A very small percentage (16.67%) of the total of practitioner accountants answering this interview are aware of the fact that inventories are evaluated and presented in the balance sheet at the smallest value between the cost and the net achievable value, the rest choosing either the first value or the second one. 63.33% of the entities organize internal control procedures of inventories, on each category. More than three quarters of the respondents evaluate the

indistinguishable inventories by using FIFO method, the rest use the other methods in accordance with the percentages in the following figure:

(Source: authors' calculus)

Figure 5. The distribution of answers in the sample regarding the evaluation method of inventories

The last 5 questions are the object of accounting policies regarding the accounts receivable, income and expenditure. Only 76.67% of those interviewed agree that short term accounts receivable are evaluated at their nominal value, on the date of their occurrence, periodical updates not being necessary anymore. The long term accounts receivable are emphasised at the updated value, in accordance with an average rate of the inter-banking interest, an exchange rate or in accordance with the graph of collections staging. A significant percentage (20%) does not agree with these regulations. From the table below, it results another unsatisfying aspect, the fact that there are respondents (36.67%) who do not consider that for the clients who have not paid for more than 60 days, adjustments for depreciation are required. Also, all the accounts receivable whose age of bad payment is more than 90 days are uncertain accounts receivable and will be presented as such, with the presentation in the explanatory notes of the professional judgment applied and those particular clients will be prosecuted.

Table 6. The distribution of answers regarding the accounting policy of accounts receivable, debts, income and expenditure in the sample

Nature of problem investigated	Answers	Correct	Vague	Incorrect	Total
Evaluation of short term accounts receivable at their nominal value and of long term accounts receivable at their updated value		76.67%	3.33%	20%	100%
Setting up adjustments for depreciation, for the accounts receivable which have not been cashed in 60 days and those outrunning 90 days are uncertain accounts receivable and these particular clients will be prosecuted		63.33%	0%	36.67%	100%
Evaluation of accounts receivable and foreign currency debts by acknowledging the income or expenditure from the differences		95%	1.67%	3.33%	100%

Nature of problem investigated	Answers	Correct	Vague	Incorrect	Total
in the exchange rate					
Adjustment of income and expenditure entailed of fundamental errors		95%	3.33%	1.67%	100%

(Source: authors' calculus)

It is rejoicing the fact that regarding the evaluation at the end of each month of the accounts receivable and foreign currency debts and of the accounts receivable and debts expressed in lei, whose settlement is made according to a foreign currency's exchange rate, 95% agreed (60% strongly agree and 35% agree) that this is made in accordance with the exchange rate of the foreign currency market, communicated by the National Bank of Romania on the last banking day of the month in discussion. The recorded exchange rate differences are showed in accounting in the expenditure or income from the exchange rate differences or other financial income or other financial expenditure, may be the case. The situation is similar in the case of correction policy of fundamental errors observed in income or expenditure. If the errors are afferent to a period of current year, they will be corrected in the period in which the error is discovered. If the error is discovered in the following years, its correction will not affect anymore the income or expenditure accounts but the result account reported from corrections of fundamental errors and changes in the accounting policies. Regarding the drawing up of cash-flow statements, 48.33% of the SMEs in the sample state that they carry out this statement, while 51.67% do not carry out this document.

5. Conclusions, limits and future research

As we presented in the previous sections, our study is a questionnaire based research, applied on a sample formed by 100 SMEs from Bihor county, selected using size, annual turnover at the end of 2008 as well as the average number of employees criteria. Only 83 of the applied questionnaires were validated. It is important to note that 65 of the respondents have over 5 years experience in preparing financial reports, that is over 85% of the sample, the others have an experience of 1 to 5 years, in the meantime, 44% of the respondents have economic higher education and other 44% are chartered accountants. The most interesting results were obtained from the answers to the questions from the second section of the questionnaire. Our attention was focused on the 24 questions in the second part of the questionnaire, those regarding the enterprise specific accounting policies, as they are provided in Order 3055/2009. The first 3 questions tackle the problem of presenting the accounting information in the financial statements and only 93.33% of the respondents agree that the elements presented in the annual financial statements of the entity are evaluated in accordance with the general accounting principles stipulated in Order 3055/2009, according to the accrual accounting. Half of the people interviewed had in view all four qualities of the accounting information (intelligibility, relevance, credibility, comparability) in drawing up the annual financial statements, and most of them (56.67%) are not aware of the possibility to use a significance threshold (10%-15%) of the total value of that particular category of assets, liabilities, expenditure, income and results for an as faithful as possible presentation of the information in the balance sheet and in the profit and loss account.

Out of 83 people interviewed, only 53.33% are aware of the fact that when entering into management the purchased tangible assets are evaluated at the purchase cost and 3.33% are not aware or have a vague opinion about the fact that the depreciation policy is based on the detailed depreciations periods used for each tangible asset and the depreciation methods correspond to the manner in which these tangible assets are used and they start producing effects the moment they

are used. As a depreciation accounting method used to recover the input value of the tangible assets, 95% of the entities prefer the linear method, 1.67% use only the accelerated method and the rest apply the accelerated method for machinery and means of transport and the linear method for the rest of the tangible assets. As regards accounting policy of inventories three quarters of the analysed enterprises prefer the perpetual inventory method as an accounting method used for the stock valuation, 8.33% intermittent inventory and 13.33% use the mixed method. A very small percentage (16.67%) of the total of practitioner accountants answering this interview are aware of the fact that inventories are evaluated and presented in the balance sheet at the smallest value between the cost and the net achievable value, the rest choosing either the first value or the second one. 63.33% of the entities organize internal control procedures of inventories, on each category. More than three quarters of the respondents evaluate the indistinguishable inventories by using FIFO method, the rest use the other methods.

Finally, only 76.67% of those interviewed agree that short term accounts receivable are evaluated at their nominal value, on the date of their occurrence, periodical updates not being necessary anymore. The long term accounts receivable are emphasized at the updated value, in accordance with an average rate of the inter-banking interest, an exchange rate or in accordance with the graph of collections staging. A significant percentage (20%) does not agree with these regulations. Cash-flow statements, only for 48.33% of SMEs in the sample is relevant to be completed, while 51.67% do not carry out this document. The main result of our investigative research on the SMEs from Bihor county sample is the identification of the need of specialists' training in the development of specific accounting policies, according to the entity's features, as well as the necessity of specialized assistance in the elaboration of a policy and procedure manual(guide) for the accounting department, which should comprise the specific theoretical framework for the development of strong accounting policies, premise of a believable and comparable financial reports, reflecting the economic substance of events and transactions. The limits of our study are related especially to the elaboration of the questionnaire, the formulation of the questions as well as the choice of the sample. Future research will be centered on the investigation of specific accounting policies used in the region of North West Romanian SMEs, their presentation in the financial reports and the motivations behind the choose of an accounting policy or method in the detriment of another one.

THE TYPOLOGY OF REGIONAL MERGERS FROM THE PERSPECTIVE OF FINANCIAL-ACCOUNTING ASPECTS

Răchișan Paula Ramona

Babeș-Bolyai University from Cluj-Napoca, Romania, Faculty of Business

Berinde Sorin Romulus

Babeș-Bolyai University from Cluj-Napoca, Romania, Faculty of Business

The interest for approaching this paper is determined by the actuality of the theme concerning mergers, and also by the scale proportions this type of transactions have arrived at, both at global level and also at national level, everything having as cornerstone a market economy within which competitiveness plays a more and more important role. The aim of the study consists in analyzing the external restructuring of entities under the form of mergers. On one side, in order to clarify and deepen the theoretical aspects concerning mergers, and on the other side, in order to identify certain features related to merger transactions in Cluj County. The aim of the study is to identify the conditions and manner of merger development within commercial entities from Cluj County and to establish a typology relying on the results concerning the relationship between the entities' shareholding structure, their contribution and the exchange ratio when performing the transactions. The actuality of the theme, the requirement and the increasing manifestation of the merger phenomenon also within the Romanian territory, the necessity of a thorough analysis of merger trends and typologies, they all have been trigger factors of this objective. In order to achieve the objective a research methodology was followed, assumptions were made, which have been confirmed or infirmed. The methodological sphere consists of an approach of considered quantitative and qualitative models, of techniques for data collection, hypotheses testing, but also of research boundaries. As a result of the processing and analysis of the data on which this study relies, one arrived to the following conclusions concerning mergers that were performed in Cluj County, conclusions which could lead to the elaboration of a typology for the mergers that have occurred in this region: in terms of shareholding structure, the two entities usually had a joint majority shareholder, and regarding the financial aspects, the contributions of both entities are in most of the cases positive, and the contribution of the absorbent entity is greater, and rarely, when the contributions are negative, these contributions usually belong to the absorbed entity. Also, when the shareholding structure is the same, the exchange ratio is usually 1:1.

Key words: merger, contribution, exchange ratio, positive equity, negative equity

JEL CODE: Accounting and Auditing: General M40; Mergers; Acquisitions; Restructuring; Voting; Proxy Contests; Corporate Governance G34

I. Introduction

The actuality and importance of merger as a restructuring form underlie the approach and analysis of this paper. The aim of the study is to identify the conditions and manner of merger development within commercial entities from Cluj County, and mainly to identify the typology of developed mergers from the perspective of previous bonds and of the contributions within the transaction. The main objective consists in obtaining certain results and also in establishing certain correlations concerning: the existent connections between the entities participant at the merger, respectively the connections between entities regarding shareholding structure and their contributions. In order to obtain the results the following three stages have been gone through: obtain the data, formulate the hypotheses and verify them. The first stage of the study concerning

the analysis of the entities participant at the merger consisted in collecting, processing and centralizing the data taken from the merger projects published within the Official Journal of Romania, part IV, and also the financial situations of the entities, published by the Ministry of Finance. The so obtained data have been centralized and encoded in worksheets, by means of SPSS statistical software, version 11. The second stage consisted in formulating the hypotheses relying on the legal provisions in force regarding the legal regime of mergers according to the Law no. 31/1990 concerning companies, with the subsequent modifications and additions of the Law no. 26/1990 concerning the Court of Registration, republished. On one hand, we took into account the identification elements of the entities involved in merger (entities' denomination, legal form, main object of activity according to NACE and founding year), and on the other hand, the financial elements (evaluation method, the value the transaction relied on, exchange ratio, merger premium). The third stage of the study consisted in finding solutions for the hypotheses formulated within the previous stage, using the instruments of descriptive statistics.

II. Research methodology

The methodological sphere consists of an approach of the considered quantitative and qualitative models, of techniques for data collection, hypotheses testing, but also of research boundaries. The quantitative and qualitative methods used are meant to analyze the experience for cognition, these methods being the most frequently approached within the field of economic sciences.

The quantitative data have been collected from the publications made within the Official Journal of Romania, part IV, being selected the entities which have performed merger operations in Cluj County, and also from the data collected from the financial situations published by the Ministry of Finance. The qualitative data were obtained by means of observation method and analysis, taking into account the fundamental criteria of research hypotheses. Both quantitative and qualitative data have been encoded and centralized in worksheets. The sample representing the object of this study consists of 103 commercial entities from Cluj County. The advantage of the study is that the collected data rely on public information, but it also involves certain boundaries derived from insufficiently detailed information. Even though the data collected from the publications furnished by the Official Journal have been substantially supplemented with those offered by the Ministry of Finance, some information remained incomplete. The cause of these boundaries can be attributed to the fact that merger projects are elaborated by the administrators of the participant entities or on their liability, and in most of the cases they do not have the necessary economic and legal knowledge to elaborate this sort of projects. Regarding the processing and the statistical analysis of data, we used the SPSS statistical software version 11 for encoding and centralizing the data, which were subjected to certain processing in order to establish correlations between variables, the influence degree of certain variables on others, all in order to obtain information as closer to practical reality as possible and to find solutions for the hypotheses.

III. Hypotheses' formulation and demonstration

Hypothesis 1

In most cases, the merger occurs between entities with the same shareholding structure or between entities with the same majority shareholder or when the absorbent entity possesses the absorbed entity in proportion of 100%.

Demonstration: The shareholding structure plays a decisive role when performing a merger, given the fact that a certain structure of the shareholding allows significant modifications within the development of the merger transaction. This position of the shareholding, of key element within the merger process, is prefigured in Law 31/1990, which states within the article 115, par. 2 that: "the decision to perform merger shall be taken by a majority consisting of at least two

thirds of the rights to vote possessed by the present shareholders or representatives”. Another limitation may exist for the condition of majority shareholder, which is that imposed by the legislator in order to protect thirds parties, limitation which offers them the power to suspend the merger’s development. The formulation of this hypothesis has its origins in the trend manifested on the Romanian territory of taking control by means of successive acquisitions of shares, followed by the merger operation after a certain period of time. It is important to mention here, the example of Astral Company, which had performed such an action for a long period of time.

Hypothesis 2

When participating at an absorption-type merger, the most common case is that in which the absorbent entity has the greater contribution.

Demonstration:. We chose this hypothesis relying on the fact that the absorbent entity has, at the same time, a greater economic and financial power, which in most cases bestows this position. The economic and financial power is strongly related to the global value of an entity, which represents the entity’s contribution within the merger. Therefore, a greater power would imply a greater contribution (and the other way around).

Hypothesis 3

In most cases, the contribution of the absorbent entity is positive, and the contribution of the absorbed entity is negative. If, within the merger operation, there are both positive and negative contributions, the negative ones belong to the absorbed entity, and the positive ones to the absorbent entity.

Demonstration: This hypothesis represents another consequence of the argument presented at the previous hypothesis, in other words, it is a sequel and depth of that certain hypothesis. In addition we can mention that, in most cases, the companies decide to merge and to be absorbed when they are in an unfavorable situation from an economic, financial or profitability perspective.

Hypothesis 4

If the merger contribution of the absorbed entity is negative, the merger occurs only if between the absorbed and absorbent entities there is a relation concerning the shareholding.

Demonstration: When the decision to perform a merger is made, the agreement must be consented by all the entities which participate to the merger. Every merger involves dealing with certain risks, both by the participant entities and their shareholders/associates. Absorbing an entity with negative contribution (which may indicate major financial difficulties) obviously involves a higher risk, which can be accepted easier when between the entities there is a relation concerning the shareholding. We consider that the takeover of a negative net merger contribution by the absorbent entity does not affect the participation rate to the capital of the shareholders/associates of the entity resulted after merger, given the fact that they are also shareholders of the absorbed entity.

Hypothesis 5

In most cases, the 1:1 exchange ratio is determined only when the merger occurs between entities with the same shareholding structure.

Demonstration: The financial evaluation is the support when establishing the exchange ratio, the central elements of negotiation. Talking about negotiation, it is not compulsory for this exchange ratio to be established taking into consideration the mathematically determined values; it can also be a 1:1 exchange ratio, namely, a share from the company that makes the contribution gives the right to a share within the company that benefits from the contribution or this contribution can be

established by agreement between the participants. Therefore, basically, the exchange ratio can be both objective and conventional. When the entities that participate to the merger have the same structure of the shareholding (are possessed by the same legal persons/individulas) the calculation of a exchange ratio is not justified. When the absorbent entity possesses 100% of the absorbed entity, the merger operation is strictly a substitution of financial assets with the merger contribution made by the absorbed entity, and from the structure perspective, the capital of the absorbent entity does not suffer modifications, in this case the exchange ratio is not justified. The social capital of the absorbent entity does not increase with the social capital of the absorbed entity, but the shares possessed by the absorbent entity are annulled. Therefore, we consider that in order for a 1:1 exchange ratio to exist, the entities should have the same structure of the shareholding.

IV. Results, processing and interpretations

Hypothesis 1 (Table 1: Structure of the shareholding)

Shareholding structure				
Type of structure	Name	Absol values	No. of answers	No. of cases
Independent	STRCTIND	9	11,3	12,7
Same structure	STRCTACE	20	25,0	28,2
Joint majority shareholder	STRCTACT	31	38,8	43,7
The absorbent owns 100% of the absorbed	STRCTABN	6	7,5	8,5
The absorbent owns shares within The absorbed	STRCTNPR	14	17,5	19,7
Total answers		80	100,0	112,7
3 missing cases; 71 valid cases				

(Made by authors)

After processing the data one can observe that, in Cluj County, the relation between the entities concerning the shareholding structure is as it follows: in most cases, the companies have a joint majority shareholder (43.7% from the considered types of structure), have the same structure (28.2%) or the absorbent owns shares within the absorbed company (19.7%). Regarding this hypothesis, we must mention that an entity can have one or multiple types of shareholding structures from the above mentioned list. *Hypothesis 1 : partially confirmed*

Hypothesis 2 (Table 2: The contribution of the absorbent)

The contribution of the absorbent (greater/smaller)

	Frequency	Percentage	Valid percentage
smaller	18	24.3	26.5
greater	50	67.6	73.5
Total	68	91.9	100.0
Missing	6	8.1	
Total	74	100.0	

(Made by authors)

By analyzing the frequency table, we can observe that for most of the entities that merged, the absorbent has the greater contribution, in 74% of the entities from Cluj County that offered this information. For the remaining 26% of the entities, the absorbent has a smaller contribution than the contribution of the absorbed entity. *Hypothesis 2: confirmed*

Hypothesis 3 (Table 3: Type of contribution)

The status of the entity within merger*Type of contribution

			Type of contribution		Total
			positive	negative	
Status of the entity within merger	Absorbent	Absolute value	21	3	24
		% from the entity's status	87.5%	12.5%	100.0%
		% from total	30.0%	4.3%	34.3%
	Absorbed	Absolute value	35	11	46
		% from the entity's status	76.1%	23.9%	100.0%
		% from total	50.0%	15.7%	65.7%
Total		Absolute value	56	14	70
		% from the entity's status	80.0%	20.0%	100.0%
		% from total	80.0%	20.0%	100.0%

(Made by authors)

From the 70 entities that furnished the necessary information for demonstrating this hypothesis, 80% had a positive contribution and 20% a negative one. From the 20% of the entities with negative contribution, 15.7% were absorbed and 4.3% absorbent. And from the 80% of the entities with positive contribution, 50% were absorbed and 30% absorbent. The proportion of negative contribution is greater at the absorbed entity (23.9%) compared to the absorbent (12.5%). *In conclusion*, in most cases, the entities (irrespective of their status of absorbent or absorbed), had a positive contribution. However, the proportion of negative contribution at absorbed entities is greater than in the case of absorbent entities, therefore, it is more likely the negative contribution to belong to the absorbed entity. **Hypothesis 3: partially confirmed**

Hypothesis 4

For the entities from Cluj County that had performed merger, this hypothesis was not confirmed. The statistical processing furnished the following results:

The negative contribution occurred both when there was a relation between the entities concerning the shareholding, and when the entities were independent. The negative contribution occurred in the following cases of shareholding structures: independent, joint majority shareholder, the absorbent owns shares within the absorbed. The other cases were not registered within the considered entities. As we mentioned within other demonstrations of hypotheses, in most of the cases the contributions were positive, irrespective of the shareholding structure.

Hypothesis 4 : unconfirmed (Table 4: The negative contribution of the absorbed entity when there is a relation concerning the shareholding)

Independent*Type of contribution

			Type of contribution		Total
			positive	negative	
Independent	No	Absolute value	48	10	58
		% from Total	71.6%	14.9%	86.6%
	Yes	Absolute value	5	4	9
		% from Total	7.5%	6.0%	13.4%
Total		Absolute value	53	14	67
		% from Total	79.1%	20.9%	100.0%

The same structure*Type of contribution

			Type of contribution		Total
			positive	negative

Hypothesis 5 (Table 5: The 1:1 exchange ratio and the shareholding structure)

Independent*Exchange ratio

			Exchange ratio		Total
			mathematic	Without ratio or unspecified	
Independent	yes	Absolute value	4	5	9
		% from the Independent	44.4%	55.6%	100.0%
		% from Total	5.6%	7.0%	12.7%

The same structure*Exchange ratio

			Exchange ratio			Total
			negotiated	1:1	mathematic	
The same structure	yes	Absolute value	3	15	2	20
		% from the Same structure	15.0%	75.0%	10.0%	100.0%
		% from Total	4.2%	21.1%	2.8%	28.2%

Joint majority shareholder*Exchange ratio						
			Exchange ratio			Total
			negotiated	1:1	mathematic	
Joint majority shareholder	yes	Absolute value	7	10	14	31
		% from the Joint majority shareholder	22.6%	32.3%	45.2%	100.0%
		% from Total	9.9%	14.1%	19.7%	43.7%
The absorbent owns 100% of the absorbed*Exchange ratio						
			Exchange ratio			Total
			negotiated	mathematic	without ratio or unspecified	
The absorbent owns 100% of the absorbed	yes	Absolute value	2	2	2	6
		% from The absorbent owns 100% of the absorbed	33.3%	33.3%	33.3%	100.0%
		% from Total	2.8%	2.8%	2.8%	8.5%
The absorbent owns shares within the absorbed*Exchange ratio						
			Exchange ratio			Total
			negotiated	1:1	mathematic	
The absorbent owns shares within the absorbed	yes	Absolute value	2	2	10	14
		% from the Absorbent owns shares within the absorbed	14.3%	14.3%	71.4%	100.0%
		% from Total	2.8%	2.8%	14.1%	19.7%
(Made by authors)						

For the entities from Cluj County, the processing indicates that the 1:1 exchange ratio occurs with the highest proportion (75% from all the types of ratios, for that certain structure of shareholding) when within the entities there is the same shareholding structure. Moreover, this 1:1 exchange ratio also occurs within the other shareholding structures, as it follows: for “joint majority shareholder” in proportion of 32.3% from all types of ratios, and for “the absorbent owns shares within the absorbed” in proportion of 14.3%. The exchange ratio does not exist when the companies that participate to the merger are independent, from the shareholding structure’s perspective. *In conclusion*, the 1:1 exchange ratio mostly occurs when there is the same shareholding structure; it also occurs in other shareholding structures, but it does not exist in the case of independent entities. ***Hypothesis 5: partially confirmed***

V. Conclusions

The merger by means of absorption remains the most complex operation, especially when between the participant entities there are connections before the merger occurs. Within this type of merger, when establishing the value of the contribution brought by the participant entities, three special situations are identified:

a) **the absorbent company has positive equity, and the absorbed company has negative equity**; in this situation there is no exchange ratio, and the absorbent entity will not issue shares in order to remunerate the contribution of the absorbed entity. We consider that a situation of this kind can occur when between the absorbent and the absorbed there are previous connections, namely the absorbed is owned by the absorbent or the entities that merge have a joint majority shareholder or they have the same shareholding structure. The absorbent entity will approve to takeover a negative contribution if it considers that the contribution of the absorbed entity will

lead to increase the performances subsequent to the merger operation. Regarding the accounting reflection, the patrimonial asset and liability elements are transferred between the two entities, and the difference between the asset and liability elements of the absorbed entity at the moment of the takeover within the absorbent's accounting shall be reflected within the result, but within the result of previous financial years.

b) the absorbent company has negative equity, and the absorbed company has positive equity; if the absorbent entity has a negative net contribution, in order to determine the exchange ratio, one will consider the nominal value of a share in order to establish the number of shares the absorbent entity has to issue for remunerating the absorbed entity's contribution, according to the example of accounting reflection of operations concerning the Order 1376/2004. We consider that, in this case, the shareholders/associates of the absorbed entity are affected by this kind of exchange ratio. Therefore, we believe that, in order to simplify the situation, the entities should consider a reverse operation, basically the absorbent entity should be the entity with the highest merger contribution, and in order to determine a fair exchange ratio, it could be a conventional ratio, negotiated between participants.

c) both the absorbent and the absorbed companies have negative equity. When both participant entities have negative contributions, we consider that an exchange ratio cannot be determined. Therefore, the operation relies on negotiation between parties; basically the patrimonies of the two entities merge in terms of a conventional exchange ratio or without share issuance by the absorbent entity.

Farcane Nicoleta

West University of Timisoara, Faculty of Economics and Business Administration

*Based on a controversial issue, namely determining and controlling costs in the energy sector, the present study falls within the scope of management accounting and control. This scientific approach was initiated as a result of personal research concerns in the area of accounting, starting from the need to know and quantify costs in a sector of the economy that is less exploited. The main objective of this scientific approach is to address the evolution of the energy sector in a national and international context, in terms of economy and finances, with the aim to underline the need to organize and conduct management accounting in this sector. We will present a few particularities of the energy system, the current status of implementation of a medium and long term strategy aimed at developing the energy sector, as well as the need to adopt modern costing methods in this sector, which ensure operative cost control and performance growth of the entities that operate in this sector. Information on the reviewed topic was conducted by studying the national and international literature in the field, by analyzing the associated legislation, by consulting specialized web-sites and various articles in the database. The main research methods used in this scientific approach were **analysis** and **synthesis**, and qualitative research was the type of used research. The results of the research will materialize in providing the necessary conditions for designing an econometric model for implementing the ABC method, the conceptual and ideological delimitation of the ABC method, the deepening of the positive and negative aspects that the implementation of the Activity Based Costing involves. The major implication for the researched field is ensuring success for the implementation of a modern costing method in the energy sector, underlining the shortcomings of the traditional costing methods. The added value of the paper consists in conducting a rigorous study of the current state of an overlooked sector of global economy and shaping trends in the evolution of energy costing.*

Keywords: energy sector, strategy, costing method, activities, operative control

JEL classification: M40, M41

1.Introduction

The purposes of this research are to study, present and adopt a modern costing method for production in the energy sector, starting from the specific of the entities that operate in this sector. The characteristics of the energy sector, such as: extended periods of implementation for various sectorial policies, achieving strategic objectives, the large capital requested for the development of this sector, the need to achieve production at the same time with consumption, and others, require the existence of **medium and long term strategies** aimed at developing the energy sector. These characteristics require organizing and conducting an efficient management accounting in terms of costs.

To achieve this goal, we will propose the implementation of the ABC method (Activity Based Costing) whose targets include: revealing the causes that lead to choosing the activity based costing method; the reorganisation in cross-section of the entities where the method will be implemented by taking into account the organizational and technological features of the

production in the energy sector; developing the account system used to reflect consumption and activity costs, which is specific for entities in the energy sector; drafting specific documents that match the needs of evidence, analysis and control, and highlighting the links between them; the contribution of the activity based costing method to the development of the methodological and informational support in entities from the energy sector.

2.The energy sector in national and international context

Energy represents an indispensable product, having high economic, social, strategic and political value. The general objective of any implemented strategy in the global energy sector consists in meeting the energy needs both now and on the medium and long term, at an appropriate price for the modern market economy and complying with a good living standard, in conditions of quality and safety of power supply, but especially by complying with principles of sustainable development.

Forecasts indicate an economic growth that will generate increased energy consumption. In the context of these evolutions, it is estimated that the total energy demand for 2030 will be higher by 50% than in 2003, and the demand for oil will increase by 46%. Other equally gloomy previsions refer to the global oil reserves that could last until 2040 at the current rate of consumption, natural gas reserves would ensure consumption until 2070, while coal reserves are ensured for the next 200 years.

The International Energy Agency (IEA) and the World Energy Council (WEC) claim that for the next decade, the primary energy consumption structure will see an increase of the share of renewable sources, but also of natural gases. Furthermore, it is estimated that a quarter of the primary energy needs will still be covered by coal.

The lack of refining capacities, the tendency of some countries to increase their energy stocks in order to cope with the crisis, the increase of the energy demand combined with geopolitical factors have determined the growth of crude-oil prices, which further determined a increase of prices for natural gases. All these factors led to the reorientation of energy policies in countries that import energy, in terms of increasing focus on renewable energy sources and improving energy efficiency.

In modern times, Europe was the true centre of the world. It was the continent which was always at the helm of the development process.

The energy sector represents, at EU level, a major economic and geopolitical factor. EU is the second energy market in the world. Currently, it imports over 70% of its oil and almost 45% of its gas, and this dependency could reach 90% for natural gases and almost 100% for oil by 2030.

Although the European Union has tried to reduce energy consumption and to promote renewable energy, its dependency to global suppliers of fossil fuels is increasing. EU is the world's largest importer of energy and the second consumer, being dependent on gas supplies from Russia (24%), Norway (15%) and Algeria (11%). While the energy consumption of European Union members is going upward, it is estimated that by 2015 only 30% of the need for natural gases will be covered from own sources.

In order to ensure energy sustainability, competitiveness and security, the European energy strategy project, called **A European Strategy for Sustainable, Competitive and Secure Energy**, establishes the main courses of action for the European Union:

- diversity of energy sources;
- strengthening solidarity between member states and ensuring the energy flow by revising the legislation regarding national gas and oil stocks;
- developing a joint external policy for all the EU states and building a protection infrastructure of the energy system.

Romania, a member of the European Union, is in a particular situation. Because the energy sector represents the main contributor to environmental pollution and climate changes, our country must meet a double requirement: on one hand, the high standards of the European Union regarding energy and its impact on the environment, and, on the other hand, Romania has to correct its own deficiencies in the energy sector.

Because it is a member of the European Union, our country has to comply with the **Integrated strategy on energy and climate changes**, adopted in March 2007 by EU, which had the strategic objective to reduce emissions of greenhouse gases (especially CO₂) by 20% by the year 2020, taking into account the limitation of the global warming effect to only 2 Celsius degrees more than the temperatures in the preindustrial age (the energy sector contributed with 80% to the total volume of emissions). Another target of the European Union was to reduce energy consumption by increasing energy efficiency by 20% by the year 2020.

Romania *“has a wide range of primary energy resources, but they are reduced in quantity: crude-oil, natural gases, coal, uranium ore, as well as an important potential of renewable energy that may be capitalized”*

(Official Gazette of Romania 2007: 4).

The priorities of the energy industry in our country involve *energy efficiency* (the Romanian energy industry is the most energy-intensive in the European Union, with a potential to reduce energy losses of about 30-35% of consumed primary resources, half of them being imported), *cogeneration and district heating* (approximately 70 towns in our countries need modernization, because the total energy losses in urban systems are high), *the energy production capacities are old and unreliable*.

In addressing the development of the energy sector, in Romania was considered the need to create structures that will adapt to the sole European market, where national markets gradually lose their traditional borders and become an integrated part of the common market.

In conclusion, improving legislation in the field, modernizing and privatizing the production sector, improving the electric energy markets, electrifying the rural area, reducing environmental pollution, stimulating research, bringing development and innovation in the field are only a few important priorities of the energy sector in our country.

Starting from the expression “energy is not expensive, but its lack is”, we may state that in Romania the following decades will be dominated by the challenges of developing an energy efficient and competitive economy, with low carbon emissions and energy security.

3. Research methodology

Information on the reviewed topic was achieved by studying national and international literature in the field, by analyzing the associated legislation, by consulting specialized web-sites and various articles in the database. The main research methods used in my scientific approach were *analysis* and *synthesis*, and qualitative research was the type of used research.

4. The need to organize management accounting in the energy sector

The managerial information is used by the management factors of the economic entity as a product of management accounting. Sometimes, *“the information is credible, but irrelevant. Other times, it is relevant, but it’s not credible. In both cases, it is not useful”*(Briciu et al. 2009: 12).

Being regarded as a *“specific method of processing accounting information”*(Pântea and Bodea 2008: 16) management accounting aims to know the costs of various functions of the entity, to ensure the assessment basis for its produced goods, to explain the obtained results and to establish forecasts. Reaching all these objectives requires the adoption of a proper costing method.

The main dysfunctional elements that characterize the energy sector in our country are related to: energy prices, which are kept low for reasons of social protection; high energy losses on the entire stream, from primary resources to energy use; maintaining state property in the production sector, with multiple adverse economic consequences; old and inefficient equipments that need high investments; an unstable and unattractive legal framework; high level of pollution, etc.

In terms of accounting, one of the pressing needs in this system is organizing and conducting a management accounting by implementing modern costing methods, capable to facilitate the calculus of performance.

The permanent evolution of the global business environment has generated the permanent adaptation of management accounting to current requirements. The evolution perspectives of these two has manifested under the mark of being open to change, this being one of the most important features that globalization has brought to management accounting and control.

In the context of macroeconomic phenomena, such as: stagnation of economic activity, increased global competition, inflation and environmental turbulences that considerably increased the vulnerability of entities, management accounting and control are forced to intervene to enable work in optimum conditions and operational decisions. Reducing this vulnerability may be achieved by increasing the reaction of the entity through the implementation of an information system capable to signal these “dangers”, but also by improving the entity’s competitiveness through the adoption of a reliable information system.

Starting with the 1990s, the issues of management accounting and costing have started to be approached separately, the basic approach being “*a costing method like full costing, doubled by a booking technique specific for accounting, using Class 9 of accounts – Management Accounts – stipulated in the regulations issued by the Ministry of Public Finance*”(Dumitru and Calu: 31). Over the next two decades, in Romania, the issue of management control has started to take shape in close relation to management accounting. The more prominent manifestation of the role of management accounting as an information tool of management has led to adopting and using on a wider scale the notion of management accounting.

Currently, there are a number of factors that influence the organization forms of management accounting. These factors are numerous and are related to the specific of the technological process, to the functional and operational structures of the entity, to the full or partial interference of the management accounting’s objectives in assisting the decision-making process, to the flexibility or rigidity of using one or another system of accounts to reach these objectives.

Under the influence of these factors, the specialized literature shaped two models of organization of management accounting (a dualistic model and an integrated model) that resulted in four organization concepts for management accounting (the concept of single-entry bookkeeping, the integral organization concept, the dualistic concept and the modern concept of organizing management accounting). **The basic components** of management accounting organization are: “*costing, budgeting and conducting a rigorous budgetary control, writing reports of internal information necessary in assisting the decision-making process, the control of activities and performances of the entity based on the concept of efficiency of the responsibility centres within the entity*”(Fătăcean 2009: 43).

The delimitation of these components is associated with clipping the entity into responsibility centres. The cross-clipping of the entity complies with the logic of purpose and cooperation in order to describe the object of the actions that are determined internally for the organization process. This new way of practical organization achieves the connection between strategic objectives and their materialization into actions, “*the clipping of the enterprise, seen as an accounting entity, into analysis centres that are considered accounting sub-units is the most important stage in implementing a costing system, upon which the reality, accuracy and*

exactness of the registered information supplied by management accounting depends”(Pântea and al. 1993: 64).

5. Adopting Activity Based Costing in the energy sector

Management accounting as an end in itself has the obligation to meet the informational requirements enunciated by the managers of the entity, but satisfying these requirements depends on the chosen calculation method and on the percentage at which this method is orientated or not towards the principle of efficient management of the activity.

In terms of costs, the efficiency of the information become essential for the efficiency of the production process because any information that is not useful on time will lose ground and its use value, and therefore, the work consumption necessary to obtain it is wasted. The goal of applying the activity based costing method is to enable reception of efficient information, efficiency that should reach a point where any unsaved expense will be tracked down before it even occurs.

Activity based costing represents one of the latest advancements in the area of costing.

“The origin of the activity based costing method is found in US literature in the paper *“The Hidden Factory”* written by Jeffrey G. Miller and Thomas E. Vollman, which subjects to critical analysis the sectors generating indirect costs”(Caraiani and Dumitru 2005: 225). The two authors have examined with great accuracy the places where indirect costs occur, concluding that it is very important to assign a decisive role within cost control to the development of a more detailed model for the causes of these costs. They didn’t insist on creating a new system for determining costs, but they insisted only on detailing the occurrence of indirect costs and the measures that should be taken when clarifying the causes that contributed to the recording of negative deviations of indirect costs.

Applying the ABC method in the energy sector provides enhancement of the classification of costs not only in terms of their economic nature, but especially in terms of destination, and creates bigger analysis opportunities on three categories of activities: production, transport and supply.

Accounting of environmental costs may be partially considered as a special application of the ABC method. It is successfully applied to monitor the use and allocation of material, financial and energy resources based on the life cycle of the products. *“Applying the ABC method to determine environmental costs requires identifying the costs related to the environment that are normally attributed to the common centres, which involve environmental costs, and the environmental costs hidden in indirect costs”*(Bețianu 2008: 350).

Activity based costing represents only one of the ways in which environmental management accounting is integrated into the business. One of the major advantages of using the ABC method to assess environmental costs is that it may be used to integrate environmental costs within the strategic management process, thereby incorporating environmental issues within the strategic objectives of the entity’s life.

The ABC method is not limited to providing more relevant and accurate informational costs than traditional approaches. In this new approach, costing is still considered a significant management tool, but isn’t an end in itself. The aim isn’t to influence the level of costs (such as the cost method of cost centres) but rather to allocate an efficient action on activities, which determines costs. *“People can’t manage costs, they can only manage the activities that determine costs”* (H.T. Johnson). Therefore, a new dimension was given to the ABC method: Activity Based Management (ABM). A simple calculating feature is not the main element of the method, but adding strategic and managerial dimensions increases it.

Among the modern methods of calculation, Activity Based Costing asserted as one of the new strategic initiatives in business, being considered by experts an innovation in cost management. It is only one of the refining methods of the cost system, *“it is not an entirely new or original*

method, it is not a perfect management tool, but it seems to solve in a satisfying manner for the enterprise the limits of the traditional cost system”(Albu and Albu 2003: 158).

Following research conducted by specialists in the management accounting field, the next causes of processes' costs have been identified: the deficiencies of costing systems for contemporary costs, the diversification of the information demand for management and changes in the strategic position of the company.

We are practically dealing with two types of activities: “*on one hand, activities that can be attached to products, called **primary or main activities** (are the ones used outside the entity, either by a product or a different entity; they express the main mission of the entity, but they don't necessarily have a direct relation with the products that may be support activities) [...]; on the other hand, we are considering activities that the entity carries out in conjunction with main activities, as their support. They are called secondary activities and are not related to products”*(Bouquin 2004: 184).

Activity Based Costing was perceived as an alternative to the traditional accounting systems, having a production system organized like a set of activities. Managers were asked to consider first the resources consumed by different activities, and only afterwards to allocate costs to products. Practically, the ABC method is based on the cross-section clipping of the entity. The method became known as a cost measuring process of operations with the help of: analyzing the costs' elements, determining performances based on activities, measuring production and functional costs.

The ABC method “*provides two ways to reduce costs: it helps identify the opportunities of real reduction of costs (with the help of cost inductors) and furnishes simulations of the impact of cost reduction”*(Dumitru and Calu 2008: 186).

Once an entity decides to implement the ABC method, it must determine the level of informational details that it wants to collect and put at the disposal of management, knowing that more accurate information is much more expensive. To a certain point, the additional detail is not worth it. Cokins, Stratton and Helbling provide a useful focus on implementing the ABC method and discuss these issues. For example, the entities will have to pay attention especially to expensive resources, to resources whose consumption varies depending on the product and to resources whose demand models are not correlated to traditional allocation standards.

The ABC method “*is more than a simple cost allocation tool, it can also be a tool to control the activities of a business in order to optimize the allocation of resources”*(Mendoza and al. 2009: 167).

The hypothesis of the ABC method is that the careful analysis of activities should lead to the identification of relationships that maintain several products. Activity Based Costing rejects imputations in cascade and seeks to maintain relations between costs and the causes behind them. For this reason, the costing method believes that each entity producing directly productive activities ensures peripheral activities also. “*To gain a better understanding of the company, we look first at a measurable volume unit or at the activity that serves as cost-driver”*(Meigs and al. 1996: 955). Thus, we establish for each product a list of directly consuming activities and of those that they generate.

6. Conclusions

The improvement of management accounting in the energy sector requires adopting budgetary methods and techniques, monitoring and costing that allow simplicity, efficiency, economy, anticipation, accompanied by higher quality of the obtained results. The value created by improving costing techniques and methods in the energy sector should largely compensate the used or consumed resources.

One of the most important contributions of Activity Based Costing is that it repairs the weaknesses of traditional production costing approaches. Although the ABC method was quickly accepted, there were still a variety of opinions regarding its efficiency. Over time, by stimulating the adoption of this method, literature presented a series of factors with influence over the effectiveness of this method, particularly financial factors. The results of the study confirmed the benefits of the ABC method when it is used in parallel with other strategies and when it is implemented within entities with complex activities, where costs are relatively important.

Currently, we are talking about successfully applying the ABC method for environmental costing. The managers of entities believe that, in general, environmental costs are not significant for the functioning of their business, but they ignore that some production costs, especially in the energy sector, have an environmental component also.

THE INTELLECTUAL CAPITAL REPORT WITHIN UNIVERSITIES: COMPARING EXPERIENCES

Silvestri Antonella

(Sections 1, 3, 5)

University of Calabria, Department of Business Administration

Veltri Stefania

(Sections 2, 4)

University of Calabria, Department of Business Administration

The paper focuses on the intellectual capital (IC) report in universities, a relevant theme actually for the growing interest in applying an IC approach in managing universities. The paper compares the experiences in reporting IC of two different university institutions, the Autonomous University of Madrid (UAM) and the Austrian Universities, to highlight pros and cons of the two different IC models employed. In order to compare these two experiences, firstly we analyzed, through a literature review, the state-of-the-art in measuring and reporting IC, then we focus on the IC measurement models used as framework by the two institution, finally we turned our attention to the IC reports issued by the two universities. Both experiences presented refer to advanced IC measurement models, but both suffer of some limits in applying the models in practice. Like all measurement and management systems that deal with knowledge-based processes, Austrian and UAM's IC reports face the methodological problems of measuring non-physical processes and outputs. In detail, Austrian IC reports lack of qualitative indicators, UAM's IC report lacks of efficiency-related and activities-related indicators. The main research limit is that the theoretical comparison has been carried out on two experiences, due to the lack of awareness of IC relevance in managing universities. The establishment of an ad hoc IC measurement model for universities could have both internal and external benefits. As regards the policy implications, Government, ranking universities by their IC, can get information about their strengths and weaknesses and using it to reallocate resources. This study contributes to broaden the research community's understanding about a relevant management (internal) and communication (external) universities' tool, the IC report, through the examination of two real life European universities experiences in disclosing intangibles. To the best of our knowledge, this is the first paper that focuses on comparing the two best university practices in reporting IC.

Key words: Intellectual capital, universities

JEL code: M41, I23

1. Introduction

In the actual knowledge-based economy, intangible assets are seen as essential elements to value creation in companies and to economic wealth (Lev 2001). Consequently, measurement and management of intellectual capital (IC) is becoming more and more critical (Veltri, 2007). Although the IC concept was first developed as a framework to analyze the contributions of intellectual resources in for-profit enterprises, it has been soon taken over by public and non-for-profit organizations, due to its overall importance (Mouritsen *et al.*, 2004; Kong and Prior, 2008). Actually, there is a growing interest in applying an IC approach in managing universities, since their main goals are the production and diffusion of knowledge and their most important investments are in research and human resources (Sánchez and Elena, 2006). Moreover, universities are increasingly considered key actors in the wider move towards an increasingly global and knowledge-based economy and this circumstance led supranational organisms to

promote the spread of IC management within universities. At the European level, in 2002 the European Association of Research, Managers and Administrators (EARMA) in collaboration with the European Centre for Strategic Management of Universities (ESMU) launched the initiative about IC in higher education institutions and research and technology organizations (HEROs) with the objective to raise awareness and disseminating good practice research in the field of IC management and reporting among universities and research organizations (Leitner, 2005). In Ricardis' report (Reporting Intellectual Capital to Augment Research, Development and Innovation in Smes), the High-Level Expert Group encourage universities to participate in the efforts to develop IC reporting culture, as a part of a strategy to make universities accountable towards their stakeholders, by improving both the transparency in governance and their resource management and strategies (European Commission, 2006). Necessities like the increasing stakeholders' demand for more transparency, the increasing competition between universities and firms, and a wider autonomy, push universities towards the adoption of new management and reporting systems which should necessarily incorporate intangibles (Sánchez *et al.*, 2009).

The main aim of the paper is to compare IC report model applied by Austrian universities, and the Intellectual Capital Report for Universities (ICU report) model applied by the Autonomous University of Madrid (UAM) in measuring IC through a specific system of indicators.

The remainder of the paper is organized as follows. Section 2 briefly discusses the relevant literature on IC, illustrating also the declination of IC within university sector. Section 3 describes research methodology, Section 4 provides the results of the comparison between Austrian and Spanish universities IC report, while Section 5 concludes the paper.

2.Literature review on the intellectual capital measurement models and their application to the university context

Intellectual capital literature comprises a lot of IC definitions (for all, see Tan *et al.*, 2008). The definition accepted in this paper considers IC as a dynamic system of intangible resources and activities, at the basis of the organization's sustainable competitive advantage. In general terms, all of the major players in the IC community share the idea that intellectual capital, from a qualitative point of view, can be divided into three categories: structural (or organizational), human and relational capital, further validated by Meritum Project (2002). Briefly, human capital consists of knowledge, capabilities, competencies, and skills possessed by the organization's workers, the organizational capital is constituted of structured knowledge possessed by the organization and is shareable (database, procedures etc.), while the relational capital is the totality of relations between the organization and its main stakeholders.

Methods for IC measurement can be classified in four basic categories (Sveiby, 2009): 1) Market capitalization; 2) Return on Asset; 3) Direct Intellectual Capital and 4) Scorecard. The first three model focus on the financial side of measurement and the monetary value of intangible assets, whereas scorecard approaches look for indicators able to measure intangible resources and activities. It is important to highlight that scorecard methods had an evolution going from pioneering IC measurement models such as Intangible Asset Monitor of Sveiby (1997) and Skandia Navigator of Edvinsson and Malone (1997) to advanced ones, such as Danish Ministry of Technology and Innovation guidelines (DMSTI, 2003), Meritum guidelines (Meritum, 2002) and Austrian Research Centre IC model (ARC) (Chiucchi, 2004).

In the *pioneering* models, attention is focused on the content of the IC subcategories. The vision behind is a typical accounting vision, according to which IC is an aggregate of intangible resources. The mainstay of these models is the IC value measurement and their main aim is to explain causes of the differential between accounting and market value, mainly attributed to IC. The *advanced* models adopt the evolved notion of IC as a dynamic system on intangibles resources based on knowledge. In these kinds of model attention is focused on the interactions

between the IC items, at the basis of the organization's value creation and on intangible activities essential to produce, maintain and develop intangible resources. The assumption behind these IC models is the knowledge management, their main aim is to identify the paths of the organization's value creation based on knowledge.

Universities are social institution which have gone through several stages of development in their long history. In recent years, a third mission, over to the traditional teaching and research functions has been added, meaning the purpose of contributing directly to social and economic development (Brătianu, 2009). In Europe, universities are faced with numerous challenges caused by the political initiatives aimed to harmonize the different national university systems as well as new management modes proposed for universities (Leitner, 2004).

The instrument of IC report and the general methods for valuing intangible within universities finds its justification from one hand in the political and managerial challenges that require the implementation of new management and reporting systems in order to improve IC internal management and to disclose information to stakeholders, from the other hand in the consideration that national and supranational organisms recognize a central role to universities in the actual knowledge-based society (European Commission 2003; 2006). Moreover universities are knowledge producers per se: their most important output is knowledge incorporated in research results, publications and educated students (Sánchez and Elena, 2006).

Declining the IC categories in the context of universities, *human capital* is the knowledge of the researchers and non scientific staff of universities such as professors, researchers, PhD students, and administrative staff; *structural capital* comprises the governance principles and modes, the organizational routines and procedures, culture systems, databases and intellectual property; *relational capital* could be assimilated in the so-called third mission of the universities, which includes all the activities and relations between universities and non-academic partners, i.e., firms, non-for-profit organizations, public authorities, local government, and society as a whole (Leitner, 2004; Sánchez *et al.*, 2009).

On the basis of the advanced guidelines to report IC, some universities and research centres started to develop a report for describing their intellectual assets and knowledge flows (Brătianu, 2009). Among these, it is worthy to mention the Autonomous University of Madrid (UAM) experience (Sánchez and Elena, 2006; Sánchez *et al.*, 2009), since it applied the Intellectual Capital Report for Universities (ICU report) developed by the Observatory of European University on the basis of the advanced IC report models (OEU, 2006) and the Austrian Universities (Leitner, 2004; Altenburger *et al.*, 2005; Schaffhauser-Linzatti, 2004), whose IC reports reflect model and principles of the ARC, which is the most outstanding and longest experience in reporting IC in research centres. Starting from the above mentioned studies, our paper focused on the exploitation of the Austrian and UAM experiences in reporting IC.

3. Research methodology: analysing the IC measurement reference frameworks

In order to compare these two experiences, firstly we focused on the IC measurement models used as framework by the two institution, then we turned our attention to the IC reports issued by the two universities. Since it is a conceptual paper, the documental analysis appear to be the more adequate method to identify the key points of each reference model and to highlight which IC indicators are emphasized in the two different experiences.

As regards Austrian experience, the Austrian Ministry for Education, Science and Culture, in the course of the preparation of the new Austrian university law, settled a project team with the task to develop an IC report model for universities which met the specifics of their knowledge-production process in the new organizational and legal context of universities (Leitner, 2004).

The Austrian University Organization and Studies Act (Universitaetsgesetz 2002, further UG 2002) introduced an obligatory Intellectual Capital Report (further Austrian ICR).

Section 13, subsection 1 of UG 2002 states that “each university shall submit an intellectual capital report for the past calendar year to the Minister, by way of the university council, by 30 April of each year. This shall, as a minimum, present in itemized form:

1. the university’s activities, social goals and self-imposed objectives and strategies;
2. its intellectual capital, broken down into human, structural and relationship capital;
3. the processes set up in the performance agreement including their outputs and impacts.

The corresponding Intellectual Capital Report Act determines its structure and design”.

IC reporting for Austrian universities should fulfill two aims. First, it should provide internal information for the management of intangible resources. Second, it should provide external stakeholders with information about the effective use of IC (Schaffhauser-Linzatti, 2009). Additionally, since in the course of preparation of an IC report, universities have to discuss their strategy and aims and interpret IC indicators, the process of preparing an IC report foster universities to learn about their knowledge production process.

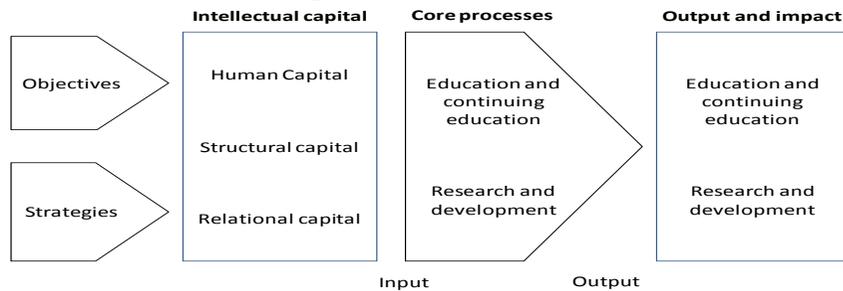

As regards the UAM experience, the Observatory of European University (OEU) ICU measurement framework is grounded in the Strategic Matrix developed within the OEU Project. From this Strategic Matrix, the 141 indicators have been reclassified into the categories of IC (Human, Organisational and Relational), creating a framework for the IC in universities (ICU framework). To create a homogenised IC Report specifically designed for universities and research centres, OEU team designed the ICU Report finding inspiration from DMSTI guidelines, Meritum experience, Ricardis project and ARC experience (OEU, 2006). ICU report comprehends three main sections: Section 1, “Vision of the institution”, Section 2 “Summary of intangibles resources and activities, Section 3 “System of indicators”. Section 1 illustrates the university mission in a narrative way. Following knowledge narrative of DMSTI guidelines, this section answers questions on the main objectives of the institution and the critical intangibles needed to reach these objectives. Section 2 describes the intangible resources that institution can mobilize and the different activities undertaken to improve the value of these resources, in doing so following Meritum guidelines. Section 3 provides a description of a system of indicators, related both to intangible resources and activities. IC indicators are both current and forward, have both an internal and an external aim, derived from university strategy and are in line with the characteristics required by Meritum guidelines to indicators (usefulness, relevance, comparability, reliability, feasibility).

4. Research results in comparing Austrian and UAM experiences

The IC measurement model

The Austrian ICR follows the Schneider/Koch model which has been developed and applied by the Austrian Research Centers Seibersdorf (ARC), in turn inspired by the Meritum guidelines (Leitner, 2005). Being the archetype of IC models especially applied by research organizations, it represents a *process-oriented* approach, since it visualizes the university knowledge production process and the role of IC as input of the process. The Austrian IC report model, following ARC model, hereby ideally sets itself against the *structure-oriented* model, focused on the classification of the different forms of IC, on their content and on their relations.

Figure 1 – The IC reporting model for Austrian Universities

Source: our adaptation of Leitner (2004)'s model

The IC measurement model followed by OEU team in preparing the ICU model is mainly inspired by the DMSTI and Meritum guidelines. The ICU report assigns a central role to the knowledge strategy, from which derive IC indicators and focuses both on intangible resources and activities that university has to carry out to develop intangible resources. The main distinctive point of the ICU model is the use of activities related indicators, its main limit is its focus on the content of IC categories and on the definition of IC indicators. This limit is common to all structure oriented model that do not allow the visualization of the IC role in the university's knowledge process.

IC indicators

In both models, IC indicators derive by a logical input-output process, starting from the strategy definition and activities' identification to carry out to develop and maintain university's IC. Moreover, in both models IC indicators are divided into the well known categories of human, organizational (structural) and relational capital. Nevertheless, in the ICU report applied by UAM, the IC subcategories mix input and output IC indicators, while the IC model of Austrian universities visualizes the separation between input IC indicators (included in the IC subcategories), process IC indicators and output (or impact) IC indicators. These last two are divided into teaching and research indicators. For instance, in the Austrian IC report model the number of researchers is an example of input IC indicator, the number of ongoing evaluated research is an example of process research IC indicator, the number of scientific publication is an example of output research IC indicator. On the contrary, in ICU report, number of researcher is included in the human capital indicators, the number of scientific publication is included in the organizational capital, the number of ongoing evaluated research is not included at all, because the model does not consider process indicators at all. Summarizing, the Austrian IC report model show clearly the role of IC as input of the knowledge-production process and separates IC indicators in teaching and research indicators. The main research limit is that the theoretical comparison has been carried out on two experiences, due to the lack of awareness of IC relevance in managing universities.

5. Conclusions

Both experiences presented refer to advanced IC measurement models, but both suffer of some limits in applying the models in practice, since the links with the institutions strategy and the role of IC in the knowledge process are hidden in the Austrian universities IC reports (wissenbilanz) and in the UAM's IC report (Schaffhauser-Linzatti, 2009). Like all measurement and management systems that deal with knowledge-based processes, Austrian and UAM's IC reports face the methodological problems of measuring non-physical processes and outputs. In detail, Austrian IC reports lack of "soft" and qualitative indicators, relative for instance to the

employees' satisfaction, climate, image (Altenburger *et al.*, 2005), while the UAM's IC report lacks of efficiency-related and activities-related indicators (Sánchez and Elena, 2006).

We think that IC report is an important tool expressive of new management control, on which universities and government should invest: comparability is possible in the future on the international level if the indicators will be selected according to commonly accepted definitions or conventions in the science community. Moreover, it will be faced and managed problems related to the structural differences that can hinder comparison (national differences in university systems, size of universities, their degree of specialization, their different stages of development in IC measurement) and if it will be addressed practical questions such as how to collect the data needed, who should be responsible of this data gathering, how frequent the IC report should be and so on (Sánchez and Elena, 2006).

The reasons for the lack of available and comparable IC universities data are several, not last the barriers to introduction of IC measurement and management models in universities on which to development standardized systems of IC indicators. Among main barriers, we can list cultural barriers (fear of measurement and new systems, lack of understanding), lack of meaningful employees involvement, lack of common definitions of terms and IC indicators, vision and strategy poorly defined and understood. In spite of this, we think that IC in universities should be measured for many reasons, such as to increase the transparency of public institutions, to allow comparison among them, to bring the "ivory-tower" university philosophy closer to the requirements of public and industry. Of course, the introduction of more objective and reliable methods for measuring IC will require to build awareness among the senior academics occupying management positions at universities, to create *ad hoc* IC measurement task force, to introduce IC measurement methodologies, timely implemented and published. The establishment of a measurement and reporting model of the university's IC could have both internal benefits, in the sense of fostering learning on the organizational level, as well as external benefits, in stimulating transparent competition. As regards the policy implications, Government, ranking or benchmarking universities on the basis of their IC, can get information about their strengths and weaknesses and uses them to reallocate resources to universities that invest on their IC. Clearly, in the future, reviewers and funding agencies will have to learn how to interpret IC information.

This study contributes to broaden the research community's understanding about a relevant management (internal) and communication (external) universities' tool. The paper could be a first step to further on develop a model that summarize the best features of both investigated models. To the best of our knowledge, this is the first paper that explicitly focuses on comparing the two best university practices in reporting IC.

PARTICIPATORY GOVERNANCE IN THE PUBLIC HEALTHCARE SYSTEMS OF THE SCANDINAVIAN AND BALTIC COUNTRIES

Ștefănescu Aurelia

Bucharest Academy of Economic Studies

Mocanu Mihaela

Bucharest Academy of Economic Studies

Țurlea Eugeniu

Bucharest Academy of Economic Studies

The diminished trust of citizens in the public sector, the increased complexity of policy issues and the reforms in accordance with the new public management principles generate the need of focusing more extensively on participatory governance. Participatory governance can be defined as the genuine engagement of citizens and other organizations in the formulation of policies and strategies, in the decision-making process from the public sector and in the implementation of the decisions. The present paper's objectives are to define the concept of participatory governance, to argue in favor of implementing it in the public sector and to find to what extent public healthcare institutions from Scandinavian and Baltic countries publish information on participatory governance and how they perceive community engagement. The research findings are that the information on participatory governance disclosed on the websites of relevant institutions from within the Scandinavian and Baltic public healthcare systems is scarce. The countries with the greatest concern for community engagement are Denmark and Sweden. It is argued that there should be a shift in focus within the public sector in general and within the healthcare system in particular, so that citizens are genuinely involved in the relevant processes and their satisfaction is indeed at an adequate level.

Keywords: participatory governance, engagement, public healthcare, Scandinavian, Baltic

JEL Classification: M40, H0

1. Introduction

Citizens usually take the passive role of beneficiaries of the services provided by the public sector or are directly impacted by the developed policies, without having much to say about it. Even if the discourse of public sector entities may emphasize the orientation towards the general public and their needs, it is precisely the public which is actually least empowered. The power of the citizens to influence the decision-making process in the public sector is related to the concept of “participatory governance”, which according to Sneddon and Fox (2007) is a matter of power. The present paper's objectives are to define this concept, to argue in favor of implementing participatory governance in the public sector and to find to what extent public healthcare institutions from Scandinavian and Baltic countries publish information on participatory governance and how they perceive community engagement. The paper is structured as follows: the first section includes a brief literature review, the second describes the research design, then the concept of participatory governance is defined and arguments in favor of a greater emphasis on this type of community engagement are presented. Last but not least, the penultimate section describes the results of a qualitative research on the information on participatory governance disclosed by institutions from within the public healthcare sector of Scandinavian and Baltic countries.

2. Literature review

The international body of literature on the concept of “participatory governance” is rather scarce when compared with the relevance of the issue. Participatory governance is examined as part of governance in the public sector. For instance, the paper of Edwards (2008) is part of a major project in Australia called “Corporate Governance in the Public Sector: An Evaluation of its Tensions, Gaps and Potential”. Participatory governance is considered to be a process that strengthens local democracy by opening new spaces for citizens’ participation. This understanding of the concept belongs to Peris et al. (2011), who explore the link between participatory government and urban environment planning. Actually implementing participation in the public sector is difficult, as pointed out by Sneddon and Fox (2007) who elucidate recent efforts to enhance policies of public participation within the context of governance in the Lower Mekong basin. Additionally, participatory governance was researched in the context of the public sector of the most diverse countries: China (Zhong and Mol, 2007), Brazil (Baiocchi, 2003), and Morocco (Berriane Y., 2010). The present paper builds upon the existing body of literature by developing a study on the participatory governance disclosure practices in the public healthcare systems of Scandinavian and Baltic countries.

3. Research design

The research is interpretative in nature and consists of three dimensions: conceptual clarifications on participatory governance, arguments in favor of focusing more extensively on participatory governance and analysis of the information disclosed by Scandinavian and Baltic countries on community engagement. Authors performed a qualitative analysis consisting in the investigation of the websites of different relevant institutions of the public healthcare systems from Scandinavian and Baltic countries, namely from Sweden, Norway, Denmark, Finland, Estonia, Latvia and Lithuania. The purpose of this analysis was to find to what extent these bodies publish information on participatory governance of the health system and the way they perceive community engagement. The healthcare system was first of all chosen due to its importance within the public sector, and secondly in order to continue the empirical studies performed by Ștefănescu et al (2010) regarding performance measurement and regarding the disclosure of information on social responsibility issues of public healthcare institutions. The reason for choosing to analyze the Scandinavian and Baltic countries was their pronounced and well-known interest for the well-being and social protection of their citizens and for social responsibility issues.

4. The concept of participatory governance and arguments in its favor

In the view of OECD, governance is a concept that encompasses not only the public institutions and the instruments for governing them, but also the set of relationships between governments and citizens. In this context, citizens are considered to act both as individuals and as part of or through institutions, e.g. political parties, productive enterprises, special interest groups and the media. Edwards (2008) identifies within this approach two dimensions of corporate governance in the public sector: vertical and horizontal. The vertical dimension refers to hierarchy issues within the public sector, while the horizontal one refers to the involvement of stakeholders outside of the public sector. Hierarchy is not to be ignored, since it provides the structural framework necessary for the public decision-making process. However, the involvement of citizens and organizations outside of governments is increasingly important nowadays and is the focus of the present paper.

The involvement of stakeholders outside of the public sector is not limited to disclosing to them relevant information, but also comprises their taking part in the formulation of policies and strategies, in the decision-making process and in the implementation of the decisions and

measures taken. This genuine engagement of citizens and other organizations in the public sector processes is called “participatory governance” and sometimes “community engagement”. The essence of “participatory governance” consists in all relevant non-government stakeholders having the opportunity to influence the process of policy development. They should have the chance to express their views and interests and according to Osmani (2007) should feel their opinions have been given consideration, even if the end result of the decision-making process may not fully comply with their wishes.

The main reasons for focusing more extensively on “participatory governance” are according to Edwards (2008) the following: (1) diminished trust of citizens in the public sector; (2) increased complexity of policy issues; and (3) reforms in accordance with the “new public management” principles. First of all, citizens become more cynical and less trustful in the public sector, especially on the background of the numerous “crisis measures” taken by governments, such as salary cuts, personnel cuts, and increased taxes. Second of all, the complexity of policy issues is increasingly greater and comprises the difficulty of defining issues, the involvement of several parties, and the impossibility for the governments to solve them on their own. Third of all, following the adoption of some measures from the private sector and the externalization of certain public services, governments lost part of their control and lacked the knowledge necessary for developing effective policies and offering high-quality services.

5. Participatory governance in the public healthcare systems of the Scandinavian and Baltic countries

The public healthcare system of a country is essential for the welfare of its citizens. Healthcare issues are of major interest for all citizens, at every stage of their lives, irrespective of age or social status. Naturally, a healthy lifestyle, healthcare adapted to one’s personal needs, and a proper life and work environment are highly desired both by the population, and by governments. As in the corporate sector human resources are considered the most valuable assets of companies, so in the public sector, people are a strategic resource and their wellbeing is critical. We therefore chose to focus our study on the public healthcare system and as previously presented, we limited to the Scandinavian and Baltic countries. We investigated the websites of the relevant institutions from Denmark, Sweden, Norway, Estonia, Latvia and Lithuania, in order to identify to what extent these bodies disclose information on community engagement within the healthcare system of that country and to examine the way they perceive participatory governance. An overall view of the results is presented in Table 1.

Table 1: Disclosures on participatory governance in the Scandinavian and Baltic public healthcare systems

COUNTRY	NAME OF INSTITUTION	SITE	DISCLOSURE LANGUAGE	INFORMATION ON PARTICIPATORY GOVERNANCE
<i>Denmark</i>	Ministry of the Interior and Health	http://www.sundhedsministeriet.dk/English.aspx	- Danish - English (partially)	The Danish Government launched in May 2002 the reform program “Welfare and Choice”. The underlying idea of this program is to enhance competition and quality in the public sector through choice. The citizens’ freedom of choice is considered very important. The website discloses information on the implementation of choice in education, health care, elderly care, child care, and on the implementation of choice for vulnerable groups.

Made by the authors

The general finding of the research is that the information on participatory governance disclosed on the websites of relevant institutions from within the Scandinavian and Baltic public healthcare systems is scarce. In Norway, Finland, Estonia, Latvia and Lithuania, no explicit information on participatory governance is disclosed. Their disclosure on such issues is rather limited. For instance, Finland admits that cooperation within municipalities and groups of municipalities, and with the state, church parishes, NGOs and the private sector is required in welfare promotion. In Estonia, the concern for the satisfaction of patients is obvious, and one of the Ministry's objectives is to develop a patient-centered healthcare system.

Denmark and Sweden are the two countries from this geographical area which show the greatest concern for community engagement. The Danish Government launched in May 2002 the reform program "Welfare and Choice". The starting point of this program is that the common responsibility to provide welfare services for the citizens should be combined with personal freedom to choose between different solutions. The citizens' right to choose is thus acknowledged. As a consequence, competition and quality in the public sector are to be enhanced by means of choice. On the other hand, Sweden shows clear and explicit interest for participatory governance. One of the most important public health objectives stated on the website of The Swedish National Institute of Public Health is to increase people's level of participation in society. It is considered that strengthening democracy and defending human rights reinforce the feeling of affinity in society as a whole and increase trust between people, two factors which promote good health. Opportunities to influence and participate in society are especially supported for financially and socially challenged persons, as well as children, young people and the elderly.

6. Conclusions

Participatory governance can be defined as the genuine engagement of citizens and other organizations in the formulation of policies and strategies, in the decision-making process and in the implementation of the decisions. The diminished trust of citizens in the public sector, the increased complexity of policy issues and the reforms in accordance with the new public management principles are the main reasons for focusing more extensively on participatory governance. However, the research showed that the information on participatory governance disclosed on the websites of relevant institutions from within the Scandinavian and Baltic public healthcare systems is scarce. The greatest concern for community engagement is displayed by Denmark and Sweden only. Authors consider there should be a shift in focus within the public sector in general and within the healthcare system in particular, so that citizens are genuinely involved in the relevant processes and their satisfaction is indeed at an adequate level.

Dragu Ioana-Maria

Babeş-Bolyai University, Faculty of Economic Sciences and Business Administration

This paper concentrates on information disclosure regarding IAS 23, being included in accounting research field. It comprises an empirical study on the correlation between information published by companies in consolidated financial statements with respect to borrowing cost policies and a series of variables that characterize a firm. The objectives of this paper involve estimating and establishing an econometric model in which is assumed that disclosure index for information required by IAS 23 depends on certain elements in the form of country of origin, sales, total assets, debt ratio, solvency, ROA and ROE. International accounting literature presents a series of studies on the subject of compliance with IAS disclosure requirements. Similar with this paper, various authors considered annual reports as starting point for data gathering in their reasearch on disclosure phenomena. The criteria used for data gathering, processing and analysing have been previously used in a successful manner by important scientists who published in accounting field. The methodology used involves Disclosure Index computation, as well as SPSS data processing, analysis and interpretation. Results show that the model is valid, meaning that there is correlation between information disclosure with respect to IAS 23 and the analyzed variables. According to our estimated econometric model, most of the variables maintain a certain influence on disclosure as we can observe a significant correlation level between the studied elements. This research contributes to the development of both accounting field and international accounting literature, by studying borrowing costs disclosed information in relation to certain elements that best characterize the activity of a company. Although an empirical paper, it concentrates also on accounting practices, as it uses real data extracted from annual reports and consolidated financial statements. The importance of this research relies in its originality approach, by studying the information disclosure for borrowing costs that represent one of the most important accounting fields.

Keywords: information, disclosure, borrowing costs, annual reports, correlation

C51, C53, M41

I. Introduction

International accounting literature contains a serie of studies on disclosure. The most recent of them, involve the analysis of compliance with IAS requirements. Many scientists have started to consider annual reports in their reasearch on disclosure phenomena. In addition, this paper uses certain criteria in data gathering, processing and analysing that have been previously used in a successful manner by important scientists who published in accounting field. Regarding the motivation for implementing this research, there is a need to establish the level of IFRS compliance, as both recognition and appliance of IAS is considered to be an essential element in the process of accounting development. Further on, by analysing information disclosure in

financial reports, and defining its correlation to some key indicators that show the financial position and profitability of companies, IFRS requirements regarding information made public could meet progress in compliance. This study contributes to a better understanding of IFRS compliance as well as of the factors that influence information disclosure. Furthermore, international organisms from accounting field should supervise IAS acceptance and thus the process of disclosure is one important part of it.

II. Literature review

Nowadays is becoming more and more difficult to make economic forecasts without having the necessary information. Decisions cannot be made in the absence of information disclosure. Further on, in all fields there is a need for published information, otherwise negative effects of non-disclosure can appear (Edmiston 2011:281-320). There is evidence of the fact that a 'real-time reporting' can be attained only through continuous evolution of financial reporting, in order for accounting standards and policies adopted by companies in practice to reach a common point (Kueppers and Sullivan 2010:292). International accounting literature mentions the benefits of improved disclosure (Lang and Lundholm 1993), as firms increase intensity of disclosure efforts before offering public debt and equity, and thus from compliance with international standards (Barry et al. 1991). There have been many attempts to study the level of disclosure for mandatory and voluntary issues using disclosure index. Donna Street (Street 2001:27-35) made a research on factors that generate noncompliance, and uses regression analysis in order to estimate their correlation to information disclosure. By studying the information made public in annual reports, some scientists try in fact to underline the importance of disclosure for accounting and for the economy, in general. According to them, the process of disclosure assumes three main aspects or characteristics of the information to be disclosed (Hossain 2008: 661): efficiency from economical point of view of disclosed information, influence of published information on economic agents' behavior, background of disclosure decision. Results of the study reveals that banks seldom choose to disclose voluntary elements; on the other hand, for mandatory issues, disclosure and transparency meets compliance. Hossain et al. (Hossain et al. 2009:664-667) made a study on corporate disclosure measurement for financial and non-financial companies. Their research is based on some analysis criteria, including: size of the firm given by turnover or sales, profitability (ROE, ROA), complexity of business- industry, activity field, country of origin, and assets. According to the authors, all these variables are supposed to influence information disclosure in financial reporting. In scoring of disclosure index, they used 0 for non disclosed and 1 for disclosed, which is known as the unweighted disclosure approach. Another research on disclosure concerns public listed companies in Malaysia (Lee 2010: 40-42) in which is studied the level of human resource information disclosed in correlation to a series of variables: size, industry and listing. The conceptual and relational SPSS analysis is based on information disclosed in companies' annual reports. Some researchers intended to create models for borrowing costs, in order to facilitate decisions and secure debt (Booth 2006: 70-72). In addition, ROE and ROA ratio indicators are used in empirical research to perform comparative analysis for companies' data in relation to borrowing costs (Bohusova and Nerudova 2009: 35-39). Other studies on capitalization of borrowing costs and their disclosure (Chung et al. 1993: 886-893) investigate firms from oil and gas industry, the analysis revealing two types of companies: successful efforts that expense borrowing costs, and are expensed full costs which capitalize costs.

III. Research methodology

The methodology used involves *Disclosure Index* computation, as well as *SPSS* data processing, analysis and interpretation of results. Data gathering implies a selection of companies and a

detailed read through all their consolidated financial statements. Research development is being sustained by certain analysis criteria, such as: *market capitalization, company profile, headquarter, or time period*. The number of firms involved in the study has been elected in accordance to the market capitalization level corresponding to each one of the ten countries implied in the research (*France, Germany, Spain, Italy, Poland, Austria, Romania, Hungary, Ukraine and Bulgaria*) and the period of study comprises a five years' analysis (from year 2005 to 2009). The elements determined for all the 92 participating companies include: *disclosure index, sales, total assets, gearing- solvency and debt rate-, ROE, ROA*. Regarding the information disclosed by firms in their consolidated financial statements, the paper investigates the compliance with Disclosure Checklists of borrowing costs that is disclosing the *accounting policy* adopted with respect to borrowing costs, amount of *capitalized borrowing costs* and *capitalization rate*.

The function that best describes the econometric model can be presented as follows:

$$DI_t = \partial_0 + \partial_1 \text{Sales} + \partial_2 \text{TA} + \partial_3 \text{DebtRatio} + \partial_4 \text{Solvency} + \partial_5 \text{ROA} + \partial_6 \text{ROE} + \partial_7 \text{Country} \quad (1)$$

In the above function, t is the year of study and takes values from 2005 to 2009. Disclosure Index determination involved two stages. First of all, for each one of the three items to be disclosed, in the form of borrowing costs policy adopted by company, amount of capitalised borrowing costs and capitalization rate, were denoted with '1' in case information for that item has been disclosed in the annual report, and '0' for the firm that did not publish the respective information. The second step involved summing up the result for the three elements, and then dividing by three- as this was the maximum probability for disclosure.

$$DI = \sum(d_i \text{ effectively presented}) / \sum(d_i \text{ all the possible cases}) \quad (2)$$

IV. Interpretation of results

(Source: own computations)

Table no.1 presents the correlation between Disclosure Index and its corresponding variables (Sales, Total Assets, Debt ratio, Solvency, ROA, ROE). In analyzing the evolution of correlation coefficients for the 5 years' period (2005-2009), we consider three significance thresholds, of 10%, 5% and 1%. The results show that according to our estimated econometric model, most of the variables (Sales, Total Assets, ROE and ROA), maintain a strong influence on disclosure for year 2005, as we can observe a high correlation level between the studied elements. In addition, we can observe that in most of the case, Pearson Coefficient registers values that are above the significance levels (see Table no.1). One of the variables that influences disclosure index with respect to borrowing costs is represented by *sales*. Pearson Coefficient for sales (0,102) shows that the more complex the company is, having a high turnover, the higher the level of published information. This is also valid for the case of *total asset*. Its coefficient of 0,105 demonstrates that as a firm increases its assets, it is also willing to publish a greater amount of information. On the other hand, for both *debt ratio* and *solvency* there is a low correlation level in their relation to disclosure index. For instance, debt rate has a negative correlation with respect to DI, which means that in some of the cases (tough, few, as the value of -0,058 does not indicate a significant influence) when a company's debt ratio increases, disclosure concerning borrowing costs has in contrast a tendency to decrease. Concerning ROA and ROE for year 2005, although they seem to be highly correlated with the indicator showing information published by firms in accordance with IAS 23, the significance level is lower than 0,05 (see Table no.2). For years 2006 and 2007 we can state that again debt ratio and solvency show high correlation, but similar with the previous year, the level of significance does not reach 5% (see Table no.2). The other variables do not register coefficients that should indicate a relevant influence for disclosed information regarding borrowing costs. However, there is the exception of Pearson's coefficient for ROA recorded in 2007 (0,115), that stands for a strong correlation between disclosure index and ROA for the mentioned year. The last period of our analysis (2008-2009) is characterized by some evidence of correlation- sales from 2008 (0,132), as well as debt ratio and solvency, in 2009 although for the last two items the significance level is under 10%, respectively 5% (see Table no.2). Regarding the assumption that the country in which a company has its headquarter and where it has been set up has an influence politics adopted concerning information made public, the findings suggest that Romanian companies have similar behaviors when it comes to publishing information regarding borrowing costs. In addition, the significance level is lower than 1%. Further on, Bulgaria registers a small influence on disclosure index for the entire period of 5 years' analysis, the maximum value being under 0,03. Similar values for Pearson's Coefficients are recorded for Poland and Spain, that present a negative correlation in 2009 (-0,075 and -0,089). Ukraine does not seem to have an important influence on disclosure with respect to borrowing costs, excepting year 2009 (0,130). For France, there is evidence for high correlation in 2006 and 2007, but the significance level is under 5% and 10%. In case of Italy, it seems that there is both positive and negative strong correlation. For years 2006 and 2007 the recorded values (0,127 and 0,129), imply that this country influences the firms that have headquarters and were set up within its borders, in the matter of information disclosure policy for IAS 23 issues. In 2008, Austria recorded a high degree of influence on its companies with respect to borrowing costs, while in 2009 Germany seems to also have a great impact on the way its firms publish information of IAS 23 appliance.

Finally, regarding the relevance of the econometric model, according the SPSS analysis, the dependent variable (disclosure index for borrowing costs information) is explained through the model in a percentage of 39% in 2005 and 2007, 37% for 2006, while in 2008 and 2009 this amount decreases to 21%. In addition, the values for adjusted R² stand as evidence for the mentioned facts.

V. Conclusions

This paper is meant to study the consistency of information published by companies in their consolidated financial reports. The research objective relates to the impact of international accounting standard IAS 23 Borrowing Cost demands on companies' accounting policies. Further on, the study involves estimating and establishing an econometric model in which is assumed that disclosure index for information required by IAS 23 depends on certain elements in the form of country of origin, sales, total assets, debt ratio, ROA and ROE. The importance of this research relies in its originality approach, by studying the information disclosure for borrowing costs for a 5 years' period, starting with 2005, until 2009, and also by considering a large sample of companies being significantly chosen. On the whole, this paper is meant to bring a national and international contribution to the literature of borrowing costs, as one of the most important accounting fields.

Results show that the model is valid, meaning that there is correlation between information disclosure with respect to IAS 23 and the analyzed variables. According to our estimated econometric model, most of the variables maintain a certain influence on disclosure as we can observe a significant correlation level between the studied elements. Regarding the relevance of the econometric model, according the SPSS analysis, the dependent variable -disclosure index for borrowing costs information- is explained by the model, adjusted R² taking values between 21% and 39%. This research contributes to the development of both accounting field and international accounting literature, by studying borrowing costs disclosed information in relation to certain elements that best characterize the activity of a company. Although an empirical paper, it concentrates also on accounting practices, as it uses real data extracted from annual reports and consolidated financial statements.

RESSOURCES ALLOCATION POSSIBILITIES WITHIN HEALTH SERVICES

Toplicianu Selina

Valahia University of Targoviste, Faculty of Economic Sciences - Doctoral School

Manea Liliana

Valahia University of Targoviste, Faculty of Economic Sciences- Doctoral School

The state policy in the health care area must take into account the complexity and specificity of the domain. Health means not only “to treat”, but also “to prevent” and “to recover and rehabilitate the individual physically”. Regardless of the adopted health insurance system, the health system is facing a big problem and this is the insufficient funds necessary to function properly.

The underfunding may have various causes, from a wrong health policy, based on “treating” instead of “preventing”, by the misuse of funds. This papers intended to formulate assumptions that underpin the research I am conducting within the Doctoral Research Program held at the Valahia University of Targoviste, which aims at using the management control in increasing the health services performance.

The application of the accounting and management control methods in determining health costs can be a beginning to streamline the system. This is also a result of the fact that health care is a public service with specific characteristics: it can not be subject only to market requirements but at the same time he must undergo an administrative savings, representing a typical case of market failure.

The increased cost of treatment, as well as the decline in their quality can be determined by the discrepancy between the funding and payment mechanisms. Different payment systems currently available do nothing but perpetuate the shortcomings in the system. Switching to the introduction of cost and budgets by cost centers or object (if solved) can be a step forward for a better management of resources. In this context, we consider as a necessity to be imposed the cost analysis on responsibility centers, the definition of the cost object and cost center identification and determination of direct costs and those indirect services to choose the basis for the allocation of cost centers and the determination of each actual cost per diagnosis.

JEL Classification: H51, I18

1. Introduction

Health is a factor with direct implications for the proper conduct of social life and economic activity.

The definition of health, provided by the World Health Organization, states that, “*Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity*” (Voiculescu 1986: 5). Analyzing this definition there might be drawn the conclusion that the health policy should be an objective of state policy. This is particularly important, since the health should be considered from a triple perspective: *political and demographical*, according to which “the health of a nation depends on the health of its members”; *economic*, a healthy population is a premise for a greater productivity, and *social*, designed to provide a healthy life.

State health care policy must take into account the complexity and specificity of the domain. Health is not just “treating”, but also “preventing” and “recovering and rehabilitating the individual physically”. It follows that health care is not only a problem of health assisting, but

also a profound social problem, an integrant part of all the social and economic conditions for development.

In the last decades there have been multiple and profound changes in the health system, from changing funding schemes, to the reshaping the whole system. The purpose of these changes was, on the one hand, to ensure a balance between health system's income and costs, and, on the other hand, to increase performance sectors of health, so that the population health and quality of health services in Romania to be, as much as possible to those existing in European Union countries. Giving the Romania's accession to the European Union, the population health state and health services in EU member countries, become also the Romanian reference in this field.

Public health system has undergone numerous reforms, designed to ensure better use of available resources, in order to meet the European values in this domain: the right to health care, ensuring the access to health care, respecting the right to free choice of provider, and equal opportunities.

The transition from centralized health insurance (type Semasko), to health insurance system type Bismarck, based on the principle of social solidarity, has changed the financing method, but has not solved the big problem facing the health system, that is, the lack of necessary funds.

The problem of underfunding of the health sector continues, regardless of the measures taken. Underfunding may have various causes, from bad health policy, based on the "treat" and not "prevent", by the misuse of funds.

2. Health sector, typical case of the market failure

Health care is a public service with specific characteristics: it can not be subject only to market requirements but also it must run under an administrative economics system.

In 1963, Kenneth Arrow pointed out in his "*Uncertainty and the welfare economics of medical care*", that health services are a particular market, highlighting that this is not a traditional, self-adjustable, market but rather a typical case of market failure.

According to Simona Haraga, the main causes of this market failure are: heterogeneity of health services, information asymmetry between consumers and providers of health services, consideration of health services as a public service, moral hazard both for the supplier's and patient's side, and the particular situation of monopoly or oligopoly on the market, that allows the providers to set the price (Haraga 2007).

Arrow shows that "the uncertainty in the incidence of disease and treatment efficacy determines the competitive markets to inefficient resources allocation, and thus to contribute to the appearance and intervention of an administrative institutions (non market) as compensation for market failures" (Arrow 1963). Despite its controversial nature, this idea turned into a fertile ground for developing theories regarding the formation of social institutions.

There have been remarkable changes in the health system, since the Arrow's article publication. Health expenditure has increased dramatically, both because of increased demand for health care and because the diversification of investigative methods are accompanied by their cost increases. This directly led to the emergence of new diversification entities in order to relieve the public health care system and increase the efficiency of existing units.

Another fact to bear in mind is that health is a particularly good, which determines a certain specificity in health insurance services. By the impossibility of substitution of such goods, unlike the classical goods and services, caused by situation of unaffordable purchase, and by the specific way to insure against such risks, health care has totally different features from all other goods.

"Individual health" is a complex phenomenon, influenced by many factors whose action may not always be controlled, including:

- The quality of the individual (hereditary endowment, level of general education, basic medical education, eating habits, preventive attitude, etc.).
- Living environment (pollution, stress etc.).

- The life standard (material and financial conditions);
- Healthcare system (health care institutions, medical equipment endowment, medical personnel, the quality of medical care, etc.).

At the same time, individual health determines individual behaviour, personal growth, social and economic development and, not least, the quality of his life.

Health policy, as an integrant part of social policy, requires significant financial resources. Alongside the economic expansion and the scientific medicine, health expenditures have a tendency to increase due to factors such as: health care needs amplification, as effect of population growth and it's structure change, increased risk factors, the increasing cost of medical services as a result of introduction into medical practice new ways of investigation, treatment, medication, the increase in number of medical professionals, etc. In modern health systems, an increasing importance is granted to the theory according to that the medicine should not be the patient's medicine, but primarily it has to be healthy human medicine that emphasis on disease prevention.

In these circumstances, financial resources for health care are used predominantly for investments (building hospitals and their endowment with medical equipment and tools, and adequate means of transportation), for maintenance and normal operation of hospitals, dispensaries (salaries and other personnel rights, medical supplies, medicines, expenses for patients' food, repairs, etc.) and to ensure disease prevention.

One can appreciate that, globally, in the last three decades (1960-1990), the value of health expenditures doubled in most developed countries. According to UNCTAD's Human Development Report 1998, the share of total health expenditure in GDP in OECD countries increased from 4.5% in 1960 to 9.7% in 1991; in North America from 5.3% to 13.0%; in the European Union from 4.1% to 8.2%. In developing countries there has been total, also a share of the public health expenditures in GDP (from 1% in 1960 to 2% in 1990), but large differences between countries.

3. Imbalances in the Health services financing

Setting up the revenues for financing health services combine different ways: public financing (governmental) having taxes as main source, social security contributions made by private insurance (conducted by individual payment of insurance premiums) and patients' direct payments.

With the exception of the last way, these systems provide all the insurance schemes elements, meaning that they collect and distribute risks. The first two funding categories provide health services for free or below their price, based on past entitlements arising from contributions paid by all taxpayers.

Similar to insurances schemes, health financing schemes can provide an element of mutual support. The contributors with higher risk and those who have a lower income are partially supported by those with higher incomes and lower risks. Given the correlation that exists in all countries between low income and increased risk of disease, this support is necessary to be provided.

The autonomous public institution of national interest, which administers and manages the health insurance system in Romania, is, according to the Law no. 95/2006, National Health Insurance House (CNAS).

The Single National Health Insurance Fund's incomes are constituted of contributions from individuals and businesses, grants from the state budget, donations, sponsorships, interest, income derived from the heritage of the National Health Insurance House and the county health insurance houses, amounts from the revenues of the Ministry of Public Health and other income, according the law.

The overwhelming share of Single National Health Insurance Fund's incomes has as source the contributions of individuals and legal persons (Table no. 1).

Table no. 1. - The structure of funding of health care in Romania in 2004-2009 (%)

	2004	2005	2006	2007	2008	2009
Total revenues	100	100	100	100	100	100
State Budget	1.33	5.44	2.07	6.08	9.28	5.97
National Health Insurance House	96.84	93.65	95.44	93.46	90.26	93.92
Other sources	1.84	0.91	2.49	0.46	0.46	0.10

Source: Calculated by the author, based on data from annual reports of National Health Insurance House

According to the Health Insurance Fund budget, health expenditures might be divided into two broad categories: health care costs and Fund's administration expenses.

The expenditures for medical services include materials and supplies of medical services, such as: primary care, specialized outpatient care (except medical laboratory services), medical laboratory services, outpatient dental care, hospital services, medicines and materials typical used in hospitals for some chronic diseases and specialties based on programs, assistance with medications in outpatient treatment, medical devices, pre-hospital emergency medical services, health services, recovery and rehabilitation health care services at home.

Analysis of the structure of expenditure in the health system indicates the large share of expenditure in health care facilities with beds (Table 2).

Table no. 2. Structure of health expenditure in the period 2005 - 2009 (%)

	2005	2006	2007	2008	2009
Total expenditure of which:	100	100	100	100	100
Pharmaceutical products, sanitary materials and medical devices	23.15	31.57	31.19	29.43	28.02
Outpatient Medical Services	10.69	10.40	12.78	15.75	12.39
Pre-hospital emergency services	2.95	2.84	2.87	3.34	4.05
Medical services in hospitals with beds	52.40	48.76	46.53	45.21	47.93
Medical care at home	0.03	0.04	0.08	0.12	0.12
Administrative expenses of the Fund	1.31	1.64	2.12	1.50	1.24
Other expenditures	9.48	4.74	4.44	4.64	6.24

Source: Calculated by the author on the basis of the Health Insurance Fund Budget draft for 2005-2009

Given that revenues are reportedly growing CNAS, there is a shortage in the financing of health services (Table no. 3).

Table no. 3. The shortage in the financing of health services in Romania (thou lei)

	2005	2006	2007	2008	2009
Total revenues	8474378	10151441	13080571	15780537	14623761
Total expenditure	9157441	10170503	12859102	16636256	15274758
of which:					
Deficit Financing	-683063	-19062	221469	-855719	-650997
% Shortfall in income	-8,06	-0,19	1,69	-5,42	-4,45

Source: Calculated by the author on the basis of the National Health Insurance House (CNAS) reports

Naturally, appears the question: Why this money shortage in health financing? The question is the more legitimate, giving that, in recent years, in addition to public sector health insurance has

grown the private healthcare sector (in 2009 there were approximately 380,000 policyholders in the private sector).

There might be multiple answers:

- An increased demand for medical services due to deterioration of health;
- Inadequate collection of revenues;
- Inefficient allocation of funds for different categories of expenditure;
- Lack of a cost management (cost control) to the major health providers (hospitals).

The following paragraph will address the last two answers identified.

4. Methods of allocating public funds in health sector

Health care system performance depends largely on how the payment system for health care providers is organized.

Arrangements for funding the system can not be treated separately nor from payment mechanisms nor to the types of care provided.

Increased cost of health care services, as the decline in their quality can be determined by the discrepancy between the funding and payment mechanisms. On the health care market, the consumer does not have sufficient knowledge to make voluntary, independent choices. The supplier, in our case the doctor, is one who sets the price and influences the demand. Because doctors can decide the treatment, the medication and the quantity of services, through their behavior, they can influence the cost, efficiency and quality of health services.

Different payment methods determine different behaviors, depending on their typology.

Payment per service has as main unit of payment the medical examination or medical act itself. The supplier is paid in proportion to services rendered. The method is used in hospitals, health centers and individual physicians practice. Providers may be tempted to raise the number of services, even some of them are non-necessary. Also, from the patient's side might be observed the same tendency to over use these services.

Pay per capita represents a fixed amount payment over a period of time for each patient entered on a doctor's list, regardless of the number of services. Age or gender might influence the price per patient. In this case, there may be the tendency to attract only healthy individuals on their lists, preventing access of patients ("cream skimming"). Also, the number of services could be reduced to that required.

Payment per case has as payment unit the service package or the number of hospitalized patients. The supplier receives, through a standardized contract, a predetermined amount for the package or hospitalized patients. This method is used in hospitals funding. There is a tendency to reduce the duration of hospitalization, a diminution of services per case, but also for selecting cases with less severe disease.

Pay per day-hospital care causes the tendency to increase length of hospitalization, knowing that the last days of hospitalization are even less expensive. This form of funding tends to over-increase the hospital beds utilization and the appearance of oversized health care units. In this context, the number of services per case will fall.

Payment by salary represents the monthly payment to the doctor, with a fixed amount, regardless of the number of patients treated, the quantity and cost of health services provided.

The overall budget is the amount allocated in advance to the provider. It may decide to redistribute money on various items of expenditure. This payment method is used for hospitals and health centers.

Each type of payment for service health providers has specific limitations.

In this context, we consider that it would require the cost analysis by responsibilities centers.

In order to increase performance in the health sector and better management of funds, David W. Young proposes the introduction of the management accounting in the patients' care (Young, 2003).

This process involves six strategic decisions in determining costs, taking account of sector specific analysis:

- Definition of the cost object;
- Identification of cost centers;
- Identification of the direct and indirect costs;
- Choose the basis for allocating service cost centers;
- Select the method of allocation;
- Attaching to the cost of a cost centre a cost object.

These decisions are no more than cost accounting methodology.

Conclusions

In the case of hospitals, the cost object can be represented either by the cost of hospital inpatient days, either by an episode of illness (diagnosis). The introduction in 1983 of DRGs (Diagnostic Related Groups) changed the cost of the hospital subject to a "day care" at discharge for a given diagnosis. Using this method represented an attempt to uniform and somewhat to standardize the expenditures for a specific diagnosis.

DRGs system has often been criticized because, most often with a specific diagnosis, there are associated other related diseases that can lead to increased costs. In addition, patient care activities are carried out in units having different endowments than those considered as standards, which involve different overheads.

These observations lead to the necessary to identify appropriate cost centers and their budgeting. The cost centers delimitation within the healthcare unit, affects the way of aggregation of these costs. If the budgeting is done at the organization (hospital) level, there is likely to overstatement the overhead costs, which will then be distributed to each item of cost. If the organization is divided into a many cost centers, the expenditures to can be better managed. From the management perspective, the costs are better identified and more easily to calculate if they are grouped on homogenous activities.

THE INTELLECTUAL CAPITAL STATEMENT AND THE BALANCED SCORECARD AS COMPLEMENTARY MODELS IN MEASURING FIRM'S INTANGIBLES. AN EXPLORATORY STUDY

Veltri Stefania

Department of Business Administration, University of Calabria, Italy

The purpose of this paper is to examine the role of two different new management tool, the Balanced Scorecard (BSC) and the Intellectual Capital Report (ICR) in managing and reporting intangibles. Unlike the majority of IC scholars the author, and consistently with Bukh et al. (2005), the author starts from the idea that BSC and ICR are not alternative, but complementary tools in measuring intangibles, addressing different needs for firms that measure, manage and report intangibles. The research hypothesis of the paper will be demonstrated through the analysis of a case study of an Italian group which use both intangibles' reporting systems. A case study methodology has been chosen, given that it is widely used by researchers and provide the basis for the application of ideas and extension of methods (Yin, 1994). Intercos group has been chosen to test the research hypothesis, since it makes use of both models in measuring and reporting intangibles. The study of the case Intercos group found evidence that the two types of extended reporting are different and yet complementary and that both tools are necessary for firm in measuring IC, since they address different aims. This includes therefore a marked difference in use of indicators, given that IC indicators in the ICR have to support the overall aims derived by company's strategy, while BSC indicators provides a breakdown of strategic goals with respect to profitability, growth etc. The contribution of the paper to the IC literature is to extend the findings of the Bukh et al.'s (2003) study, investigating the hypothesis (and finding evidence) that BSC and ICR are complementary in reporting intangibles in an Italian group. Implications of the paper are for company's manager, who increase the awareness that they have at their disposal two management tools, with address different aims, to manage intangibles.

Key words: Intellectual capital report, balanced scorecard, complementary models

JEL code: M41

1.Introduction

In the present economy, known as the knowledge-based economy owing to the critical role played by this factor, relevant changes, external (related to the competition's modalities) and internal ones (related to the resources' composition) has caused a modification in value creation modalities, whose main source is no longer based on the production of material goods, but on the creation, acquisition and evaluation of intangibles (Prism Report, 2003). Since intangibles have become the main value drivers for the 21st century firm, the problem measuring intellectual capital (IC) performance became a central issue in measuring firm's performance.

The definition and classification of intangibles (or IC) is still an open question (Zambon, 2003). The definition accepted in this paper considers IC as a dynamic system of intangible resources and activities, at the basis of the organization's sustainable competitive advantage. All of the major players in the IC field share the idea that intellectual capital, from a qualitative point of view, can be divided into three categories: structural (organizational) capital, human capital and relational capital; even if the labels utilized are different, the content of categories is more or less quite similar. Briefly, human capital consists in knowledge, capabilities, competencies and skills possessed by firm workers. Organizational capital is constituted by structured knowledge

possessed by firm and shareable (database, procedures etc.). Relational capital is constituted by the totality of relations between firms and its main stakeholders (Bontis *et al.*, 1999).

Basically, methods for measuring IC can be classified in methods focused on the financial side of measurement and the monetary value of intangible assets and “scorecard” methods that look for indicators able to measure intangible resources and activities (Sveiby, 2009). To the category of scorecard methods belong methods measuring multiple aspects of firm’s performance, including intangibles, such as the Balanced Scorecard (BSC) and methods developed ad hoc to measure intangibles through a system of IC indicators disclosed in an IC report (Chiucchi, 2004).

The main’s paper aim is to demonstrate, by using case study methodology (Yin, 1994), that Balanced Scorecard (BSC) and IC Report (ICR) models are not alternative but complementary model in measuring intangibles.

2.Literature review on the IC scorecard measurement systems

The Balanced Scorecard (BSC) belong to the multidimensional firm’s performance models (Bitcici *et al.*, 1997), developed to overcome the limits of the traditional, mono-dimensional performance measurement models, focused only on the accounting/financial side of firm’s performance. Briefly, in the BSC four perspectives are considered: financial, customer, processes and learning and growth perspective. The *financial* perspective identifies long term financial results; the *customer* perspective allows managers to ask themselves on what factors client consider really important and which actions the firm have to implement to reach customer satisfaction; the *processes* perspective is an internal one, which allows managers to evaluate which factors have a deep impact on client’s valuation, such as production and delivery times, productivity, flexibility, etc.; the *learning and growth* perspective concurs to the distinctive competencies which maintain and increase the firm’s competitiveness. BSC tool had great evolution with time, from a performance measurement system (Kaplan and Norton, 1992), to a strategic performance management system (Kaplan and Norton, 1996, 2001), to a system focused on transformation on intangible assets intangible results (Kaplan and Norton, 2004).

Our analysis focuses only on BSC in relation with the measurement of intangibles and on its role in measuring . Until 2004, in fact, authors had never explicated their concept of IC, so the IC scholars made a connection between the three non-financial areas, especially the one of learning and growth, and the IC. In 2004 Kaplan and Norton “making official” the shift of the BSC from strategic management tool to an intangibles management tool by providing their own version of IC, identifiable within the learning and growth perspective. According Kaplan and Norton (2004), IC can be divided into human (employees’ skills, talent and knowledge), information (databases, information systems, networks and technology infrastructure) and organizational capital (culture, leadership, employee alignment, team work and knowledge management). Such division perplexed some IC scholars, since it does not consider the traditional IC division in human, structural and relational capital on which, in recent times, there is an almost general convergence (Marr and Adams, 2004). For this reason, BSC is a model included, by some IC scholars, in the measurement of intangibles models (Sveiby, 2009; Zambon, 2003).

There are different positions in doctrine about the usefulness of BSC in measuring intangibles. Some scholars (Bontis *et al.*, 1999; Petty and Guthrie, 2000) consider BSC a fundamental tool to measure intangibles, some others question the use of the BSC model to value intangibles since it is not a model created ad hoc to measure IC, and intangibles, for their own peculiarities had to be measured by *ad hoc* measurement systems (Mouritsen *et al.*, 2005; Lev, 2001).

The IC scorecard measurement models had an evolution passing from the first, *pioneering* studies to the *advanced* ones (Chiucchi, 2004; Veltri 2007). To the pioneering models, belong, among others, the Intangible Asset Monitor – IAM (Sveiby, 1997) and the Skandia Navigator

(Edvinsson and Malone, 1997); to advanced models belong, among others, the IC report models developed under the Meritum (Meritum 2002) and the Danish project (DMSTI, 2003).

Briefly speaking, in the *pioneering* models, attention is focused on the content of the IC subcategories. The vision behind is a typical accounting vision, according to which IC is an aggregate of intangible resources. The mainstay of these models is the IC value measurement and their main aim is to explain causes of the differential between accounting and market value, mainly attributed to IC. The *advanced* models adopt the evolved notion of IC as a dynamic system on intangibles resources and activities based on knowledge. The attention is focused on the interactions between the IC items, at the basis of the organization's value creation, and on intangible activities essential to produce, maintain and develop intangible resources. The assumption behind these IC models is the knowledge management, the main aim of the advanced models is to identify the paths of the organization's value creation based on knowledge.

Our position is that both instruments, BSC and ICR, are needed to measure intangibles, and we try to prove it by analysing a real life case of a company that use both tools in measuring intangibles, with different aim, in the next paragraph.

3. Research methodology: the Intercos case study

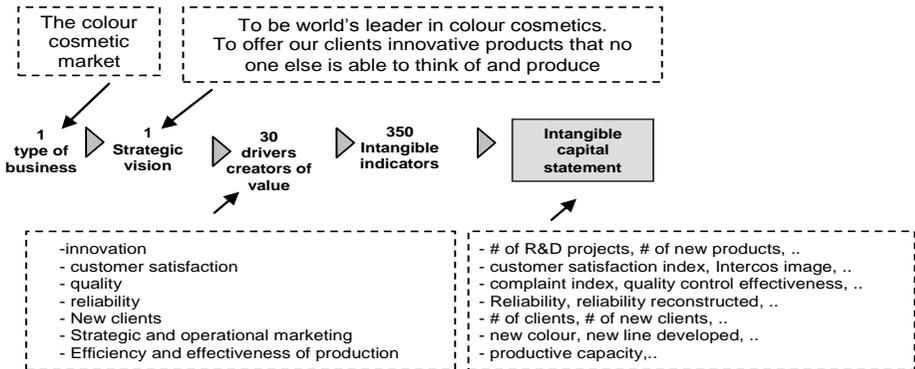

The research method used to investigate if BSC and ICR are complementary tools in measuring intangibles is the analysis of a qualitative case study. Case study methodology is widely used by researchers across a variety of disciplines to examine contemporary real-life situations and provide the basis for the application of ideas and extension of methods (Yin, 1994). We took the idea of the paper from the Buhk *et al.* (2003)'s study, which investigated the same research question for a Danish software company, Systematic Software Engineering, finding that BSC and ICR were different and yet complementary when applied to Systematic Software Engineering.

In details, the ICR and the BSC of an Italian group, Intercos, have been investigated in order to highlight the different role of the two tools in measuring intangibles and to analyze their relationships. Intercos group's history is excellent, since it focuses on innovation and capability to manage the complexity of business. Intercos group experienced a big growth: founded in 1972, it has become an international firm, global leader in creation, development and production of make-up products. In the last years Intercos group has confirmed its leadership in the cosmetic sector. Intercos is one of the few Italian group to issue an IC report and the only one in the cosmetic sector. Our analysis focused on 2004 Intercos group's ICR and BSC, since after 2004 Intercos group stopped to disclose its IC report to stakeholders (Gasperini and Novellini, 2004).

The attention of Intercos towards intangibles was a reaction to a stakeholder satisfaction survey, in which customers and employees did not consider fully satisfying the relationship with company (only 50% were fully satisfied). The results of the survey pushes Intercos to consider the opportunity to issue an IC report (Gasperini and Novellini, 2004). The identification of intangibles indicators was a shared process, on the basis of interviews and workshops which had the aim, at first to identify the type of company business and of its vision, then to identify the strategic areas of value creation (30 value drivers creators were identified) and to define a set of key indicators (350 intangible indicators were identified, which have also the finality to evaluate the employees' behaviour (fig.1). In 2004, the main aim of the IC Report (*Intercos Group Global Report*) was to enlighten the culture and philosophy which animates Intercos group. In preparing the ICR, Intercos Group declared to follow DMSTI guidelines. The strategy (a global one) defines the framework within which initiatives related to knowledge resources taking place. The Intercos Group approach put the customer at the centre, and each section (customer, innovation, marketing, supply chain, people) illustrates a series of intangibles indicators focused on customer and related to the global strategy; the section dedicated to *customers* summarizes important information with regard to *customer satisfaction*, measured in relation to company'

innovation, marketing, organisation, employees skills, quality and corporate image, measures in client perspective and in a cross-valuation between clients and human resource perspectives. *Innovation* is the basis of Intercos’s competitive advantage and the data presented in this section are related to raw materials, projects, products, and processes show the corporate performance on innovation. The section destined to *marketing* contains a description of the results achieved by the marketing division, then it examines the results achieved in the strategic market area (which includes the creative activities) and in the operative one, which are strictly linked. The section destined to *supply chain* contains a description of the company plants; the focus is on reliability and quality indexes. The section dedicated to *people* contains, apart from a deep workforce analysis, data on diversity management and the results of the survey on employees and top manager with relation to their satisfaction, motivation and energy, leadership and emotional competence.

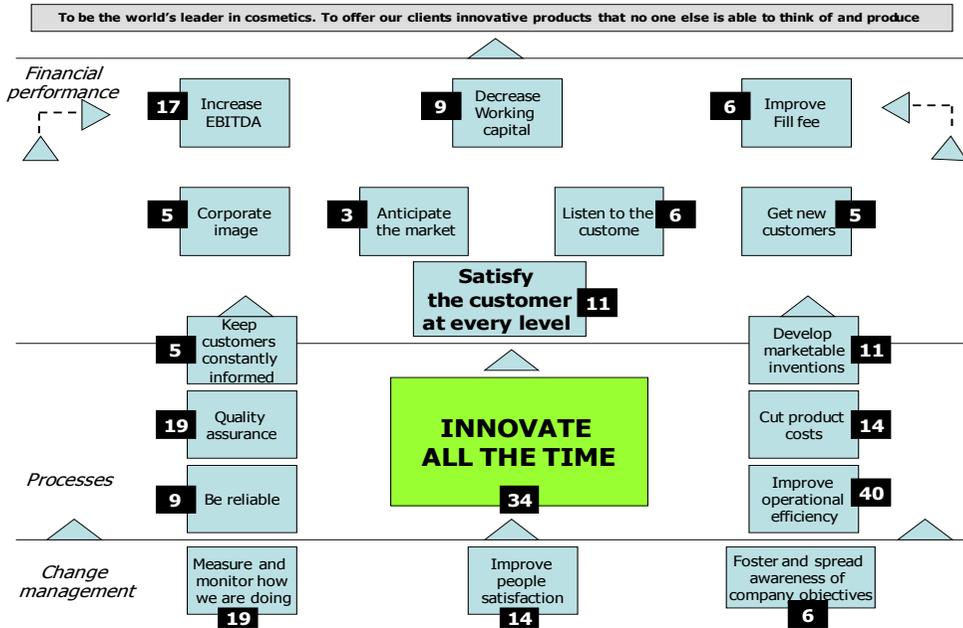

Fig. 1 – The process of IC report in Intercos Group

Source: own adaptation from Gasperini and Novellini, 2004

The declared aims of the Intercos group’s BSC are to monitor the key factors for Intercos group within the BSC framework and to communicate corporate strategy within Intercos group (fig 2).

Fig. 2 – The intangibles resources in 2004 Group Global Report of Intercos

Source: own adaptation from the 2004 Group Global Report of Intercos

The BSC of Intercos Group comprehends a wide number of IC indicators in all areas, with a main focus on internal area, because of its main role is to translate the broader IC objectives included in the IC report into more detailed objectives. Therefore, the two instruments are related, meaning that BSC provides the necessary degree of detail, breaking up the objectives defined into the ICR in more achievable objectives contained in the BSC and derived by ICR (whose number is reported in fig. 2). BSC has also the aim to control that employees carry out the adequate activities to achieve the objectives, given that a detailed internal management control system is based on BSC.

4. Research results

Both intellectual capital reports and balanced scorecards relate corporate strategy and integrated performance management systems, and they both expand reporting beyond the financial view with categories of customers, processes, and employees. This paper discusses their differences and complementarities based on an analysis of their use in one Italian cosmetic group. Intercos group has published ICRs for three years and implemented a balanced scorecard after the first year of reporting IC. From the analysis of its 2004 IC report, it can be said that Intercos stresses the double scope of the statement as a management tool (intangible indicators are included in the incentive plan) and a communication tool about the firm's knowledge management activities (at Cosmoprof 2003, the major of the cosmetics market, Intercos presented its IC report instead of its products). As regards the BSC, Intercos introduced this tool after the publication of the first IC report in 2002 and use it with an instrumental role, to anchor corporate strategy to single projects and to people's objectives and in order to promote the employees' commitment. BSC comprehends sensitive data, so it is only an internal tool, while ICR has both an internal and external aim. The use of BSC in Intercos was obliged by the consideration that ICR cannot address the operating needs to coordinate the different activities, to detail them and to link the commitment of employees to the corporate aims. On the contrary BSC, due to its features, such as the possibility to include sensitive data, to make explicit cause-effect relationship and the

possibility to be developed at a single project level, can address the organizational needs above mentioned and qualifies itself as a tool linked to the ICR by an instrumental relationship. A comparison of the indicators in the BSC and the ICR reveals that they do not report the same indicators, given that BSC has been developed after the ICR to break down IC indicators. Another important difference is that BSC relates its indicators in a cause-effect relationship, while ICR presents the indicators related to the dimensions of Intercos presentation framework. The study of the case Intercos group found evidence that the two types of extended reporting are different and yet complementary (BSC is included in the Intercos group's ICR) when applied in this firm and that both tools are necessary for firm in measuring IC, given that they address different aims. This includes therefore a marked difference in use of indicators, given that IC indicators in the ICR have to support the overall aims derived by company's strategy, while BSC indicators provides a breakdown of strategic goals with respect to profitability, growth etc.

5. Conclusions

The intellectual capital statement and the balanced scorecard in Intercos group both report issues beyond the financial on customers, processes, and employees, but they do this differently. Using two integrated performance management systems does not seem to be difficult for Intercos group. The ICR is used primarily as a means to develop and communicate the firm's intangible activities, and the balanced scorecard is used primarily as a mechanism to make employees accountable for achieving the company's objectives. In Intercos these models are complementary. The difference in indicators is a consequence of the different purposes of the models. The intellectual capital statement is produced with the purpose of external communication and therefore it cannot contain sensitive data and measures according to strategy and competition. On the contrary, the balanced scorecard is developed with the purpose of internal management of projects and is never intended to be published externally, which makes it possible to include sensitive issues and measures in the model. The main limit of the paper lies in the circumstance that it is based on just a qualitative case studies. In order to investigate on the complementary relationships of these two management tools, many qualitative cases should be studied. The contribution of the paper to the IC literature is to extend the findings of the Bukh et al.'s (2003) study, investigating the hypothesis that BSC and ICR are complementary in reporting intangibles in an Italian group. As for the company analyzed by Bukh's et al.'s (2003), we found evidence that the two types of report are different and yet complementary when applied to Intercos group. Implications of the paper are for company's manager, who increase the awareness to have at their disposal two management tools, addressing different aims, to manage IC.

SOME INSIGHTS REGARDING CREATIVE ACCOUNTING IN ROMANIAN ACCOUNTING ENVIRONMENT - REGULATORS, FINANCIAL AUDITORS AND PROFESSIONAL BODIES OPINION

Vladu Alina Beatrice

Babes-Bolyai University, Cluj Napoca, Faculty of Economics and Business Administration

Grosanu Adrian

Babes-Bolyai University, Cluj Napoca, Faculty of Economics and Business Administration

This empirical study reports the results of a survey designed to explore the existence and magnitude of creative accounting practices in the Romanian accounting environment using as a reference point the opinion of some of the top representative accounting professionals like: financial auditors, regulators and professional bodies representatives of the Chamber of Financial Auditors of Romania and also representative of the Body of Expert and Licensed Accountants of Romania.

Since the existence of creative accounting practices are connected in accounting with issues of vulnerability and in some cases panic getting to know its magnitude can be regarded of higher importance. In this respect we were interested to see if our respondents can document its existence and magnitude based on their experience. In order to achieve this goal our methodology employed neutral and direct interviews based on closed questions questionnaire.

The results of our empirical study documented that the credibility of accounting profession in the Romanian accounting environment is not affected by items like creative accounting since all our respondents asserted that is not facile to employ creative accounting schemes in the practice of accounting. One particular question was concerned about the ease of detection of creative accounting practices. In this respect we interviewed our respondents and all had similar opinions that in order to detect those practice skilled professionals are needed and more than that the desire to engage in this demarche since it is not specified particularly in the law.

When it comes to creative accounting schemes that our respondents could identify in their day to day work they shared similar views: items like profit overstatement and profit undervaluation, income tax and leasing can be included frequently in those schemes. On the other hand practices of creative accounting that include goodwill, provisions and developments costs are not found in a significant proportion in the Romanian economic environment.

Keywords: creative accounting, creative accounting practices, credibility, existence, magnitude

JEL code: M 41

Introduction

Nothing is more important or more rewarding in the course of preparing and communicating accounting information that the ability to present it to users and in this context the wording “ability” is representative since this profession is based entirely on professional judgment. Accounting is assessed primarily through its capacity to present financial information for the process of decision making. In this respect objectivity of accounting information is crucial since it should be elaborated under the TFV requirements. The above describe the fair accounting part while all the items that are not included in this category were documented as unfair components that made their presence felt increasingly as empirical studies documented their existence through elaborate evidence (Smith 1992:4-221; Mulford and Comiskey 2002, 2005).

Motivation of the study

Instead of extending the importance of such a topic we bring into attention the opinion of Katherine Schipper (1989:91-102) regarding the importance of getting to know earnings management and pointing out the fact that her opinion can be expanded to our entire study area: "Understanding earnings management concerns one of the central questions in accounting". From that point in time and until the present time its opinion becomes even more appreciated even if it was formulated long time ago and referred only to a small part of creative accounting: earnings management.

State of the art

Creative accounting presented under all its forms of manifestation represents a highly debated subject in the literature with old roots in accounting literature in the debating area. Naser (1993:9) asserted in his book *Creative Accounting: Its Nature and Use*, that manipulation of accounts is an old accounting problem that goes back in the 1920s. The trend of examining creative accounting increased over the years and the interest in examining its existence and the taxonomy of its practices also. Sen and Inanga (2009:27-42) asserted in their study also that creative accounting occurrence increased in many developed countries in recent years. Recent developments (Vinnari and Nasi, 2008:97-116) place creative accounting in the public sector too, defying a general wording according to which creative accounting is present only in the private sector. Erickson, Hanlon and Maydew (2006:113-144) discussing on the demand for research in the area of accounts manipulation discussed about the importance of such a topic and also about the legislative and regulatory changes. Earlier empirical studies documented the existence of earnings losses and decreases (Burgstahler and Dichev 1997:99-126), executive compensation and manipulation (Erickson, Hanlon and Maydew 2006:113-144), off balance sheet financing, creative cash flow and goodwill, manipulated development costs, stock valuation methods, income tax and provisions (Mulford and Comiskey, 2002, 2005), accrued income, depreciations and others manipulated items likewise (Naser, 1993).

Methodology

The methodology employed for our empirical study consisted in the neutral and direct interviews based on a series of 18 closed questions addressed to top representatives of the Romanian regulators, financial auditors and professional bodies' representatives.

The motivation for choosing this particular methodology comprised the fact that we wanted to minimize the discrepancies that exists between the declared opinions and the actual behavior (Chelcea, 2001:124). In this respect we wanted to minimize the biases that could occur. By using this particular path we eliminated any freedom to innovate or changing the actual path of research since our scope of the study was to collect the respondent's opinion (Ghiglione and Matalon 1991:77) regarding a predefined set of questions. The main advantages of this instrument are that we had the possibility to observe the nonverbal behavior, to ensure the standardization of the response condition and to collect spontaneous responses.

The closed questions were developed based on Likert Scale rating the items in a group of judges using 1 to 5 rating scale where: 1 can be defined as *strongly unfavorable to the concept*, 2 is *somewhat unfavorable to the concept*, 3 is used when *undecided* rating item is used, 4 is *somewhat favorable to the concept* and 5 is *strongly favorable to the concept*.

The interview lasted from minimum 25 minutes to 80 minutes with a mean of 55 minutes conducted in the workplace of the respondents and one at the Faculty of Economics and Business Administration from Babes Bolyai University from Cluj Napoca. In Appedix 1 we summarized the list of the interviews, the dates and the duration of the interviews, the person who interviewed the respondents.

All our respondents were Romanian citizens based in Cluj Napoca, except one respondent from Bucharest. All interviews were conducted in Romanian language and both researchers took notes during the interviews. No ambiguous answers were received and all questions had an answer.

Research Design

This empirical study conducted in the Romanian accounting environment reports the main results of a survey that used as a research instrument the interview, focused on the perceptions of regulators, financial auditors and representatives of professional bodies regarding the magnitude of creative accounting practices. Since the empirical studies conducted in the literature documented the existence of creative accounting practices in various economic environments (Jones 1991:193-228; Dechow *et al.* 1995:193-225; Burgustahler and Dichev 1997:99-126; Mulford and Comiskey 2002:2-375; 2005:289-303), the Romanian economic environment is also susceptible of being characterized by its incidence. The perception regarding the magnitude of creative accounting practices may depend firstly on the category that we interview: regulators, financial auditors and professional bodies.

In order to explain if that magnitude has the potential to differ in those particular respondents view in practice of accounting we interviewed 8 respondents involved in accounting regulation and accounting practice in Romanian accounting environment. Our sample was not randomly chosen since we were interesting in interviewing some top respondents of Romanian accounting environment and cannot be considered as being a sample that compressed any statistical path that must be followed in the construction of samples used in a research area.

Findings

Our questionnaire contained as we stated before 18 closed questions. The first five questions assessed the credibility of accounting information when taking economic decisions (Q1: *Can one trust the information compressed in the financial statements when taking economic decisions in the Romanian accounting environment*); the ease for a company to employ creative accounting schemes (Q2: *Can be considered facile for a company to employ creative accounting schemes in Romanian accounting environment*); the ease to detect those schemes in general (Q3: *Can be facile to detect creative accounting schemes*); the role of professional bodies and regulators in fighting creative accounting (Q4: *The role of the professional bodies and regulators is essential in fighting creative accounting schemes*) and the role of financial audit in fighting creative accounting (Q5: *The role of the financial audit is essential in fighting creative*). The 13 questions remained tested for the magnitude of some of the most cited items of creative accounting practices or techniques of creative accounting as it is presented in table 2.

The results for the first 5 questions are presented in table 1 as following:

Table 1. Credibility of the accounting information, ease to employ and detect creative accounting practices and the role of regulators, professional bodies and financial audit:

Questions/Respondents	Financial auditors	Regulators	Professional bodies
Q1	FA 1, FA 2 /4	R 1, R2, R3/ 5	PM 1, PM3/4; PM2/5
Q2	FA 1/3; FA 2/4	R 1, R3/ 1; R 2/2	PM 1, PM3/2; PM2/2
Q3	FA 1/2; FA 2/4	R 1, R3/ 2; R 2/3	PM 1, PM3/4; PM2/2
Q4	FA 1, FA 2/4	R 1, R3/ 4; R 2/5	PM 1, PM2, PM3/5
Q5	FA 1, FA 2/3	R 1, R3/ 3; R 2/4	PM 1, PM2/3, PM3/5

Source: Projection of the authors]

When it comes to assessing the answers received for our first question one interesting aspect can be discussed and that is related to the fact that only the professional bodies and the regulators asserted that one can trust fully in the accounting information. In their vision the “financial

statements are constructing under the principle of TFV and should be no place for misjudgment” as PM 2 asserted.

FA 1 consider that “ we cannot say that we can trust 100% of the information that is comprised in the financial statement but on the other side we can never say that this particular information is always characterized under the creative accounting influence how some international studies documented”. R2 in this respect admits that accounting information can be manipulated but the incidence is not high. The second question shared contradictory answers as the financial auditors considered that is not difficult to employ creative accounting schemes in the Romanian accounting environment while the latter categories strongly disagree with this. R3 asserted that „ the mirage of creative accounting is beautiful but how much can we talk about creative accounting indeed and how much can we talk about the desire of doing that”. The third question was the only one that received only the strict answers with no additional information on behalf of the regulators. FA 2 asserted that „the detection process of creative accounting schemes must be judged according to the experience of the person that analyzes one accounting item”. PM 1 and PM 4 asserted that is easy to detect those practices “as long as the person that follow this demarche is interested in this” (PM 1) and “you just need the right person to detect them” (PM 3). The role of regulators and professional bodies in fighting creative accounting was considered very important since all respondents were strongly agreed. FA2 declared in this context that “the accounting practices that do not lead to TFV must be inhibited through accounting regulations and that is an ongoing process that never ends”. PM 3 asserted that „everybody must fight creative accounting. I see it only through a spectrum of negativity. We are all responsible for constructing the credibility of the accounting proffesion and for that reason we all must limit unfair practices”.

The role of the financial audit in fighting those practices was seen as not essential by the financial auditors itself. The latter categories strongly agreed. In this respect PM 3 asserted that “when we discuss about the financial audit and creative accounting the answer may appear as simple, but is complex. We have noticed that every time creative accounting practices are discovered, financial auditors are to be blamed but the truth is that this is not their responsibility to detect that. They must verify for the legality of the accounting information not for items of morality particularly”. Table 6 combined schemes of creative accounting documented in the literature (the references are the ones above). Some of them were presented to the respondents in order for them to assess the frequency that they head or found the item in their day to day work.

Table 6: Schemes of creative accounting and their magnitude in the Romanian accounting environment:

Schemes of creative accounting	Financial auditors	Regulators	Professional bodies
Profit undervaluation	FA 1, FA 2/4	R1, R 2, R3/5	PM 1, PM 2, PM 3/4
Profit overstatement	FA 1, FA 2/4	R1, R 2, R3/4	PM 1, PM 2, PM 3/4
Income tax	FA 1, FA 2/4	R1, R 2/4, R 3/5	PM 1, PM 2, PM 3/4
Depreciation	FA 1/2, FA 2/1	R1/2, R2/1, R3/3	PM1, PM2/2, PM3/3
Provisions	FA 1, FA 2/1	R1, R2, R3/1	PM1/2, PM 2, PM3/1
Goodwill	FA 1, FA 2/1	R1, R2, R3/1	PM1/2, PM 2, PM3/1
Prepayments	FA 1/4, FA 2/2	R1, R 2, R3/4	PM 1, PM 2, PM 3/2
Accrued incomes	FA 1/4, FA 2/2	R1, R 2, R3/4	PM 1, PM 2, PM 3/2
Adjustments	FA 1, FA 2/1	R1, R 2, R3/1	PM 1, PM 2/1, PM3/2
Leasing	FA 1, FA 2/4	R1, R 2, R3/4	PM 1, PM 2, PM 3/4
Development costs	FA 1, FA 2/1	R1, R2, R3/1	PM 1, PM 2/1, PM3/2
Off balance sheet schemes	FA 1, FA 2/1	R1, R2/1, R3/2	PM 1, PM 2/1, PM3/2
Stock valuation methods	FA 1, FA 2/1	R1, R2/1, R3/2	PM 1, PM 2/2, PM3/3

Source: Projection of the authors

As it can be observed from table 6, some of the techniques of creative accounting are present in the Romanian economic environment and as it can be concluded based on their answers in a higher proportion. Those schemes of creative accounting are the ones that include: profit

underestimation and overstatement, income tax and leasing manipulations. Other items that are present in a higher proportion (Smith 1992:4-241; Mulford and Comiskey 2002:2-375) in other economic environments like stock evaluation, off balance sheet, developments costs are somehow inexistent in the Romanian economic environment based on the respondent's answers. When it comes the creative accounting schemes that are developed based on provisions we cannot assert that those are present in our economic environment since none of the respondents declared it as being present. Regarding to this item all respondents asserted that Assistant Lecturers of accounting information don't use provisions even if from a legal point of view they have this possibility. Also none of the respondents declared that they could found in their day to day work an item like goodwill included in a scheme of creative accounting. In this respect PM1 asserted that "I have heard of cases like those where this item was used creatively but I personally didn't found in my work this situation".

Conclusions

In the Romanian accounting environment the credibility is the accounting information has described by our categories of respondents as being high which is not surprisingly since two of the categories are directly responsible for constructing the credibility of the accounting profession. Contrary to the international studies results (e.g. the above cited sources) our respondents asserted that is difficult to employ schemes of creative accounting and the detection process of those scheme involved skilled professionals. The role of regulators and professional bodies is important in limiting its incidence. Profit overstatement and undervaluation, income tax and leasing manipulation are found in the Romanian accounting environment while others techniques of creative accounting that involve goodwill, or developments costs weren't documented by our respondents.

Further developments and scope for future research

Having the fact that this research instrument may offer multiple advantages we intend to use it in our future research but to apply only the interview without combining it with the questionnaire, leaving in this respect room for creativity and also for no influence at all. We intend to use a larger sample and to develop a more robust study at a national level including respondents from each category plus two new categories: Assistant Lecturers and financial analysts. Also from a lack of space we couldn't approach on a higher scale the additional explanations that our respondents gave so in a further study we intend to discuss this part too since that could explain better their opinions.

DETECTION OF EARNINGS MANAGEMENT – A PROPOSED FRAMEWORK BASED ON ACCRUALS APPROACH RESEARCH DESIGNS

Vladu Alina Beatrice

Babes-Bolyai University, Cluj Napoca, Faculty of Economics and Business Administration

Cuzdriorean Dan Dacian

Babes-Bolyai University, Cluj Napoca, Faculty of Economics and Business Administration

The scope of this theoretical research is to outline recommendations for improving the complex process of detection of accounts manipulation. In this respect we turned to the previous literature and assessed empirical studies in order to be able to develop a robust model for understand the process of detection for accounts manipulation and further to ease the path of detection by proposing as we stated above a theoretical framework in this respect. Since there is a constant conjecture between cause and effect we are able to assert that two direction of research can be identified and both can explain further the roots for limiting earnings management since its detection can be much easier approached: the event that can represent the root for accounts manipulation and the normal trend considered for a certain company related to the accruals level and economic trend. In the end if we know the cause we can interpret the event and combat its appearance. But when this kind of research appears, another question springs. Should we fight earnings management practices? Clikeman (2003:78) sensed that by using those practices companies are walking on a very slippery slope where minor accounting gimmicks become more and more aggressive until they create material misstatements in the financial statements. So, the recourse to such practices creates a stake that is not negligible. The users of financial statements are misled when making decisions based on manipulated accounting numbers. To a certain extent, the existence of earnings management distorts the usefulness of financial statements, and in this respect the process of detecting it can be regarded both as being important and challenging. Our proposal is not related to a technical process of detecting earnings management as typical empirical studies found in the literature and more than that we open a new stream of research based on understanding the forms of manifestation for accounts manipulation, getting to know the antecedents, the features, the possible interactions among antecedents and current features. Based on the recommendations found in the literature the eradication of manipulative processes is next to impossible but the limitation can be a reality. In this respect the researchers recommend controlling the conditions and motives that increase the likelihood of its presence and also developing stronger tools to detection.

Keywords: earnings management, accruals

Cod JEL lucrare:M 41

Introduction

This particular study represents the first step of a larger empirical study that will assess the credibility of the accounting information presented into the financial statements in the Romanian economic environment. Into the present study we intend to analyze the paths of detecting accounts manipulation with a scope of developing a general framework for better understanding this complex process.

The existence of earnings management practices under all its forms of manifestations is possible under the aegis of various factors that work together as a whole in order to permit its appearance. By reviewing the literature we are able to elaborate a framework that has a genesis point the influence of those factors explaining in this respect the context of appearance for manipulating

behaviors. This demarche is realized as a consequence of the fact that psychology-based research indicates that learning and subsequent judgment is facilitating by knowledge frameworks and availability of examples.

Motivation of the study

The importance of the study is underlined by the interest of the investors and other contracting parties in assessing the possibilities of detecting unfair accounting information.

The present study presents a different view that the traditional view of detecting accounts manipulation, based on qualitative and quantitative information.

The main idea of the study was constructed based on the shortcomings evoked by the empirical studies that conducted various quantitative methods trying to assess the magnitude of accounts manipulation but didn't explained the detection process which is a very complex process with psychological accents that put in connection always the cause and the effect. In the end if we know the cause we can interpret the event and combat its appearance. Based on the recommendations found in the literature the eradication of manipulative processes is impossible to conceit but the limitation can be a reality. In this respect the researchers recommend controlling the conditions and motives that increase the likelihood of its presence and also developing stronger tools to detection (McBarnet and Whelan 1999: 272). In detecting earnings management practices the objects of manipulation and the actions undertaken in order to achieve it also must be known. Also the magnitude of interventions that management actually makes to influence earnings is relevant for the inference of earnings management in an empirical context.

State of the art

The general trend found in the literature regarding earnings management manipulation is related to the fact that managers may manage net income by controlling various accruals. Accruals such as accounts receivables, inventory and accounts payable are discretionary in that they allow for some flexibility by management to control. A manager may decide to become more optimistic about warranty claims on its products its current year than in previous years to decrease the accounts payable and accrual liabilities thereby increasing reported net income. Since accruals management is less obvious and detectable than changing accounting methods that have to be explained in the financial reports by explaining every material change in the accounting treatment together with an estimation of how much difference it makes; the management make use of them more often then they use changing accounting methods for manipulating of accounts.

Accrual accounting theory is based on the idea that there is a difference between cost and expenditure versus benefits and revenue. In this context net income is seen as adjustments of the operational cash flow for transitory items resulting in net income from operations. All the adjustments involved are called accruals. Accrual accounting is considered open to manipulation, as we stated before, having the fact that comprise various subjective decisions taken in the allocation of expenditure and revenue over time. By getting to understand the magnitude of earnings management practices we should identity the objects or the main instruments used in order to perform the manipulative behavior. This demarche is very important since this step represent the roots of constructing our theoretical framework.

In the following table we summarized some instruments and objects identified in the literature, presenting in the same time the methodology used by previous researchers in order to assess the existence or the magnitude of earning management income practices. Those studies are empirical studies and the main goal was to detect earnings management practices by identifying the objects that were managed.

Source: Projection of the authors

In detecting earnings management practices the objects of manipulation and the actions undertaken in order to achieve it must be known. Also the magnitude of interventions that management actually makes to influence earnings is relevant for the inference of earnings management in an empirical context.

Methodology

By positioning our research in this large field we can say that this particular research is focused on every area of accounting field. The method applied consist in a analytical method, the most suitable to use in this type of research according to Macdonald and Rutherford (1989:89) that

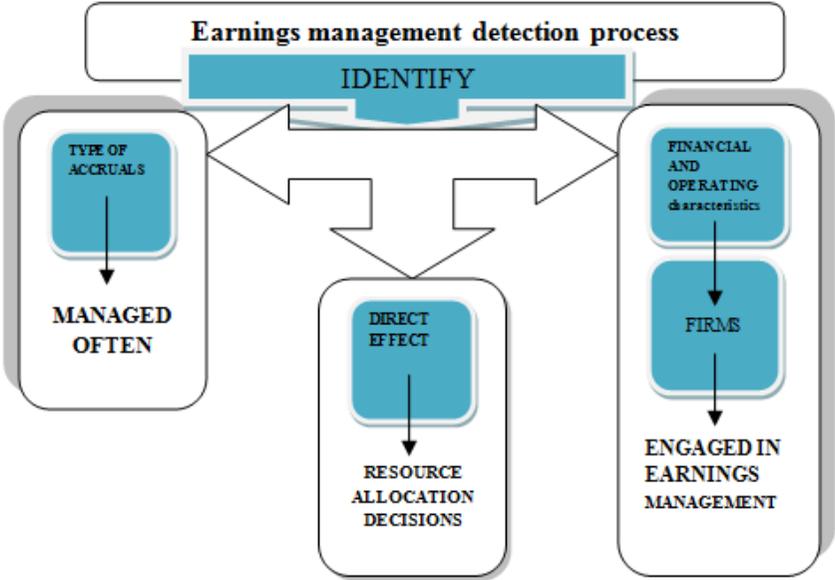

asserted that when constructing a model from assumed or observed relationships, analytical methods must be used. As type of research our paper can be included in the theoretical research type which importance was underlined by Kothari (2001:106) who asserted that: “empirical research is (or should be) informed by theory, since interpretation of empirical analysis is impossible without theoretical guidance”. Ronen and Yaari (2008: 289) underlined the importance of both types of research and concluded that theoretical research benefits from empirical research having the fact that: “an analysis is conducted through modeling, which by definition admits only a few features of reality”.

A Proposed theoretical Framework for detecting earnings management

In our vision in detecting earnings management behavior is important to follow at least three directions. The first step comprised the identifying process of the most managed accruals (in order to do so the incentives for managing earnings must be assessed). In this respect the object that can be susceptible of manipulation must be known based on the company trend. Also the context in which the company activates is important. Features like: dearth of regulations; any change in accounting treatment noticed by the auditors; any new growth of profit after arrival of a new chief executive or finance director; unusual change in the trend of sales growth or profit margins; unusual increase in debtor days or stock days; large acquisitions; discrepancy between reported profits and operational cash flow that employ differences that persist for period after period. All those must be followed by the examination of the magnitude of earnings management direct effect on resource allocation decisions having the fact that earnings management may have adverse effects on resource allocation decisions by investors and creditors, with far-reaching consequences. The last step comprises the identifying process of the financial and operating characteristics of the firms that are engaged in earnings management activities based on our opinion.

The following figure may represent the starting point in shaping our proposed framework.

Figure 1. Framework for understanding earnings management detection process

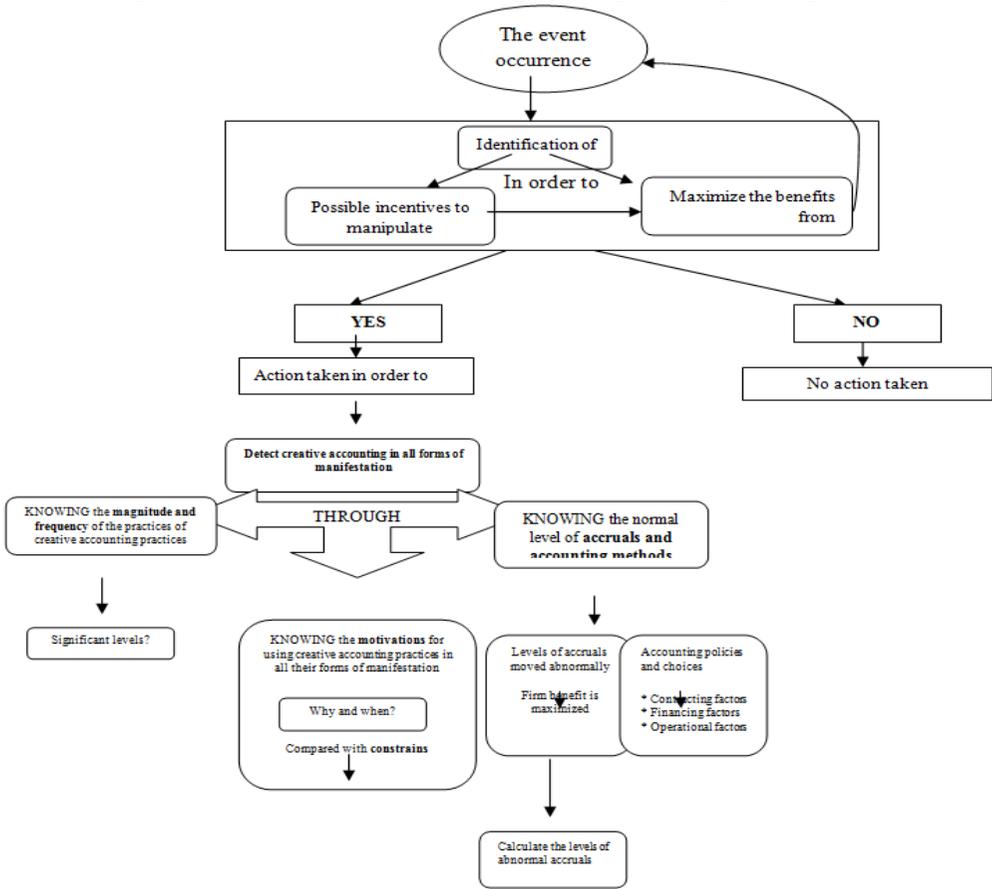

Source: Projection of the authors based on Healy and Wahlen (1999) conceits

The event occurrence is related to the opportunity that can arise in different periods of time in a firm's economic cycle. By identify the possible incentives to manipulate accounts in order to maximize the benefits from the event occurrence the manipulative behavior can be understood. Once examined the possible incentives and concluding regarding their existence the detection may be closer to realize. In order to be able to detect possible earnings management practices in all its forms of manifestation three simultaneously directions can be outlined as following. The magnitude and frequency of the practices of earnings management in all its forms of manifestation must be assessed. If those practices are encountered to have significant levels then the detection will be a success.

The second direction is materialized in the process of finding the main incentives or motivations for using earnings management practices in all its forms of manifestation. The main questions that may arise are: `` Why does practices are needed?`` and ``When those practices are used?``. The motivations for using creative practices need to be compared with the existence constrain in order to assess the degree of which firms may escape regulatory and publicity sanction. A low level of constrains may induce a high level of motivations or incentives. The third direction of research is focused in detection of the main accruals used in order to employ earnings management practices and all its forms of manifestation and the main accounting policies and choices design to achieve its goals and concretization of its incentives. In this respect Table 1 can offer some insights into the results documented by previous empirical studies. Table 2 present our proposal.

Figure 2. Framework for detecting earnings management process:

Conclusions and scope for future research

The transactions of a certain company can be structured in such a way that in the end reported earnings are reduced or enlarge, depending on the management *intent*. In this context the managerial *intent* is the genesis point that makes the whole mechanism of structuring transactions to be developed and old habits to change. According to the framework that we have proposed for understanding what a detection process of accounts manipulation should comprise, a logical “red thread” must be followed based on the context in which the company activate in order to assess what kind of actions can be taken and in this respect to be able to ease the process of detecting earnings management. As we stated above this study represents a first step into assessing the most suitable path to follow when judging the process of earnings management detection. Based on this framework we intend to develop an econometrical model that can simulate various detection processes in order to improve the present research designs for detecting earnings management.

SUB-SECTION: MANAGEMENT

OBJECTIVES, PERFORMANCES, RESULTS – VIEWS ON THEIR USE IN THE PUBLIC ORGANIZATIONS FROM ROMANIA

Bacanu Bogdan

“Transilvania” University of Brasov, Faculty of Economic Sciences and Business Administration

The present paper focuses on the management associated with relatively common concepts: objective, result and performance (ORP). The study is important because in the Romania of the year 2011, a “state reform” is being planned, which will substantiate into the reorganization of public institutions, as the improvement of their activity is set forth by utilizing the set of tools associated with the aforementioned concepts.

The study represents an analysis related to the use of the set of management tools associated with the aforementioned concepts within the Romanian public organizations. The study is concerned with a qualitative estimation involving the translation of the existing theory into the practice of the present moment.

The review of the specialized literature is aimed at selecting the most common theoretical milestones, in order to increase the probability to retrieve them from the practice of the organizations. The works of Drucker represent the first theoretical system of reference. The way the ORP concepts have been utilized within the American organizations generate the guiding elements of the present study.

The research presents a longitudinal segmentation, the frontier between the two parts being the present moment. The current state of facts is studied by means of an inductive approach. The hypothesis related to the ORP management in the near future is actually built on the grounds provided by the estimation of this state of facts. Its deductive approach starts from evaluating the pragmatic premises, involving the support of the process that will utilize the ORP in the near future, according to the theoretical percepts. The analysis is qualitative in nature. The identification of the cases that represented “the exception” was taken into account.

The analysis focused on public institutions considered a priori as more transparent: the university, the hospital and the town hall. Even if in the case of the university there are regulations that facilitate the strategic planning, the utilization of objectives according to the MBO precepts is absent. The same situation is to be found in the case of hospitals and town halls. The use of primary and secondary information sources prove that the ORP has not been utilized. It was ascertained that the premises for utilizing the ORP are the same for the near future, a fact that implies the same results.

The main implication is associated with the “myth or reality?” question. The result has a demystifying impact, showing that a reliable estimation on the ORP basis related to the activities of or people working in these organizations cannot be developed nowadays - in 2011.

The present study aims at a realistic analysis related to the discrepancy between words and facts within the management of the Romanian public organizations. The fact that the aforementioned organizations represent the object of the “management of shallow labels content” is signaled and demonstrated.

Key words: objectives, MBO, results, performance, public organization

JEL Codes: H11, I00, I23, L31

I. Introduction

The present-day economic crisis has augmented the segment of public opinion which is favorable to a critical analysis of the activity developed by the public organizations and by the public sector as a whole. The phenomenon is more than obvious in Romania, where salient transformations of the public sector occurred during the last two decades and where the major problems associated with the management of the public organizations persist. The dominant impression expressed explicitly and implicitly is that the public organizations involve too many resources, in order to develop activities whose results are prone to be criticized.

Being studied from the point of view based mainly on the principles of the new public management, the problem generated by the malfunction of these organizations focused mainly on the analysis of costs associated with the expected results. Even the shift of interest from processes and procedures to results represents a significant change in the management of these organizations. The advocates of this change of attitude, a change synthesized by Osborne and Gaebler (1992: 108-166) by means of “mission-driven government”, consider that in this manner the entrepreneurial approach is encouraged.

The pressure to implement a management guided by results and economic criteria is amplified by the consequences of certain unfavorable economic evolutions. In Romania the need for a critical analysis becomes obvious.

Even if there is a macroeconomic context which is favorable to this managerial approach, the expected success is determined by the understanding of the specificity related to the public sector. It cannot be omitted that, in theory, there are more important matters than the economic ones in guiding these organizations, while in practice there is the experience of many centuries which validates their existence and their manner of work.

II. Present-day concepts and practices

If the discourse of the people involved in reform of the public sector and organizations is followed carefully, it can be ascertained that there is an ambiguous manner to use of the terms objective, result and performance. The alarming aspect is generated by the fact that these confusions substantiate in public policies whose consequences are, of course, negative. The effect may be amplified if the terms are associated with certain management practices which are transferred from private organizations to the public organization.

In this respect, the management by objectives (MBO), the managing for results (MfR) and the performance management (MP) belong to the category of management tools on which hundreds of works of all types have been published. They have a different content because in the first place, from a detached point of view, the objective, the result, and the performance stand for different concepts. “The objective” relates to something that is to be accomplished, “the result” is a consequence and “the performance” represents the outstanding or the best result. On the other hand, the quantification of the objective is desirable as the quantification of the result represents a compulsory condition that involves the opportunity to discuss the performance. Taking into account these common observations based on the dictionary definitions of the respective terms, one can appreciate a “chronological sequence” of the discussion as logical, if related to the objective-results-performance type.

The management by objectives, MBO, is ascribed to Drucker (1954). MBO is associated mainly to the planning, being adopted after 1975 as a tool of strategic management. In this context, the objective embodies the mission of the organization. The rapid utilization of MBO by certain companies has generated a number of situations which imposed critical observations and methodological corrections. Drucker (1954; 1974) emphasizes that a system of objectives represents a necessity, and this system must be developed in a balanced manner, by avoiding certain exaggerations related to the role played by the profitability. By extension, it can be

inferred that this warning is valid in the case when the role of economic objectives are being exaggerated. However, in 1974, an international conference dealing with the MBO topic showed that 80% of the American companies use this instrument, not more than 3% doing it in a correct manner (Schuster and Kendall 1974). What is more important for this study is that the conference questioned the applicability for specific fields.

“Managing for results” (1964) is one of the Drucker’s works discussing “the business realities”. This book, which has generated an instrumental approach, focused on the individuals who were initiated in the business management but, however, certain “realities” may be perceived from the point of view of the management involved in other types of organizations. For instance, the idea that the resources and the results exist outside the organizations is worth to be understood and adapted to the public organizations. In this manner, it is suggested that the effort should be focused on the outputs/results.

As in the preceding cases, the performance management referred to the organization follows different “trajectories”, corresponding to the private and the public sector. In what the private sector is concerned, the performance of the organization is associated with a minimal limit of profitability which implies its survival. In the case of the public sector, the performance of the company hasn’t been associated with its survival. Due to political and social context, almost all the public organizations have been kept in function, without being affected by the appraisals of their results or performances. The continuity of their function has been considered in itself a positive result, despite the costs perceived as irrational.

Taking into account the main area where the theory was associated with the discussed concepts and the fact that most of the discussions promoted at a global scale are linked with the North American economic and social space, an estimation of the pragmatic results of the public sector becomes compulsory. From the time intervals needed to implement the strategy and then achieve certain results and from the problematic created, a series of particularities or consequences of the utilization of the respective management tools can be inferred. A source of this type, available in Romanian, is Henry (2005: 416-613). Henry’s textbook focuses on the US public administration, making available certain moments and data with a statistic value that offer an image of the significant elements. MBO was promoted in the American administration during the seventies. Other combinations objectives-results-performances followed a fact that generated more sophisticated public management instruments, known under different acronyms.

Finally, for this study the following facts can be taken into account:

- before the “official moments” concerning the discussed instruments it existed a practice that guided the elaboration of the theory related to their utilization;
- the utilization of instruments is promoted and experimented by some governmental agencies and the results are quantified and then made available for public discussion;
- the instruments are improved continuously, under the pressure of constant criticism and objective appraisals.

At the beginning of the nineties, after five decades of efforts to improve the public sector management in the USA, it was ascertained that the capacity of the government to estimate the performances, on a scale from 1 to 10, reached the level corresponding to the figure 2 on the named scale (Henry 2005: 448-449). An appraisal developed in 2002 and related to 26 federal agencies according to two criteria registered one maximal position for one organization, while half of the organizations scored at the minimum level while all the criteria were concerned.

Extending the study to other geographic areas, it can be ascertained that the theoretic bases and the practice associated with the ORP triad suggest a cautious and flexible approach, due to the dilemmas that appear in relation with the specificity of the public organizations. For instance, Pollitt and Bouckaert (2000) discuss the reform of the public management, using the titles “The results – through the blurry mirror” or “The results: a slippery concept”. Even in this context, it is

obvious that the various governments (of the OECD countries) interested in the matter attempt mainly transparent and gradual approaches, accompanied by projections of the consequences with a multitude of disapproving reactions at the public level.

In Romania, the discussion involving the strategic planning and implicitly the utilization of the mission and objectives in the public sector began more than 10 years ago. Brătianu and Lefter (2001) offer a discussion of the planned utilization of the objectives and of other strategic instruments in the universities. In practice, the fact that an institutional degree is afforded to a university by a public agency marks the implementation of minimal elements of performance.

III. Methodology

The study is aiming at an analysis with a retrospective character, on which is based a projection valid for the next years. This temporal orientation with two segments allows the use of two different approaches, which are connected by the idea of a construction with a preventive role.

An inductive approach was used for the last period of time. The approach was based on the collection of some qualitative data related to the utilization of the ORP triad within the framework of a public institution from the non-profit category, these institutions offering a higher transparency. The institutions belonging to the education, health and local administration systems were preferred. The analyzed elements were obtained via observation and were extracted from the different sources, which are available for public use due to the organizations websites, or were inferred from the events and operational processes. A special attention was paid to the elements with a “dissonant” character from the amount of collected data. Their estimation represented the appraisal of the agreement between the real state of facts and the data registered in the official documents.

The accomplishment of this inductive phase is substantiated in an assertion with a theoretical value. The research hypothesis is built on its basis, in order to realize a prediction associated with the next interval. A part of the collected data for the last period of time was used in order to test the hypothesis related to the manner the management instrument in discussion will operate in the near future.

The research strategy represents a mixture of case studies at the organizational level for several institutions from the fields which were mentioned previously. These case studies focus only on the elements related to the ORP triad. The chosen organizations represent a sample consisting of typical cases, but taking into account whichever event leads to “an extremely positive case”. “The extremely positive case” is represented by a confirmation in practice of the “textbook theory” associated with the ORP topic.

The methodology of data collection has included, beside the utilization of the secondary sources, the unstructured exploratory interviews and the direct observations which focused on the respective organization and on its executives.

Finally, the deductive reasoning implies a construction with a predictive character associated with the conclusions. The translation of the inductive sequence into an ulterior deductive sequence is based on the phenomenological continuity assumption, when elements that prove a certain discontinuity do not occur, as the ones involved in the catastrophe type .

IV. Findings

When taking into account the mentioned difficulties concerning the correct implementation of the MBO, the first public institution analyzed was the university. This institution is compelled to elaborate a mission statement and a strategic plan. On the other hand, it can be assumed that the university is the institution which has acquired the theory.

The analysis began with the study of the strategic plans and university charters which were made available on the websites. After studying the plans of 40 public universities, it was ascertained

that the objectives are formulated in a rather ambiguous manner, a fact that suggests a desideratum related to a process. The terms used are “increase”, “accomplishment”, “improvement”, and so on. No example where the objectives were formulated in a SMART (Specific, Measurable, Achievable, Realistic, Time related) structure was found and neither certain supplementary characteristics. The measurability was carefully avoided and the obligation to report in a determined period of time was inexistent. The term “permanent” occurred frequently as a formulation associated with the time related to an objective labeled as “improvement”. The interviews showed that the academics don’t assume the objectives deriving from the objectives of the organization. As a matter of fact, there are no elements to prove the existence of an MBO in the universities.

The orientation toward results and their appraisal within the universities is associated only with the research activities accomplished by academics. Each university establishes a minimal threshold concerning this type of results. Probably more than 90 % of the academics reach this threshold, a fact that proves that this threshold is not operative.

In what the “outputs” of the educational process are concerned, there is no serious system of assessment concerning the graduates’ success on the market, even if the accreditation of certain programs of studies supposes an assessment belonging to this type and this specific criterion is acquired in almost all the cases. The universities are categorized according to an aggregated indicator of qualitative type, labeled as “degree of trust”. There are no reasonable Romanian classifications to match the type used in the Western Europe or in the USA.

Finally, two separate “events” have tested indirectly the existence of a management based on the ORP triad: the “legal” reduction of the academics’ income during the year 2010 and the change, starting with February 2011, of the rules and procedures which deal with recruitment of new teachers. The lack of institutional reaction to events that endanger the autonomy of the organization’s management is obvious, no special situations being signaled.

In the case of the local public administration, one can ascertain the same ambiguous expression. Due to the enforcement of law, all the town halls have been determined to elaborate a plan with the title “strategy of sustainable development”. This plan is available on the official website of the town hall, the plan being more developed in the case of bigger cities. Without taking into account the volume of the named plan, the objectives were expressed in a rather ambiguous form. The results of the unstructured interviews emphasized the lack of any concrete elements when a time interval longer than a semester is concerned.

As in the case of the universities, the reduction of public clerks’ salaries and the diminution of the personnel working in the town halls, with uniform percentages for all the organizations, revealed the fact that there is no coherent approach which relates to the theory of the topic. The negotiations at the hierarchical level, the assessment of results which are relevant for the organization, or the comparison used in order to estimate the performance were not to be found. However, it can be admitted that there was established a target of budgetary nature, whose significance is obscure in the lack of a transparent argumentation coming from the government.

An interesting situation from the point of view of results is related to the organizations belonging to the public health system. In this area, there are a significant number of result or performance indicators, most of them having the characteristic “maximal threshold” and being related to costs. As a matter of fact, the significant indicators have an economical character, being dictated by budgetary constraints coming from the central administration. In what this matter is concerned, the results of the interviews show that there is no reliable proof of using a range of management instruments associated to the ORP triad.

Finally, the reduction of salaries and the reshaping of the health system represent supplementary reasons that prove the management using these instruments doesn’t live up to its role in the area related to the health system.

It can be also inferred that the system of wages related to the named institutions became more rigid due to the effect of the “unitary wages law” elaborated in 2010, which decreased the margin of the employees’ positive motivation, increasing instead their negative motivation, as a result of the new legislation related to the work market. The effect of these laws, corroborated with the budgetary targets and other strategies of financial nature, which are decided and applied in very short periods of time, have drained of its real content the MBO, MFR or PM in the studied public organizations.

V. Conclusions

All the formal elements related to the elaboration of plan-type documents, in what the three institutions under discussion are concerned, refer to the concept “objective”, but in all these cases there is no proof for operating with a SMART type form, or a form which should allow the measurement or operation within a control system. The existence of guiding elements belonging to the costs is not encompassed into a systemic construction which should involve a higher amount of objectives. Even if there are a number of prescriptions, sometimes in a fuzzy form, for formulating the mission or other documents for planning, nothing similar has been developed for the objectives, although the specialized literature offers several models and discussions.

In the practice specific to the organizations under discussion, there are no events able to represent in an indirect manner, by consequences related to their position (e. g. penalties), the proofs of utilizing an MBO type system. An objective such as “compliance with the budget”, which is achievable by reducing the activity and by actually creating an operational discontinuity, cannot be validated as a proof to certify an acceptable managerial orientation for the public organizations. Even the “directional goals” such as “increase”, “improvement” etc. are not to be found under forms which can be translated in practice within departments or positions.

The absence of the objectives triggers the post-factum character of any findings related to results. Actually, a complex set of results has been discussed that offers an unsubstantial image related to the activity of the organization. As regards the institutions analyzed, most of the universities close the year with substantial budget excesses, while the majority of hospitals fit into the opposite category. Almost all the published results represent the consequence of activities which are irrelevant for the basic process defined in the mission of the organization, or are concerned with the “output” of certain compartments and positions, without reflecting the consequence of a specific coordination, which should be able to provide a significant impact on the management style specific to the organization.

In a similar vein, this is also the case for using performance as a means to achieve a systematic improvement of the activity. Even if there is a tendency to compare the activity of similar organizations, the various classifications in Romania are questionable or of little relevance as compared to what are regarded as essential in the mission statement.

As compared to the past activity cycles of the institutions considered, it can be stated that a coherent application of a certain form of management - on the grounds of the ORP triad, in the sense of the reference theory – has not been signaled. The probability that other public institutions, less taken into account by mass media and by theoretical studies, would use certain strategies belonging to the MBO type is insignificant, because there are no regulations in this respect, and the practice does not reveal events of this type.

The inductive assessment related to the past and present cycles and to the premises of the same type associated with the category of processes guided by ORP allow the deduction that, in the near future, the estimation and control related to the activities of public organizations are not likely to develop in a coherent manner, by using the associated management techniques.

Due to the fact that the organizations do not utilize the ORP tools, the planned assessment of the employees or of certain organizational entities on these grounds has turned into the evaluator’s

arbitrary act of power with questionable consequences on the results that could prove relevant for the organization. As a matter of fact, following the same deductive reasoning, the consequences can only be negative for the management within a modern reference system.

PUBLIC-PRIVATE PARTNERSHIP IN COMMUNITY DEVELOPMENT. THE CASE OF ROMANIA. CONCEPT AND MANAGEMENT.

Bibu Nicolae

West University, Timisoara (Romania)

Faculty Of Economics And Business Administration (FEAA)

Lisetchi Mihai

West University, Timisoara (Romania)

Faculty Of Economics And Business Administration (FEAA)

The public administration has a major role in partnerships establishing and operating with different community actors aiming at solving specific community problems. In the process of identifying and solving the community problems the actions of the non-governmental organisations are considered as “alternatives” to the solutions of the public administration.

The advantages of an on-going collaboration between non-governmental organisations, as relevant agents in the social economy, and the public authorities aiming at solving the community problems were identified and acknowledged by both sides representatives. The access to complementary resources, and implicitly, an increase in the range of actions of the partners beyond mathematical calculus, an increase in the credibility and public image of the partners, as well as the social benefit corollary to positive models established within the community, are only a few of the arguments. The question raised is why this type of a more consistent approach is not used in the current practices of solving the community issues in Romania. The following causes should be considered in response to this question: the lack of an associative culture at the level of all potential partners, the access to resources is by far too limited on behalf of any of the two parts involved, a neutral, thus, unrestrictive legislative environment, but at the same time, unstimulating towards an associative action, i.e. limited management capacities on both sides.

From this perspectives, this paper aims at clarifying the partnership concept (definition, typology), the public-private partnership role in solving community problems and the management issues related: partners identification, negotiation of the cooperation protocol, decision making process and resource management, assesment, etc.

Key words: partnership, public administration, non-governmental organizations, public-private partnership, partnership management.

JEL Classification codes: L33, L38

I. Public Administration and Partnership Practice

Bringing supplementary resources represents the aim of the openness of the public institutions to public-private partnership, as an instrument in community problems solving process. This openness is a must considering the genuine explosion of citizens' public needs corroborated with the chronic lack of resources any public institution has to face, regardless which part of the world it functions.

The Partnership Concept

Assuming partnership as a governing principle represents, from a political point of view, a democratic option and, thus, has the significance of a political message; meantime, it implies an great effort to ensure its institutional and procedural premises and, by consequence, has the significance of a institutional development program, situation which brings advantages and risks simultaneously. Among its advantages for the public authorities are increased public support for

their ongoing programs, attracting supplementary resources compared with the ones commonly available to public authorities and an increased adaptation of the public services to the community needs (Bancila et al. 2002:42). Partnership is not a purpose in itself, but, from a methodological point of view, it is a way to approach problems, while from a managerial point of view it is an instrument used in solving problems. Partnership is the way, formal or informal, through which two or more parties act together in order to achieve a joint goal or joint objectives, based on a joint plan of action and joint dedicated resources and under a joint resources and activities management. The specific approach through which resources are jointly dedicated under a joint management makes the difference between partnership and cooperation concept while the differences between the two words are difficult to notice from a semantic point of view. In the same respect, joint management makes the difference between a partnership and a funding relation.

As far as it concern the decision process, in partnership relation, the parties must not necessarily have equal shares, but is important that they are treated as sitting on equal grounds because partnership can not be build on a subordination relation. Consequently, in a partnership, the decision power can be split between parties evenly or proportionally with their contribution (Bancila et al. 2002:40).

The partnership types can be considered based on diverse criteria, acting simultaneously or independently, which generate a relatively complex typology (Bancila et al. 2002:39). Thus, from a legal point of view, partnerships can be formal or informal. When the goal is specific enough and achiving it is not a problem, an informal partnership can be established if the parties are similar entities, knowing each other and, eventually, having a cooperation history together. In the case of a more complexe or long term or if parties are different type of entities (NGOs and public authorities, or NGOs of different nationalities), partnership tends to be formalised. Another criteria for partnerships classification is the type of the partnership goal. Thus, one can find *representation partnerships* like federations, unions, councils, aliances, coalitions, etc. together with *operational partnerships* which implies the existance of specific projects as a reason of the venture. Partnerships can be established on a long or short term, with its own funding or attracted funding, etc.

Meantime, it should be mentioned that public-private partnership, as a specific cas of partnership [1], may define an public authorities' initiative to solve community problems by involving a private partners, either from business sector, or nonprofit sector. This paper is focusing on the second category of potential private partners.

NGOs as Public Policy Subjects in Romania

Coagulation and development of the nonprofit sector, as an alternative to the activity of the market and public institutions, creates the opportunity of an analysis of the public authorities-NGOs partnership management and, implicitly, the clarification of the nongovernmental organization concept. Comparing to the other categories of institutions which operate in the community, nonprofit nongovernmental organizations (commonly known as nongovernmental organizations - NGOs) ressamble to private commercial entities concerning the way they function, but their goals and objectives are focused on social needs approached through public interest activities, without a distribution of the profit (if does exist) among the persons involved in the activities. This brings NGOs closer to the logic of the public institutions (Andersen et al. 2010:8). There are many definitions on the nonprofit nongovernmental organization concept. According to the structural-functional definition (Salomon 1992:6), NGOs should meet couple of criteria: to have an institutional structure, to be of private nature, to do not share profit, to be self governed, to be volunteer run.

Further, the discussion is focusing on only some of the NGOs, more precisely, in the meaning of this text, nongovernmental organizations or nonprofit organizations are defined as an organizational category, formed by institutionalised entities, of private nature, dedicated to social needs, independent from public institutions and not interested in political power (i.e. political parties) or profit (i.e. commercial private organizations).

In some countries, the relations between NGOs and public authorities have a long and well grounded history. For other countries, Romania included, relations without an evident political character between NGOs and public authorities represent a new type of public relations emerged in the beginning of the '90ties. They were possible only when democratic changes in former socialist countries started while previously their governments kept all private initiatives under strict surveillance and administrative control (ICNL 2000). All the governmental strategies issued in Romania after 1990 included public authorities-NGOs partnerships as a constant objective for all governments. Periodically legislative and institutional initiatives aimed to facilitate public authorities-NGOs sectoral, national and local consultations were announced (Lisetchi and Olteanu 1998:3). While the governmental interest for NGOs has a history of over 20 years, a review of the public policy on NGOs main hallmarks shows that actual period is a transitional one and Romania is still in a phase of institutional set up (Lisetchi 2006:1).

NGOs' Evaluation by Public Authorities

In order to evaluate the NGOs' potential to be associated in the public policies elaboration, implementation and evaluation process, and, also, to apply the Romanian legal norms (O.G. 26/2000), it is useful for the public authorities to elaborate an appropriate methodology. Public perception on NGOs is an important factor in assessing this potential (Bancila et al. 2002:45). NGOs shows an higher level of public trust comparing to authorities (FDSC 2010). Citizens' appreciation for NGOs is as increased as they: facilitate the citizens' participation, strengthen cohesion and solidarity, get involved in partnerships with the authorities and have strong local roots. NGOs seem to be less trustful if perceived as part of the public system, beneficiary and consumers of public resources, or if they are perceived as weak or centred on their own goals, if these are different from those of the community (Bancila et al. 2002:45).

Assessment Criteria of Public Policies on NGO

In order to foster the possibility of evaluating the willingness of the public authorities to get involved with the non-governmental organizations it is necessary to employ some criteria to ensure a standardised assessment of the associative behaviour of the public administration towards potential community partners. Such criteria (Bancila et al. 2002:45-46) are as follows:

- a) existing institutionalised structures that link the public authorities to the associative sector;
- b) existing solution grids, accurately and univocally defined, such as recurrent institutionalized processes;
- c) applying the principle of equal opportunities to any non-governmental organisations that request assistance;
- d) applying the principle of supply and demand in any public administration- NGO relation;
- e) employing accurate selection criteria of the services offered by the organizations;
- f) the access of organisations to public services contracting within equal terms as other economic agents;
- g) the registration of relevant information regarding the organisations that perform their activity within the covered geographical area;
- h) jointly designing a job description of the public clerk whose attributions should entail the relationship with the non-governmental organisations;

- i) showing interest in raising the awareness and the sense of responsibility of the elected officials in relation to the electorate;

II. The Partnership between Public Administration and Non-Governmental Organisations ***The Opportunity of a Partnership between Public Administration and NGOs***

The advantages of an on-going collaboration between non-governmental organisations, as relevant agents in the social economy, and the public authorities aiming at solving the community problems, are as follows: the access to complementary resources, and implicitly, an increase in the range of actions of the partners beyond mathematical calculus, an increase in the credibility and public image of the partners, as well as the social benefit corollary to positive models established within the community, etc.

In the process of identifying and solving the community problems the actions of the non-governmental organisations are considered as “alternatives” to the solutions of the public administration. In order to render perspicuous the choice of the word “alternative”, it is necessary to explain that communities do not have to choose between the development model brought forth by the public authorities and a model suggested by the organisations, for the very reason that organisations cannot launch such an offer. Only in exceptional circumstances can NGOs entirely solve a community problem. At the same time, the way in which NGOs take action can represent a model of approaching a problematic matter, not the only way or the best way, however, most definitely efficient from the perspective of a cost/benefit analysis. This does not mean that non-governmental organisations are to replace the public administration or that they are to perform the duties of the latter. The offer of the non-governmental organisations does not represent an alternative *per se* to the services offered by the public institutions. NGOs represent an action method complementary to the activities of the administration, through which the community becomes responsible towards solving their own issues (Lisetchi 2006:1). In this context, *the partnership can be considered a desirable principle of action* which can be found, to a certain extent, in the organizational culture and the practice of some public institutions.

Management Approach of the Public Administration - NGOs Partnership

In an attempt to optimize the public administration-NGOs partnership, some specific aspects are to be considered:

- a) *different resources*: the authorities have the possibility to allocate public funds, as well as the capacity to issue regulations, while the NGOs have the possibility of accessing private funds, respectively, the expertise to solve specific issues and the capacity to motivate/mobilise volunteers.
- b) *working method*: the operation capacity of the authorities is limited by the attributions foreseen by their regulations, respectively, a slow reaction held back by bureaucracy and the propensity towards solving the general issues, while the NGOs are more flexible, faster in their reactions and the tendency to focus on specific problems.
- c) *the organisational structure and culture*: the authorities are larger organisations comprising complex structures, while NGOs are smaller organisations with simpler structures (Altman-Sauer et al. 2001:34).

The differences can generate tension; the main obstacles that hinder an efficient relationship between the NGOs and the public authorities have been identified: (I) different perspectives of the two sides concerning the same matter, (II) the lack of understanding the peculiarity of the activity carried into effect by the other, (III) the particular economic and cultural effects of the community on the communication methods, on the spreading of the information and of the decision-making and (IV) the power relations between the two parts involved (Altman-Sauer et al. 2001: 35-38). The common element that was identified by the two sides, i.e. the fact that it

addresses the same group (members of the community sharing the same problems) and the capacity to find solutions for the above-mentioned obstacles, can lead to an advantageous cooperation between public administration and NGOs, that will, consequently, benefit the community.

Cooperation within a public-private partnership is facilitated in the following circumstances: collaboration should focus on a single matter, the purposes are clearly stated, public participation in the process of solving the community problems, each partner should devote time and resources to plan the cooperation, the intentions and coordinates of the partnership should be clearly established by the two parts, the necessary resources for a good cooperation within the partnership should be accurately identified, assessed and allocated, communication should be appropriate and efficient, the attributions, skills and responsibilities of each partner should be specified, a decision-making system based on the equal status of the partners should be designed (Altman-Sauer et al. 2001:34-35).

Exercising the Public Administration- NGOs Partnership in Romania

If at the beginning of the last decade non-governmental organisations were perceived as being rather anti-governmental by the public authorities, partnerships between them being exceptional, currently things have changed considerably with the opportunities offered by the European financing programmes prior to Romania's accession to the E.U. The fact that the European Union, according to the financing programme, either imposed on the public administration the partnership with the non-governmental organisations, respectively, imposing on the public institutions the partnership with NGOs, or it granted a higher score for such collaborations, has led to a spectacular proliferation of the number of public-private partnerships in Romania. It is worth mentioning that, as a consequence, more funders took up this approach as part of their financing policies. Given this context, towards the end of the last decade, partnerships became a purpose themselves, being assessed inconsistently in terms of the management or the results of such a process.

On the other hand, financing the projects of the non-governmental organisations by the public authorities, as a recommended practice by the community development theory, has led to an extensive employment of the term partnership in the marketing discourse. Nevertheless, such an interpretation of the financing relationship between the two types of institutions, even if valued on first sight, is abusive if compared to the concept of partnership which entails a process of co-decision in operating the tasks to be handled by the parts involved in the partnership. Regarding the above-mentioned issues, the problem raised is that the public-private partnership is deprived of its deep structure and meaning.

To bring forth a general perspective regarding the practice of the public-private partnership, it is worth mentioning that, as in the case of Romania, the current legal framework allows the development of the relations between public authorities and the non-governmental organisations (OG 26/2000). The question raised is why this type of a more consistent approach is not used in the current practices of solving the community issues in Romania. The following causes should be considered in response to this question (Lisetchi 2006:20): the lack of an associative culture at the level of all potential partners, the access to resources is by far too limited on behalf of any of the two parts involved, a neutral, thus, unrestrictive legislative environment, but at the same time, unstimulating towards an associative action, i.e. limited management capacities on both sides. Concerning the issue of the associative culture, the GLOBE Romania research (Bibu et al. 2008) shows that in relation to the obtained score for the cultural dimension criterion, *Institutional Collectivism* (Collectivism I), Romania is situated on a scale from 1 to 7 at a relatively low level, 3.75, in comparison with the rest of the world. This number outlines the degree to which institutional practices at the social and organisational level encourage and

compensate for the collective distribution of the resources and the collective action. A low number indicates less collectivism, thus, more individualism in relation to the general interest in society. Nonetheless, the score of 5.43 for the cultural dimension *Group Collectivism* (Collectivism II) is situated at a higher level on the world scale, which indicates that in Romania individual expressions of pride, loyalty and cohesion within smaller groups, such as the organisation, the family, are more recurrent. Romanian culture favours smaller groups and their interests and puts at a disadvantage the general interest in the society. Consequently, the associative factor is not favoured by the Romanian culture. The narrow interest of the group they belong to is the strongest. Therefore, it is necessary to clearly point out the common areas of the two partners in order to render the partnerships viable.

In practice there are naturally more differences in approaching the way in which the authorities and NGOs relate to community problems. Public administration tends to unfold partnerships in especially in certain fields: unemployment, social care, local development, citizen-public administration relation, health, SMEs, environmental care, education, the non-profit associative sector, the protection of the disabled, tourism development, child care, regional development, culture (Bancila et al. 2002:42).

In establishing the partnership vocation of the NGOs, the representatives of the administration tend to employ, in this very same order, the following indicators: the objectives of the organisation, the target-group, the resources of the organisation, the impact, the level the public participation. There is a considerable difference between this evaluation grid and the one carried into effect by the financing foundations (for example, the small amount of importance given to the impact), which can be explained through the different experience in terms of evaluation of an organisation and its programmes.

In Romania, according to the public administration representatives, the following major obstacles stand in the way of the administration-NGO partnership: deficiencies in the functioning of the authorities 29%, inadequate institutional and legislative environment 22%, authority resources 15%, disfunctions in the running of the NGO 15%, lack of information 10% (Bancila et al. 2002:44). In effect, it was noticed that in the past few years in Romania, falling beyond an existing theory concept and favourable narrative discourse, there still exists an unequal involvement of the two potential partners in the development of the collaboration. Naturally, there are also many cases of partnerships between non-governmental organisations and public institutions, this fact being registered positively. The truth of the matter is that, on the background of the opening declarations of the public authorities on the common actions, there is a passive attitude towards this type of approach on behalf of most of the institutions (Lisetchi 2006:21-22). The initiative regarding the common resolution of the problems of public interest continues to be to a great extent in the hands of non-governmental organisations. Needless to say, not all organisations can be included in our analysis, as well as not all public institutions are part of this discussion. Nuances of the discourse should be observed in the context of a reality in which not all non-governmental organisations should take a role in the public welfare, insomuch as the assertion above does not mean that all public institutions should collaborate with non-governmental organisations in order to deal with community problems. NGOs are, in general, the ones who request the collaboration of the public authorities according to various conditions: individual priorities, willingness to work in a partnership, the public relations image of the organisation, etc. The public administration accepts or refuses to be involved in such actions. At a surface level, the normality of the situation described above cannot be refuted. The problem, though, that should be raised revolves around the attitude towards the responsibility of solving the community issues of the two potential partners. If, for the public administration, this type of responsibility is legally regulated, having a binding character, imposed, and, eventually, it represents the reason to be of a public institution, for the non-governmental organisations, as

structures of private initiative, taking this kind of responsibility is the result of the individual willingness, motivated by the interest in the public welfare of a private group. (Lisetchi 2006:22).

Recommendations Regarding the Public Administration-NGO Partnership

The problem of the partnership between the public administration and the non-governmental organisations represented an interest point for the Romanian nongovernmental sector even from the period of the first mandate of The Group for the Implementation of the Resolution of the NGO National Forum (GIR) formed in 1998. Thus, some general recommendations that make direct reference to the current discussion can be enlisted among the mentioned activities within the context of a GIR proposition regarding the future actions of the associative sector:

- a) The reinforcement of the local and central public administration capacities to work with the civil society, manifested through public authorities agreement procedures of the non-governmental organisations as service providers and organisers of citizen consulting centres
- b) Involving the citizen in the public decision-making on the basis of pre-arranged procedures

Altman-Sauer, Henderson and Whitaker (2001:37-38) have a couple of recommendations for the two parts involved in the promotion of the NGO-public administration partnership:

What can the non-governmental organisations do?

1. Inform the relevant authorities throughout the year about their progress, not only in the case of the partnership launching or fund raising.
2. Attach importance to the functioning of the entire community, not only to the organisation target group.
3. They should be responsible and fair and bring proof of that to the public eye.
4. To reinforce the trust of the public in the organisation by presenting a trustworthy and professional image.
5. To help the community learn how to manage the problems that the organisation tries to solve and into which they have not gained an insight yet.

What can the public authorities do?

1. Diminish the frustrations, tensions and mistrust in the NGO.
2. Ensure an overt management of the financial requests which come on behalf of the NGOs.
3. Tackle the problems and needs of the community as being part of it, not only the ones of the NGOs.
4. Recognise the potential of the NGO as a serious investment.

What can the non-governmental organisations and the public authorities do together?

1. Exchange information during their common work relations, as well as in general.
2. To commonly use certain resources.
3. To develop clear guidelines about each part's expectations and work on this to reach a common balance ground.
4. To acknowledge the other part as the best support for dealing with the public sector priorities.

Apart from the usefulness of these recommendations, it is foreseeable that carrying them into effect in the partnership between the public administration and the non-governmental organizations is done progressively, during a slow process conditioned by the common culture in Romania, both at an institutional and at an individual level. Nevertheless, their value is highlighted by the possibility of their use as a referential point towards which the organisational behaviour of the two types of institutions should be oriented, as well as criteria for a post-factum evaluation of the management and the results of the partnerships.

Note:

1. It is worth mentioning that the partnership typology also comprises public-public or private-private partnerships, apart from the public-private one.

ELEMENTS FOR A MODEL OF ENTREPRENEURIAL SCHOOL FOR WOMEN IN RURAL AREAS OF ROMANIA

Botezat Elena

Faculty of Economics, University of Oradea

Tarcza Teodora

Faculty of Economics, University of Oradea

Romanian mentality, especially in rural areas is deeply influenced by culture, literature and history of the Romanian people. This proves to be both adaptable and rooted in the old Romanian traditions and customs. In the last two decades, the transition from socialism to capitalism, modern society, the socio-economic development of the country has left strong impressions on the way of thought, expression and action of the Romanian people. Women in rural areas are no exception. As some groups of people interested in their development of social-economic scale, rural women are trying to adapt, to evolve, to overcome the barriers imposed at psychologically, socially and financially.

The paper highlights the results of a survey on a sample of 979 women students in the project "Entrepreneurship and Equal Opportunities. An inter-regional model for women entrepreneurial school "(AntrES acronym), which certified mediators intention to initiate their own business. The results of questionnaires have provided important information about the character, ambition, motivation, courage, and moral support and financial support to women entrepreneurs based in Romania, including those in rural areas. The information obtained inetrmediul "I shattered" 7 myths about starting a business in our country. Romanian entrepreneur spirit, women in rural areas in Romania is not only a manifestation of strong desire to improve living standards in financial terms, but rather an "effort" to improve and "beauty" of the individual, family, environment and society we belong!

In developed countries, at its home, female entrepreneurship is trying to reform, to seek new solutions to rethink the principles, to exercise imagination, to learn. Here, in Romania standard behavior still predominates. Female entrepreneurs are doing what everyone else in the same category does. The future however belongs to those who will opt diversity, surprise, excitement, personalization. How could this happen in the Romanian rural environment and take place in a sustainable way?

Keywords: antreprenoriat feminin, mentalitate românească, mediul rural, mituri, potențial

Jel code: M12, M52

1. Continuity and change in rural Romania

"The main feature of Romanian people is its gregarism, a condition imposed by the circumstances and traditions, no entrepreneurs come out from within the rural population, however exists a tradition of collective work, each aligning with what others do. From the perspective of the future, gregarism continued as such, can be fatal. Modern society requires individuality, consciousness of effort and personal sacrifice". (Radulescu-Motru in Malița C. M., 2010). Modernity entered the Romanian society over 200 years, but has not profoundly changed economic and social life, especially in rural areas, the Romanian village. The continuous transition of Romanian society and especially the latter, the last 20 years, gave birth to a mosaic, a modern "type patch" without a clear dominant form. It is a modern trend, ie a type of modernity that affects only a certain part of society and is beneficial only to certain groups concerned with their economic and social condition. (Schifirneț, C., 2007, 2008). Romanian mentality is the result of survival in a given area, seen as a drama in time - paraphrase by Patrick Geddes, who

proposes the term "survey before action", ie the need for building action on a synergy between ecology, economics, politics and anthropology. Data collection should blend with the description, explanation, observation integrated into a systemic research, in which the mentality seems to occupy a central place as part of a unique spiritual model, specifically built over time, which determine the motivation for use of resources on a territory (area, central area, region). Romanian mentality, especially in rural areas shows a great capacity for adaptation and also versatility, a balance between idealism and fear, between the initiation of large projects and autoassertion of certain limits. In fact, Romanians have all the features, static distributed in the population, but what is evident is that they change according to circumstances, meaning they are adaptable (Malița, M., 2010; Draghicescu, D., 1995). *Adaptability*, as a intermediate soul structure between Western creative ability and Oriental passive resignation may mean evolution, intelligence, finesse, suppleness, as progress may mean cowardice, duplicity, cunning, superficial. (Ralea, in Malița M. M., 2010). There seems to be more obvious what Mihail Ralea says in his book in 1933, *Romanian Phenomenon*, that "progress towards modernity will never come from autochthon localism, but of Europeanization". "Romanianism, ie, what is particularly unique and Romanian, is not done, yet not coagulated, but with a bergsonian formula, is yet to be done. He's still that prospect that is questing, endeavouring itself "said Michael Ralea. This emerging trend is visible in many Romanian villages in western Romania, with new and modern homes, through various goods and crafts exposed along the road and especially by many rural firms who have found qualified and cheaper labour force, lower rents, lower taxes. In addition it seems to be some kind of reconciliation of the "house" with "work", after over 20 years, during which millions of Romanian worked in Europe where they have adapted, were integrated and learned. Sometimes by bitter lessons, sometimes paying a price too high. Some have returned and are looking to do something, here at home, home being a state of mind rather than a specific location. Rural community, like all other social forms, is the result of six components: biological, moral, religious, aesthetic, economic and political (Braileanu, T., 2000). Migration of Romanians abroad was primarily due to financial reasons, poverty. What we need to say at this point, however, is that it talks about three types of poverty: "Poverty of goods and money (type I), moral poverty (mediocrity of social feelings, of the sense of family, of the love of nation, love for God and neighbor), which is a poor type II and poverty type III, the one in knowledge"(Daniel Bell Badescu, I., 2005). "The dominant mentality is that of trade and finances, which have created, trained and handled a consumption society, in which the citizen identity has been replaced with the credit card. There is no falsification of the human essence more bitter than the representation of man as a seeker of silver pots. He looks, indeed, other treasures, which ensure a dignified life and by merit earned through effort and wise strategy ... The crisis revealed the weakness, which requires time for healing and normalization". (Malița, M., 2010).

2.The research of entrepreneurial intentions of women in rural areas within the project AntrEs

Between January 2009 and December 2010, was implemented by the University of Oradea Faculty of Economic Sciences as coordinator, the project "Entrepreneurship and Equal Opportunities. An inter-regional entrepreneurial school model for women "(acronym AntrES) strategic project financed by the European Social Fund, the key area of intervention "Promoting an entrepreneurial culture". The main objective of the project was to promote equal opportunities for entrepreneurship by encouraging the involvement of women, in general, rural women, especially in the initiation and development of their business in the context of sustainable development of communities in the counties located along the western border of Romania (Bihar, Timis, Arad, Maramures, Caras-Severin, Satu-Mare). Among the specific objectives were enrolled: providing training to acquire expertise in business startup; active promotion of lifelong

learning, promoting competitive spirit by awarding the best business plans, dissemination of best practices in entrepreneurship in order to develop sustainable communities in the counties located along the western border of Romania.

The study conducted between July 2010 and March 2011 followed the intentions of a number of 874 women - women business school graduates from rural areas of West Romania to start their own business.

Data were collected through a survey at the beginning and end of the Module I course - Starting a business, conducted between July-September 2010 by non-directed interviews and by the study of documents prepared within the project mentioned above.

The initial sample consisting of 979 women presented a series of characteristics retrieved synthetically as follows: average age is 35.47 years, 74.6% are married, two-thirds live in households with one or two children, 66% are employed and 84% did not initiate any deal so far. 43% of the total have undergraduate and graduate studies, almost 60% work for the state (public administration or education) and intends to open a business in trade - 32, 4% as expected in agriculture.

According to the latest data, the number of newly established businesses by the entrepreneurial business school graduates at the rural level is 88 (10% of graduates), as follows: Bihor – 18, Timis - 8, Arad - 12, Maramureş - 29, Caras-Severin - 9, Satu Mare - 12.

What factors have led these graduates to take action to overcome their fears and leave their habits? And especially what are the key elements on which an entrepreneurial school for rural Romanian women must be based to succeed?

In an attempt to provide a consistent answer to these questions, we will start from the results of the questionnaire analysis, questionnaire applied in the 72 rural centers of business school for women, to a total of 979 respondents:

- Question 1: What do you think are the chances to open a successful business? 12% of the respondents believe that the chances to open a successful business are high and 53% believe the chances are average;

- Question 2: What are the qualities you think a woman needs to open a business? Choice number 1 was: confidence, courage, optimism - for 184 respondents (18.79%); intelligence, intellectual resources - 130 respondents (13.27%); will and ambition - 128 respondents (13.07%);

- Question 3: Which is the reason you are willing to start a business? Responses were: the need to earn more - 46%, the desire for fulfillment - 33%, desire to have a higher social and professional status - 12%;

- Question 4: What support elements do you think are needed to start a business? 66.49% - financial and material resources, emotional support (family, friends, close) - 10.72%;

- Question 5: What do you think are the areas in which to start a successful business? Trade - 335 respondents (34.21%), tourism - 210 respondents (21.45%), other services - 118 respondents (12.05%);

- Question 6: How should labour be seen to succeed in business? A pleasure - 79%, a necessity - 9%, a duty - 8% non answers - 4%;

- Question 7: What is the factor which depends primarily on success in business? Courage / audacity - 30%; intelligence - lucidity - 23%; exercise capacity - 15%; socio-economic context - 13%; chance - 11%; imagination - 4%; non answers - 4%

The review of the results is shown below.

Seven myths dispelled

The first myth: Second hand entrepreneurs do not take risks!

Reality: The entrepreneur may seem to the uninformed spectator strait-laced and conservative, but that does not mean that he is not prepared to engage boldly assuming significant risks. Like

when you prepare to climb a high mountain, you can be fearful, but such a challenge puts the blood in motion and can generate a momentum and a huge effort. And something more: "the Romanian is more difficult to move and easier to stop. It does not seek immediate spectacular results, but other more subtle and profound ". (Malița, M., 2010). The society within us, a product of the spirit of our times, puts his stamp on the limited, strait-laced of our thinking. "We all live in a very narrow cage, the spirit of our age in which we have very little freedom of movement. If in different ages, people have thought in different ways, not because it was due to expanded cage, but for the fact he was moved from place". (Szent-Gyögyi, A., 1981).

Second myth: With the ability of an entrepreneur you have to be born!

Reality: Man is build, as a road as long as it is it starts with the first kilometer. In our opinion, even if someone does not seem to be an entrepreneur, he/she can become! There are no few recent examples populating the area of knowledge that we have access. "Life itself is what you want it to be" (Marcus Aurelius). To do this you first have to believe (strongly). "Transformation, real change always occurs from the inside out ... arising from work which toils at the roots, operating on our way of thinking, on the paradigms that define our character and create the lens through which we view the world (Stephen R. Covey)". Romania is trying to change the binding data and seeks to define objectives and methods that allow more suitable ways to promote the interests, of which the first is survival." (Malița, M., 2010).

The third myth: In business you enter to make money!

Reality: A professor of production management for a long time explains to his students the importance of "a job well done", until he was interrupted by a (bored) student who said (determined) "I do not want to make products, I want to make money ". The professor (calmly) asked: "And the money for what?". Contrary to popular saying, money brings happiness. *A kind of happiness.* One direct, material that is not rejected at all, or even a more subtle dependent on the holder person, most envied (the joy of giving). Poverty is far from being "a card" and has little to do with "honesty" (almost at all). Therefore we advocate for "wealthy and honest" and not for "poor and honest ". At the same time, with more conviction, we believe that continuing to work hard in a business where money is no longer a problem is something to be appreciated (very much). What is worth saying at this point is that the path to "having" (sparingly!) has many other items, ie determination. Obsession to make money seems to be a fairly sure way not to get them!

Fourth myth: In business you have no friends!

Reality: Is it all true that "the spirit of democratic capitalism, which led to development was to encourage individual, based on deep understanding that this is the main source of economic and social power (Novak, M. Ionescu Gh in Gh, 1997). But this is individualism? That crazy idea that "the world begins and ends with you", that you are enough? Not so, the existential model is quite different. Beyond having with what to live, you have to have something to live for. It is natural to pay special attention to our business, our goals, our ideas. But the result of an exclusive concentration on interests and selfish attitude of seeing the world as a whole and the people around us as tools used in our plans lead to counterproductive and disgraceful results. Key terms of today's economy, durability, in my view, female entrepreneurship in rural areas of western Romania, refers primarily to the people!

Fifth myth: A successful business requires a great idea!

Reality: Setting up a business from such a conception may be a bad idea. Few businesses have been based on such an idea. In fact, some have been established simply based on an idea more simple, banal even while another group were raised from the ashes of failure. "the Romanian can not accept almost any event or program in a form which is given, or is required. The Romanian is realistic. He rates fiction, myths and legends he likes, but keeps his feet on the ground ". (Malița, M., 2010). We join the mathematician Grigore Moisil's opinion, that the logic is rather a

nuanced reasoning in which thinking is evolving in a direction that includes, besides true and false or dubious value as possible, with possible and necessary.

The sixth myth: In business the most important thing is "to deal"!

Reality: Our view is that the vital question for an entrepreneur is not : "How well am I doing?" Or "How can I cope?" Or even "How well we handle ourselves to cope competition?" but "How can we make things better tomorrow than we did today? ". The history of a business is written by its people and their work is the special "ingredient" in the "magic formula" that "is to grow". "The Romanian undertakes all the action, if it has a real motivation." (Malița, M., 2010). Motivation is an emotional drive type, but with rational arguments. More strings must vibrate: ambition, rewards, influence, social position, reputation. But beyond these events rather selfish comes a heavy argument: "you are what you know to do".

The Seventh Myth: You have to be lucky to succeed in business!

Reality: Reflecting on the essence of success, J. Willard Marriott, wrote in his diary: "Discipline is the most important thing in the world. Where there is no discipline, there is no character. And with no character, there is no progress ... problems gives us the chance to grow. And usually, we get the thing for which we worked. If it encounters obstacles and overcome them, we anneal our character and qualities that bring success". "Long term success of a business organization, is determined by three main factors: 1. good planning of various activities / actions, 2. a better implementation of various plans / strategies, 3. luck or that non-chance in a given context. " (But the chance never comes to an unprepared mind – o. n.) (Harrington & Harrington, 2001).

3.Preserving the essence and stimulate progress

In our view, in rural areas, women have a real chance in the direction of setting up a business because "the village is the shrine where she took refuge and is kept living the manifestation of the Romanian people" (Dimitrie Gusti) including the preservation of moral values and skills necessary to create a complete product, in other words knowledge.

As Professor Allen Wilson, a biologist at UC Berkeley who has studied closely the behavior of birds, knowledge creation and dissemination of appropriate behaviour had to do with three basic elements: 1. mobility (the ability to move freely to learn and experience) 2. spread within the community (the ability to transfer from individual to community building communities of best practice), 3. innovation (the ability to develop new skills to take advantage of new knowledge in specific environmental conditions) (Hjelmervike Ove R., 2001). We have identified the existence of these elements in the rural areas of western Romania, including examples of adaptation between the most interesting. Adaptation, defining feature is based on the characteristic skills: *knowledge, information, experience, which can be put into use to create wealth and remain the same in any social environment.* Efficient use of knowledge, skills, abilities and cultural values of rural women towards encouraging female entrepreneurship depends on public awareness that women, who prove to be more vulnerable, more exposed to "insolvency" are much more concerned than men on what she spends, what she earns for food, education and child and family health insurance (Brockhaus, R. & Horwitz, P., 1986 Miniti, M. & Naud, W. 2010). Despite many obstacles in the way of Romanian rural female entrepreneurship, we believe that it "is about to get done, although is still that prospect that is questing, endeavouring itself" (Michael Ralea).

On the basis of this statement there are three important aspects:

- *the existence of a potential* consisting of knowledge, information and experience which can help achieve competitive products and services;
- *the ability of this potential* to transform in a number of operational elements, creating value, to be integrated into final products;

- *grafting this potential of adaptation* as a characteristic feature, which is a transformation, an adjustment, a location, a selection that you cannot do without having inside the affinity with what you choose.

In our view, rural female entrepreneurship in Romania is not only something that is expressed in terms of improved incomes, the desire to avoid dependence on others or even better control of their lives but most of all, "a deed" that improves the person concerned and the world around them. It takes however a first generation of entrepreneurial skills to rehabilitate honest skill, science - and pride - to do what you do with virtue. Future will not mimic models but invent them!

ORGANIZATIONAL STRESS AND ITS IMPACT ON WORK PERFORMANCE

Bucurean Mirela

University of Oradea, Faculty of Economics

Costin Mădălina-Adriana

University of Oradea, Faculty of Economics

Nowadays, in times of economic crisis, most managers or entrepreneurs have to cope with a lot of new job challenges which can easily transform into stressors. Work related stress is of growing concern because it has significant economic implications for the organization. Even if some stress is a normal part of life, excessive stress can influence one's productivity, health and emotions and it has to be taken under control. When people lose confidence, they refuse to take responsibilities, they get quickly irritated, they are unsatisfied of their job, their performance will be very low and the organization will be in danger. Fortunately, most managers and entrepreneurs know which stress main symptoms are and have the necessary knowledge for managing and reducing it before it can affect employees' daily work.

Stress can have an impact both on the organizational welfare and on personal behavior of supervisors or employees, that's why, the ability of managing it can make the difference between job's success or failure.

The purpose of this paper is to study Romanian managers and entrepreneurs from Bihor County's perception regarding the stress phenomenon, if they feel that they are affected by stress, if they promote some methods to reduce it and if they consider that stress can influence the organizational performance.

As a research method we used an online questionnaire, applied to a number of 75 managers and entrepreneurs that represent the target group of the project "Flexibility and performance through management", project financed by the European Social Fund - "Invest in people". Each participant had to answer a number of 35 questions regarding stress and the results will be presented in this paper. The main conclusion is that, even if job itself is seen as a stressor, there are other important factors that can produce stress such as: family problems, personal problems or social problems.

Keywords: organizational stress, impact, managers, entrepreneurs, work performance

Cod JEL lucrare: M54

1. Organizational stress

Organizational stress can be defined as an emotional, cognitive, behavioral and physiological response to the aggressive and harmful aspects of work, work environment and organizational climate. It is a condition characterized by feelings of helplessness in solving tasks.

In other words, work-related stress is people's reaction when they have to face some demands or special tasks that are out of their abilities or knowledge.

Types of organizational stress

The main types of organizational stress can be considered the following (1):

Eustress represents a positive kind of stress and helps people to prepare their mind and body for whatever is about to occur in the future. Eustress can develop one's energy, creativity or competitive spirit and can offer the strength for achieving performance.

Distress occurs when something affects one's routine for a short period of time. It has a negative impact on people and it contains the following categories of stress: acute stress and chronic stress.

Acute stress appears when a change transforms one of the usual works that a person do. Although it seems to be an intense type of stress, it passes very quickly. The symptoms to that kind of stress are: headaches, hypertensions, rapid heartbeat and stomach problems.

Chronic stress is the most serious type of stress and can be very harmful for people's health. It occurs when something changes the routine for a long period of time, from weeks to years. This kind of stress appears when facing several work or personal failures.

2. The effects of stress on the entrepreneurs/managers and stress management

Sources, symptoms and effects of stress for entrepreneurs/managers

After analyzing the causes of organizational stress we can distinguish between those who act solely on entrepreneurs or managers. These causes can be the following:

- the diversity and complexity of tasks;
- high responsibilities that require management positions;
- concern for the organization's future;
- aware of the potential effects of a poorly developed decision;
- inappropriate management style;
- excessive centralization of authority;
- the existence of poorly professional trained subordinates;
- the extension of work program due to the emergence of some special situations.

The relationship between stress sources, symptoms and diseases caused by stress for managers/entrepreneurs, can be graphically represented like this (Fig. no. 1):

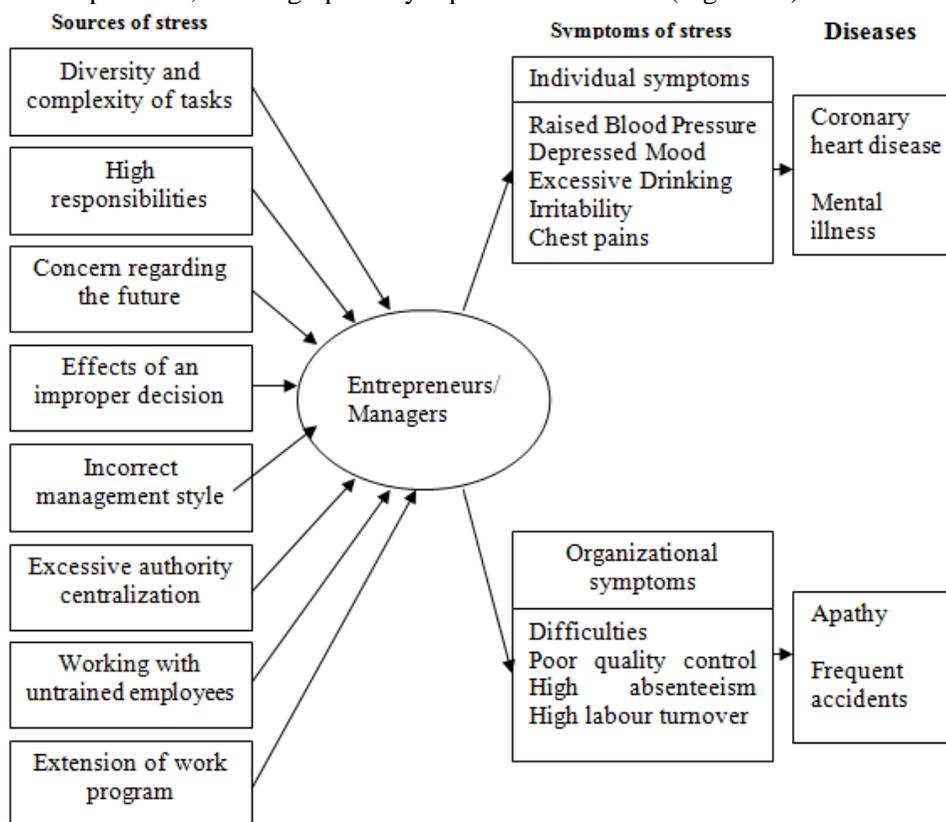

Figure no.1 The relationship between stress sources, symptoms and diseases caused by stress for managers/entrepreneurs (2)

Adaptation by: Agrawal, Rita, *Stress in life and at work*, Response books, London, 2001, p. 146

Ways of managing individual stress

There are a lot of actions that individuals can take in order to manage their stress level and to prevent them from developing into more serious problems. The main positive actions that people can take fall into three categories:

- modification of behavior;
- development of a healthy lifestyle;
- alteration of mindset.

When talking about *behavior*, the interventions that can be made are:

- being more assertive: listen to others, respect others, tell others what you feel or need, negotiate, compromise, being self-confidence.
- improving time management: establish priorities, make a list of what must be done, eliminate time-wasting activities, focus on essentials, be able to delegate effectively, learn to say “no”, organize daily activities, make a list of targets.
- avoid perfectionism
- avoid getting angry over things that you cannot influence;
- accept (sometimes) the errors of yourself and others;
- smile and give affection;
- practice being a good listener;
- learn to relax;
- learn to turn stressful life events into challenges for personal growth;
- get used to take some “time out”.

As far as *healthy lifestyle* is concerned, the main activities that people can follow are:

- a healthy diet: alcohol taken with moderation, limited quantity of caffeine, avoid carbohydrates, eat fruits, vegetables and sufficient quantity of water;
- regular exercise: reduce muscle tension, increase energy, maintains self-image, appearance and tends to control weight, helps to clear the mind of worrying thoughts;
- relaxation: improve sleep patterns, ameliorate pain, reduces stress response, increase self-esteem;
- increase leisure time and taking up hobbies.

The third area in which people can make interventions refers to the *alteration of mindset*, including:

- modification of perspectives;
- self-talk;
- positive thinking;

Ways of managing organizational stress

There are a lot of strategies that can be applied when talking about managing organizational stress, such as:

- early prevention and elimination of work-related problems that can produce stress;
- change work demands;
- ensure that employees have the necessary knowledge and abilities to perform effectively their jobs;
- improve constantly the technique used at work;
- apply a proper management style;
- ensure a proper work environment;
- offer employees a stress management training in order to teach them ways of overcoming stress;
- increase the support needed by employees;
- ensure a good level of cooperation within employees;
- clearly define disciplinary procedures;

- establish a supportive working culture in order that employees feel integral to the organization and are motivated to achieve its goals;
- offer employees the necessary support and information for developing their career;
- encourage flexible work schedules;
- try to manage the change process in a way that employees cannot become stressed due to it.

3. Case study - aspects of stress perception of entrepreneurs and managers from Bihor County

The proposed research was conducted by using the database of the project "Flexibility and performance through management" developed in partnership by the Faculty of Economics and Business Administration, University of Craiova and the Faculty of Economics, University of Oradea as a partner, no of contract POSDRU/81/3.2/S/57620, implementation period: 12/02/2010 to 01/31/2012 in the amount of: 2,137,229 lei.

The project's general objective is to develop the professional skills of general managers in order to prepare them to promote the adaptability and the introduction of new technologies. The specific objectives are: the professional training of 180 entrepreneurs and SMEs managers from two development regions in order to promote new forms of work organization and new technologies with reduced environmental impact; the increasing of informational level of the target group entrepreneurs and managers when talking about the necessity of introduction and the compliance of safety and health rules at work.

Further the study will be referred to the target group of the NW - Bihor County.

Research Methodology

This research is a descriptive one and its aim is to provide an image at a certain time on the studied phenomenon - stress. For implementation of this quantitative research was chosen as a research method - the survey. For this purpose, a structured questionnaire was developed in two parts with 35 questions.

The target population is the target group - Bihor County entrepreneurs and managers, participants in the course of the project - "Flexibility and performance through management", project financed by the European Social Fund - "Invest in people". The database of the target group - entrepreneurs and managers from Bihor County is based on online questionnaires. This database has a total of 75 entries.

The respondent's structure

In terms of affiliation to a business category entrepreneur/manager, 40% of respondents are entrepreneurs and 60% are managers at all levels within the SMEs.

Gender structure. The share of women in the total number of respondents is 40%, 60% are men.

Age. Taking into consideration the age in completed years, the situation is as follows: 16%, 18 – 24 years, 73%, 25 – 45 years, 9%, 45 – 54 years, 2%, 55 – 64 years.

Regarding family status, most participants are married (62.8%), 34.8% are unmarried, 0.04% being divorced.

Stress and stress concerns

45% of respondents work more than 48 hours per week. In these circumstances, it is not surprising that 70% of respondents believe they are affected by stress (Fig. no. 2).

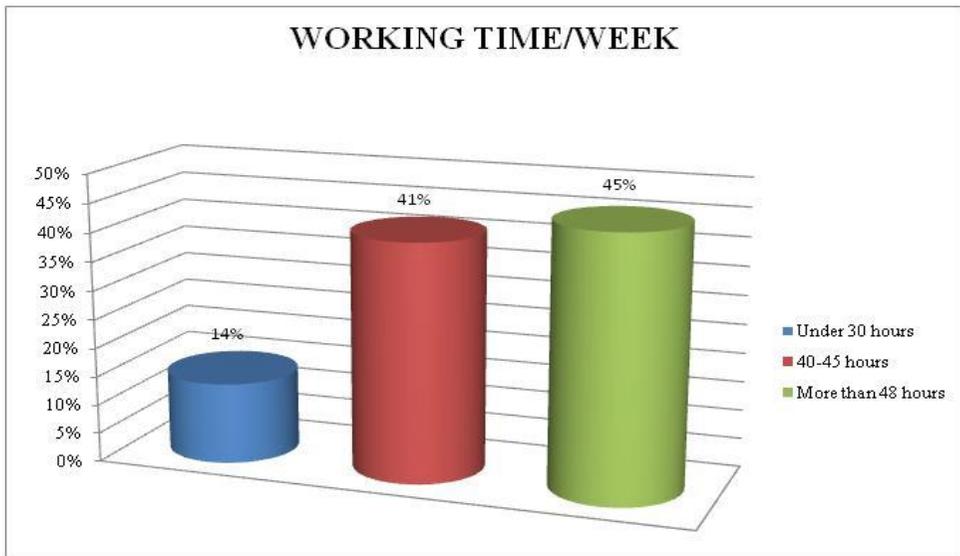

Figure no. 2 Working time/week in the case of managers and entrepreneurs from Bihor County

It follows therefore that a larger number of respondents believe they are affected by stress. 69% say they are concerned about stress, but only 21% say they have adopted measures to combat stress. Also a small number of managers (18%) say that the organization in which workers have been taken measures to combat stress. (Fig. no. 3))

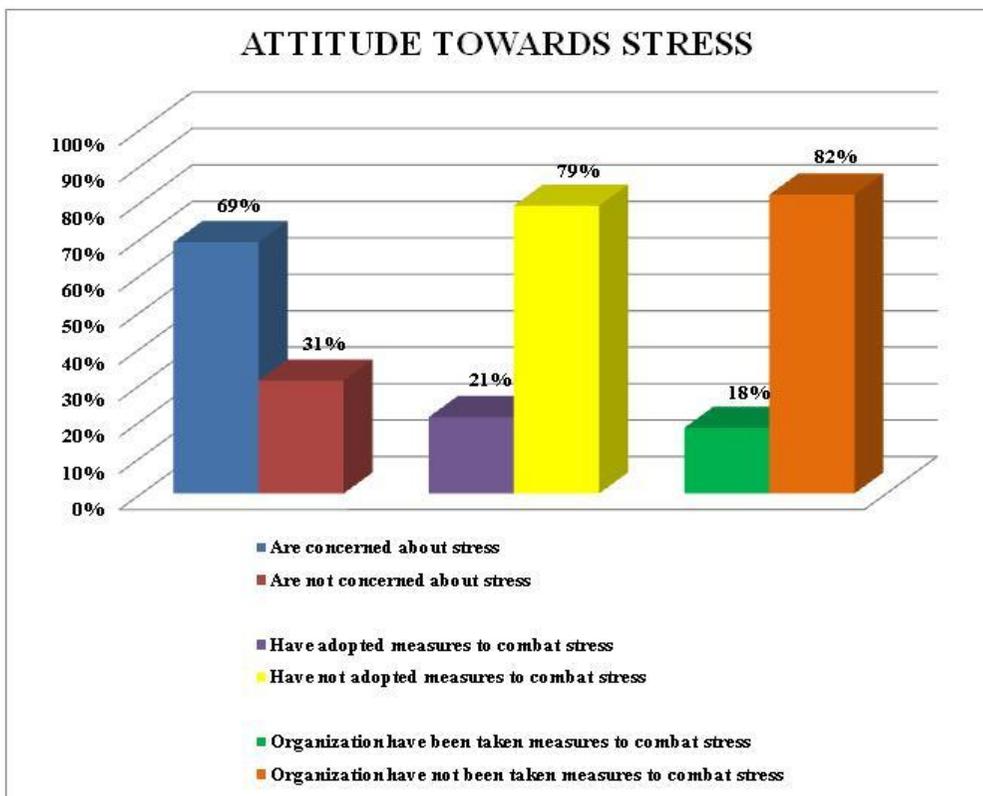

Figure no. 3 Managers, entrepreneurs and organization's attitude towards stress

To a large extent (85%) respondents considered that work is the main source of stress in their lives. (Fig. no. 4)

The main stress factors

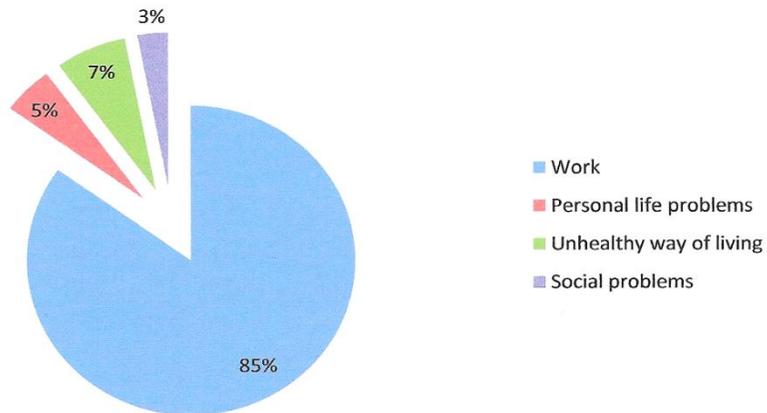

Figure no. 4 The main stress factors

Over 65% of questioned people said they would continue to work even if they did not have any financial need. Many managers, however, (60%) would prefer "to work elsewhere."

A minority of respondents (16%) say that there are situations in which stress motivate them to act in order to achieve something - it is positive stress (eustress); but the most common is negative stress (distress), when body and / or mind begin to respond negatively to stress agents. Over 85% of respondents considered that the stress level is much higher now as compared to five years ago.

4. Conclusions

According to the conducted cross research the conclusions are the following:

- entrepreneurs are more stressed than managers;
- women entrepreneurs/managers are more stressed than men entrepreneurs/managers;
- married entrepreneurs/managers are more stressed than unmarried entrepreneurs/managers;
- the majority entrepreneurs/managers believes that stress level is much higher now as compared to five years ago;
- the entrepreneurs and managers are concerned about stress;
- on personal level, entrepreneurs/managers usually fail to take measures to combat stress;
- within the organization are generally not taken measures to combat stress;
- the situations in which stress motivate entrepreneurs/managers to act to achieve something are rare;
- entrepreneurs/managers believe that work is the main source of stress in their lives;
- entrepreneurs/managers would continue to work even if they did not have any financial need;
- most of managers would prefer "to work elsewhere".

Concluding, although the work is considered the main source of stress, not the work itself is stressful, but the conditions and social environments in which it unfolds.

THE ADOPTION/ADAPTATION OF THE „SUPPLY CHAIN” CONCEPT IN ROMANIAN

Butilcă Delia

There are several terms used in Romanian for the English term supply chain. We have counted eleven. It has been adopted in several ways and it is perceived (adapted) in several ways in Romania. There are several causes which have determined this fact: the English terminology inconsistency regarding supply chain has been translated into other languages, professionals roots determine the usage (logistics professionals use it for logistics, strategic logistics use it in general etc.), the lack of Romanian discussions regarding the new professional terminology at general level and supply chain and logistics in particular. We expose the different ways by which supply chain is reflected in Romanian, we discuss the causes which have generated this total confusion and then we suggest a proper term for supply chain in Romanian, considering the real meaning of the term and the strategies adopted by other countries regarding supply chain adoption. In conclusion, we propose a general adoption and adaptation for the term in Romanian.

Keywords: supply chain, logistics, strategy, adoption, adaptation.

JEL: M29, M19, L19, M31

Introduction

One major and troublesome issue that we are confronted within all branches of the economy is finding adequate equivalents for the Anglo-American terms that prevail in the global terminology of economic theory. This is far from being solely our problem; in fact, all nations that do not use English as their native tongue have to cope with it, either by adopting the Anglo-American term as such or by designating an equivalent term in the local language.

For a variety of reasons, such as nationalism, educational necessity, local customs, each nation has developed its own approach to this matter, either accepting or rejecting the Anglo-American terminology and producing substitute terms that render the meaning of the English term more or less accurately.

We believe that it is the experts' duty to discuss and clarify such issues. Unfortunately, a significant amount of knowledge and information relevant to this topic (including lectures, conferences, etc.) is delivered in foreign languages and Romania is no exception. As a result, the terminology reaches the practitioner in an inconsistent and confusing form, generating chaos and lack of professionalism on the long term. This haphazard adaptation to local economic cultures more than often results in the loss of certain meanings that the term may convey in the original language. The terms are thus adapted to the precarious level of knowledge pertaining to the area in question.

The purpose of this article is to clarify the usage of the terms „supply chain” (SC) and „supply chain management” (SMC) in Romanian. If any such term would make the object of a similar article, the magazines would definitely become chock-full with trivia. However, this term is

crucial to several areas. The Romanian equivalents of these terms are used by professionals and researchers from various branches of management: strategy, logistics, production, service, and also by researchers from different areas of economy, such as marketing, finance, accounting, economic IT, engineering. These terms owe their importance not only to their extensive usage, but also to their relevance in the daily economic routine. A significant number of companies do not exist as autonomous entities anymore, but rather as links of these supply chains (SC). Competition occurs now between supply chains, rather than between individual companies (Verduijn, 2004).

This article is designed to clarify the problem of these two terms and to suggest adequate Romanian equivalents for them. The aim of this paper will be approached in several steps:

1. In the first part of the article, we will define the SC and SCM according to foreign researchers. The aim of this first part is to identify the multiple facets of these terms. The English notion of SC appears to be quite problematic and so does the consistent and comprehensive understanding of the SCM concept;

2. The second part of the article includes examples of this term's usage in Romanian, highlighting the variety of terms used and the randomness that seems to govern such usage. The term was appropriated by the Romanian language in a disorderly fashion, through a variety of arbitrary adaptations. We found a number of eleven terms that are supposed to render the Anglo-American term of supply-chain, which will generate in turn eleven possible interpretations of SCM;

3. There are two alternatives for an adequate appropriation: we either keep the Anglo-American term or suggest an optimal Romanian equivalent. Our suggestion is based on the common understanding of the term SC in English. It is vital to find a term that will be accurately construed by the majority of experts and convey, after the word „management” is added, the generic content of the SCM in English.

1. SUPPLY CHAIN AND SUPPLY CHAIN MANAGEMENT – ACCEPTED INTERNATIONAL DEFINITIONS

The term „supply chain” does not exist per se. It was highlighted by several researchers in the area of Supply Chain Management (SCM). First of all, we will introduce the main SCM schools and their SCM implementation paradigms. We will then shift the focus of our attention to the globally-accepted definitions pertaining to the supply chain, emphasizing several aspects regarding the perception of the SCs. We will conclude this section of the paper by presenting the main definitions of SCM and the processes normally included in the scope of SCM.

1.1 Supply chain management schools

From an organization theory point of view, the concepts of SC and SCM have emerged simultaneously with their systemic perception. The system theory of the 20th century provides a radically different organization-related paradigm, i.e. the transition from an atomistic representation of a company's constituents to a relational representation that marks a leap forward rather than a superficial improvement of older theories regarding organizations. The organization is a system made up of several sub -systems that may in turn be made up of several sub – sub – systems that interact. The organization is part of a greater whole, being a system open to its environment.

There are several groups of authors (generically called schools) that interpret the place and role of SCM at organizational level. Bechtel and Jayaram have initially identified four schools (p. 2):

1. The first school among those mentioned by the authors is the one **that is primarily aware of the functional chain** that has to be coordinated. A definition was provided by Houlihan in 1988: „SCM enables the flow of goods from the supplier to the manufacturer, to the seller and to the

final consumer". The emphasis is therefore laid on both flow of materials and agents involved in this flow. One source of this view is Porter's value chain (Delfman and Albers: 2001, p. 3);

2.The partner relationship or logistics school is the next mentioned school. This one focuses on the coordination of the relations between the partners, which may lead to the improvement of the competitive advantage. According to Turner (1993) „SCM is a process that includes all the relations within the chain between the suppliers, various levels of production, storage and distribution to the final consumer". With its authoritative voice, this school has succeeded in dominating the discussions on SCM for years, taking credit for coining the term and often claiming that SCM basically means logistics management at SC level (as an example. And yet, SCM means more than the flow of goods management within a SC (Cooper et al., 1997, Ilieş and Crişan, 2008b);

3.The informational school emphasizes the flow of information between the partners of a SC. Johansson defines the SCM in these terms (2004): „The SCM's primary requisite is that all members of a SC are well informed. With the SCM, information flow becomes a critical element of a SC's overall performance";

4.The integration or process school looks past the various agents of the SC and emphasizes the processes carried out along the supply chain. Cooper, Lambert and Pagh provide a definition in 1997: „the integration of the processes within a SC is what we call SCM". Bowersox and his collaborators also take notice of this aspect: „SCM is the collaboration between companies to the purpose of improving the strategic position and operational efficiency of a SC". They regard the SCM as a universal strategic alternative, as any company is able to choose this integration and informational & managerial dependence alternative.

A new school of thought pertaining to SCM has recently emerged: the collaboration school (Verduijn, 2004), with Mentzer as a notable representative. He defines collaboration as a long-term relationship between organizations, in the sense of a common pursuit. Collaboration has become evident in practice, as several companies work together in order to exercise an adequate management of the SC: planning, execution, performance assessment, all these are performed jointly. In our view, there are no significant differences between the integration school and the collaboration school. These schools have brought the concept into popular awareness, making a valuable contribution to the development and improvement of the public perception of SC and SCM. The use of these terms is relatively recent. In 1995, at the annual conference of the Council of Logistics Management, only 13,5% of the papers contained the term „supply chain", whereas in 1997, the term was already contained in 22,4% of the papers (Mentzer et al., 2001). However, it was the globalization of the big corporations' activities, the global competition and the advances in IT, rather than the popularization efforts of these experts that persuaded most of the practitioners that collaboration is the only viable solution for the future. This collaboration generically designated as SC and SCM was and still is subject to an ever-evolving perception.

1.2. International definitions of supply chain

In fact, the definitions regarding the SC are scarce in the international specialist literature, as most authors rather insist on clarifying the concept of SCM. For a given company, three levels of SC can be defined (Mentzer et al., 2001): direct supply chain – it includes the company, a supplier and a customer that participate in the upstream or downstream flow of a product, extended supply chain – it includes the company, the supplier's immediate suppliers as well as the customer's immediate customers and fundamental supply chain – it includes all the suppliers and customers involved in the production and delivery of the product, both downstream and upstream.

A similar perception is that a SC can be identified as company-related (the totality of closely-related partner companies upstream and downstream), product-related (the totality of companies

that contribute to the manufacturing of a specific product of the company) or generically company-related (all the partners involved in the production and delivery of all products (Quyale, 2006).

It should be noticed that the differences concern the perception of the SC, not the SC itself. Some perceive and understand it to be rather narrow (the extent of the SC depends on the collaboration between the companies), while others think that a SC is extended, as it exists regardless of the collaboration between partners or the lack thereof. Mentzer's analogy is fully fitting (Mentzer et al., 2001): the river exists and the water flows downstream just like the products in a SC, regardless of the fact that someone becomes aware of the possibility of a global management of the river basin or not. If several states share the same river basin, only cooperation enables them to achieve clearly-defined goals pertaining to it, as none of them taken separately would be able to implement decisions for the entire basin because of existing state borders. The SC (the riverbed) and the flow of goods (the water) exist anyway, with or without SCM. A company is usually part of several SCs. A company acts as a supplier for many customers and each of them represents a new SC with its customers. The companies create supply for the customers together, irrespective of whether they do it in a coordinated or uncoordinated manner.

The graph below depicts a generic SC in Wisner's view. It should be noted that a SC is a network consisting of suppliers of raw materials, manufacturers of semi-finished goods and parts, manufacturers of finished goods and distributors that are in charge of supplying the goods and services to the final consumer. In addition to the main flow of the SC, there is also a reverse flow of products (in the form of scrap or recycling materials – referred to in the Anglo-American literature as „reverse logistics”), as well as the flows that support these main flows: planning, information, activity integration .

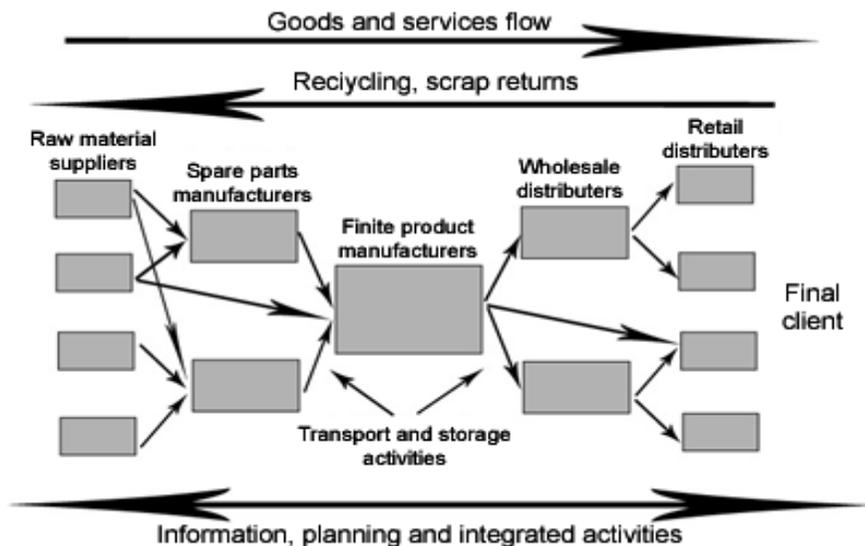

Fig. nb.1 Generic SC

Source: Wisner, J., Leong, K., Tan, K., Principles of Supply-Chain Management, South Western Publishing, Ohio, 2005, p.6

Frazzelle provides a definition of the SC, emphasizing its logistics side. With the fact that logistics is „the game that is played in the arena called SC” as a starting point, he defines SC as a network of locations (warehouses, production facilities, terminals, ports, shops, homes) vehicles (airplanes, trains, trucks, cars) and logistic data transmission and processing systems interconnecting not only the company's suppliers and the supplier's suppliers, but also the company's customers and the customers' customers (Frazzelle, 2001). However, Bowersox and his

collaborators (Bowersox et al., 2002, p.4) define the supply chain as a value chain or as a supply-generating chain made up by several companies, with no special emphasis on the logistic side of the SC.

It must be noted that most researchers stress the fact that a SC equals the group of companies that participate in the creation and delivery of a product, in the creation of supply and do not insist (Frazelle stands out as an exception) that SC refers only to those companies involved in the flow of goods, i.e. logistics. It is, in fact, the group of companies that participate in the creation of supply. For that reason, it is called a demand chain. In our view, logistics is only one of the many games that are played within a SC, such as marketing, production, R & D, SC quality and overall performance assurance.

1.3. International controversies regarding the designation „supply chain”

Although the explanations provided above seem to converge towards the acceptance of the fact that a supply chain is a group of companies that contribute to the creation of supply, things are conceptually more convoluted than they appear to be, as there are several controversies addressed below:

Controversy 1: Why supply chain rather than demand chain? Marketing experts have been recently trying to bring a deservedly neglected aspect back into public consideration, namely the fact that the term „supply” would imply that the group of companies work to produce a certain good for the customer (Jüttner et al., 2007, Thublier et al., 2010, De Treville et al., 2004, Charter et al., 2001). Marketing theories suggest that the company works to satisfy the customers' needs, i.e. the demand, therefore „demand chain” would be a much more appropriate term. Although we fully agree with that detail, it is now too late to change this designation because the term „supply chain” already has a long history behind and it's widely used to refer to this group of companies. Oliver and Weber have coined the term SC in 1982, while the critics of this term raised their objections as late as the 2000's, when SC and SCM were already widely-circulated notions. Demand chain continues to be used in SCs to designate the need of a marketing orientation towards the customer within the SC (De Treville et al., 2004).

Controversy 2: Why supply chain rather than value chain? The term „value chain” was devised by Porter in 1985 to highlight the company's sources of competitive advantage, that create value in the customer's perception, discerning primary and auxiliary activities. There are many similarities: both views, SC and value chain are systemic, process-orientated and aim to create value for customers. Although the value chain best describes the basic process within the SC, namely the creation of value, it may be argued that this term was doomed to fail in competition with SC from the very start, because of its primary function to describe activities within an individual company.

Both options demand chain and value chain roughly convey the same aspects: several partners and product manufacturing / delivery and even certain additional details: compliance with customer needs and creation of value. But things have been settled to a certain degree: SC is the term favored by most experts.

1.4. Defining supply chain management at international level

Supply chain management is one of the most used concepts in business. But, despite its popularity there isn't a general understanding of its meaning. SCM is seen either as a collaboration philosophy, either as management processes within a SC, either as just an operational concept from logistics (Mentzer et al., 2001, Burgess et al., 2006).

As a philosophy, SCM is perceived as seeing a SC as a single entity, not as a conglomerate of several companies. The degree to which SCM is implemented should be reflected in the way the partners are collaborating, the success of the operation as a whole. SCM philosophy would require

synchronization and convergence , both inter and intra organisational (Mentzer et al., 2001). It should be rather an orientation of a SC, a philosophy that can be implemented further .

As management processes, SCM is defined as all the activities concerning planning, organizing, coordinating, and controlling at supply chain level, aimed at serving customers better and meeting their needs. We refer to management of materials , information, and all business functions at SC level. If we have an integrated management, then we have a successful SCM. Among the managerial processes, we recall (Mentzer et al., 2001): customer relationship management, customer service management, order management, production management, supply management, innovation management, sales management, logistics management.

SCM is less often confused with logistics operations at SC level. We will not dwell on this issue, but we will give definitions according to this view of SCM.

The definitions that we found are consistent with international perception of SCM:

1. We found the following definitions that reflect SCM as a philosophy, as a strategic alternative for any organization:

- Christopher (2008) (Jüttner et al., 2007): SCM is the relation management with partners upstream and downstream, in the sense of creating value for the end customer, at a minimal cost, on the whole SC.

- Handfield și Nichols (Van Goor, 2001): In order to obtain a competitive advantage, companies need to operate on SC level. Only a SCM at SC level enables faster delivery, achievement of better and cheaper products than the competition;

- Croxton (2001) (Gundlach et al., 2006): Integration of key business processes from end customer to the most distant suppliers, with the purpose of creating value for customers and stakeholders as a whole;

2. Most definitions are at the level of management processes within the SC:

- Mentzer (Mentzer et al., 2001): SCM is the strategic and systemic coordination of the conventional functions, and also the tactical coordination of these functions, both at the firm level and at the SC level, in order to improve the company's long term performance and the SC as a whole;

- Chan și Lee (2005) (Gundlach et al., 2006): SCM is the efficient management of the complete processes (from customers to suppliers) of design, planning, supply;

- Institute of SCM (2005) (Gundlach et al., 2006): SCM is the design and ongoing management of processes crossing organizational boundaries to meet customers' needs;

3. At operational level, SCM is defined mainly by logisticians, who see SCM as a logistics management at SC level:

- Novak și Simco (1991): SCM covers the flow of materials from supplier to manufacturer to end customer;

- Lee și Covey (1995) (Jain et al., 2010) define SCM as the integration of the activities taking place within a network of facilities for the purpose of materials' supply, their processing, and delivery of products through a distribution system;

- CSCMP (Council of Supply Chain Management Professionals): SCM is the management of all activities related to supply, conversion and all logistics activities at SC level (Gundlach et al., 2006);

- Charter (2001) argues that practitioners perceive SCM as only the management of the flow of goods at SC level .

What is apparent in these definitions is their evolution. Three issues were included in all definitions, the evolution making sense by extending the coverage of these issues (Stock et al., 2010): the activities within SCM, SCM benefits and SC actors. Activities under SCM have evolved from the management of logistics activities to information management, management of the relationship with partners and of the overall performance. The benefits have evolved from

cost and service related to logistics to strategic benefits, increased customer satisfaction, increased effectiveness and efficiency at SC level. The actors have evolved according to perceptions of a SC exposed in this article.

In addition to the definitions of SCM, we believe that are important the processes assigned to SCM by specialists. We used multiple sources to see if SCM refers only to logistics management at SC level. The conclusion is clear: no, SCM is much more. SCM includes the following processes (Burgess et al., 2006, Verduijn, 2004, Van Goor, 2001): strategic leadership, intra- and inter-organizational relationship management, logistics management, continuous improvement - quality management, management information systems, performance management, marketing processes, R & D, product design.

In conclusion, the inconsistency concerning the terms of SC and SCM is caused in part by an ongoing evolution of the business terminology on international level, due to economic development, its globalization, to the high interest from specialists from many related areas connected to these terms. Each tries to shoot fire from his pot and thus create confusion.

Majority rules - this is what we think on the perception of SC and SCM. It is obvious that this first part of the article shows that a supply chain is a group of companies (conglomerate, network) involved in production - delivering a product and that SCM is the management of the relationship between companies. Not only it refers to logistics, nor just the logistics management system or group of companies, being a much broader concept.

2.USING IN ROMANIAN THE TERM CORRESPONDENTS OF SUPPLY CHAIN

Further on, we still insist on what we found in the literature and especially on the Internet on SC and SCM in Romania. We have not found any author who insisted on this issue, we never found an author outraged by using more terms to fill the corresponding English one.

Adoption of the terms SC and SCM in Romanian took two forms:

I..Not translating in Roumanian is the first form. This aspect we noticed in the following cases: Vicepresident ARILOG (Romanian Association of Logistics) does not translate this term (Dumitru, 2008), retaining the Anglo-Saxon form; the logistics magazine retains the term supply chain (eg. Tutunaru, 2010); at Alexandru Ioan Cuza University in Iași, in 2010, is a Management specialization course, third year, called supply chain management;

II.A second form involves finding correspondent words for SC and SCM and hence their adaptation to the context used, the experience of the researcher. There is no lower or wider use of these terms, further exposing them alphabetically:

1.,,Lanț de aprovizionare – desfacere” - procurement- sale chain is a term used in the same paper in which there is the term „lanț de distribuție” (Fotache and Hurbean, 2006);

2.,,Lanț de aprovizionare – distribuție” , procurement- distribution chain is a term used by several consulting firms in the field (Tradeconsult, 2010, CAT, 2010);

3.,,Lanț de aprovizionare – furnizare” , procurement-supply chain is a term used at the Polytechnic University of Timisoar (Mocuța, 2009);

4.,,Lanț de aprovizionare” , procurement chain is a term used at the Academy of Economic Studies (Pelau, 2007);

5.,,Lanț de aprovizionare și producție” , procurement and production chain is the term used by the experts from Romania for SC Unilever (Unilever, 2010);

6.,,Lanț de aprovizionare-livrare” , procurement-delivery chain is a term used in the Academy of Economic Studies in one of the most extensive work on logistics in Romania (Bălan, 2006);

7.,,Lanț de distribuție – aprovizionare” ,distribution-procurement chain is a term used by some consulting firms in the industry (Training&Consulting, 2010);

8., „Lanț de distribuție”, distribution chain is a term used at Iași for SC (Fotache and Hurbean, 2006), but also by those who drew up a glossary of terms at the University of Târgoviște (ECR, 2008);

9., „Lanț de ofertă”, offer chain is a term used also in the Academy of Economic Studies, in collaboration with a teacher in the U.S. (Glasser et al., 2006);

10., „Lanț logistic”, logistics chain is used both at the Babes-Bolyai University in Cluj (Ilieș and Crișan, 2008a), and at the Academy of Economic Studies (Belu, 2008, Țarțavulea and Bănac, 2009);

11., „Procese de aprovizionare și livrare”, Supply and delivery processes is a term used by Microsoft representatives in Romania (CG-GC, 2010)) at a presentation of Microsoft Dynamics Nav.

From these details we can see following:

-There is no uniform designation for SC and SCM in Romania;

-Change does not take into account the geographical area of origin nor the affiliation to academia or business of authors ;

-There is a lack of standardization and lack of correlation between the work of multiple authors;

-English translation of the term supply is deficit, in this context supply means offer and not procurement. Supply is the offer created by members of SC.

-There is an almost general mistake of charging a SC, insisting on the logistics side of it. Except the term of section 9 (offer chain), we can see that things took a nasty turn. On the one hand that supply is translated as procurement, and on the other hand the limitation of perceiving SC as a logistics chain or logistic relationship (procurement, delivery, distribution, supply, sale) is an aspect that affects negatively the research, reducing the activities at SC level ;

In an attempt to clarify the situation, we looked to see what happened in other Latin languages borrowing the two terms:

-In Italian the term has remained untranslated, AILOG (Association in Italy) has the original name: Associazione Italiana di Logistica e di Supply Chain Management;

-In French the term was adopted by a regulatory body language (general delegation of French and other languages of France - DGLFLF): SC is used as "Chaîne logistique", and SCM is used as „la gestion de la chaîne logistique”. However, what we noticed is the parallel use of another term for SCM: „management et économie des réseaux”;

-The Spanish language uses two names: „Cadena de Suministro” (procurement) and “Cadena de Abasto” (distribution);

-The Portuguese used the term “Cadeia de fornecimento” (supply chain).

We can notice the similarities between the translation attempts in Romanian and in other Latin languages. It is also apparent that there is a larger unit for the treatment of these terms, in our research we discovered no more than three terms in each language corresponding to the Latin for SC or SCM. We believe that we need a larger unit also in Romania.

3. Conclusions

The proposals that we make below are rather pragmatic and not one hundred percent correct from grammar or literary point of view. It is clear that the Romanians feel the need to translate these terms, that's why we deal with such confusion at both academics and the business environment. Italian option to not translate this term cannot be taken into consideration.

For the term supply chain we must consider what it really means: all the companies participating in production and delivery of a product, in creating supply. This supply chain exists even if there is coordination between firms, and even if this cooperation between companies is not present. It is obvious that all terms used in Romanian reflects the operational side – at the 2000s level in international logistics. How we currently not have a term like supply chain that will not reflect

reality (ie reality demand chain or value chain), any term which will not narrow the academic and business vision only to operational, logistics aspects, is welcome .

Another problem is the use of the term “chain” until now. The chain is rather a linear form of links between different nodes. The term chain is right at the operational level, from where he was taken. Neither the term “rețea” network is appropriate because the network would require direct interconnection of all its members, this aspect being more or less noticeable at SC level because of the sharp division between the raw material suppliers, manufacturers, distributors etc. At the strategic level was used often the term distribution channel. We believe that companies that create together the offer, are making at the same time a downstream channel towards upstream of the materials and products to the customer. But the term channel is not usable because of the connotations related to distribution and logistics.

Proposal 1: We propose keeping the term “lanț”, chain in English, due to the widespread use of this term already. Although does not reflect reality, but rather the structure of the SC as a tree, we believe that the term chain suggests the links between partners.

The long form of the supply chain in Romanian would be “lanțul creării ofertei “, in English the chain of creating the offer, but it has three words and things would become too long.

Proposal 2: To customize the chain and give a similar connotation to SC, we propose to use the association „lanțul ofertei”-“supply chain” to denote in Romanian the term supply chain from management. It reflects all the definitions set, and can be converted into “Managementul Lanțului Ofertei”- supply chain management without diminishing and affecting theoretically any of the relevant points for both concepts, at international level.

Regarding the supply chain activities, as outlined in the study of literature, it is clear that not only logistics “play” in it. Management implementation of supply chains at first is to be made at operational level and the benefits of cooperation between companies are particularly relevant by optimization of logistics activities. But these are the first step towards an efficient SCM. Other processes can be integrated, according to international literature: marketing, quality, sales, innovation, etc..

Definition 1: “Lanțul ofertei”-the supply chain represents all firms participating in the production and delivery of products or services, in other words creating the market-supply.

Definition 2: “Managementul lanțului ofertei”- supply chain management is perceived as all managerial processes at the supply chain level (inter-organizations). It includes several processes: strategic management, marketing, production management, innovation management, research and development, computer network management, logistics management, customer relationship management, sales management etc. These processes can be performed at the supply chain level to a lesser extent or may be implemented in full. These things depend on the coordination of a unified supply chain or a less coordinated existence of it.

We believe that the two terms and general definitions are clear and comply with international requirements, in order to be widely used in Romania. We are willing to consider other solutions scientifically justified.

HOW FUTURE MANAGERS VIEW SOCIETAL CULTURE: A CROSS-COUNTRY COMPARISON

Catana Gheorghe Alexandru
Technical University of Cluj-Napoca

Catana Doina
Technical University of Cluj-Napoca

Our study aims at enriching the existing literature about the prospective managers' view of an ideal societal value system and the existing cultural practices in their society. The findings about the students' perception on cultural practices and their expectations about societal culture are helpful in imagining the societal culture in its dynamics. The research sample consists of 727 students in business and engineering on undergraduate and graduate levels from Romania and Slovenia. The reason we have chosen to compare Romanian sample with the cultural profile of the "average" future manager from Slovenia is the scientific curiosity of finding out if there are signs of cultural convergence of Romania with a previous communist country, and an older member of European Union. In doing so, our study will hopefully broaden the body of knowledge about the cultural convergence (or divergence?) between the former socialist countries joining European Union. The theoretical and methodological foundation is rooted in GLOBE international research project. Our findings revealed that at practices level, Romanians perceive significant higher Power Distance and significant lower mean value for Uncertainty Avoidance. At the expectations level, the Romanians and Slovenians are very similar in the desire concerning their societies orientation toward In group/Family Collectivism, Assertiveness and Performance Orientation, and record significant differences in all the other societal values. The fact that for all the cultural expectations the future managers assign different mean values than for the correspondent practices make us expect that they will act to change their cultural environments. Still, the cultural orientation of Romanian future middle managers will differ in many regards from the Slovenian sample averages.

Keywords: societal culture, cultural practice, cultural value, Romania, Slovenia

JEL classification: M14, M19

1. Introduction

Starting from GLOBE international research project dealing with top and middle managers, GLOBE STUDENT project was initiated (2008)^{*****}, aiming at targeting future managers, to be recruited mostly from today's students in business and engineering. One of its objectives is to determine the profile of future managers from their perceptions on and expectations about societal culture dimensions point of view. *The main research question concerns the similarities and differences between the Romanians with the average future manager in Slovenia.* The reason we have chosen to compare Romanian sample with the cultural profile of the "average" future manager from Slovenia is the scientific curiosity of finding out if there are signs of cultural convergence of Romania with a previous communist country, and an older member of European Union. In doing so, our study will hopefully broaden the body of knowledge about the cultural convergence (or divergence?) between the former socialist

^{*****} The project is co-ordinated by R. Lang from Chemnitz University of Technology. The data for Slovenia has been collected by D. Pucko and T. Cater (University of Ljubljana)

countries joining European Union. Specifically, we will try to answer the following *research questions*:

1. Which are (if any) the significant differences between Romanian students' perceptions of current societal practices and those of students from Slovenia?
2. How do Romanian students' societal values (expectations) differ (if) from those of students from Slovenia?

2. Theoretical background

As known, there is no single generally accepted definition of societal culture (Chhokar et al., 2007:3). Our study shares the definition used by GLOBE international research project: "shared motives, values, beliefs, identities and events that result from common experiences of members of collectives and are transmitted across age generations" (House et al., 2002: 5). The GLOBE project distinguishes between *practices* ("as it is") and *values* ("as it should be"). Values distinguishing a culture from the others are predictors for cultural practices, as well as for leadership features and behaviours in that culture (House et al. 2002). In all societies, the shared values become good predictors of *future practices*.

GLOBE project operationalised culture in nine *dimensions*: 1) Uncertainty Avoidance; 2) Future Orientation; 3) Power Distance; 4) Collectivism I (societal collectivism); 5) Humane Orientation; 6. Performance Orientation; 7) Collectivism II (in-group collectivism); 8) Gender Egalitarianism; 9) Assertiveness (House et al., 2002: 5-6). As the GLOBE researchers acknowledge (House et al., 2002: 6), the first six dimensions are rooted in cultural dimensions defined originally by Hofstede (1980), Future Orientation and Humane Orientation from Kluckhohn & Strodtbeck (1961), Putnam (1993) and McClelland (1985), while Performance Orientation from McClelland (1985). Short definitions of these cultural dimensions are given in GLOBE related book (House et al., 2004:3).

Our research compares the cultural foundations of prospective managers and leaders in Romania and Slovenia. The findings about the students' expectations about societal culture are helpful in imagining the societal culture in its *dynamics*. Accepting that values "high in centrality, pervasive, and supported by powerful sanctions and high consensus and supporters of these values hold positions of high prestige and authority" (Williams 1979: 34) are resistant to change, we also are aware that they change especially when one generation succeeds another (Keating et al., 2002: 637).

3. Methodology

GLOBE student project uses the section 1 (*as it is*) and, respectively, section 3 (*as should be*) GLOBE research *Beta* questionnaires (House et al., 2004) with some modifications required by the subjects' nature (students). Scales in section 1 ask the students to value "the way our society is" (practices), while scales in section 3 ask the students opinion about "the way our society should be" (values) using a seven points Likert scale. The surveys were carried out in either 2008 or the first half of 2009. The respondents are enrolled at the Technical University of Cluj-Napoca, Babes-Bolyai University (Cluj-Napoca) and Petru Maior University in Targu-Mures (Romania) and at University of Ljubljana (Slovenia). Table 1 shows the joint sample structure of our respondents, which gave us usable data.

Table 1: Sample structure

Country of origin	What subject area/ study path do you study?		Total
	Business/ Economics	Engineering	
Romania	166	261	427
Slovenia	150	150	300
TOTAL (valid answers)	316	411	727

Collected empirical data has been processed with SPSS 17. Descriptive statistical analysis was carried out separately for Romanian and Slovenian sample. In comparing Romanian sample with the Slovenian one, the *independent samples t-test* was used, with 0.05 significance threshold.

4. Findings

The research findings concern: 1) differences between Romanian and Slovenian students' perceptions of current cultural *practices*; 2) differences between Romanian and Slovenian students' *expectations* concerning societal values.

4.1. Differences in perceptions: Romanian vs. Slovenian students

Table 2 displays the significant differences between Romanian and Slovenian sample with respect of perceptions of societal culture *practices*, while the differences between the mean values of perceptions on cultural practices in Romania and Slovenia are displayed in Figure 1

Table 2. Significant differences in cultural practices: Romania vs. Slovenia

Cultural practice ("society as it is")	Romania	Slovenia	Absolut differences	t-test (sig 2-tailed)
<i>Uncertainty Avoidance</i>	3.49	4.19	- 0.70	- 11.617 (0.000)
<i>Future Orientation</i>	3.44	3.79	- 0.35	- 4.659** (0.000)
<i>Power Distance</i>	5.81	5.03	0.78	12.306** (0.000)
<i>Collectivism I (Institutional)</i>	3.78	4.04	- 0.26	- 3.920 (0.000)
<i>Humane Orientation</i>	3.83	3.97	- 0.14	- 2.204 (0.028)
<i>Performance Orientation</i>	3.66	4.05	- 0.39	- 5.089 (0.000)
<i>Collectivism II (in group)</i>	5.13	5.22		(0.175)
<i>Gender Egalitarianism</i>	3.99	4.13	- 0.14	- 2.427** (0.016)
<i>Assertiveness</i>	3.51	4.24	- 0.73	- 10.587** (0.000)

95% confidence; *two independent samples; ** equal variances not assumed

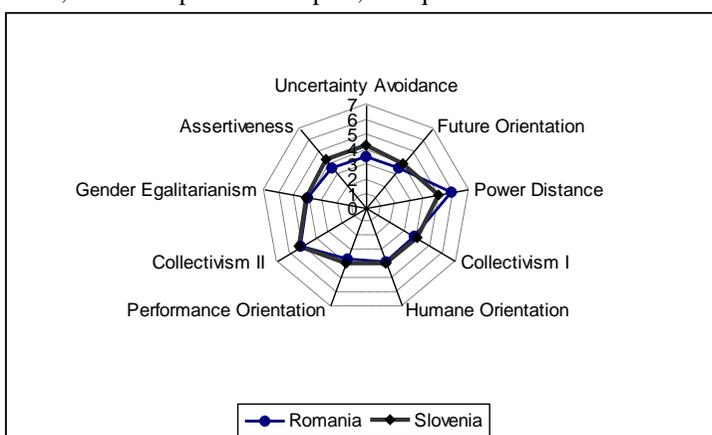

Figure 1. Differences in perception of cultural practices: Romania vs. Slovenia (mean scores)

T-test of differences between the mean scores (*two independent samples*) shows that the Romanians perceive significant higher Power Distance ($t = 12.306$; $\text{sig} = 0.000$) than the Slovenians (equal variaces not assumed). Significant lower mean values are recorded by Romanians for (decreasing order): Uncertainty Avoidance ($t = - 11.617$; $\text{sig} = 0.000$), Assertiveness ($t = - 10.587$; $\text{sig} = 0.000$), Performance Orientation ($t = - 5.089$; $\text{sig} = 0.000$), Future Orientation ($t = - 4.659$; $\text{sig} = 0.000$), Institutional Collectivism ($t = - 3.920$; $\text{sig} = 0.000$), Gender Egalitarianism ($t = - 2.427$; $\text{sig} = 0.016$) and Humane Orientation ($t = -2.204$; $\text{sig} = 0.028$). The lack of significant differences for Collectivism II (In group/Family) might be interpreted as a *convergence* in practicing tight relationships within membership group in both countries.

4.2. Differences in expectations: Romanian vs. Slovenian students

The data in Table 3 summarized the significant differences between the most appreciated cultural values by the future managers and leaders in the Romanian and Slovenia and the “spider” in Figure 2 reveals the differences between the average score of cultural expectations (values) in Romania and Slovenia.

Table 3. Significant differences in societal values: Romania vs. Slovenia (mean scores)*

Cultural value (“society as it should be”)	Romania	Slovenia	Absolut differences	t-test (sig 2-tailed)
Uncertainty Avoidance	5.10	4.55	0.55	9.427 (0.000)
Future Orientation	5.23	4.74	0.49	6.781 (0.000)
Power Distance	2.65	2.94	-0.29	- 3.737 (0.000)**
Collectivism I (Institutional)	4.94	4.46	0.48	7.069 (0.000)**
Humane Orientation	5.41	5.08	0.33	4.887 (0.000)**
Performance Orientation	5.89	5.78	0.11	(0.068)
Collectivism II (in group)	5.70	5.69	0.01	(0.824)
Gender Egalitarianism	4.42	4.55	-0.13	- 2.384 (0.011)**
Assertiveness	4.01	4.09	-0.08	(0.186)

*two independent samples; ** equal variaces not assumed

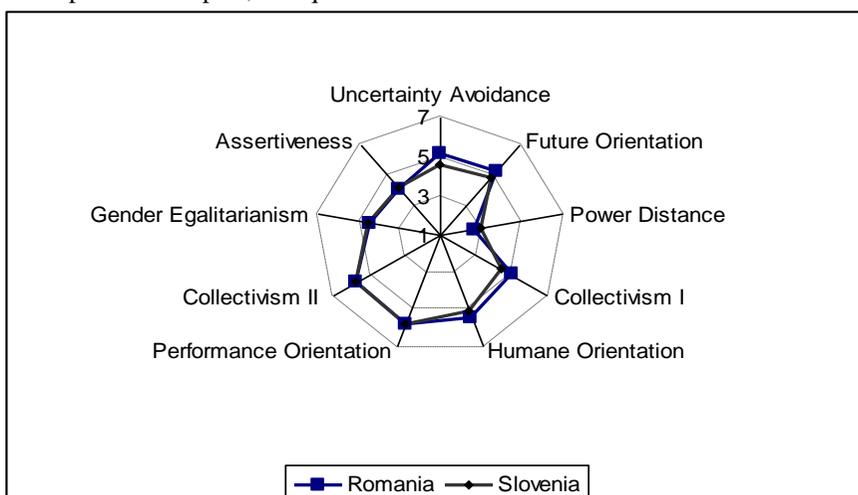

Figure 2. Differences between average scores of cultural expectations: Romania vs. Slovenia

As seen, there is no (or very low) difference between the mean scores ($p < 0.05$) of the compared samples expectations concerning Collectivism II, Assertiveness and Performance Orientation. Romanians expect significant higher Uncertainty Avoidance ($t = 9.427$; $\text{sig} = 0.000$), Collectivism I ($t = 7.069$; $\text{sig} = 0.000$), Future Orientation ($t = 6.781$; $\text{sig} = 0.000$), and Humane Orientation ($t = 4.887$; $\text{sig} = 0.000$) than the Slovenians. The highest statistically significant

difference is related to Uncertainty Avoidance. Significant lower expectations are recorded by Romanians for Power Distance ($t = -3.737$; $\text{sig} = 0.000$) and Gender Egalitarianism ($t = -2.384$; $\text{sig} = 0.011$). Given the mentioned findings can be argued that *some* Romanian cultural values (expectations) are convergent with the Slovenian ones (desire for higher performance concern of society, tighter relationships with the membership groups and stronger Assertiveness in defending/arguing own position). Even though the identified changes in cultural dimensions will occur in the future, we cannot speak about a *complete* harmonization of culture in the two countries under study.

5. Discussions and conclusions

The Romanians perceive actual cultural *practices* in their environment differently from Slovenians, with the highest difference for Uncertainty Avoidance (Romanians perceiving their society not being enough concerned with creating a stable legal, political and economic environment or with long term planning). Hofstede found in his research (Hofstede, 2002: 100) a very high level of Uncertainty Avoidance (mean score 6.16) in the Slovenian environment, while for Romania he estimated an index of 90 (http://www.geert-hofstede.com/hofstede_dimensions.php), suggesting that in the past socialist environment, the managers worked in a culture with a very high Uncertainty Avoidance. The GLOBE study identified a mean score of 3.78 for Uncertainty Avoidance for Slovenian *practice*, and a GLOBE type study performed on 216 Romanian middle managers, got to an average score of 3.92 for this cultural dimension (Catana & Catana, 2011). This shows that the processes of transition to the market economy brought “turbulences” in the “traditional” way of heaving someone taking care of things (through central planning in the case of Romania). The lowest difference is recorded for Humane Orientation (Romanian mean value, higher). Based upon these findings, cannot speak about a convergence in cultural practices perception.

Both samples display higher mean values for all nine cultural dimensions at *expected* level, except Power Distance in both samples and Assertiveness in Slovenian sample. Our findings show the Romanians and Slovenians are *very similar* in their desires concerning their societies orientation towards In group/Family Collectivism Collectivism II), Assertiveness and Performance Orientation. These findings might reveal a certain *harmonisation* of cultures within the compared countries. The highest significant (positive) difference between the samples is recorded for Uncertainty Avoidance, showing the Romanians desire to increase in a higher degree than Slovenians, the level of certainty in their society, including the long term planning. The lowest significant (positive) difference concerns Humane Orientation, revealing that the two samples record the same trend, towards paying more attention to encouraging and rewarding fairness, altruism, friendship, generosity, kindness and promoting altruistic ideals. Significant (negative) differences are recorded in expectations concerning Power Distance and Gender Egalitarianism. These two expectations reveal other “avenues” towards increasing the convergence in cultural values and future cultural practices (if the subjects holding such values/expectations will become managers and transform them in societal practices). Although according to institutional theory, changes in the more culturally embedded elements of management, seem to be more difficult to achieve (Lang/Steger 2002), the fact that for all the cultural *values* the future managers assign different mean values than for the correspondent practices make us expect that they will act to change their cultural environments. Still, the cultural orientation of Romanian future middle managers will differ in many regards from the Slovenian sample averages.

We are aware that our research findings have a few limitations, among which the assumption that business and engineering students will become a core part of the future population of managers. Beyond the limitations, we believe that our findings offer certain insights into relevant issues for

researchers, academics and consultants in management and leadership, as well as for today's practitioners, especially related to culture dynamics in the region. The dissemination of our research findings among active managers, researchers, academic staff and management consultants may contribute to improving the management training of students, as well as the management practices in Europe. Future research should focus on studying cultural practices and value systems in directions like possible differences in respondents' relevant perceptions based on subjects demographic characteristics (age, gender, field of study, major subject etc.). In addition, comparisons could be making with other countries taking part to GLOBE student project.

REGENERABLE ENERGY, A KEY TO INTEGRATING COMPETITIVE POLICIES WITH ADVANCED ENVIRONMENT PROTECTION STRATEGIES

Cinade Lucian Ovidiu

University of the West – Timișoara, Economics and Business Administration Faculty

Development of competitive policies and improvement of environment protection strategies are two basic trends of the development of the European Unique Market. Energy, also known as „industry bread”, is basic product and strategic resource, where energy industry plays an obvious role in the economic and social development of any community. Traditional energy production is marred by three major drawbacks: it generates negative externalities by polluting; it is totally in the hands of the producers; hence, prices rise at their will, of fossil fuels such as oil and gas.

Present study focuses on electric energy industry, yet bearing over the whole length of the chain producer-to-end-consumer, thus revealed as particularly complex. The question is do alternative energy sources meet the prerequisite of market being competitive meanwhile environment protection being highly observed. We identify limits in point, of the energy market; effects of market liberalization; entry barriers; interchangeability level of energy sources; active forces on the energy market.

Competitive rivalry has been expressed as per market micro-economic analysis, based on Michael Porter's 5-forces model.

It will thus be noticed that, morphologically, competition evolution depends firstly on the market type. For the time being, the consumer on the energy market stays captive, for various reasons such as: legislation; limits of energy transfer infrastructure; scarcity of resources; resources availability imbalance; no integrative strategy available, of renewable energy resources usage. Energy availability is vital for human society to function.

Comparative advantages of renewable energy resources are twofold, as manifested: in terms of economics, i.e. improving competition by substitute products entered at the same time as new producers enter market; and in terms of ecology, by reducing CO₂ emissions. As to energy production technology and transfer, the complementary nature will be noticed, of renewable energy resources, such nature manifesting itself as a 6th force, „the force of complementary products” apt to stimulate low competition on the energy market.

Key words: competition, environment protection, renewable energy, strategy

JEL M11-Q42

1.General

The action of competition operates primarily when the prices are free, which can make any buyer to freely search and pick the seller with the lowest prices, encouraging also the producer in his action of searching for new clients. In the energetic market, its limits are clearly visible. Taking into account that the action of the competition on the market is an expression of the market development degree, the economic liberalization degree, this theme represents some constant interest. Competition challenge and environmental protection is able to stimulate the creativity of the economical agent in his action in effective exercise of economic activity.

In Romania, as well as in other countries, markets have undergone drastic changes, of services industries based on infrastructure nets, such as electricity, water, gas, railway and telecommunication. Such changes are manifested as privatization; subsidiarizing; and retechnologization. Besides these three, common to various industries, dereglementation works now on the energy markets, i.e. markets traditionally serviced by public enterprises, become open to competition.

Owing to the scarcity of market agents and to the rising efficiency figures of developing electricity networks, energy transfer and distribution comes close to the natural monopoly model by the book.

Energy peculiarity is its non-stocking nature, balancing being needed at each production/consumption moment, in its basic meaning market mechanism not manifesting itself

prone to self-balancing: the large production-transfer integrated enterprises have taken over such balancing function, i.e. technically managing energy flux in real time.

Dereglementation severed such function from the competitive activities dependent of the market power such enterprises could own.

Juridical type and attributes of the flux administrators vary from country to country. In practice, two energy types can be defined, function of how production relates to environment and type of resource used: conventional energy, based on fossil fuel consumption; and renewable energy: solar, aeolian, a.s.o.

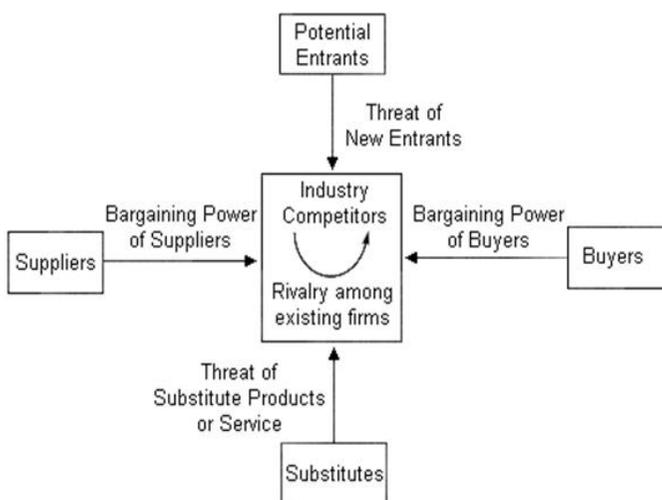

2.Prior Research and Approaches

Our topic is finding the key to social and economic development based on balanced natural capitals; as such, the topic falls under *sustainable development* header. Such concept, as approaching man-environment relation, implies integration of 3 factors: economy; society; and ecology. At its debut, the concept seemed a key to the ecology crisis generated by industrial exhaustion of resources. Later on, it expanded to cover aspects such as: justice,equity; life quality, social and economic life factors.

Practically, to economy basic principle – i.e. minimal effort deployed – one more, complementary, is added, i.e. meeting ecology natural requirements, asking man to prove his creativity and adaptability to such prerequisites.

Strategy means vision, vision is generated by past and also present state diagnosis, such states causing both strategy and vision. Scarcity of resources, competition, market limits, natural unbalance, all asked for ways out, not only from strategy or engineering researchers but also from famous SF writers, such as Frank Herbert in *Dune*, the first major SF ecology novel before the oil crisis of the'70s.

Michael Porter develops his 5 forces model (Fig.1.), meaning to cover actual market competition aspects.Three of Porter's five forces refer to competition from external sources. The remainders are internal threats. Porter referred to these forces as the micro environment. They consist of those forces close to a company that affect its ability to serve its customers and make a profit. A change in any of the forces normally, requires a business unit to re-assess the marketplace given the overall change in industry information.

(Fig.1) The Five Forces model of M.Porter, Source M.Porter, Strategie concurențială:București:Teora, 2001

The overall industry attractiveness does not imply that every firm in the industry will return the same profitability. Firms are able to apply their core competencies, business model or network to achieve a profit above the industry average

Writings focused on economic and strategic valence of renewable energy depended on prior research and development of technology.

A network industry is an activity organized around an infrastructure that assumes quite high fix costs related to variable costs.

Analyzing the competition on the energetic market and its specificity is important the concept of transactional costs introduced for the first time by Ronald Coase in his 1937 paper entitled "The Nature of the Firm. Afterwards Williamson in the neoinstitutionalist current shows that firms have interest when to internalize certain activities when to externalize them.

Alexandrina Duță, in her Advanced Macro-economics, approaches market limits as related to public goods and externalities: „As a rule, public goods are not totally subjected to specific market transactions. As such, market field is limited, while access to public goods is, at least in theory, limited. Game theory explains the rationale of market limits determining the specific market logic”. (1)

The network activities are generally assigned to some public services, however, unlike the pure public services their consumption is divisible. It can be observed a certain weakness of the market so that it can allow access to everyone at the network, is necessary the intervention of the national public or regional power. The existence of public service missions requires the presence of a regulator. This regulator watches over the respect of rights and liabilities of the concessionaire and makes sure that has an equal treatment towards certain users.

„The regulator's role is triple:

- 1.to protect the investor against a destructive competition, this is done through the adjustment of some exclusive rights to the concessionaire of the public service.
- 2.Protection of the user against the abuse of dominant position of the concessionaire(whatever monopol having a "natural" tendency of abusing the dominant position).
- 3.The saving of the collective interest, which requires taking under consideration of preoccupations regarding the national independence, the territory improvement, redistribution of income.”(10)

3. Research Methodology

The topic needs both static approach and dynamic analysis of competition. Present study stage covers the former of the two, implying an analytical approach of, firstly, the basics of *industry* and of *market structure*; and, secondly, of competition pressure, evidenced by Michael Porter's 5 forces model; power of each such 5 forces and interaction thereof if working together by morph the specific economic activity field as to competition intensity, which, ultimately, determines the field efficiency. The typical market of economic activity is the imperfect competition market.

The market's structure study implies the analysis of the following elements: degree of atomicity, of transparency, of product homogeneity, of freedom to freely enter and exit the market and also of the production factors mobility.

Through a qualitative approach of competitive intensity it shows that products substitutability is manifested as the consumer finds the opportunity of a similar usage. “Highly subjective by nature, the establishment of a characteristics list of the products and their performances helps thou to clarify if the products are substitutable or not, in particular examining if those performance characteristics are equivalent or comparable.”(7)

4. Research results

In the energy production field, although traditional energy and solar energy are generated by widely differing technology (i.e. based on fossil fuels the former, on photovoltaic effect the latter), the two are substitutable by filling the same need, i.e. consumption of energy.

Given that technological processes are run in various business fields, substitutable products industry is a type of competition more and more often encountered. The trend becomes more and more tempting of enterprises turning to such type expanding and diversifying. (6).

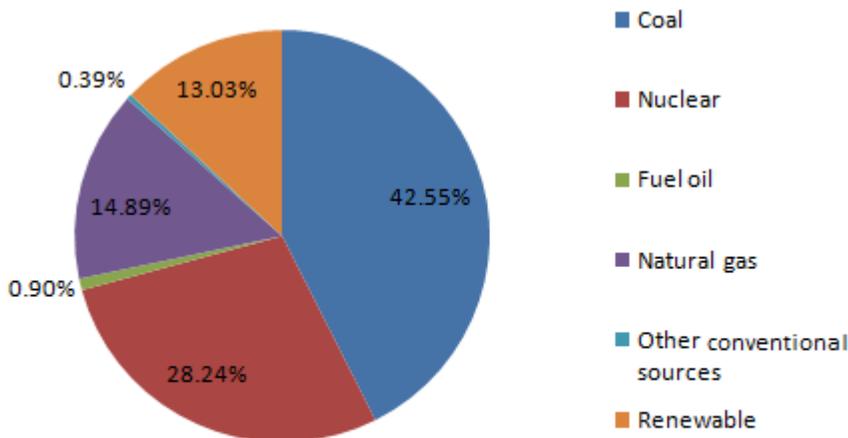

The future of, say, photovoltaic energy, depends on the innovating capacity of enterprises coming from silicon industry, i.e. different from fossil fuels. As, yet, expensive, scale economies can be a key-factor for the success of such enterprises.

The entry barriers in the energy sector are first of technical nature, this being the main factor in influencing the competitive game. Virtually choosing a substitute product in the energetic market is conditioned by the network's capacity to take care of the energy in its various points.

Apparently industries upstream of the energy industry get to have a higher negotiation power, due to the unbalance of ratio demand/supply. This relationship between demand schedules leads economists to classify goods as either substitutes or complements.

Practically three types of interlocking are manifest in Europe: physical, economic, and political.

"The numbers speak for themselves: almost 50% of the energy consumed in Europe is imported, and it is estimated that 20-30 years from now, Europe will be 90% depended regarding the oil, 70% regarding natural gas, and 100% regarding coal"(9). The physical dependence determines an economic dependence due to the dynamic of the traditionally resources prices which can create tensions and affect the world economy. The purchasing security develops a new dimension of the dependency, the political one generated by the resources asymmetric growth. The main electric energy supplier from Romania supplies in a low amount renewable energy (Graphic1), and this is mostly (99%) a hydro-energy.

Graphic1: Electric energy supplies by SC ENEL ENERGIE SA

Source: ENEL ENERGIE SA

The opportunity of a similar usage of a renewable energy with traditional energy conditions the substitutability degree. In fact the usage of renewable energy must be approached in two plans: a spatial plan founded on natural fluxes which are not present abundantly on the whole planet (the solar potential differs from one region to another), and a temporal plan which emphasizes the intermittent character of production and consumption of renewable energy. For example in the

case of solar energy the intermittence is generated by the lack of light during the night, Practically the two energies do not substitute one another completely but they coexist and their intercalary way of usage generate a complementarily degree of their own. In my opinion in the electric energy market manifests a sixth force "the force of complementary products".

5. Conclusions

Stimulation of the renewable energy industry develops like an integrative factor of competition policies with the environment protection strategies. Macroeconomic arguments pro are robust: on the one hand, the beneficial effect is manifest, of the energy resources' renewable nature; and on the other, as determined by competitiveness increasing through more and more inter/intra-industries competitiveness due to energy production being substitutable, therefore causing more and more economic agents to enter the energy market.

Beneficial effects manifest at both energy market and environment levels are multiple, a lavish research topic for both technology experts and for economists, who target common goals, such as: freeing captive consumers; increasing competition on the energy market; cutting on negative externalities of production by lowered CO₂ emission.

Substitutable producer goods would include: petroleum and natural gas (used for heating or electricity). A substitute good, in contrast to a complementary good, is a good with a positive cross elasticity of demand. The degree to which a good has a perfect substitute depends on how specifically the good is defined. The fact that one good is substitutable for another has immediate economic consequences: insofar as one good can be substituted for another, the demand for the two kinds of good will be bound together by the fact that customers can trade off one good for the other if it becomes advantageous to do so.

In particular the advantages of solar electric energy are multiple:

- The resource is available everywhere even if it is less in North than South
- The energy is renewable and clean: 1 m² of pickup avoids the annual emission of approximately 100 kg of CO₂
- The local production is decentralized: it is produced in the proximity of the consumption place, thus, avoiding network losses
- Absence of noise
- Not one part is in motion and the collectors resist at unfavorable climate conditions.

The renewable energy development may determine local economic development because in most of the cases renewable energy is based on proximity resources, a feature that justifies the use of the expression "decentralized energy. Use of the proximity resources involved in stripping some areas without access to electricity grid: for example islands in the Danube Delta, inaccessible mountain areas, outermost regions, etc.

Using renewable energy systems to store energy accumulated, can be an alternative to connecting the national network which makes the strategic point of view to consider substitute services). Basically, in this case the beneficiary has a dual role of energy within a closed network: a role of producer and consumer.

The high cost of connecting to a conventional network when the customer is away from mains power makes an investment in a single autonomous system to be viable in financial terms. It is found that renewable resources cannot substitute in any moment the traditional energy practically to serve constantly, the two sources must coexist. The introduction of the new renewable energies sources can be translated through the appearance of a sixth force which is exercised in the energetic market that emphasizes the complementary character of products and services.

CURRENT ECONOMIC AND MEDICAL REFORMS IN THE ROMANIAN HEALTH CARE SYSTEM (1)

Drăgoi Mihaela Cristina

Bucharest Academy of Economic Studies, Faculty of International Business and Economics

The “issue” of health has always been, both in social reality and in academia and research, a sensitive topic considering the relationship each individual has with his own health and the health care system as a public policy. At public opinion levels and not only, health care is the most important sector demanding the outmost attention, considering that individual health is the fundamental prerequisite for well-being, happiness and a satisfying life. The ever present research and practical question is on the optimal financing of the health care system. Any answer to this question is also a political decision, reflecting the social-economic value of health for a particular country. The size of the resource pool and the criteria and methods for resource allocation are the central economic problems for any health system. This paper takes into consideration the limited resources of the national health care system (the rationalization of health services), the common methods of health financing, the specificity of health services market (the health market being highly asymmetric, with health professionals knowing most if not all of the relevant information, such as diagnosis, treatment options and costs and consumers fully dependent on the information provided in each case) and the performance of all hospitals in Romania, in order to assess the latest strategic decisions (introduction of co-payment and merging and reconversion of hospitals) taken within the Romanian health care system and their social and economic implications. The main finding show that, even though the intention of reforming and transforming the Romanian health care system into a more efficient one is obvious, the lack of economic and demographic analysis may results into greater discrepancies nationwide. This paper is aimed to renew the necessity of joint collaboration between the economic and medical field, since the relationship between health and economic development runs both ways. (This paper was co-financed by the European Social Fund through the Operational Programme of Human Resources Development 2007-2013, POSDRU/1.5/S/59184 „Performance and excellence in the economic science postdoctoral research in Romania” coordinated by the Bucharest Academy of Economic Studies; my postdoctoral research period lasts from Nov. 2010 to Mar. 2013)

Key words: health care system, rationalization, decentralization, co-payment, hospital mergers

JEL Classification: H 51, H 75, I 18

I. Introduction

The end of 1989 found Romania in a deep economic, social and obviously, sanitary crisis. The health of the population was quite poor, partly due to the lack of finance for the health services, of positive factors to motivate the staff and internal inefficiency of the system. **The political changes since December 1989** generated a replacement of the old structure – part of a totalitarian system – and in the health field the principles and organization of a socialist health system, such as Semaško. Physicians fought to introduce a new Bismarck model (**health insurance system**) and to develop the private sector or private practice in public services. Under the context of changes since December 1989, in terms of reforms, the health care system has set up the following goals: reconstitution of the legislative and organizational framework; introduction of the health insurance system; payment of services on the basis of the medical act efficiency and quality; facility of a better access to health services; improvement of medical

service quality; replacement of traditional medical service with ambulatory care, in terms of health care services; decentralization of the health system by increasing the role of the local authorities, financing institutions, communities. Frequent changes of government and ministers, the lack of clear strategy and defined objectives to be pursued rigorously and independently of political changes slowed down the health reform process after 1990; only after 1997, Romania adopted a social insurance health system. But the main strategic decision was the start of a process of management training for new executives appointed after the revolution, which had to manage crisis and lead change. The main difficulties in the early years of reform, not completely cleared until today, were the exact definition of the future roadmap, identifying priority issues specific to the whole system, as well as to each phase and area, inability of absorption of medical aid and financial management, serious shortcomings in communication science, negotiation and stimulation of all "actors" participation in the process of change.

II. Rationalization of the medical services

The analysis of countries with representative health care systems shows that there is a determined relation between the objectives of health systems, their structure and health policies. (Drăgoi 2010: 128). Basically, health policies that lead to a certain structure of the health system are affected and respond to the objectives that policy makers intend to achieve in terms of public health care. It is impossible to set up a sanitary policy and a health system that should ensure universal access for a large number of people, to high quality services and that should decrease costs at both macro-systemic and micro-systemic level. This can be translated through the impossibility of universality and equity regarding the access to welfare services and low costs. As a consequence to the mechanisms used when establishing the policies of allocating resources in the health system, one should highlight the fact that in all countries where the payment for the medical services is not made directly, **the phenomenon of medical services rationalization** appears (Klein 1993: 308). The configuration of a medical service package was regarded as an option of facing up the discrepancy between the available public resources and the related requirements.

In the national systems such as the one of Great Britain, the rationalization process was achieved by streamlining the implicit and less explicit mechanisms; doctors used to send to specialist services only certain patients, and in terms of specialized, ambulatory or hospital care, the issue itself was a matter of waiting lists. Following the reforms taking place in Britain, these decisions tend to be explicit, through negotiated contracts between health care providers and payers, establishing more clearly the number of patients that can be treated, the quality and the volume of services involved. The rationalization phenomenon is also present in health systems that are based on public or private health insurances. In such cases, rationalization has often been explicitly approached, detailed contracts between the insurance house and health care providers, which specify what services are covered by the insurance policy, including criteria under which those services to be rendered (quality, waiting time, additional costs etc.). When the right to medical services is not explicitly stated and the system is theoretically comprehensive, it is the buyers who decide (e.g. insurance funds) thus undermining equity of access. In situations where there is a defined package of health services, buyers are free to provide more benefits (services). This is quite rare in Central and Eastern European countries.

III. Decentralization of the health care systems

Decentralization of health services, considered a key concept in reforming health systems in many countries, including Romania, conceived and applied with responsibility, can be an effective means of stimulating local and individual initiative to facilitate a better resource allocation according to the health needs, leading through the community involvement, to a more

efficient decision-making process and a reduced inequity in health care. Decentralization should not be viewed as a saving solution to structural problems of a system as, at the same time, it should not be omitted its disadvantages (fragmentation and duplication of services, increased costs). Traditional forms of decentralization in health services were defined by analysis of the role of public administration, focusing on how a national political structure relates to the distribution of authority and responsibility for health services at the local level. The initial elements of decentralization were introduced in the early years of the new regime. Local Administration Act in 1992 sets a new decentralized government structure defining the organizational context in which the public health care system should operate.

According to the experts' opinion (Vlădescu 2004: 64), decentralization may envisage four major forms:

- **deconcentration** – refers to a partial transfer of central administration authority towards the local segment;
- **devolution** – involves the creation or strengthening of the autonomous sub-national administrative level, which should have greater independence from the national one, the authorities concerned being elected locally rather than appointed by the centre;
- **delegation** or **functional decentralization** – relies on the transfer of management responsibilities that belong to a number of well-defined positions, a specific organization, outside the central administrative structure, which is indirectly controlled by the late one;
- **privatization** – use a price system as a set of "signals" that consumers and producers can use to make decisions.

The study on the decentralization of health facilities and services as well as introduction of some elements of market economy has been experienced in Romania with World Bank support in four and then eight pilot counties. Strategies and objectives at the county level have been identified for the pilot, with emphasis on primary health services, performance and motivation of human resources, improving hospital management and integration, community involvement and strengthening the role of county health departments. Until the introduction of social health insurance system, decentralization of health care organization was limited by rigid hierarchical reporting system. So far, decentralization has manifested itself just as deconcentration. After entering the law on health insurance, delegation and privatization began to play an important role in the decentralization process. Thus, the National Health Insurance has taken over responsibility for revenue collection, allocation of resources considering the geographical areas, levels of care assistance and health care institutions. Under the new legislation, part of the Ministry of Health responsibilities has been delegated to the College of Physicians and Pharmacists respectively. These include rules on work, planning the number of medical staff (together with the Ministry of Health) and physician' representation towards the third party payer.

Given that the health care system in our country (but the phenomenon is present in many other countries) is not efficient enough in terms of both health care accessibility and quality of services, people look for alternative sources on the private market, privatization and competition occurring in response to these pressures. The so often invoked privatization, which some authors (Collins 1996 in Vlădescu 2004: 62) even contested as specific form of decentralization of health services, should not be regarded as an objective itself but rather as a means of achieving pre-set objectives. This has important implications in defining ways of introducing private health care practice, since the achievement of different types of objectives can lead to acceptance of certain modes of privatization at the expense of others. For example, co-payments may be brought to increase access to certain services, which are applied in excess, or to reduce the demand for them. Also, privatization may increase or reduce funding priority for the health sector. Essentially, privatization can be a means to a default goal, when you want to achieve a coherent strategy, and as a general rule, privatization that does not provide competition may be more harmful than no

privatization at all. And this is one reason why more and more countries choose the public/private mix against the total privatization.

IV. Current decisions in the Romanian medical system

IV.1. Co-payment

The allocation of financial resources requires a comprehensive and thorough planning process to balance the costs of various sectors of the health field and the adequate level of equity between regions and social groups. In this respect, the World Health Organization (<http://www.who.int>), focusing on efficient use of resources as vital element of health development, recommended preferential allocation of resources to primary and intermediate care services, particularly for health services coverage of social disadvantaged groups.

The financing methods of medical- sanitary assistance refer mainly to (Ashworth et al. 2005: 259-262): ***general fees*** – collected at the state budget and then distributed to the sanitary sector, in accordance with the approved budget; ***compulsory insurance*** – cover the entire population, regardless of the health status of those who pay; ***voluntary insurance (optional)*** – related to health or the insured person's illness risk; ***direct “out of pocket” payment*** – rarely in the western countries, usually as part of co-payment.

Co-payment was used in the *national health service model*, introduced in Great Britain by William Beveridge, who through the *Report of Social Insurance and Related Services* (1942) opened an opportunity of a wealthy state with an efficient national health service, and set medical assistance as one of the national political priorities (<http://www.nhs.uk>). The system has the general taxation as a funding source, which is controlled by public authority, as well as a budget; there is also the private sector. In this model, there is free access for all citizens, the coverage is general and administration is supplied by state authorities. Physicians are either employees or paid for the number of patients enrolled on their lists (capitation method), co-payment of a portion of the cost of some service being practiced to some extent (Dobson 1999: 19). Therefore, co-payment involves patient's contribution to the costs of health care assistance, which is co-participation. The argument is that using this method stimulates consumers not to use unnecessary medical services. Its opponents consider this method to affect disproportionately poor people and discourage preventive care.

From the perspective of classical economic theory, the individual is regarded as the best expert of its needs and, therefore, decides what to buy (consumer sovereignty). In healthcare, this means that the patient looks for health services based on price and quality, as anybody does when buying any other product. However, the medical services market does not work the same way as other markets, displaying certain specificity. As it is well known, only if the market functions properly, it becomes efficient and its customers have sufficient information to choose correctly, too. Market transactions are problematic because of **information asymmetry** between providers, consumers and health care financers. Information asymmetry is high: most doctors are informed (by the nature of their profession), which can thus induce the behavior of consumers (patients). The consumers of medical services find very difficult to be properly informed, mainly because of the high cost of information. Most often, they are unable to determine whether their symptoms are severe or do not know the type and form of therapy required, and generally, there is little information about the effectiveness of all existing treatments. Consequently, if the doctors and hospitals operate in a free market by seeking to maximize profits, is unlikely to lower price of health services due to competition. In a situation of tacit cooperation between physicians and hospitals, due to the setting of standard prices and the protection of their income, one can hardly speak of a fair competition. Even if the doctors would compete freely, it is unlikely that patients should be informed so as they may choose the best medical service quality and the lowest price. The question is whether or not all health services could be allocated through market mechanisms

just like any other goods or services. But there are a number of fundamental constraints (uncertainty about the anticipated medical needs, lack of complete information and patient ignorance, unfettered access to medical services determined by income, oligopolistic situation.), which, making it impossible to allocate all resources through free-market health, helps to shape context frame that makes health care market be typical example of **market failure**. The constraints that make a free market mechanism fail in the allocation of health resources do not stand for an argument that government intervention and free medical services offer would be the best alternative. Most often, the free market failure takes the form of government intervention which subsidizes the consumption of medical services, regulating the behavior of producers of medical services (doctors, hospitals) or imposes taxes on consumption, such as co-payment.

IV.2. Merged Hospitals

Ministry of Health has recently made public **the list of merged hospitals**, a process that is part of **the reorganization of the hospital system**. In accordance with the project implemented by the **Ministry of Health**, of the 435 **hospitals** with beds that currently exist, 182 units are proposed to remain unincorporated and to **get reorganized** as outer sections. Of 182 **hospitals**, a number of 111 **sanitary units** will be merged (<http://www.ms.ro/>. <http://www.sanatateatv.ro/stiri-medicale/spitale-comasate/>). This decision of the Ministry is based on arguments such as:

- profile change of certain hospital will lead to a more stable sanitary system;
- hospitals that are not able to meet certain conditions, finally will not benefit from the contract with the National Health Insurance House (prof. dr. V. Astărăstoae, <http://www.ziaruldeiasi.ro/local/comasarea-spitalelor-pro-si-contra-ni724q>), thus being excluded the reimbursement of the medical services belonging to some unprofitable units;
- merging process will cut health care system bureaucracy, considering that patients will be treated for different diseases within the same hospital;
- reduction of management positions – the hospitals that are merged are to have only one manager and a single administrative body.

But there are several arguments against that deserve to be taken into account. On one hand, opponents of mergers argue that the Health Ministry should not condition hospitals' classification and funding from this point of view. Starting from certain hospitals inefficiency argument put forward by policymakers in health care, based on National Center for Statistics and Public Health, I analyzed the performance of hospitals in Romania through the following parameters: average number of hospital beds, the average use rate, the rate of their optimum utilization and the resultant of the two or the demand or the surplus of beds in each of the 435 hospitals. Centralized data shows the following:

- within each county, (including Bucharest) there are both units recording a surplus of hospital beds (in relation to optimal utilization rate) and hospitals with beds deficit;
- nationally, totaling the excess of beds needed, the figures show that there is a surplus of hospital beds, according to table no. 1. In the light of these indicators, merger or readjustment of certain hospitals is justified, but a closer analysis shows that hospitals list for such restructuring do not fully comply with any economic considerations (merging a hospital with a surplus of beds with one with a deficit), not even the medical terms or merging hospitals to cover other necessities) and, not least, the context regarding patients or medical staff (which regards hospitals located in different places at considerable distance between them – for example, to get an approval from the manager of the hospital, the employee of the medical sector could be forced to go to another town).

Table no. 1 – Demand/surplus of beds in Romanian hospitals (the average of 2007-2009)

County	Demand/surplus of beds	County	Demand/surplus of beds	County	Demand/surplus of beds
Alba	59	Covasna	-208	Neamț	-24
Arad	-41	Dâmbovița	-216	Olt	-53
Argeș	-48	Dolj	-105	Prahova	-51
Bacău	-104	Galați	-164	Satu Mare	-178
Bihor	30	Giurgiu	-82	Sălaj	-224
Bistrița Năsăud	-281	Gorj	-10	Sibiu	-161
Botoșani	-68	Harghita	-346	Suceava	-359
Brașov	-111	Hunedoara	-279	Teleorman	-178
Brăila	-61	Ialomița	-55	Timiș	-445
Buzău	41	Iași	-46	Tulcea	-238
Caras-Severin	-146	Ifov	3	Vaslui	62
Călărași	-119	Maramureș	-235	Vâlcea	166
Cluj	-145	Mehedinți	-147	Vrancea	-99
Constanța	-173	Mureș	-277	București	514
Total			- 4602		

Note: sign „-” stands for a surplus of bed; sign „+” stands for a demand of beds

Source: achieved by author on the basis of data offered by the National Center of Statistics and Information in Public Health

V. Conclusions

If the picture of the past health care system has had rather a documentary value, the current and future image cannot be indifferent to us, especially since the transition has prolonged excessively, overlapping global crisis. The reasons for which the health reform, in Romania, has generated, at best, partial results are manifold, but they can be mainly summarized as follows:

- ignorance of tradition and evolution of public health concepts in Romania by physicians in general, and decision makers, in particular, seems to be the most serious deficiency, which adversely affected the cooperation with foreign experts;
- contradictions between the views of public health experts and their acquisition by public policymakers in implementing the reform;
- democratic deficit in health system planning (at the implementation of laws);
- excessive politicization of the health system, from the minister up in all health units;
- a general lack of public health managers in the ministry structure that does not change with each government or minister;
- absence of implementing the primary health care programs;
- inability to prioritize system as a major imperative in terms of transition to a market system with mechanisms different from the previous total and limited resources;
- excessive bureaucratization of business at the expense of medical care itself.

In this context, to accelerate the process of reforming the health system certain priorities should be established with utmost responsibility, that can be achieved with available resources and potential so as the primary health care programs may become reality. It is also necessary to reinvent the College of Physicians and Pharmacists functions to restore public respect for the doctor, not just through professional attire, but also by behavior and attitude (common sense, morality, decency, dignity). Another tool for optimization of the reform process is voluntary health insurance market (private insurance). The advantages of this type of medical insurance are designed to introduce elements of competition between health providers as well as the encouragement of loyalty towards employers. For the first time in Romania, voluntary health insurance creates a legal remedy that allows medical personal income growth in line with quality, value their work and its social importance, creating prerequisites for decreasing the "informal payments". Also, the relationship between health care providers in the budgetary network and insurance companies will induce greater discipline in the public system through indirect control that insurance companies exercise over the expenses incurred by their customers in this system.

As for the Romanian context, I consider that the experiences of certain European countries can be taken as a basis for developing an efficient health system. In addition to the national interest, it appears as a necessity in terms of European integration and “health globalization”.

COMPARATIVE STUDY ON CORPORATE GOVERNANCE

Gavrea Corina

Babeş-Bolyai University, Faculty of Economics and Business Administration

Stegerean Roxana

Babeş-Bolyai University, Faculty of Economics and Business Administration

Corporate governance is a key element of today's economic reality being more and more present in many countries around the world. This paper has two main objectives. The first one is to offer more insight into the concept of corporate governance by a thorough literature review and by presenting and analyzing a framework of corporate governance. The second objective of this paper is to investigate the corporate governance situation in three developing economies (Romania, Bulgaria and Hungary). The World Bank and the European Bank for Reconstruction and Development published a series of reports on corporate governance. The present study uses data from these reports in order to illustrate how these developing economies are dealing with corporate governance. Based on ROSC Reports a corporate governance score was calculated. As this score shows, there is room for improvement for all three developing economies. This study is important because it shows the differences in corporate governance among developing economies and the need to study these nations at the individual country level. Corporate governance has many benefits for developing economies. It helps developing economies to register sustainable growth rates, to increase investors' confidence in the national economy, and to increase the ability of capital markets to mobilize savings.

Keywords: corporate governance, shareholders, stakeholders, investors, corporate governance principles.

JEL Classification: G30, M10

I. Introduction

Corporate governance has become an important topic in practice and academic literature in recent years. To ensure a competitive position, to attract capital, to ensure sustainability, and to combat corruption, companies from developing countries need to put in place good governance institutions.

According to Monks and Minow (2004) the importance of corporate governance has increased dramatically in 2002 when a series of events led to the bankruptcies of large U.S. companies and the loss of thousands of jobs. The way companies are governed determines their fate as well as that of the economy in general. Failure to attract adequate levels of capital threatens the existence of firms which can have serious consequences for the entire economy. Firms that are unable to attract capital may remain outside of international markets entirely, while economies may not benefit from globalization. The investors are interested in those companies with good corporate governance because, according to OECD (1999), Corporate governance specifies the distribution of rights and responsibilities among different participants in the company, such as managers, shareholders and other interested parties, specifying the rules and procedures for making decisions on company's affairs. In this way, it also provides the structure through which company's objectives are set, the means of attaining those objectives and monitoring performance. Thus deficiencies in corporate governance can have as a consequence not only scandals and corporate liquidations but also financial crises and economic instability.

The Center for International Private Enterprise (2002) listed some of the main advantages of a strong corporate governance. These include:

- improved access to capital and financial markets;
- higher accountability and transparency;
- stimulation of performance;
- protection of shareholders and their investment;
- reduces the incidence of corruption;
- enhancement of marketability of goods and services

The list illustrated above gives a general image of the most important benefits of a good corporate governance. For developing countries, the problem of good corporate governance development becomes more complicated because of the underdeveloped institutional infrastructure. For this reason there is a need for a careful approach to governance restructuring.

A weak or absent corporate governance can have the following consequences:

- reduces the opportunities to attract sufficient capital, limits competitiveness and job creation;
- has a negative impact on employees' commitment;
- may lead to bankruptcy due to a lack of solid company strategy and leadership from the board of directors;
- allows company managers and directors to follow their own interests at the expense of shareholders, creditors, and other stakeholders;
- excessive regulation that impacts private sector growth (CIPE, 2002).

II. Review of the literature

The literature on corporate governance is extremely broad. Only in recent years hundreds of articles and dozens of books have been oriented toward corporate governance.

The concept of corporate governance began to take shape more clearly after 1997, in the European Union, when most countries have adopted codes of corporate governance. The impulse of adopting these codes has been the financial scandals related to the failure of British companies quoted on the stock market. On the other hand, the Asian economic crisis of 1978 and the withdrawal of investors from Asia and Russia had created problems for the international business community regarding the consequences of the investors lack of trust in corporate management.

Corporate governance principles developed by the OECD (Organization for Economic Cooperation and Development) provide specific indications, meant to improve the legal regulations. They formulate practical proposals to the attention of stock market authorities, investors and other pillars that have intervened in the governance of the company. Adapting corporate governance principles for the purposes of ensuring transparency, accountability and fair treatment of shareholders has resulted in the development of the OECD Principles of Corporate Governance. The principles underlying corporate governance should ensure the strategic direction of the company.

The concept of corporate governance encountered many definitions. Depending on their perspective, different authors define this concept in different ways. Thus corporate governance definitions can be grouped in two categories: narrow and broad definitions. These two categories are illustrated below.

In a narrow sense, corporate governance can be defined as the relationship among various participants in determining the direction and performance of corporations. The primary participants are (1) the shareholders, (2) the management, and (3) the board of directors (Monks and Minow, 2004).

A broader definition was given by Cadbury Committee, 1992. Thus corporate governance was defined as the system by which companies are directed and controlled.

An even broader definition belongs to Zingales (1998). According to this author, corporate governance is the complex set of constraints that shape the ex post bargaining over the quasi rents generated by the firm.

Many researchers consider that the corporate governance mechanisms fall into one of the two groups: those internal and those external to the firm. This aspect is illustrated in figure 1 which depicts the separation of ownership and control.

On the left side, figure one illustrates the internal governance and on the right hand side the external governance. The Board of Directors is charged with advertising and monitoring management and has the responsibility to hire, fire and compensate senior management team (Jensen, 1993).

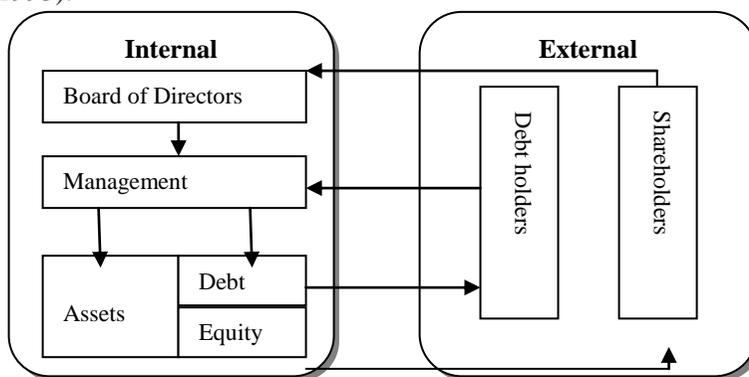

Figure 1. Separation of ownership and control – balance sheet model.

Source: Adapted from Gillan, S. (2006): 382.

In conclusion we can say that there is no exact definition of corporate governance, not even in developed countries. All are based on the theory of interest holders. Interpretations of corporate governance refer to a set of relationships, distribution rights, set of rules, sector of the economy.

III. Corporate governance framework

If we closer analyze Figure 1 we can see that firms are more than board, managers, debt holders and shareholders. A more detailed framework of corporate governance is depicted in Figure 2. This is an expansion of the previous figure in order to examine a broader set of governance influence. As in Figure 1, the corporate governance framework is divided into two broad classifications: Internal and External Governance.

At the center of this system as an internal force, is the board of directors which is considered by many as the lynchpin of corporate governance (Gillan, 2006). Its overriding responsibility is to ensure the long-term viability of the firm and to provide oversight of management. In many countries the board is responsible for approving the company’s major decisions and strategy and for hiring, monitoring and replacing the management (World Bank, 1999).

A large amount of research on corporate boards was concentrated on the relationship between board structure and firm value (Vafeas, 1999). Others were concentrated on the analysis of the structure and activity of board subcommittees (Klein, 2002; Deli and Gillian, 2000).

More recent studies focus on changes of board structure over time. Here we can mention the study conducted by Coles at al. (2005) who focused on board changes over time and on the costs associated with board changes resulting from the new regulations.

Other empirical studies were focused on board characteristics. According to Ferris et al. (2003) busy boards don’t have a negative impact on the shareholders’ wealth and Larcker et al. (2005) found that “cozy” board relationships limit effective monitoring.

The composition of the board of directors also shows strong contrasts between countries. For example, Japanese companies are known for the large number of board members and therefore their inefficiency. These can consist of more than 50 members with few external ones to monitor the management activity and the strategic direction of the company. Italy and France are considered to have medium-sized boards but still inefficient due to the lack or reduced number of independent non-executive directors. The most active boards are the ones in Great Britain and the United States due in part to the efforts in improving corporate law.

As previously stated the framework includes internal and external forces that face one another and have an impact on the activity of the existing corporations. The external forces are represented by policy, legal, regulatory and market. The role of the external forces is to strengthen the internal mechanisms for corporate governance.

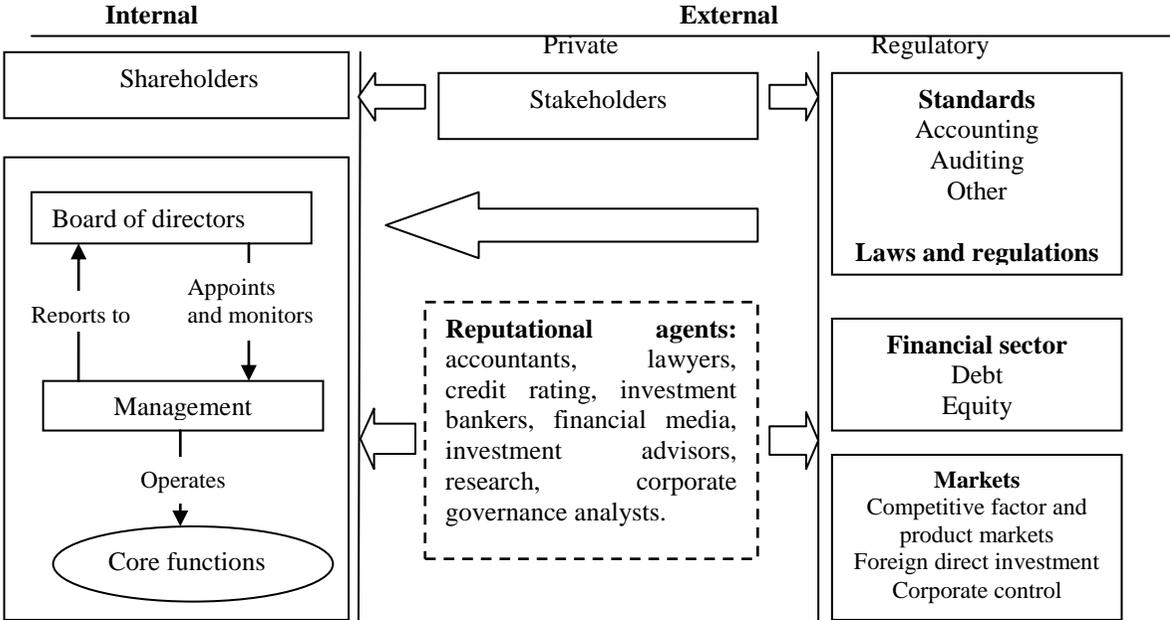

Figure 2. Corporate governance framework.

Source: Adapted from World Bank, Corporate Governance: Framework for Implementation, Overview, 1999: 4.

Many authors and analysts consider that the problem of corporate governance has become increasingly important for developing countries. The challenge for these countries is to adapt systems of corporate governance to their own corporate structures and implementation capacities, in order to create a culture of enforcement and compliance.

IV. Research methodology

The object of this section is to provide some insight on the corporate governance situation in three developing economies: Romania, Hungary and Bulgaria. In order to analyze the development of corporate governance in these counties we used secondary data analysis, more specifically reports or statistics offered by: European Corporate Governance Institute (ECGI), World Bank Reports (ROSC Reports), European Bank for Reconstruction and Development (EBRD) reports.

V. Data analysis – Country comparison

Table 1 illustrates, for all three analyzed countries, the overall ease of doing business rank (out of 183 economies) and the ranking for protecting investors. As we can see Hungary has the highest index of all three countries with an increase in 2011 of 6 points compared to 2010. Romania is the second one followed by Bulgaria. We should mention here that of all three analyzed countries Romania was the only one which went down two places in the overall ranking regarding the ease of doing business.

We chose to illustrate the investor protection index because we consider it to be very relevant to our study. The Investor Protection Index consists of three dimensions of investor protection: transparency of transactions (Disclosure Index), liability for self-dealing (Director Liability Index) and shareholders' ability to sue officers and directors for misconduct (Shareholder Suits Index). Thus, as the above table shows the situation in Romania and Bulgaria (both ranked 44 with an absolute value of 6) is far better compared to the one registered in Hungary (which ranked 120 with an absolute value of 4.3).

Table 1. Ease of doing business ranking

	Romania	Hungary	Bulgaria
Ease of doing business-rank	56(-2)	46(+6)	51(0)
Protecting investors-rank	44	120	44
-disclosure index	9	2	10
-director liability index	5	4	1
-shareholder suits index	4	7	7
-investor protection index	6	4.3	6

Source: own compilation, based on Doing Business Report, 2011

Table 2 illustrates the existence of a national code for corporate governance and the degree of compliance of CG legislation with the OECD principles of corporate governance.

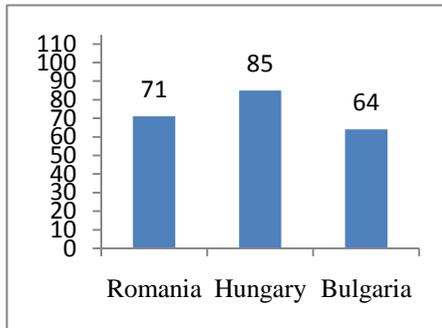

Table 2. Corporate Governance assessment

Country	Corporate governance (CG) code	Compliance of CG legislation with the OECD Principles of Corporate Governance.
Romania	The Bucharest Stock Exchange has issued a voluntary Corporate Governance Code for the companies traded on the regulated market of the Bucharest Stock Exchange, 2008	Low-compliance
Hungary	The Budapest Stock Exchange non-binding guide on corporate governance (Corporate Governance Recommendations), 2008	High-compliance
Bulgaria	Bulgarian National Code For Corporate Governance, voluntary, 2007	Medium-compliance

Source: own compilation based on EBRD Report 2004, 2007; ECGI Index of Codes

All the Codes mentioned in Table 2 are meant to contribute to raising national corporate governance standards and practices by adding voluntary requirements to the national framework's statutory provisions.

Figure 3 shows the score for the observance of various corporate governance practices. The score was calculated from the ROSC reports (2002, 2004) on a 1-5 Likert scale (5-Observed, 4-Largely observed, 3-Partially observed, 2-Materially not observed, 1- Not observed). If a country registered the highest score for all OECD Principles, it's corporate governance score would be 115 (5x25 principles). The lowest score would be 23 (1x23).

As Figure 3 shows none of the three countries had a perfect score. The highest score was registered by Hungary (85) followed by Romania (71). Bulgaria was the last one with a score of 64. As this data shows, for all three countries there is room for improvement.

Figure 3. Corporate governance score.

Source: Own calculations based on World Bank-ROSC reports.

V. Conclusion

This study illustrates the corporate governance situation in three developing nations: Romania, Hungary and Bulgaria. Even if Hungary registered the highest level of compliance of corporate governance legislation with OECD principles and the highest corporate governance score, key deficiencies still remains. For instance Hungary has to solve the problem of protecting investors because a key determinant of a nation wealth is investors' confidence.

Bulgaria ranked last based on the corporate governance score, but regarding the compliance with OECD principles the situation is better than the one reported for Romania, Bulgaria being the only country who has a National Code for Corporate Governance. Also a number of 53 companies reported to have a full comply with the principles of the National Corporate Governance Code (Bulgarian Stock Exchange).

In Romania some progress can be observed in the development of corporate governance in such as in January 2009, when the Bucharest Stock Exchange published an updated Corporate Governance Code, which is required for all listed companies on a "comply or explain" basis. Even so, in Romania there are discrepancies between the written law and the implementation of the law regarding the enforcement of the corporate governance framework. Thus this is a situation that has to be addressed in the future.

Most organizations are going through massive changes. Their customers are changing, their competition is changing, their customer's needs are changing and their resources availability is changing - the cosmetics companies are no different. Organizational survival and success depends on the ability of the managers to detect and adapt to critical changes in the environment, which may impact the company.

The paper has two main purposes. First to underline the importance performance measurement has in today's business and second to present a few key elements regarding the performance of the cosmetics sector in Romania. For this we have tried to answer the following question: Are the cosmetics companies competitive?

This paper is based on exploratory literature review of different approaches regarding organizational performances in organizations in general.

Despite the global economic crisis and the general slowdown of many markets, the Romanian beauty and personal care market continued to grow in 2009. Consumer awareness and product knowledge is growing rapidly and the development of retailing chains and their widening product offer have also helped to further the development of the beauty and personal care market.

The paper also presents the results of section three of an online survey conducted at 10 cosmetic companies from Romania. The results have shown that multinationals have both the economic and managerial power to succeed in obtaining their goals. Even though the sample of 72 respondents was rather small, we managed to conclude from the received answers that the majority of companies focus on economic and managerial performance rather than on social and ecological performance indicators.

This paper aimed to contribute to the literature review development in the field of performance management. The results of this study can be of use for managers from the analyzed domain or for other researchers in the economic field.

The authors have contributed to the originality of this paper, by presenting pertinent conclusions about the cosmetics market from Romania, resulted from the literature review and from an empirical study.

Key words: management, performance, cosmetics market, competition

JEL Code: M10, L25, L66

1. Introduction

It is amazing to look back at the different changes that management has gone through in the past 20 years. But even with all the so-called management trends that were supposed to "solve" all the problems of management, there are two things that have remained constant (Rieley 2006: 123)

- 1) Managing an organization to high performance is not easy.
- 2) There are a small number of organizations that are able to consistently demonstrate high performance over time.

The senior managers of companies that are able to sustain consistent performance growth over time seem to have a clear understanding that everything that has to do with organizational performance is interrelated, and being able to command an understanding of those relationship can be significant differentiator in business today.

The question that arises for most managers must be “*how can I improve performance in my business?*”

The paper offers an interesting perspective, both theoretical and practical, on overall organizational performance with special focus on economic, managerial, social and ecological performances, analyzing the cosmetics industry in Romania.

2. The concept of organizational performance

Organizational performance refers to the ability of the organization to achieve its objectives.

Management organization should be guided by one objective, for example maximizing the value of equity, or several objectives that may not necessarily involve maximizing actions. Examples of such objectives could be to maintain or increase employment, environmental protection, increase customer satisfaction, etc.

The question that arises is: “What measures should be oriented towards this type of objectives?”

To answer this question it is necessary to have clear and measurable targets because:

- Assessing the individual and department is objective, this being based on individual contribution to overall goals.
- Having a clearly defined purpose, people are more motivated, focused efforts and resources are directed towards achieving the goal.
- Monitoring and evaluation is made easier and more equitable because the focus moves from the man on the result.
- Enabling more effective management control is to intervene only when the parameters set are not met.
- Allows a clearer communication and better understanding of management expectations.
- If you understand, at management level, that “you get what you measure” such a system becomes a way of empowerment of employees.
- Role ambiguity disappears. Everybody knows what to do, what results are expected and the resources available.
- A systematic approach to assess how it affects all of its components changes.
- Measuring performance against established standards allow early action when results are not expected.
- Move the focus on customer needs.
- Engaging in a cycle of continuous improvement is the basis of a performance.

2. Categories of organizational performance

Organizational performance can be divided in several categories: economic performance, managerial, social and environmental, technical and technological, financial, etc.

Economic performance is a consequence of the provision of an efficient management and aims to achieve at high levels, with targets, the results measurable by volume and efficiency indicators. The purpose is to obtain the lowest production cost for the best quality possible (as a combination of both). Economic performance aims to obtain the highest possible income (total income, turnover or net income - from the work). Economic performance and profitability is expressed best by the rate of return (the benefit of capital).

Managerial performance refers to adapting to the needs of the organization in general and not least, the cultural conditions (in particular the organization and operating area). Managerial performance is all about decision making. How and why decisions are made. How they are implemented and communicated. Managers need ongoing training in how to think differently to understand the challenges they and the organization face; how to influence employees, peers, as well as suppliers and customers to help the company successfully address these challenges.

Social performance refers to the customers' needs and their purchasing power by providing products / services of technically good at a reasonable price. The organization shall provide satisfactory wage jobs and a favorable climate within.

The technical performance refers to the efficient use of available resources in the organization and is measured primarily by productivity. Increased technical performance is influenced by increased productivity and a better organization of production.

In conclusion, increased organizational performance can be achieved by increasing the efficiency and effectiveness.

3. Cosmetics market study

An overview of the broad cosmetics industry made by Global Insight, in the EU, Japan, China, and the U.S. reveals that Europe's market size is almost as large as the U.S. and Japan combined, due to its large population.

Data revealed by Euromonitor International showed (Table no. 1) that U.S. cosmetics market was €38.2 billion, while Japan's was €23.7 billion and China's €8.2 billion. The total EU 27 cosmetics market was valued at €63.5 billion. Among the EU countries, Germany has the largest cosmetics market, valued at €11.7 billion, followed by France (€10.4 billion), the U.K. (€10 billion), Italy (€8.8 billion), and Spain (€7.4 billion).

Table 1: Market Sizes - Historic - Retail Value RSP - Current Prices

As could be expected in a vast region with different tradition and cultures such as the EU, unique trends in buying patterns may be found in particular countries, as well as some common trends across the board.

From country to country, spending on cosmetics varies by product. The French primarily purchase skin care products while Germans and the British spend mostly on toiletries. The Nordic countries, Finland, Norway, and Sweden spend a much lower share of their consumption basket on fragrances, compared to the EU average, while Spain and Portugal spend lower-than-average shares on decorative cosmetics.

3.1 Nature of competition

Currently, large cosmetic corporations combine to control over half of the cosmetics market. The tables below lists each of the top 10 companies in 2001-2009 and their respective shares of the global cosmetics market (retail sales value).

Table 2: Company Shares (by Global Brand Owner) - Retail Value RSP - %

Holding a position as one of the top 10 manufacturers is enviable, however, these companies understand that they must constantly reconsider and re-evaluate their market positions by listening to the demands of their customers, gaining footholds in new markets, and evaluating their organizational structures. These large multinational firms are finding themselves facing stiff competition from other popular brands. Other cosmetics companies are pushing ahead, trying to gain their own place in the market, and have largely been successful in developing their own name.

The industry's key players pursued a strong acquisition strategy in recent years. The purpose of this strategy was to introduce new business lines, streamline production, and expand the types of products under company control. Over the next few years, the success of these acquisitions will have to be evaluated as the relentless demand for the consumer's loyalty will surely continue.

The great majority of the products sold in Romania are produced and distributed by multinational chains, such as L'Oréal or Beiersdorf as shown in table no 3. The economic crisis of the last two years of the review period helped local producers be noticed on the market, as they offer cheaper products characterized by a good price/quality ratio. Local company, Farmec took over smaller local producers and their brands and expanded its market share, but still remained behind the multinationals. Although company advertising budgets decreased in 2009, the sums invested by multinationals in media advertising increased the visibility of their products and made an important difference in their sales levels.

The situation is not likely to change in the first few years of the forecast period, given that the multinationals have the ability to adjust rapidly and efficiently to the changing requirements of the market, unlike their Romanian counterparts. The strongest Romanian player on the beauty and personal care market is Farmec. However, even with its latest investments in new production technologies and in promotional activities, it cannot overthrow the established hierarchy.

This does not mean the demise of Romanian manufacturers, but rather new development trends. These trends will take the form of mergers or takeovers as well as reorientation towards export and more easily accessible markets. Players will also have to adjust to those requirements which do not demand a huge financial investment but which can bring considerable benefits.

4. Organizational performance in the cosmetics industry

In order to determine what are the best performance indicators used in the cosmetics companies the authors developed a questionnaire (Grigore, 2010), which was applied on 10 cosmetics companies from Romania: Procter & Gamble, L'Oreal, Avon, Oriflame, Farmec, Beiersdorf, Unilever, Colgate-Palmolive, Elmi Prodfarm LLC and Genmar Cosmetics. The results presented in this paper are part of a bigger on-going research. For the main research, we built a questionnaire aimed at identifying specific management practices inside Romanian organizations with special emphasis on those which have as main activity the production and sale of cosmetics. About 90% of the participants who answered the questionnaire were mostly mid-level and low-level managers. The questionnaire consisted of 40 questions grouped into ten sections. Section three had as purpose identifying key elements for strategies and organizational performances.

The existence of a development strategy revealed that the organization have inclination for strategic planning. Because of the trend towards long-term policy actions and financial projections made trimistrial, strategy helps establish a unified direction for the organization in terms of its operational goals and provides the basis for allocating resources to guide the organization towards achieving these objectives. In this respect, the development objectives of an organization implement a set of performance indicators. 70% of respondents working in the organization, acknowledged the existence of a development strategy, among them a similar percentage saying that the strategy has objectives related to organizational performance.

In an attempt to define the concept of performance we noticed that, in spite of uses, it becomes a multivocal word. Many of the respondents defined the performance thinking how it can be measured. In general knowledge, organizational performance measurement is seen as a further evaluation of the results. Therefore we came to one conclusion, performance has to be measured, for example it can be described by a set of indicators with a degree of complexity more or less elevated. Particular emphasis is given to economic and management performance indicators, over 50% of respondents stating they use a measurement system for these types of indicators.

The variety of indicators for performance measurement shows that they differ depending on the information received by managers are on each hierarchical level and depending on their interests. Thus, higher level managers are focused on their company's overall performance and mid-level managers perceive performance and lower profitability through the department or team working. The respondents gave some examples of organizational performance used in their organization: profit, productivity, revenue, reducing the amount of non-compliant products manufactured from 3% to 2%, reducing the time spent honoring orders from 30 days to 20 days, indicators measuring the number of products/services sold in a period, the number of customers attracted, gross margin, carbon footprint, etc

5. Conclusions

A number of EU countries have developed a large trade surplus and a significant comparative advantage in cosmetics products. This is clear evidence that cosmetics manufacturers in these countries have, over the years, identified the most important consumer trends and have responded with new product offerings that have been successful. These companies have accomplished this task in both domestic and export markets. In the process, these companies have successfully developed strong brand recognition in a highly competitive and dynamic market place. In conclusion, based on the results presented in this paper, we believe that most of the multinational have managed to be competitive on the Romanian market.

MANAGEMENT MATERIAL COSTS ELEMENTS

Adrian Ioana

University “Politehnica” of Bucharest, “Science and Engineering Materials” Faculty

The paper presents the main elements of the analysis of the dynamics and structure of the material costs. Also, there are presented the principal indicators for tracking and analyzing the Physical Consumption of Materials (PCM). The factorial analysis's elements of the costs with materials per products there are presented too. The modification of the sales price and the modification of the costs with materials per product unit there are also presented. Economical use of the material resources used represents the principal factor of economic growth, an important element of the efficiency of any industrial enterprise. In the category of material costs we take into account both the costs regarding the consumption of labor objects (base materials, raw materials, fuel, energy, auxiliary materials) and those reflecting the equivalent of consuming fixed funds. For characterizing the status of material resources use, we need a system of indicators which allows the following of the objectives execution. The system of indicators which refers to the metal consumption illustrates a widely used and complex resource. Some of these system indicators can also be used for any material resource. In the category of material costs we take into account both the costs regarding the consumption of labor objects (base materials, raw materials, fuel, energy, auxiliary materials) and those reflecting the equivalent of consuming fixed funds. The analysis of the metal consumption per specific unit (CSM) implies comparisons with the specific consumptions for the products sol in the previous periods and for similar products in the industry.

Keywords: Management; Physical Consumption of Materials; Material Costs

JEL Clasificasion: E23, L10, L11.

1.INTRODUCTION

Economical use of the material resources used represents the principal factor of economic growth, an important element of the efficiency of any industrial enterprise.

The main issues that will be examined during the analysis of the material costs are (Ioana 2007a, 2006):

- The analysis of the costs with materials.
- The analysis of the dynamics and structure of the material costs.

In the category of material costs we take into account both the costs regarding the consumption of labor objects (base materials, raw materials, fuel, energy, auxiliary materials) and those reflecting the equivalent of consuming fixed funds (Ioana 2007b, 2008a).

2.INDICATORS FOR TRACKING AND ANALYZING THE PHYSICAL CONSUMPTION OF MATERIALS (PCM)

For characterizing the status of material resources use, we need a system of indicators which allows the following of the objectives execution (Ioana and Nicolae, 2002).

The principal indicators for tracking and analyzing the physical consumption of materials (PCM) are presented below. It will illustrate a system of indicators which refers to the metal consumption as a widely used and complex resource. Some of these system indicators can also be used for any material resource (Ioana 2008b, 1998).

- A. The specific consumption (C_s) per product unit (the level of specific consumption).
The model of this indicator is:

$$C_s = C_T / Q \quad (1)$$

Respectively:

$$I_{CS} = C_{S1} / C_{S0} \quad (2)$$

Where:

C_T – represents the total consumption per product;

Q – is the physical volume of the product;

I_{CS} – is the indicator of the specific consumption;

C_{S0} – represents the basis of comparison.

The indicator of the specific consumption can be presented less than one of the situations:

$$\text{➤ } I_{CS} < 1 \quad (3)$$

$$\text{➤ } I_{CS} = 1 \quad (4)$$

$$\text{➤ } I_{CS} > 1 \quad (5)$$

$I_{CS} < 1$ indicates the reduction of the specific consumption, compared to the planned one or to the one corresponding to a previous period.

$I_{CS} = 1$ indicates the placement at the normal level or at the previous level.

$I_{CS} > 1$ indicates the exceeding of the specific consumption, having negative impact on the compact activity.

- B. The metal consumption per specific unit (consumption per functional characteristics).

The model of the metal consumption per specific unit (C_{SM}) indicator is:

$$C_{SM} = C_T / N_s \quad (6)$$

Where:

N_s represents the numbers of specific product units (the dimension of the characteristic, eg: horse power; cubic meters etc).

3.CONCLUSIONS

The system of indicators which refers to the metal consumption illustrates a widely used and complex resource. Some of these system indicators can also be used for any material resource.

The analysis of the metal consumption per specific unit (C_{SM}) implies comparisons with the specific consumptions for the products sol in the previous periods and for similar products in the industry.

INTRINSIC AND EXTRINSIC MOTIVATION. AN INVESTIGATION OF PERFORMANCE CORRELATION ON STUDENTS

Matei Mirabela-Constanța

University of Oradea, Faculty of Economics

Abrudan Maria-Madela

University of Oradea, Faculty of Economics

A series of research undertaken in the last decade have revealed some interesting aspects regarding the effects of different types of motivation on performance. Among the researchers who have shown interest in this field we can number: Richard Ryan, Edward Deci, Sam Glucksberg, Dan Ariely, Robert Eisenhower, Linda Shanock, analysts from London School of Economics, and others. Their findings suggest that extrinsic incentives may have a negative impact on overall performance, but a general agreement in this respect has not been reached.

In this paper we intend to shed some light upon the relationship between intrinsic and extrinsic motivation and performance. Experts define intrinsic motivation as being the execution of a task or activity because of the inherent satisfaction arising from it rather than due to some separate outcome. In contrast with intrinsic motivation, we speak of extrinsic motivation whenever an activity is done in order to attain some separable outcome.

With the purpose of contributing to the clarification of the links between concepts, we initiated and conducted an explanatory research. The research is based on the analysis of the relations between the results obtained by third year students and their predominant type of motivation. For this, we formulated and tested four work hypotheses using a combination of quantitative methods (investigation) and qualitative methods (focus group). After the validation of the questionnaires, the respondents were divided into four categories: intrinsically motivated, extrinsically motivated, both intrinsically and extrinsically motivated and unmotivated. To analyze the collected data, we made use of Excel and SPSS.

Some of the primary conclusions of the research are as follows: as the average increases, the percent of individuals having both extrinsic and intrinsic motivation is decreasing; the highest percentage of unmotivated students is concentrated in the highest average category; Female students tend to have better performance at university level. The research intends to be nearly a first step in the attempt to clarify the relationship between intrinsic (and extrinsic) motivation and performance. Further research is needed.

Keywords: intrinsic motivation, extrinsic motivation, performance, correlation.

JEL: M12, I23

I. Introduction

The concept of motivation has emerged around 1930 and it was long debated and studied in an attempt to identify what drives people to undertake a particular action. After decades of studies and research it can not be said that there is a unified theory of motivation. However, some characteristics of motivation are generally accepted.

A series of research undertaken in the last decade have revealed some interesting aspects regarding the effects of different types of motivation on performance. Among the researchers who have shown interest in this field we can number: Richard Ryan, Edward Deci, Sam Glucksberg, renowned economist Dan Ariely (together with his colleagues from Carnegie Mellon and the University of Chicago), analysts from London School of Economics, Robert Eisenhower, Linda Shanock and others (Pink: 2009). Their findings suggest that extrinsic incentives may have a

negative impact on overall performance, but a general agreement in this respect has not been reached. Although there is no clear answer yet on the effect of extrinsic incentives on creativity or in regards to the implications of intrinsic motivation on performance, many companies are building a new conception based on autonomy, mastery and purpose (Matei and Abrudan: 2010, 1137-1139).

In this paper we intend to shed some light upon the relationship between motivation and performance. With this purpose, we initiated and conducted an explanatory research. The research is based on the analysis of the relations between the results (performance) obtained by third year students and their predominant type of motivation (intrinsic and extrinsic motivation).

II. Intrinsic and extrinsic motivation - defining the concepts

When an individual is motivated, he feels energized or inspired to act, whereas an unmotivated person feels no impetus to do so (Ryan and Deci: 2000, 54). Thus, it is clear that people have different amounts of motivation. In addition, human motivation can vary not only in level, but also in orientation and type of motivation. Some of the contemporary researches are based precisely on these peculiarities of motivation and intrinsic versus extrinsic motivation has never been more debated.

Intrinsic motivation is defined as being the execution of a task or activity because of the inherent satisfaction arising from it rather than due to some separate outcome. Intrinsic motivation reflects the natural propensity of people toward learning and assimilation. Despite this, theorists (Ryan and Deci: 2000, 56) have shown that this propensity appears to be expressed *only under specifiable conditions*.

In contrast with intrinsic motivation, we speak of *extrinsic motivation* whenever an activity is done in order to attain some separable outcome (Ryan and Deci: 2000, 60).

Experts Ryan and Deci (Ryan and Deci: 2000, 58) state that extrinsic rewards can decrease intrinsic motivation. Rewards linked to the completion of a task, threats, deadlines and directives undermine intrinsic motivation because individuals perceive them as behaviour control techniques. On the other hand, free choice and the opportunity for self-direction can increase intrinsic motivation because of the sense of autonomy linked to them. Yet, even extrinsic motivation can have a certain amount of autonomy. The degree of autonomy varies in extrinsic motivation and it can be a reflection of either external control or true self-regulation (Ryan and Deci: 2000, 59).

III. Research methodology

In conducting the research, we considered the following work hypotheses:

- Individuals for whom the intrinsic motivation is prevailing have higher averages than those for whom extrinsic motivation is prevailing.
- Individuals having both extrinsic and intrinsic motivation are better performers than individuals with only one active type of motivation.
- Unmotivated individuals have the lowest averages.
- Intrinsic motivation is present in significant different proportions in women than in men.

To test the work hypothesis an explanatory research has been conducted. For this, quantitative methods were combined with qualitative methods so as to achieve the most significant results. Thus, we associated the investigation – which was the primary method of research – with the focus group to attain suggestions for data interpretation.

Within the investigation, a questionnaire was used as research tool. The questionnaire - which was adapted from that of Horst H. Siewert and Renate Siewert (Siewert H.H, Siewert R., 2000) – contains 31 closed questions and it is designed to measure extrinsic and intrinsic motivation. The

questionnaire was applied to 37 third year Management students from The Faculty of Economics. Of the 37 questionnaires, 35 were validated and 2 were not taken into account.

To facilitate the interpretation of data collected, we organized three focus groups. The grouping of participants was based upon the results of the questionnaire, as follows:

- The first focus group gathered individuals with both extrinsic and intrinsic motivation (16 students);
- The second focus group brought together individuals with either intrinsic or extrinsic prevailing motivation (12 students);
- Unmotivated individuals participated in the third focus group (7 students).

IV. Research findings

The sample consisted of 37 third year students who took part in the first phase of the research: the questionnaire. Subsequently, 35 questionnaires have been declared valid. Of these respondents, 37,1% were men and 62,9% women. The results of the questionnaire can be summarized as follows:

- 45,8% of respondents have both extrinsic and intrinsic motivation prevailing;
- 17,1% of respondents are intrinsically motivated;
- 17,1% of respondents are extrinsically motivated;
- 20% of respondents are unmotivated (neither extrinsic nor intrinsic motivation prevailing).

To analyze the relations between the prevailing type of motivation and performance we considered the average of each student for the first two years of university studies. The averages were divided into three categories so as to be roughly equal proportion:

- the first category: averages between 5 and 6,5;
- the second category: averages between 6,5 and 7,5;
- the third category: averages higher than 7,5.

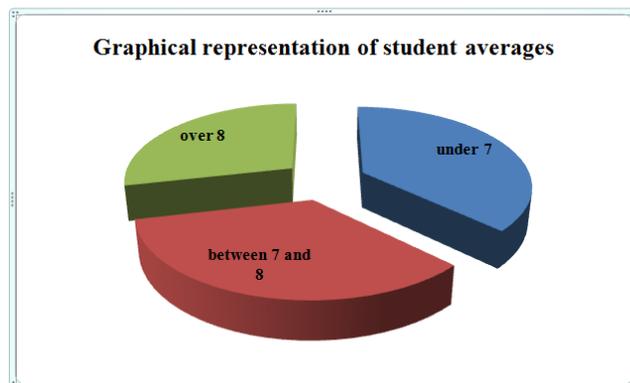

Exhibit 1. Graphical representation of student averages

Source: own research

Further, we made use of the Crosstabulation function available in the SPSS software in order to get an idea on the possible relationships between motivation and averages (Exhibit 2). This reveals the following conclusions:

- 46,2% of students with averages lower than 6,5 have both extrinsic and intrinsic motivation prevailing; 23,1% of them are intrinsically motivated, while 15,4% are extrinsically motivated and 15,4% are unmotivated;

- 58,3% of students with averages between 6,5 and 7,5 are extrinsically, as well as intrinsically, motivated; only 8% are just intrinsically motivated, while equal proportions of 16,7% are extrinsically motivated, respectively unmotivated;

- in the case of students with the highest average (over 7,5), a percentage of 30 are both extrinsically and intrinsically motivated, 20% are just extrinsically motivated, for 20% intrinsic motivation is prevailing, and the remaining 20% are unmotivated.

Average_1 * Motivation Crosstabulation

			Motivation				Total
			Neither EM nor IM	Just EM	Just IM	EM and IM	
Average_1 between 5 and 6,5	Count		2	2	3	6	13
	% within Average_1		15,4%	15,4%	23,1%	46,2%	100,0%
	% within Motivation		28,6%	33,3%	50,0%	37,5%	37,1%
	% of Total		5,7%	5,7%	8,6%	17,1%	37,1%
between 6,5 and 7,5	Count		2	2	1	7	12
	% within Average_1		16,7%	16,7%	8,3%	58,3%	100,0%
	% within Motivation		28,6%	33,3%	16,7%	43,8%	34,3%
	% of Total		5,7%	5,7%	2,9%	20,0%	34,3%
over 7,5	Count		3	2	2	3	10
	% within Average_1		30,0%	20,0%	20,0%	30,0%	100,0%
	% within Motivation		42,9%	33,3%	33,3%	18,8%	28,6%
	% of Total		8,6%	5,7%	5,7%	8,6%	28,6%
Total	Count		7	6	6	16	35
	% within Average_1		20,0%	17,1%	17,1%	45,7%	100,0%
	% within Motivation		100,0%	100,0%	100,0%	100,0%	100,0%
	% of Total		20,0%	17,1%	17,1%	45,7%	100,0%

Exhibit 2. Crosstabulation between averages and the types of motivation prevailing

Source: own research

The findings are not encouraging as three of the work hypotheses are, evidently, not verified. Moreover, apparently as the average increases the percent of individuals having both extrinsic and intrinsic motivation is decreasing. Furthermore, it is worth mentioning that the highest percentage of unmotivated students (30%) is concentrated in the highest average category. Concluding, it seems *there is no correlation* between the two variables considered. The correlation coefficient is presented in Exhibit 3. The small value of the correlation coefficient (0,139) suggests *there is no significant relationship between motivation and performance* (average).

	Average	Motivation
Average	1	
Motivation	0,1397454	1

Exhibit 3. Correlation between average and motivation

Source: own research

The first three hypotheses are not verified. Further, we focused on the forth hypothesis, which is: Intrinsic motivation is present in significant different proportions in women than in men. To verify this, we applied a Crosstabulation analyze on average and gender variables, we calculated Chi-Square and the correlation coefficient. The findings can be summarized as follows:

- The majority of students with the average lower than 7,5 are men (60%). 92,3% of male students fall into the category with the lowest average.

- 93,3% of the students with the highest average are women. 63,6% of female students are situated in the highest average category.

Average * Gender Crosstabulation

		Gender		Total
		Male	Female	
Average Under 7,5	Count	12	8	20
	% within Media	60,0%	40,0%	100,0%
	% within Gen	92,3%	36,4%	57,1%
Over 7,5	Count	1	14	15
	% within Media	6,7%	93,3%	100,0%
	% within Gen	7,7%	63,6%	42,9%
Total	Count	13	22	35
	% within Media	37,1%	62,9%	100,0%
	% within Gen	100,0%	100,0%	100,0%

Exhibit 4. Crosstabulation between averages and gender

Source: own research

Based on these observations, as well as on the results of the Chi-Square Tests (Exhibit 4) and on the correlation coefficient calculated (Exhibit 5), we can state that *there exists a correlation between the two variables.*

Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	10,443 ^a	1	,001		
Continuity Correction ^b	8,283	1	,004		
Likelihood Ratio	11,911	1	,001		
Fisher's Exact Test				,002	,001
Linear-by-Linear Association	10,145	1	,001		
N of Valid Cases	35				

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 5,57.

b. Computed only for a 2x2 table

Exhibit 5. Chi-Square Tests: Average and gender

Source: own research

Thus, female students tend to have better performance at university level.

	Average	Gender
Average	1	
Gender	0,403640948	1

Exhibit 6. Correlation: Average and gender

Source: own research

In regards to the relationship between gender and motivation there are no significant differences between male students and female students. Yet, the percentage of men who are intrinsically motivated is higher than that of women.

V. Conclusions

In order to draw the conclusions of the research conducted, we revisit the work hypotheses:

- Individuals for whom the intrinsic motivation is prevailing have higher averages than those for whom extrinsic motivation is prevailing. *Not verified.* There are equal percentages of intrinsically

motivated students and extrinsically motivated students in the highest average category. Research at this level can not state that there is a correlation between intrinsic motivation and better performance.

- Individuals having both extrinsic and intrinsic motivation are better performers than individuals with only one active type of motivation. *Not verified*. It appears that, as the average increases, the percent of individuals having both extrinsic and intrinsic motivation is decreasing. Further research is needed.

- Unmotivated individuals have the lowest averages. *Not verified*. For the sample analyzed, the highest percentage of unmotivated students is concentrated in the highest average category.

- Intrinsic motivation is present in significant different proportions in women than in men. *Verified*. Female students tend to have better performance at university level.

The research conducted has, of course, limitations. The most important aspect worth mentioning is that there is no statistical representativeness for the population investigated. The research intends to be nearly a first step in the attempt to clarify the relationship between intrinsic (and extrinsic) motivation and performance.

VI. Acknowledgments

HUMAN RESOURCE MANAGEMENT - THE ROLE AND IMPORTANCE OF MULTINATIONAL COMPANIES

Muscalu Emanoil

Universitatea "Lucian Blaga" din Sibiu, România, Facultatea de Științe Economice

Stăniț Alexandra

Universitatea "Lucian Blaga" din Sibiu, România, Facultatea de Științe Economice

If one of the factors of growth and economic development in the contemporary period is "human capital" in the analysis of human resources correlations between specialization and volume of information that can materialize evolution of human society, manifested in the last decades of the twentieth century and the beginning of the new millennium, outlines the prospect of an increasingly integrated world, which finds its origins in the experience accumulated by mankind over the processes and phenomena with economic, social and cultural. It was thus concluded that the individual is more than a mere component of productive factors and human resource management than rigid principles of asset management company, should take into account a number of features that are beyond economic calculation. Only taking into account all aspects that define the human personality, abilities, acknowledge, aspirations, temperament and character traits, resource management may be able to lead the precious, the only resource equipped with the ability to know and overcome their limits.

Globalization, European companies/multinational, human development, economic diversity, social, political and cultural-specific regions or countries are factors that have a major impact on human resources management. European human resource management is very complex. No other region in the world encompassing so many differences in terms of historical, cultural and linguistic aspects as well as Europe.

Each country has its own employment system, its laws and institutions, its own education system and a strong individualized managerial culture. Human resource management becomes the main instrument through which companies can provide competitive advantage in the intensification of globalization. In experts opinion, the main cause of European companies failure is the lack of understanding of key differences in human resource management in different countries. Companies must ensure their competitive advantage and deliver value added in terms of achieving a single market share.

Keywords: human resource management, human resources, multinational companies, human resource globalization

JEL Classification: F23, O15

1. Introduction

In the '90s, we witnessed to the human resources concept enlargement, employee and correlated with openness to the outside company. The proliferation of communication channels lead to a simple observation: the companies have realized that the real resource is the human capital value. Companies are forced to find profitable and loyal employees with high potential. Information technology is an intelligent manner to identify each employee's expectations based on a detailed and specific knowledge of each. Good human capital management allows not only lower management costs of personnel, but also increase individual profitability. The ultimate objective must be the center position of the employee's business strategy and integration in all the traditional functions of human resource management.

Multinational companies have implemented the idea of making contact with the employee as a personalized contact, organizations must adapt to each situation created - only in this way the

relationship between employee and employer becomes truly profitable. Similarly, the demand for human resources management solutions in particular still comes from multinational companies who imported the management culture of the groups they belong to.

Multinationals now play an important role in the economies of all countries in international economic relations, a topic becoming increasingly important for governments. Foreign direct investment, firms can also bring substantial benefits to both countries of origin and host countries through contributions to the efficient use of capital, technology and human resources between countries and can thus play an important role in promoting economic and social welfare.

But multinational enterprises, and organizing their operations beyond the national framework may lead to abuses by the concentration of economic power and to conflicts with national policy objectives. Moreover, the complexity of the multinationals and the difficulty of clear understandings on their diverse structures, operations and policies sometimes lead to concern.

Thus, the target is shared by all countries to encourage positive contributions which multinational firms can achieve economic and social progress and to minimize or resolve difficulties which may arise from carrying out their operations.

2. Human Resources Management

The term "human resource management" began to be used in the past fifteen years. Before, they used the term "personnel management", which became a stand-alone department in 1920 and was largely concerned with technical aspects of employment, evaluation, training and motivation courses. In late 1970, U.S. organizations have begun to be affected by factors such as globalization and rapid changes in technological level. Under their influence, firms began to be concerned with strategic planning, forecasting a change process in business.

In human resource management strategies are formulated and implemented in the medium and long term, thus contributing to human resource managers to key business objectives. The concept of human resources is not new. Peter Drucker, in his book "The Practice of Management, attributed management three functions: to obtain economic performance, leadership and management operators and managers work. "Man is the only resource available to man that can be developed," he says, and "people must think that people ... together managers and workers is an organization's human resources." Individual, structure, feeling, thinking, culture, motivations, desires and, in particular, self-awareness is a big unknown system, which can prevent or, conversely, the potency of an action, process, activity. By its nature a social being, man is taught to live and to work collectively as part of some group that feels more or less attached groups, in turn, interact with other groups, depending on one and exerting influence on others. Therefore, the successful initiation can conduct to various activities in an organization depending on the extent of motivated and coordinated human factor.

Human resources constitute the creative, active, and coordinating element in the work of the organization, influencing the efficacy critical material, financial and international aspects. It is necessary to describe people as "resources" to emphasize the importance and to show that their management requires high levels of sincere concern for people, care and professionalism. Emphasizing the role of human resources does not mean, however, an understatement of other resources.

3. Multinational companies. Origins and Evolution

Multinational companies, are the most powerful forces and play an important role in these actual conditions for the deepening of globalization pressure, their business taking place in a dynamic, turbulent space, at certain times or areas in the world's economy.

A national or transnational company is a company that engages in foreign direct investment and owns and controls the value-added activities in more than one country.

In general, we use "transnational" and "multinational" with the same meaning. The first term was adopted by the United Nations Centre for Transnational Corporations in 1974 at the request of several Latin American countries who wanted to distinguish between companies domiciled in a Latin American country could invest in another country, for those who and originate outside the region. The second term is preferred by developed countries, the business and academic community.

Over time, methodological differences have disappeared, so now both terms designate the same thing. However, there are differences between the two terms on the level of analysis. For example, in academia, the term "transnational" is used to designate "a multinational corporation that pursues a strategy of full integration and multi-dimensional organization." In another design, using terms that have the same meaning and believing that it refers to the same phenomenon, the only difference is that "transnational company" is a term used after 1980, and "multinational company" is a term used before 1980. There are academics who argue that there is one major difference between the two terms.

Among them is Carl Dassbach giving separate definitions for two terms. Thus, a multinational company is a company primarily focused on the different national markets or regions. It is characterized by a decentralized management (national or regional units are largely autonomous from the center of the main decision-making), a variety of production lines (each national or regional market oriented) and one division of work overlapped super flux activities as each unit operates independently of the others. On the other hand, a transnational company is a market-oriented world, or at least to an external market covering several countries or regions. The administration is far more centralized than for multinational company, your main office with a more direct control over units. Furthermore, a transnational company is moving towards creating a single enterprise with a single division of labor by eliminating redundant activities and focus activities in those countries (regions, markets) that offer the greatest benefits in the activity.

To assess the degree and size of multinational companies to take into account the following criteria:

- number and size of foreign subsidiaries or associated companies which it owns or controls;
- number of countries in which they engage in gainful activities;
- proportion of global assets and revenues or the number of employees for foreign subsidiaries;
- degree of internationalization of the management, ownership and high value activities.

Multinational firm's distinctive features are:

- profit organization and coordination of many activities beyond national borders;
- internalization of external markets for intermediate production that arises from these activities.

No other institution combines the two activities: production and trading abroad. A multinational company may be privately or publicly, may come from a country or a socialist market economy, may be motivated by private or social objectives, may have a large network in many countries or a single product in a single foreign country, the property can be owned and controlled by persons / institutions in one country (Mars, Tateng) national and international owned and controlled (Ford, Sony, Samsung), or internationally owned and controlled (Agfa, Royal Dutch Shell). Arriving at a stage of maturity, multinational companies have taken a number of features:

- turnover of many multinational excess even GNP of developed countries such as Portugal or Greece;
- can get loans on terms more favorable than many governments;
- adopt a centralized management and decentralization issues are vital to other activities, a strategy called "integrated management";
- vitality and dynamism: grow, expand, absorb, multiply, continuously expanding their scope of business, technology and capital migrate, the activity is diversified;

- combines the diversification benefits of scale;
- a "modular production", standard components are assembled into finished products differentiated by the characteristics of each target market.

4. Multinational companies and human resource management

It is widely theorized notion that, in terms of purpose, business exists to promote human welfare, and yet people are active participants in this activity as scientists, engineers, managers, administrators, sales staff and workers. And the work of multinational firms has contradictory effects on the international division of labor: improve the human resources at home and on the perspective of the host country, depending on the nature of the production process introduced by the company multinational labor skill level may be lower or higher. Other multinational companies even create their new specific benefits by recruiting a large number of unskilled or low skilled workers from one country and transporting them to engage in another. A multinational firm also affects international working conditions and wages: firstly, given that experience large and multinational information they hold on compensation of employees, labor and personnel management practices in different parts of the world, a multinational company is able to implement best practices to stimulate and motivate employees and increase productivity in all its branches (branches are usually transferred to the methods adopted in the country of origin). Secondly, the management of a multinational has a higher power and flexibility in negotiating with trade unions and governments work practices, conditions of employment and human resource development in countries that have branches than indigenous firms. A third point would be the relationship between multinationals and host country governments, in many cases, approaches to labor problems the two countries may be different methods and laws because they have accepted.

It is also worth mentioning that the effect it has multinational activity as promoters of foreign direct investment, the indirect employment of labor, which depends on the size of the product's output of foreign affiliates, their ability to source intermediate goods from local suppliers and how to choose a technology designed according to characteristics of the subsidiary and suppliers. Besides these effects on the vertical effects can be recorded the horizontally ones among local businesses as a result of competition with multinational subsidiary and global expenses incurred by the subsidiary's employees.

The countries multinationals also lead a policy of training and raising the qualification of human resources, although some are tempted to pay salaries comparable to local businesses, many international companies granted a similar level are higher, working conditions as compared to local standards are much higher, leading an aggressive recruitment policy, and identified two cases of people hiring highly qualified and trained personnel or younger and less experienced to be then "polished" .

For the home country in this plan, there are four consequences:

- effects of export incentives, where the subsidiary is supplying raw materials, intermediate goods, capital, finished products and services from parent companies or from home, creating new employment opportunities;
- employment effect for the parent company headquarters, as the subsidiary grows, innovation will increase, collateral management and other activities, is generally carried out by the parent, will generate new jobs;
- employment effect of firms 'support' of business subsidiaries, is actually an indirect employment (accounting firms, consulting, engineering, banks, etc..)

Human resource management becomes the main instrument through which companies can provide competitive advantage in the intensification of globalization. The experts, opinions about the main cause of European companies failure is the lack of understanding of key differences in

human resource management in different countries. Companies must ensure their competitive advantage and deliver value added in terms of achieving a single market shares. One of the most important requirements of the internationalization of business organizations is the training of managers in terms of culture, to knowledge, application and administration of cultural elements, specific country or region in which the company does. According to Geert Hofstede, HR practices should reflect the cultural specificity of each country, companies must recognize that different kinds of people should be valued using different standards, and exploit the ability to understand foreigners using their standards. Specific cultural context of each country exerts a major influence on human resource practices in that country. In many situations, the rule that is valid in one culture may not be applicable in another.

For example, in Japan, young managers are taught that overtime work compensated for golf parties that should play with or participation with customers in a karaoke contest held in a bar, are not always voluntary activities which they participate. The purpose of such actions is to develop team spirit, on the one hand, and understand the needs and mindset of the people in a relaxed, on the other side. Japanese companies in France have faced resistance from the employees supported the French when they tried to implement the spirit *bonenkai* parties, held on Christmas Eve. In place of such social events, the French preferred bonuses and bonuses paid during the Christmas holidays, and being willing to organize such events at home rather than at work. Such an attitude can be justified by the behavior of the French individualist.

American model of management values, performance, free enterprise and autonomy, are quite difficult to apply in Japan or European countries like France, Spain, Italy, Belgium or the countries of Central and Eastern Europe, due to differences between the culture of these countries and the U.S. U.S. is highlighted by a strong emphasis on pragmatism and profit maximization, organizational efficiency and productivity. In the U.S., hiring and dismissals are made as needed, management by objectives is the main method of assessing performance, management focuses on the idea of career mobility of employees at a large number of organizations, rewards are given based on performance work, and the relationship between unions and managers is an antagonistic nature.

The main values of Japanese culture are equity group, commitment, personal relations, work discipline, status, conflicts, and totally different from those promoted by the culture of western countries like USA, UK, France, where wealth, individualism, mobility power, authority and conflict resolution are the main cultural values. Compared to the U.S. human resource management, and Japan is characterized by long-term commitment to employees, employee involvement in the management of companies, promoting and rewarding based on the principle of seniority, and relations between unions and managers are dominated an attitude geared towards cooperation.

According to some experts, the European management is characterized by a lack of national identity management across Europe, compared with U.S. and Japanese management models. Changes in the European area are more complex than in the U.S. and Japan. Enlargement of the European Union to the south-eastern Europe, has generate a series of mutations in the economically, socially and politically field. Another dominant feature of European management is the need to develop new forms of work organization and enhance flexibility in business organizations in order to use the diversity and complexity of cultural, social, political, economic, to achieve competitive advantage. The European model of human resource management is characterized by a high diversity of economic, social, political and cultural property reflect the size, organizational, national and international corporate activity. Unlike the American model, is characterized by a high level of organizational responsibility and managerial support to employees and unions. Compared with the U.S., regulations on hiring and firing employees, education and licensing process to formalize training programs, reward system, the conclusion

and execution of individual contracts of employment is one of the main factors that define the application of human resource management in Europe.

Specific multicultural context of the European continent produces a number of major differences in the human resource practices, not only from one country to another, but even in the same country. For example, in Sweden, their application is used as a simple administrative tool, while in Britain it is mainly used as a tool for selecting candidates. Moreover, in Britain, the usual name of the form of employment is for employers Employer's application form, while the term is used in academic standard application form. In Luxembourg, a job interview is a more formal, while in Germany and the United Kingdom is well structured and the answers to the questions should be accurate and very clearly stated, leaving no room for interpretation. In Italy, a job interview is of a relaxed, free and informal. There are some differences between European countries in terms of selection criteria. If your skills and personality in Greece are the main criteria for selecting individuals in Germany and Britain put an emphasis on technical expertise and their previous work experience.

EU enlargement is the premise of increasing demands of work and living conditions across the continent. Very different rules on working and living conditions existing in the European Union for Romanian managers are very serious challenges that will have to align. Managers from EU are the main promoters of the concept of European career, career on EU is a direct consequence of the process of Europeanization. European Career management becomes an extremely important process, the emergence and development being favorably influenced the increasing population mobility in the European Union and multinational companies expanding operations in Europe.

The tendency in some companies from European Union countries is to secure European expertise through employees who have international experience and exhibit opening.

Evolution of human resource functions in Europe can be highlighted by current trends and future human resource management in Europe, for example:

- upgrading of human resources functions;
- training of human resources managers;
- "personalized" human resources management;
- adaptability and flexibility of human resource functions;
- mobilization of human resources;
- development of computerization and information resources.

ANEXA

EDUCATIONAL MANAGEMENT- AS THE RESPONSE TO THE SOCIAL-ECONOMIC CRISIS IN CONTEMPORARY EUROPE

Orțan Florica

Taking carefully into consideration the way in which emerged and evolved the actual economic and financial crisis, in Europe and in Romania, one can conclude that the educational management, as an academic program, or as a scientific research, can provide some solutions. First are analyzed the initiatives taken by the decision factors from the superior European education, in 1999, before the breaking out of the crisis, through the Bologna Convention. Due to the educational management's particularity to establish a communication channel between academics, specialists in educational sciences, educational institutions managers and political leaders, are presented the beneficial effects which a number of decisions like the stimulation of young people's interest for the studying of economical and entrepreneurial sciences, systematic programs open socially and culturally of knowing the foreign languages, the analysis of career's dynamic in parallel to the modernization of the career education, could have.

Educational Management- as the Response to the Social-Economic Crisis in Contemporary Europe

Orțan Florica

A few decades after the ending of Second World War, Europe was the witness of some velvet revolutions, including a bloody revolution in Romania, after which the communist system collapsed.

The hopes that accompanied the long period of transition and of adherence to the democratic traditions and to a united Europe were interrupted by a serious economic and financial crisis. As it is known, the crisis, which first started in The United States of America in 2008, expanded across Europe, a little bit later, but more violently in Romania where it surprised us extremely vulnerable and unprepared.

The main problem that we are facing is if the decisions of educational management from the level of a university or from a national and European level can contribute significantly to the attenuation of the actual economic crisis. We also ask, in a democratic way, which political decisions or of educational management can be taken and what their effects will be.

Let's determine some regulations taken by the European responsible factors before the bursting of the crisis. As it is known through the Bologna Declaration, from 1999, the responsible factors from the educational level initiated a long process of homogenization of European education, so that the education to be more efficient facing the severe social-economic problems of our continent. Studies have been restructured in order to make bachelor, master and doctor's degree aiming the compatibility between the academic educational systems and the introduction of transferrable credits. The transnational hypothesis of the university represents of course, an earlier challenge. We want to mention, in this context, the invocation of John Allen "which defines university like an organisation which can be reduced, almost entirely, at people, whose task, in a variety of roles, is to keep on searching the truth and the knowledge that will be disseminated, through communication, firstly among young people." (Stefan Buzarnescu, 2004, pag. 241). Such a definition corresponds to the conception of Paul Temple, who ironically observed that some universities were in the head of the complex process of internationalisation

and globalization which have acted as global market institutions. The internationalization of European higher education has been facilitated by the transferable credit system, which evolved in two phases:

- a. internal adjustment of universities, through the transformation of the old academic programs in the permeable system of transferrable credits,
- b. the establishment of a set of rules and procedures through which the credits to be recognized between universities and to favor in this way the students' and the teachers' mobility (Stefan Buzarnescu, 2004, pag. 253).

The illusion that through decisions taken by responsible factors, the European education could become harmonious in a short period of time and the circulation of scientific, technical and cultural information, was quickly crumbled. The spreading of transferrable credit system developed slowly, the students' and the teachers' mobility being delayed not only by financial and bureaucratic difficulties, but also by small number of universities which speak several foreign languages.

Given that Europe as a whole cannot respond promptly and appropriately to crisis calls, and national governments face increasing difficulties, the opportunities that appear at the level of some educational institutions from one country or another, are promising.

The current economical and financial crisis from Romania generated complex, unbelievable problems in all sectors of economic life, which continued to manifest themselves.

This brings us to a problem closer to our possibilities. What kind of decisions can we have, the specialists in educational sciences, in order to ameliorate the actual situation and in order to open more advantageous perspectives?

Even bigger hopes fall on the faculties with an economic profile, which could give economic and financial projects, through which we could decrease the most severe effects of the crisis.

What other solutions taken at an institutional level could have beneficial effects?

Let's take into consideration the cruel reality of intempemstive bankruptcies, the big number of firms which closed their activity and the fear that this process will go on, so that some activities will stop.

Political and legal regulations taken by the Parliament and the Government are decisive. Through these regulations they should promote the economical activity. The managers of the educational institutions could find their ways in this context giving a bigger attention to the economic and entrepreneurial training of the young people.

The economic sciences chairs could interfere supporting young people's interest for the economic preparation for the world of business. We could take into consideration not only measures that concern the number of students, but also the structure of the curriculum, giving a bigger attention to those subjects and modules that broadly speak about the beginning, the development and the efficiency of business.

The psycho-pedagogical sciences could also offer help if they would offer more efficient patterns for the career counseling. It has been observed that the complex activity of career counseling is appreciated as "a rational process of informing and testing the person counseled, the testing based on the use of quantitative evaluation" (G. Tomsa, V. Ionel, M. Popescu, 2008, pag. 478). It was also noticed that in counseling problems emotional and familiar aspects could appear. An important role occupy the individual preferences, the parents' and friends' advice. The career education appears to be a complex process where appears beside building a career or the decision to follow a certain career, elements more or less related, but also the knowing of the world of jobs.

The educational sciences can interfere in this direction for an appropriate knowledge of jobs, the accurate description of jobs and the study and hiring conditions and of course the salary.

Another set of decisions could be taken not only at the academic level, but also by the community leaders, starting from the reality that millions of young people and grown-ups are working in different European countries: Italy, Spain, Germany, etc.

In our opinion the best decision in this respect would be the multiplication of foreign language programs: English, French, etc. coordinated by the philology faculties in a large social opening. This kind of programs could be funded from European funds or budget resources.

The experience so far demonstrated outstanding skills in the field of information, which weren't supported enough by the political factors. At the academic level from the leaders' initiative and the chair of Informatics, systematic activities that attract the young people in this area could be initiated.

The specialists in the sciences of education are increasingly realizing the need for systematic studies regarding the dynamics of jobs in Romania on the whole or from certain areas, or European countries. It would be desirable a direct communication between the researchers and the decision factors from academic level and from the community level. We take into consideration not only the funding of these programs but also the quick dissemination of the conclusions.

The current economic and financial crisis has destroyed the myth according to which the educational management is and it should remain a neutral academic discipline and placed at a certain distance in reality. The specialist in educational management has the duty to discuss with the manager of an educational institution and after that in collaboration with other leaders and finally to extract well-balanced decisions, the only viable way to break the deadlock.

COMMUNICATION AND CONFLICT IN PUBLIC INSTITUTIONS

Ponea Constantin Ștefan

University of Craiova, Faculty of Economics and Business Administration Craiova

Crăciun Liviu

University of Craiova, Faculty of Economics and Business Administration Craiova

The importance given throughout the world to public management issues and especially to the quality of management process, having central coordinates the enhancing of the institutional capacity and building an effective and efficient strategic management, is a proven argument of the necessity of studying the phenomena that have an impact on the managers' activity.

There isn't any successful organization without conflicts. These should be regarded as a ubiquitous reality in the world of organizations. Conflicts are considered necessary to enable the development of the organization and to make conditions for change.

In Romania, in most organizations, not only private but also public, people work in a rather tense environment. It is known that employees from public sector are required to perform work at a very high standard on little money. This way may be explained the high percentage of work disputes. In the case of employment relationship, conflicts have a higher cost, but a hidden one, unexpected in the budget. Most organizations do not realize these costs result from poor management of conflict situations.

Managers' responsibility is to admit, control and solve conflicts so as to increase organizational performance, the first step in solving a conflict being to deal it as an opportunity. This research focused on the role of communication in the process of managing the conflict. To effectively reduce conflict, organizations must continually ensure that managers, through their personal style and behaviour, do not cause frustration, conflicts of personality or other type of conflict, and they reduce the probability of triggering conflicts through decisions, policies developed and conducted processes in the domain of communication,

The research undertaken in The Inspectorate of the Police of Mehedinti County is an opening for this distinct field of public administration. In the research conducted so far there is a focus rather on individual than on group or collective of employees and on particular aspects of daily activity occurred at work, the evaluations having a strong psychological character, neglecting the psycho-sociologic one. We believe that such an approach should be continued through an extensive research in all structures of the Ministry of Administration and Interior, especially in the current context marked by profound and numerous changes that generate conflict.

I.Introduction

Present reflections regarding organisation, especially of work, are oriented towards the identification of flexible and evolving forms that are able to prepare the development of the organisation under a strong competitive environment. Flexibility and evolution involve broadening the decisional horizon of managers and increasing the autonomy, the freedom to act of the subordinates. Both - the decisional horizon and the autonomy - depend on both the process of acquiring skills, as well as their vertically and horizontal transmission on any organization. The process of acquisition and transmission of competence is based on the access to knowledge of the human resources of the organization through a culture capable of assuring the multi-

dimensional integration of hierarchies. In such a culture, managers and subordinates come to understand and solve problems through communication that derives from strategic thinking. Organizational communication can be defined through a discourse for both overall economic and social agents and their employees. The first concerns of an organization are to address their employees. In this case, the organization has the ability to communicate to employees by talking about the production of goods, services, and their distribution. The organization informs its interlocutors, the employees, through a message whose content covers: the nature of activities carried out, structural organization, resources, operation and results. The overall messages for their employees means internal communication. Regarding internal communication, it should be noted that the organization faces a number of difficulties related to the needs and expectations of employees. They often perceive internal communication as a form of propaganda and they assimilate it to threats. Therefore, the organization must establish trustful relationships in order to avoid failures. The language necessary to render specific internal communication (the nature of the activities, perceptions, objectives, actions and constraints) is transposed into the internal communication strategy.

Communication plays a central role in the approach to optimize the organizational climate and thus in the overcoming conflict situations. Identifying the causes of conflict is an extremely difficult task, given that recent studies on the issue emphasize the need to take into account contextual factors and circumstances. It is therefore very difficult (if not impossible) the task of providing generalizing explanations to some fluid, particular situations. Causes of conflict are numerous. This is due to the complexity of relationships that arise from the interaction of the parties involved. If we use an economic term to describe this interaction, we could say that human relations are the "market" where the wishes and interests of each employee interfere. Depending on this individual goals there is set a relative balance of the social interactions. The balance of human relations is, therefore, the result of "supply and demand" from the market of individual goals. By extending this model to a larger scale, we could say that the balance is determined by the harmonization of general interest and it is characterized by the consensus of the parties. Or, in this space, communication is the only bridge between different interests or factions that lead to the strengthening of a common area of interaction between relational parties.

II. Research Methodology

Communication plays an essential role in conflict management. For this reason, it is strictly required to study how the communication process is carried out in public institutions. It was selected as object of study the Inspectorate of the Police of Mehedinti County. To investigate the views of employees, it was considered that such a quantitative research (survey) is the most efficient way, by administering a questionnaire. In the approach of designing the questionnaire, an analysis of instruments used to measure conflict issues was previously accomplished: Conflict Management Research, Teleometrie, 1996, Rahim Organizational Conflict Inventory I and II (ROCI-I and II) (Rahim, 2001) Questionnaire and the Decision Conflict and Cooperation (DCCQ) (Dalton and Cosier, 1989), etc. In addition, there are some instruments based on internet that measure aspects of conflict management (Psychtests.com, 2002). The questionnaires were selected because, in their development psychometric processes were used, thus demonstrating its empirical credibility.

Based on the study, a questionnaire was developed comprising 30 items of which five are signage referring to the employee. Of the 25 items related to the topic investigated, 23 have multiple items, while the other two involve the hierarchy of responses. The questionnaire was administered to employees of the Inspectorate of the Police of Mehedinti County. Data collection was conducted from the 18th September to the 25th November 2010 and the interviewed subjects were informed about the fact that the questions were designed to help

carrying out this work and their answers will be used only for that purpose, and their names will not be mentioned. There were administered 106 questionnaires. Before placing responses in the database, it has been made a preliminary analysis of the collected questionnaires. It was found that all 106 questionnaires are valid. Data processing was performed with SPSS software package, version 17.

III. The results of the research

When the behaviour of a manager is a direct or proximate cause of conflict, the effects are limited to the employees involved. But when this is an indirect cause or a basis cause, the behaviour of the manager affects management systems, which cause conflicts between lots of employees at their turn. The direct way of interaction between manager and employees represents a mechanism to reduce conflict conditions.

When asked how to carry out direct communication between superiors and employees, 75,5 % of the investigated staff declared that they discuss all the time matters of current activity, 12,3% said that this happens formally, during meetings, 10,4 % mentioned this sometimes happen and only 1,9 % state that there was never a consultation between them on current problems (Table no. 1.).

Table no. 1. Percentage of appraisals regarding the way employees discuss with their superior current problems

	Frequency	%	% cumulated
Yes, all the time	80	75,5	75,5
During meetings	13	12,3	87,7
Sometimes	11	10,4	98,1
No, never	2	1,9	100,0
Total	106	100,0

Effective and efficient communication depends also on the way we communicate in a certain situation, namely communication style. Communication style must be appropriate to purpose and objectives of communication, receiver, and communication channel (media) and communication context. In the process of organizational communication, the manager's communication style has an impact not only on the effectiveness and efficiency of communication, but also the climate of communication in general. The manager communicates in order to fulfill some definite and specific objectives and not for the pleasure to communicate. In order to fulfil the objectives, the manager, starting from a self-knowledge of trends, should have the flexibility, knowledge and necessary skills to adopt the appropriate style in a specific situation and context to each communication act.

Regarding the degree in which orders and instructions received from superiors are understood, as we can see in table 2, 80,2 % of those questioned consider that they fulfil this requirement, 9,4 % state that sometimes orders are clear, 9,4 % don't understand what are they asked to do and only 1 % sustain that orders aren't clear.

Table no. 2. Structure of employees' opinion regarding the clearness of the orders received

	Frequency	%	% cumulated
Yes, always	85	80,2	80,2
I don't understand what I'm asked	10	9,4	89,6
Often	10	9,4	99,1
No	1	0,9	100,0
Total	106	100,0

Managers always have preconceived notions, based on their roles and perspectives, on the way conflicts should be solved. They expect that their subordinates see things they way they see, but when employees act differently they expected, managers see this as a problem rather than a valuable resource. But actually, each person perceives the others and their environment in a unique way, especially when someone has a superior role, while the other person is a subordinate in an organization. Managers are focused on a general image, while most employees focus on details. Managers are responsible for others, while subordinates are responsible for themselves. Managers have more power, while subordinates have less. These differences and other determine different perspectives of managers and subordinates on conflict, and therefore, it is possible to have different opinions about solving. The questionnaire measured the extent to which employees are willing to offer a contrary solution to that offered by the manager (Table no.4). We notice that 62,3 % of respondents would expose an opposite solution, 22,6 % would expose it thoughtfully, 9,4 % wouldn't do that and 5,7 % justify the attitude not to proceed in such a manner to reduce chances of promotion.

Table no. 4. Assessment of the degree in which respondents are willing to present to the manager a solution contrary to his opinion

	Frequency	%	% cumulated
No, he doesn't bear to be contradicted	10	9,4	9,4
In no case, it would cost me the promotion	6	5,7	15,1
Yes, but with more cautions	24	22,6	37,7
Yes, if I have troubles	66	62,3	100,0
Total	106	100,0

In order to solve efficiently a conflict, managers must accept that thoughts, feelings and needs of the subordinates are justified from their perspective. This doesn't mean they have to agree with their subordinates; there will be cases when decisions should be taken and applied over their objections. However, this means that each employee's perspective is important and it should be included in decision making. This happens when the manager really listens, sides with employee's perspective to know how he feels and to put him in his place and considers that perspective as an element in decision making. This empathy encourages recognition and allows balanced and informed solving. More important, his presence will be obvious among subordinates and for finding solutions supporting the interested parties.

Regarding the manner of communication 35, 8 % of the employees consider that it's imperative to know the rules of communication 31, 1 % state that you must take into account the context, 17, 9 % bring honesty to the forefront and only 15, 1 % is on an opposite position (Table no. 5.).

Table no. 5. Communication with superiors requires the knowledge of the rules

	Frequency	%	% cumulated
Yes, certainly	38	35,8	35,8
Depends on the situation	33	31,1	67,0
Not necessarily	16	15,1	82,1
No, you only have to be honest	19	17,9	100,0
Total	106	100,0	

Source: Performed by the author

In terms of communication with colleagues, 73, 6% of the employees interviewed (Table no. 6.) state that is always beneficial, 25, 5% considers that the convenience of communication depends on context and 1% doesn't consider this beneficial.

Table no. 6. Do you consider beneficial to communicate with colleagues?

	Frequency	%	% cumulated
Yes, always	78	73,6	73,6
Depends on the situation	27	25,5	99,1
No	1	0,9	100,0
Total	106	100,0	

Source: Performed by the author

A system of solving conflicts should determine the employees to have more confidence to get involved and to provide direct information, with knowledge that any dispute will be solved correctly.

IV. Conclusions

In order to built and maintain confidence between employees, management should value all operational channels of communication, to have only one voice and to be perceived consistent. However, managers may be seen inconsistent and actually to be inconsistent – although they are sincere in their perspective. This can happen in various circumstances: when managers speak from different circumstances or perspectives, when someone presents details and someone else extensions, when managers reach different conclusions of the same facts and when on one or

more managers do not really understand real facts. This kind of circumstances probably exists between managers at different levels, who have different roles and responsibilities and therefore disseminate different types of information.

Management always takes decisions capable of causing conflicts because they don't listen to employees' needs. Communication exists, but there isn't a wish or a specific system to understand really what they say. An efficient system to solve conflicts involves a process of listening and improves the bottom-up communication. According to confidentiality obligations, the relevant data collected from cases handled by the system should return to management. This method provides the management valuable information regarding behaviour patterns, trends, and references of the employee or other problems existent in the labour system.

The research shows that the manager is, even in public sector, a major actor in reducing conflicts. The main way in which a manager can create an environment without conflicts is to create a climate based on communication.

Communication requires to each employee to balance the assertiveness of his views and concerns with the views and concerns of the other colleagues.

Communication is more than a way to solve conflicts. It may be used to achieve goals, to solve problems, to create new opportunities and realize other things that fulfill best the needs of interested parties.

THE ROLE OF THE E-PROCUREMENT IN THE PURCHASING PROCESS

Pop Sitar Corina

Fellow of the Romanian Academy

Iași Branch

This article aims to examine the role of the E-procurement forms in the six phases of the purchasing process. The paper starts with an introductory part about the purchasing process. Next, based on a literature review we selected and defined the most important forms of E-procurement. Furthermore, we develop a theoretical framework that suggests what form of E-procurement is best to use in every phase of the purchasing process. At the end of the paper we draw conclusions and we set some ground rules for managers regarding to the implementation of an E-procurement form.

*Keywords: purchasing, E-procurement; management, supply chain management, optimization
Coduri JEL: M15, 032*

1. Introduction

It appears that during the past few years purchasing has begun to play an ever more important role in the strategy of the firm (Weele, 2010). In order to survive, managers have begun to rethink their competitive priorities and their value chain. Increasing numbers of organizations have recognized that E-procurement holds the potential to transform their competitive performance for the better.

E-procurement has made substantial technological advantages over the past few years and is expected to continue improving efficiency and productivity in the future. Lederer, Mirchandani and Sims (2001) proposed that an organization could use the E-procurement forms to create strategic advantage through improved customer relationships resulting from greater business efficiency and better information access and flexibility.

A large number of E-procurement applications are available on the market and it could be hard for companies to know what application to choose and implement. Companies may answer the following questions regarding E-procurement:

- if they should implement E-procurement?
- it is really beneficial for them to implement E-procurement?
- what is the impact of implementing a form of E-procurement over the company?
- which form should they choose?
- how they should use E-procurement in every phase of the purchasing process?

The paper starts with an introductory part about the purchasing process. We provide several definitions of purchasing and we describe the phases of the purchasing process. Next, based on a literature review we present the main well known forms of E-procurement.

Furthermore, we present a theoretical framework that indicates what form of E-procurement is best to use in each of the six phases of the purchasing process. At the end of the paper we draw conclusions and we present some guidelines for managers regarding to the implementation of E-procurement.

2. The purchasing process

Over the time many definitions have been done for purchasing management. At the beginning, purchasing has been seen as an administrative and operational activity. Thus, it has been defined as follow as “buying the right materials, in the right quantity, at the right moment, at the right price and from the right supplier” (Heinritz, Farrwell and Smith 1986: 15).

Over the last decades, the definition of purchasing management became wider and purchasing has become a strategic activity for organizations. That is why it is defined as “the behavior of an organization towards its suppliers” (Gadde and Hakkansson, 1993: 8).

Van Weele (2010) defines the purchasing process as obtaining from external sources all the goods and services that are needed for maintaining and developing direct and indirect production activities in the best conditions. The author divides the purchasing process in two parts:

- tactical purchasing;
- operational purchasing

Each of this parts comprises three specific phases, resulting the following six phases of purchasing process:

1. *Specification* – this is the phase where all the needed materials and services for maintaining and developing direct and indirect production activities are identified.
2. *Selection of suppliers* – this phase consists in identification, evaluation and selection between different suppliers.
3. *Contracting* – in this phase the prices are negotiated and the contracts are concluded with the suppliers.
4. *Ordering* – in this phase goods and services are ordered from the selected suppliers with whom contracts have been done before.
5. *Monitoring* – this phase consists in tracking deliveries of goods and services that must be in accordance with those set in the contract.
6. *Evaluation* – in this final phase, the analysis of the purchasing process is done.

All of these phases are presented in the framework of the purchasing process (figure 1).

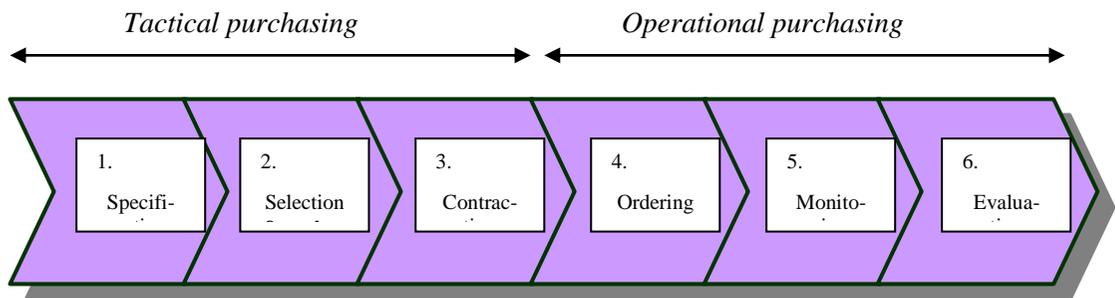

Figure1. The framework of the purchasing process

Source: Weele, A. J. van, *Purchasing and supply chain management*, Thomson Learning Business Press, London, 2010

In our view, the purchasing process consists in exploration, discovery and exploitation of markets and organizations that provide resources to obtain and use products and services in the best conditions.

3. E-procurement forms

The concept of E-procurement has many different meanings ranging from shopping on the internet (through reverse auction) to collaborative initiatives taking place in virtual meetings. There are more definitions given to the E-procurement. Van Weele (2010) considers that “E-procurement includes web technology-based purchasing solutions aimed at simplifying commercial transactions within and between organizations and information technology solutions for ordering, logistics and handling systems as well as for payment systems”. E-procurement is

defined by de Boer, Harink, Heijboer (2002: 120) as “using Internet technology in the purchasing process”.

A large number of E-procurement forms can be distinguished in the literature. In this article we choose to focus on the following forms of E-procurement (mentioned by Boer, Harink, Heijboer, 2002): *E-ordering*, *Web-based ERP*, *E-sourcing*, *E-tendering*, *E-reverse auction*, *E-informing*.
E-ordering

E-ordering focus on the process of creating and approving purchasing requisitions, placing the orders and receiving the goods and services ordered using a software system based on internet technology. An E-catalog is used by all the employees from the organization for ordering items that are needed. In the case of E-ordering the goods and services ordered are non product related (indirect goods and services).

Web-based ERP (Enterprise Resource Planning)

Web-based ERP is similar with the E-ordering, the only difference is that in the case of web-based ERP the goods and services ordered are product related.

E-sourcing

E-sourcing allows identifying new suppliers for a specific category of purchasing requirements using internet technologies across spatial boundaries. Most important benefits of E-sourcing are increased decision making flexibility and lower prices.

E-tendering

E-tendering is the process of sending RFI (request for information) and RFP (request for proposal) to suppliers and receiving their response using internet technologies. Often e-tendering is supported by an e-tendering system that can analyze the responses received from the suppliers.

E-reverse auction

E-reverse auction enables the purchasing organization to buy goods and services needed from the supplier that has the lowest price or combination of lowest price and other conditions as well using internet technologies.

E-informing

E-informing does not involve transactions but it handles gathering and disseminating purchasing information both from the internal and external parties.

4. The theoretical framework for the use of the E-procurements forms in the six phases of the purchasing process

Because of the variety of the E-procurement forms available on the market it is difficult for organizations to know which one to choose and how is best to use them during the purchasing process. Based on the E-procurement forms and on the phases of the purchasing process that we have presented earlier in this article, we created a theoretical framework that indicates what E-procurement form is best to use in each purchasing phase (see figure 2).

	<i>Specification</i>	<i>Selection</i>	<i>Contracting</i>	<i>Ordering</i>	<i>Monitoring</i>	<i>Evaluation</i>
E-ordering				* Cost savings Increased efficiency	* Cost savings Increased efficiency	* Cost savings Increased efficiency
				*	*	*

Web-based ERP				Cost savings Increased efficiency	Cost savings Increased efficiency	Cost savings Increased efficiency
E-sourcing	* Increased competitive force Cost savings					
E-tendering		* Time savings Less labor consuming				
E-reverse auction			* Cost savings Time savings			
E-informing	* Increased purchasing power Improved commercial relationships with suppliers Improved control over the purchasing process	* Increased purchasing power Improved commercial relationships with suppliers Improved control over the purchasing process	* Increased purchasing power Improved commercial relationships with suppliers Improved control over the purchasing process	* Increased purchasing power Improved commercial relationships with suppliers Improved control over the purchasing process	* Increased purchasing power Improved commercial relationships with suppliers Improved control over the purchasing process	* Increased purchasing power Improved commercial relationships with suppliers Improved control over the purchasing process

Figure 2: The theoretical framework for the use of E-procurement forms in the purchasing process

As you can see in this framework we indicate through an asterisk in which phase of the purchasing process is best to use the E-procurement forms. Beside this, we mention the major benefits that an organization can achieve using each E-procurement form. So, for example, E-ordering and Web-based ERP can be best used in the last three phases of the purchasing process (operational purchasing) and they can provide cost savings and improved efficiency of the purchasing process. E-sourcing is best to be used in the specification phase and can offer to the organizations increased competitive force and cost savings. E-tendering can be used in the selection phase and the major benefits that can provide are: time savings and less labor consuming activities. E-reverse auction is best to be used in the contracting phase and can offer cost and time savings. The last form of E-procurement, E-informing may be used in all six phases of the purchasing process and can provide the following benefits: increased purchasing power, improved commercial relationships with the suppliers and improved control over the purchasing process.

5. Conclusions

The framework that we presented in this paper is theoretical and it hasn't been tested yet. We have to test it in a number of organizations and to compare the practical results with the

theoretical ones. Based on the practical insights we will be able to draw conclusions and to improve the framework.

The theoretical framework can be used by managers as the starting point in the process of adopting and implementing E-procurement in their organizations. Managers have to analyze carefully what are the advantages that they can provide and what form of E-procurement is best to use in each phase of the purchasing process. They have to take into account also the main barriers that they have to overcome in the implementation process of the E-procurement. Only after this analysis they should decide if they will implement an E-procurement form and if yes what form to choose.

This paper aims at determining the main quality parameters of grain mill products in the Transylvania region, also studying and emphasizing the enzymatic activity of flour. Determination of quality characteristics of grain mill products entails establishing physical, chemical and sensory parameters and assessing them against the limits imposed by law.

Analysis was performed on samples formed by mixing basic medium extracted from different batches. Incremental size, sampling tools, how to extract them, the training sample and laboratory environments, packaging and labeling of samples were performed according to STAS 1068 69.

Determination of the fall (Falling Number), an empirical test that relies on the ability of endogenous α -amylase to reduce viscosity of the treated warm flour suspension is used, large scale milling and bakery industry to predict and assess the Baking quality of flour. In sprouted wheat, characterised by a low Falling number, dextrin produced by the action of α -amylase leads to a sticky bread core. Experiments suggest that the values fall turnover (FN) does not shrink in direct proportion to the percentage of germinating seeds. Amylolytic activity depends on the stage of sprouting of grains. Lack of α -amylase activity can be corrected by adding malt grain α -amylase or fungal α -amylase.

Keywords: quality control, parameters, grain mill products, α -amylase activity, Transilvania, food quality

1. General aspects

Enzymes are used for a long time to convert complex carbohydrates in the fermentation processes. Except for sugar processing and use of glucose isomerase cyclodextrin glycodextriltransferase, enzymes are used for hydrolysing carbohydrates, with reducing the size of macromolecules as the main transformation suffered.

Enzymes carry all biochemical transformations. Amylase is an enzyme that hydrolyzes amylose, breaking down a specific glycosidic linkage in starch to yield its degradation products in the form of oligosaccharides. Amylase participates in numerous biological processes such as maturation and germination of cereals or in the digestion of starchy substrates by animals and

microorganisms. They are, on the other hand, of significant importance in industry, where their ability to depolymerised starch is paramount in the preparation of glucose syrup or bread. The objective is to transform bakery flour, plus possibly other ingredients (yeast, salt, malt, milk fat) in food preparation and easily preserved by operation of alcoholic fermentation and baking. Alcoholic fermentation is a clear step to understand the role of amylase.

Amylolyze is the process of hydrolysis of starch under the action of α and β amylase. The process is particularly important in dough of flour because its sugars are insufficient to maintain throughout the fermentation in the technological bakery process. Bread obtained only from the fermentation of carbohydrates originating in the flour has a low volume, is dense and undeveloped. Maltose derived from starch hydrolysis is the main sugar that is fermented and thus provides the necessary amount of gas in the final part of the technological process. For this reason, the starch is considered as the main source of carbohydrates in the dough leavening process. In a normal bakery is 6 ... 12% hydrolysed starch in dough. Amylases allow the production of glucose and maltose, which are then fermented; a poor fermentation, resulting in an increase of less than bread. Low percentage of carbohydrates in the flour initial content (0.5 to 2%) involved a hydrolysis of starch in the proportion of 1-2%. The action of amylases in the dough is influenced by environmental conditions: the degree of hydration of the dough, temperature and state of degradation of starch granules. Baking dough cause a gradual increase in internal temperature, with dual action on enzymatic activity and physical state of starch. However, the surface temperature will be about 250 °C. During temperature increase, there is a short period or longer (depending on how baking is done) in which enzymes can act. Amylase is activated by adding water to the dough during the manufacturing.

Dough fermentation and, especially, the production of carbon dioxide are related to the presence of fermentable carbohydrates. The α -amylase activity has a significant effect on excessive water absorption capacity of the dough and the core training. An excessive activity causes an overproduction of dextrin, which leads to a colourless core with large pores, and a colourful crust. The ratio of α and β amylase activity influence the quality of bread. If there is an excess of α -amylase against β -amylase, not all dextrin will be hydrolysed and this leads to the formation of a sticky dough.

2. Experimental part

The determination principle consists in jellifying of flour suspension in a test-tube located in a boiling water bath and measurement of gel liquefaction degree under the influence of amylase. The falling time of grain and its products is the activity criterion of α -amylase enzyme which occurs in small quantities in grain when they are correctly grown and gathered in dry conditions. In conditions of increased cereal moisture, above 15%, especially when crops are gathered in unfavourable weather conditions, activation of α -amylase occurs, which results in starch damage. Dough made of such flour has disadvantageous physio-chemical properties which negatively influence the quality of bread. Therefore, the determination of the damage degree of grain and their products allows classifying and using cereals differently, for example:

- as feed
- in mixtures of damaged cereal and grain not affected by α -amylase
- development of individual technological processes with addition of “improvers” to avoid unexpected losses

2.1. Working mode

Falling-number Hagberg Method (Hagberg, 1961) is a method based on autolytic degradation of starch in starch milk by α -amylase. An increased α -amylase activity resulting in a low viscosity, which is defined as the time in which a metal rod falls through the starch gel. The method is used,

broadly, to measure the trade of grain sprouting. Also, endogenous enzymes are known for their adverse effects when sprouting before harvest.

Pre-harvest sprouting of grain shows the effects of enzymes during germination and also influences the milling industry, bread and beer.

Index fall (Hagberg index) provides information on amylase activity (in α -amylase) and on the process of fermentation that occurs in wheat flour dough. Fall index values are inversely proportional to amylase activity.

Table 1. Index values fall and their influence on flour

Drop index (in seconds)	Comments
60 – 150	Increased amylase activity. This flour is made from sprouted grain bread and its use leads to the core that remains tacky and immature. It is almost useless, unless it is mixed, as appropriate, with other flours with high drop index.
150 – 220	Amylase activity superior to that which is normal. This requires a correction by mixing flour with the flour with the index falling sea or by using special methods of making bread
220 – 280	Normal amylase activity.
> 280 – 300	Low amylase activity. Using these results in bread flour that is not developed, small and middle volume too dry. Requires addition of diastases malt.

Drop method is used for the samples which contain starch as a substrate. It is based on rapid jellifying of flour suspension in a boiling water bath and measuring the gel liquefies under the action of α -amylase.

Equipments:

1. Falling Number Mill 3100 or 120 with a grid $\phi=0.8\text{mm}$;
2. Falling Number device.

Method:

Crush 300 g of wheat to a mill Falling Number. The water bath device is inserted to mark water and bring to boiling temperature is maintained throughout the determination. Weigh $7 \pm 0,05$ g flour, are inserted into the tube viscometer were previously added 25 cm³ of distilled water at 200C with a rubber stopper and shake 20-30 times, until smooth.

With mixer viscometer loose particulate flour that joined the wall of the tube, then insert the tube with mixer viscometer bath water and start the device. Just after 5 seconds after inserting in the bathroom starts shaking suspension in the tube. After 59 seconds stir bring superior position (up or automatically) and after 60 seconds (5-55) falls under its own weight of flour heated gel at a speed that depends on the degree of liquefaction of starch gel.

Time measured from the time the tube viscometer bath water and stirs until it falls on a given distance, expressed in seconds and does the number of falls. Media repeated measurements differ by max $\pm 5\%$. The α -amylase activity Is relationship between the number of drop C inversely and expressed by calculating the „number of softening”

With the number of softening we may calculation the flour mixture with a certain number of falls, from lots of different qualities, so that the processing technology resulting in better quality products.

3. Results and discussion

Samples analyzed were purchased from different locations in the region of Transylvania. For each sample were made ten determinations of the index falls. The average value of determination is placed in the table below.

Table 2. Amylase activity

Sample	Determination value Ic (sec)	Normal value Ic (sec)	Observations
1- Gambas (Alba county)	250	220 – 280	Normal amylase activity.
2- Gambas (Alba county)	220	220 – 280	Normal amylase activity
3- Gambas (Alba county)	217	220 – 280	Normal amylase activity.
4- Aiud (Alba county)	243	220 – 280	Normal amylase activity.
5- Ghirbom (Alba county)	276	220 – 280	Normal amylase activity
6- Blaj (Alba county)	336	220 – 280	Low amylase activity. Using this flour has resulted in bread that is not developed, with low volume and very dry pulp.. Require the addition of diastatic malt.
7- Craciunel (Alba county)	225	220 – 280	Normal amylase activity.
8- Valea Lunga (Alba county)	375	220 – 280	Low amylase activity. Using this flour has resulted in bread that is not developed, with low volume and very dry pulp.. Require the addition of diastatic malt.
9- Blaj (Alba county)	319	220 – 280	Low amylase activity. Using this flour has resulted in bread that is not developed, with low volume and very dry pulp.. Require the addition of diastatic malt.
10- Valea Lunga (Alba county)	322	220 – 280	Low amylase activity. Using this flour has resulted in bread that is not developed, with low volume and very dry pulp.. Require the addition of diastatic malt.
11-Lancram(Alba	264	220 – 280	Normal amylase activity.

Sample	Determination value Ic (sec)	Normal value Ic (sec)	Observations
county)			
12- Lancram(Alba county)	282	220 – 280	Normal amylase activity.
13-Lancram(Alba county)	252	220 – 280	Normal amylase activity.
14- Galda de Jos(Alba county)	270	220 – 280	Normal amylase activity.
15-Galda de Jos(Alba county)	212	150 – 220	Medium activity of alphaamylase
16- Ighiu(Alba county)	193	150 – 220	Medium activity of alphaamylase
17- Ighiu(Alba county)	195	150 – 220	Medium activity of alphaamylase

4. Conclusions

Determination of the fall (Falling Number), an empirical test that relies on the ability of endogenous α -amylase to reduce viscosity of the suspension treated warm flour is used, large scale milling and bakery industry to predict, assess the Baking quality of flour. Falling number – index drop is inversely proportional to α -amylase activity of flour and acceptable field depends on cereal product. In the wheat sprouted, with a low Falling number, dextrin formed by α -amylase action leads to a bread with sticky core. It was found from experiments that the values fall turnover (FN) do not shrink in direct proportion to the percentage of seeds germinate. Amylolytic activity depends on the stage of sprouting of grain. Lack α -amylase activity can be corrected by adding malt grain or fungal α -amylase.

The present research aims to establish and configurate human resources development strategies for the employees of small and medium-sized enterprises (SMEs) that activate in the tourism field of activity (hotels and other accomodation establishments, restaurants, passenger transport, travel agencies, cultural turism agencies). As knowledge role in the contemporary economy is increasing and defining the economical and social context as knowledge-based ones, we shall consider the research frame as the knowledge-based economy.

Moreover, in order to better highlight weaknesses and strenghts of the human resources management approaches and to define recommendations, our research theme is developped as comparative study: similarities and differences within SMEs human resources management practices in Romania and other European Union's country members (the example of Spain was considered).

Keywords: human resources, motivation, profitability, SMEs, tourism

The article's JEL code: M3, M31, L81

Introduction

Our goal is to identify and formulate proposals aimed to improve the SMEs activities and performances from the perspective of the human resources management, as we believe this situational context represents a scientific and practical challenge.

We have chosen the human resources area for our investigation because human resources development (HRD) has gained a permanent role within SMEs (Beardwell, Holden, 2001: 272-273), agencies and nations, increasingly not only as an academic discipline, but as a central theme in the development area (Popescu et al., 2010: 49). Being a combination of training and education, in a broad context of adequate human resources policies (Sutherland, Canwell, 2004: 163-168), HRD ensures the continual improvement and growth of both individual and organization.

SMEs represent the most numerous and important category of enterprises, with multiple economic, technical and social functions (Popescu et al., 2010: 51). SMEs are the most dynamic and vital factor of progress in the contemporary society, main generator of economic performance and substance in any country, major contributor to the national budget, and engine to improve the living standard of the population (www.europa.eu.int/comm). Representing 99% from all enterprises, SMEs are drawing up the main human resources agglomeration. Furthermore, SMEs generate the most of Gross Domestic Product (GDP) in every country - usually 55%-95%, provide employment for most of population (www.europa.eu.int/comm).

In the context of The European Union forming a group of countries with the most intense concerns and performance in supporting and encouraging SMEs, *globalization* involves an uniformization of managerial practices and organizational behaviours (Yamnil, McLean, 2001: 195-208). This is an additional a reason to adopt a comparative approach of HRD from EU countries.

Investigating the correlation between managers approach to motivating the human resources and organizational activity performances, represents the start-up of a research that could lead us to results to be developed afterwards. For instance, the influence of superior-trained and well-motivated human resources on the SMEs outcomes, can be extended to the influence upon the tourism domain and the economy service sector.

Main objective of the paper:

The present paper aims to analyze, as a consequence of managers opinion regarding human resources management, the compatibility between positively motivated employees and superior performances of the SMEs they belong to.

Secondary objectives of the paper:

- to set-up an economic interpretation for *motivated employees (positively or negatively)*, considering the similarities and differences between European Union's country members;
- to establish in what measure positively motivated employees can provide a competitive advantage for the Romanian and Spanish SMEs.

Hypothesis of the research

Three main hypotheses were formulated relevant to the role of human resources motivation and development in SMEs on one side, and sustainable economic performance on the other side.

Based on the previous objectives, the research hypotheses are:

- 2.1) Within the organization, employees represent an important, strategic resource, main creators of economic added value and economic performance.** The rise of the service economy, the increasingly flow of global information, and the growing recognition of the importance of intellectual capital are turning employees knowledge and abilities into a key resource and a source of competitive advantage for the organizations in the global economy;
- 2.2) Based on the human resources management practices, SMEs managers could favourize the compatibility between positively motivated employees and superior performances of the enterprises they belong to;**
- 2.3) Within the contemporary economic context, SMEs development and performance can be achieved by human resources development programmes and concerns, through learning activities and knowledge-based activities, especiallz if we consider that HRD:**
 - a) depends on *the employees education level* and on *the facilities employees have at ther work place;*
 - b) can take place in the organization (*indoor development*) or outside the organization (*outdoor development*).

In order to test these three hypotheses, as a continuation of a research started in 2000, connected to SMEs birth rates and death rates, a number of 117 managers and entrepreneurs were interviewed. The results of these interviews were analyzed in the following empirical part of our paper.

Methodology research

The methodology used is a logical consequence of *the research questions applied within the survey*, representing a first step in choosing the qualitative/quantitative approach (www.socscidiss.bham.ac.uk). For our research, the key question is: *In what measure managers from the SMEs that activate in the field of tourism consider that positively motivated employees determine highly organizational performances?*

We have chosen *the qualitative path* as it refers to managers opinion upon employees motivation-employees performance connection.

Acknowledging the importance of HRD and SMEs performances, we realized a study on a sample of 117 respondents that belong to SMEs from tourism domain: *Accommodation, Restaurants, Passenger Transports, Travel Agencies and Cultural Tourism Organizations*, from different regions of the two countries taken into consideration, measuring 19 variables. The results are based on a *study performed in September and October 2010 in different regions of two European Union's Country members (Romania and Spain) and confirms the research hypothesis regarding DRU and its contribution to SMEs performances*.

Research design: in fundamenting the research, we have taken into consideration the numerous answers received from the 117 respondents. Each question was formulated in order to answer, directly or indirectly to the research hypothesis. The questionnaire includes general, easy-to-answer, closed questions, in order to make the tasks easier for the respondent. A second part is reserved to issues regarding the SMEs profitability and economic performances (Howell, David, 1997: 120-129) and the third part refers to human resources performances. The main purpose of the research is strongly connected to the answers received from the second and third part of the questionnaire.

The data was analyzed using *Statistical Packages for Social Scientists (SPSS) 16.0* and yielded multiple results that are presented sintetically in the present paper. Therefore, the most significant results are highlighted, with a focus on the profile characteristics, and the detailed secondary correlations (Cohen, 1988: 81-95).

Work method: Primary data, through **structured questionnaire**, were collected from a sample of 117 respondents (response rate of survey: 56,80%), randomly selected from among the SMEs engaged in tourism types of activity. The survey elaborated by the researchers group consisted of 20 items. The research adopted a survey method to collect data on the **SMEs general characteristics** (*field of activity, form of propriety, market experience, geographical position, legal form of organization*), **organization performance** (*turnover and profit evolution, tangible assets contribution, average number of services, organization's turnover structure, first three clients and suppliers importance*), **human resources performance** (*employees level of motivation, education, average number of training days, average wage, facilities for employees*) - (Mintzberg, 2004: 87-89).

Results of the study

From all 117 respondents, 86 are from Romania and 31 are from Spain. Both for countries, the micro and small enterprises (less than 49 employees) number is higher than medium ones (more than 50 employees), due to the fact that their number (as a general tendence) is smaller and, also, due to contextual barriers (the access for organizing an interview may be more reduced).

All organizations that have participated to the survey were clasified into two main categories, according to the size criterium: small enterprises (0-49 employees) and medium enterprises (more than 50 employees). As we expected, the survey demonstrated that the majority of the answers came from the small enterprises.

Encouraging harmony and work confort by giving equal material advantages to employees (bonuses, prises, professional and leisure facilities, agreeable work climate) is a management

practice in SMEs. Comparing the two set of results (Romanian and Spain SMEs), the first information is that both romanian and spanish managers do not agree to identical type of motivation for different employee performances. Meanwhile, within spanish SMEs the attitude towards this hypothesis is rather uniform distributed between neutral, agree and strongly agree alternatives, spanish managers tend to agree (more than 60% of the respondents from all types of touristic organizations). This indicates a general concern of the managers to different approaches of personnel motivation according to distinct performance levels. The questionnaire results infirm hypothesis 1 and sustains the human resources complex approaches within SMEs from a service field of activity.

Not giving any suplimentary advantage to employees, except the wage could generate the same organizational performances, as no employee would have the tendence to leave his working places, given the dificult present economical and social conditions. The global economic crisis also affected the tourism domain. This fact is confirmed by the managers' answers related to suplimentary motivation elements for their employees: as for Romania and Spain, most of the answers correspond to *neutral, agree and strongly agree* alternatives. Being aware of the lack of alternatives of their employees, managers do not concern seriously about special types of motivation and act mostly guided by predetermined arguments: employees do not have any alternatives for leaving the job, so there is no need for management to make special effort in human resources motivation. This types of managerial behavoiur confirms hypothesis 2.

In order to achieve a competitive advantage, SMEs need to be able to learn faster than their competitors and also develop a responsive culture (Richman-Hirsh, 2001: 105-120). In light of these pressures, modern organizations need to maintain knowledge about new products and processes (Wells, Schminke, 2001: 135-158), understand what is happening in the outside environment and produce creative using the knowledge and skills of all employed within the organization. This requires co-operation between individuals and groups, free and reliable communication, and a culture of trust (Yamnil, McLean, 2001: 73-84).

Stimulating competition between employees, and giving them material and unmaterial advantages, according to their work results is the best way to high organizational performances. Answers to questions related to hypothesis three of the research, indicates a active preoccupation of managers for rewarding employees after the work effort was made and economic performances were registered. According to the managers' answers, more than 85% of all types of the questioned enterprises choose to motivate their employees according to their prevoius performances. Hypothesis 3 is confirmed.

All these considered, key-changes involving the transition to a competitive SMEs sector should take into consideration the following: creating and implementing human resources development strategies of SMEs, as a prerequisite to increase their performance in the new socio-economic context (Campo-Martinez *et al*, 2010: 862-870). SMEs tend to give greater importance to human resources than larger organizations, because of the simplified hierarchical structure, which promotes greater interaction between management and execution personnel, and, furthermore, higher interest and commitment of organization employees. In our opinion, another sollution represents innovation support within SMEs, fact also sustained by development and implementation of the scientific progress.

Variables used within the research: organization economic performance (OEP), human resources material motivation (HRMM), human resources unmaterial motivation (HRUM) are presented in Table 1.

Variable name	Measurement scale	Variable type	Definition
<i>OEP</i>	Numerical (1-10)	Endogenous	<i>Organization economic performance</i>
<i>HRMM</i>	Numerical (1-5)	Explanatory	<i>Human resources material motivation</i>
<i>HRUM</i>	Numerical (1-5)	Explanatory	<i>Human resoruces unmaterial motivation</i>

Table 1: Main Variables Used within the Research

The results are presented in Table 2.

Explanatory variables	Total sample 117	Medium Romania	Medium Spain	Small Romania	Small Spain
Mean value for OEP	8,33	9	8,30	7,25	8,05
Standard deviation	1,1413	1,1265	1,396	2,527	1,322
Varinace	1,996	1,600	1,949	6,385	1,748
Mean value for HRMM	3,95	4,30	4,38	3,93	3,92
Standard deviation	0,760	0,825	0,707	0,704	0,688
Varinace	0,578	0,678	0,500	0,495	0,474
Mean value for HRUM	3,14	3,13	3,14	5,50	1,67
Standard deviation	3,185	2,031	2,167	8,296	1,029
Varinace	10,142	4,125	4,695	68,818	1,059

Table 2: Mean Value for the Variables Used within the Research

Some of the significant findings of the study tested under *the standard deviations* and *variance* assumptions are given below.

The importance given by managers of tourism enterprises to organizational performance tends to increase as the size of the firm becomes larger (from small to medium enterprises).

The importance given to *Human resources material motivation* is not distributed similarly across small and medium enterprises; managers are more likely give importance to employees' material motivation than to unmaterial forms of motivation. The use of unmaterial motivation is not correlated with the main variable – organization economical performance –fact sustained to the extremely high variance value (10,142). The dependent variable *Human resources material motivation* proved to be associated with the independent variable *Organization economic performance*. The standard deviation measures the error of the assumed association between the independent variable *Organization economic performance* and the dependent variable *Human resources material motivation*, with result less than 1 (0,760) – the error is accepted.

Conclusions

The results of the study demonstrate that managers opinion regarding the way employees should be motivated corresponds with the research hypothesis: a different type and form of motivation should be applied for every employee, according to his/hers work results and performances. Furthermore, the learning capacity and knowledge sharing within SMEs consists of maintaining levels of innovation and remaining competitive, being better prepared to respond to external pressures, improving corporate image by becoming more people orientated. At the organizational level, a successful human resources development programme will prepare the individual to undertake a higher level of work. Hypothesis 1 and 2 are confirmed.

Our research results confirm hypothesis 3: HRD has gained a permanent role within SMEs and ensures the continual improvement and growth of both individual and organization.

As part of the overall development strategy, HRD mainly refers to skilful provision and organization of learning experiences, in order that business goals and organizational growth can be achieved.

OPPORTUNITY TO REDUCE RESISTANCE TO CHANGE IN A PROCESS OF ORGANIZATIONAL CHANGE

Predișcan Mariana

West University of Timisoara Faculty of Economics and Business Administration

Săcui Violeta

West University of Timisoara Faculty of Economics and Business Administration

This paper aims to present the research results conducted on several models of organizational change regarding the identification of the appropriate moment in which the managers' interest should turn towards the reduction of the employees resistance to change. More specifically, we intend to identify when is the best moment to reduce the resistance to change, depending on the change we want to achieve.

Keywords: organizational change, resistance to change, success, opportunity, organizational change model

Cod JEL : O30, O39

Introduction

Successful organizational change depends on many factors. Managers may intervene on some factors and thus can use these as levers in order to reach the established objectives set by the desired change faster and to a greater degree. In the case of other factors, specialist intervention is unnecessary, since specialists can not create the effects on the final outcome in a process of organizational change.

Through this work we don't aim at identifying all the factors on which managers can intervene in order to ensure higher chances of success for a particular change. Our focus in this work turns towards two factors that can ensure a high degree of success of a change. One of these refers to the efficient and effective reduction of the resistance to change of the employees affected by the change. Another one, equally important, is represented by the completion of the actions meant to lead to the implementation of the desired change in a logical manner, well structured and with clearly defined objectives at each step. In other words, the need that an implementation of a change be not chaotic, but to follow a change model, a process of change that would include a clear chain of steps, of stages that need to be completed. This is the reason why many management or organizational change management specialists have suggested change models on which the process of change should be based. Given the fact that the changes that may take place in an organization are extremely diverse, the models recommended by experts for their implementation in the organizations are also extremely diverse.

Models of organizational change

Many specialists concerned with making changes in organizations have proposed, for a greater success of those changes, also a plan of action, an order in which certain activities were recommended to be carried out. This led to the current situation that literature abounds in such theories and models of organizational development and change.

A. Van de Ven and S. Pool (1995) have concluded, after the studies conducted, that the processes of development and change in organizations are explained by experts through four types of theories. These are:

- life cycle theory;
- teleological theory;

- dialectical theory;
- evolutionary theory

Each of these theories shows that change is taking place after a certain sequence of phases of the process (different sequences), in which the mechanisms that take place are customised. In order to see the specific change processes, researchers often combine elements of the four theories presented above. Each of the four theories provides a way to describe the process of change in an organization which actually represents a model of organizational change.

R.M.Kanter, B.A.Stein, Tood D. Jick (1992) conducted a comprehensive analysis of representative models of organizational change. They argue that organizational change is usually modeled as a three-part process. In support of this assertion, the authors indicated above summarize in a table the stages to be completed, according to different specialists, so that change take place.

Table 1. Models of organizational change

MODEL	PROCES		
Lewin(1947)	Unfreeze	Change	Freeze
Beckhard și Hariss(1977)	The current state	The transition state	The future state
Beer (1980)	Dissatisfaction	Process	Modeling
Kanter (1983)	Separation of tradition and crises	Strategic decisions and the first movements	Action and institutionalization
Tichy și Devanna (1986)	Act I Awareness	Act II Mobilization	Act III (Epilogue) Empowerment
Nadler și Tushman (1989)	Energizing	Vision	Posibilizare

Source: R.M.Kanter, B.A.Stein, Tood D. Jick - *The challenge of organizational change*, Free Press, New York, 1992

The specialty literature of our country proposes two representative models of organizational change: the Popescu - Florescu model in 1988 and the Predișcan model in 2001.

Research results

We have considered several models of organizational change and we have noticed that there are many models that do not contain explicitly the step of reducing resistance to change (Moorhead - Griffin 1998, 2009, Lewin 1947, Beckhard and Hariss 1977, J. McCalman and R. Paton 1992, Block 2000, Cooperrider 2003). A relevant example is the model Florescu and Popescu (1988) where the step of reducing resistance to change does not exist. In many models the phase of reducing resistance to change can be inferred from the presentation of actions that aim at making people believe that the proposed change is necessary, even if the name of this stage is not explicitly presented (Kanter 1983, Tichy and Devanna 1986, Nadler and Tushman 1989, John P Kotter in 1995 and 2002).

Kotter's (6) eight step change model can be summarised as:

- 1. Increase urgency** - inspire people to move, make objectives real and relevant.
- 2. Build the guiding team** - get the right people in place with the right emotional commitment, and the right mix of skills and levels.
- 3. Get the vision right** - get the team to establish a simple vision and strategy, focus on emotional and creative aspects necessary to drive service and efficiency.
- 4. Communicate for buy-in** - Involve as many people as possible, communicate the essentials, simply, and to appeal and respond to people's needs. De-clutter communications - make technology work for you rather than against.
- 5. Empower action** - Remove obstacles, enable constructive feedback and lots of support from leaders - reward and recognize progress and achievements.
- 6. Create short-term wins** - Set aims that are easy to achieve - in bite-size chunks. Manageable numbers of initiatives. Finish current stages before starting new ones.
- 7. Don't let up** - Foster and encourage determination and persistence - ongoing change - encourage ongoing progress reporting - highlight achieved and future milestones.
- 8. Make change stick** - Reinforce the value of successful change via recruitment, promotion, new change leaders. Weave change into culture.

In several stages of this model, even if it is not said that the aim is to lower the resistance to change, it is recommended that managers use methods, techniques and procedures aimed at exactly that. These are: communication, positive motivation, encouraging people, etc..

In other models of change this stage is explicitly presented, is given great importance in the change process and is usually positioned before implementing the change. An example is the model presented by J. Ivancevich, James H. Donnely and James Gibson (1989). According to this model, organizational change can be done after following the following steps:

1. Understanding the factors that trigger change
2. Recognition the need for change
3. Diagnosis of the problem
4. Identification of the methods and alternatives that will make the change
5. Presenting the existing conditions
6. Selecting the method
7. Overcome the resistance to change
8. Implementing and coordination of change.

It may be noted that the authors located stage 7 (overcoming resistance to change) before the implementation phase.

In 2001, the model of organizational change proposed by M. Predișcan to be used in particular for achieving strategic large-scale changes in an organization, presents explicitly within the second phase of the model, the phase of reducing resistance to change.

The Predișcan model suggests the following steps and phases.

1. Awareness of the need for change
 - 1.1. Data collection and analysis;
 - 1.2. Identifying the need for change;
 - 1.3. Evaluation of change and choice of the best variant(s).
2. Design of the change
 - 2.1. Develop the implementation schedule of the change;
 - 2.2. Reducing resistance to change;
3. Implementing change
 - 3.1. The actual implementation
 - 3.2. Monitoring, analysis and evaluation of the results
 - 3.3. Improving the change

This model also establishes the actions meant to ensure the reduction of resistance to change before the transition to the implementation of the desired change.

The importance of the actions of reducing resistance to change is particularly large in any process of organizational change. Not infrequently, the failure of a change was given by the opposition of the employees who did not understand well enough the purpose for which the managers wanted to accomplish that change. Of course that the greater the number of employees affected by a change, the greater is the effort that managers need to submit to gain their commitment to change. Obviously not only the number of employees influences the degree of the managers' efforts, or the necessary time to effectively reduce human resistance to change. Analyzing two different organizations we will find that the force with which employees oppose to a change differs greatly. The employees opposition to the managers proposals may be different from one organization to another, from one employee to another, from one change to another, it may strengthen or, on the contrary, weaken, depending on the expression of the following elements:

- organizational culture
- characteristics of the environment in which the organization operates;
- the nature of the activities of the organization;
- emergency of change;
- the extent to which the rhythm of change required by managers is supported by employees;
- management style;
- type of organizational structure;
- the quality of the organization's information system, etc..

There are many situations in organizations when it is necessary to make emergency changes. In such moments there is time to perform all phases of a traditional process of change. Obviously we will not have time to plan the change, and the time that we have available for making a change in practice is extremely short. In such circumstances it is necessary to carry out required changes.

We propose for these cases even a reversal of the order of the stages of a process of organizational change. For the changes required in crisis situations, we recommend the following steps:

1. Identify necessary changes
2. Implementing change;
3. Reducing resistance to change.

The first stage of the process is no longer based on a comprehensive analysis of environment and internal environment of the organization. In crisis conditions it is easier to identify the type of change needed because the events that occurred and resulted in a crisis situation are known. Starting from the effects of these events on the organization it is tried that by identifying the necessary change, the bad influence of these events on the organization be corrected.

After having answered the question: What is to be changed?, we recommend to proceed urgently to the implementation of the changes identified as necessary.

After the change has been implemented we recommend the third stage to be followed as well, that is, the reduction of resistance to change. Otherwise, the chances of successful long-term changes may be affected by further reactions of opposition of the employees.

Conclusions

After more research of organizational change models, we have reached the following conclusions:

- not all models of organizational change present reducing resistance to change as a necessary stage;
- the place of this phase in the models of organizational change is not considered to be the same;

- some models of organizational change recommend indirectly reducing employee resistance to change by indicating the use of some methods, techniques, processes that would lead to this result. Here we include mainly: communication, training, positive motivation of employees;
- we recommended that the place of this stage should vary depending on the desired change to achieve;
- in strategic changes, which are extremely important for an organization and which affect a large number of employees, we recommend that the reduction of the employee resistance to change be achieved before passing to the implementation of the plan developed to implement the change;
- in imposed changes, in conditions of crisis when we have no time available to plan the change, immediately after it had been implemented it is necessary to conduct effective actions meant to ensure, even if the change has been made, the reduction of the resistance to change of the affected employees
- to achieve time savings in the process of organizational change, we recommend that after having obtained a certain attachment of some employees to change, the implementation of the methods, of the techniques that would increase their commitment to continue to be developed in parallel with the implementation of the change.

What is competitiveness – a performance result or a driver of future performance? Competitiveness is both a result and a cause and therefore it is a controversial issue that requires continuous investigations to consider the permanent dynamics of the involved variables. Organizational competitiveness is influenced by a multitude of factors. Some of the variables are not controllable, yet others may be influenced as well. The most important example is the managerial system, which is a complex, yet controllable variable.

This paper aims to propose a conceptual model to analyze the relationship between management and organizational competitiveness. The major factors presented and directions for future research are suggested according to the proposed model containing a series of dependence and inter-dependence relationships that were empirically tested. Our results are based on processing information after applying a questionnaire to organizations of different scales and from different fields of activity in two periods of time, in order to see the causal relationships and the transformations over time. The general model was actually developed in an initial form by one of the authors in her PhD. research and is further developed in this paper, by following a multidisciplinary approach and by taking into account many aspects developed by different specialists in the field of organizations' competitiveness.

This paper also aims to propose a series of specific analysis areas in the field of business higher education, by having as a starting point our proposed general model of competitiveness. The implications should be a better scientific management and future organizational performance of business higher education institutions and a better quality of the educational process that should really meet customers' needs and should lead to a better performance of the economy as a whole. The authors' main contributions refer to the development of the general strategic model of competitiveness and the ideas for specifically applying it in the field of business higher education.

Keywords: competitiveness, management, strategy, dynamics, business higher education

Introduction

Competitiveness is a broad topic with a set of theories we consider to be both interesting and complementary; however, we do believe these theories can be developed furthermore.

There are many definitions that complement each other. We define competitiveness as *the capability to successfully compete, to provide products and services as or more effectively and efficiently than relevant competitors for a specific time frame* (Radu and Grigore, 2010).

Competitiveness is clearly a time-dependent structure (a currently competitive organization is not necessarily competitive in the future).

In order to analyze the evolution of organization's competitiveness from a time frame t_0 to a time frame t_1 , we disagree with the resource-based theory, because, assuming that two organizations dispose of exactly the same resources (practically impossible, yet still assuming that), we can notice that one of them is better than the other. We want to underline the importance of strategic use of resources rather than the resource by itself. This idea has a series of similarities with competence-based competitiveness (Hamel and Prahalad, 1994).

It is clear the need for a causal model. It is not easy to build such a model, and perhaps the highest difficulty comes from the fact that we generally consider competitiveness is just an effect ("organization X is competitive, while Y is not" and we can explain which should be the causes that led to a competitive organization and, respectively, to an uncompetitive one). However, competitiveness is not only an effect, it is also a cause.

The biggest challenge is measuring the dynamic competitiveness. If two organizations have at a specific moment in time approximately the same level of competitiveness (measured on a particular scale), their actions will make the difference for the future (competitiveness as a cause or determinant is the same for the two organizations, but competitiveness as a result is different). Strategies should be dynamic, as there are always unpredictable changes in organizations' external environment. It is clear that dynamic strategies require consistent compromise between the economic logic of low cost and the one of differentiation as main factors of strategy. However, dynamic competition is a constant challenge for organizations to continuously improve their actions on the market and often to strive for rewriting the rules (Carpenter and Sanders, 2007).

Competitiveness and sustained competitive advantage – Literature review

Organizations face many problems, two of them having a really high impact: (1) how to grow a business, and (2) how to ensure that the growth helps the organization become sustainable over the time (Rieley, 2006).

In order to have a good vision regarding a company's future, a careful analysis of the whole system a company is part of and the ability of the company to achieve future growth are clearly necessary (Woodhead and McCuish, 2003). It is clear that current competitive position and potential influence the future level through company's current responses (actions). However, an incorrect assessment of the current situation may lead to two errors: an under-response (in terms of relative competitive force) should result in deteriorating relative competitive position; the over-response is also a problem, as it can result in wasted resources with little gain in advantage (Oliva, Day and Macmillan, 1988).

A company's long term adaptation is actually produced by a series of strategic behaviors and organizational innovations. Therefore the organization's capability to develop effective strategic behaviors and organizational structure is critical for any company's growth (Kuwada, 1998).

Strategic decision speed is very important; it matters for companies' growth (competitiveness as a result). Therefore, companies need to master fast decision-making (Baum and Wally, 2003).

Most specialists believe competitive advantage is the base for attaining competitiveness. Competitive advantage reflects the relative position of an organization compared to positions of industry rivals (Carpenter and Sanders, 2007).

By taking into account the way competitive advantage is attained, organizations try to find an appropriate position (Porter, 1998). According to Porter, there are two essential sources of competitive advantage: having a lower cost structure than competitors or having a product of which customers believe it is different from other products. The main drivers for a low-cost strategy are: economies of scale, learning, economies of scope, superior technology or superior

product design. However, low-cost strategy will have to oppose to a series of threats: development of new technologies, inferior quality, risks associated to outsourcing (as this is a large-scale approach in order to cut costs). The main drivers for a differentiation strategy are: a premium brand image, customization, unique styling, speed, convenient access and a high level of quality. Of course, this strategy will also have to face a series of threats: buyers' unwillingness to pay higher prices, underestimating costs of differentiation, over fulfilling buyers' needs, low-cost imitation.

Sustained competitive advantage usually originates in a core competence (Hamel and Prahalad, 1994), which is anything from product development to employee dedication.

The activities of strategic management are based on the assumption that organizations attempt to achieve a position of competitive advantage over their competitors when serving target customers. An organization really benefits from competitive advantage when it implements a strategy that creates value and that is not adopted also by a current or potential competitor and when competitors are not capable of benefiting from the advantages of this strategy (Barney, 1991). The same author insists over the criteria that resources have to meet in order for the organization to benefit from a sustained competitive advantage (the VRINE model):

- *Valuable resources*. The resource or capability should allow the organization to meet a market demand or protect it from market uncertainties. A resource is valuable if it enables an organization to better benefit from opportunities and face the threats. However, value by itself does not guarantee the advantage. For profit organizations, the normal performance implication consists of normal profits, yet abusing a valuable resource can also lead to higher costs.

- *Rare resources*. Valuable resources that are also rare (scarce relative to demand) clearly contributes to a competitive advantage but not necessarily for a long-term one.

- *Inimitable and/or nonsubstitutable*. It is clear that a valuable and rare resource is not an advantage if competitors gain possession of it or find a good substitute. Only valuable and rare resources that are also hard to imitate or substitute can contribute to sustained competitive advantage. Property rights are the most straightforward cause of difficulties in trying to imitate or substitute.

- *Exploitable resources*. It is clear that, without meeting this last criterion, the others cannot lead to a real competitive advantage. An organization should be able to exploit its resources, to get the value out of any resource or capability that it may generate.

VRINE analysis can be a useful tool for managers interested to systematically test the importance of particular resources and capabilities and the desirability of acquiring new resources and capabilities (Carpenter and Sanders, 2007).

Conceptual framework – Towards an integrative competitiveness model

Our proposed model is based on the hypothesis that an organization's level of competitiveness at moment N+1 is certainly influenced by the organization's level of competitiveness at moment N (as stated in the resource-based theory). However, a very high level of competitiveness at moment N does not necessarily lead to very good results also for the moment N+1, as between the two moments there is a transformation process that depends in its turn on several factors.

The model we propose is a dynamic perspective on competitiveness. The basic idea from which we started to build this model is that future level of competitiveness is a result variable that depends on a series of independent variables: current level of competitiveness, organization's current actions (which are strongly related to current level of competitiveness and also depend on competitiveness' potential, on leadership, on organization's competences and on external environment), current actions of key competitors, leadership, organization's competences and the whole external environment. Future level of competitiveness is the result of a transformation process that takes place depending on all the factors mentioned above.

The transformation process deserves a special attention, as, if carried without care, will negatively affect the organization’s level of competitiveness. According to some authors (Bjelland and Chapman Wood, 2008), there are five distinct, reproducible ways of radically altering organizations: the standard model process (“holism”), transformation through the ambidextrous form, transformation through acquisition/restructuring, the Collins “Good-to-great” process, and improvisational transformation process. And there are also the hybrid approaches, which are mixtures between them. Of course, we should not necessarily look for radical changes, although a significant improvement in the level of competitiveness very often requires this. Some change is always necessary and should be implemented. It is true, yet, as Collins and Porras remarked, we cannot omit the fact that continuity is also important (Collins and Porras, 2002). It is absolutely essential not to confound the fundamental vision with strategies, culture, tactics, operations or other unfundamental practices.

Briefly, our proposed model can be seen in the following figure:

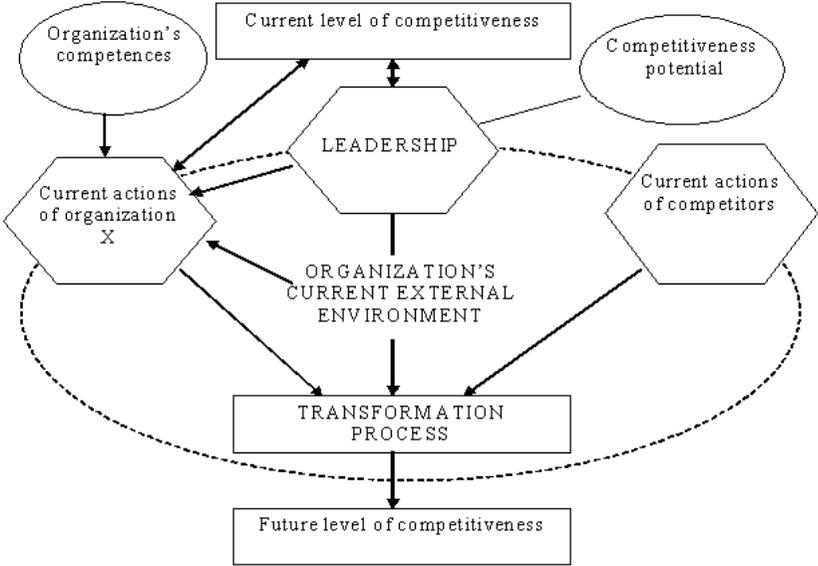

Figure 1. Organization’s competitiveness in dynamics

Leadership development plays a very important role in the process of organizational transformation that explains the shift from a competitive level to another one. Leadership is seen as “the process of influencing the activities of a person or group of people in order to achieve the organization’s objectives (Ursachi, 2005). Organization’s leaders should be managers and not other people, in order not to lead to organizational conflicts. Obviously, this condition is not always met.

The considerable impact of leadership on organizations’ performance is clear, for instance, in Six Sigma. Six Sigma can be considered, among others, a model of leadership, whereas commitment of business leaders is essential in order for Six Sigma initiatives not to disappear too quickly (Pande, Neuman and Cavanagh, 2000).

In this model current competences are an independent variable affecting organization’s current actions of the organization and thus its future level of competitiveness.

From the perspective of strategic management, Hitt, Ireland and Hoskisson (2005) define competences as a combination of resources and capabilities.

Hamel and Prahalad (1990) considered core competences to be portals to future opportunities. A core competence consists of a range of skills and technologies that mean an advantage for the organization from a significant point of view of its customers (Hamel and Prahalad, 1994).

In building the model, the external environment was a pretty big challenge, for several reasons. Firstly, it is clear that it is a very important variable to be considered (as the organization is an open system). Secondly, it is a complex variable (which takes into account many different factors). Thirdly, the main problem this variable creates refers to the fact that it is not exactly an independent variable in this model. Causal relationship between the variables “external environment” and “current actions of the organization” can be considered of a dual implication (interdependence), whereas not only the environment influences the actions of the organization, but also vice versa. However, in the model current external environment is an independent variable. Future external environment is a result of the transformation process and it was not subject of the study.

Research methodology and main findings

In order to test our hypothesis, we developed a questionnaire that was applied in two periods of time (June – September 2007 and June – September 2009), in order to see the causal relationships and the transformations over time.

223 questionnaires were distributed to managers of different Romanian organizations (7 of them non-profit organizations, the rest of them companies of different scales and from different fields of activity). Our final analysis was limited to 98 organizations.

In practice, when we analyze competitiveness dynamically, we refer less to specific strengths or weaknesses, and more to “a potential of competitiveness”, a response capacity and adaptation to various evolutions in the environment in which a company activates (Radu, Grigore and Cătăneț, 2009). The difficulty of dynamical analysis consists of the variable certainty of the predictions (regarding the environment), as well as the difficulty of obtaining relevant information, which many times happens to be confidential. However, the potential of competitiveness may be analyzed in dynamics, by using an extended Porter’s model in dynamics (Radu, Grigore and Cătăneț, 2009), a dynamic analysis of the five competitive forces and of the macro-environment. The idea is to identify the organization’s responses to the main evolution trends regarding competition, potential competitors, substitute products, customers, suppliers and general environment.

After processing the completed questionnaires we analyzed the average scores for each company regarding the variables included in our model. Therefore we could analyze the distribution of results and also to perform a regression analysis in order to test our hypothesis. The interdependence relationships were confirmed by the Pearson coefficient of correlation. The dependence relationships were validated after performing the regression analyses.

It was not easy at all to evaluate organizations’ current actions, strategic and tactical movements. Respondents to our questionnaire would not have answered to specific questions (or perhaps they would have answered, but not sincerely). However, we understood that the main points to be attained refer to cost, time and quality in an extended view (Radu, 2009) and these aspects could be pursued in our questionnaire. With respect to cost, we were particularly interested in analyzing the cost of actions seen as use of resources and tendencies towards outsourcing or not non-core activities. With respect to time, we followed to rapidity of organizations in adapting to various new conditions (flexibility). Last but not least, with respect to quality, we looked for organizations’ focus on customer.

Business higher education and future development of our model

We intend to apply our model for a specific field of activity – business higher education. We intend to make a comparative European analysis, by emphasizing a series of elements: (1) customers' demands; (2) teaching activities; (3) research activities; (4) mobility programs; (5) macro-environment factors. We are at the beginning with this second research for which we applied a questionnaire to students and graduates of Academy of Economic Studies, Bucharest (pilot study). We used the online platform SurveyConsole in order to determine our students' perceptions with respect to the educational process – we were particularly interested in aspects such as case studies, teamwork and online education. Up to now we have 236 respondents.

There are many important issues to be analyzed, some of the most important being the following:

1. For organizations – what positioning is required in order to benefit from as many network resources as possible (at international, national or regional level) and in order to be competitive?
2. For employees (professors) – how can they reach an equilibrium between teaching and research processes, on the one hand, and between excellence in teaching and relevance in real world, on the other hand, as competitiveness does not need to be measured only in the traditional way, strictly from the academic point of view?
3. Who are the “real” customers? Students or companies?
4. For students – how can they find the best conditions for the educational process, that should be both able to satisfy the individual needs and aspirations and to have acceptable costs?
5. For companies – what are their interests?
6. How could we apply the “value innovation” (concept discussed in “Blue ocean strategy”, by Kim and Mauborgne, 2005)?
7. What are the adaptations needed for having a particular competitiveness model in this field by having as a starting point the general competitiveness model? For example, university's capability to attract funds is a very important result of partnerships with companies as part of the “external environment”, while the university's image (partnerships between academicians and universities, for instance) is certainly an important aspect of the “potential of competitiveness”.

THE INTENSIFICATION OF THE MOTIVATIONAL CHARACTER OF SMES MANAGEMENT

Robu Nicoleta Raluca

Bucharest Academy of Economic Studies

Savlovschi Ludovica Ioana

Bucharest Academy of Economic Studies

Irrespective of their size, all the companies in Romania face deficiencies in the motivation of the staff, situation leading to the employees' dissatisfactions in work, their instability, the lack of interest of employees in the performance of the organization.

An effective motivational system is the one bringing satisfaction in work to the staff. The satisfaction in work is the state of balance that the individual reaches when he/she answers completely some aware or unaware needs or expectations.

The new vision in the field of human resources is that managers should have in their suborder self-motivated working teams, who, with a little supervision, can put into effect the goals established. In this case, the managers have only the supporting role, granting consultancy to the members of the team and providing the interface of the team with the exterior. As for the rest, the team members do it all, from the establishment of the objectives to accomplish to their achievement. The concept of motivation approaches aspects that make people work better and more; that they should be perseverant and to go over obstacles; that they should be committed to work and enthusiastic with respect to the activity they carry out. A component of the managerial role is that of providing people with motivations, making them be committed to their work, but the success will be unlikely if we do not fully understand what people want from their job.

Key words: reengineering, human resource, motivational management, motivational scale

1. Trends in the motivation of human resources in SMEs

Although, for several decades, no one has challenged the importance and major implications of an adequate motivation of the staff, the progresses at this level have been relatively slow. Hardly in the last decade, in the management practice, has a substantial change in the direction of a complex and effective motivation of the staff occurred.

Therefore, the motivational management crystallised, which is based on decisions and actions which consider, at a high level and on a permanent basis, resorting to evolved concepts, modalities and techniques, the interests of the company's employees and the other stakeholders, with a direct reflection in the increase of the potential and performances of the organization.

At the delineation of this mutation, several factors have contributed starting with the modification of the conception of management on the human nature, which started to be approached in its complexity considering the multiple qualities and roles that it has in the enterprise, the society and the family. The employee is approached in the context of the organisational culture and climate, which allows a more profound and more complete understanding of its interests, aspirations and behaviour. A substantial contribution in the interpretation and popularisation of the complex human nature and the need to take it into account in the conception and accomplishment of the activities within the companies was brought by the representatives of the behavioural school. Mayo, Maslow, McGregor, Crozier, Lickert are only a part of the scientists whose theoretical and methodological contributions have especially been noteworthy on this plan.

Another main means of operationalizing the company's flexibility consists in reengineering. Currently of great contemporaneousness – especially as a result of the successful book of M.

Hammer, J. Champy “Reengineering the Corporation” – although its name is conceived by certain specialists in the field, reengineering is more and more frequently invoked as a major means of flexibilisation and modernisation of management. In the conception of the authors quoted, reengineering consists in the fundamental rethinking and radical redesigning of the economical processes in order to accomplish major improvements aiming at the performances regarding the costs, quality, service and rhythm. In a very systematic approach, the Israeli professor Ronen shows that in essence, reengineering requires the reconstruction of the company by catering on the client, cutting down the average management echelon and by cutting down control and coordination. This involves essential changes in the economic fundamentals of the company, concentrating on the processes within, remodelling them, persistently pursuing top performances.

A second major cause of diversification and intensification of the staff motivation in enterprises consists in discovering its multidimensional nature. As a result of the research carried out, several motivational scales have been identified, of which the most known is the one conceived by Maslow. He established that there are five main categories of needs, the satisfaction of which has a motivational effect, namely:

- Elementary physiological needs of nourishment, clothing, shelter etc.;
- Needs of personal security and safety;
- Needs of human contacts and affiliation to the group;
- Needs of social status and esteem;
- Needs of self-fulfilment

As it results from chart no. 1, the satisfaction of the first four categories of needs up to a certain level also attracts an increase of the motivation of that person, then it is gradually diminished. The only category of needs, the satisfaction of which at an upper level corresponds to an increase of motivation, as there is no threshold, consists in the needs of self-fulfilment.

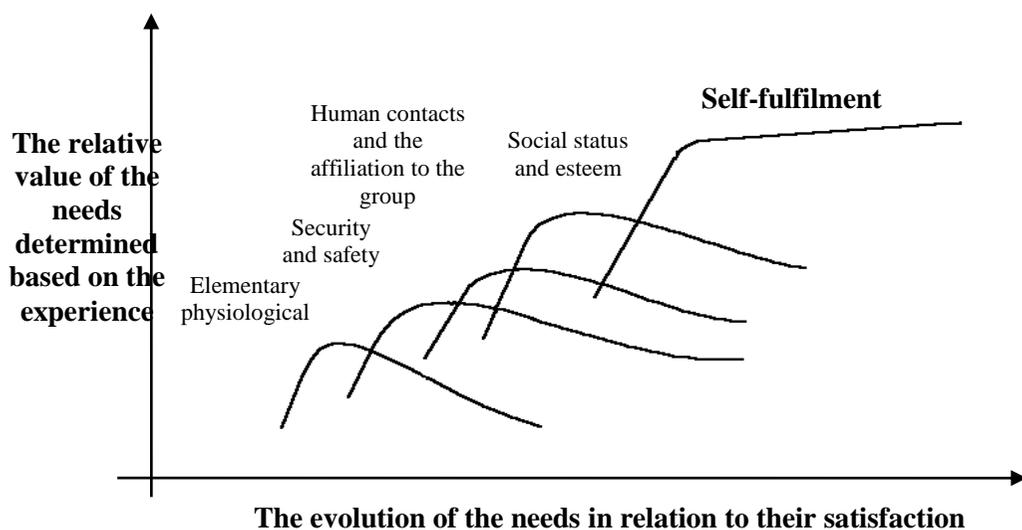

Chart 1. Maslow's motivational scale

At the re-evaluation of the importance of motivation and upon its acknowledgment in a plenary way, a substantial contribution consisted in proving the tight relationship between the motivation of the staff and the results obtained. As argued in a specialised paper, frequently quoted by the specialists, the pivotal role within any organization is played by people, representing a more important asset than the other ones. At the same time, it is considered that the human resource

presents a great strategic value. The increase in the efficiency of staff work, as a result of the intensification of their motivation and vice versa, eventually consisted in the most convincing argument for the management members of the enterprises, in order to approach and use the motivation in all its complexity. The contingency approach is an eloquent proof at this level.

Along with these causes, reflecting especially the evolution in the field of theory of management, a major role in the intensification of staff motivation was by the occurrence of dysfunctionalities in the companies, which could not be solved without changes in the means, methods and techniques of motivation. Among them, we mention resistance to changes of part of the staff, the insufficient creative participation in the accomplishment comprised in the plans and programs, the use of ineffective management behaviours, and so on. Regarding the last aspect, the research carried out on a sample of 1600 people in the Western Electric company for three years, showed that the hostility towards the subordinated people present in the behaviour of some leaders (called type A behaviour), based on the belief that you cannot work with and motivate them by being polite and nice to them, is directly correlated to the frequency of heart diseases in them.

Conclusions

The motivational management determines important positive effects within the organization:

- it contributes to the development of a frame of mind in the staff and of an organisational culture favourable for making efforts and obtaining the performance by the organisation;
- it amplifies the leadership of all the categories of managers, the upper motivation of the employees for assuming and carrying out the tasks, encouraging the formation of team spirit and increasing the audience that the managers have in their subordinated staff as well as their receptivity towards the decisions and actions of the supervisors;
- it determines the intensification of the work both at the level of the management members and at the level of the execution staff, against a sensibly larger participation of them in the initiation, preparation and execution of the actions requested by the operationalization of the company strategy and policies;
- substantially raises the productivity of the physical and intellectual work of the staff, the quality of products and services, which reflects directly and positively on the economical results of the company (turnover, costs, profits etc.)

The exploitation of the potential advantages of the motivation pointed in the previous paragraphs is affected by several limits manifested with a high frequency within the organisations.

A notable part of the managerial staff in the companies does not have enough qualities and motivational availabilities, resulting in major deficiencies at this level. Moreover, even the talented and well-prepared managers find it extremely difficult in noticing and considering the multiple human and organisational aspects of the motivational decisions and actions. At last, a final limit resides in the limited financial resources of the companies, often insufficient for supplying at the optimal level the income bonuses that the intensification of motivation assumes.

The organisations that have a real motivational management are the ones that have succeeded in exploiting at an appreciable level their multiple advantages and to counter-balance sensibly the inherent limits associated to them.

METHODS OF IDENTIFICATION OF THE NEED FOR ORGANIZATIONAL CHANGE AS BEING OPPORTUNE

Roiban Roxana Nadina

West University of Timișoara, Faculty of Economics and Business Administration

Given that the world is constantly changing and the speed at which these changes occur is very fast, it's vital that organizations understand the necessity and opportunity of change, before their results or performance start to decrease. Although we always hear everybody speaking about change, this concept still raises many questions and problems, and the managers have difficulties on identifying what changes should be made in their organizations, in developing an action plan to achieve change and to manage the entire process of change. Without changing and without always adapting to new market requirements, which as a result of the process of globalization includes not only the local market but also the international one, organizations will not survive and will not be effective and efficient in order to achieve performance.

The purpose of this paper is to highlight the importance of the opportune identification of changes in order to reach the success of any organization by presenting how to recognize them by managers or by owners in order to manage efficiently the scarce resources and achieve better long term results. To identify the need for change as being opportune is recommended an environmental analysis based on internal and external factors, to see the influence that they show so that the organization could achieve those reactive changes, which consist in adapting to the environment, or contrary to promote proactive changes that make the organization to influence the environment and not vice versa.

No matter what kind of change takes place in an organization is important to note that it needs to attract with it an improvement, so that top managers, who have a much clearer vision of the organization as a whole, must promote only those changes that lead to better results than those recorded before starting the process of change.

Key words: organizational change, opportunity of the need of change, change process, internal factors, external factors

JEL Classification: M10

The opportunity of the need of change

The release of the process of organizational change occurs when managers or owners of an organization identify the existence of opportunities leading to improved business processes, or when things go bad and there are various problems in the organization.

In the first case in which the change comes after the identification of possible ways to improve the activities of the company, whether it is the whole organization, or just a specific department or group of people, we are talking about proactive change through which the organization is trying to influence the environment in which it operates.

The proactive change is the surest and the most rapid path to success, progress and performance, but at the same time the most difficult because not all managers are willing to create and innovate when things in the organizations that they manage go well.

Thereby the most important role in making proactive changes is accomplished by top managers or owners of the organization that by launching a new product or designing a new manufacturing technology are able to generate changes in consumer behavior and able to achieve a competitive advantage over competitors.

The second situation in which the change takes place is also the most common in practice, the majority of managers calling to change only when things go wrong in their organizations or show signs of worsening.

In this case we are speaking about the reactive change that helps the organization to adapt to the influence of the environment, due to increased competition, depletion of resources, technological development, etc.

The problem that occurs in this case is that managers often don't have enough time to implement such a change, because they are frequently hit by the resistance of employees, so the results obtained after the change are not the best.

Depending on the seriousness of the situation and the speed with which events took place outside the company, managers must identify the most appropriate changes for their organizations and act swiftly and decisively, even if sometimes it means creating a state of tension and uncertainty within the organization. Once the crisis is resolved, it is recommended that the initiators of the change explain to those affected by that change, why such drastic measures were taken in such a very short time, in order to gain their confidence and make them feel comfortable with the change, thus reducing any form of resistance.

To identify the need for change as being opportune managers should carefully consider the internal and external environment of the organization and to form a more realistic view of the influences manifested by it, because as Rosabeth Moss Kanter stated, *"Organizational change is not stimulated by pressure from the environment, resulting in a set of problems that trigger an automatic reply, but the perception of key actors on the environment."*

Methods of identification of the need for organizational change as being opportune

There are many cases where even though the environment has expressed strong influence on organizations, they had no response because their managers did not know how to identify those reactive changes.

Whether we talk about proactive or reactive changes, it is important to emphasize that a change needs to attract with it an improvement, so that managers must answer three basic questions before starting any process of change:

- What to change?
- When to change?
- How to change?

What to change?

To answer this question managers can call upon a consulting firm or they can find the answer themselves together with their employees.

If calling for a consulting firm managers can obtain an opinion from specialists with relevant experience who have an accurate perception on the environment but the associated costs will be significant.

If the organization has the necessary resources, it is recommended for managers and employees to find answers to this question, based on identifying the factors that generate change, the analysis of their mechanism of action, the current state of the organization and future influences manifested by the environment.

When to change?

The answer to this question is very simple: as soon as possible!

Once the managers have found the answer to the first question "what to change" they should take those actions to implement the changes as quickly as possible, but not before considering whether they are indeed appropriate and realistic, with visible results.

The actions to be undertaken will be part of an action plan that aims to show how the change will be made, a detailed description of each action, their sequence in time, the responsible persons, the resources and the outcomes.

How to change?

In order to answer this question many models of organizational change were developed, one of them belonging to the German psychologist Kurt Lewin, who argues that organizational change involves three steps:

1. Unfreeze

This is probably the most important step because it refers to how organizations are preparing for change, identifying the pros and cons and the motivation to go further.

2. Change

Change is not an event but a process, so this stage corresponds to a state of transition from the initial state to the future one where changes have occurred. Here takes place the implementation of the action plan and the reduction of the resistance manifested by the organization's employees.

3. Freeze (or refreeze)

After the change occurred and reached the required status, new processes, behaviors and attitudes should be made permanent so that desired results are achieved and the progress is recorded.

Factors that generate the need for change

The need for change is generated by the action of internal and external environment, characterized by a number of factors that affect differently the organizations, depending on the specifics of their business, their size, their organizational culture, etc.

In the category of the internal factors that may cause the need for change we have:

- *the company's employees*, who often have a hostile attitude towards change and show resistance especially because they are not consulted regarding this process, so it is important that the initiators of change clearly explain why change is beneficial to the organization and try to involve them as much as possible;

- *the organizational structure*, the more rigid, the more the power is centralized and does not apply the principle of delegation and there are many rules, procedures and regulations, the more difficult is to change. An organic type structure, which focuses on delegation, experience and informal relationships allows an easier implementation of the changes, considering them appropriate and even necessary;

- *the informational system*, the efficient movement of accurate, complete and timely information promotes the change because each member can form an accurate picture of the existing problems in the organization, identifying the opportune changes to address those issues;

- *the quality of management*, decisions taken in the organization can foster a change process if managers have a favorable attitude toward change, the practiced style of management could also encourage creativity so the change as well - in the case of democratic and consultative management, or rather can lead to coercion - autocratic management. The manager's decisions also affect the organization's strategy which can also lead to a series of changes or limit their number;

- *the organizational culture*, is the most difficult variable that can be changed so where there is a pro change culture within the organization, the resistance manifested by members will be much reduced or even zero, which will identify the need for change as being appropriate.

External factors are different and generally include:

- *economic factors*;

They can include the internal and international market, the purchasing power of consumers, the degree of economic development, the infrastructure etc.

These factors show a significant influence because the changes made by firms, particularly those related to upgrade its product mix, primarily depend on current market demand and consumer purchasing power, in condition of the intensification of competition. The development of the economy has a direct impact on imports and exports, infrastructure, on the financial potential and on investments. Organizations operating in highly developed countries are able to identify more quickly the opportunities and have many available resources, unlike other less efficient economies organizations.

For many of the factors included in this category, organizations can adopt only reactive changes, but there are also cases in which they can promote proactive changes, especially when it comes to creating certain needs through the launch of revolutionary products that lead to increased exports, and hence demand.

- *political factors*;

The policy of a country can attract foreign investors and facilitate cooperation with other international bodies, which will lead to some major changes as a result of increased competition and alignment of the directives and legislation of those bodies.

When it comes to these factors, organizations can generally perform only those reactive changes, without being able to express any influence.

- *legislative factors*;

These factors are closely related to the political ones and generally include all laws, ordinances, resolutions, etc. within a country. The organizations are obliged to respect the law of the country where they operate and to pay some taxes, contributions, most of them being unfavorable, so the smallest legislative change attracts itself a number of changes in firms. To deal with all the legislative changes, it is necessary a correct and complete information so that organizations can benefit from certain facilities and programs that support business development. Just as in the case of political factors, organizations have little influence over legislative factors, resulted in changes made by adopting a reactive behavior.

- *technical and technological factors*;

In this category we have: the technical level of equipment available on the market, the number of licenses, patents, trademarks, know-how. The technological changes are probably the most frequently encountered and their pace is very fast due to continues fights that organizations have in order to achieve a sustainable competitive advantage that ensures customer loyalty, market share growth, sales and profits. Without change, innovation and updating the technologies they use, organizations can't keep up with what is happening on the market and will not become effective. An up-to-date technology allows the costs reduction and better use of resources leading to increased performance.

Adapting to existing technology requires a continuous reactive behavior, but if we talk about proactive change, the organizations that are investing large sums of money in research and development to develop new technologies, in order to use or sell them to other interested organizations, have a much higher performance and profit because they are able to identify and use the opportunities offered by science.

- *management factors*;

National economic strategy, mechanisms for coordination and control of firms, methods and management science techniques have also an important role in making changes because organizations must comply with certain rules and principles for organizing and their managers should be open regarding the application of methods that provide effective leadership, with visible results.

- *socio-cultural factors*;

Socio-cultural factors including customs, mentality, tradition, health care, culture, science and education also induce some changes in terms of employee attitudes toward work, the staff's

degree of specialization and even on the products offered by companies as a result of the change in consumer's preferences and behavior.

- *demographic factors*;

The population number, its structure by age, sex, occupation, rural and urban areas, life expectancy, population growth, influence organizations that according to their field of activity, location and size are forced to do a number of changes to adapt to the specific area that they operate, because each market segment has different needs and requirements, so the standardization of products and services is not always recommended. Another issue that organizations must take into account is the degree of expertise and skills existing within a given region to assess whether certain changes are necessary in this regard (for example retraining).

- *ecological factors*;

Organic or natural factors are represented by water, soil, subsoil, vegetation and climate. Environmental protection is increasingly important given that the world's population is more numerous, and the degree of pollution is increasing, so the organizations are required to make those changes that lead to reducing carbon emissions, waste resulted after the process of production and increasing recycling.

More and more organizations adopt a policy on social responsibility and sustainable development, making major investments that lead to changes in terms of manufacturing technology, used materials, production processes, etc.

Another problem relates to the scarcity of natural resources that also require changes and investments in research in order to identify alternative sources of energy or materials to replace some scarce resource.

In order to identify correctly the influences of these factors, organizations have various tools that allow a thorough review of the status and future trends, the most commonly used being the SWOT analysis. This allows the identification of weaknesses and strengths from the internal environment and extends to an external environment analysis, identifying key opportunities and threats.

Due to the ease with which it can be applied many managers resort to such an analysis to identify necessary changes to ensure the transformation of weaknesses into strengths by using existing opportunities from the external environment, or to strengthen those strengths in order to maintain the competitive advantage.

Conclusions

The need for change must be associated primarily with the need for survival and later with the organization's efficiency and competitiveness because there is a direct relationship between the two so without awareness of the need for change, managers can not ensure long-term maintenance of the organization's results and much less won't be able to ensure their growth, and this will lead to regress and even bankruptcy.

Identifying the need for change as being appropriate for the organization depends primarily on the interest shown by managers, who on the basis of information obtained from a diagnosis of the environment, must take the necessary measures to conduct the change process. There are many cases in which managers are not interested in change, mainly because there are no problems in their organizations, and the results are good, but as we previously stated the change should not be a result of deficiencies in the implementation of business processes. Another situation is where managers are overwhelmed by the speed of changes taking place around them and abandon the idea of change, motivating this by the fact that even if they would change anything, this effort will be in vain because the necessary time for a change is usually longer, or because they don't have resources.

Both cases correspond to a passive behavior that leads to a negative attitude of strong resistance to change.

Whatever justification is found, the fact is that without an adaptation to change, an organization won't be able to survive and to expand, so it is essential for any manager to identify on time the need for change that will lead to the success of his business.

The method of identifying the need of change as being opportune is the environment's analysis that allows a clear down of the current situation of the organization and allows identifying the necessary steps that have to be followed in order to make the changes that will lead to performance.

Not all factors manifest their influence with the same intensity, so it is important for managers to first identify those key factors, with the highest power of action and then to focus their attention on factors less influential.

The potential changes identified from this analysis must be carefully studied and correlated with the resources and the particularities of the organization, establishing a hierarchy and then move on to their implementation because of the quality of this stage is depending the success of the organizational change process.

Our paper, entitled "Explanatory Econometric Method for the Analysis of the Behaviour Management in Organizations in Romania" reflects the wide opening of econometric modelling to quantify the Romanian management issues, representing a practical guidance on multiple recovery plans to fund the huge data collected as part COMOR project launched by the Scientific Society of Management in Romania to characterize the behaviour of managers in the Romanian economic organizations. Construction of these models offers possibilities for complex analysis, descriptive and factorial sequence of firms, counties, geographical areas, but comprehensive summary of studies on the macroeconomic level. Scientific knowledge through a comprehensive assessment of managerial behaviour in the most representative types of business organizations of all geographical areas of the country are, in the context of globalization, one way to prevent surprises market economy. Thus, the results of this exploratory research will provide economic environment, and not only strong argument for anticipating decisions in order to choose the best economic policies, with beneficial effects as conclusive and with as few undesirable implications. Research based on the opinions of thousands of respondents approved, processed through a variety of instruments subject of extensive econometric and interdisciplinary interpretation, psycho-socio-economic management, is a modest contribution to the affirmation of local scientific research that aim for theoretical and applied Romanian school of management by defining:

- knowledge of behaviour management in all types of business organizations in Romania;*
- identifying the Romanian space dimensions of organizational culture as a reflection of the peculiarities of national culture and especially of the main ethnic-specific subcultures;*
- profile defining effective manager and leader of excellence in terms of character traits and their behaviour.*

Keywords: econometrics, management, organizational culture, descriptive analysis, factorial analysis.

Coduri JEL: M12

1. Preamble

Without proposes to develop the defining elements of econometrics, the specific features of this scientific field in relation to statistics, mathematical statistics or in the preamble of our approach using econometric method in an exploratory research on behaviour management in large scale economic organizations Romania, makes some-option argument on the use of econometric indicators to quantify the value judgments of various socio-economic variables of our research.

According to this, we refer to adopt the following key behaviours of econometrics, the study undertaken in this specific case, namely:

- factual component that the specific area under investigation is a reality of management processes in a well defined geographical area: economic organizations in Romania as the unit of observation, that respondents from these organizations as units of sampling;
- conceptual component of economic management for the dimensions of organizational culture, specific types of managerial behaviour different subcultures of the Romanian space and effective leader and the typology of excellence;
- logical-formal component that we built quantitative models and rational behaviour on different sides of managerial and calling their methods inferential statistics (theory and theory tests estimate) that draw a general conclusion from the quantitative analysis of several private facts I checked the assumptions made in terms of management theory in general and human resource management theory in particular.

2. The construction of econometric models

Depending on the scale and complexity of research, but also the degree of deepening the analysis, econometric models used in research as set out above as shown in Fig. 1 managerial explanatory models are composed of a more or less complex input variables, a process of transformation of probability distributions mathematically range of views expressed by the exponents, a set of variables leads to the result (the outputs).

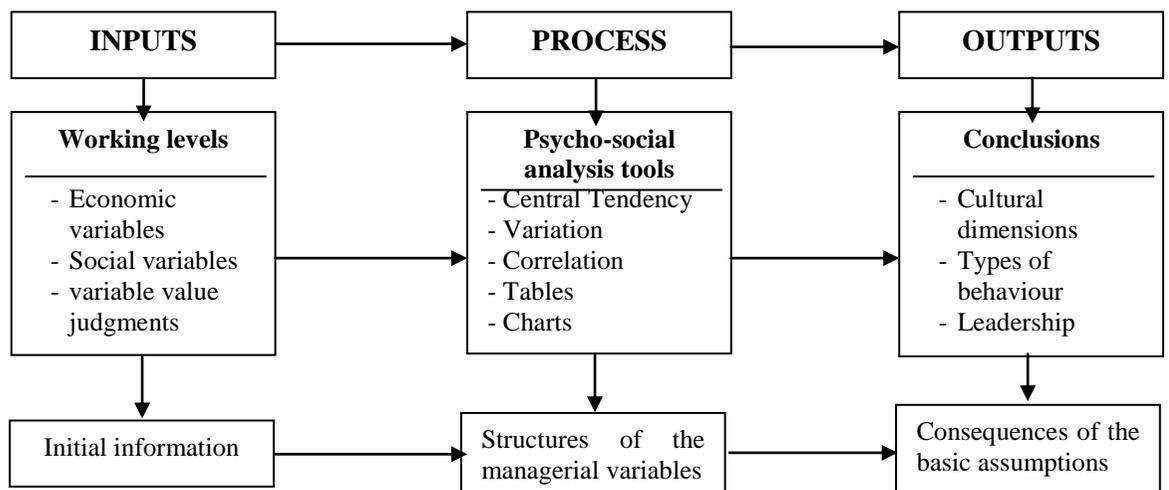

Fig. 1 The systemic structure of the econometric model

Building models based on the initial capitalization of knowledge in the context of econometrics integrated knowledge management and organizational psycho specific limits of investigator.

Assumptions that formed the basis for models reflect the volume and quality of information we had about the reality investigated using the following input variables:

- *economic variables* of the statistical units of observation of the firms: the field of activity according to CAEN code, size of organization based on the number of employees, ownership of equity;
- *social variables* of the statistical unit surveyed (respondents): sex, age, marital status, level of schooling and education in management, the position in the organizational hierarchy (managers, performers);
- *variable value judgments*, those measurable by designating entities beach views expressed, and which were assigned numerical values on the scale from highly positive (strongly agree) to highly negative (disagree).

The information held in the observation data was processed using the managerial structure of the variables of a system of statistical and mathematical indicators consisting of: position indicators (weights), indicators of central tendency (arithmetic mean, median, modulus and asymmetry); indicators of change (amplitude variation, individual deviation, standard deviation, the dispersion, coefficient of variation); indicators correlation (regression coefficient, correlation table, the correlation chart).

The conclusions derived through econometric models are logical consequences of assumptions underlying the inferential analysis process allowed the release of initial information content of their dormant state to highlight the following variables outcome (output):

- dimensions of organizational culture: power distance, individualism-collectivism, masculinity-femininity, uncertainty avoidance, future orientation (long-short);
- types of managerial behaviour: management approach, work style, attitude toward change, policies and practices of motivation, organizational communication procedures and practices, and / or interpersonal, concern for performance;
- behavioural profile of character and effective leader;
- typology of excellence leader.

3. The econometric method, basis for analysis

Ultimately seeking a comprehensive and as accurate characterization of the different structures of management variables, we focused our approach on two lines of analysis: a *quantitative analysis* focused on value judgments, on the one hand by the statistical units of observation (firms), and secondly by statistical sampling units (respondents) and the second direction oriented *qualitative analysis* with indicators of variation and correlation.

The two types of correlation analysis (quantitative and qualitative) we decided to identify and characterize managerial behaviour in key areas of economic activity across different subcultures of the Romanian territory and into the major temperamental traits of different managers and executors geographical areas of the country.

To meet this requirements-goal, we adopted a systemic approach, whereby we develop an analysis stratified by different levels of aggregation (system elements) as follows:

- for large enterprises at the microeconomic level (on request);
- mezo-economic level with aggregated counties, regions and macro-economic development;
- at the macroeconomic level, with conclusions on the national economy.

3.1. Descriptive Analysis

The quantitative analysis (descriptive) was used in structure relative sizes (weights) calculated as percentage ratio to the whole party, namely:

$$p_{\%} = \frac{\text{part}}{\text{whole}} \cdot 100$$

With the help of weights, which are indicators of position, it is argued:

- a) representativeness of the total economic organizations observed, reflecting the domain structure of economic activity (agriculture, mining, manufacturing, construction, transport, trade, etc.), by the degree of size (50-100 employees, 101-250 , 251-500, over 500 employees), by type of capital ownership (public, private);
- b) the reliability of judgments of value (total agreement, partial agreement, indecision, partly disagree, strongly disagree) expressed by respondents in different social variables (gender, age, education, hierarchy within the organization) for each item (question) that characterize a specific variable Managerial dimensions of organizational culture, managerial behaviour, characteristic traits of leadership.

3.2. Factorial Analysis

Unlike the descriptive analysis, in which we used a single indicator, one that characterizes the position of a given quantitative variable (part) throughout the community studied, *the factor analysis* we made use of a true system of indicators with which we managed many sides to put out quality of managerial behaviour in its various aspects.

Without abusing detail on the material we present a brief overview of these indicators, their relationships with computers and how to use the process to review the research, according to the valence of each of them. Thus, the system of indicators that I did not use the factor analysis, is composed of: measures of central tendency, simple indicators of change, synthetic indicators of variation, correlation indicators.

3.2.1. Specification

Before developing each indicator used in factor analysis, we make two methodological notes:

1. Calculating each of the indicators that are part of the groups mentioned above, a process required to convert the numeric expression value judgments on a Likert-type scale. Thus, depending on the range of value judgments provided by the construction of the questionnaire respondents used the primary data collection, conversion was done on 5, 3 or 2 levels, as in the models below:

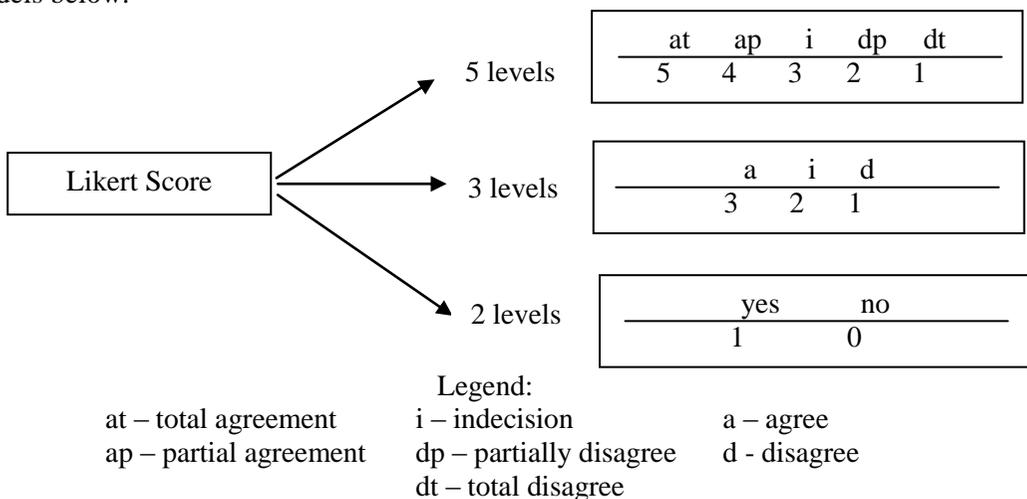

Fig. 2. Model of conversion of opinions to numerical expressions

2. To measure respondents' opinions on a particular variable studied, we started from the premise that people are honest in expressing their beliefs and opinions, however, to arrive at generalized conclusions, we have relied on a single question.

Therefore, for each variable outcome (dimensions of organizational culture, behaviour management, effective leader or typology profile leader of excellence), the questionnaire applied, we have formulated a set of questions that allow us to establish the position of respondents to a variable or another. For example, to measure the cultural dimension "individualism - collectivism" were formulated 16 questions, or to characterize the size of "masculinity - femininity" were used six questions etc.

3.2.2. Indicators of central tendency

From this group of indicators have appealed to the mean, median and dominant module. These indicators, allowed us to put out the essential trends of the variability of responses to the questions in the questionnaire. Thus, **the mean value** (\bar{x}), as a synthetic expression levels of individual value judgments embodied in a single representative level, which highlights the average scores of opinions expressed by respondents to each question in questionnaire responses from the entire range of intensely positive the intensely negative, was calculated as a weighted arithmetic mean formula:

$$\bar{x} = \frac{\sum_{i=1}^n x_i f_i}{\sum_{i=1}^m f_i}, \text{ where :}$$

\bar{x} - means medium value;

x_i - Spectrum opinions expressed on the scale of values (i) from 1-5;

f_i - the number of respondents, m , varying according to the level of aggregation: business, county, region developing, country.

The median (Me) is the average score occupying the central place statistical series ordered in ascending or descending, so the average scores of the series number of values which divides into two equal parts. When the series has an odd number of terms, the median score is given by the rank $\frac{n}{2}$; where the series has an even number of terms, the median is given by the central

terms of simple arithmetic.

Statistics compiled for each question series that helps to characterize a variable result, has different meanings depending on the content and the level at which lies such analysis:

- at the firm level, the series is comprised of average score of the views expressed by each respondent;
- at the county level, the average score is made up of the views expressed by the average sample firm in each county;
- development in the region, the average mean score of opinions expressed by counties comprising the region's development.

At any level of aggregation, median highlights the question that was most meaningful significance to characterize the result of research variable. It is important, in terms of theory, construction of the questionnaire in future research.

Module (Mo) or **dominant frequency** is the value that has score greater.

Is determined using the statistical series as the median scores obtained by highlighting the tendency of respondents to a particular judge stated value of the spectrum: from highly positive to highly negative, and from total acceptance to total rejection.

Asymmetry (As) is the indicator that allows us to know the degree of skew or non symmetry dimensional distribution of symmetry, from the position and values of the indicators of central tendency: mean, median and the module.

Form distribution with left and right asymmetry can be analyzed either by using graphical methods or calculating indicators of asymmetry.

Graphical representation of statistical series provides a suggestive picture of the degree of asymmetry using, on a case by case frequency polygon and histogram.

Indicators of asymmetry are expressed both in absolute size and in relative sizes. Asymmetry is calculated absolute relationship:

$$As = \bar{x} - Mo$$

To make comparisons between statistical series resort to indicators of asymmetry relative. Among them, we stopped at what is called the asymmetry coefficients authors: Pearson and Yule.

Pearson coefficient of asymmetry (Cas) is calculated using the formula:

$$C_{as} = \frac{\bar{x} - Mo}{\sigma}$$

This coefficient can take values between -1 and +1, as the absolute value is less than the Pearson coefficient, the asymmetry is smaller.

The value of this coefficient has the following meanings:

$C_{as} = 0$ symmetry means the terms of the series;

$C_{as} > 0$ distinguish a left skewed distribution;

$C_{as} < 0$ we deal with a distribution skewed to the right.

Yule asymmetry coefficient (C'as) is calculated in cases where we determined the median statistical series (Me), using the formula:

$$C'_{as} = \frac{3(\bar{x} - Me)}{\sigma}$$

Yule coefficient can take values between -3 and + 3 and used when between three measures of central tendency relationship is verified:

$$\text{Module} = \text{Average} - 3 (\text{Average} - \text{Median})$$

Coefficient will show a higher degree of symmetry as will be closer to zero.

3.2.3. Indicators of change

If our research, the value judgments expressed by different respondents, more or less with each other, may be more or less scattered close to the average score, regarded as the most representative value for the research unit (sample taken enrolment).

These indicators allow us to characterize the degree of homogeneity or opinions expressed in the scattering of a social group in general (at the company, county, geographic area, etc..), as well as some of its structures (gender, age, education, hierarchy).

In this group of indicators of change there are two groups: simple indicators of change (amplitude variation, e.g. individual deviations) and synthetic indicators of variation (standard deviation, the dispersion, coefficient of variation).

With these indicators we develop the analysis at different degrees of depth, allowing us to put some light on the qualitative side of the value judgments expressed by respondents.

Amplitude variation (A) is the indicator by which, in-depth analysis, especially analysis of the company or the county, determine the differences between extreme values of the views expressed by respondents. The amplitude of variation is greater, the opinions are different, and vice versa. It is expressed in two forms: absolute amplitude (A_a) and relative amplitude ($A_{\%}$), relationships with the following calculation:

$$A_a = x_{\max} - x_{\min}$$

$$A_{\%} = \frac{A_a}{\bar{x}} \cdot 100 \quad x - \text{represents the opinions score; } \bar{x} - \text{means value scores}$$

Individual deviations (d_i) are calculated as the difference between each variation recorded (score value judgments) and their arithmetic means (average score), using equations:

$$d_a = x_i - \bar{x} \text{ for individual absolute deviations; } d\% = \frac{d_a}{\bar{x}} \cdot 100 \text{ for individual absolute deviations}$$

It is mainly used in the analysis at the firm level, and only exceptionally in the county.

Standard deviation, standard deviation or standard deviation (σ) is calculated as the average squared deviations of the score recorded for each item determined opinions characterizing variable outcome (dimensions of organizational culture, behaviour management, etc.) from their arithmetic mean. To this end we used the relationship:

$$\sigma = \sqrt{\frac{\sum_{i=1}^n (x_i - \bar{x})^2 f_i}{\sum f_i}}$$

Thus, using this indicator consider how the respondents opinions vary on the scale of value judgments (from *at* to *dt*) calculated from the average of each variable result.

Example:

Variable result sought: Behaviour managers in different situations.
Faces situational managers:

1. Attitude towards settling tensions/conflict in the workplace.
2. Attitude towards the expression of the performers, opinions about their work address.
3. Attitude towards mistakes by employees during the activities.

Number of statistical units of observation in Suceava County = 15

Number of statistical sampling units (respondents) = 222

Based on data from Appendix 1, Table present standard deviations below the mean score calculated from the views expressed by respondents to characterize both the current state and considered to be normal in the organizations surveyed.

Managers' behaviour in different situational

Analysis indicators	Symbol	Current practice	Desired practice
1. Average value judgments	\bar{x}	3,727	4,183
2. Standard deviation	σ	0,258	0,279

Summary interpretation of these indicators leads to the following conclusions:

1. Almost ¾ of respondents say that current practice managers are interested in maintaining a spirit of understanding and cooperation between employees and are involved as mediators between the parties when there are situations of tension or conflict, are open to collaboration in the team encouraging employee participation in solving practical service problems and is also tolerant of the mistakes they inadvertently committed during the activities.
2. Value judgments expressed by respondents is quite high values clustered around (partly agree to strongly agree).
3. Despite the favourable findings about the behaviour of managers in the three situational instances, the number of respondents who believe it would be better place, is almost 10% higher than the existing situation (83.7% vs. 74.5%).

A hierarchy of employees who desire signifies a strong attachment to the goals of the organization is working is as follows:

- 86.3% (11.8% more than the current situation) believes that managers should make greater use of employee participation with solutions to solve the tasks;
- 89% (8.1% more than the current situation) believes that managers should intervene more effectively and to ease tension or conflict between state employees;
- 75.7% (7.4% more than the current situation) believes that managers should be more sympathetic to unintentional mistakes committed during the activities, especially by young people who need more support to their immediate bosses.

4. Even if the range of value judgments is somewhat higher in practice desired by respondents, (standard deviation 0.279 to 0.258) shows that the average score is 12.2% higher than the current practice, which means that "total agreement", the whole scale of assessment is crucial.

Dispersion or variance σ^2 a variable result is calculated with a simple arithmetic average of the squared terms of statistical series which consists of questions score variable that is characterized by the relationship:

$$\sigma^2 = \frac{\sum_{i=1}^n (x_i - \bar{x})^2}{n}, \text{ where } n \text{ is the number of items that characterize each variable outcome}$$

(dimension of organizational culture, types of managerial behaviour etc.).

The coefficient of variation (v) is the ratio between the average standard deviation and statistical series, and shows us the degree of homogeneity of the collectivity of questions / answers that characterize a variable outcome, using the relation:

$$v = \frac{\sigma}{\bar{x}} \cdot 100$$

The higher the coefficient of variation is close to zero, the variance is lower, so statistical collectivity is more homogeneous and the media has a higher level of significance.

3.2.4. Indicators of correlation

In our research we are dealing with direct factorial correlations, simple linear type, which led us to make use of the following indicators of intensity commensurate factorial causal links between variables symbolized by x_1, x_2, \dots, x_n and the variable outcome or effect variable y symbolized: the correlation table, the graphic method and the regression coefficient.

With the **correlation table** identifies issues such as: the existence and meaning of correlation, the shape and intensity of causal links. Thus, we use the correlation table analysis of causal links between traits of character which designates the profile of the effective leader, the variables x and types of managerial behaviour, the variable result. So, for example, may reveal the correlation between some features of the leader, such as courage, self-confidence, will, its rigor on the one hand, his attitude toward change, on the other side.

Corelograma as a graphic expression of the correlation, is constructed as follows: the abscissa scale is going to represent the values of variable x factorial, and the ordinate y pass variable values result by uniting intersection points of coordinates x, y , is obtained expressing corelograma suggestive correlation that we want to highlight in particular.

Regression coefficient. As a method of econometrics, regression helps to determine the contribution of the factors underlying (causative) effect of variability phenomena. Since in our research are linear causal links, to measure the strength of correlation using linear function of the form:

$$Y_x = a + bx, \text{ where}$$

Yx - are theoretical variables; a - y result variable values are determined outside the influence of variable x factorial;

b - is the regression coefficient;

x - represents the values of x_1, x_2, \dots, x_n factorial of variable x.

The coefficients a and b is determined using ordinary least squares method, using relations:

$a = \bar{y} - \mu_{u(x)}$, where: $\mu_{u(x)}$ represents the first order cantered factor for variable x. It has zero value.

$$b = \frac{\sum xy}{n\sigma_x^2}, \text{ where: } x - x_i \text{ variants are deviations from their average}$$

y - y_i variants are deviations from their average

In our research we measure the linear correlation between the intensity of respondents' social variables (gender, age, marital status, education level, the position in the organizational hierarchy), as variable factors and value judgments, as a floating effect. Thus, we build correlation coefficients entering the following notation for the variable factor x:

Sex: male x_1 , female x_2

Age: 30 years x_1 , 30 - 44 years x_2 , between 45 - 60 years x_3 , x_4 over 60 years

Education: elementary x_1 , x_2 environments, beyond x_3

Hierarchy: top managers x_1 , x_2 middle managers, managers of basic x_3 , x_4 performers.

Similarly, we introduce the following notation for the variable y result (value judgments about the dimensions of organizational culture, types of managerial behaviour, effective leader profile, types of Excellence leader):

Total agreement y_1

Partial agreement y_2

Indecision y_3

Partial disagree y_4

Total disagree y_5

or

agreement y_1

indecision y_2

disagree y_3

Conclusions

The models described in this paper is the set of indicators is based on an econometric variety of descriptive and factor analysis, structural and managerial behaviour in comparative economic organizations in Romania. Among them were:

- to characterize the dimensions of organizational culture at all levels of aggregation: the big companies, counties, regions, macro, national economy;
- characterization of managerial behaviour in all types of business organizations by field of activity according to CAEN code, by type of ownership of capital, depending on their size as number of employees;
- description of character and behavioural profile of the effective manager;
- characterization of the leader of excellence;
- according to various categories of respondents (by sex, age, education, hierarchy) on the various elements listed above characterization etc.

These econometric models, with minimal possibilities for the interpretation of measured results are used in the study phase of the pilot - the example of Suceava county, to develop national analysis by established analytical team in Bucharest, Craiova, Oradea, Suceava, Targu Mures, Galati, Resita, Braşov most competent scholars with interests in management, sociology and organizational psychology, computer science, econometrics.

THE EVALUATION OF EDUCATIONAL SERVICES QUALITY BY THE STUDENTS OF THE FACULTY OF ECONOMICAL SCIENCES „DIMITRIE CANTEMIR” CLUJ-NAPOCA

Rusu Corina

„Dimitrie Cantemir” Christian University Bucharest The Faculty of Economic Sciences Cluj-Napoca

Vlad Miranda-Petronella

„Dimitrie Cantemir” Christian University Bucharest The Faculty of Economic Sciences Cluj-Napoca

Abstract: The evaluation of the educational services quality by the students represents an important element of the internal quality monitoring process for the identification of the necessary actions required in the continuous improvement of the offered educational quality, and on the other hand it represents an indicator of the university interest of having access at the student's point of view. Starting from the student needs, together with the staff involved in the evaluation and quality assurance committee of the Faculty of Economic Sciences Cluj-Napoca, “Dimitrie Cantemir” Christian University Bucharest, we elaborated a questionnaire for the evaluation of the educational services quality by the students, concerning: teaching-learning activities, available admission information, tutorial system, class schedule, material base, laboratory, course and seminar rooms equipments, administrative services, student organizations, counselling services offered by the faculty. The conclusions of the study were discussed with the faculty's management, decisions being made to take actions in order to increase the student satisfaction level.

By developing and implementing their own strategy to quality policies and procedures, the higher education institution is explicitly committed to develop a quality culture in all its activities.

Keywords – quality, university management, educational services, higher education, the quality circle.

JEL Codes – I23, M10, M31.

The questionnaires were individually applied, between May and June, to the students following the bachelor's degree programs of the faculty, regardless of the education form or the specialization, the results being as follows:

32 questionnaires were applied through personal interview, all of them being validated as they were fully completed;

40 questionnaires were distributed among the students, only 27 of them being processed in the end (because only these many were brought completed to the faculty's Evaluation and Quality Assurance Committee).

The results of the study are given below.

At the first question, related to the importance of the Romanian higher education, in their professional preparation, the respondents appreciated:

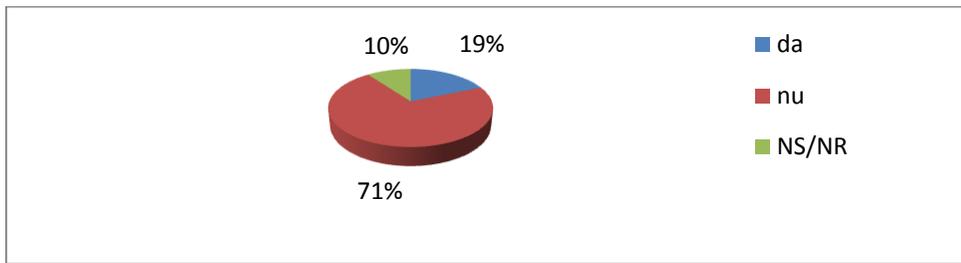

Fig. no.1. The answers to the question related to the importance of the higher education in Romania. Realised by the author

The ones who chose the first answer version (“yes”), cumulate approximately 19% of the respondents. We could say that they have confidence in the bigger chances of integration on the labour market after obtaining a higher education diploma. We assume that these students consider that the higher education offer has been very well adapted to the needs imposed by a changing society.

The majority of the questioned students (approximately 71%) consider that the higher education has not managed that well to adapt to the changes in the Romanian society, maybe from the same reasons why they consider that the society is heading towards a wrong direction. The expectations, the needs of these students, in their opinion, are not fully satisfied by the higher education offer. In this respect higher education institutions can be recommended a more extensive analyze of the Romanian society.

The students that preferred the third choice (DK/DA) add up about 10% in the total answers. Like a short motivation to these answers, we could think about the fact that these students, are either not informed about the evolution of the higher education in Romania or maybe they don’t believe that the risk of not finding a job after the graduation of these studies is too big.

The question “*You have chosen to become a student of the Faculty of Economical Sciences, Cluj-Napoca, “Dimitrie Cantemir” Christian University, Bucharest. What were the main reasons of your choice?*” is trying to identify what were and what still are the main information source for the future students, related to the faculty they will apply to, the answers highlighting the following:

Approximately 15% of the respondents chose this faculty because they considered it a faculty with a high level of education. Through quality we understand quality of offered conditions and services.

12% of the ones questioned answered that they made this choice because of the level of the tuition fee. We can say that they consider the tuition practiced by the faculty acceptable in comparison with their income.

The third answer choice (“I preferred to be a student in the city where my parents live,”) had a 5% of the total answers. It is possible that these students are still living with their parents or they wish to stay close to their families.

A good marketer appreciates that the advertise coming from the satisfied clients is the most inexpensive and in the same time the most efficient way of promoting the products and services offered by a company. It is also said that 20 satisfied clients can bring another 100 to the organization. These theories are also available for our study, which is proved through the very high percentage (60%) of those who chose this faculty at the advice and insinences of other people (these people being considered those clients satisfied by the quality of the education in the faculty).

The “DK /DA” was the choice of 2% of the students. We could say that this students got into registered into this faculty without putting into the balance what is important for their career,

without allow time for thinking about this decision or simply refusing to give a concrete answer to this question.

The following question offers information about the student satisfaction, the respondents having to appreciate the next aspects:

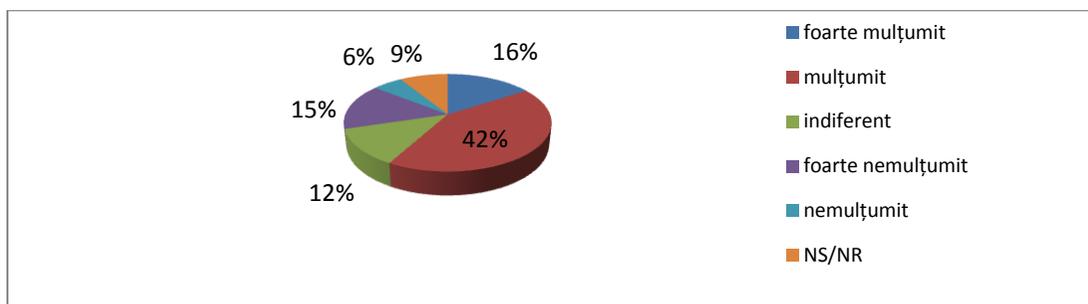

Fig.nr.2 The answer to the question related to the student satisfaction

Realised by the author

According to the chosen criteria, about 16% of the students declared that they are very satisfied with the conditions and services offered by the faculty. This could be a gratifying percent for the faculty's administration, but it cannot be considered big enough or satisfactory enough.

Approximately 42% of the students declared that they are satisfied with the conditions and services offered by the faculty, while 12% are not concerned about them.

From the ones questioned, 15% declared themselves dissatisfied and 6% very dissatisfied with the conditions and services offered by the faculty. Therefore a 9% of the students are left, who do not consider themselves able to evaluate some of the criteria regarding the activity that takes place in the faculty and the conditions it offers or they just refuse to give an answer.

Regarding the question related to the services offered by the Centre for Information, Counselling and Career guidance for students out of the total questioned students, approximately 5% answered that they are very satisfied with the services offered by the CICOC Centre, and about 19% said they are "satisfied" with it. The percentages for the other answers present themselves as follows: 41%"indifferent", 35%"DK/DA". The CICOC Centre is a service made available for the students to guide them in their career or to help them make a decision about their future career. The 41%, respectively 35%, mentioned above could raise question marks regarding the notoriety of this centre among the students. One recommendation that we can do from this point of view to the faculty management is to concentrate on promoting the centre and thus try to attract more students into the information and career orientation centre.

The usefulness of the studied subjects in relation to the specialization's (study program) requirements.

The percentages of the answers given to this criterion are the following: 22 % „very satisfied”, 44% „satisfied”, 13% „indifferent”, 19% „dissatisfied”, 2% „very dissatisfied”.

The study programs are formulated in detail, according to the results expected by learning and are matched with an academic qualification. Therefore, subjects to be studied separately for each specialization must be carefully selected to meet program objectives and targets.

The percentages are quite satisfactory, which means that the curriculum is well thought out, in accordance with the requirements of the specialization.

However, there is a fairly large percentage of students who were not satisfied. Talking with some of them I found that their complaints are related to the fact that they consider some material unsuitable for their specialization or expect a greater depth of material (in terms of practical application of the theory studied).

Complementarities and relations between classes

Flow rates are needed so that information obtained by studying a subject to be related to the information material studied further on, to create a "homogeneous" field where all the parts fill each other.

A very high percentage was obtained to the "satisfied" option, approximately 36%, but nevertheless an almost equal percentage (about 32%) was obtained for "dissatisfied." All of this could be related to the above criterion, namely „usefulness of subjects studied in relation to the requirements of specialization”

The other answer versions cumulated approximate percentages of: 12% "very satisfied"; 7% "indifferent"; 13% "very dissatisfied”.

Teacher-student communication

After the responses given to this statement we are very pleased because about 71% of students surveyed were "very satisfied" or "satisfied" with how their communication with teachers is carried out.

A percentage of about 12% of students say "indifferent" ,10% are "dissatisfied" and 7% "very dissatisfied."

The quality of the faculty website:

A percentage of about 10% of surveyed students are "very satisfied" with the quality of the faculty website, and about 42% are "satisfied."

These percentages are considered positive, but, nevertheless, a percentage of 31% of students are "very dissatisfied" and 10% are "dissatisfied" with the quality of the site. We believe that we should improve the website of the faculty since lately young future students prefer searching the internet for the desired information on the faculties which they want to follow.

The quality of information provided by faculty staff (decisions, regulations, etc..)

The satisfied and very satisfied students, in relation to the quality of information provided by the faculty staff cumulated a rate of approximately 36% (5% "very satisfied" 31% "satisfied") of all responses. This can be considered a positive response.

But however, the real situation is the fact that, about 47% of respondents are dissatisfied or very dissatisfied with the quality of the received information.

Given that the percentage of dissatisfied students is higher than of the satisfied ones, we propose changing the way the students are being informed (from the summary information on the bulletin board to the detailed information available on the site, etc.).

We also obtained a rate of about 15% of students who said they were "indifferent" probably because, probably, for their part, student life at a university is about going to classes or not, passing the exams and all these, without considering other activities taking place within the faculty where they study.

About 2% of the students chose the answer "DK/DA"

Sense of community (student teachers)

We've all been told Lenin's famous words: "Learn-learn-learn!!!" But life in a university requires more than simply learning activity. It requires the formation of links, student growth and development within an academic community, a sense of community.

However, unfortunately, after analyzing the results we observed that not much sense of community is reflected among students. According to the answers , we have 7% "very satisfied" ,22% "satisfied" ,15% "indifferent" ,35% "very dissatisfied", 2% "dissatisfied" 19% "DK / DA".

We consider however, the percentages of the variants "regardless" and "DK / DA" rather sad than unsatisfactory. Efforts to create a "community" should not be made only by teachers but also by students. I believe now that Lenin wanted to say, "Learn- theory-learn to communicate -learn to behave!!!"

At the question "In general, in relation to the activity and the conditions offered by the Faculty of Economic Sciences in Cluj-Napoca" I am:" the questioned students answered: 13% "very satisfied"; 63% "satisfied"; 19% "unsatisfied"; 5% "very unsatisfied".

The results of this question show the fact that more than half of the questioned students declared themselves satisfied with the activity and the conditions in the faculty. If we consider the stipulations of the ARACIS methodology for external quality evaluation, which considers that if the minimum level of students that appreciate positively the learning/development environment offered by a higher education institution and their own learning path is 50%, then we can say that the faculty is in a good position from this point of view. However we cannot ignore the percentage of around 25% of students who are unsatisfied in relation to the activity and the conditions offered. This raises the problem of identifying the needs of the students and finding the methods for satisfying them as efficiently as possible.

CONCLUSIONS:

The students who filled in the questionnaire, according to the factual data, are mostly people over 30 years old, from urban areas, therefore we can consider that their answers are based on a life experience and an already established personality with a well-defined character.

We must take into account the fact that more than half of the respondents are from Cluj-Napoca, city considered one of the "big university centres" in Romania. This is because the lifestyle and the way of thinking in such a city cannot compare to the lifestyle in a smaller town and much less to the way of thinking and living in the rural area.

Also the type of education, year of study and specialization must be taken into account as policy makers in providing answers. The year of study is important in several ways, among which we mention the fact that, for example, the students in the second year are halfway through the study period. Therefore they do not know the content of all the subjects they are going to study, they are undecided (and, on one hand it is normal to be this way) on the career to follow, they are not decided on the job they wish to fill after graduation, etc. Specializations are a decision maker because they focus on labour market areas.

Speaking of employment, as part of the society we live in, in the present conditions of financial crisis it is not considered particularly "thriving". That is why I believe that some students gave negative answers to certain questions, such as forecasting a future for the changing Romanian society. However, leaving aside their social condition (not related to the activity in the faculty), I consider that the interviewed students appreciated positively the quality of the educational services offered by our faculty. The negative percentages obtained with certain evaluation criteria, can be fixed with little effort from all parties involved. For example, a closer communication between academics (teachers, tutors or faculty management) and students, *as many students as possible*, may reduce complaints about the quality and the quantity of the information offered by the teachers to the students, it could increase the sense of community, it could change the opinion of certain students on the complementarities and relations between classes as well as on the usefulness of the studied classes etc. It is understood that in order to remedy all these, a high level of student's participation in class is a must.

However the main problem is not the teacher-student communication, but the lack of effective participation of students in organized activities within the faculty. We consider inappropriate for such a large percentage of students not to be able to have an opinion, be it critical or appreciative, regarding the activity of student associations. Also there is too much indifference regarding the services available for students within the COCOC centre which was especially designed / created for students.

As a final conclusion, we wish to point out however that there is a disregard to the conditions and services that are available for students. I believe that as long as there were complaints against

them, suggestions could be made to the faculty's management and the spaces concerning these suggestions wouldn't have been left blank.

Higher education is a service offered to the society, with a great impact on the personal development of individuals, because it gives them " a chance for greater autonomy, a greater social mobility, professional and international mobility, higher incomes and an increased personal empowerment" (1) It is also, why we strongly affirm that the Romanian higher education has contributed and should contribute in the future in the formation of the nation, the development of Romanian society's intellectual capital, the training of elites from different activity fields and the consecration of the most important Romanian values.

In the last decade, the Romanian universities have gone through an extensive transformation process, which is not over yet. Changes imposed by the Bologna Process, the transition towards the knowledge economy, multiculturalism, information society, the pressure of more and more people to access higher education, face universities with new requirements.(2) At the same time, within the European and global academic space new universities are developing - such as the virtual or transnational ones - which compete with the traditional ones, competition that does not identify itself with anything that existed in the academic area ten years ago. The effects of this competition are felt in our academic area, causing profound changes in the specific rules and procedures of higher education, in the specific values of one or another of the Romanian universities, in the behaviour of the two categories of "actors" involved in the act of education : teachers and students. By developing and implementing their own strategy in the quality policies and procedures, the higher education institution explicitly commits for the development of a quality culture in all its activities.

Personally, I consider that the main objectives of the higher education institutions must address quality and at least in terms of relationship with the students these objectives should be:

- student involvement in extra-activities (debates on college activities and processes) in order to improve them;
- creating analysis and synthesis skills, communication and interpretation of certain situations, events, actual actions and activities;
- developing creativity in an ameliorative thinking system, to find solutions.

Given the conducted survey and its results we propose for the future activities of the Faculty of Economic Sciences, Cluj-Napoca, a discussion forum about the quality of teaching and learning within the faculty, organized under the title **Quality Circle**.

The circle of quality should be an activity based on a free agreement between students from all majors and years of study and at the dean's initiative. Meetings will be held once a month and, in general, will be attended by heads of year and other representatives.

The purpose of debates is to understand the concept of quality, not on a general level, but a concrete and practical level of the activities and processes that are actually occurring and to interpret the current situation, not from the perspective of finding guilty ones but solutions to improve. For example, if a student has passed an exam but does not have the mark written in the student book, we must not identify the responsible person for this situation (teacher, secretary, etc..), But solutions must be found to establish rules concerning the registration of marks (one teacher writes marks in the booklet - the teacher or assistant).

At the end of the academic year, the activity of the Quality Circle can be monitored, identifying the main conclusions and improvement proposals for certain activities. For example, in virtue of the conclusions drawn at the end of an academic year proposals can be submitted, that include solutions to problems identified on the way: changing the site, improving communication, etc.

The success of the activities carried out under the Quality Circle stands in the satisfaction of seeing the students participating in an organized way to improve faculty processes. Thus, the faculty's management knows better what the perception on various activities is, among students

and can apply procedures to improve on some activity components: schedules, teaching, seminars, students practice, the preparation of essays, evaluation etc. In the context of student-centred education, a requirement is that students are explained the working methods so that they understand the regulations and criteria for the requirement, without excluding the possibility of improving them. Future plans relate mainly to the effectiveness of professional practice and improve the practice period, both in duration and in the actual performance. It refers to defining new forms of partnerships or agreements with institutions that can accommodate the practice.

Notes:

SOCIAL PERCEPTION OF THE EDUCATION SYSTEM REFORM. SURVEY CONDUCTED IN UPPER HIGH SCHOOLS OF BIHOR COUNTY

Sabau Remus Mircea

"Vasile Goldis" Western University of Arad, Faculty of Economics Sciences

1. Introduction

Between the elements which mark the global processes, we can include educational issues, the management of processes in pre-university education. Therefore, the synthetic approach to educational problems in Romania, studied in terms of the processes and the phenomena of social development, but also due to the need for submitting the pre-university Romanian educational process to the European Union requirements, appears to be current and important. This analysis focuses on the decentralization of education. This theme is a true significant of the stage and of the the changing potential of the management practice in the public area. Its actuality is also hard to contest under the conditions in which changes in this area have been slow compared to those of the other countries that joined the European Union (Hungary, Czech Republic, Poland), contradictory and inconsistent (Herczynski and Levitas, 2001: 1-2). The legislative changes, training facilities, as well as the constant institutional reorganization of pre-university education show the presence of an active interest in this matter. However, the real reform of university education still requires essential improvements. This study analyzes the social perception of performers in pre-university system, establishes positive and negative aspects of the reform in pre-university education, all from the perspective of teachers. The research was conducted between March 1st, 2011 and April 1st, 2011. During this time the questionnaire was applied and the data interpreted. The data obtained from the questionnaire interpretation were introduced into the SPSS program. For the analysis and interpretation of data we used SPSS 15.0. under Windows license. My investigation efforts were directed towards the impact of decentralization on the performers in pre-university education system and on their perception. The main purpose of the experimental study was to determine the essential perceptions of the performers involved in the decentralization process. Two general hypotheses were formulated: it is presumed that there is a negative perception concerning the reform in pre-university education, and it is also presumed that the reform in pre-university education does not coincide with a quality education, hypotheses confirmed at the end of the research.

2. Literature review

After Romania joined the EU in 2007, the reforming and adapting of education was more dynamic and priority focused from the perspective and requirements of the European Union structures. Moreover, in the official documents of the Ministry of Education and Research there is often a formula concerning the achievement of compatibility between Romanian education and EU rules, this being a defining part of the education reform policy in our country. An enumeration of external performers that contribute decisively to the deterioration of educational problems reveals the following list (Colceac, 2010: 1):

- The politicization of education that, notwithstanding the degree of professionalism of the administrative staff, raise to the level of system management people without skills necessary to ensure quality education. This external education and its flawed structuring is the factor with the highest weight in destroying the education system;
- Removal of teachers from the system without considering their professional quality and the evaluation of their work and results. The elimination based on being a holder or not, is contrary to the most elementary rules of increasing the quality in education;

- Demotivation of wages in education made by some politicians who show their inability to manage a nation. This demotivation obviously contributes to a great number of valuable people leaving the system, deciding on changing their profession.

The three causes external to the system shield the internal issues of education, which are the following: a curriculum based on speculation, not on practical application of information, an outdated assessment system, which makes only quantitative estimates, without taking into consideration the quality of education; a centralization made by a ministry staff largely composed of political appointees who do not have the necessary competence for the proper functioning of the system; a lack of autonomy of schools, who can not adapt to the crises conditions, a teaching staff with little training and the young ones with a poor professional training, a salary system that eliminated the performance and quality in education in the grid of wage growth, the lack of specialists in education in schools and complete lack of compensatory education programs that lead to solving school matters, except for programs provided by some NGOs; the lack of a labor market oriented education, community development without personal development and further use of a mass education without immediate practical application, a poor working relationship between parents and school because being a teacher is not considered a liberal profession and therefore it does not respond to market needs, but to political order. To these external or internal causes we can add the fact that the collective **terms** of employment at national level lead to the trade unions being unable to exercise pressure upon the government.

4. Results of the research:

In the methodological approach to see whether the assumptions made in the study are accurate, we have appealed to a quantitative type analysis. This data analysis will reveal the overall results provided by participants in this study, allowing the observance of the results trend and of those who were the subjects of this study. Based on statistical analysis and interpretation of sociological type we will define the results obtained from a spelling of methods that lead to the verification of the study hypothesis. Also in this approach we will make a series of charts to highlight the study assumptions.

Hypothesis no. 1

For Case 1: "It is assumed that there is a negative perception concerning the reform of pre-university education"; we used a qualitative analysis to determine the truthfulness of the hypothesis

	Frequency	Procent	Procent valid	Procent cumulat
Valid not coincide	14	17,5	17,5	17,5
to a lesser extent	31	38,8	38,8	56,3
to some extent	25	31,3	31,3	87,5
fully coincide	10	12,5	12,5	100,0
Total	80	100,0	100,0	

Table. 1. Frequency table for item no. 2 "To what extent do your aspirations coincide with the current changes"

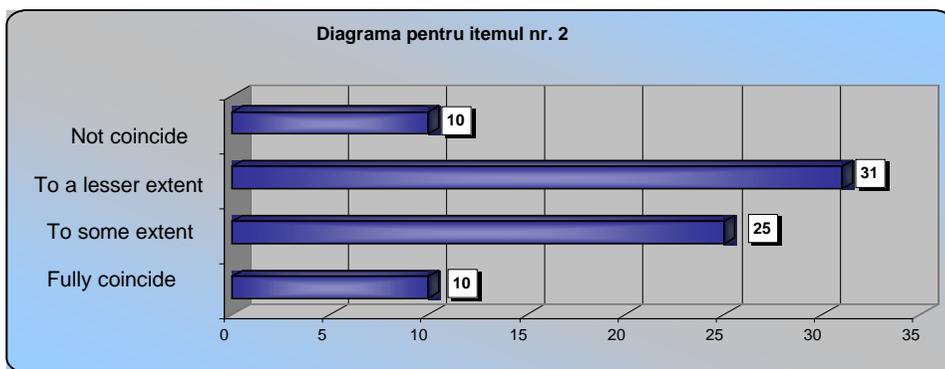

Fig. no. 1 Diagram for item no. 2

The presence of this frequency table and the chart of the studied item indicate a range of issues. Participants in the study say at a rate of 38.8% that the current changes do not coincide with their aspirations and a percentage of 17.5% believe that these measures do not coincide at all with their aspirations. Negative perception expressed by the ratio of scores is also visible in Fig. 1. This fact comes from the distrust of the study participants in the new educational reform and a reluctance to what this reform will bring. Also to confirm the first assumption we used the analysis of item no. 4 which says: "Specify the main weaknesses of the reform."

	Frequency	Percentage	Valid percentage	Cumulative percentage
Valid encouraging corruption	26	32,5	32,5	32,5
favoritisme	23	28,8	28,8	61,3
involving people from outside the system	18	22,5	22,5	83,8
financial constraints	13	16,3	16,3	100,0
Total	80	100,0	100,0	

Table. 2 frequency table for item no. 2

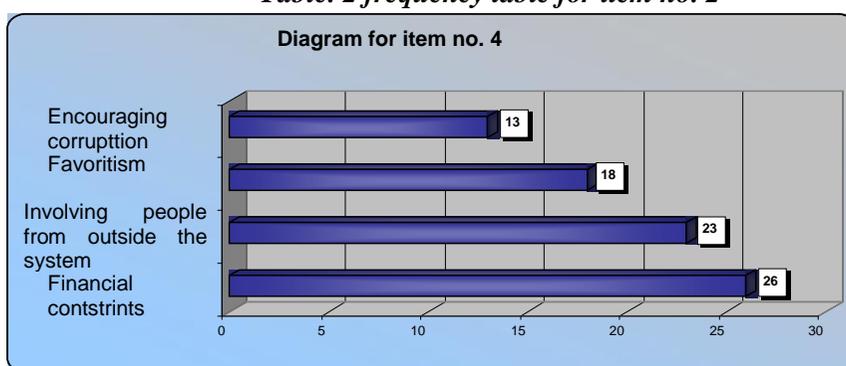

Fig. no. 2 Diagram for item no. 4

The analysis of the frequency table and figure no. 4 shows the great negativism related to the reform perception. According to the study participants encouraging corruption is the first major element, followed by favoritism, the involvement of outsiders and also by financial constraints.

Regarding the two items we can say that the first case examined was confirmed and that there is a negative perception towards pre-university education reform.

Hypothesis no. 2

For Case no. 2 "It is assumed that the reform of pre-university education does not emphasize the aspects of a quality education " we used a qualitative analysis to better observe the answers of the participants in the study.

For confirmation of the two hypotheses we analyzed items 7c, 7e and 7f. 7c "Continuous Improvement of Education Officials'

	Frequency	Percentage	Valid Percentage	Cumulative percentage
Valid largely	11	13,8	13,8	13,8
quite a lot	12	15,0	15,0	28,8
moderate	29	36,3	36,3	65,0
insignificantly	22	27,5	27,5	92,5
none	6	7,5	7,5	100,0
Total	80	100,0	100,0	

Table. 3 frequency table for item no. 7c.

7e. "The growth of transparency of organizing the competition for employment and promotion in pre-university education."

	Frequency	Percentage	Valid percentage	Cumulative percentage
Valid largely	4	5,0	5,0	5,0
quite a lot	22	27,5	27,5	32,5
insignificantly	44	55,0	55,0	87,5
none	10	12,5	12,5	100,0
Total	80	100,0	100,0	

Table. 3 frequency table for item no. 7e.

7f. "Development and capitalization of teachers' potential"

	Frequency	Percentage	Valid percentage	Cumulative percentage
Valid largely	2	2,5	2,5	2,5
quite a lot	42	52,5	52,5	55,0
moderate	27	33,8	33,8	88,8
insignificantly	9	11,3	11,3	100,0
Total	80	100,0	100,0	

Table. 3. Frequency table for item no. 7f.

The three frequency tables illustrate how education reform issues are viewed.

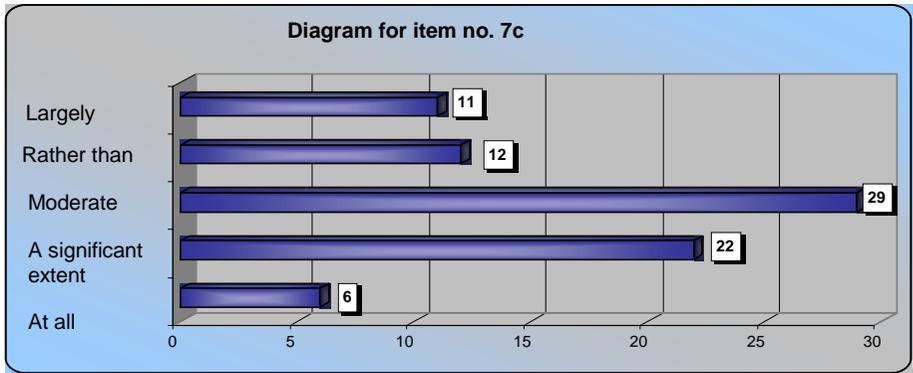

Fig. no. 3. Diagram for item no. 7c.

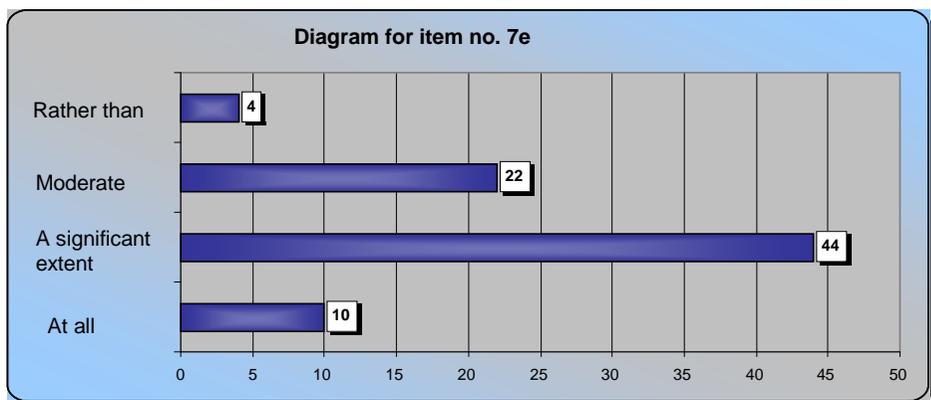

Fig. no. 4. Diagram for item no. 7e.

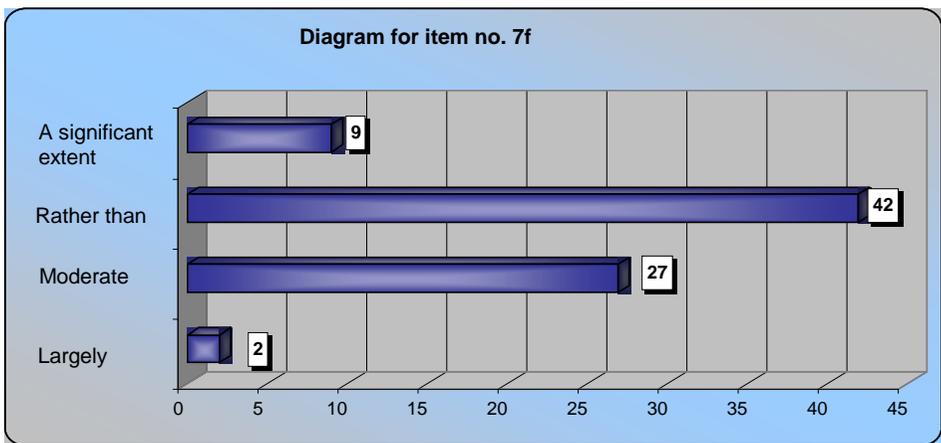

Fig. no. 5. Diagram for item no. 7f.

According to the study participants, the new educational reform does not highlight the aspects of training and preparing teachers for quality education. This chart is given in Fig. 3 which targets the improvement of staff training in schools. Score 29 for moderate and 22 to a minor extent comes and confirms that fact. For item 7e, which targets the increase of transparency in organizing the competition for employment and job promotion in pre-university education, its

results, ie a score of 44 for minor extent is eloquent for this phenomenon. Lack of transparency leads to suspicion regarding this phenomenon. For item 7f, concerning staff development and capitalization of education staff potential, the results are eloquent for „moderate“, the score being 27. After analyzing the three items listed above we can say that hypothesis no. 2 was confirmed after a quantitative analysis of the data obtained.

5. Conclusions

In this study we have highlighted aspects of the study participants' perceptions on the Romanian education reform. For the first hypothesis which assumes that there is a negative perception concerning the reform of pre-university education, the qualitative analysis of the items studied allowed the confirmation of this hypothesis. The changes in present measures do not coincide with the aspirations of the study participants and there are also highlighted the weaknesses of the reform such as: encouraging corruption, favoritism and involvement of others outside the system. The qualitative analysis allowed confirmation of the first working hypothesis. For the second hypothesis, which presumed that the reform in university education does not emphasize the aspects of a quality education, we used the analysis of three items: 7c, improving continue training of staff in education, 7e, increase of transparency in organizing the competition for employment and promotion positions in pre-university education and 7f, development and capitalization of teachers' potential. The quantitative analysis of items led to the identification of issues that the participants in the study have revealed. Thus, an insufficient training of staff in education, a lack of transparency in the contests for seats in pre-employment and a weak capitalization of the educational potential of teachers prevent this system from having quality in education. The qualitative analysis allowed the confirmation of the second hypothesis of the study.

GENERAL CONSIDERATIONS REGARDING THE EVALUATION OF PERFORMANCES OF EMPLOYEES IN A SME

Savlovschi Ludovica Ioana

Bucharest Academy of Economic Studies

Robu Nicoleta Raluca

Bucharest Academy of Economic Studies

The evaluation of performances, in a broader meaning, is deemed an action or a certain type of cognitive activity whereby an evaluator assesses or estimates the performance of a person in relation to the performance standards settled, as well as his/her mental representation, with his/her own system of values or his/her own conception regarding the performance obtained.

The performance evaluation systems are an intrinsic and utterly important part of the management of human resources system, because the evaluation, when it is not done as a mechanical activity, turns out to have a significant influence on the economic/social activity and on the organisational climate within an organization, with direct repercussions on the efficiency increase in general and the productivity in particular.

Key words: performance evaluation, appreciation, performance management

The evaluation system of the employees has the main objective of improving communication between the employees and the organization management and that of providing a working climate as favourable as possible to carry out the activity. At the same time, depending on the results of employees' appreciation, the organization management can adopt a series of measures regarding:

- The establishment of some forms of improving the professional training for certain employees;
- The adopting of a new solution regarding the level and waging modality of some employees;
- The promotion of some employees etc.

Still, at the same time, each employee is interested in getting an appreciation as objective as possible of its activity and potential because this way, he/she can know better the development opportunities existing at the level of the organization, the requirements and means of improving their professional training, the perspective for the development of their career within the organization and the possibilities of multiplying awards.

The systems for the assessment/evaluation of the employees must be adapted to the specificity of the activity carried out by each employee, to this end it is necessary to carry out:

- An assessment/evaluation of the employee in relation to the requirements and the particularities of the job (or the position) he/she is occupying;
- A differentiated assessment/evaluation, in step with the responsibilities attributed to each job.

The competition context and the desire of the organizations to develop require a permanent preoccupation to increase performance. This explains why the theoretical concepts regarding the performance, become more and more numerous.

For a better understanding, we underline the contents of some of these concepts:

- The professional performance represents the level of accomplishments of an employee by the reference to the performance standards.
- The social performance refers to the impact of the managerial activity on the employees, being defined by the intensity with which and individual contributes to the development of the organization, by the reference to the objectives and standards established.

- The performance management can be defined as a strategic and integrated approach of ensuring the long-term success in the organizations activity, by improving the performance of people working in them and by the development of the teams' abilities and the individual participants.

The performance management consists in a systematic approach of the human resources management, in general and the performance evaluation in particular, using the objectives, performances, assessments and feedback as means of motivating the employees so that they can understand and use to the maximum their creative potential.

- The evaluation of the performances is the basic activity of the human resources management, carried out in order to determine the degree in which the employees in an organization accomplish their tasks and responsibilities effectively.

The performance evaluation process is defined as an ensemble of standardised procedures aiming at obtaining information, in a system of managerial hierarchy, regarding the professional behaviour of the organization staff. Two aspects are emphasized from the definition presented:

- The evaluation procedures used by the organization correspond to the vision of the unit regarding the way in which they organise their activities and orient their staff;
- The procedures are standardised, avoiding as much as possible the negative effects caused by the evaluators. The standardisation can be provided by the evaluators' training, the use of written documents or audiovisual means and the control of procedures by a specialised compartment;
- The system of obtaining information and carrying out the performance evaluation is in tight agreement with the managerial hierarchy.

The success of the evaluation process is conditioned by the quality of the criteria used. They must meet the following conditions:

- They should be formulated in a simple, clear and concise way, they should not comprise generalities and they should be understood both by the evaluators and the people evaluated;
- Their number must be limited, because the use of too many criteria might lead to the levelling of the results, their relevance being diminished;
- They should be quantifiable, so that they should diminish the challenging of the results;
- They should be applied to all the subjects who carry out their activity in comparable conditions.

The managerial theory and practice in the field of human resources certify the fact that there is no ideal procedure for the evaluation of the performances, the methods and techniques used being the expression of an action from certain factors influencing the system for the performance evaluation. From these factors, we note:

- The history and culture of the organization – the evaluation of human resources performances depends on the history of the organization and its system of values (organisational culture);
- The size of the organization and its line of business – the great organizations in the sectors with a strong competition were the first to develop formal evaluation systems, determining the employees to understand the role of performance;
- The strategic orientations – determine the choice of those performance criteria, which are in compliance with the organisational mission, objective and strategies;
- The practices used in the employment, payment and promotion of the staff – the waging system represents one of the most important factors in choosing the procedures for the evaluation of the performances, because, if the salaries level is caused by other factors but the performance, then the evaluation loses its purpose, becoming a formal activity. Moreover, in an organization in which promotion is done intuitively, there will always be a tendency not to use the evaluation of performances as an operational variable in the management of human resources;

- Working environment has direct repercussions on the professional performances by: the failure to accomplish the tasks, absences and delays, a high rate of human resources fluctuation.

The manager of a small business really needs a system for the evaluation of the employee that allows him/her to answer the question: "How well do my people manage?" In such a system, the performances and progress of each employee can be evaluated, and the results above average can be rewarded. If no system of management by objectives is used, criteria such as the following can be used: a) the workload and work quality; b) the cooperation spirit; c) the initiative; d) the confidence; e) the training; f) the teamwork skills. A simple scale can be created (qualitative) that can influence the waging of that person. Going further, only such criteria can allow the manager to define realist objective and the degree of accomplishing them.

The managerial research and practice in the field prove that small organizations generally prefer an informal system for the evaluation of performances, functioning at the same time, pretty well correlated with this one. The advantage of an informal system of performances evaluation consists in the fact they require less time of design and administration, compared to a formal evaluation system.

Hornsby and Kuratko considered that the evaluation of the performance varies in step with the size of the company and the industrial sector. They identified narrative descriptions (essays) of the employees' performance, the evaluation of their capacity of accomplishing the objectives, the use of some value scales as methods of evaluation that increased in importance alongside the company size. In contrast, MacMahon and Murphy have brought arguments according to which the entrepreneurs don't usually have, the necessary training in order to make concrete evaluations of the performances and they might perceive the formal systems for the evaluation of performances as a waste of time. In very small companies, the evaluation of the performance is informal and continuous because the entrepreneurs-managers control directly all the activities. As the control space increases, the evaluations are expected to be more formal and to take place at bigger time spans.

The entrepreneurs-managers find it difficult to provide confidence to employees and they are reluctant in delegating tasks.

Kotey and Slade asserted that the evaluation of the workers' performances by the middle level managers extended alongside the company size. As the company size increased, one could note the use of more evaluation methods at the managerial level than the operational level. At the same time, the survey shows that most of the companies have evaluated the performance of their employees, mostly in small and medium enterprises (82.4%, 80% respectively). At the micro-enterprises, the tight connection of the entrepreneur with the employees allowed them to notice and correct the errors almost immediately. The evaluation scales were the most used methods at the operative level, and some employers compared the performances between the employees. As the number of employees increased, the evaluation of their performances was gradually trusted to the managers to whom they were subordinated (47.4% in the medium enterprises compared to 19.5% in the micro-enterprises).

The use of the evaluations carried out by peers and of self-evaluations was extended alongside the size of the company. Nevertheless, at the operational level, the use of other methods of evaluation has seldom changed as the size of the company grew.

Conclusions

At present, more and more small and medium face the need to increase the productivity of work and for that, they have limited possibilities. One of the least exploited means of increasing work productivity is to improve the human performance or, maybe, better said, most companies try it but few of them succeed it.

The low opportunities for the limited formal promotion and instruction in the micro-enterprises, compared to the small and medium enterprises, can explain why the performance evaluation aims less at estimating the employees' training needs and the promotion possibilities. This suggests that the micro-enterprises cannot afford to bear the costs of a long-term training for employees with weak performances.

DO WE REALLY HATE OUR JOBS? DETERMINANTS OF JOB SATISFACTION IN ROMANIA

Săveanu Tomina

University of Oradea, Faculty of Economic Sciences

Săveanu Sorana

University of Oradea, Faculty of Economic Sciences

Job satisfaction is said to be an important factor of productivity at work along with having the proper training, interests and motivation. Frustrations at work may derive from different aspects of the job itself, the work environment as well as personal motivation for work and its results. Human resources management theories focus on job satisfaction and motivations as means for achieving the institution's objectives, and consequently see motivations and satisfaction at an individual level. Our paper investigated these issues at macro level, going beyond the individual variables of job satisfaction to the ones that explain the attitudes towards work at national level. This approach is derived from cultural theories analyzing attitudes towards work as a cultural value that varies across nations. In this manner we analyze data at national level, investigating the factors that influence work satisfaction and attitudes towards work of Romanians.

This paper aims at explaining the identified differences regarding the individual's attitude towards their professional life. Considering the fact that work occupies a lot of time in people's life and it is considered the second most important aspect of life after family, we questioned the aspects that explain the levels of job satisfaction both in the light of theoretical constructs and as results on the Romanian population. These indexes have a direct impact on the quality of life, reflect the level of development, as well as point to further social aspirations of individual actors. The current analysis reflects on different aspects of the appreciation of work and investigates variations of work satisfaction: Which is the value attributed to work? How important is work and how satisfied are individuals with their jobs? Which are the characteristics that determine variations of job satisfaction?

After a theoretical synthesis of different approaches of work related attitudes in the literature, the second section presents the data and the main research findings. For data analysis we used the data obtained in the European Values Survey 2008, research conducted by the Romanian group for the study of social values, supported by the Research Institute for Quality of Life. Other data used in this paper derived from a research program developed at University of Oradea – Social Sciences Faculty - HURO 0801/180 ENRI. The research section of this paper follows the theoretical questions: first we focus on the value attributed to work by Romanians and its contribution to self definition, then reflect on the significations of work, and finally explain the levels of work satisfaction. The main findings of our analysis suggest that even though work is seen as very important by Romanians, the main explanatory factor of job satisfaction at a general level is connected to economical status provided by a certain job. In the concluding section we stated several research directions that would provide better insight in this topic.

Keywords: appreciation of work, job satisfaction,

JEL codes: M12, O15, J89

Theoretical aspects

The analysis regarding work motivation and satisfaction derives from two general lines: the first one is in connection with work theories: work psychology and sociology, management, especially human resources management which deals with individuals and the effects of professional

activities of the individuals over the institutions in which they are performing their activities. The second dimension is in connection with the analysis of economical policies, different work indicators (incomes, work hours, professional training, satisfaction, commitment to the organization) being taken into consideration for measuring the well-being of the citizens and also for doing evaluations and comparisons between countries. We are going to present the general elements and results of the researches from both directions in order to point out their importance and interdependence. A general analysis of all attitude co-variables regarding the job has to contain both individual and organizational characteristics of the field of activity and also the ones from the macro-social level, like the political-economical environment; the effects of satisfaction/dissatisfaction towards the job can also be found in all of these three levels.

From the first approach category regarding work, it is important the classical distinction between the types of work motivations are based on intrinsic-extrinsic classification. The individual characteristics, like responsibility (the feeling that own work is important), autonomy, the possibility of usage and development of own abilities etc. belong to the first category, these being stable characteristics in time, from which the perceived professional life quality's appreciation derives. Extrinsic motivational factors contain all kinds of rewards and penalties: bonuses, promotion, criticism, wage diminishing (Armstrong: 2009). The types of motivations that act upon the individuals are important for the work satisfaction: a motivated person who gains the awaited work benefits (be it intrinsic or extrinsic) is satisfied by the undertaken professional activity. Motivation can be defined as "the sum of forces, internal and external energies which initialize and lead the behavior towards an objective, which once fulfilled determines the satisfaction of a need", in other words, work satisfaction is directly influenced by the satisfaction of motivational needs (Abrudan: 2009). Thus, the level of satisfaction can be influenced by opportunities, independence, relationship with co-workers, communication with the superiors, success obtained in the field of work etc. Money is the most direct and obvious type of motivation, not because of its intrinsic value, but for the things that can be achieved with it: social prestige and position, access to superior goods and resources. Contrary to a general and accepted perception by the common sense, the studies do not demonstrate a direct relationship between work satisfaction and performance, the relationship having the possibility of being inversely: an individual who gets to high performances consequently is going to be satisfied by his/her work (Judge et al., 2010), element taken into consideration in the previous analysis of the authors regarding evaluation of work performances (Saveanu, Osvat, Saveanu 2010: 706). Even though, motivating the employees is important for the managers for achieving organizational objectives, for creating a positive work environment, low absenteeism etc. (Mathis: 1997, apud Abrudan: 2009). Even though, it is important to keep the conceptual differences between work attitude, work satisfaction in subjective terms and work evaluation based on objective criteria, distinctions kept in the analysis in this paper (Weiss 2002).

In the present paper we are going to investigate the existing connection between work motivation types, work perception declared by the subjects and their effect on work satisfaction. The question to which we are trying to answer is: *to what extent does the work satisfaction level vary according to the following motivational factors: income, work position, freedom for decisions, occupations?* The data did not allow the investigation of the relationship between this and the aspects from the institutional level in which they are performing their activities, even though the theories present their relevance.

The second direction for investigating the attitudes toward work is a macro-social one, emphasizing the general social characteristics, the attitude towards work being a social indicator which can be aggregated to different levels (Seashor and Taber 1975). Most of the analysis in this category are connected to the rate of occupation, rate of unemployment, salary incomes,

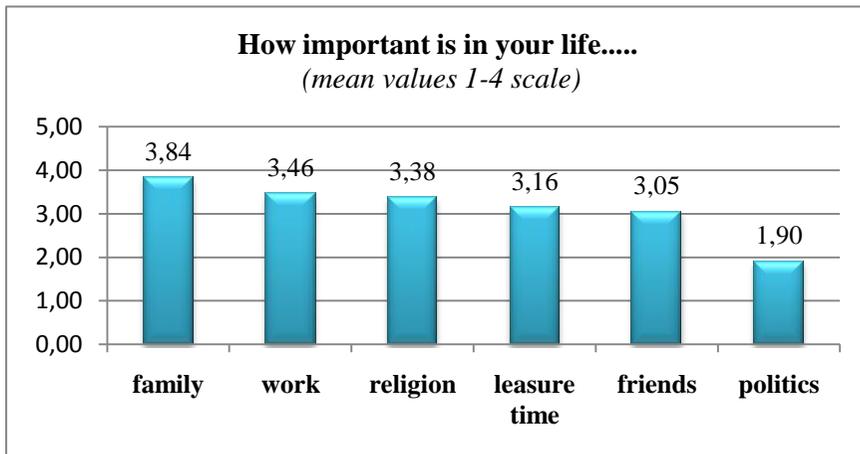

average period of work, fields of professional activity etc. This data is also completed by the subjective indicators of life quality, just like the perceived satisfaction regarding work, the value given to the job. These dimensions are the ones that build up the objective of the present paper. Thus, the comparative analysis between Romania and other European countries has revealed the fact that Romanians are generally less satisfied with the job, less sure regarding their job, a fact explained through the structure of the labor force and also through the rate of occupancy of the active population in our country (Ciutacu 2008: 59-108). Other factors that explain the work satisfaction degree of the Romanians are: age (young and old), education and occupation (those with a superior educational and/or occupational level are more satisfied) (Comsa, 2009: 1). The type of employment is also a factor that influences work satisfaction, the owners being the most satisfied ones according to a representative study on a national level (Comsa 2008: 46 - 48). These relationships are going to be tested in the present paper for highlighting the factors that influence work attitude and the degree of satisfaction on macro-social level, as social indexes of well-being and of development level. Nevertheless, the present analysis did not allow the comparison with the results obtained in these countries, being more an investigation on a national level of the aspects regarding work.

Data and methodology

The objective of this paper is the investigation of the variation of work valuing and of work satisfaction. For obtaining the results, I have used the data of the EVS 2008 survey. The 2008 research performed by the Romanian group for studying social values, sustained by the *Life Quality Research (ICCV)* Institute, had as objective the evaluation of the values' dynamics of the Romanians. The study is part of the surveys known as *European Values Study (EVS)* and has as objective the comparison of values between different European countries and the presentation of the evolution in time of the values' orientation (for more information regarding the EVS study in Romania, go to www.iccv.ro/valori). The representative sample for the Romanian population involved 1489 subjects. The structure of the sample is the following: distribution according to gender -51.8 women, 48.2 men, average age of 46.4 years, with a standard deviation of 18.3. The data has been processed by the authors by using the SPSS statistics software.

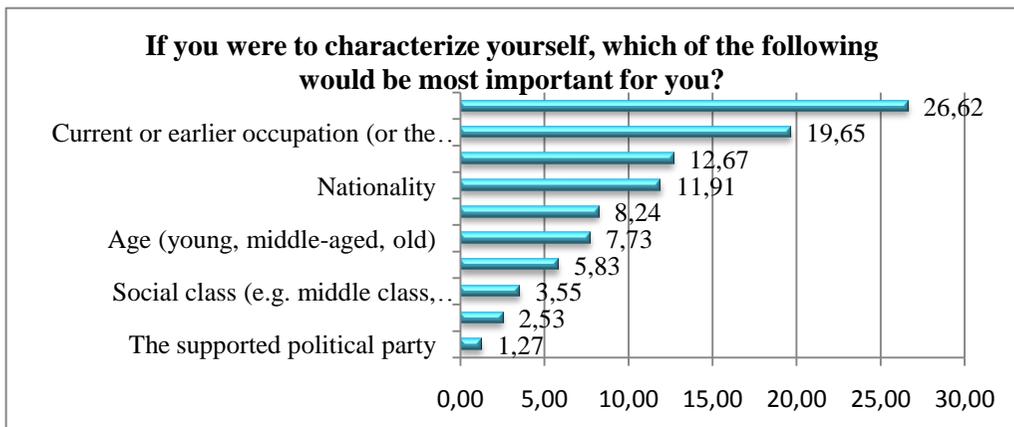

Results

Taking into consideration life as a whole, for the Romanian population, according to its importance, work is on the second place, the first place being allocated to family. This aspect shows that, in Romania, work is a desideratum, all the more so as the lack of work is one of the identified factors in previous studies as a determinant for social exclusion. Employing in professional life contributes to the satisfaction of the need for rising and to personal development of the individuals. A comparative analysis in European countries highlighted the fact that Romania belongs to the countries which value work the most, this appreciation presenting a constant trend in the last 20 years (Comsa: 2009).

Graphic 1. The importance of work attribution, made by the author, data source: EVS 2008

What is important to highlight regarding work appreciation is the fact that work represents one of the defining aspects of the individuals' identity. According to a research performed by the collective of the Sociology desk, University of Oradea (HURO 0801/180 ENRI), work does not only occupy an important place in the life of the individuals, but it also defines them as persons: the subjects answered the *Which is the most important thing that describes who you are?* question by 19% declaring (on the second place after family) that work is what defines them.

Graphic 2. Appreciation of the defining characteristics of social identity, made by the author, data source: ENRI 2010

Taking into consideration these aspects hereinafter, we are going to investigate which is the value given to work by the Romanians. The five items presented in the table below are in reference to the appreciation of the role and place held by the job:

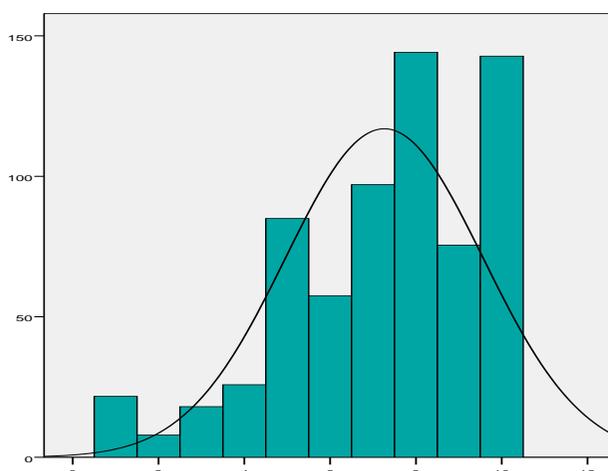

Table 1. Work appreciation (5 points scale: 1- totally agree, 5 – totally disagree)

	N		Average	Std. Deviation
	Valid	Missing		
You must have a job in order to make the most of your abilities	1453	39	1.77	,78
It is humiliating to receive money without working for it	1456	37	2.28	1.15
People who do not work become lazy	1436	57	1.98	,95
Work is a duty to society.	1429	63	2.47	1.14
Work always has to be on first place, even if it means less free time	1450	43	2.36	1.08

The centrality of work is also confirmed in the case of these items. Most of the individuals consider that work gives them the possibility to prove their abilities and keeps them active. The fidelity of the scale is thus confirmed (cronbach alpha>.700), by using the inverted variants of the items, we have developed the index for work appreciation, having an average value of 19.1. High index values show a strong valuing of work.

The analysis regarding the variations of the work appreciation index did not show specific characteristics of the individuals which determine different levels of the valuing of work. We had a positive correlation only in the case of age (Pearson coef. .166**, sig. 000), thus older people value work more. One of the possible explanations for the lack of significant relationships can be found in the way the scale has been built. It can be seen that the scale uses codes from 1 to 5, where 1 stands for a positive appreciation. Even though we used inverted values for developing the index, it is possible that the answers given to these items to be distorted due to the used codes (downward orientation).

Another way to interpret the lack of characteristics which determine the variation of the value given to work by the individuals is found in the subject of the measurement. The used scale measures the importance, the value of work and, as we could see in the first section of the paper, work is the most important after family. Thus, the appreciation of work's value does not represent different variations according to social-demographic characteristics of the individuals and their involvement in professional life. Also, the items use the word "work", word that does not directly refer to the job of the individuals, but rather to the involvement in different activities. Further on we have tested the identification of the characteristics which determine the variation of work satisfaction. Using the scale with values from 1 to 10 (1 - unsatisfied), the average value of work satisfaction is 7.26 with a standard deviation of 2.3. The previous comparative analysis place Romania on the 18th place from a total of 21 European countries, showing a lower level of satisfaction regarding work (see Comsa: 2009). Work satisfaction does not present significantly different variations according to age, gender and level of instruction of the individuals.

Graphic 3. Histogram Job satisfaction, data source: EVS 2008

The analysis show a higher degree of satisfaction in the case of subjects with a superior occupational level, both regarding the type of employment and what this implies: the level of incomes and work position.

The tested relationship between the degree of work satisfaction and the level of incomes shows the major impact of income over the work appreciation. Thus, one of the major criteria according to which a job is evaluated is the salary. The positive value of the correlation coefficient is of Pearson coef. .235**, sig. 000.

The difference is significant regarding the type of employment. The average value of work satisfaction is higher in the case of self employed individuals: 8.25, in comparison to the 7.29 average value obtained for those who are employed (F=9.7, sig<005).

Also regarding the type of employment, the Levene Test for the equality of the variance shows a significant difference regarding the number of subordinates an individual has. Thus, the average value of work satisfaction is higher for those who have subordinates, compared to those who do not have subordinates (7.91 in comparison to 7.17: F=6.31, sig<005).

Also, in the case of decision making freedom degree, the analysis identify a significant relationship. Thus, the positive correlation coefficient shows higher levels of work satisfaction if a job implies a high decision making power (Pearson coef. .572**, sig. 000).

Another aspect investigated by the paper deals with testing the relationships regarding the type of professions. For coding the professions, the *Classification of Professions from Romania 2011* (COR) was used, recoding the professions in the database on the 10 major occupation group: (1) Members of the legislative body of the executive, heads of public administration, superior chiefs and officers from economical-social and political units; (2) Specialists with intellectual and scientific professions; (3) Technicians, fitters and assimilates; (4) Administrative officers; (5) Operative agents in services, commerce and assimilates; (6) Farmers and qualified workers in agriculture, forestry and fishing; (7) Craftsmen and qualified workers in crafts, adjustment and maintenance of machines and installations; (8) Operators for installations and machines and assemblers of machines, equipment and other products; (9) Unqualified workers; (0) Army forces. The analysis shows significant differences in case of intellectual professions and administrative officers. Thus, the average value of work satisfaction in the case of subjects with intellectual professions is higher in comparison to the average value of the other occupations (8.00 in comparison to 7.20: F=4.26, sig<005). Regarding administrative officers, the average value of work satisfaction is 7.73, compared to 7.15 recorded for the other professions (F=5.56, sig<005). These results are consistent with the average levels of salaries for these professional

groups: the second salary level group is represented by the intellectual and scientific professions, thus it is possible that the obtained significant differences to also come from the income differences of these (INS, 2010).

Final discussion

The analysis presented in this paper contributes to the larger understanding of the work motivations and satisfactions of the Romanians, as an index of both well-being and of development level. In the same manner as other studies regarding this issue, I have shown that for the Romanians, work is a very important dimension, second after family, the professional status being an important criteria in shaping personal identity. The analysis regarding work valuing, with other words the role of work, sustains the conclusion that this represents an essential dimension of life, even if it is important to draw a line between involvement in professional life and involvement in different other activities outside work.

These results generated the analysis performed in the following section, the investigation of work satisfaction level of the Romanians. Their conclusion shows the fact that, even if work by itself is considered as being very important, satisfaction is connected to incomes, chief status, self-employment, high decision making power, intellectual and administrative professions - all of these showing a superior occupational level.

Further investigations are necessary for testing the direction of determination between work satisfaction level and achieved performances. For these, it is necessary to obtain information regarding the type of employer, work relationships and other institutional level indexes. This way, the individual level is averaged to the macro-social one, making generalizations possible.

ASPECTS OF SERVICE QUALITY AND ECO LABELLING OF ROMANIAN LODGING SERVICES

Tomescu Ada Mirela

Universitatea din Oradea, Facultatea de Științe Economice

Tourism has a significant environmental, economic and socio-cultural impact, which makes it important for environmental initiatives.

The Rio Earth Summit (1992) was a milestone for these initiatives, having introduced the concept of sustainable development, its major principles and recommendations of implementation. So, the ecological movement grew globally more and more by widely disseminated actions among various bodies such as governments, associations, businesses, academics, NGOs and communities.

In the European Union eco-labelling scheme, is “a voluntary initiative to promote products and services which have the potential to reduce negative environmental impacts, as compared to the other products and services in the same product or service group, thus contributing to the efficient use of resources and a high level of environmental protection. This shall be pursued through the provision of guidance and accurate, non-deceptive and scientifically based information to consumers on such products and services”. In fact this is official approach known as EU-Ecolabel Scheme, launched in 2005.

In general, the idea of sustainable development, and eco-attitude of many of the activities carried out in different economic sectors have been encouraged to be certified, and to adopt sustainable practices to improve their environmental practices, and to inform and educate their clients regarding their friendly-environmental policies. The tourism sector adopted all of these.

One by one in hospitality industry have emerged new trends, new destinations. Some of these trends are as well connected to environmental policy, eco-initiatives that certify EMS (Environmental Management System) and to use of eco-label in hospitality industry.

For years, the tourism sector in Romania was declared a strategic sector. Within this framework, we decided to examine this area, the specific topic of eco-labelling and quality of lodging services in Romania.

This paper proposes a short examination by observation of studies dedicated to lodging eco-label services and their quality based on a comparative analysis between Romanian supply of tourism "green services" and international one.

This study has as a result a synthetic perspective on eco-label services and some aspects on the state of art of this topic in Romanian and international context of lodging services.

Keywords: environmental policy, environmental management system, tourism, lodging services, quality of services, eco-labelling, Romania.

JEL Code: Q5, Q57, L15, L83

I. Introduction

The purpose of this paper is to examine and to present a short synthesis of literature, which is indicative of the quality and importance of factors which may lower the environmental impact during tourist product life cycle. The main focus is on lodging services / hotels which adopt a pro-natural and eco-label use (**EU-Ecolabel**), while examining the eco-labelling initiative in contemporary Romania⁷².

⁷² http://ec.europa.eu/environment/ecolabel/about_ecolabel/revision_of_ecolabel_en.htm

All products and services have an impact on the environment from one or all stages of their life cycle, starting during the extraction of raw materials, then going through the design, manufacture, assembly, marketing, distribution / sale, ending the use of and / or final disposal as waste⁷³.

The **Rio Earth Summit** (1992) was a milestone for organic initiative, with the concept of sustainable development as its major principles and recommendations for implementation, and in recent years the movement has grown more and more.

In general, **sustainable development initiatives**, eco attitude and many activities in different economic sectors have been encouraged to be certified and such practices have been adopted to improve environmental practices, along with informing and educating the public about the environmental friendly policies.

Tourism has a great impact on the environment during its life cycle. The concept of "sustainable development" has been extended in this area, and the term "**sustainable tourism**" is becoming more present. The tourism sector has adopted these practices and initiatives. In the hospitality industry new trends have emerged, new destinations. Some of these trends are very well connected to **environmental policy, initiatives and eco-certified EMS** (Environmental Management System) and use eco-labelling in the hospitality industry. Higher levels of income cause consumption of goods and services so that they reach unsustainable levels that threaten the natural resource depletion. The Annual Report 2004 [1] of the World Watch Institute⁷⁴, which focuses on consumer society, states that currently there are certain goods and services that have long term consequences for human wellbeing and the planet.

During its life cycle phases, tourism interferes with the environment, having a significant impact on natural habitats, urban environment, etc. The relationship between tourism and the environment is complex, because these two factors are interrelated. Fundamental principle regarding a friendly environment and quality tourism is axiomatic in ecology, and sustainable development from the viewpoint of the organizers (tour operators, hoteliers etc.), and partly to a proper use of the facilities from the point of view of tourists.

The court must first consider the effects of tourism on the environment, exploiting resources, but also by locating tourist structures (natural attraction of the area where a hotel is located is very important, so it is essential to be monitored and protected).

Many tourism-related activities directly or indirectly have an impact on bio-diversity.

Natural areas are affected, sometimes damaged by the arrangement of tourist facilities and the presence of tourists can destroy the local flora and fauna. It appears possible that environmental pollution and the use of large quantities of water contribute to desertification.

Attention should be focused on different phases of activity, which if they have been identified as environmental hazards, must be dealt with by proposing solutions that take into account the following objectives⁷⁵:

- Major tourism operators;
- Education for Eco-living;
- Minimizing the impact of integrating environment and saving resources structures;
- Promoting and supporting responsible tourism;
- Protect the beauty of the countryside and biodiversity;
- Reduce production costs;
- Reducing waste.

For years, the tourism sector in Romania was declared a strategic sector. In this paper, we decided to examine, in the light of these assumptions stated above and in a comparative manner,

⁷⁵ Inițiativa VISIT: <http://www.ecotrans.org/visit/brochure/fr/100.htm> și <http://www.istaygreen.org/>

the relationship between eco-labelling and the situation of lodging services in Romania as compared with other countries.

II. Hospitality and the natural environment

Interest in an area is always in close contact with expectations of attracting more and more tourists, so hoteliers can recover the money invested. Most of the investors' interests often conflict with environmental interests. Investors tend to prefer quantity over quality. The result is a structure which continuously affects the environment, even in some ways it changes the socio-cultural elements. Do not forget that each tourist site has a different level of tolerance (number of tourists visiting an area, following a lifestyle), so operating over the limit can create environmental changes, compromising its appeal. In the tourism industry through the tourist-hotel relationship, sustainable development became a priority, which is achieved via careful application of new environmental management tools. Most environmental management systems are geared towards sustainable development and their application in the hotel industry is increasingly required, by its stated objectives and the instruments used to conduct a series of advantages (saving resources, prevent pollution, lower costs, attractiveness a particular segment of consumers, etc.).

Hospitality is an activity with a wide variety of high resource consumption, which requires environmental impact and hence the need to protect the environment.

In recent years, several studies have shown that people/tourists are more cautious to the environment, but also feel the need for a formal attestation of 'quality hotel', which is achieved through certification. Operators' interest in the industry stems from the need to differentiate the quality of services from those traditionally offered on the market. Quality must be certified. There is a tendency to amplify the importance of certification in accordance with standards of ISO 14000 and the Environmental Management and Audit Scheme EMAS and EU-Ecolabel.

Thus, the hotel business moves towards the introduction of environmental management tools, tools that are more credible and visible because they operate on an international level and are publicly recognized. **Applying the principles of EMS and its implementation is helping the hotel management to establish and assign responsibilities to motivate staff to implement best practices and monitor performance.**

At present, there are numerous national initiatives, even if, at first, they were strictly voluntary initiatives, and some operators have launched their own regulations and thus codes of conduct, guidance, quality label for tourist-oriented environment and structure arose.

One example is an Italian initiative, known in Italy as environmental label Jesolo, respectively and Green Hotel Riccione tags for the environment, but these initiatives have official recognition, so there is the risk of this kind from his own declaration of intent public hotels.

In the **hotel business these initiatives are likely to improve the quality**, the use of the following measures:

- a) Use of compatible eco-products (e.g. use clean products whose quality was recognized by certification and EU-Eco-labelling; or by national eco-labels instead of traditional).
- b) Streamlining services so that improvements to services may include either new technology or a better organization. Examples with optimization:
 - Discovery of loss or defects;
 - Flexible change of linen;
 - Reducing laundry costs by using paper products production;
 - Installing soap dispensers;
 - Use energy saving bulbs with low energy consumption;
 - Use of alternative sources of energy for water heating / solar panels);
 - Using sensors to turn on water and light;

- Electrical devices that operate with magnetic keys;
- Reducing the purchase of products such as soap, useless decoration;
- Increased use of recyclable packaging;
- Adoption of environmental criteria, etc. supply.

However the problem of protecting the environment should allow the service level offered in the hotel to remain high and to ensure customer satisfaction.

Practice shows that it definitely would be easier if the customer/tourist should be sensitized on the issue and would also become involved. The idea that the customer should be informed about the initiative taken by the hotel for environmental protection, might lead to cooperation between the two.

There have been studies aimed at discovering the criteria necessary for obtaining EU-Ecolabel environmental quality label.

These studies were based on the analysis of tourist services offered by hotels in the phases of life cycle.

In terms of life cycle phases of the environmental service that ought to draw the interested customer's attention are those foregoing the services (site and buildings) and the actual service. Location is considered important, except that, in general, when it comes to private operators, they often neglect this aspect in particular, something which should be evaluated during the planning phase through an environmental impact study.

The actual service stage is divided into elementary activities grouped into product life cycle phases of hotels, with relative impact on the environment; the impact of each of these phases on the environment and proposals for improvement can only be assessed once an overview of the whole stage exists.

III. Eco-Labeling the Hotels

In the European Union (EU) we note a modern trend of following "a voluntary initiative to promote products and services that have the potential to reduce negative environmental impact compared with other products and services in the same group of services, there by efficient use of resources and a high level of environmental protection. This is done by providing guidance to consumers and accurate, fair and scientifically based on such products and services" (**EU-Ecolabel Scheme**)⁷⁶.

The EU-Ecolabel is considered to provide certain economic benefits, as well as competitive aspects of differentiation and has a positive image in this area, outlining certain advantages when used [HoraBlaga A. 2010, 256]. In fact, eco-labelling:

- Is an internationally recognized collective mark;
- It may be a marketing tool promoting image quality, addressing certain segments of consumers;
- Is developing an environmental strategy that proposes to change consumer behaviour in the sense of environmental protection is increasingly sought.

Eco-label is granted for products and services with reduced environmental impact. "EU-Flower" is a distinctive sign recognizable at European level [Serbulescu L. 2005, 165].

Quality Certification is more increasingly common practice; even in tourism, it is presented as certification according to ISO 9000, ISO 14000, ISO 22000 etc. standards. However, for several years, lodging and restaurants were adapting to the market demanding certification of higher quality, and started following the ecological trends and their desire to modernize according of new standards. For this reason, we are witnessing a proliferation of brands in order to certify the

⁷⁶ Present the ecolabel of various eco business /products:<http://www.ecolabelindex.com/ecolabels>, for tourism sector:
http://www.ecolabelindex.com/ecolabels/?search=turism&as_values_032= for hotels:
http://www.ecolabelindex.com/ecolabels/?search=hotel&as_values_023=

environmental management system facilities relatively more countries. Germany, Denmark, Austria, USA, Italy.

Regulation no. 1980/2000 approved by Parliament and the Council reviewed the first EU-Ecolabel criteria, and is now expanding its scope and tourism focusing on all the hotel business. The hospitality industry is interested to certify that an accommodation meets some conditions within the rules of low environmental impact (use of renewable resources, has a waste collection system, etc.).

More specifically this kind of label can be applied to hotel units, provided in particular those related to improving the quality of service provided by the hotel relative to where⁷⁷:

- Tourism demand is sensitive to environmental issues;
- Service providers are concerned about the environment and potentially interested in using eco-label;
- Series of five standards (ISO 14020 -14024) are dedicated to eco-labelling activities (Environmental labels and declarations)⁷⁸;
- Increasing interest in using eco-labels when the competitive advantage obtained by using labels, creates a chain effect of copying, the market should continue to encourage permanent improvements;
- Lodge/hotel operators sensitivity to environmental issues can be measured by the presence of policy, instruments and methods oriented to protect the environment;

The first specification for environmentally friendly tour operators, accommodation establishments and various tourist spots in 1991 was the brand / logo Green Suitecase / Der Grune Koffer created in Germany by Ökologischer Tourismus in Europa e.V⁷⁹ (OTE) to provide the tourism sector, a mark similar to Blau Engel⁸⁰ used for industrial products in 1978; now, the German mark used for ecological tourism is Viabono. There are other initiatives of this kind in Denmark (Den Gronn Nogle⁸¹ The Green Key & Destination 21⁸²), USA (for 18 years, the Green Hotel Association⁸³), Austria (Das Österreichische Umweltzeichen Tourismusbetriebe seal⁸⁴), Italy (Legambiente Turismo⁸⁵), Portugal, the Netherlands (Milieubarometer /Green Key), Estonia and Sweden (Den Gronn Nogle) Nordic countries: Sweden, Norway, Iceland, Denmark, Finland (Nordic Swan⁸⁶), France (La Clef Verte⁸⁷), Estonia (Estonian ecotourism Quality), Switzerland (Stainbock⁸⁸), United Kingdom, Ireland and Scotland (The Green Tourism Business⁸⁹), Hungary (1994-Hungarian Ecolabel/Környezetbarát Termék Védjegy⁹⁰).

At this moment it may access Ecocolabel Index⁹¹, a database which lists 25 sectors, 377 eco products and services category, out of 211 countries, of which numerous are national, regional and global, including 44 dedicated to strictly eco-tourism.

⁸⁹ <http://www.green-business.co.uk/>

⁹⁰ <http://www.kornyezetbarat-termek.hu/>

⁹¹ <http://www.ecolabelindex.com/ecolabel/eu-ecolabel>

As noticed in the literature, around 2001-2004 an increasing Eco-labelling trend appeared; in the year 2004, the total number of accommodation units labelled with the EU-Ecolabel was 20, while in the year 2010, there are hundreds across Europe, and thousands in the world.

Since 2002 in Romania, in accordance with EC Regulation no. 1980/2000 Eco-labelled Schemes and European Community eco-label criteria for product groups, the necessary legislative framework for eco-labelling was created and was valid until EU accession when Romania took all legal regulation and procedures of EU.

In year 2009⁹², in Romania a number of 1170 hotels were functioning, of which only two were eco-labelled (representing 0,17% of the total)! We consider this result extremely modest, in spite of an existing legal framework, and also although there are professional concerns in this area. In 2009 we can identify the initiative of the Romanian Green Building Council (RoGBC)⁹³ that is interested to sustain this type of policy, beside NGOs aware of ecological aspects concerning tourism.

We note that the first hotel was certified only in 2008, when Hotel Saturn from the same name sea-side resort on the Black Sea. This was the first accommodation certified unit as green in Romania, and received the Eco-label from the Tourism Ministry at that time. After a year, another was certified; this is Vega Hotel in Mamaia, also on the Black Sea. Vega Hotel in Mamaia has been tagged by TUV Reihart and is the first hotel in Mamaia aligned to the European Eco-Hotel Management System standard⁹⁴.

The hotels have been awarded and certified, which demonstrates that they are trying to protect the environment using eco-friendly technologies, products etc. We remark that with only two eco-labelled hotels in Romania, this is a very modest result!

There is a procedure with 84 mandatory and optional criteria to be met in a proportion of 30%. In general, the criteria focus on reducing energy consumption, the reduced use of chemicals and selective waste collection, waste minimization, recycling and reuse of some resources/waste.

The objective of those who adopt this mode is to be a model for communities, consumers and other businesses.

IV. Conclusions

The presence of specific conditions that support the use of the EU-Ecolabel is linked for example to techniques adopted by hotels, and these able to improve the environment, besides economic and commercial opportunities for those lodging units who qualify as environmental quality.

Inclusion of EU-Ecolabel for the tourist facilities in a wide program of sustainable tourism, such as those for environmental management, namely in general EMAS, and/or in particular according to standards ISO 14000.

The ability of tourism operators to promote environmental protection and conservation is one of the main objectives of the job. This is a strong point of interest in business development and competitiveness.

Undoubtedly, the use of environmental labels increases the visibility of the business, and tourism Eco-labelled services can be seen by operators, as well as hoteliers as a positive thing, but only if it is accompanied by economic, competitive and commercial advantages that can add value to this initiative.

MANAGING RENEWABLE ENERGY IN THE EU10 REGION

Zamfir Andreea

Academy of Economic Studies Bucharest, Faculty of Management

Bucurean Mirela

University of Oradea, Faculty of Economic Sciences

The problems of renewable energy and regional development have gained a global dimension, as well as the concerns about the economic growth. Therefore, this study investigates the issue of managing renewable energy in the EU10 region, within the context of recovery and anticipated growth of the region. The findings of this study disclose that an important source of economic growth in the EU10 region's countries may be to start some new investments in renewable energy. In order to develop the field of renewable energy may be used EU funds, and may be envisaged different public-private partnership models, that may contribute to lower societal costs and increased deployment rates. The study was conducted by combining a wide variety of sources, such as statistics, reports and articles. The results reported in this study could be used for further research in the area of implementing green energy projects in the EU10 region. Another direction for further research could be to identify the most attractive countries for different renewable energy investment projects in the EU10 region.

Keywords: renewable energy, EU10 region, regional development, investment, economic growth

JEL Classification: Q42, R11, O30, M10.

1. Introduction

Nowadays all European regions are interdependent in terms of guaranteeing energy supplies, creating stable economic conditions and effectively combating climate change. All actors are playing an essential role in managing this change, at local, regional, national and European level. The aim of this paper is to reveal the issue of managing renewable energy in the EU10 region, within the context of recovery and anticipated growth of the region.

The research was conducted using a wide variety of sources, such as statistics, reports and articles. The research question was answered by analyzing published sources, evaluating and interpreting evidence.

2. Recovery and anticipated growth in the EU10 region

The EU10 region includes the eight Central European countries that joined the EU in 2004 (the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, the Slovak Republic and Slovenia), as well as the two countries that joined the EU in 2007 (Bulgaria and Romania).

The global financial crisis has harmed the supply potential of the EU10 economies. The credit constrains and higher risk aversion have lead to lower capital flows, restrained investment, possibly higher structural unemployment and lower total factor productivity growth (The World Bank, 2011a: 22).

In early 2011, about two and a half years after the global financial crisis broke, economic output in the EU10 region had returned to the pre-crisis level. The annual growth rates in the EU10 region in 2008-2010 timeframe is illustrated in figure 1. The pace of the recovery differs across the EU10 region, reflecting, among other factors, the overheating prior to the crisis, trade openness and competitiveness.

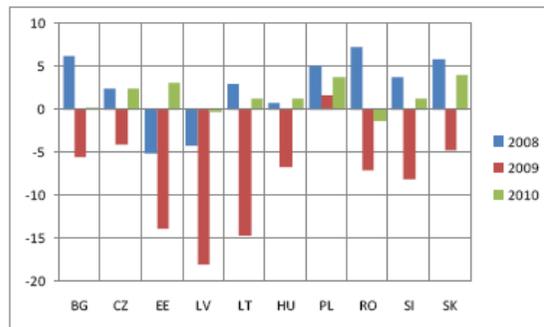

Figure 1 Annual growth rates in the EU10 region, year-on-year, in percent
(Source: The World Bank, 2011a: 6)

The recovery was mainly driven by external demand, while domestic demand was restrained by weak labour market conditions, higher commodity prices, and fiscal policy. The biggest growth improvements in 2010 were experienced by the countries with the most significant overheating prior to the crisis and largest contractions in 2009, such as Latvia, Estonia and Lithuania. As a result, growth differences across the EU10 region narrowed from almost 20 percentage points in 2009 to just over 5 percentage points in 2010. Nevertheless, country differences remained important. Three countries expanded by 3.1 percent or more: Estonia and the countries with limited pre-crisis imbalances, namely Slovakia and Poland. Strong restocking was supported by solid net exports in the case of Slovakia and Estonia, and by consumption in the case of Poland. The growth varied between 1.2 percent and 2.4 percent in the Czech Republic, Hungary and Slovenia where was supported by restocking and in Lithuania where was supported by very strong restocking. Growth remained close to zero in Bulgaria and negative in Romania and Latvia in light of weak consumption and even weaker investment (The World Bank, 2011a: 5). Further structural reforms can help to boost potential growth and facilitate the large fiscal consolidation (The World Bank, 2009).

The contribution to gross value added (GVA) growth in the EU10 countries (figure 2) shows that the accelerating growth in the EU10 region during 2010 came with a broadening of growth across sectors.

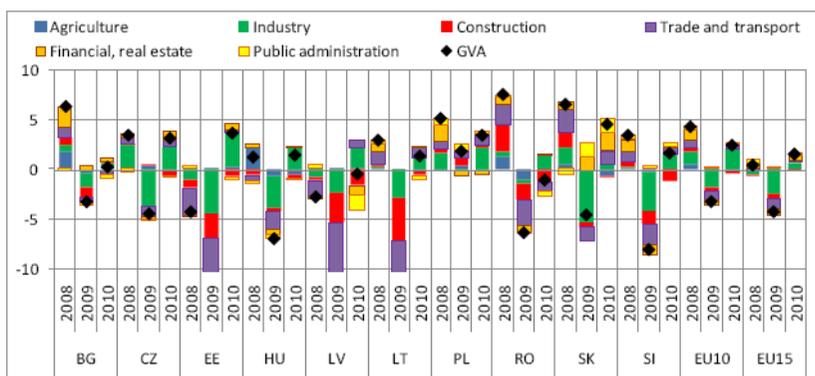

Figure 2 Contribution to GVA growth in the EU10 region
(Source: The World Bank, 2011a: 5)

The double-digits growth of industry reflects the rebound in global demand for capital goods and durables and the deep integration with European production chains (The World Bank, 2011a: 4). However, in some EU10 countries the growth spread to finance and real estate and strengthened

trade, hotels and restaurants, and transport, while public administration and community services remained subdued due to fiscal pressures across the region.

For the timeframe 2010-2012 firms are expected to raise investment with higher capacity utilization and strong global demand for capital goods and durables, and households to step up consumption with improving confidence about future prospects (The World Bank, 2011a: 2). Therefore, the projected gross domestic product (GDP) growth rates (figure 3) may be about 2-4 percents for some of the EU10 region’s countries, and more than 4 percent for other of the EU10 region’s countries in 2012.

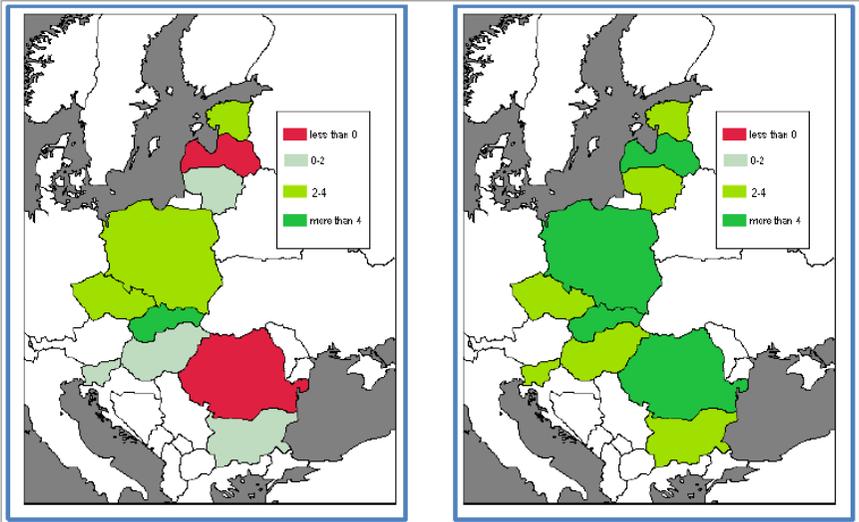

Figure 3 Projected 2010 and 2012 GDP growth rates in the EU10 region, percent
(Source: The World Bank, 2011b: 8)

The analysis of the anticipated growth in the EU10 region (figure 4) reveals that Slovenia, the Czech Republic and Hungary may have a growth somewhat less than elsewhere in the region. The growth in these countries could increase to about 2.5 percent to 3 percent by 2012. One reason for this increase may be that these countries have already converged more to EU income levels (The World Bank, 2011a: 21).

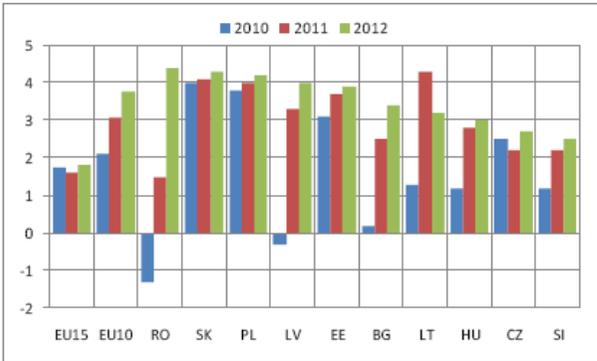

Figure 4 Anticipated growth in the EU10 region
(Source: The World Bank, 2011a: 22)

On the other hand, according to The World Bank (2011a: 21) the pace of the recovery in Slovakia and Poland is set to remain solid due to limited pre-crisis imbalances, strong integration in European production networks, EU funds, and, in the case of Poland, stable consumption. In

Estonia, Lithuania and Latvia growth could improve to about 4 percent by 2012 as domestic demand continues to recover. Aside from Latvia and Lithuania, Romania and Bulgaria, where the crisis hit later than elsewhere, are set to see the biggest improvements in growth in 2011.

In particular, the recovery of the Romanian economy may last more than expected. The Government of Romania is confronted with the difficult challenge of reconciling three objectives: to protect priority programs for economic and social development in order to enhance growth prospects and to mitigate the social costs of the economic crisis; to exit from anti-crisis policies and ensure fiscal consolidation once the recovery is under way in order to make room for a private sector led recovery; and to improve policies, regulations and coordination in order to prevent such crises in future (The World Bank, 2009).

An important source of economic growth in the EU10 region's countries may be to start some new investments in renewable energy.

3. Managing renewable energy's development in the EU10 region

The ambitious European 2020 targets on energy and climate, and more particular for renewable energy, request an important mobilization of investments in the coming decade (ECOFYS, 2011: 143). Before the financial crisis of 2008, several electricity-importing countries in the EU10 region had begun to experience difficulties with supply, but the crisis has reduced demand and created some breathing room. In addition, the crisis created the opportunity to take action to mitigate the impact of the anticipated energy crunch. Mitigating actions are required on both the supply side and the demand side and will require significant investments if the region wants to meet all its anticipated energy needs. This level of investment cannot be provided by the public sector alone and measures will be required to create a climate that appeals to private sector investors (The World Bank, 2010: 1).

There are some investment funds at the European Union's level, of which some may be used in order to develop the field of renewable energy. Through the European Regional Development Fund (ERDF) and the European Social Fund (ESF), otherwise known as the Structural Funds, as well as the Cohesion Fund, investments can be made in thousands of projects across all Europe's regions, with the aim to promote economic and social cohesion by reducing the disparities between Member States and regions. With a budget of €347 billion for 2007-2013, Cohesion Policy represents the single largest source of financial support at the European Union's level for investment in growth and jobs, designed to enable all regions to compete effectively in the internal market (European Commission, 2009: 1). The financial allocations through the Cohesion Policy for energy efficiency and renewable energy in the EU10 region are illustrated in figure 5.

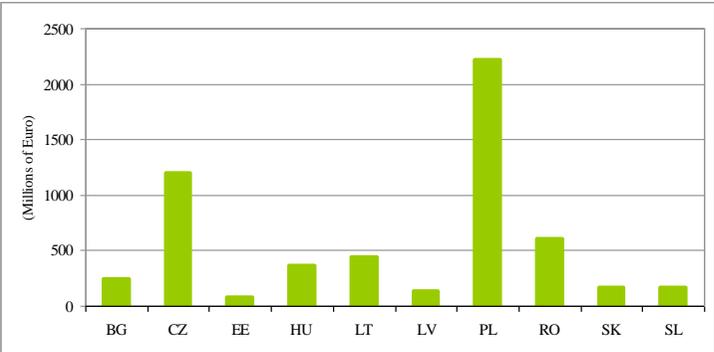

Figure 5 EU funds for energy efficiency and renewable energy in the EU10 region (Source: Adapted from European Commission, 2007)

As the challenges faced by Europe's regions have changed over time, so has changed the policy. Against a background of momentous change in the Union as a result of enlargement and of increasing globalisation, concerns about energy supplies, demographic decline, climate change and more recently, world recession, the policy has evolved, as a key part of the response to meet these new realities (European Commission, 2009: 1).

Governments have a major role to play in energy efficiency, by allowing energy tariffs to reflect costs, and also by being proactive in setting and updating energy efficiency standards for homes, equipment, and vehicles, and in enforcing them. Some measures that may be taken by governments may be carrying out energy efficiency programs in the public sector, informing the public on energy efficient technology options, and designing cities with alternative means of transport (The World Bank, 2010: 3).

The investment in energy efficiency can often give a major boost to local industries (for instance, the restoration of buildings). While regional energy strategies are implemented in the context of European integration, the role of regions as economic players is also becoming increasingly important and therefore, regions must work to create an overall framework which is conducive to action (Frant and Minica, 2008: 2). The deployment of most renewable energy technologies still needs both financial and non-financial policy support, due to the stage of development of either technology or market, and due to fact that renewable energy sources still do not have the same playing field as conventional energy technologies (ECOFYS, 2011: 143).

A key priority of the policy makers is to secure the funding to meet the region's future energy needs. However, the countries of the EU10 region also need to ensure that in developing their energy strategies and in implementing their investment programs they act in an environmentally responsible fashion (The World Bank, 2010: 4).

In case of the large-scale projects (that require investments of 50 M€ or more), with significant technological, regulatory, or market risks, government involvement/participation may help to establish financial close at lower cost of capital. In order to address this issue, different public-private partnership (PPP) models can be envisaged, and may contribute to lower (societal) costs and increased deployment rates (ECOFYS, 2011: 148).

4. Conclusions

This study has revealed that in early 2011, about two and a half years after the global financial crisis broke, economic output in the EU10 region had returned to the pre-crisis level. However, the pace of the recovery differs across the EU10 region, reflecting, among other factors, the overheating prior to the crisis, trade openness and competitiveness. The projected gross domestic product growth rates may be about 2-4 percents for some of the EU10 region's countries, and more than 4 percent for other of the EU10 region's countries in 2012. Firms are expected to raise investment with higher capacity utilization and strong global demand for capital goods and durables, and households to step up consumption with improving confidence about future prospects.

Another conclusion of this study is that an important source of economic growth in the EU10 region's countries may be to start some new investments in renewable energy. The ambitious European 2020 targets for renewable energy request an important mobilization of investments in the coming decade, which cannot be provided by the public sector alone and therefore measures will be required to create a climate that appeals to private sector investors. In addition, EU funds may be used in order to develop the field of renewable energy, and different public-private partnership models may be envisaged, and may contribute to lower (societal) costs and increased deployment rates.

The results reported in this study could be used for further research in the area of implementing green energy projects in the EU10 region. Another direction for further research could be to

identify the most attractive countries for different renewable energy investment projects in the EU10 region.

Economic education in Romania has gone through many changes in recent years, in order to modernize and adapt to the requirements of the economy based on knowledge. But, regardless of the stage, students' satisfaction is a key criterion for assessing the relevance and the accomplishment of the mission of universities in society. The highest satisfaction should be a constant concern for managers of higher education institutions. In order to achieve this goal, it is very important to periodically determine which are the most significant factors for students, how satisfied are they and which is the performance of the higher education for these attributes. The knowledge transfer process and the degree to which we can speak of a modern university tailored to the needs of the business environment and focused on increasing the relevance of the educational process for the labour market can be appreciated taking into consideration the content of the educational activities. The objective of this research is to identify relationships between the importance, satisfaction and performance of the instructional process in the process of improvement of the university management and the creation of better university programs. Our analysis was based on an empirical research conducted in a major Romanian faculty in the field: Faculty of Economics and Business Administration of Cluj-Napoca. The research was carried out by means of the survey method using quota sampling. Findings have revealed a significant positive contribution of the assessed factors to the increase of the quality of educational process. Also the factors that characterize the instructional process are correlated. The results revealed students' concern to acquire practical knowledge. There is also a significant difference between students' expectations and students' satisfaction regarding the quality of the content of teaching activity. Unfortunately, in case of all factors the performance of institution was negative associated with a number of negative effects.

Keywords: institutions of higher education, educational management and marketing, quality of educational services, student satisfaction, instructional process.

JEL Classification: I21, I23, M39

1. Introduction

Brătianu and Pop (2007:9) stated that even if the educational management and marketing in Romanian universities aren't a novelty, the instruments used are often simple or inappropriate. In the present context, both the Romanian universities and companies face the same problems (Pop, et al. 2009: 215): establishing a connection with the environment, raising resources, developing and providing quality services that contribute to the social welfare of the community, attracting

new customers and building their loyalty, maintaining a good image, fighting the intensifying competition and so on.

The competition in the current educational environment is intense due to the internationalisation of education and the impact of information technology and communications. Given the present context of global economy, the situation is even more dramatic in the case of the economic education. This competition profoundly affects one (but not the only one) essential components of a university mission: the learning process, the essence of the educational process, focused on knowledge transfer and creation of skills and competences usable in the labour market. The degree to which we can speak of a successful university can be determined through the overall satisfaction felt by its main category of public, namely the students, taking into consideration the content of the educational activities. This element along with the evaluation process and the quality of the human resources represent the main components of the instructional process and thus their evaluation is the first step to develop better educational programs.

2. Literature review

In order to provide educational services at the European Union level, the Romanian institutions of higher education must improve the educational management and marketing practices, especially given that the percentage of the budget funded by universities and students increased. (DesJardins 2002:531).

The increasing competition among universities, the decrease in government funding, the students' expectations increase and the general decline in birth rate have led to the awareness of the importance of providing quality educational services in order to retain a sufficient number of students with high abilities (Canic and McCarthy 2000: 41; Li-Wei 2005: 863). Researches show that student's satisfaction is the factor that contributes most to students' loyalty (Helgesen and Nettet 2007:51; Brown and Mazzarol 2008:90). Student satisfaction is defined by Elliot and Healy (2001: 2) as "a short-time attitude resulting from an evaluation of a student's educational experience" which occurs when the current performance meets or exceeds the student's expectations (Parasuraman, Zeithaml and Berry 1985: 42). Research undertaken by Munteanu et al. (2010: 138) had also shown that the most important satisfaction factors are different in case of students with low and high performance.

Hishamuddin et al. (2008) stated that there is a positive correlation between the quality of educational services and student satisfaction, thus the improvement of the services can lead to higher satisfaction. Aldridge and Rowley (1998:202) have found that students' dissatisfaction affects the learning process leading to low performances or even to abandonment of the studies. The necessity to determine students' satisfaction in order to improve the education management was confirmed by Carey, Cambiano and De Vore (2002:97) which found that higher education managers are rarely focused on determining students' satisfaction and believe that the satisfaction level is higher than the real one.

3. Study objectives and methodology

The main objective of the study, namely identifying the current situation of the economic higher education in Romania by evaluating its empirical dimension and its relevance for the labour market and using the satisfaction of those directly concerned with these issues - the students, in order to create more performant educational programs. Strongly connected with the main objective of the paper (and subsidiary to achieve it) we considered also important to study the following aspects:

- O1. Identifying the performance of higher education institutions as difference between student's expectations and perceived value of received services.

- O2. Identifying the main factors that contribute to the satisfaction with the instructional process.
- O3. The contribution of the satisfaction with the instructional process to the overall satisfaction with the economic higher education.

This research was carried out by means of the *survey method using quota sampling* (year of study, line of study, specialization). It employed the interview technique while the questionnaire was the instrument of data gathering. The study was conducted on a sample of 490 students enrolled at the Faculty of Economics and Business Administration of the „Babeş-Bolyai” University of Cluj-Napoca. The hypotheses of the study were:

- H1. There are several significant differences between the expected level of the factors specific to the educational process (represented by importance) and the perceived value from the educational experience (represented by satisfaction).
- H2. The factors contributing to students’ satisfaction with the instructional process are highly correlated.
- H3. There is a dependency relationship between the factors which influence the instructional process and the overall satisfaction, all these elements significantly influencing the relevance of the educational process.

The evaluation of the educational process in terms of its empirical character, adapted to the requirements of the society as a starting point for development of performant economic educational programs, focused on the labour market needs, was carried out through one dimension of educational experience: the content of the teaching activity, which contains eight items. Students were asked to evaluate their academic experience by comparing the importance of the considered factors and their satisfaction with these factors using a six-point scale, ranging from (1) “not at all important” to (6) “very important” and from (1) “not at all satisfied” to (6) “very satisfied”. It has also been determined the “satisfaction with the instructional process” and the “overall satisfaction with the educational experience” using same scale.

First of all, we determined the internal reliability of the items used to measure the content of teaching activity, namely the importance and satisfaction scores. Thus, we resorted to *Cronbach’s alpha reliability coefficient*, Item-total correlation and Cronbach’s alpha “if item deleted”. The value of the *Cronbach’s alpha coefficient* was 0.889, indicating a high internal reliability. We also have a high internal reliability of the model when analyzing the reliability of the items used to evaluate the level of satisfaction with the educational process, because the *Cronbach’s alpha value exceeds 0.850*. Therefore, all the conditions are met and we can proceed to the next step, namely data analysis and the interpretation of the results.

4. Research Results

In order to achieve the first objective, namely identifying the three key dimensions of the educational experience – student expectations, their satisfaction and the performance of the educational institution, we have identified the mean scores for the importance and the satisfaction with the content of teaching activities (Table no.1).

Table no. 1. MIS, MSS and MPS regarding the content of teaching activities

	MIS	MSS	MPS=MIS-MSS	t-Student
1.1. Valuable content of the courses	5.44	4.38	1.06	t=17.932
1.2. Interactiveness of the courses	5.31	4.27	1.04	t=15.778
1.3. Practical courses are based on case studies	5.30	4.23	1.07	t=16.715
1.4. Information is up to date	5.33	4.43	0.9	t=13.411
1.5. Specialists from companies are	5.24	3.74	1.5	t=21.087

	MIS	MSS	MPS=MIS-MSS	t-Student
<i>involved in teaching activity</i>				
<i>1.6. Students may choose the desired courses</i>	5.30	3.94	1.36	t=21.842
<i>1.7. The courses offer is adequate</i>	5.34	4.39	0.95	t=14.998
<i>1.8. Opportunity for internships</i>	5.40	4.17	1.23	t=14.144
The content of teaching activity	5.34	4.20	1.14	(****)

MIS= Mean Importance Score; MSS =Mean Satisfaction Score; MPS= Mean Performance Score

***** significant at $p < 0.001$. Source: authors' calculations*

Then, in order to identify the institution's performance, we analyzed the differences between the importance and the satisfaction with the analyzed factors, as in the presented methodology. The results show that we have high or very high importance for all the factors investigated. The most important aspects of the educational dimension of the content is "valuable content of the course", "opportunity for internships", "the courses offer is adequate", and "information is up to date". As we can see, students' first focus is on acquiring practical, relevant and complete knowledge in order to integrate easily into the labour market. Therefore, the opinions of the students can be successfully used as a predictor of the relevance of the economic education to the business environment (*H3*), because this aspect is their main concern through the instructional process. "The involvement of specialists from companies in teaching activity" is the factor with the lowest mean importance score. This is probably due to the high confidence that students have in the skills of university professors.

The highest values of the mean satisfaction scores regarding the content of education are encountered for "information is up to date" (the fourth most important factor), "the courses offer is adequate" (the third most important factor) and "valuable content of the courses" (the most important factor). Just in case of "the involvement of specialists from companies in teaching activity" (the least important factor) and "students may choose the desired courses" the mean satisfaction scores are lower than 4 ("mostly satisfied").

Analyzing the differences between the mean importance score (as an indicator of the expected value of the service) and the mean satisfaction score (as an indicator of the actual value provided), we obtained positive results for all factors considered in the case of the content of teaching activity. Therefore, at least at the moment, there is a negative performance of the educational institution in the case of content of teaching, meaning that the delivered services are lower than students' expectations. In order to determine the reliability of the results, the differences between MIS and MSS were tested using the Student t-test, which confirmed the existence of significant differences between the two dimensions considered (*H1*).

The worst performance is recorded for "the involvement of specialists from companies in teaching activity". Although it is the factor with the lowest importance it seems that the institution is far from reaching the level desired by the students. If we also take into consideration the performance of "opportunity for internships", we may conclude that the partnerships or the collaborations between academia and the private sector are not enough developed.

Instead, the smallest difference between what the students want and what the students get is for "the information received is up to date" and for "the courses offer is adequate". However, the result is very interesting, as students are willing to take a higher number of courses than they actually do. This means the economic institutions of higher education should increase the number of the subjects and the number of classes and not reduce them as in the last years.

Analyzing the relationships between the dimensions of the educational process (using the Spearman's correlation coefficient, for ordinal variables), we have noticed that an increase in the satisfaction of any factor (Table no. 2) implies an increase in the satisfaction level for all the

other factors (*H2 was confirmed*). The same influence is displayed on the entire instructional process. Thus, the satisfactions with “valuable content of the course” and with “information is up to date” are strongly linked to the satisfaction with “interactiveness of the courses” (the most intense correlation identified). Those students, who appreciate the participation of specialists from companies in the teaching activities, equally appreciate the opportunity to choose the desired courses. The assessment of the “valuable content of courses” also implies to take into consideration the amount of “up to date information”. We may conclude that the “interactiveness of the courses” is assessed through the others elements of the quality of teaching content (the most by the “valuable content of the courses” and the least by “opportunity for internships”). But for the entire instructional process it’s not as relevant as the “information up to date” and the “valuable content of the courses” which have a greater influence.

Table no. 2. The Correlations between the scores of students’ satisfaction with the Content of teaching activity

Rho	I.P.	1.1	1.2.	1.3.	1.4.	1.5.	1.6.	1.7.
1.1	0.376		(**)	(**)	(**)	(**)	(**)	(**)
1.2.	0.337	0.632		(**)	(**)	(**)	(**)	(**)
1.3.	0.349	0.498	0.537		(**)	(**)	(**)	(**)
1.4.	0.382	0.529	0.552	0.475		(**)	(**)	(**)

I.P. = Instructional Process; *Rho* = Spearman’s correlation coefficient; **significant at $p < 0.001$.

Source: authors’ calculations

Next, we sought to determine which of the 8 factors used to assess the satisfaction with the content of teaching activities are the best predictors of satisfaction with the instructional process (O2.) through a multiple regression. First of all we converted the independent variables into standardized variables (z-scores) to avoid the multicollinearity problems. Only one significant predictor was identified: the valuable content of the course, the dimension which may be interpreted as the knowledge utility and relevance in the labour market (*H3*), ($Beta=0.250$). The value of F statistics obtained from the ANOVA table was 23.389 ($p < 0.001$). The coefficient of determination ($R^2=0.276$) (standard error of the estimate=1.148) suggests that about one third of the variance of the satisfaction with the instructional process is determined by the selected factor. Next we tried to identify to what extent we can predict the overall students’ satisfaction with education (Mean=4.27, SE=0.066) based on the satisfaction with the instructional process (Mean=4.33, SE=0.083) (O3.). The results of the linear regression allowed us to construct the following model: *Overall satisfaction with education* = 2.539 (0.335) + 0.417(0.017) * *Satisfaction with the instructional process*. Test value $F=29.928$ ($p=0.000$) from ANOVA table shows that the variation explained by the model is not due to chance, but to the factors considered. The coefficient of determination ($R^2=0.110$; Standard error of the estimate=1.229) indicates that 11% of the variance of students’ overall satisfaction with education is explained by the satisfaction with the instructional process, while the rest of the variance is due to other factors.

5. Conclusions

The objectives of this study were firstly oriented to determine the expectations and students satisfaction with the content of teaching activities as a key dimension of the relevance of higher education to the society and in particular to the business environment. The results revealed

students' concern to acquire practical knowledge, identified by their interest in "the valuable content of the courses", receiving "up to date information" and "opportunity for internships". Another result of this study shows that students may experience high levels of satisfaction both in the case of factors considered very important ("the valuable content of the courses") and in the case of factors considered less important ("practical courses are based on case studies"). The hypothesis of the existence of significant differences between students' expectations and students' satisfaction regarding the quality of the content of teaching activity had been verified. Unfortunately, in case of all factors the performance of institution was negative associated with a number of negative effects described above.

Factors that characterize the instructional process are correlated. Thus, the increase of satisfaction of any factor determines the increase of satisfaction for all other factors in both categories: the content of teaching activities and the quality of professors. Satisfaction with instructional process is most strongly related to satisfaction with the valuable content of the courses and the novelty of information, first one being the factor with the most significant contribution to the satisfaction with the instructional process (best predictor).

Latest findings of the study reveal a positive contribution of the satisfaction with instructional process to the overall satisfaction with education. Another conclusion we can draw is that the economic institutions of higher education should focus in case of recruiting and retaining strategies on different dimensions of the educational experience. Recruitment strategies must focus on the dimensions considered the most important in this case the valuable content of the course and the opportunity of internships. Retention strategies should be focused on ensuring student satisfaction and therefore be focused on improving the performance of the institution with the factors that contribute the most to their satisfaction with the instructional process.

Given the limits of research (the investigated population is not representative for the whole academic economic community) we believe that research objectives have been achieved by identifying some important factors to increase the relevance of higher education for business environment and society and some relationships that allow the improvement of the instructional process.

The situation analysis, as a separate component of the strategic planning, involves collecting and analysing relevant types of information on the components of the marketing environment and their evolution on the one hand and also on the organization's resources and capabilities on the other. The main purpose of the study of the analysis techniques of the internal environment is to provide insight on those aspects that are of strategic importance to the organization. The marketing environment consists of two distinct components, the internal environment that is made from specific variables within the organization and the external environment that is made from variables external to the organization. Although analysing the external environment is essential for corporate success, it is not enough unless it is backed by a detailed analysis of the internal environment of the organization. The internal environment includes all elements that are endogenous to the organization, which are influenced to a great extent and totally controlled by it. The study of the internal environment must answer all resource related questions, solve all resource management issues and represents the first step in drawing up the marketing strategy. The present paper accomplished a documentary study of the main techniques used for the analysis of the internal environment. The special literature emphasizes that the differences in performance from one organization to another is primarily dependant not on the differences between the fields of activity, but especially on the differences between the resources and capabilities and the ways these are capitalized on. The main methods of analysing the internal environment addressed in this paper are: the analysis of the organizational resources, the performance analysis, the value chain analysis and the functional analysis. Basically such an analysis of the internal environment allows the organization to identify its resources and capabilities as best as possible, in relation to the threats and opportunities brought about by the crisis situations. The research allows the identification of the organizational behaviour of resource and capabilities capitalization that must be adopted during the economic crisis. The study may be useful to both the academic and the business environment.

Keywords: marketing environment, internal environment, resource analysis, performance analysis, value chain analysis.

JEL classification: M31

I. Foreword

Any organization represents a component of the marketing environment where it is active. Starting from this statement, the implementation of the market strategy is regarded as a development of long term actions plans, aimed to ensure an efficient management of opportunities and threats within the marketing environment while considering the strengths and weaknesses of the organization in itself. The situation analysis, as a distinct component of the strategic groundwork (Figure 1), involves collecting and analysing the types of relevant

information on the marketing environment components and their evolution on the one hand, but also on the company's resources and capabilities on the other.

The marketing environment of the organization consists of two distinct levels, the internal environment that is made from specific variables within the organization and the external environment that is made from variables external to the organization. The external environment is divided further into two distinct categories (sub-environments of marketing): macro-environment and micro-environment. The potential result of the external environment analysis is identifying the organization's opportunities and threats, both present and future. On the other hand, the potential result of the internal environment analysis is identifying the strengths and weaknesses that are present in the organizational structure and culture.

II. Literature Review

The internal environment includes all elements that are endogenous to the organization, which are influenced to a great extent and totally controlled by it. The study of the internal environment must answer all resource related questions, solve all resource management issues and represents the first step in drawing up the marketing strategy. All these components are making up a “value chain”; the value chain analysis is based on the connection between the company's resources and its competitive position and it explores how these components contribute to the profitability (Porter 1985:121).

The external business environment comprises are set of factors that make up a complex, heterogeneous structure, consisting of a network of exogenous variables matched by the own resources of the company – endogenous variables. The marketing environment consists of two main components: the micro-environment and the macro-environment (Balaure 2003:75).

The micro-environment of the organization is comprised from those components that are in direct relationship with the company, of mutual inter-dependency, permanent and high intensity, issued from the need of achieving present or future objectives. These components are: merchandise suppliers, services providers, labour force providers, competitors, public organizations (Dumitru 2004:26).

The macro-environment includes all the factors that are influencing indirectly, on the long term and with weak intensity, generating business opportunities for the company or, alternatively, threatening and forcing the organization to adapt, with no possibility of a direct influence of these factors. The macro-environment components are: the demographic environment, the economic environment, the technologic environment, the cultural environment, the politics environment,

the legal and institutional environment, and the natural-geographic environment (Balaure 2003:78).

III. Methodology

The present paper accomplished a documentary study of the main techniques used for the analysis of the internal environment. Although analysing the external environment is essential for corporate success, it is not enough unless it is backed by a detailed analysis of the internal environment of the organization. The study of the internal environment must answer all resource related questions, solve all resource management issues and represents the first step in drawing up the marketing strategy. The special literature emphasizes that the differences in performance from one organization to another is primarily dependant not on the differences between the fields of activity, but especially on the differences between the resources and capabilities and the ways these are capitalized on.

IV. Internal environment analysis techniques

The analysis of the organizational resources is the most used instrument for the internal environment analysis. The following figure (Figure 2) presents the role that the resources of the organization hold as a starting point in the drawing up of the organizational marketing strategy. Also, one can note the way in which the organizational resources and capabilities may constitute the basis for developing the competitive advantage.

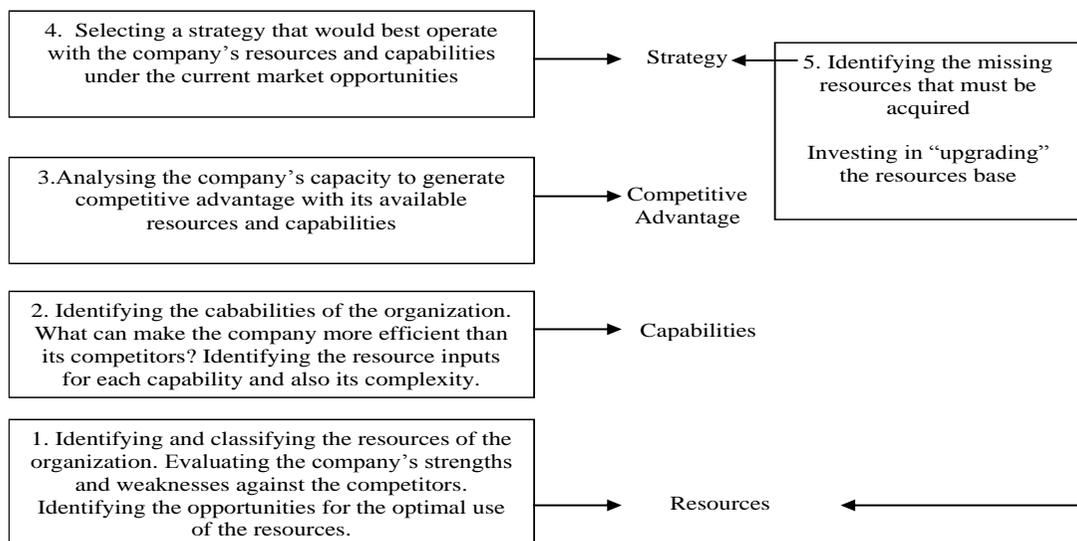

Figure 2. The use of the organizational resource analysis as an instrument for the internal environment analysis

Source: Adapted from Grant Robert Michael. *The resource based theory of competitive advantage: implications for strategy formulation*. California Management Review 3(1991):45-71;

The stages of this method are the following: defining the company resources that generate the organizational strengths and weaknesses; identifying the optimum method to combine the resources and generated capabilities; identifying the extent to which the combined resources and capabilities are generating sustainable competitive advantages; selecting strategies to best exploit the resources and capabilities of the organization in relation to the market opportunities; analysing the main characteristics of the resources and capabilities in terms of sustainability, transferability and repeatability as basic elements in sustaining competitive advantage and identifying the resource gaps. The research conducted on the method of analysing resources as a

method of internal environment analysis has proven that the development of sustainable competitive advantage depends directly on the company’s resources and capabilities. The analysis of resources is the basis for identifying those resources capable to sustain competitive market strategies. Through their nature, the strategies based on the organization resources are requiring a better understanding of the strategic capabilities of the organization. The marketing professionals may chose to combine the analysis of resources with one of the following methods.

Performance analysis. PIMS Programme (Profit Impact of Market Strategy) is the most known method of performance analysis and was developed by the American Institute of Strategic Planning to emphasize the influence of the internal strategic factors on the activity of the organization. The main aim of the PIMS method is to empirically develop principles to determine which strategic variables and under which circumstances are producing one result or another, identified as the sales volume or investment profitability. The conclusion following the research was that nine strategic variables are influencing 80% out of the variations in the organizational profit. It must be also considered that there are many other ways to evaluate the organizational performance. Indeed, although most of them suppose financial assessment, there is also a series of non-financial indexes that may offer a long term image on the “health” of the business. Part of these indexes may be the market position, the value of products, managerial development or work productivity. We must also bear in mind that the strategic objectives of the organization may change over time and the financial indicators measuring the business performance must also be modified. For example, when a new product is launched, the key index may be the sales growth rate, while when the product is at its maturity, one may use the return on initial investment or the profitability rate. Considering the importance of both the financial and non-financial indicators Kaplan and Norton (Kaplan and Norton 1992:71-79) have developed the balanced scorecard as a method of evaluating and measuring the company performance. This approach suggests four perspectives to integrate the financial and non-financial performance indicators of the organization: *internal perspective, financial perspective, learning and growth perspective and the customer perspective*. Identifying the strategic factors with the greatest impact (positive or negative) is also important to be performed by the strategic managers seeking to increase the company’s performance. Otherwise put, the managers should identify those variables that have significant effect on the company’s strengths and weaknesses. A variable may be considered as a strength if it generates competitive advantage, if it brings extra value to the consumer and if the organization is able to capitalize it at a superior level than the competitors on the market. On the other hand, a variable is a weakness for the organization if it is also of value to the consumer but if the company is unable to generate it, or produces it at an inferior level than the competition.

Value chain analysis. This model (Figure 3) was formulated by Porter as a method of examining the nature and development of existing synergies between the internal activities of an organization.

SUPPORT ACTIVITIES	ORGANIZATION INFRASTRUCTURE					PROFIT MARGIN
	<i>HUMAN RESOURCE MANAGEMENT</i>					
	<i>TECHNOLOGICAL DEVELOPMENT</i>					
	<i>PROCUREMENT</i>					
	<i>INBOUND LOGISTICS</i>	<i>OPERATIONS</i>	<i>OUTBOUND LOGISTICS</i>	<i>MARKETING & SALES</i>	<i>SERVICE</i>	

Figure 3. The value chain model

Source: Adapted from Porter Michael. *How competitive forces shape strategy*, Harvard Business Review, 2(1979):137-145;

According to Porter, any company is a succession of activities undertaken to develop, produce, promote and deliver its products. These activities may be grouped and represented into five primary activities and four support activities using the value chain concept. The basic principle of the value chain is that it represents a systematic method of examining all activities taking place within the company and the method in which these interact to differentiate the organization's value chain from those of its key competitors. This differentiation is recognised as a key source for competitive advantage. One of the key advantages of this model is recognising the fact that an organization is more than a random collection of production machines, financial and human resources, as all of these resources are not valuable unless they are emphasized by activities and organization within a system that ensures that the products and services delivered are offering value-added to the customer/consumer.

We must also consider that the offer of most of the organizations is made up from many types of products and services, meaning *several value chains*. Thus, an analysis of the internal environment supposed analysing these value chains. The internal analysis of an organization may be conducted through the following steps: examining the value chain of each product line, considering the activities involved in manufacturing those products; examining the connection between the value chains of each line of products; examining the potential synergies between the value chains of different product lines. In addition to the above presented issues, one must also consider that a great extent of the value added created through the organization's goods and services also depends on the supply chain. For example, the quality of a car is not only influenced by the activities inside the organization but also by the spare parts, components or dealership performance.

One of the simplest methods of analysing the internal environment is the *functional analysis*. The abilities and resources of an organization may be classified under a capability profile starting from the basic business functions of the company: marketing, finance, research and development, production, etc. (Table 1).

Table 1.-The profile of the organization's strategic capabilities

Internal area	Resource/competence	Evaluation
<i>The profile of the strategic capabilities based on resource analysis</i>		
Material resource	New production facilities that incorporate the latest technology	High intensity strength (+4)
Human resource	Highly specialized staff	Low intensity strength (+2)
Financial resource	High liquidity	Low intensity weakness (-2)
<i>The profile of the strategic capabilities based on value chain analysis</i>		
Intangible assets	Solid corporate image on the market Known brands	High intensity strength (+4)
Inbound logistics	Excessive use of a low number of suppliers	High intensity weakness (-4)
Outbound logistics	Inefficient management of external warehouses	Medium intensity weakness (-3)
Human resource management	High absenteeism	High intensity weakness (-4)

Source: Adapted from West, Douglas, Ford, John and Ibrahim, Essam. *Strategic Marketing, Creating Competitive Advantage*, Oxford: Oxford University Press, 2006, p. 87

The resources of an organization do not include only financial and natural resources, but also human factor abilities to implement the necessary objectives, strategies and policies for each area of activity. When used properly, these functional resources are strengths base on which future strategies may be developed. The organizational culture and structure must also be regarded as key elements of the internal environment of the organization, in addition to being functional resources.

V. Conclusions

Regardless of the analysis method used and of the variable researched, the analysis of the internal environment of the organization may be accomplished through the development of a “strategic capabilities profile” that must identify, measure, and weigh the strengths and weaknesses of the organization. Basically such an analysis of the internal environment allows the organization to identify its resources and capabilities as best as possible, in relation to the threats and opportunities brought about by the crisis situations.

SOCIAL RESPONSIBILITY VALUES: A CROSS COUNTRY COMPARISON

Catană Doina

Technical University of Cluj-Napoca

Catană Gheorghe Alexandru

Technical University of Cluj-Napoca

This empirical study aims at finding out how similar and/or different are the future Romanian and Slovenian managers in assessing the importance of organization's social responsibility values. The assumption of the research is that most of most of students in engineering and business will hold middle management position in the near future. The sample consists of 727 undergraduate and graduate students' levels from Romania and Slovenia, two former socialist countries. The data has been collected between 2008 and 2009 in the framework of GLOBE student project⁹⁵, using a section of GLOBE III questionnaire, about the importance of CSR related values in critical decisions. The findings concern the similarities and significant differences between: 1) whole Romanian and Slovenian samples; 2) Romanian and Slovenian students in engineering; 3) Romanian and Slovenian students in business. Our findings revealed a trend toward convergence in the importance given to decision's effect on contribution to the economic welfare of the nation and local community, as well as on employees' professional growth and development and on environment. The biggest difference between the groups concerns the decisions' effect on firm profitability (the Romanians considering this value as more important in critical decisions than the Slovenians). The students in engineering proved to be a more homogeneous group, showing convergence in assessing the importance of eight out of fifteen social responsibility values. The biggest difference concerns the decisions' effect on firm profitability (Romanians consider it as having higher importance in critical decisions than the Slovenians). Comparison of students in business revealed convergence in assessing the importance of employees' professional growth and development and decision's effect on environment. The biggest positive difference concerns the same value of decisions' effect on firm profitability. The Romanians are well behind Slovenians in realizing the importance of decisions' effect on relationships with important partners of the organization, ethical considerations and decision's effect on long term competitive ability of the organization.

Keywords: Social responsibility, Romania, Slovenia, students

JEL: M14

1. Introduction

The research question the present study tries to answer concerns the convergence and divergence in Romanian and Slovenian students' opinion about the *organization's social responsibility values*.

The importance of the issue is emphasized by the actions taken by international and global decisional institutions, aiming at strengthening a more humane, ethical and more transparent business behavior. Among these actions, a critical importance has the *ISO 26000* which provides guidance to the organizations on how to understand, integrate and communicate the social responsibility, in order to improve its credibility and social image. It deals with definitions,

⁹⁵ The project is co-ordinated by R. Lang from Chemnitz University of Technology. The data for Slovenia has been collected by D. Pucko and T. Cater (University of Ljubljana)

principles, core subjects of social responsibility and guidelines on integrating the social responsibility in the organization's management and behavior (Discovering ISO 26000). Our attempt offers a general view on the future managers understanding on how an organization should behave/decide while being socially responsible (*doing good for doing well*).

2. Literature review

When approaching the organizations duties and accountability for their global environment constituents, the researchers use a wide spectrum of *concepts* (corporate social responsibility, corporate social accountability, corporate societal responsibility, corporate citizenship, corporate sustainability, sustainable entrepreneurship, social performance, triple bottom line, business ethics etc.) and *theories* (shareholder, stakeholder, societal, philanthropic etc. theories). While at the beginning of the 7th decade, *Friedman* (1970) argued that the only one social responsibility of business is to use its resources and engage in activities designed to increase its profits so long as it stays within the rules of the game, other researchers contributed to defining the *new paradigm* of doing business (tuned with today's society expectations). For instance, *Carroll* (1999) asserts that corporate social responsibility involves the conduct of a business so that it is economically profitable, law abiding, ethical and socially supportive. *Moir*, a partizan of stakeholder theory, defines business social responsibility as its commitment towards ethical behavior, economic development and improvement in the quality of life of its workforce, their families, the local community and the society at large (*Moir* 2001). *Kotler & Lee* (2005) argue that "corporate social responsibility is a commitment to improve community well-being through discretionary business practices and contributions of corporate resources" (*Kotler, Lee, 2005, p.3*). They provide a matrix of six options for social responsible activities of a company: cause promotions; cause related marketing; corporate social marketing; corporate philanthropy; community volunteering and socially responsible business practices (*Ibid.*, p.23-24). There is also a recent view on the need to reframe corporate social responsibility (CRS) into corporate social responsibilities (CSRs), positioning "against the common academic practice of aggregating CSR behaviors into some overall umbrella construct such as CSR, corporate social performance (CSP), or business citizenship" (*Godfrey et al, p. 317*).

Obviously, there is no one definition of what *it takes* to be a responsible organization (corporation). The key is to have a rigorous process for *identifying* those responsibilities and fulfilling them (*Blyth* 2005, p. 30). This is why, in our approach we do not aim to build a special *construct* ("umbrella") of organizational social responsibilities, or to empirically discover the socially responsible *practices* of the organizations, but rather focus on the *importance* should be given to social *responsibility values* in managerial decision making.

3. Methodology

The students' involvement in the research is based upon the assumption that most of them will hold middle management position in the near future. The sample consists of 727 subjects, structured based upon: *field and level of study* (43.47% business/economics; 56.53 % engineering; 68.2 % Bachelor; 31.8 % Master); *gender* (49% female, 51% male), *age groups* (% 18-22 years; % 23-27 years; % ≥ 28 years), *interest in management career* (59.6% yes), and *interest in founding a business venture* (65.2%% yes). The Romanian sample consists of 427 students (52.7% male, 47.3% female), while the Slovenian sample has 300 subjects (60.3% male, 39.7% female). The surveys were carried out in either 2008 or the first half of 2009.

The data has been collected using a part of GLOBE III questionnaire (about CSR). The subjects were asked to show the *importance* each item should have in making critical decisions, using a seven points scale (1 = no importance; 2 = of minor importance; 3 = some importance, but

limited; 4= moderate importance/the item should be frequently considered as important; 5 = high importance/almost always the item should be considered important; 6= very high importance/the item should always be considered important; 7 = the highest importance/the item should be considered the most important one). Data processing has been performed in SPSS 17. The scale reliability shows a *Cronbach Alpha* coefficient of .827 if two items are deleted from the original 17 scale items (Pleasing, respecting, not offending a Devine being and, respectively, Effects on supernatural forces such as auspicious days, forecast by truth sayers). In testing the *statistical significance* of the differences between the different groups, the *independent samples test* was employed, using the *0.05 significance threshold* (equal variances assumed for *Levene's test*).

4. Findings

Table 1 displays the rank of social responsibility values in critical decisions in students' opinion. Similar rankings are seen for *customer satisfaction* (first place in both samples) and employees' professional growth and development (fifth place). The decision's effect on local community and national welfare, as well as on minority and female employees are considered to be least important in both samples. An important difference concerns the second important social responsibility value: while the Romanians consider it should be the decision's effect on profitability and product quality, the Slovenians see the organization's long term competitive ability as the second important in critical decisions.

Table 1 Importance of social responsibility values

ROMANIA			SLOVENIA		
<i>SR dimension</i>	<i>Mean</i>	<i>Rank</i>	<i>SR dimension</i>	<i>Mean</i>	<i>Rank</i>
Customer satisfaction	6.18	1	Customer satisfaction	5.55	1
Effect on firm profitability;	5.76	2	Effect on the long-term	5.52	2
Effect on product quality	5.76	2	competitive ability of the		
			organization		
Effect on sales volume	5.59	3	Effect on product quality	5.47	3
Employee rel. issues (employee	5.58	4	Effect on rel. with other org. with	5.39	4
well-being, safety, working			which you do serious business		
conditions)			(suppliers, government		
			agencies, partners in strategic		
			alliances)		
Employee professional growth	5.41	5	Employee professional growth	5.28	5
and development			and development		
Effects on the environment	5.37	6	Employee rel. issues (employee	5.26	6
			well-being, safety, working		
			conditions)		
Cost control	5.15	7	Effects on the environment	5.21	7
Effect on the long-term	5.10	8	Ethnical considerations	5.18	8
competitive ability of the					
organization					
Effect on rel. with other org. with	5.05	9	Effect on firm profitability	4.89	9
which you do serious business					
(suppliers, government agencies,					
partners in strategic alliances)					
Ethnical considerations	4.88	10	Effect on sales volume	4.85	10
Welfare of the local community	4.86	11	Cost control	4.82	11
Contribution to the economic	4.69	12	Welfare of the local community	4.69	12
welfare of the nation					
Effect on minority employees;	4.40	13	Contribution to the economic	4.57	13
Effect on female employees	4.40	13	welfare of the nation		
			Effect on female employees	4.00	14
			Effect on minority employees	3.82	15

Table 2 depicts the significant differences in the mean scores given by the two groups ($p \leq .005$). *T*-test failed to reveal significant reliable differences between the two samples for the following social responsibility values: decision's effect on contribution to the economic welfare of the nation (sig 2-tailed = .243) and local community (sig 2-tailed = .105), as well as on employees' professional growth and development (sig 2-tailed = .152) and on environment (sig 2-tailed = .144). Thus, it could be assumed there is a trend toward convergence in the importance given to these social responsibility values. The biggest difference ($t = 9.117$) concerns the decisions' effect on firm profitability, the Romanians considering this value should be more important in critical decisions than the Slovenians (Romanians mean score = 5.76, Slovenians mean score = 4.89). The negative gaps are recorded for decision's effect on relationships with other organizations with which the company has serious business (-4.674), on long term competitive ability of the organization (- 4.672) and the ethical considerations (- 2.907; equal variances assumed). These gaps show that the Romanians give lower scores for the mentioned social responsibility values than the Slovenians.

Table 2 Importance of organizational social responsibility values: testing the significant differences between Romanian and Slovenian students

<i>Social responsibility values</i>	Mean diff	<i>t</i>	Sig(2-tailed)

Effects on sales volume	.58	4.559	.000

95%confidence interval; Levene's test for equality of variances; * equal variance assumed

As seen, *t*-test failed to reveal significant reliable differences between the two samples for the following social responsibility values: cost control (sig 2-tailed = .158), contribution to the welfare of the nation (sig 2-tailed = .707) and local community (sig 2-tailed = .992), employees professional growth and development (sig 2-tailed = .223), decision's effect on environment (sig 2-tailed = .242), ethical considerations (sig 2-tailed = .224), decision effect on relationships with other organizations (sig 2-tailed = .116) and on female employees (sig 2-tailed = .155). The biggest positive difference ($t = 6.362$) concerns the decisions' effect on firm profitability, the Romanian students this value should be more important in critical decisions than the Slovenians (Romanians mean score = 5.82, Slovenian students mean score = 5.02). The only one negative gap (-4.178) concerns the decisions' effect on long time competitive ability of the organization, with the Slovenian group of engineering students considering this value as being more important than the Romanian group (Slovenian mean score = 5.59; Romanian mean score = 5.09).

Table 4 shows the significant differences between Romanian and Slovenian students attending *business studies* (Romanian sample: 166 Slovenian sample: 150).

Table 4 Importance of organizational social responsibility values: testing the significant differences between students in business

<i>Social responsibility values</i>	Mean differ.	<i>t</i>	Sig. (2-tailed)
Cost control	.49	3.621	.000
Customer satisfaction	.66	4.921	.000
Employees relations issues	.39	2.836	.005
Contribution to the economic welfare of the nation	.39	2.651	.008
The welfare of the local community	.39	2.632	.009
Employee professional growth and development	.12	.892	.373

<i>Social responsibility values</i>	Mean differ.	<i>t</i>	Sig. (2-tailed)
Effects on the environment	.13	.893	.373
Ethical considerations	-.40	-2.671	.008
Effect on the long term competitive ability of the organization	-.32	-2.401	.017
Effect on relationships with other organizations with which you do serious business	-.49	-4.892*	.000
Effect on firm profitability	.91	6.288	.000
Effect on of minority employees	.84	4.632	.000
Effect on female employees	.65	3.528	.001
Effects on product quality	.27	2.018	.045
Effects on sales volume	.84	5.907	.000

95% confidence interval; Levene's test for equality of variances; * equal variances assumed

T-test failed to reveal significant reliable differences between the two samples for the following social responsibility values: employees' professional growth and development (sig 2-tailed = .373) and decision's effect on environment (sig 2-tailed = .373). The biggest positive difference ($t = 6.288$) concerns the decisions' effect on firm profitability, Romanians considering this value should be more important in critical decisions than the Slovenians (Romanians mean score = 5.66, Slovenians mean score = 4.75). The smallest positive gap (favoring the Romanian group) is recorded for decisions' effect on product quality (2018), with 5.70 mean score for Romanians and 5.43 for Slovenians business students' group. Negative gaps are recorded for the following dimensions: decisions' effect on relationships with important partners of the organization (-4.887- the highest gap), ethical considerations (-2.671) and decision's effect on long term competitive ability of the organization (-2.401). For these dimensions, the Slovenian business students gave higher importance than their Romanian counterpart (Slovenians mean scores for mentioned dimensions = 5.61; 5.35 and, respectively, 5.44; the Romanians mean score = 5.12; 4.95 and 5.12 respectively).

5. Conclusions

Our findings show that the new generation of managers share the (average) opinion that decision's effect on *customer satisfaction* comes first, while on local and national welfare, on female and minority employees the least. These might be taken as signs of convergence in the future managers' attitude in decisional process. The most significant differences between Romanians and Slovenians (at all levels of comparison) is recorded for decision's effect on *profitability*, long term competitive ability of the organization and on serious business partners. Romanians tend to be interested more in money related issues and short term effects of their decisions, while Slovenians have a more strategic vision. Perhaps these significant differences have *cultural* explanations (for instance, future orientation, in group collectivism, institutional collectivism, human orientation, gender equality etc.), thus, it seems rational to direct our future research towards such topics.

THE ROLE OF THE SALES TECHNIQUES IN THE MARKETING ACTIVITY OF THE COMPANIES IN BUCHAREST

Cruceru Anca Francisca

ASE București, Facultatea de Marketing

Moise Daniel

ASE București, Facultatea de Marketing

Tatu Cristi

ASE București, Facultatea de Marketing

In a time of economic crisis there can be easily observed the difficulty in finding managerial viable solutions to support the business at least at a level considered satisfactory in terms of economic performance. The managers will try to adopt marketing strategies able to drive to the preservation of the competitive position held in the reference market and to achieve goals. But this cannot be achieved without a pertinent analysis of the situation of both enterprise and business environment. It is also necessary to assess the marketing skills at its disposal, those specific capabilities needed to conduct a profitable operation. All the marketing department's efforts will be directed to implement sales techniques capable of giving to the promoted products specific advantages and thus to achieve the marketing goals proposed.

In the present study will be presented just a few issues considered important for creating a view about the behavior of the enterprises in the adoption of sales promotion techniques. The analysis of the information continued in the direction of understanding, by managers and marketing executives, the necessity of the implementation of some coherent communication approaches centered on sale promoting techniques. The analysis of the results obtained after the initiation of communication processes, which is based on sales promotion techniques, represents a significant component of the marketing audit initiated by the enterprises.

The strategic market orientation of the studied companies could be analysed also through some existing correlations between the position held in the reference market and the frequency of the use of the sales promotion techniques as well as between the level of competition and the frequency of the use of these techniques. Attracting and retaining customers over a long period of time, differentiation from competitive products are just some of the main objectives pursued by these companies. . Regardless of the place occupied in the reference market, it is absolutely necessary to implement specific types of promotional techniques to achieve the mentioned objectives.

Keywords: sales techniques, competitive position, competitiveness, marketing

JEL classification M: Business Administration and Business Economics; Marketing; Accounting

From this perspective, the importance of decisions made in the marketing department can be critical to the business concerned, which will seek the best solutions to overcome the crisis. As a result, there frequently arises a series of questions that can be structured as follows:

- Will the adoption and implementation of some techniques of promoting the sales in a time of economic crisis succeed to differentiate the offer of the company from that of other competitors in the same market segment?
- Which would be the most efficient sales promotion techniques, capable of fulfilling the communicational objectives arisen by the marketing ones?

- How much would the budget be for sales promotion techniques in case of an obvious economic crisis?

For all these questions were sought and found answers through quantitative marketing research initiated in the year 2010, among the 70 companies with headquarters in Bucharest. The collection, data analysis and interpretation were conducted during March-June of that year, based on a predetermined questionnaire with 19 questions. The observation unit was the company in Bucharest and the research unit was the marketing director or the person responsible for marketing activities within the enterprise.

In the sample there were comprised the following business areas: services (including telecommunications, insurance, marketing and advertising), with the highest share (51.42), trade with a share of 37.14%, production and distribution of industrial equipments, having a weight of 11.42% out of the total sample.

The limitations of this quantitative marketing research took into account the sample's representativeness, but if it is assumed that the analysed companies from Bucharest are in the top of the best Romanian enterprises in what marketing implementation concerns, then these results can be analysed qualitatively and in relation to the national situation.

In the present study will be presented just a few issues considered important for creating a view about the behavior of the enterprises in the adoption of sales promotion techniques as pertinent solution to support a competitive position in the market even in times of economic crisis.

What was considered to be relevant was the information resulted from the research on identifying the existing competitive level in a given field of activity and the position held by the enterprise in the reference market. Thus, 67.14% of the respondents indicated the existence of more than 20 competitors in the same market segment, while the positions held by national enterprises are concentrated in a proportion of 47.14% below the 11th place.

It is noteworthy the fact that 71.43% of the interviewed persons from the managerial level believed that in their field there exists a very strong competition, while 25.71% think that competition is rather strong. Only 1.43% of the respondents indicated a lack of competition. This information reflects the level of appraisal regarding the existing competition and it may indicate a trend towards knowing the competition thus embracing competitive strategies that will lead at least to the preservation of the competitive position held by that time.

The analysis of the information continued in the direction of understanding, by managers and marketing executives, the necessity of the implementation of some coherent communication approaches centered on sale promoting techniques showed a rate of 92.86% of the respondents who had adopted such techniques, while only 7.14% indicated the absence of such techniques from the communicational steps previously initiated. The importance of sales promotion techniques adoption was supported by a significant percentage of the respondents and namely: 61.43% considered it as being very important, 32.86% important and only 5.71% did give no relevant importance to the application of the sales promotion techniques.

The sales promotion techniques (table nr. 1) have been adopted to achieve clear communicational objectives, such as:

Table 1. The objectives of sales promotion techniques

Communicational objectives	Frequency of the responses - absolute-	Frequency of the responses - relative-
The increase in the sales volume for the promoted service or product	55	78,57%
The stimulation of the demand for the promoted	42	60%

Communicational objectives	Frequency of the responses - absolute-	Frequency of the responses - relative-
service or product		
Consumers loyalty	49	70%
Countering the actions of the competitors	17	24,29%
Influencing the consumers' behaviour	19	27,14%
Strengthening the company's image among the target audience	45	64,29%

From the point of view of the categories of the sales promotion techniques which were most frequently adopted by the enterprises, there were the following answers registered:

Table 2. The sales promotion techniques which were most frequently used by the enterprises from Bucharest

Sales promotion techniques	Frequency of the responses - absolute-	Frequency of the responses - relative-
Special offer	50	71,43%
Free offer	19	27,14%
Launching price	29	41,43%
Bundle sales	22	31,43%
Discount voucher	15	21,43%
Sample offering	14	20%
Tasting	8	11,43%
Demonstrations	20	28,57%
Promotional gifts	31	44,29%
Promotional contests	23	32,86%
Merchandising	15	21,43%
The advertising at the point of sale	27	38,57%

There can be noticed (table nr. 2) the preponderant focus on: special offers, promotional gifts, launching price in case of new products, the advert at the point of sale etc.

The analysis of the results obtained after the initiation of communication processes, which is based on sales promotion techniques, represents a significant component of the marketing audit initiated by the enterprises.

A conclusion of these internal researches was in accordance with the satisfaction of the clients in regard with The adoption of the sales promotion techniques. Approximately 92% of the enterprises have graded a high percent of satisfaction among their own clients in regard with the variety of promotional techniques adopted.

This positive result could be considered a positive signal in the direction of the coherent implementation of these type of techniques with the goal of maintaining the competitive position of the organizations.

Table nr. 3: Categories of sales promotion techniques that will be adopted next year

Sales promotion techniques	The frequency of the responses - absolute -	The frequency of the responses - relative -
Price reductions	44	62,86%
Presents and promotional premiums	3	45,71%
Contests and promotional games	20	28,57%
Free testing of the products	16	22,86%
Merchandising	15	21,43%
Advertising at the place of sale	26	37,14%

There can be noticed from the table, (table nr. 3) the orientation of the clients towards price reductions and promotional presents, techniques that drive customer interest towards the promoted products due to the easily perceived benefits. In addition, it was observed the fact that 74.29% of the enterprises of the study understood the necessity of increasing the budget of sales promotion techniques, while the other 25.71% preferred to maintain the same budget for the next year. What is also remarkable is the fact that none of the companies would consider reducing the budget even taking into account the negative economic situation.

Unfortunately, from a marketing theory standpoint, the specialists of these enterprises do not succeed to match correctly the sales promotion techniques with the implemented strategy. Therefore, 61.43% of the respondents consider that the sales promotion techniques have a direct connection with the marketing strategy of the organization and only 11.43% of the companies establish a direct relation of subordination towards a communication strategy. The enterprises which could not indicate any correlation between the techniques and the strategy were in proportion of only 11.43%.

The strategic market orientation of the studied companies could be analysed also through some existing correlations between the position held in the reference market and the frequency, (table nr. 4) of the use of the sales promotion techniques as well as between the level of competition and the frequency of the use of these techniques.

Table nr.4 The frequency of the use of the sales promotion techniques in accordance with the position held at the national level

Position held at the national level	The frequency of the use of the sales promotion techniques					Total	
	Frequently		Occasionally		Rarely		
	Absolute	Relative	Absolute	Relative	Absolut	Absolute	Relative
First position	11	15,72 %	5	7,15%	0	16	22,87%
Positions 2-3	14	20%	7	10%	0	21	30%
Positions 4-10	10	14,28%	4	5,71%	0	14	19,99%
< Position 11	15	21,43%	4	5,71%	0	19	27,14%
Total	50	71,43%	20	28,57%	0	70	100%

It is noted that in the case of the enterprises located in a lower position than the number 11 in the reference market, managers have indicated in proportion of 21.43% the frequent use of merchandising techniques, showing their concern for their existing competence in their field activity and for the adoption of techniques aimed to differentiate their product from other

competing products. Moreover, the values obtained were placed relatively close to the situation of the places 2-3 and those ranked lower than 11, followed by those located in the first place, and that of places 4-10. No respondent indicated the rare use of sales promotion techniques.

Also, the influence of competition, (table nr. 5), present in marketing activities focused on the adoption of sales promotion techniques. In other words, the companies studied have the ability to identify the existing level of competition in their field and to find solutions to move towards promotion techniques that lead to achieving a competitive position.

Table 5: The influence of level of the competition on the frequency of use of sales promotion techniques

The level of the competition	The frequency of the use of sales promotion techniques					Total	
	Frequently		Occasionally		Rarely		
Very strong	37	52,86 %	13	18,57%	0	50	71,43%
Rather strong	12	17,14%	6	8,59%	0	18	25,73%
Rather weak	0	0	1	1,42%	0	1	1,42 %
Weak	0	0	0	0	0	0	
Inexistent	1	1,42%	0	0	0	1	1,42%
Total	50	71,42%	20	28,58%	0	70	100%

A very strong competition causes the adoption of common merchandising techniques aimed at increasing the sales volume of the products promoted. It could be noticed that 70% of the businesses that operate in an area marked by very strong competition and rather strong one understand the need and role of sales promotion techniques in the marketing strategy.

Attracting and retaining customers over a long period of time, differentiation from competitive products are just some of the main objectives pursued by these companies. Regardless of the place occupied in the reference market, it is absolutely necessary to implement specific types of promotional techniques to achieve the mentioned objectives. Thus, discounts, promotional gifts, advertising at point of sale, etc.. are techniques that can respond quickly to these requirements. An appropriate budget allocation for the effective application of these techniques shows the management maturity of the enterprises with marketing vision. Rapid exit from an unfavorable economic crisis requires decision making and communication planning, targeted to support sales promotion techniques.

THE PREMISES OF STRATEGIC MARKETING PLANNING IMPLEMENTATION WITHIN SMALL AND MEDIUM SIZED ENTERPRISES

Curmei Cătălin Valeriu

Bucharest Academy of Economic Studies, Marketing Faculty

Ionescu Florin Tudor

Bucharest Academy of Economic Studies, Marketing Faculty

Popescu Andrei

Bucharest Academy of Economic Studies, Marketing Faculty

The main purpose of the present paper is to identify the framework and the necessary conditions for the small and medium sized enterprises (SMEs) to be able to adopt the strategic marketing planning. Also, the paper aims to underline the importance of the strategic marketing planning and the manner in which the SMEs can adopt, implement and operationalize the strategic marketing planning instruments, whose correct understanding and usage ensure the capacity to generate competitive advantage, the key element both from the perspective of the fierce competition and the perspective of the future development of the SMEs. Within SMEs the implementation of marketing becomes an evident requirement, mostly due to the relationship that these have with the market, thus, leading towards market orientation of the activities, a new approach developed by the marketing vision on managing the activities from these types of organizations. Regarded upon, from the marketing perspective, the activities from the SMEs, especially the marketing activities, cannot take place randomly. Resource allocation, a characteristic of these types of organizations, and the objectives with regards to superior customer needs satisfaction and economic efficiency maximization, claim thorough planning and deployment of the activities in a sequence that represents the implementation of a strategy previously assumed. Within this framework, the strategic marketing planning appears as a complex process employing all scientific instruments that comprise segmentation, positioning and marketing mix. Utilizing the strategic marketing planning within SMEs depends to further extend on marketing integration; process directly related with a series of factors such as the nature of the market, development stage, product type, management quality and the influences of the marketing department of the SME. The implications onto the marketing activities from SMEs are reflected upon each strategic marketing planning instrument, where we can find, under correct understanding and application, objectives and market and penetration strategies as product, price, distribution and promotion strategies.

Keywords: marketing, SMEs, segmentation, positioning, marketing mix.

JEL Classification: M31

Introduction

Small and medium sized enterprises (SMEs), the main factor of development of the present economy, represent, for the modern marketing, a challenge that needs to be addressed by adapting all scientific instruments to the features of these types of organizations. The methods, techniques and marketing instruments dynamically connect the SMEs to the *market*, characterized within the last decades by multiple changes, evolutions that have as premises within marketing development the social-economical dynamism (Florescu 1992: 12). The development of SMEs depends more and more on their capacity to place the general, strategic and tactic planning (Olteanu 2007: 45) in the center of the activities, position that can ensure the fulfilment of both

marketing and general objectives of these types of organizations. The SMEs have a special role in the present economy. They represent a permanent source of innovation, creation of new working places, which in turn create the framework for the development of entrepreneurship abilities. The marketing activities must take into consideration all these elements as being the main features of SMEs, both from the perspective of market relations that can be found in the marketing environment and from the perspective of planning the marketing activities.

As a requisite in the strategic marketing planning the features of the SMEs must be taken into consideration and valorized to an extent that permits the economic efficiency maximization.

The importance of strategic marketing planning within SMEs

Strategic marketing planning, like many of the marketing concepts with which we operate today, have undergone numerous changes, thus leading to an enrichment of its content due to the social and economic evolutions. All the changes led to the repositioning of marketing within SMEs and to the changement in status of the marketing activities, which became marketing function (Olteanu 2007: 113). The marketing function ensures within SMEs (Walsh and Lipinski 2009: 569) the success through the determination and satisfaction of target clients' needs, wants and aspirations, in utilizing the scientific marketing instruments, and represents the base for the accomplishment of the marketing objectives.

Taking all these elements into consideration it is only natural for the strategic marketing planning to be part of a more complex process having as base component strategic planning, that defines the place of marketing activities within the structure and different strategic level of the organization (Pop and Dumitru 2001: 203). In understanding the marketing role within SMEs the managers must also take into consideration the strategic planning.

Strategic marketing planning must be regarded as a complex process, whose dimension appears within the vertical succession as having as components strategic planning oriented towards the market, strategic planning of the activities and strategic marketing planning (Olteanu 2007: 155). Within the process of strategic marketing planning it is necessary that the segmentation, positioning, marketing mix elaboration and the methods and techniques used to be properly adapted to the specific limitations of the SMEs.

From the large variety of limitations of the SMEs in connection with the marketing characteristics can be mentioned (Gilmore, Carson and Grant 2001: 6):

- limited resources – such as finance, time, marketing knowledge;
- lack of specialist expertise – owners-manager tend to be generalists rather than specialists;
- limited impact in the marketplace.

It is also important to mention that there is a direct connection between the influence factors onto SMEs and marketing characteristics (Figure 1). According the marketing experts (O'Dwyer, Gilmore and Carson 2009: 48) the influence factors act unitary and simultaneously so that they reflect the process character of the full components assembly, which mirorr the importance of adapting the marketing activities and of the strategic marketing planning instruments.

Among the factors that influence SMEs competitiveness can be included, as having a high impact, innovation that must be regarded from the perspective of strategic marketing planning as central element in segmentation, positioning and mix marketing dimensioning.

Thus the main objectives of all marketing activities become the increase of innovation rate, which can be achieved by introducing new products, goods and services or/and technologies onto the market, and superior demand satisfaction both from a quantitative but also from a quantitative point of view.

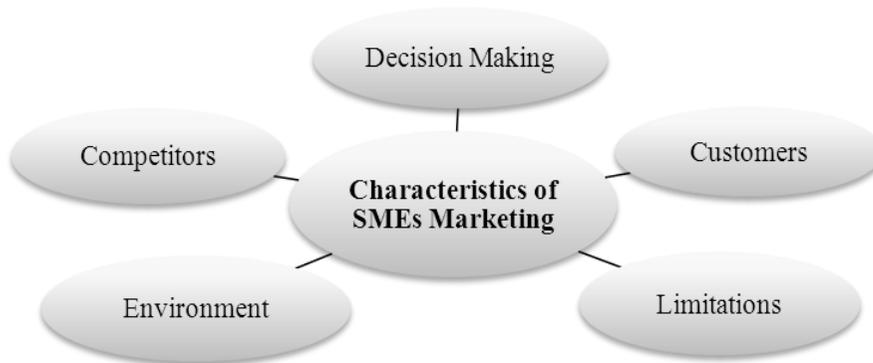

Figure 1. Characteristics of SMEs marketing

Source: Adapted from O’Dwyer, Michele, Gilmore, Audrey and Carson, David. “Innovative marketing in SMEs”, *European Journal of Marketing* 43(2009): 48

Strategic marketing planning – instruments to be used within SMEs

The strategic marketing planning process that operates within SMEs has as starting point strategic planning itself, which can be found within entrepreneurial organization (Mintzberg 2008: 377). According to this valuable classification this type of organization has a simple and flexible structure where the owner/manager coordinates and controls directly the activity. There can be found important differences from the point of view of strategic structure and decisional process between SMEs and large enterprises (LSEs) mostly related to a different point of view regarding planning, where the former are characterized by an emergent strategy (Hollensen 2007: 10), and direct and personal implication of the owner/manager, dominating, thus, the decisional process. The strategic marketing planning instruments must be regarded as part of a complex process of strategic planning of the organization, where at a superior level, can be found four planning activities, included in the three processes of the strategic cycle (planning, implementation, control). These activities are (Kotler and Keller 2008: 41): defining the corporate mission; establishing strategic business units; assigning resources to each SBU; assessing growth opportunities. Strategic marketing planning integrates (McDonald and Wilson 2011: 50) the objectives of the company and reflects the objectives specific to each functional level (Figure 2).

Figure 2. Hierarchy of planning within SMEs

Source: Adapted from McDonald, Malcom and Wilson, Hugh. *Marketing plans: how to prepare them, how to use them*, 7th Edition, Chichester: John Wiley and Sons, 2011: 50

Segmentation as an instrument of strategic marketing planning has an increased importance within SMEs because of the limited resources, thus, ensuring a better financial efficiency and a better understanding of the market, whose division leads to the identification of different groups of buyers with different needs, characteristics and behaviors (Kotler and Armstrong 2008: 63), which in turn create the premises of a correct employment of positioning and marketing mix. Furthermore, it becomes evident that different groups of buyers need different policies and an adaptation from the point of view of product, price, and distribution and promotion mode.

The complex character of segmentation becomes evident in the following stages (Etzel, Waker and Stanton 2007: 144):

- identify the current and potential wants that exist within a market;
- identify characteristics that distinguish among the segments;
- determine the potential of the segments and how well they are being satisfied.

The correct understanding and employment of segmentation establishes the premises of a correct application of the analysis methods and techniques that are used within the strategic marketing planning process. Also, relevant for the identification of the structure of the market is the utilization of the concept of market orientation.

We can mention that we find segmentation from a different perspective as an instrument, which helps in the identification of market structure, and is made operational in the framework of the concept of market orientation, where the variables of segmentation are mostly quantitative (age, income). The new approach for segmentation as marketing instrument employs it both in clients/consumers segment identification and supplier segmentation. Thus, the process implies the division of suppliers in distinct groups with different needs, characteristics and behaviors, that claim different approaches for the relations established between organizations (Day, Magnan and Moeller 2010: 626).

In a logical sequence positioning, as instrument of strategic marketing planning, can only follow segmentation and identification of the segment or segments onto which the company will operate. In the process of identification of the position that the company intends to occupy on these segments must be underlined that positioning refers to the position that the organization or its product has in the mind of the consumer (Kotler and Armstrong 2008: 64), the marketers having the role to differentiate the offer of the organization from that of the concurrence, creating the motivation of acquiring the products and accomplishing another objective at this level to have "the most advantageous position" (Trout 2005: 24).

In the complex process of positioning, the effort to create a distinct image of the organization and a differentiation of the offer in the mind of different customer categories whose needs, wants, demands the organization wants to satisfy, must be accompanied by the identification of the points-of-difference and points-of-parity (Kotler and Keller 2008: 456).

Taking into consideration the previous aspects it can be identified the idea that the purpose of positioning is not the creation of a new and different product, but the modification of the existing relationships with the consumers with relevant influences onto the product, price, distribution and promotion, which reflects the remarkable value of this instrument of strategic marketing planning.

The main objective of the whole strategic marketing planning process and the main reason to concentrate on target segments of clients is to gain the competitive advantage (Perreault and McCarthy 2000: 40), by developing a marketing mix that leads to the superior satisfaction of customers needs in the context of economic efficiency maximization, fulfilling, thus, the two objective functions of marketing.

Furthermore, in the marketing literature are underlined contradictory points of view with regards to strategic marketing and, especially, with regards to strategic marketing planning instruments, which place, for example, mix development in different situations at strategic or tactic level (Varadarajan 2010: 121).

In our opinion the frequent confusions arisen are not necessary the result of an incorrect understanding of the concepts of strategy or marketing tactics, but the result of an incorrect application of the marketing instruments reported to different levels of management.

In conclusion, the strategic marketing planning integrates the processes employed at functional level of the organization, processes that appear in sequence generating objectives and strategies (Figure 3) associated with each employed instrument (Olteanu 2007: 102), whose ranking is not aleatory and can be presented as follows: segmentation, positioning, marketing mix elaboration.

Figure 3. The phases of strategic planning at functional level within SMEs

Source: Adapted from Olteanu, Valerică. *Management- Marketing*, București: Editura Ecomar, 2007: 102

With regards to strategic marketing planning and the specific scientific instruments we can say that a series of experts have appealed, as a result of quantitative and qualitative marketing audit undergone in different SMEs, the lack of strategic planning at SMEs level (Parrott, Roomi and Holliman 2010: 196).

Conclusions

The way in which the strategic marketing planning is employed within SMEs depends, to great extent, on the marketing integration, process directly related to a series of factors such as the nature of the market, growth stage, type of product, good or/and service, quality of management (Reijonen 2010: 279), and, also, the influence of the marketing department from the organization (Verhoef and Leeflang 2009: 26).

As a conclusion, we can mention that at the level of each strategic marketing planning instrument can be found, having as requisite a correct understanding and employment, market, positioning, product, price and distribution objectives and strategies that ensure the market orientation, which, together with entrepreneurial orientation (Baker and Sinkula 2009: 443) influence the success of the SMEs and their long term development.

Regarded from a perspective that cannot ignore the future, but plan it, the SMEs are the seeds of the future large organizations.

Abstract

Brand awareness, together with other behavioural indicators (sympathy, trust, image, satisfaction or loyalty), is one of the main vectors that has an essential contribution to the outline of brand equity in general and to that of retail brand, in particular. The perception upon these indicators must be taken into consideration by production, service or retail companies in order to be able to identify their position on target markets, and in order to be able to create an adequate strategy that would help them reach the desired positioning.

The aim of this paper is, on one hand, to reveal both the dimensions of brand awareness, and the relationship between these and consumers' brand perception and, on the other hand, to offer a suitable instrument to measure awareness level of various retail chains. Questioning of almost 4.000 consumers indicates a significant awareness of the retailers that have been on the selected market for a longer period of time.

Keywords: awareness, recall, recognition, retail brands

JEL Classification: M3, M31

¹Acknowledgment: This paper has been co-financed from the European Social Fund, through the 2007-2010 Human Resources Development Operational Sector Program Project number POSDRU/1.5/S59184 "Performance and excellence in the post-doctoral research within the economic field in Romania".

Introduction

In order to adequately manage a brand, its owner must understand its value and the advantages that may be obtained through its constant support. Brand equity may be quantified both from its owner point of view and from consumers' one, with the aid of two types of indicators: financial (quantitative) and behavioural. Both types are useful for the fundamentation of strategic decisions regarding correct and efficient brand positioning on the target market. While quantitative indicators are relatively easier to determine, behavioural ones require special attention. Among the quantitative indicators we must mentioned the ones that evaluate company's competitive position (market share, relative market share, commercial network density), market dimensions (competition structure, products degree of newness, size of the market, volume and structure of quantitative and value sales), estimated profits and turnover evolution, relative advertising spending or the costs with brand management (Esch 2007: 73; Hammann 1992: 226; Penrose 1989: 40-42).

Even though behavioural indicators are more difficult to understand because of their relatively abstract nature (Esch & Geus & Langner 2002: 39-47), literature identifies several such examples. Almost all proposed models are mainly based on brand awareness or image – Keller's

and Aaker's models (Keller 1993: 1-22; Aaker 2004: 32). Other behavioural indicators taken into consideration by several studies include brand sympathy or trust; positive relationship between consumers and brand or intensity level of this relationship; brand associations; and loyalty, satisfaction or contentment induced by brand use (Sirdeshmikh & Singh & Sabol 2002: 34; Yun & Good 2007: 12; Backer et. al. 2002: 131).

1. Theoretical models of brand awareness

Aaker considers in the developed model that awareness refers to the level of name and symbol recognition of the analysed brand. Besides that, Aaker also integrates within this approach as determinant behavioural vectors of brand equity, brand loyalty, supposed or perceived quality, brand associations, together with other brand merits, represented by patents, distribution systems or other various marks (Aaker 2004: 32; Esch 2007: 65). Keller shows that brand awareness, together with its image, are the vectors that compose brand knowledge (Keller 2003: 58-102; Keller 1993: 1-22). Keller's merit is that of decomposing awareness in two components: brand recall or active awareness due to its visual and verbal anchors and assisted awareness, or passive that requires its identification through verbal and non-verbal access of consumers' mind associations. Brand image must be understood through brand associations – emotional, conative or cognitive.

Besides the model in which Keller explains brand equity through the use of concepts such as awareness and image, he draws the conclusion that awareness has two dimensions (Keller 2003: 92), consisting of the depth of awareness levels (ease and speed of brand recall) and the width of awareness facets (specific situations when a person is able to remember certain brand characteristics). Departing from brand awareness depth, Aaker builds the awareness pyramid, according to the degree to which a consumer can or cannot indicate or recognize a certain brand (Aaker 1992: 84). Therefore, if a person asked to name a retail brand does not succeed in indicating one, it is considered that the retail brand is unknown. When the consumer can identify the retail brand from a list or when he decides to visit the store only when in front of it, the brand has an assisted or passive awareness. A retail brand may be considered active and to enjoy spontaneous awareness if it is considered before starting an acquisition or establishing the store where to make the purchase. A retail brand may be considered "top of mind" when the consumer recalls it as the first from a short list of brands. It occupies the dominant position in consumers' mind only if the person cannot name a competitor brand (Aaker 1992: 84; Esch 2007: 69).

2. Awareness measurement

Here it can be made a distinction between brand "recall" tests (active awareness) and "recognition" ones (passive awareness). While in the first case respondents are required to spontaneously indicate brands from a certain category, in the second one they must recognize their brand, product, packaging or logo from a given list and to be able to integrate it within a category.

In this respect, time factor may or may not be taken into account, but short thinking time makes it more difficult for consumers to remember several brands, which may represent a way to select the brands with dominant and intense awareness. Meanwhile, the brands order, together with correct or incorrect integration of the brand within a category may represent important indicators for recall tests (Esch 2007: 499-501).

3. Research methodology

In order to check in a suitable way the theoretical concepts previously described, the method employed was the survey. The questionnaire referred to Romanian consumers' perception regarding retail units present in one of the most important and relevant economic, cultural and

social regions of the country. The data collection phase took place in two years under the coordination of one of the two authors (Dabija). There have been used one hundred interview operators and the number of collected questionnaires has reached 5.000. In order to quantify the awareness of investigated units there have been used an open-end question (for measuring unaided awareness), and a close-end one (for revealing assisted awareness).

If in the first case respondents were asked to spontaneously name between one and six stores they could remember, while in the second one they had to choose from a list of 18 local, regional and European retail units present in Romania. The list included at least one example of hypermarkets like Auchan or Carrefour, supermarkets like Billa, cash & carry stores like Metro and Selgros, discounters (Kaufland, Plus), Do-It-Yourself stores (Ambient, Baumaxx), several proximity shops, electronic and household appliances stores like (Altex, Domo or Flanco), specialised stores (pharmacies, bookstores, textile and clothing stores), as well as shopping centres.

Classification on retail formats (hypermarket, supermarket, discount, etc.) has not been introduced to respondents, but it has been carried out by the authors. They have used literature (Barth 1999: 88; Dabija 2010: 77; Liebmann & Zentes & Swoboda 2008: 394-419; Theiß 2007: 491-495; Zentes & Swoboda 1999: 81-85).

4. Results

4.1. Spontaneous awareness

In the case of spontaneous awareness it has been noticed, after response codification, that, in the three research years, over 99% of the respondents have been successful in indicating at least two stores and almost 70% of them named six retail units. As it may be noticed in table 1, among the two research moments, year 1 – 41% and year 2 – 57% it is present a significant increase in the number of individuals that are able to spontaneously name six retail brands.

Table 1. Total number of stores indicated by respondents on the six alternatives of the question referring to spontaneous awareness

			one	two	three	four	five	six	Total number of respondents
			Store(s)						
Number of people that indicated in ...	Year 1	abs.	977	976	967	864	636	403	977
		%	100%	99.9%	98.9%	88.4%	65.1%	41.2%	100%
	Year 2	abs.	1844	1834	1800	1604	1317	1057	1844
		%	100%	99.5%	97.6%	87.0%	71.4%	57.3%	100%

Legend: abs. – absolute frequencies; % – relative frequencies; resp. – respondent

Source: own research;

The distribution of the totalized responses on retail formats, but divided on the two moments of research is represented in table 2. In the category of other retail formats are included specialised stores (textiles, bookstores), electronic and household appliances, Do-It-Yourself and shopping centres.

As it may be noticed, in year 1 consumers spontaneously remember supermarkets (1593 nominations), and the two cash & carry units – Metro and Selgros (1426 nominations). If we take into account the fact that the supermarket format includes five stores, it results that the two cash & carry units express the highest level of awareness. The least known are proximity stores, which in fact have the largest number and have the largest territorial network.

Table 3. Distribution of the nominations of retail formats, divided on the six response alternatives

<i>Number of responses on the six response alternatives</i>							Total	
Year 1	I	II	III	IV	V	VI	Nominations	%
Cash & Carry	275	313	325	279	159	75	1426	29.57

Total nominations	1844	1834	1800	1604	1307	1057	9446	100

Source: own research

In the second year of research the situation is distinct. Cash & carry units lose the supremacy and the dominant formats become those of hypermarkets and supermarkets. Intense communication carried out by one of them, but especially the new experience offered by this store, together with the other two new shopping centres, place the hypermarket category on the first place among global nominations (2666). Besides hypermarkets, the supermarket format also registers a significant number of nominations (2506 on the whole), succeeding in fact in a better positioning in the mind of consumers. As it may be noticed, supermarkets obtain 33.46% of the first place nominations (versus 30.04% for hypermarkets), and 29.88% of the second place nominations (versus 27.54% for hypermarkets). Only starting with the third response alternative (after which consumer strives harder to spontaneously remember a retail brand), hypermarkets surpass supermarkets. A possible explanation of this phenomenon probably resides in the proximity of supermarket locations to consumers. Hypermarkets, being developed on large surfaces require a large number of parking spaces, thus being placed in the periphery of urban areas or of neighbourhoods.

For a more exact evaluation of the competitive situation from the perspective of awareness, unassisted awareness analysis must be carried out through a classification of stores. In this respect table 3 presents a ranking of retail brands that occupy the first five positions on each response alternative. In research year 1 Cora hypermarket is the leader of the first response alternative and challenger on the second one. Its dominant position is surpassed by Metro (two, three and four response positions) and by Selgros (five and six). The two cash & carry units thus occupy five of the six response versions.

Table 3. The ranking of the first three nominations for the six response alternatives regarding spontaneous awareness in the three research moments

		Position										
		1		2		3		4		5		
Year 2	Alternative	1	Kaufland	330	Cora	243	Metro	162	Billa	161	ABC ¹	151
		2	Kaufland	238	Billa	190	Cora	177	Metro	166	ABC ¹	130
		3	Kaufland	198	Cora	170	Metro	164	Billa	138	ABC ¹	118
		4	Metro	162	Kaufland	154	Cora	116	Real	114	ABC ¹	111
		5	Kaufland	113	Cora	108	Billa	95	Selgros	92	Auchan	90
		6	Kaufland	95	Profi	79	Metro	76	Plus	71	Billa	66
Year 1	Alternative	1	Cora	235	Kaufland	196	Metro	160	Selgros	115	Billa	110
		2	Metro	178	Cora	175	Kaufland	175	Billa	148	Selgros	135
		3	Metro	193	Billa	151	Kaufland	146	Cora	137	Selgros	132
		4	Metro	169	Kaufland	139	Billa	115	Selgros	110	Cora	92
		5	Selgros	88	Billa	71	Metro	71	Profi	63	Kaufland	61
		6	Selgros	45	Profi	44	Billa	37	Oncos	36	Praktiker	36

Source: own research

Legend: ¹ – Within the ABC stores have been included various proximity units that are not part of a retail chain

It is considered that this situation is explained by the fact that Metro has been present on the selected city's market even from the beginning of the years 2000, and in Romania for over ten years. In this context, it may be talked about an experience (mainly positive) accumulated by consumers with the oldest modern retail unit of the city. Moreover, it is believed that these units have become to a certain extent a sort of benchmark, a comparison base for any newcomer. It is therefore considered that Kaufland supermarket occupies one of the first five response alternatives in year 1, while in year 2 it gains five first positions. In research year 2 appears in the ranking of most often nominated units Real – once (fourth alternative) and Auchan once (fifth alternative).

In order to more accurately stress the position held by the selected retail formats on the six possible response alternatives, it has been utilized a method to weight the absolute number of nominations with the importance score (table 4), as follows (Pop & Plăiaș & Dabija 2008: 165-169): for the retail formats indicated on the first place the coefficient is six, for those on the second position five, and so on until for those on the last place one. By summing up the scores obtained on the six response alternatives it results the corresponding score for each retail format. The two cash & carry units lead in research year 1, followed by super- and hypermarkets. In research year 2 the leader type of retailers are hypermarkets, which are seconded by supermarkets.

Table 4. Classification of weighted nominations on retail formats

Retail format	Score year 1	Score year 2
Cash & Carry	4819	5745
Discounter	3242	1678
Supermarket	7793	5734
Hypermarket	9984	3391
Proximity store	4851	1050

Source: own research

4.2. Assisted awareness

As expected, when facing a list of retail units from all five retail formats previously introduced, respondents were able to easily identify even the stores that previously they had not been able to

spontaneously remember. Data interpretation must be carried out paying attention to the fact that in research year 1 there have been taken into consideration only 18 retail units, while in the second year of research their number rose 30. This augmentation is owed to the fact that several retail chains have entered the analyzed location and several others have announced their intention to penetrate this market. In the first year 3.8%, and in the second year 3.5% of the respondents were able to nominate five or fewer stores, while 76.8% in the first year and 86.7% in the second year could nominate over 10 units.

Table 5. Assisted nominations distribution on questionnaires

Number of nominations on intervals			Number of cumulative nominations		
Year 1	Respondents	Percentage	Year 1	Respondents	Percentage
Up to 5	37	3.8%	Up to 5	37	3.8%
Between 6 and 10	190	19.4%	Up to 10	227	23.2%
Between 11 and 15	617	63.2%	Up to 15	844	86.4%
Between 16 and 18	133	13.6%	Up to 18	977	100%
Year 2	Respondents	Percentage	Year 2	Respondents	Percentage
Up to 5	65	3.5%	Up to 5	65	3.5%
Between 6 and 10	197	10.7%	Up to 10	262	14.2%
Between 11 and 15	354	19.2%	Up to 15	616	33.4%
Between 16 and 20	519	28.1%	Up to 20	1135	61.6%
Between 21 and 25	550	29.8%	Up to 25	1685	91.4%
Between 26 and 30	159	8.6%	Up to 30	1844	100%

Source: own research

If in research year 1, Metro was the retail unit with most assisted nominations (959), followed by Billa (953), Kaufland (939), Cora (930) and Selgros (919), in research year 2 this top five appears to be different. Kaufland becomes the leader (1749), followed by Metro with 1792 assisted nominations and then by Billa (1653), Cora (1554) and Selgros (1520). Analysing absolute and relative frequencies (even though the values are descending) it may be stated that Kaufland became in research year 2 the benchmark unit with whom all the others are compared. However, Metro still holds a powerful position, probably because of the fact that has been the first large store on this market and had represented for many years the only real alternative to the traditional proximity units.

It is very interesting that the four hypermarkets present on the studied market have seen a spectacular evolution. From the total number of possible nominations in research year 1 (977), Cora registered 930, this representing 95.2%. In research year 2 its situation has undergone a significant decrease of over 10% (84.3%). Following the inauguration of one branch each, the other three hypermarkets experience considerable augmentation. Even though between Auchan and the other hypermarkets the difference in the second year of research between the number of actual nominations and the maximum possible one is not so great, varying between 8.9% and 12.1%, it is considered that this situation can be explained through the fact that the image of Auchan and that of Iulius Mall shopping centre, where it is located, are partially overlapped. In other words, consumers, when asked about a food store, respond Iulius Mall and not Auchan, because, paradoxically, the association between the two concepts is too tight. Of course that this situation may also be determined by Auchan's less intense communication strategy, caused by high promotional costs or by its reduced number of stores, which are sparsely dispersed in over the country.

5. Conclusions

Of course, the present research is limited by the subjective inclusion of certain retail units among the ones introduced by interview operators to respondents. In the future it is imperative that a more complete coverage of various retail formats is being achieved. Future studies in this area will allow for better data comparability. The collected data allow the authors to conclude that European retail units have been relatively easily accepted by Romanian consumers, gaining their trust, sympathy and awareness. It is going to be interesting to find out how consumers perception will change as the number of stores of each retailer increases and other competitors penetrate the market.

In European and international context of a knowledge-based society, education becomes a strategic element of sustainable economic growth. Developing human capital and adapt its training to the present requirements of the labor market requires major investments both in the formal education system and in individual study. In his position as a promoter of change, the educational environment must actively respond to external challenges, demonstrating a strong flexibility and openness to new.

Implementing the concepts and marketing strategies in the educational environment have gradually led to the development of educational services and improvement of their quality. Focusing on student, the mainstream of marketing, brings in front his requirements and expectations, and the development of the educational strategies aim to satisfy his information and intellectual development needs. School success is reflected in its students achievement as a successful commercial product is observed by analyzing sales figures recorded.

Frequent changes occurring in society as a result of accelerated evolution of technique and technology have made their mark on education. The assimilation of innovations in the traditional educational processes imposed and behavioral changes and adaptations to all education stakeholders. Thus knowing the consumer behavior, the influencing factors and the psychological processes decision making, becomes essential in creating an effective education system.

The emergence of e-learning platforms as a result of the growing importance of lifelong learning and integrating them in the traditional educational environment was a crucial moment in the evolution of educational practices. Focusing on computer, Internet and intranets, e-learning brings education a surplus of interactivity, interaction, responsibility and collaborative learning. Considered as innovative solutions, initially, complementary to the classical teaching techniques, e-learning technologies gradually penetrate the traditional classroom learning environment.

Introducing innovation in the educational environment causes changes in the behavior of all actors confronted with it. Hence, knowing the perceptions of the main consumers of knowledge is a key element in the implementation process of innovation and assessing its effectiveness. This paper aims to develop major behavioral theories on e-learning environments, seeking to establish and explain the attitude of students, the main consumers of educational services, in terms of their perceptions about the introduction and use of these technologies in the classroom.

Considering the results of the presented study may be the starting point in developing a complex behavioral pattern specific of the educational market by integrating behavioral aspects of all actors involved in providing education and confronting them with the main factors of influence.

INTRODUCTION

In the context of contemporary society, education becomes an activity centered on the development of intellectual capacities of the individual, and highly influenced throughout the life by his desire for knowledge and by his practical experiences. Educational process is seen as a continuous and evolving one, depending on the age and level of preparedness of the individual.

According to the report of the European Commission, European Union countries were to develop by the end of 2010 the most competitive and dynamic knowledge based society (European Commission, 2004: 5). This directions are long –term maintained. Knowledge-based economy becomes a reality of contemporary society and education its main mobile.

New knowledge-based economy considers human capital as the main factor of economic progress and social event. Therefore contemporary society is becoming increasingly linked to the quality of the educational system, the primary creator and distributor of knowledge. The complex process of knowledge consists of three phases: transfer, assimilation and interpretation, and dissemination of information. All these are based on the individual's intellectual capacity, able to provide added value to the information received through an internal process of interpretation of the meaning of objects and events. In this conditions the role of education is not just the mere transmission of information but also providing the necessary specific dissemination through the socialization process. Through education the individual can provide himself with superior adaptation to the environment in order to enhance his welfare and that of the whole community.

The social transformations caused by the emergence, development and direction of the new knowledge-based economy have led to multiple changes in the educational system. Although the general structure of education has remained constant, the attempt to identify the best learning and evaluation option lead to a progressive change in the content of the mandatory superior education system and especially in the compulsory education. Most of them concern the introduction of IT technology in the educational environment as the main agent of transmission, dissemination and evaluation of information and their level of assimilation.

Lisbon Strategy reaffirms the need to integrate technology into the educational environment in order to promote innovation. Information and communications technology is considered “the backbone of the knowledge economy, the main engine of economic growth” and social development. (European Commission, 2005: 20-23).

The European quality standards and the need to adapt to specific requirements of the labor market have forced both the resizing and reshaping of the educational processes in terms of curriculum and teaching techniques used in formal education and also at the level of the continuing education. Now the boundaries of this two types of educational activities are undetectable, thus ensuring the continuity of the formal education through informal education. The specific forms of the educational products change from an unidirectional process to a bidirectional one. The role of student’s feedback grows, emphasizing the importance of interactive, proactive and anticipatory learning. Integrating e-learning technologies in the formal education and their widespread use in continuing education is the solution to the requirements of a modern and effective student - centered educational system.

LITERATURE REVIEW

XXI century education involves the identification and proliferation of three essential elements: professionalism and quality in lifelong learning, creating and developing knowledge and its dissemination. At the base of these three elements is situated innovation, a major importance being achieved by the IT innovation (Weert, 2006: 217). The need to develop collaborative learning contributed to the emergence and widespread use of virtual environments as a social communication support and educational interactive learning. E-learning becomes an important driver of educational change and of its adaptation to the requirements of European integration.

Ever since the first e-learning technologies, many researchers have attempted to define the typology of these educational resources based on specific tools and processes which underpin their functionality in order to identify the degree of efficiency in the acts of teaching and learning. Derek Stockley defines e-learning as "the delivery of instruction or training program through electronic means. E-learning involves the use of computer or electronic media to ensure the transfer of educational material" (Stockley, 2003: 32). The definition identifies the main characteristic of e-learning environment (use of computer or electronic media), but only indicates the transfer function of the systems presented, neglecting their contribution in the reception, detention and interpretation of materials delivered and interactive feedback results.

Considering the main objective of the e-learning platforms – to facilitate the transfer of information and their assimilation with maximum efficiency, such systems have been designed and developed based on the mental processes taking place in the minds of the learner.

Sigal, M. (Sigal, 2002: 31) explains the typology of e-learning systems starting from the four processes of knowledge identified by Piaget: assimilation, accommodation, balance and imbalance. Knowledge creation process involves interpreting the information received from others and dissemination of new information (feed-back) to the external environment. Through learning, individuals develop their memory and acquire the capacity to analyze information received from the environment and to produce knowledge.

"Today we are facing a paradigm shift in the development of the learning support systems: in recent years, their development was mainly focused on technology and now it focuses on applying specific concepts of human behavior in using new learning, communication and business technologies. Recent neuroscience research highlights together with the cognitive elements, the predominant role of emotions, intentions and social factors in learning. " (op.cit. Trausan - Matu, Cristea and Udrea, 2005 : 22). This requires a deep knowledge of students' perceptions on the use of such innovative technologies in the classroom, and so explaining student's attitude (acceptance or rejection).

The main behavioral approaches concerning e-learning placed the student in the center of its interests. Integrating e-learning platforms in daily life especially in education cause major changes in how people learn, "concentrating on the needs of students rather than on those of teachers or educational institutions" (Cross, op. Cit. Aldhafeeri, 2006: 711). Students are parts of a whole – the e-learning community, therefore their involvement in the evolution of the entire community is essential to its existence.

Given the development of e-learning based on a pedagogical model that assumes students' responsibility for their study, Porras - Hernandez (Porras - Hernandez, H., 2000: 385-392) speaks about the theory of self - regulation in the study of students, considering this to be a very important feature in increasing academic achievement through e-learning environments. Motivation and individual self – control are also relevant factors in ensuring a coherent community.

"In the area of e-learning, students are considered consumers who should receive quality services" (Rossett, op. Cit. Aldhafeeri, 2006: 711). Providing high quality educational products by adapting them to specific consumer requirements is one of the objectives of the educational e-learning systems.

Studies carried out in order to identify students' perceptions on the use of e-learning highlighted the advantages and disadvantages of these environments. Patricia Borstorff and Keith Lowe (Borstoff, Lowe, 2007:19) reflects through their research the main benefits perceived by students: flexibility and the convenience offered by these technologies during individual study and also in formal education. Most of those questioned also identified as the main disadvantage of e-learning environments the limited communication with the teacher.

Based on the study of perceptions developed by Lowe and Borstoff but taking into account all the other research on consumer behavior within the e-learning communities and the premise of student – centered activities, this paper aims to identify students' perceptions on the use of the e-learning platforms in classroom.

RESEARCH METHODOLOGY

The present research aims to identify the perceptions of students on the use of e-learning platforms and on the integration of e-learning in Romanian education system. To achieve this goal were used specific tools and techniques of qualitative research. Through in-depth interviews was identified the general perception of secondary school pupils on e-learning and also the causes that led to it. The semi-guided interviews were made based on a conversation guide shaped around three main objectives: to determine students' perceptions on e-learning platforms, determining the perception of quality in educational environment and to identify the main advantages and disadvantages of e-learning environments. The sample includes a total of 24 people, high school students, with an equal gender distribution. 60% of respondents go to an urban area school and are aged between 16 and 18. Group selection was not guided by the use of these technologies in schools because it aims to identify general perceptions of e-learning environments and not that which refer to a specific use.

RESULTS

The research reveals an overall positive perception of the students interviewed, regardless the use or the environment in which they entered in contact with e-learning. Most of those interviewed (80%) reported personal use of e-learning platforms during individual study and denied the use of innovative technologies within the school to which they belong.

Asked to define an e-learning platform in three words, many respondents were hesitant and late in providing the answer. Mostly the e-learning platform was defined by terms such as "Internet", "Programs", "projections", "interaction", "PC", "image". Very often the term used is "team" which outlines the students perceived contribution of e-learning in creating a collaborative learning environment. The terms used by the subjects of the study are correct, most components or features delimiting basic e-learning platforms.

In the case of the assisted associations students have designated e-learning platforms by linking their characteristics with the attributes of an animal. Over 70% of students have associated e-learning systems with a cheetah, based on speed as the main attribute. 15% of the students participating in the study believe that an e-learning platform is "friendly and nice" like a Koala Bear, and only 2% associate it with a repulsive rat. Even if the subjects have never used an e-learning platform, they associate positive characteristics with it.

Regarding the advantages and disadvantages of e-learning, students have identified as main advantages interactivity, the evaluation methods used and the mix of images and audio elements and video presentations within the e-learning lessons. Most of the respondents believe that e-learning classes are more interesting and helps them better retain the information transmitted by the teacher. The agreement of students is expressed also on the question of obtaining superior results by using teaching technics based on multimedia technologies. Although consider the lessons taught in e-learning laboratories to be more interesting than traditional lectures, students participated in the study do not consider that their level of attention would be increased.

CONCLUSIONS

In Romania, although the formal education area remains mostly public, the growing importance of lifelong learning based on the use of online environments, and also the actual pressure of the

labor market changes, enabled the penetration of computer-assisted teaching systems in classrooms.

The requirements of the new economy and the state of the Romanian education require increasing investments in education in order to align the local education system to European standards and global education. To function effectively, educational institutions, regardless their level, must know and consistently measure the quality of educational services and products provided by comparing them with their students' requirements.

Their quality is the main competitive advantage it may hold the existing competitive educational market. Providing quality service should start from the knowledge of demand, consumer needs and expectations, as they participate in development of a product or service and therefore can decisively influence the final performance and quality.

Identifying students perceptions on the use of e-learning platforms in the classroom allows shaping a current image on the quality of the education environment and the guidance that it should follow to meet the requirements of the main consumers. The recognition and appreciation by the students of the main advantages of e-learning platforms and their contribution in improving the education system are premises for continuing innovative actions within Romanian education sector. The receptivity manifested among children about the use of innovative technology is based on two underlying principles: interactivity and collaboration in teaching – learning processes. Developing an e-learning community and its integration not only in continuing education but also in compulsory education facilitate the adaptation of the Romanian education system at the European and international standards in quality and efficiency.

VISUAL POLLUTION: A NEW AXIOLOGICAL DIMENSION OF MARKETING

Everyone's belief is that marketing plays a fundamental role in all economic or uneconomic areas of business. However, what becomes very clear is that, in addition to the many positive aspects that it generates, marketing produces unwanted effects as well.

The paper tries to prove the relationship between marketing and axiology (its value and its perception on the people), on the one hand, and one of its most obvious effects - visual pollution, which already starts to be in the attention of those who can counter it, on the other hand.

Value, as a concept, is a result of a long and laborious research, both economic and uneconomic (philosophical, psychological, etc.). The visual pollution and the ecological architecture are recent approaches and it cannot be said that there is a very rich experience or a proper literature in this domain. But the interest is growing undoubtedly.

The authors consider that the demarche of the paper, to sit marketing, value and pollution alongside, is at the beginning of the road and certainly will arouse the interest of further research.

The paper is the result of an office research of secondary sources of information. They are limited and also limiting, the domains being studied separately. The result of the paper is the noting on the fact that marketing can be extremely harmful. We agree with the idea that marketing supports businesses and the economy of an area, but it is better to be aware that the pollution it produces is increasingly significant so the rules by which marketing plays must be rewritten.

If the authorities, the business itself and those involved in education will focus and will exactly understand their role in a sustainable development of the society, than the aim will be achieved. We believe that the authors' concerns, which are dedicated to the idea that by means of marketing one should not destroy but build, will be of public interest as well.

Keywords: axiology, value, pollution, marketing, ecology.

JEL classification: M31, Q56

1. Introduction

Nowadays, the conviction of everyone, professional or not, is that marketing undoubtedly plays a fundamental role in all economic or uneconomic areas of business.

According to the marketing study in terms of axiology, we can highlight the values followed by this activity, compared with those generally accepted. We define value as a specific axiological relationship between a natural or created object and the human subject, by means of which he expresses his appreciation for its qualities that are meant to satisfy some specific needs. Value

appears as well as the relationship between subject and object, in which by means of polarity or polarization and of hierarchy, we express our differentiated appreciation for certain things or their qualities, for certain persons or human acts, for certain works created by virtue of their ability to satisfy some specific needs, aspirations or interests.

2. Concepts used

A classification of values is as follows: economic values, legal values, political values, ethical values, historical values, aesthetic values, religious values. The first four values are determined by the constituent and regulating functions of the social life. The other three are determined by the frame in which the social reality exists and evolves.

For our study we only discuss three of these values, which are directly related to marketing, and have impact on this activity, namely: economic, ethical and aesthetic values which, depending on the way they are perceived, lead to visual pollution.

The economic value is generally understood as the awareness of the usefulness of the goods comparing to others, which satisfies a certain need. The needs are physical and mental, so we distinguish between two kinds of values: spiritual values and material values. The economic values are material. The value theory is more likely a theory of cost, since it addresses a crucial moment of the value, that meaning the cost, a labor required to produce the goods and the limited usefulness.

The economic values are constituent for the social reality; they represent only a part of the social values that span multiple levels with different functions in the social life.

The ethical values relate to our desires which can be numerous, so we always require the same question: Which is the best goal? For some people it is happiness for others wealth, virtue, etc.

The psychological theory states that a ethical value has a mental basis, it is a product of the self will, of the will to upgrade one's personality.

The analysis of the moral conscience takes into account the opposition between sensitivity and the responsibility imposed by the categorical imperative, because the ethical value is an imperative that we all must obey.

The ethical value has life as an ultimate principle and the ethical laws are natural laws, whose inobservance brings evil. So, shall we sacrifice the ethical values to the detriment of the economic ones?

The aesthetic values relate to the aesthetic pleasure by the existence of an object that has a value and a subject for which that value exists. Beauty is the central aesthetic value, to which all the other ones report. By their specifics, the aesthetic values are significantly related to sensitiveness. The aesthetic values can be intuited, felt, experienced, represented and imagined. And then we might ask ourselves: where is the beauty in all the examples that will be further presented?

3. Research on the marketing negative effects on the environment

Mankind has a spectacular rate of development and marketing has the main position in greatly contributing to this development. This one actually "pushes" forward the world economy and the contemporary society, but it is also responsible for many negative effects which are difficult or even impossible to be repaired, attracting more and more criticism this way.

The oversized consumption of resources (e.g., the paper used in much larger quantities than normal, the lights burning all night), the shopping addiction, the excessive consumption of unhealthy foods leading to obesity, cancer, etc. are negative aspects that began to be reported a few years ago. Their influence reflects on individuals, as consumers, their age being in a rapid decline.

We live in a dense environment, with attempts to influence. Much of the population seeks to make the others conform to their demands. The estimates of this type of research suggest that a

person can receive up to 400 persuasive marketing calls during an only single day. Managers boosting the productivity, a policeman directing the traffic, a vendor selling something are numerous attempts to influence every day.

In fact, the company is a massive group of people seeking for influencing, persuading, requesting, asking, urging, or manipulating each other. We call it society because it convinces us instead of physically restraining us. We cannot even imagine what it would be like if every attempt to influence would be replaced by coercion: the store owner would hit the customer who would not buy the shirt, the boss would hit the employee to make him work harder, the police officer would beat the driver who would drive by 60 km / h in an area of 50 km / h. After a typical day, everyone would be a physical wreck.

Persuasion, on the other hand, allows the work in a company to be performed without problems - while the physical coercion stops it. The successful conviction is when the physical coercion is useless. As a result, the society benefits from persuasion and those who do not know how to persuade benefit the most from society.

Lately, another negative effect is quickly to install: pollution, which is a consequence of the oversized and unjustified consumption. The forms of pollution are: air pollution, water pollution, soil pollution, radioactive contamination, and noise (sound) pollution, thermal and visual pollution. It is noticed the possibility to group them into three basic categories: chemical, sound and visual.

We shall next refer, in detail, to the final form, the visual pollution, which seems to be the least dangerous. This statement can not be demonstrated though because the „evidence” that show exactly the opposite are very numerous.

We live in a civilization based on image, this phrase becoming an automatism in expression which seems to not send any message any more. The initiator of the concept of society of the spectacle, derived precisely from this media explosion, G. Debord argues, „Where the real world changes into simple images, they become real beings and effective motivations of a hypnotic behavior. The spectacle, as a tendency to make the world, which is no longer directly perceptible, be visible by means of various specialized mediations, finds the sight as the privileged human sense, as once was the touch; the most abstract and the easiest to mystify sense perfectly corresponds to the generalized abstraction of the contemporary society” (Pascu 2002: 97).

In a simplistic and easy to understand manner, the visual pollution can be defined as the damage to the landscape issue, in a manner which can be perceptible to the human visual sense, and with effects on the psyche of the person. In the matter of fact, everything that is around and does not delight us and that has even a negative impact on us and on our psychic as well can be defined as visual pollution. Although the negative effect is much less harmful than the one of the other forms of pollution, by the full accumulation of the specific factors, the issue becomes a drama. We can state as visual pollution the vandalized buildings left in ruins, the abandoned sites, the large advertising blades placed on the vertical surfaces of the high blocks (damaged by weather and environmental pollution) and on the large stores in cities, the display on the side roads which has lost its validity, but which nobody ever updated, the parking spaces organized for a possible halt or garbage disposal, but which have been destroyed, and even panels that advise to protect the forest, but which have themselves become a pollutant because they are rusted, warped and torn. Examples may continue indefinitely.

And since this phenomenon involves the person's visual sense, we cannot limit to the quality of "images", but also to their quantity, which induces the individual in a state of hypnosis, in which he can no longer discern. Most critics of this category are directed against outdoor advertising, because the print ads in the newspapers are easily ignored by turning the page and the ones in television by changing the channel. As shown, both the “by mail” advertising as well as the billboards and the street display lead a struggle against those who wish to apply legal restrictions

against the use of these promotional techniques, which use images par excellence (Russell and Lane 2002: 870).

It must be mentioned that all living organisms (plants, insects, birds, animals, humans) are affected by visual pollution.

In this paper we shall refer primarily to people, but also note that anything that affects other creatures listed above, actually distorts the functioning of the ecosystems and hence of the human. If the bright light prevents insects to move, they can no longer be food for birds, the latter ones receive and transmit their influences in their turn, and the weaknesses chain continues.

Visual pollution on humans is manifested in two forms which have been already recognized:

- *direct*, the effects being psychological and physiological;
- *indirect*, the effects being various, from road accidents caused by distraction, to the economic decline of a community.

The authors, A. Dumitrescu and D. Manolache, define the visual pollution by the presence, in the visual field, of some human-made implants, which are in disharmony with the landscape and which promote excessive, depressed or subversive messages, (www.imst.pub.ro/TCM/Dumi/Visual_Pollution.pdf).

This is strongly felt in the large urban areas where the aggressive outdoor advertising (posters, banners, billboards, pictures, neon etc.) became more than just unbearable. Experts consider that Graffiti, for example, has a strong negative influence, which may cause depression and acts of vandalism.

The **visual pollution sources** are:

- *administrative negligence* – the local public administration loses control over what is built or assembled in public spaces, it does not know what and where is displayed, does not solve the problem of buildings in ruins no matter who the owner is.

Logic, architecture, cleanliness, space harmony must be kept in the urban jungle, but they are all suffering because of the business interests and the obtaining of the profit.

It is well known the skyscraper building type, with 19 floors, ground floor and four underground levels, called the Cathedral Plaza, built near St. Joseph Cathedral in Bucharest by Millennium Development Building.

Other changes in the environment are determined by the location of all kinds of items (terraces, public transport stations, garbage cans, huge panels so powerfully illuminated that they can blind drivers at night, stalls, tents, booths installed for commercial purposes, different network cables, etc..) on the public spaces.

- *excessive advertising* - literally suffocating because not even the green areas (trees, land, parks, etc..) are not spared in the desire to ensure good visibility. The existence of giant billboards, outdoor display in general, which is present from the means of transportation to garbage bins is also suffocating.

A frequent complaint against advertising is that it is simply too much advertising and that is annoying. With the rapid introduction of the new communication technologies, the fragmentation and the interactive nature of the future advertising vehicles will undoubtedly reduce much of this criticism, obviously, when the interactive media will allow consumers to select programs, advertising or info-advertising you want, it is unlikely that advertising will be considered troublesome.

While the economic contribution of advertising is, specifically, the major preoccupation of both companies and consumers, in the recent years its social implications are increasingly analyzed. Almost everyone, even the fiercest of his critics, agree that advertising plays an important role in informing consumers about the new products, locations, prices and markets. These are the economic functions of the institution of advertising. On the other hand, the social and cultural

roles of advertising are much less clear and are increasingly becoming a subject of discussion in some circles.

Many observers point out that advertising is both a **mirror** and also a **shaper** of public opinion, social manners and standards. They state that by the absolute value of exposure, advertising sets a social agenda on what is expected, what is fashionable and what is of good taste for a considerable number of people. This influence is manifested especially on young people, poorly educated and impressed people.

But image is not universal language, even if there is an illusion that it forwards meaning because of its analog capabilities. There is this confusion between perception and interpretation

- *vandalism* – from the Graffiti mentioned above to offensive messages, obscenities, street markings of different groups, all made without the owner's consent of course.

The study of the individual and group territoriality is important in terms of reactions that can be caused by an intrusion into the intimacy of a person or in a group territory. Thus, the proxemical research, discipline that deals with the study of nonverbal communication through fixed distances between individuals reveals the characteristics of each culture regarding this issue. The communicational action in ET Hall's studies shows the trials of individuals, often unconsciously, to give a certain distance of communication (intimate, personal, social and public) (Pascu 2002: 79). The failure to comply, as the studies in this area emphasize studies, determines the feedback from participants in the process of communication, such as: the increasing of the blood pressure and heart rate; confusion; the trying to regain territory or the acceptance of an intruder; the lowering performance; the increased verbal aggressiveness; the diminishing of the sense of cohesion within the group.

According to the survey, we shall refer forward to the reactions resulting from intrusion. We have as types of intrusion the following: *violation of territory* by using the territory without permission and looking at someone when they are not expected to be observed, *invasion of territory* by trying to „grab” the group territory and *land contamination*, namely to leave something undesirable on the territory of a person/group.

4. Results of the authorities involvement in the visual pollution

In front of this wave of attacks on the human security made in the name of progress and marketing, the authorities in some states and cities have passed effective measures. Of a particular importance in this context is the need to develop anticipatory policies and to prevent, mitigate and monitor any adverse impact on the environment in general and in a transboundary context in particular.

In *Norway*, severe restrictions have been imposed in Bergen since 1990.

The great city of *Beijing* is recognized as a pioneer of this struggle. The layout of any street advertising is reviewed by a special commission, which sets out its beneficial or polluting role, the harmonization with the urban area, and the possible distraction of drivers in congested areas with heavy traffic and only after that it is approved.

In the *U.S.A.* we are witnessing a limitation on the size and number of panels according to various criteria, such as the number of houses on a street. In certain areas there are allowed only small panels, the large ones being history. States such as Alaska, Vermont, and Maine have partially or totally banned them and in about 1500 cities, the outdoor advertising is prohibited.

The Czech Republic took a number of measures on the visual pollution caused by the excessive use of neon.

The mayor at *Moscow* has introduced a regulation to reduce the size of the outdoor advertising.

But the most radical response was recorded in *Brazil*, in the largest city, Sao Paulo, whose population has exceeded 11 million. The outdoor advertising is considered illegal here. The metropolitan local council decided it in September 2007, which triggered strong reactions from

firm's discontent. For example, lawyers from America's Clear Channel Outdoor, the largest firm in the world, considers this decision as unconstitutional, saying that it would lead to the destruction of business and, therefore, they sued the government. The „Clean City” Law prohibits advertising on public transport and strictly regulates what can appear on the frontispiece of the shop signs.

The residents have noted that Sao Paulo became a more beautiful and clean city after this demarche. Taking the example of the city which became free in terms of advertising and being inspired by its success, the authorities in Rio de Janeiro, Porto Alegre and Brasilia discussed similar measures.

The authorities in **Seoul** invest in innovative technologies and construction that respects nature, and they are also supported by the largest research and development institute in Europe, Fraunhofer Institute - Germany. The researchers here are working on developing an environmental project involving a prototype building efficiently built in point of energy, incorporating all the principles of modern technologies of saving the energy and using alternative energy like the sunlight, the wind and the geothermal heat.

The most recent reaction of the authorities in **Seoul**, however, is on the economic crisis and the increasing of oil prices, fueled by the turmoil in the Middle East and North Africa. They announced severe penalties for the „insignificant” lighting starting on 1 March 2011. Thus, many commercial buildings, bridges, houses etc. are obliged to shut down the lights after midnight. Amid the measures taken, the countries, regions and cities mentioned above are increasingly becoming a tourist attraction. In their promotion, there are sold as items of attraction the restrictions mentioned above, which is likely to offset any losses caused.

The localities and the urban population in **Romania** face the same problems and the voices and initiatives in the domain begin to be visible. For example, on 27 March 2010, 37 cities marked the Earth Hour by interrupting the lighting of prominent buildings in the hours 20.30 to 21.30. In 2011, the same action took place on March 26 at the same time slot, with extensive participation of 50 cities, which synchronized with the similar demarche of a great number of people, more than one billion in 5000 cities in 130 countries.

The increasingly used concepts are *the ecological landscape* and *the ecological architecture*.

Formed about 40 years ago, the *ecological architecture* has not yet been clearly defined. Two approaches are highlighted: the “green” (ecological) architecture and the sustainable one. The first one represents the practice of increasing the efficiency with which buildings and adjacent land use and take energy, water and materials, and the reducing of the negative impacts of such buildings on the environment and human health by improving the design, construction, use, maintenance and demolition, and the last one means the conformation of the „green” architecture with the principles of socio-economic and ecological sustainability. In practice, the ecological architecture products are represented by the passive housing, with zero emissions, green, ecological, durable and sustainable.

About *ecological landscape* it can be stated that it represents the dialogue between the buildings and their surrounding area, in compliance with the environmental regulations. In such an organization there cannot be outside display to jam this dialogue. Finally, the public spaces will not be used for private business, and the reducing of pollution will lead to social benefits that will delight many.

Even the problem of plastic waste, which often fly blown over us and which is known that they are not biodegradable has a very simple proposal to be solved, recently coming from a 16 years old student in Canada, Daniel Burda. He discovered the process of decomposition of the plastic bags in less than three months. Some water, very little carbon dioxide and Sphingomonas and Pseudomonas bacteria are needed for this.

The outdoor advertising supports businesses and businesses support the economy of an area. It is known that large amounts are collected by renting the public spaces and the rights of the display.

5. Conclusions

One will not definitely give up this kind of trade - *public spaces for information by means of advertising and money by renting*, due to the earnings. People are aware of the both sides of the phenomenon; the measures can be seen, especially in the local communities. It is a vicious circle, only that the rules will be better written! That is why business will give the both sides a strong impulse to work together.

6. Bibliography

WIRELESS ADVERTISING: A STUDY OF MOBILE PHONE USERS

Gurău Călin

GSCM – Montpellier Business School, France

Topic: Using a qualitative methodology, this study attempts to provide a general framework of the functions of mobile communication, and to identify the specific preferences of mobile phone users regarding the commercial messages received on their personal devices.

Research objectives: (1) To identify the specific characteristics of mobile communication as perceived by mobile users; (2) to define and analyze the functions of wireless communication as perceived by mobile phone users; and (3) to investigate users' preference regarding the content of commercial wireless communication.

Previous research: Bauer et al. (2002) identified time, location, information and personalization as relevant acceptance factors for mobile advertising. Barwise and Strong (2002) developed a conceptual model, arguing that social norms, user's motives, mode, time, location and personal characteristics will affect the processing of mobile information by consumers. Tsang et al. (2004) evidenced the influence of entertainment, informativeness and irritation, while Bauer et al. (2005) argued that consumer attitudes are influenced by perceived information, entertainment, and social utility. In a similar study, Xu and Gutierrez (2006) tested the effect of entertainment, irritation, informativeness, credibility and personalization on the attitudes of Chinese consumers.

Research methodology: First, a series of academic and practical articles and reports have been accessed in order to assess the existing knowledge on this topic. Second, five focus groups have been organized with six mobile phone users, aged between 20 and 40 years old. Each focus group comprised an equal number of male and female participants. The focus groups lasted between 45 and 60 minutes and addressed three main issues: the specific characteristics of the mobile phones as a commercial communication media, the functions of mobile phone communication, and the specific preferences of mobile phones users regarding the content of commercial messages.

Findings: The participants demonstrated an active attitude regarding mobile advertising, which they think it has the potential to revolutionize the practice of commercial communication, by focusing more on consumer's personal needs and circumstances.

Implications: This transformation cannot be realized without increasing the interactive control of mobile phone users' over the functionality and content advertising messages. Although the required technology already exists, it seems necessary to create new applications that can combine the advantages of customer-, product- and location- centered communication.

Original contribution: Previous studies often used an analytical approach, highlighting specific variables regarding consumer perception or technology adoption. Using a qualitative methodology, this study provides a general framework of the functions of mobile communication, and identifies the specific preferences of mobile phone users regarding the commercial messages received on their personal devices.

Keywords: wireless advertising, mobile phones, functionality, content, users' opinions

Cod JEL: M37

I. Introduction

Wireless communication evolves constantly, determined by the introduction of new technologies and the apparition of new customer demands (Park et al. 2008). However, despite the potential of wireless advertising, marketers have quickly understood that the specific characteristics of mobile

devices and communication require an adaptation of the style, type and content of advertising messages. For example, considering the personal nature of the mobile phone, commercial messages should be tailored in accordance to customer needs and preferences (Haghirian et al. 2005).

However, in comparison with internet advertising, mobile advertising is still insufficiently understood. Existing studies are often using an analytical approach, which highlights only specific variables regarding consumer perception or technology adoption. Using a qualitative methodology, this study attempts to provide a general framework of the functions of mobile communication, and to identify the specific preferences of mobile phone users regarding the commercial messages received on their personal devices.

II. Literature review

Mobile advertising was defined as “advertising or marketing messages delivered to portable devices, either via synchronized download or wirelessly over the air” (Laszlo 2009: 29). The main advertising methods/formats that were described in the literature were the SMS and the MMS (Park et al. 2008; Samanta et al. 2009), although the development of mobile internet creates a new possibility of mobile interactive advertising (Laszlo 2009).

The potential of mobile advertising has attracted many researchers who attempted to identify its success or adoption factors (Park et al. 2008). Bauer et al. (2002) identified time, location, information and personalization as relevant acceptance factors for mobile advertising. Barwise and Strong (2002) developed a conceptual model based on the information processing theory, arguing that social norms, user’s motives, mode, time, location and personal characteristics will affect the processing of mobile information by consumers. Studying the consumer attitudes toward wireless advertising, Tsang et al. (2004) evidenced the influence of entertainment, informativeness and irritation, while Bauer et al. (2005) argued that consumer attitudes are influenced by perceived information, entertainment, and social utility. In a similar study, Xu and Gutierrez (2006) tested the effect of entertainment, irritation, informativeness, credibility and personalization on the attitudes of Chinese consumers.

A qualitative study by Peters et al. (2007) identified several categories of motives that determine customers’ adoption of wireless advertising: process motives, social needs and content needs. On the other hand, Jun and Lee (2007) tested seven factors that may influence consumers’ attitudes: mobility/convenience, fashion, information, entertainment/relaxation, functional service, multimedia service and sociality, but only the impact of convenience and multimedia service were statistically significant. Using a quantitative approach, Ma et al. (2009) attempted to identify the factors determining consumers’ acceptance of mobile advertising. Their findings indicate that perceived message credibility has an important impact on the adoption intention, and the consumers’ ability to adopt high technology, inertia, and their motivation also affects their personal attitudes. Recently, Vatanparast and Butt (2010) investigated the factors affecting the use of mobile advertising, considering four categories of factors: (a) consumer factors: privacy, purpose and performance, (b) message factors: content, credibility and customization, (c) device factors: interface, interactivity and intelligence, and (d) media factor: price, process and policy.

Despite the importance of the existing research, it is easy to notice the existing contradictions between various research findings. This limitation might be due to the specific definition, conceptualization and measurement of various variables, or by a variation in the empirical setting. The identification and statistical validation of quantitative variables is certainly important, but quantitative studies cannot fully describe the personal attitudes and opinions of specific consumers, and cannot take into account their specific circumstances. In order to further develop the understanding concerning the perceptions and attitudes of users towards commercial wireless communication, this study applied a qualitative approach.

III. Research methodology

In order to investigate mobile phone users' preferences regarding commercial wireless communication, the following research objectives have been defined:

1. To identify the specific characteristics of mobile communication as perceived by mobile users.
2. To define and analyze the functions of wireless communication as perceived by mobile phone users.
3. To investigate users' preference regarding the content of commercial wireless communication.

In the first stage of the research process, a series of academic and practical articles and reports have been accessed in order to assess the existing knowledge on the topic of commercial wireless communication and to develop a theoretical research framework. Then, in the second stage, five focus groups have been organized with six mobile phone users, aged between 20 and 40 years old. Each focus group comprised an equal number of male and female participants. The focus groups lasted between 45 and 60 minutes and the moderated discussion addressed three main issues: the specific characteristics of the mobile phones as a commercial communication media, the functions of mobile phone communication, and the specific preferences of mobile phones users regarding the content of commercial messages.

The discussions have been recorded, and then transcribed. The collected texts have been evaluated using qualitative thematic analysis based on indentifying and interpreting the convergent themes expressed by the participants in the focus group.

IV. Presentation and discussion of findings

The specific characteristic of wireless communication and advertising

The participants to the focus groups outlined that the most striking features of mobile communication, are, in order, mobility, personalization and immediacy.

"Mobility is the essence of mobile communication, and the most important relative advantage in comparison with traditional communication media" [S.V., 37 years, male]. In addition, mobility is pushed at extremes with mobile phones and other wireless devices, since the user is carrying the communication devices with him/her, and can be contacted anywhere and anytime. When mobility is reduced or eliminated, either because the user has lost/forgot the mobile phone, or because of limited network coverage, the user feels isolated and unsatisfied: "If my mobile phone is not working and I need to call my husband it can be very dramatic, since now it is much more difficult to find public fixed phones. Everybody has mobile phones and expects you to use them as well" [A.T., 34 years, female].

Personalization was the second most important feature of mobile communication identified by respondents: "A mobile phone is a very personal tool. When I call the number of my mother I do not expect anybody else to answer the phone. Sometimes it is my father who picks up the call, and then for several seconds I feel lost – did I call the wrong number?" [F.B., 22 years, female].

On the other hand, the expanded functionalities of mobile phone have increased their personalized utility, sometimes creating a sense of dependency: "I do not know what I would do if I would loose again my mobile phone. It happened to me once, a year ago, and for two weeks I felt completely helpless" [A.L., 26 years, male].

Immediacy is related with the facility to exchange information over mobile phones: "When using the mobile phone, the communication is like real-time, and you can solve immediately any existing problem" [A.J., 21 years, female]. Immediacy can also be perceived sometimes as a burden by some mobile phone users: "It happens to me quite often to receive a phone call and to think 'oh my god, here we go again, I wish they would live me alone for a while'. You can say that I am quite a private person and too many unexpected intrusions in my personal life irritate me" [S.B., 28 years, female].

As it can be clearly seen, there is a clear connection between the functional and social characteristics of mobile phones and the specificity of mobile communication, both in a positive and in a negative sense. Another interesting element is the complexity of the expressed views – mobile communication is not idealized, the participants outlining both its positive and negative aspects. The negative aspects appear especially when the user lacks control over the flow and the frequency of communication: “Although I consider the mobile phone as a highly useful device, I do not like to be harassed by anyone who wants to call me. I take great care to give my mobile phone number only to close friends, and I always emphasize that I expect them to exercise restraint in using it”. [M.G., 37 years, male]. This tendency towards increased control that was evidenced by some participants indicates an important limitation in the way in which the mobile marketing campaigns should be designed and implemented. The complexity of the situation is increased by the fact that the personal threshold of tolerability (or irritability) is different from one person to another, depending on their personal history and personality.

The main functions of mobile communication

The respondents have identified four main functions of mobile communication: information, entertainment, advertising, and personal communication. In two of the focus groups, the personal communication function was considered as the main feature, which, in some respect, incorporates the three other ‘secondary’ functions. However, in the other three groups the participants reached the conclusion that the concept of personal communication is too vague and too general to represent a function, indicating in priority information, entertainment and advertising: “These three functions are really the core of mobile communication. Personal communication can be considered as the general method of communication, because the mobile phone is so personal..., so you can say that any mobile communication in which you participate represents a form of personal communication” [D.J., 25 years, male].

Many participants indicated however, that at the level of mobile messages, it is often difficult to identify only one of these three classical communication functions, the tendency being to create communication with a hybrid functionality (Alcatel 2002; Apostolou 2007; Westerink et al. 2000): advertainment (advertising + entertainment), infotainment (information + entertainment), and infortising (information + advertising). The main reason for the use of these hybrid functionalities is their increased efficiency at communication level: “Pure advertising is often not attractive enough on the mobile phone, because the user is immersed in other various activities, so to increase motivation it has to include a high dose of entertainment” [M.B., 34 years, male].

Among these three hybrid forms, infortising was not yet defined by the academic or practical literature. However, the participants outlined the necessity of the concept, and their preference for infortising messages in commercial mobile communication: “Infortising represents an advert that is mainly informing you about a specific product or service instead of attempting to persuade you using humour, sex or subliminal images. Personally I would like to have more of these, especially on the mobile phone, since I do not have the time to watch an advert which does not tell me something clear about the product, its benefits or its location.” [L.D., 35 years, female].

Ultimately the main problem in using these communication functions for marketing is the lack of interactivity and consumer control: “They [the marketers] are still using the old advertising techniques, forgetting the characteristics of the new technology. A message is designed and sent to several thousand people without attempting any real targeting or interaction ... Because of this the success is so low: you receive a message that you don’t want, about the wrong product, at the wrong moment ... They should use some filters defined by consumers; for example, sometimes I’m in the mood to watch advertainment application, like playing and advergaming or something, yet other times I’m more in the infortising mood, looking for factual, precise information.” [B.S., 24 years, male].

Other respondents specifically addressed the problem of permission marketing: “Asking for your permission to send you messages just does not work ..., not in the way they use it. You agree for a type of message and you’re suddenly flooded by useless information sent anywhere, anytime.” [D.J., 25 years, male]. The solution proposed was a customer-controlled system: “It would be ideal to have an application that gives you the possibility to ask for specific messages: you are hungry, you ask for restaurant offers and adverts, you want to see a movie, you get promotional coupons from the nearby cinemas. But it should be ultimately controlled by consumers ...” [M.V., 31 years, male].

The content of commercial mobile communication

The respondents identified three main content categories:

- Customer-centered messages: represents advertising that is highly personalized. To receive this kind of content, customers should usually develop a long-term relationship with a specific brand or company – their repeated interaction provides a wealth of information that can be intelligently used by the firm to customize the offers and the advertising messages.
- Product/service-centered messages: are the classical advertising messages that present more or less directly the characteristics and benefits of a specific product or service. The efficiency of these messages is better when the company is able to segment the market and target potentially interested consumers.
- Location-centered messages: are connected with a specific commercial location visited by the consumer. The use of these messages is made possible by the capacity of modern mobile technology to track the location of the mobile phone user, although this capability can raise personal privacy issues (Xu and Teo 2004). Another commercial application of location-track technologies is Bluetooth marketing (Haase and Martin 2008).

However, the participants indicated that an ideal mobile advertising message should include a combination of these three types of content: “Mobile advertising has the potential to combine customer, product and location-based content for the first time in advertising history. This is because mobile phones are highly personal devices and permit location tracking. If companies can identify the right product, for the right customer at the right location – they really hit the target.” [J.-C.B., 27 years, male]. Other respondents were more skeptical about this possibility: “You should also introduce in the equation the customer attitude or mood ... If I am near a restaurant at lunch time, it does not necessarily mean that I am hungry, so if I receive an advert from that restaurant it can really annoy me.” [F.J., 38 years, female].

Many people considered an increase of customer control and interactivity as a possible solution to enhance the effectiveness of mobile advertising: “Let’s say that I am looking for a travel agency ... If I could just open my mobile phone, touch a key and say ‘travel agency, holiday’, and then some sort of intelligent agents recognizes my voice, identifies my location, and sends me on my mobile phone screen a map or a list of the closest travel agencies, with specific promotional offers – this is what I would call a good commercial communication.” [P.M., 28 years, male].

V. Conclusions

This study attempted to investigate the mobile phone users’ perceptions regarding the existing practices of wireless advertising. Its importance stems from the danger of taking for granted the traditional forms of advertising and applying them automatically to new media channels, without any functional or content adaptations. The negative effects of this superficial application of advertising principles was repeatedly emphasized by the respondents: “You have the impression that very few people really think about how to communicate with you. They think that sending a

commercial offer to anybody is called marketing, but for me this is just a waste of time and money” [L.D. 35 years, female].

The findings demonstrate the necessity of a qualitative approach in investigating mobile communication principles and application. Although previous studies have identified important variables that determine the attitude of mobile phone users’ towards wireless advertising, there is still a lack of understanding of the specific needs and reactions of consumers to mobile commercial messages in real-life situations. The participants demonstrated an active attitude regarding mobile advertising, which they think it has the potential to revolutionize the practice of commercial communication, by focusing more on consumer’s personal needs and circumstances. However, this cannot be realized without increasing the interactive control of mobile phone users’ over the functionality and content advertising messages. Although the required technology already exists, it seems necessary to create new applications that can combine the advantages of customer-, product- and location- centered communication.

This study has a number of limitations determined by the choice and application of a specific research methodology. The findings are purely qualitative in nature, and the number of participants to the focus groups was relatively small to permit a valid generalization of findings, at national or international level. Future studies should attempt to develop this qualitative investigation and define the bases for a value co-creation strategy in which consumers are directly involved in the process of mobile communication development and application.

THE IMAGE OF INVESTMENT AND FINANCIAL SERVICES COMPANIES IN WWW LANDSCAPE (WORLD WIDE WEB)

Iancu Ioana Ancuta

Babes-Bolyai University, Cluj-Napoca, Faculty of Economic Sciences and Business Administration

In a world where the internet and its image are becoming more and more important, this study is about the importance of Investment and Financial Services Companies web sites. Market competition, creates the need of studies, focused on assessing and analyzing the websites of companies who are active in this sector.

Our study wants to respond at several questions related to Romanian Investment and Financial Services Companies web sites through four dimensions: content, layout, handling and interactivity. Which web sites are best and from what point of view? Where should financial services companies direct their investments to differentiate themselves and their sites? In fact we want to rank the 58 Investment and Financial Services Companies web sites based on 127 criteria.

There are numerous methods for evaluating web pages. The evaluation methods are similar from the structural point of view and the most popular are: Serqual, Sitequal, Webqual / Equal EtailQ, Ewam, e-Serqual, WebQEM (Badulescu, 2008:58).

In the paper: "Assessment of Romanian Banks E-Image: A Marketing Perspective" (Catana, Catana and Constantinescu, 2006: 4) the authors point out that there are at least four complex variables: accessibility, functionality, performance and usability. Each of these can be decomposed into simple ones. We used the same method, and we examined from the utility point of view, 58 web sites of Investment and Financial Services Companies based on 127 criteria following a procedure developed by Institut fur ProfNet Internet Marketing, Munster (Germany). The data collection period was 1-30 September 2010.

The results show that there are very large differences between corporate sites; their creators are concentrating on the information required by law and aesthetics, neglecting other aspects as communication and online service.

In the future we want to extend this study at international level, by applying the same methods of research in 5 countries from European Union: Germany, France, Britain, Italy and Spain.

Keywords: Financial Companies websites, Content, Layout, Handling and Interactivity of Websites.

JEL classification: G29

Introduction

Increasing use of Internet in Romania from 23.9% in 2007 to 35.5% in 2010 according to Internet World Stats, and market competition between Intermediaries of Investments and Financial Companies, creates the need of studies focused on assessing and analyzing the websites of companies which are active in this sector. Due to the relatively low cost and power of information and communication technologies, companies are using web pages to improve their image or to gain competitive advantages (Bonson and Escobar, 2002:2).

We emphasize that the Companies of Investments and Financial Services and investors are both winners in this competition between intermediaries. The investors have become more demanding, knowing what can be provided to them, have higher expectations and want personalized service (Maver, 2002: 5)

We study four dimensions of every web page: content, interactivity, handling and layout. Everyone has received a number of points so that a page full score is 91.5. The most important part of the test was content with 33.5 points, the rest scoring: 18 points for interactivity, 17 points for handling and 23 points for layout.

The paper will be a chapter of the dissertation: "MARKETING IN THE FINANCIAL SERVICES AND INVESTMENT COMPANIES. An empirical study". In the future we want an expansion of the international study, by applying the same methods of research. Finally, we will make a comparison between web pages from at least five other EU countries (Germany, France, Britain, Italy and Spain).

Methods for evaluating Web pages

In the literature there are numerous methods for evaluating web pages. As examples we mention the paper "Assessment of Romanian Banks E-Image: A Marketing Perspective" (Catana, Catana and Constantinescu, 2006: 4) in which the authors point out that there are at least four complex variables: *accessibility, functionality, performance and usability*. Each of these can be decomposed into simple ones. However there are differences from author to author.

In the book "Evaluation methods of on-line quality services" (Badulescu, 2008:58) the author discusses methods of assessing and measuring quality of the sites which are divided into two major categories: *methods developed from a behavioral perspective and methods developed from an attitudinal perspective*. The same paper says that the evaluation methods are similar from the structural point of view and the most popular are: Servqual, Sitequal, Webqual / Equal EtaiQ, Ewam, e-Servqual, WebQEM (Badulescu, 2008:58).

Enrique Bonson, Tomas Escobar and Virginia Cortijo - Gallego (Bonson, Escobar and Gallego, 2008: 33) describe how to measure the quality of a website from three points of view: *content* – where the amount of information the user finds is analyzed, *presentation* - the way the site appears and *browsing* – the ease the information is accessed.

To make transactions online, the Intermediaries must prove the existence of three components: *strategic flexibility, the ability to be reliable and information technology* (Saini and Johnson, 2005:360). Companies in this field face a tough competition when it comes to service delivery, and therefore they must learn to combine the complex, customized, dynamic stock market data (Poepsel, 2010). Trading online is extremely important in Companies of Investments and Financial Services and must be approached as an integral part of it. From the collected data we observe that 26 companies are able to trade online, but a quarter of trades on the Bucharest Stock Exchange are online (ZF, 2010)

Molich and Nielsen (Molich and Nielsen, 1990:249) describe four ways to evaluate a web page: *formally* - with specific techniques, automatically by a computerized procedure, *empirically* and *heuristically*. Further, the authors developed a list of principles, called heuristic principles: the dialog must be simple and natural, the language must be usual, a site must be consistent, must provide answers and feedback, have clearly marked exits, shortcuts and good error messages. The main benefit of this method of assessment would be that it is cheap, intuitive and requires no advance planning. Specifically, on evaluation of Investment Financial Services Companies web pages, we find few references. A notable one would be the article of Matthew Poepsel (Poepsel, 2010) which describes the challenges that such a company would have to overcome in order to optimize the performance of web pages. The author describes three challenges: **greater web complexity, unrelenting customer expectations and expanding diversity in customer access.**

Research methodology and data collection

This study attempts to examine from the utility point of view, Investments and Financial Services Companies web sites, following a procedure developed by Institut fur ProfNet Internet Marketing, Munster (Germany).

In Romania there are 58 Companies of Investments and Financial Services according to Bucharest Stock Exchange. All, with the exception of seven, have websites, and each web page was analyzed according to 125 criteria.

The four dimensions of the test: content, interactivity, handling and layout have been awarded points so that a page is full scoring 91.5 points. The most important part of the test was content with 33.5 points, and the rest: 18 points for interactivity, 17 points for handling and 23 points for layout.

The dates were collected by two evaluators in September 2010. The names of all Companies of Investments and Financial Services were acquired from the official website of BSE.

It is important to note that there are at least two companies (BT Capital Securities and Target Capital) which provide much more information, but only once the user passes the login. Some of the most important criteria are found in Table 1.

Table 1. Criteria of evaluating websites

Content	Interactivity	Handling	Layout
Slogan	Contact - E-Mail- Browser window	Top search engine position	Use of Graphics
Privacy Statement	Contact - E-Mail Form	Company Domain	Use of Image Map
Address	Online Activities	Search - Index	Use of Live stream
History	Market Research	Using of https	Use of Text
Business hours	Online tour	Navigation path	Use of Video
List of Phone Numbers	Chat	Jump to the Homepage	Textual Layout
Names of CEO, Board.	Forum	Jump Backward	Aesthetic Layout
Job Offers	Guestbook	Pages "not found/ under construction"	Use of Audio
Glossary	Call-Back-Service	Help Function	Use of Photos
Press Releases	SMS-Letter	Way Description - Branches	Use of 3D-animation
FAQ	Send it to a friend		
Exchange rates	Quality of Interactivity		

Results and discussions

The criteria on which all companies had the maximum score is "Top search engine position". This notes whether the company site appears on the first page of the national search engine motor (e.g.: Google.ro). Another observation is that all companies had high scores to the information required by law through Regulation 3 from 2002 from official site of National Securities Commission regarding advertising: - Addresses of the registered office and secondary offices (96.08% of companies with web sites)

- Identification attributes such as telephone, fax or e-mail (96.08% of companies with web sites)
- The names of Board and Executive Manager Members (92.20% of companies with Web sites),
- Name of shareholders (92.20% of companies with Web sites)
- Description of services (96.08% of companies with Web sites)

- At least the last annual balance (74.50% of companies with Web sites).

Looking at the data collected we can make a top of the most complex web pages. The first place is taken by Intercapital Invest with 58 point from 91.5 possible, followed by KD Capital Management, KBC Securities Romania SSIF (both 51 points), Estinvest and Tradeville (50 points).

Content

Websites cannot - and neither would it be wise to - include all possible content of attributes. Each company must select only the major components (Debreceeny, Gray and Mock, 2001:4).

However, the websites of Financial Intermediaries in Romania have many of the assessments, scored with 0 points. For example, none of the companies surveyed have a “children’s corner”, a page with answers to press or cannot save “screensavers” or images.

Many web sites of American financial companies like Broadway Federal Bank or Florence State Bank have “kid’s corner” with the aim of teaching financial responsibility from earliest ages.

Few points are accumulated on criteria as: photographs of the company, working hours, photos of the Board members, interactive games and campaigns waged by the Company.

Websites from this field must provide complete information so investors can make decisions in their interests (Singer and Cacia, 2009:11).

Top of the best websites in terms of content are: SSIF Broker and KD Capital Management (26 points), Intercapital Invest (24 points) Target Capital and KBC Securities Romania SSIF (23 points from 33.5 points possible).

Handling

In terms of handling, things are better. Out of 51 companies that have web pages, the author could open without problems 48. There are small problems here too: many companies do not have thumbnails or a previous page button.

The winners in handling field are: Fairwind Securities, IFB Invest and Tradeville with 13 points each, Alpha Finance Romania, KBC Securities Romania SSIF and KD Capital Management with 12 points each (23 being the higher score for this feature).

Interactivity

We discover that interactivity is the most neglected by the creators of Investments and Financial Services Companies web sites. There are nine criteria out of a total of 24 (e.g. callback service, e-card, chat, forum, guest book, available online company brochure) that didn’t obtain any points in the analysis of assessors. This proves the lack of interest in creating a link with investors.

Some readers may be interested in how the company is engaged in social activities or how working in such a company is like. The fact that there are no Financial and Investment Services Companies able to offer callback service or financial news via SMS makes them seem obsolete.

There is more than one study which demonstrates their usefulness (Balasubraman, Peterson and Jarvenpaa, 2002:350). The Investments and Financial Services Companies, which were the best at interactivity, are: Intercapital Invest (8 points), Raiffeisen Capital & Investment, Estinvest, Tradeville (6 points, 18 being the higher score)

Layout

Unfortunately, layout is not very well represented in the companies' websites. Criteria like the text version of pages, live broadcast cameras, or use of Web phone are completely neglected.

Indeed, we can argue that excessive use of graphics can have the adversely result. An undesirable aspect of a web page full with images may cause disorientation because the user may be lost in a forest of links and images.

The best web sites in terms of layout scored 14 points, 23 being the higher score. Forward we can make a top: Romcapital and Intercapital Invest (14 points), Interfinbrok Corporation, Interdealer Capital Invest, IFB Finwest, Alpha Finance Romania and Estinvest (13 points)

Conclusions

This paper has followed the classification of the 58 Companies Financial Services and Investment in four ways: content, navigability, layout and interaction, using a procedure developed by Institut fuer ProfNet Internet Marketing, Munster (Germany).

Conclusions are not encouraging. The company that is on the first place, in terms of complexity is Intercapital Invest with a score of 58 points, from 91.5 possible.

One way to be truly competitive and to attract investors, both Romanian and foreign, Financial and Investment Services Companies should improve their web pages in terms of content and interactivity.

Future research

A future research could show the position of Romanian web sites compared to those from Germany, France, Great Britain, Spain and Italy. The final study could show the weaknesses and strengths of companies in Romania.

PRODUCT PORTFOLIO ANALYSIS - ARTHUR D. LITTLE MATRIX

Ionescu Florin Tudor

Bucharest Academy of Economic Studies, Marketing Faculty

Curmei Cătălin Valeriu

Bucharest Academy of Economic Studies, Marketing Faculty

In recent decades we have witnessed an unseen dynamism among companies, which is explained by their desire to engage in more activities that provide a high level of development and diversification. Thus, as companies are diversifying more and more, their managers confront a number of challenges arising from the management of resources for the product portfolio and the low level of resources with which companies can identify, at a time. Responding to these challenges, over time were developed a series of analytical product portfolio methods through which managers can balance the sources of cash flows from the multiple products and also can identify the place and role of products, in strategic terms, within the product portfolio. In order to identify these methods the authors of the present paper have conducted a desk research in order to analyze the strategic marketing and management literature of the last 2 decades. Widely were studied a series of methods that are presented in the marketing and management literature as the main instruments used within the product portfolio strategic planning process. Among these methods we focused on the Arthur D. Little matrix. Thus the present paper has the purpose to outline the characteristics and strategic implications of the ADL matrix within a company's product portfolio. After conducting this analysis we have found that restricting the product portfolio analysis to the A.D.L. matrix is not a very wise decision. The A.D.L. matrix among with other marketing tools of product portfolio analysis have some advantages and disadvantages and is trying to provide, at a time, a specific diagnosis of a company's product portfolio. Therefore, the recommendation for the Romanian managers consists in a combined use of a wide range of tools and techniques for product portfolio analysis. This leads to a better understanding of the whole mix of product markets, included in portfolio analysis, the strategic position held by each product within a market, the performance potential of product portfolio and the financial aspects related to the resource allocation process for the products within the portfolio. It should also be noted that the tools and techniques specific to product portfolio analysis do not give accurate answers, despite the appearances created by the analysis stage, where the products are plotted rigorously. However, their main virtue is simplicity, as these highlight the managers' need for further investigations.

Keywords: product portfolio, ADL matrix, life cycle, competitive position, strategic analysis

JEL classification: M31

Introduction

A fundamental question that managers must answer each time is: In what direction must the company go? The strategy implemented by a company must be elaborated so that it considers all market opportunities and neutralizes current threats or foreseen threats. At the same time the company must value its strong points, by referring to the competition (Căescu 2011:98). On the basis of these features specific to an ideal strategy and by considering current options that companies may resort to, one may assert that the salient features of the strategy selection process are its difficulty and complexity. Over time, a series of methods have been created with a view to support the strategy assessment and selection process. Of these, the methods corresponding to product portfolio analysis stands out.

Product portfolio analysis is an analytical approach, whereby a company manager can view the company as a sum of products that must be managed in a profitable manner. However, taking into account the specific characteristics of the marketplace, the competitive advantage and the resource allocation process, it can be pointed out the fact that the product portfolio analysis gives the manager an opportunity to address his company from a different perspective and to provide in the future, more attention to all actions to be undertaken. This product portfolio analysis must become routine activity undertaken by the company, through its carrying out on a regular basis, so that decisions of earmarking of financial resources may be monitored, updated and modified with a view to accomplishing corporate objectives, correlated to the process of generation thereof carried out in an efficient way by each product (Armstrong and Brodie 1994:2).

The basic decisions, that involve the earmarking of corporate resources together with the general approach, by means of which a product will be managed, does not complete the strategic analysis process and the selection of the viable strategic alternative. Consequently, for each product must be examined and selected a certain type of strategy that in the end should lead to the meeting of long-term strategic objectives (Wensley 1994:86).

Within the list of significant contributions to the product portfolio analysis domain, must be disclosed the one made by Arthur D. Little consulting company. This consulting company was founded in 1886 by Arthur D. Little, a 23 year old student from Massachusetts Institute of Technology (MIT), who was trying to help paper factories from New England in order to find new chemicals substances for the paper processing. One of his first major consultancy projects was the establishment of an advisory research and development department within the General Motors Company. By the early '70s, MIT was the main shareholder. Then Arthur D. Little has quickly become a public company before being bought by its own employees. The Arthur D. Little consulting company, which has research facilities in Cambridge – USA and in Cambridge - UK, has acquired in the market, some prestige in the '70s by developing a strategic analysis model. Thus the ADL consultants wanted to improve the analytical product portfolio models, by taking into consideration the analysis of product life cycle and a more analytical approach of competitive position.

This model of strategic analysis of the product portfolio is called ADL (abbreviation for Arthur D. Little) and is structured like a matrix with five rows and four columns (5 x 4) resulting from combining two performance indicators: industry life-cycle stage and market competitive position (Florescu and Mălcomete and Pop 2003:473).

With reference to the specific market characteristics, the present method, which considers the life cycle stage of a product, points out that a market, in a certain period of time, may be in one of the following four stages: introduction, growth, maturity and decline. Each specific stage within the product life cycle can be identified, assessed, quantified and characterized by a system of indicators.

The performance indicator represented by market competitive position is valued by reference to competition, using qualitative and quantitative variables, which make up a set of determinants factors of success.

Thus, in comparison with other methods of analyzing the product portfolio, Arthur D. Little model focuses on factors that must be taken into account in order to assess the competitive position held by a company that operates in a given market. The following list is not exhaustive and may be supplemented with other factors (Florescu and Mălcomete and Pop 2003:474):

- **supply factors:** long-term contracts, labor costs and payment terms;
- **production factors:** production flexibility and capacity, experience, technical skills, environmental protection, quality of management, skill or expertise, labor productivity and production cost;

- **commercialization factors:** the power and quality of distribution network, credit conditions, the image of the product, product range, market share, sales force and price;

- **financial factors:** profitability, financial stability, cash flow and technological protection;

Further, based on these factors and using a method of weighting and scoring, competitive position can record several states, according to company forces in relation to competitors on a given market. (Popa 2004:155). In other words Arthur D. Little matrix argues that as these factors change over time, the products gain or lose ground in terms of competitive advantage, and eventually they will identify with one of the following five potential competitive positions:

- **Dominant** - this position is very rare and most often is due to the posture of a monopoly company or market dominance exerted strong, from a technological point of view. The implications of this position mean that the company is able to influence the behavior of other organizations and has a wide range of strategic options.

- **Strong** - the company has a high level of freedom in terms of strategic options and can act without its market position to be threatened by competitors.

- **Favorable** - this position is found in fragmented markets, where no competitor has a very clear market position and the most important companies have a high degree of freedom. The companies with a favorable market position often possess strengths that can be exploited through specific strategies and are facing opportunities that may generate market share growth.

- **Tenable** - companies within this category are generally vulnerable to fierce competition exerted by organizations with proactive and strong market positions. However, they survive and are able to justify their existence on the market. Also in this category are limited opportunities for an organization that wants to strengthen its market position. Thus, the profitability for a company with a good position is best achieved and supported through specialization.

- **Poor** - the company performance is generally unsatisfactory, even if market opportunities exist, through which it can be improved. However, often, the company is too big and inefficient in terms of competitiveness or is either too small to cope with competitive pressure. As such, if a company sees no action to change the future is likely to be removed from the market or even to voluntarily leave the market.

In the marketing literature some authors consider that the list, which identifies and characterizes the competitive positions of a specific product, it may also be considered a sixth position, which is suggestively called "**Unsustainable**" or "**Very Poor**". A product is located in this position when performance is unsatisfactory and there are very few market opportunities that can improve the situation. In conclusion, in an unfavorable conjuncture it is recommended an immediate withdrawal from the market, with less expensive costs.

Another basic attribute that made the ADL model to assert in strategic consulting and distinguish itself from all other methods of evaluation of the product portfolio is that it establishes a close relationship between the company's competitive position and profitability levels, within different phases of the product life cycle, on a given market.

Thus it can be said that the profitability raises and the risk of change of competitive position diminishes as it tends to a dominant position and financial needs and risk of unplanned changes decline as it records an evolution within the market life cycle. **Table nr.1** summarizes the profitability, the risk and the financial needs of products according to the competitive position and market life cycle stage.

Strategic implications

Following the establishment of product position within the Arthur D. Little matrix, we can move to the next phase of identification and selection of strategic steps.

At corporate level, the resources are normally allocated to products, based on the degree of their competitiveness.

Thus products are classified based on criteria such as: desirability of reaching the maturity stage, strength of competitive position, ability to generate positive cash flows on long term and short-term, the level of risk and the return on investment. This classification provides to higher-level management the skills to decide which products from the product portfolio will receive financial resources and which will not.

Table nr. 1 – The profitability, the risk and the needs of financial flux depending on the competitive position and industry life cycle stage

Market life cycle stage	Introduction	Growth	Maturity	Decline
Competitive position				
Dominant	<ul style="list-style-type: none"> • Good profitability • Cash flow = 0 • High investments 		<ul style="list-style-type: none"> • Good profitability • Cash flow = + + • Low investments 	
Strong	<ul style="list-style-type: none"> • Medium risk • High investments 		<ul style="list-style-type: none"> • Low risk • Low investments 	
Favorable	<ul style="list-style-type: none"> • High cash flow needs • Medium profitability 		<ul style="list-style-type: none"> • Low cash flow needs • Medium profitability 	
Tenable	<ul style="list-style-type: none"> • Cash flow = - - - • High risk • Low profitability 		<ul style="list-style-type: none"> • Cash flow = 0 • Medium risk • Low profitability 	
Weak	<ul style="list-style-type: none"> • Low profitability 		<ul style="list-style-type: none"> • Low profitability 	

Source: Bărbulescu, Constantin. “Sistemele Strategice ale Întreprinderii”, București: Editura Economică, 1999, p.140.

As such, the combination of the two performance indicators of the present matrix, represented by the competitive position and industry life cycle stage, contribute on the one hand to the diagnosis of products included in the product portfolio and on the other hand to the identification and evaluation of strategic options. **Table nr.2** shows the specific strategic options corresponding to the 20 quadrants of the ADL matrix. The ADL matrix speculate the idea that when it comes to choosing and implementing a strategy, a company will select, in most cases, one or more options from the following list, which presents a set of general strategies (Wind and Mahajan and Swire 1983:59):

- investing in order to maintain or even improve their competitive position in the marketplace;
- spending in order to maintain the status quo;
- harvesting;
- exiting the market;

However, the ADL consulting company highlights a number of guiding principles that should be considered in the selection of strategic options, of which the most important points out that the selection of a strategy should be based on actual situation of products and not on the facts and the subjectivity of managers. Thus the ADL matrix advocates realism in the strategic planning process. In conclusion we can say that the ADL matrix facilitates the choosing of a marketing strategy, but it is insufficient to define a global strategy (Florescu și Mălcomete și Pop 2003:474).

The advantages and disadvantages of the ADL matrix

Unlike other models of product portfolio analysis the ADL matrix is based on an enhanced applicability because it fits to all situations of competition encountered in a marketplace.

Also the ADL matrix can be applied to the fragmented industries, holding a small competitive advantage but with a large number of ways of obtaining it (provides multiple ways of differentiation). As such we can say that the ADL matrix has a high degree of adaptability to situations of a qualitative nature.

A first disadvantage is that the matrix does not take into account a number of phenomena that can generate long-term involution in the products life cycle of a company. Another weakness is related to the high level of difficulty in terms of objective evaluation of the ADL model variables. This is often the case for the competitive position indicator. In other words, the difficulty lies in the fact that some factors are qualitative in nature and there is a high risk of bias in their use.

In conclusion, we can say that the ADL matrix provides clearer results as a company is more diversified and enable synchronization on decisions relating to competition.

Table nr.2 - A.D.L. Matrix Strategies

		INDUSTRY LIFE CYCLE STAGE			
		INTRODUCTION	GROWTH	MATURITY	DECLINE
COMPETITIVE POSITION	DOMINANT	- Rapid development - Act offensive	- Rapid development - Defend position - Act offensive - Cost leadership	- Defend position - Act offensive	- Defend position - Focus - Consider retreat
	STRONG	- Rapid development - Differentiation	- Cut costs - Differentiation - Attack small competitors	- Cut costs - Differentiation - Focus	- Harvest
	FAVORABLE	- Rapid development - Differentiation	- Cut costs - Differentiation - Attack small competitors	- Focus - Differentiation - Attack small competitors	- Harvest
	TENABLE	- Market development - Focus	- Maintain or retreat - Identify a niche - Aim growth	- Maintain or retreat - Identify a niche	- Retreat
	WEAK	- Identify a niche - Follow the competitors	- Identify a niche - Retreat	- Retreat	- Retreat

Source: Wilson, Richard M.S and Gilligan, Colin. “*Strategic Marketing Management – Planning, Implementation and Control*”, 3rd Edition, Elsevier Butterworth-Heinemann, 2005, p. 378

Conclusions

The product portfolio strategic planning offers three potential benefits for a company. The first is that it encourages the promotion of competitive analysis among the products, through comparative assessments, resulting in a number of sustainable strategies.

The second benefit claims selective allocation of financial resources by identifying issues of a strategic nature and by adopting a standardized and unbiased process of negotiating. Thus, the mix of forces within the company will be better focused.

The third benefit derives from the experts' points of view who argue that this way of approaching the product portfolio, which focuses on a number of tools and techniques, helps the company to reduce risk, to increase the concentration and also the involvement, regarding the identification and implementation of the strategies.

Correlated with visual approach, which is based on a series of graphics, the company's product portfolio analysis is strengthened by the comparative analysis process of the market shares, market growth rates, market attractiveness, competitive position and the market life cycle, specific to each product.

According to the information mentioned above, it must be highlighted that limiting the product portfolio analysis to the A.D.L. matrix is not a very wise decision. The A.D.L. matrix with other marketing tools of product portfolio analysis has some advantages and disadvantages and is trying to provide, at a time, a specific diagnosis of a company product portfolio.

The tools and techniques of product portfolio analysis facilitate discussion and shape the competitive position of a company, generating at the same time questions related to the contribution of the current allocation of resources to the success and long-term vitality. Since resources are limited, the managers must carefully manage these strategic decisions in terms of effort invested in each market and the expected profit level for each case (Căescu 2011:101). However, besides the fact that these tools and techniques help managers to control the allocation of resources and to suggest realistic goals for each product, they also offer the possibility of using the products, as vital resources within the process of fulfilling the objectives established at corporate level. Therefore, the recommendation for the Romanian managers consists in a combined use of a wide range of tools and techniques for product portfolio analysis. This leads to a better understanding of: the whole mix of product markets, included in portfolio analysis, the strategic position held by each product within a market, the performance potential of product portfolio and the financial aspects related to the resources allocation process for the products within the portfolio. It should also be noted that the tools and techniques specific to product portfolio analysis do not give accurate answers, despite the appearances created by the analysis stage, where the products are plotted rigorously. However, their main virtue is simplicity, as these highlight the managers' need for further investigations.

CONSUMER BEHAVIOR ON THE FRUITS AND VEGETABLES MARKET

Istudor Nicolae

Academy of Economic Studies, Bucharest, Romania, Faculty for Agrifood and Environment Economics

Pelau Corina

Academy of Economic Studies, Bucharest, Romania, Faculty for Business Administration, in foreign languages

In the past years the intensification of competition has changed the way in which companies communicate with their customers. The main challenge doesn't represent anymore to create good products but also to be able to sell them. The best marketing strategy of a company can be best developed if the needs and the behavior of the consumer are known. In this paper there are analyzed the results of a research about the behavior of consumer towards fruits and vegetables. The research was done in the period December 2010 – February 2011 on 146 respondents regarding the buying behavior of consumers at retailers. The focus in the research is put on the cognitive and emotional reactions consumers have when they make the buying decision and consisted out of an observation and a survey. In this article there are presented both aspects regarding the observed behavior towards fruits and vegetables and the motives which led to this behavior. Depending on these results, there are presented the implications of this behavior on the marketing strategy of a company.

Key Words: consumer behavior, emotional and cognitive reactions, fruits and vegetables market

1. Introduction

Because of the intensification of competition on markets, one of the biggest challenges of companies nowadays is to convince the consumers to buy their products. Especially on a market such as the fruits and vegetables market with easy perishable products a company should know what type of instruments it should apply in order to convince the consumer to buy the products in the right time, before their natural deterioration. For this reason it is important to analyze the behavior of the consumers and their motives to buy these products, in order to be able to influence their decision and implement efficient marketing instruments.

In this article there are presented the results of a research regarding the behavior of consumers towards fruits and vegetables. There is analyzed the type of behavior the consumers have towards fruits and vegetables as for instance a habitualized behavior, analytical behavior or an impulsive behavior. Besides this there are analyzed the motives which the consumer has in order to buy the products and the elements which influence the buying decision.

2. The particularities of the fruits and vegetables market

The market for fruits and vegetables is a market with many particularities because of the fact that the products are easy perishable and because they represent an important nutritional component for the consumers. Because of these aspects, the market for fruits and vegetables has a lot of challenges from its production process until the distribution to the final consumers.

The challenge in the production process of the fruits and vegetables represents the quality of the products. According to Boboc, there are two aspects of quality. On one hand the quality of fruits and vegetables regarding their content, especially the elimination of undesired substances such as chemicals, bacteria and other substances used during the production process (Boboc, pg. 4). Another aspect which should be taken in consideration is the pollution from the external environment such as the soil, air or even rain which is difficult to influence. On the other hand,

from the point of view of the consumer, the quality of the product represents the subjective opinion on taste or even on aspect. In order to assure the quality of the agri-food products, there have been developed a series of reglementations both at the level of the European Union and on a national level. All these reglementations should assure the safety and the quality of fruits and vegetables and they should be taken in consideration by the companies which work in this field. From a point of view of the logistics of a company or a farmer for fruits and vegetables, the big challenge represents to bring the easy perishable products in the right time to the consumer, without damaging the quality of the products. On one hand these companies have to have well developed logistics systems in order to assure the transportation of the products in good conditions. On the other hand they have to assure the adequate storage conditions in order to keep the quality of the products, because of the fact that the quality of fruits and vegetables, as for any other natural product, deteriorates in time. The last provocation of the companies is to convince the customers to buy and consume the products in the right time before their natural deterioration. For this reason they have to develop a good sales plan and to find the right marketing instruments in order to convince the consumers to buy the products.

3. The behavior of the Romanian consumers regarding fruits and vegetables

In order to determine the behavior of the consumer regarding fruits and vegetables, an experiment was done. The objective of the experiment was to analyze and explore the cognitive and emotional reactions in the buying behavior and to determine their rationality from the point of view of the consumer. It consisted out of three parts. The initial part questioned the respondents on their initial purpose and desires of the buying process such as the products he wanted to buy, the amount of money, he wanted to spend and so on. The second part consisted out of an observation regarding the buying behavior. There were analyzed the reactions in the buying process for several product groups. The third part included a survey, which should explain the aspects observed in the previous part, regarding the motives of buying the products. In this article there are presented only the results regarding the cognitive and emotional reactions towards fruits and vegetables.

The marketing-experiment was conducted in the period December 2010 – February 2011 in different retail formats in the main cities of Romania. There were observed 146 persons, which were chosen randomly by the interviewer. The only aspect which was considered in the marketing-experiment was that the number of female respondents should be equal to the number of male respondents. This condition was put, because previous researches and studies have shown that the buying behavior of women and men differs.

In this article there are presented the results of the research which analyze the behavior of the consumer regarding fruits and vegetables. There are presented both the results of the observation regarding the buying decision of the consumer in the case of fruits and vegetables and the motives which the consumer have in order to buy this type of products. In this article there are analyzed both results, because the observation shows an external point of view regarding the behavior of the consumer, while the results of the survey show the motives which the consumer have in order to buy the products. In fig. 1 there can be observed the results of the observation regarding the behavior of the consumer regarding fruits and vegetables.

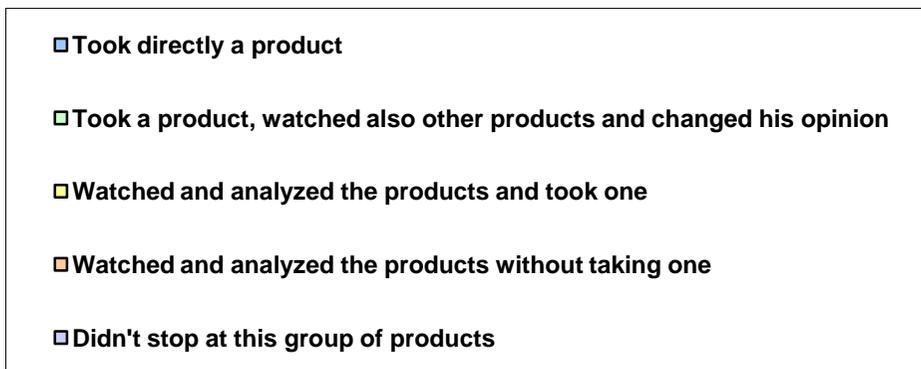

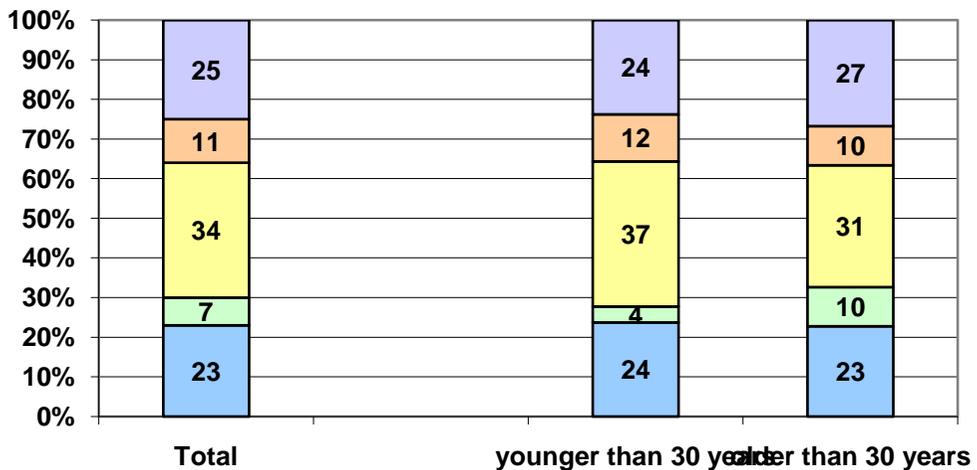

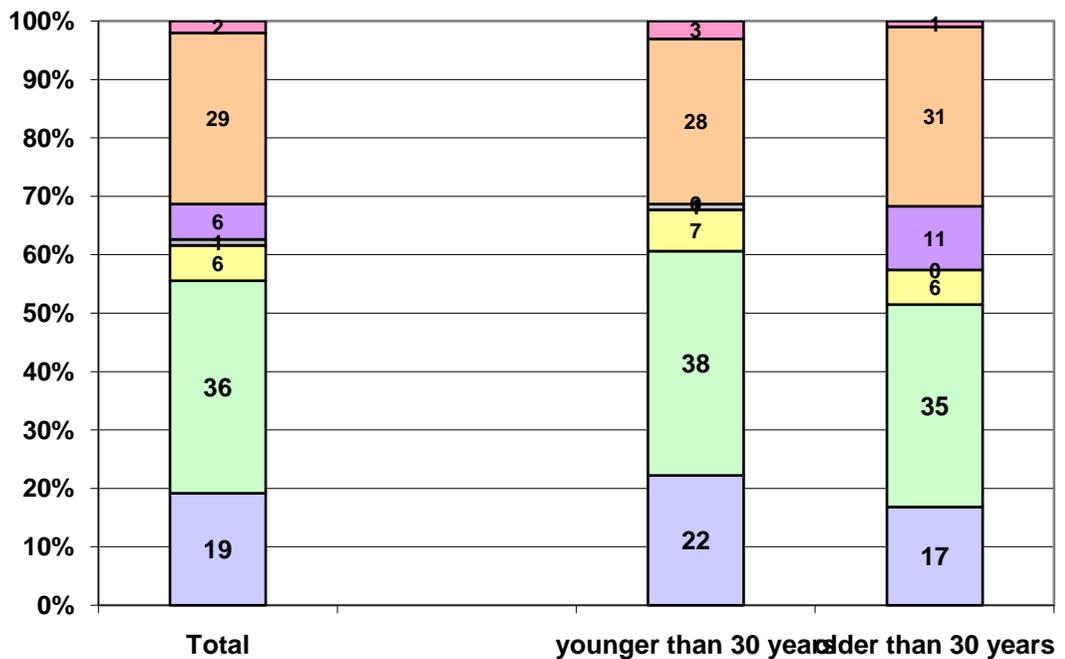

Fig. 1. Results of the observation regarding the buying behavior of fruits and vegetables

As it can be observed in fig. 1, 25% of the respondents didn't stop at this group of products. This percentage is higher for the respondents older than 30 years (27%) than for the people younger than 30 years (24%). 11% of the respondents has analyzed the group of products of fruits and vegetables but didn't buy any. This percentage is higher for the people younger than 30 years than the people older than 30 years. This can be explained by the fact that this group of respondents had the intention to buy the products but it wasn't convinced by the products. 34% of the respondents analyze the products before they buy it. The percentage for this type of behavior is higher for the younger people (37%) than for the older people (31%). 7% of the respondents are not very decided on the products they have bought. This group of respondents has changed their decision during the buying process. This percentage is higher for the elder people (10%), which shows a higher degree of undecided people. 23% of the respondents have a habitualized buying behavior regarding fruits and vegetables. They take directly the products they need, without analyzing too much. In this case there is no much difference between people of different ages.

The results of the observation show that most of the people analyze the fruits and vegetables during the buying process. More than 50% of the respondents analyze the products while buying them. For this reason, in order to sell this type of products, it is important that the products should have a good and appealing aspect. Even though the behavior of the consumer differs, most of the consumers analyze the products while buying them.

In fig. 2. there are analyzed the motives which support the buying behavior observed in fig. 1.

- I always buy the same products because I know they are good
- I analyze every time I go to a store which is the best option
- I always buy the product with the lowest price
- I look for those products which I saw in an advertising or which were recommended by friends and if I don't find them I buy something else
- I buy those products for which there are special offers
- I watch on the shelves and I buy the products I like best
- Even though I didn't intend to buy a product, but I like it, I buy it

Fig. 2. The buying motives of consumers regarding fruits and vegetables

As it can be observed in fig. 2, 19% of the respondents have a habitualized buying behavior regarding fruits and vegetables. They buy most of the time the same products without analyzing too much the products. This percentage is higher for the younger people (22%) than the older people (17%). The fact that people analyze the fruits and vegetables they buy, is also confirmed by their statements. 36% of the respondents say that they analyze the best option every time they have to make a buying decision. This percentage is higher for younger people (38%) than for older people (35%). 6% of the respondents base their buying decision regarding fruits and vegetables on the price. So the analysis is not based on the best products, but on the lowest price. This characteristics is valid both for younger and older people.

The results of the experiment show that the population is not very much influenced by advertising campaigns or friends in their buying decision regarding fruits and vegetables. This shows that the buying decision is taken in the store. The influence is slightly higher for younger people (1%) than for older people (0%). In comparison to that, people older than 30 years are more influenced by special offers in the store than younger people. So 11% of the older people are influenced by special offers, while almost none of the people younger than 30 years are influenced by special offers for the products group fruits and vegetables.

29% of the respondents state that they buy the fruits and vegetables which they like most. Consequently their buying decision is much influenced by the aspect of the products. This type of decision is an analytical one, but it also contains some emotional subjective aspects like the liking of the product. This percentage is higher for older people (31%) than for younger people (28%). 2% of the respondents have a pure emotional-impulsive behavior by buying the fruits and vegetables they like, although they didn't have this intention at the beginning. This percentage is higher for younger people (3%) than for older people (1%).

As a conclusion it can be stated that most of the consumer make their buying decision regarding fruits and vegetables based on an analysis. The results of the survey shows that the analysis is based both on cognitive and emotional elements. Consequently, some of the consumers make their decision based on cognitive elements as for instance the price or the best option. Other consumers make their decision based on emotional factors as for instance the fruits and vegetables they like best. For this reason the producers and the retailers should adjust their marketing strategy in order to convince the consumers to buy the fruits and vegetables. As it can be observed in the research, the consumers are not very much influenced by advertising or other campaigns in the case of fruits and vegetables. In this case the decision is taken in the store, so both the producers and the retailers of fruits and vegetables should take care of the sales instruments they apply in the store. On one hand the aspect of the fruits and vegetables in the store is very important, because many consumers analyze the products and they take the one that they like best. Taken in consideration the fact that fruits and vegetables are easy perishable products the retailers should concentrate their attention on how to keep the products fresh in a natural way, without damaging the quality of the product. On the other hand retailers and producers should adjust their marketing instruments in the store in order to convince the consumer to buy the products. They can adjust the prices for products which are easy perishable in order to optimize the buying process and even to convince the consumers to buy the products

4. Conclusions

The research regarding the consumer behavior shows that most of the consumers have a rather analytical behavior regarding fruits and vegetables. Most of them analyze the product, although the reasons behind the analysis differ. Some of the decisions are based on cognitive aspects such as the best price or the best alternative, while other are based on emotional elements such as the product which is liked best. Based on this behavior a company can adjust their marketing strategy. The results of the research show that the decision of the consumer regarding fruits and vegetables is taken in the store and not previous to the buying decision. For this reason, the focus of the marketing strategy of a company which sells fruits and vegetables should be on instruments at the point of sale. Only by using the instruments at which a company reacts, can increase the success of that company.

LE DYNAMISME DES TPE ET PME ET L'ÉVOLUTION DE L'ÉCONOMIE ROUMAINE

Marie-Noëlle Jubénot

Université de Reims Champagne-Ardenne, France

Marc de la Ville fromoit

Université de Reims Champagne-Ardenne, France

The Entrepreneurship concept has its roots in the mid-1970s, it is getting really important much later in the 1990s (Hernandez, 2010). The entrepreneur is at the heart of regional development as an engine of growth. It concerns the creation of enterprises, but also management, business development and networking. The aim of our research is to characterize the private sector development in Romania since the beginning of the transition to define the role of SMBs in the dynamics of development, identify the current weaknesses of the private sector and propose solutions. For our study, we used several previous studies on the characterization of the Romanian economy since the beginning of the transition. We also used recent data from the Ministry of Economy. We also used the large literature on entrepreneurship and business networks. The characterization of the Romanian economy is obtained by comparison with countries in the area but also some data from highly industrialized countries or countries of the south. Each transition is experiencing its own economic development based on its specific history and choices in terms of economic and social policies. According to our research, the private sector is characterized by an increase in the number of businesses created, but the density of firms per capita is still low compared to other countries in the area. On the other hand, companies are mostly micro (businesses without employees to create their own jobs) or small (less than 9 employees). This demonstrates a real dynamism in business creation. However, the creation of many SMBs may not be an end in itself. Enterprises have to develop in order to face competition and to achieve economies of scale, or they can even join or create their networks.

Key-Word : Micro, small and medium enterprises (MSMEs), transition, clusters

Classification JEL : M20, P20

L'économie de l'entrepreneuriat trouve ses racines dans le milieu des années 1970, mais connaît son essor dans les années 1990. Elle place l'entrepreneur au cœur du développement des territoires comme moteur de la croissance. Elle concerne la création d'entreprises mais aussi le management, le développement des entreprises et les réseaux. L'objectif de notre recherche est de caractériser le développement du secteur privé en Roumanie depuis le début de la transition afin de définir la place des TPE/PME dans la dynamique de développement, de déceler les faiblesses actuelles du secteur privé et de proposer des solutions. Pour notre étude, nous avons utilisé plusieurs travaux antérieurs concernant la caractérisation de la l'économie roumaine depuis le début de la transition. Nous avons aussi utilisé des données récentes provenant du ministère de l'économie. Nous avons également fait appel à la nombreuse littérature concernant l'entrepreneuriat et les réseaux d'entreprises. La caractérisation de l'économie roumaine s'obtient par comparaison avec des pays de la zone mais aussi quelques données provenant de pays très industrialisés ou encore des pays du sud. Chaque pays en transition connaît sa propre évolution économique en fonction de son histoire spécifique et de ses choix en termes de politiques économique et sociale. Selon nos recherches, le secteur privé se caractérise par une augmentation croissante du nombre d'entreprises créées, cependant la densité des entreprises par habitants est encore peu élevée par rapport à d'autres pays de la zone. D'autre part, les entreprises sont pour la

plupart des micros (entreprises sans salariés permettant de créer son propre emploi) ou de petites entreprises (moins de 9 salariés). Ce qui témoigne d'un dynamisme réel dans la création d'entreprise. Cependant, la création de nombreuses TPE/ PME ne peut être une fin en soi. Les entreprises ont vocations à se développer ou à s'associer pour faire face à la concurrence et pour réaliser des économies d'échelle.

Mots-clé : TPE/PME, transition, densité, réseaux

Introduction :

L'objectif de cette article est d'évaluer les forces et les faiblesses du secteur privé roumain. La démarche est la suivante : nous rappellerons dans une première partie les problèmes qui se sont posés pour la Roumanie au début de la période de transition, notamment les types et les causes des retards qui sont apparus par rapport à d'autres pays de la région. Dans une seconde partie, nous traiterons principalement des attentes et des difficultés liées à la privatisation de l'économie roumaine. Puis nous nous attarderons dans une troisième partie sur la structure du secteur privé roumain aujourd'hui. Face aux insuffisances constatées, la constitution de réseaux d'entreprises peut permettre de palier aux insuffisances du secteur privé.

I - Le processus de la transition

Au début de la période de transition la Roumanie a pris un peu de retard dans le processus de libéralisation économique, contrairement à la Hongrie, la Pologne et dans une moindre mesure la Tchécoslovaquie, comme l'indique le tableau suivant :

Tableau 1 : Indices de libéralisation*

	1989	1990	1991	1992	1993	1994	1995	1996	1997	Cumul 89-97	politique de stabilisation
Bulgarie	0,13	0,19	0,62	0,66	0,66	0,64	0,58	0,65	0,79	4,92	01/02/91
Hongrie	0,34	0,57	0,74	0,78	0,82	0,86	0,9	0,9	0,93	6,84	01/03/90
Pologne	0,24	0,68	0,72	0,82	0,82	0,86	0,89	0,89	0,89	6,81	01/01/90
Roumanie	0	0,22	0,36	0,45	0,58	0,68	0,71	0,72	0,75	4,47	01/01/93
Slovaquie	0	0,16	0,79	0,86	0,83	0,83	0,86	0,86	0,86	6,05	01/01/91
Tchéquie	0	0,16	0,79	0,86	0,9	0,90	0,93	0,93	0,93	6,4	01/01/91
Moldavie	0,04	0,04	0,1	0,38	0,51	0,55	0,68	0,75	0,75	3,8	01/09/93

* L'indice de libéralisation compris de 0 à 1 est une moyenne de trois indices séparés : la libéralisation des marchés domestiques (pondération de 0,3) ; la libéralisation du commerce extérieur (0,3) ; la privatisation et la réforme bancaire (0,4). La somme des indices annuels depuis 1989 est un indicateur de l'étendue des réformes.

Slovenia	70 %	« 3 »	« 4+ »	« 4 »	« 4+ »	« 3- »	« 3 »

Source : Transition Report 2010, European Bank for Reconstruction and Development

The transition indicators range from 1 to 4+, with 1 representing little or no change from a rigid centrally planned economy and 4+ representing the standards of an industrialised market economy.

↑ and ↓ arrows indicate a change from the previous year. One arrow indicates a movement of one point (from 4 to 4+, for example). Up arrows indicate upgrades, down arrows indicate downgrades.

Les rapports de 1997 et 2000 de la Commission Européenne soulignaient que le processus de restructuration et de privatisation avaient pris du retard et manquaient de transparence, retardant ainsi l'émergence d'un secteur privé dynamique et compétitif et que les problèmes de la corruption et du marché noir devaient être résolus. Depuis, la Roumanie a développé une politique industrielle considérée conforme aux principes communautaires. La Roumanie a adopté une série d'initiatives en faveur du développement des petites et moyennes entreprises (PME), notamment : la participation au programme pluriannuel pour les entreprises, l'adhésion depuis 2002 à la charte européenne des petites entreprises, l'adoption en 2004 d'une loi sur les incitations à la création et au développement de PME, la simplification et l'amélioration des procédures administratives, la création d'un Fonds de garantie... Néanmoins, cette politique reste contrainte par certaines faiblesses structurelles.

II - Les conditions de la privatisation

Le développement du secteur privé peut se réaliser de deux façons concomitantes : la privatisation des entreprises d'état et la stimulation de l'entrepreneuriat privé. Les grandes entreprises d'État privatisées ont été peu favorables en général à l'instauration des nouvelles règles de marché, à la transformation des structures productives. Elles ont eu plutôt tendance à résister aux modifications et exploiter leurs situations de monopoles. En revanche, la création d'entreprise et l'entrepreneuriat jouent un rôle moteur dans le domaine de l'innovation. Le nombre de création d'entreprises ne cesse de croître en Roumanie depuis le début de la transition, comme indiqué ci-dessous :

Tableau 3 : Evolution des TPE et PME en Roumanie, 1999-2005

Taille des entreprises	1999	2000	2001	2002	2003	2004	2005
Micro	294.597	279.893	280.448	285.207	313.485	358.242	477.969
Petite	25.987	29.417	31.249	32.010	34.883	36.080	39.721
Moyenne	6.102	6.864	7.455	7.989	8.342	8.674	8.576
Total	326.686	316.174	319.152	325.206	356.710	402.996	526.318

Source : Neault (2007)

Cependant, la densité des TPE/PME de 24,3 pour 1000 habitants fin 2005, contre 54 à l'ouest de l'Europe (Neault, 2007), est insuffisante. Or pour Chandan, Mumtaz, et Parkash (2009), la croissance et le développement des PME permettent dans les pays pauvres ou émergents

d'atténuer la pauvreté et la promouvoir les exportations. Les PME auraient joué un rôle crucial dans le développement de pays tels que Taiwan. Dans les pays développés, la promotion des PME serait l'un des moyens de booster l'activité. Certaines études définissent les PME à partir du nombre de salariés, d'autres en fonction de l'ampleur de l'activité. Pour Nuno Castel-Branco (2003), les différences de la structure de la dynamique sociale et économique entre secteurs impliquent des politiques de promotion des PME différenciées. Les politiques pro-PME peuvent viser, entre autres, la mobilisation du secteur informel, la création d'emploi, la meilleure allocation des capitaux nationaux et l'innovation technologique.

III - Dynamisme des TPE/PME en Roumanie

Depuis le début de la transition, l'économie roumaine s'est beaucoup privatisée. Selon la classification d'Eurostat en micro-, petites, moyennes et grandes entreprises en fonction du nombre de salariés, la plupart des entreprises sont des micro-entreprises :

Tableau 5 : STRUCTURE DES ENTREPRISES ACTIVES par taille ET PAR SECTEUR, en 2008

Types d'entreprise :	Micro 0 - 9 salariés	petites 10 - 49 salariés	moyennes 50 - 249 salariés	grandes 250 salariés et plus
Industrie et construction	78,60%	15,70%	4,70%	1,00%
Commerce et autres services	92,30%	6,60%	1,00%	0,10%

Sources : Institut National de Statistica (INSSE), ROMANIA

En France et au Japon, la part des TPE/PME est très élevée, elle est respectivement de 97 % et 99%, mais avec densité d'entreprise beaucoup plus importante. L'auto-emploi, pour faire face au chômage et à la précarité, explique en partie le phénomène de la micro entreprise. Mais, pour Nuno Castel-Branco (2003), la TPE/PME ne peut être une fin en soi. La nature de l'accumulation capitaliste est d'éviter la concurrence grâce à l'accroissement de la taille de l'entreprise au moyen par exemple des fusions et acquisitions, ou de l'extension interne via l'investissement. Mais, une autre stratégie, celle de favoriser les interactions inter-entreprises (M. Perry, 1999) par un développement horizontal (association de petites structures complémentaires) permet de palier à la petite taille des entreprises. Plusieurs types de réseaux d'entreprises : les districts industriels, les milieux innovateurs, les grappes d'entreprises (clusters) ont émergé depuis une vingtaine d'années, avec le modèle des districts italiens.

La Roumanie tente d'intégrer cette dimension. Elle a participé, par exemple, au projet européen OMNI-NET (Opto-Micro-Nano Innovative Network Exploiting Transversality) coordonné par Opticsvalley (le réseau des acteurs de l'optique, de l'électronique et du logiciel en Ile de France) de décembre 2005 à mai 2008, dans le cadre du programme « Europe Innova » de la Commission européenne. L'objectif principal du projet était de favoriser le développement de coopérations entre 6 réseaux européens dans les domaines de l'optique, de la micro-électronique et des nanotechnologies, et de lancer des coopérations technologiques au niveau européen.

La mobilisation des acteurs publics, comme privés, dans la mise en place de réseaux est jugée essentielle afin de donner aux entreprises l'accès à de nouveaux marchés, à des équipements, ressources ou infrastructures, ... Le phénomène cluster est présent dans de nombreux pays occidentaux mais aussi au Sud (Brésil et Inde notamment). Les entreprises ne pourront bien tirer leur épingle du jeu relativement à la mondialisation qu'en se positionnant ainsi au cœur des réseaux, qui sont une source d'innovation.

Conclusion:

Le secteur privé connaît un véritable dynamisme caractérisé par l'évolution positive du nombre de créations d'entreprise ainsi que la mise en place de politiques industrielles favorables aux entreprises. Cependant, la Roumanie souffre encore d'un retard par rapport à d'autres pays en transition de la région, tels que la Hongrie ou la Pologne. Le secteur privé souffre de la très petite taille des entreprises et surtout de la faiblesse de la densité des entreprises par rapport au nombre d'habitants. Outre la poursuite nécessaire des efforts de la Roumanie pour renforcer son secteur productif, le développement de réseaux d'entreprises peut s'avérer être une solution intéressante pour renforcer le dynamisme économique.

E-government represents one of the most palpable results of the dynamic development of the information and communication technology. Defined mostly as an intensive use of information technologies to provide public services, e-government has been approached in the literature rather from a technological perspective, with a significant importance given to the supply and a lower attention paid to the demand side. The increasing interest in taking into consideration the demand side in the development of the e-government initiatives and projects has created the foundation for a shift in the way the conceptual framework for e-government planning and implementation is defined, from the technology infrastructure and costs to the customer-centric character of all the efforts done.

The European Union put e-government on its agenda aiming to improve access to the public information and services, increase transparency of public administration, exploit effectively the information technology within public administration, and establishing e-procurement. The development of the e-government services in the Member States, as it is expressed by the data regarding the supply and demand side, has been conducted in a more or less different manner that led, at the Union's level, to a relatively high availability but a rather low usage of the specific services.

The paper explores the relationship between the e-government supply and demand based on the secondary data referring to the public services available to the citizens (as these are defined by the Eurostat methodology) and the usage of these services by the individuals, integrating them through an analytical matrix inspired by the BCG model. Probably the most important conclusion of this analysis states that development of the e-government services has not been accompanied by measures meant to stimulate their usage in the most of the European Union Member States. The analytical matrix allowed also the identification of the question mark, star, cash cow and dog Member States in terms of the e-government market development.

Keywords: e-government market, demand, supply, European Union

JEL Classification: M31

Introduction

The recent dynamic development of new information and communication technologies have changed significantly the everyday life of all the members of the society and offered the government new possibilities for providing citizens and businesses with better, more efficient services (Verdegem and Verleye 2009: 487). As the consumers throughout the world expect twenty-four hours a day, seven days a week availability in their commercial interactions, citizens, in their role of consumers of democracy, tend to expect the same from their government (Evans and Yen 2006: 207-208).

Encapsulating a wide variety of meanings ranging from policies that foster the development of information infrastructures to particular measures for combating the “digital divide”, e-

government is defined as the use of technology, particularly the Internet, as a means to deliver services to citizens, businesses, and other entities (Akman et al. 2005: 240). In a broader sense, e-government has been defined as the intensive use of information technologies for the provision of public services, the improvement of managerial effectiveness and the promotion of democratic values and mechanisms (Gil-Garcia and Pardo 2005: 187-188).

A significant part of the literature on e-government assumes that once the correct technology is implemented and accessible to the citizens, benefits will be delivered in terms of reduced costs, technical efficiency, greater access, accountability and transparency, and even greater 'e-participation' and 'e-democracy'. Yet, even technically successful, systems fail if intended recipients simply do not use them (Gauld, Goldfinch and Horsburgh 2010: 184).

A study conducted in the Netherlands has found that the majority of the respondents perceives rather positive the usefulness, tend to trust and intend to adopt government e-services (Horst, Kuttschreuter, and Gutteling 2007: 1850). Another study, conducted in Australia and New Zealand, addressing the human demand-side of the e-government, has found that the majority of respondents are reluctant to use some of the more sophisticated transactional e-government measures, the high users of information and communication technology are more likely to use e-government measures, and are more positive towards e-government in general (Gauld, Goldfinch and Horsburgh 2010: 184).

Successful implementation of e-government imposes changes in business processes that are performed inside governmental institutions, despite of many limitations such as the rigid structures and political reasons (Indihar Stemberger and Jaklic 2007: 229). Understanding the e-government processes of policy making is critical for the evaluation of the e-government initiatives and enablement of the appropriate technical, managerial, and political adjustments to be done by the public managers (Yildiz 2007: 661).

The conceptual framework for e-government planning and implementation surrounds the traditional marketing mix components – product, price, place, and promotion, with the customer focus perspective of customer relationship management, encompassed in the discipline and rigor of program management (Rose and Grant 2010: 32).

Promoting the use of e-government among citizens and businesses, suppose accomplishment of two interrelated actions: first, customers must be educated with respect to the scope of services and utility of the e-Government initiatives; secondly, customers must be convinced that use of the e-government applications will provide value to them (Rose and Grant 2010: 30).

The European Summits at Lisbon and Feira put e-government on the European agenda aiming the development of Internet-based services to improve access to public information and services, the improvement of transparency of public administration by using the Internet, full exploitation of information technology within public administration, and establishing e-procurement (Strejcek and Theil 2002: 305).

Methodological Notes

Data referring to the e-government availability (supply side) and, respectively, individuals using the Internet for interacting with public authorities (demand side) in the European Union countries between 2001 and 2010 have been collected from the Eurostat database.

E-government availability (supply side) measures the online availability of 20 elementary public services based on a sample of public authorities' web sites (such as central government, regional and local administration, police and social security organizations) agreed with Member States as relevant for each service. The public services for citizens measured are: income taxes, job search services, social security benefits, personal documents, car registration, application for building permission, declaration to the police, public libraries, birth and marriage certificates, enrollment in higher education, announcement of moving, and health-related services. The public

services for businesses measured are social contribution for employees, corporate tax; value added tax, registration of new companies, submission of data to statistical offices, customs declarations, environment-related permits, and public procurement.

E-government usage by individuals (demand side) measures the ratio of the individuals aged 16 to 74 that use the Internet to interact with public authorities, respectively for obtaining information from public authorities web sites, downloading official forms, sending filled in forms.

Percentages expressing the availability and usage of the e-government services at the level of the European Union and each of the Member States have been considered to construct an **analytical matrix of e-government services development and employment** inspired by the BCG matrix, where each of the Member States has been positioned in relationship with the average European performances in one of the four quadrants: (1) **question marks** (e-government supply above and e-government demand below the European average), (2) **stars** (e-government supply and demand both above the European average), (3) **cash cows** (e-government supply below and e-government demand above the European average), and (4) **dogs** (e-government supply and demand both below the European average).

Main Findings

There are two main conclusions that can be drawn assessing the supply side of the e-government market in the European Union: (1) the availability of the e-government services, as it is defined in terms of the Eurostat methodology, is high: as an average, 84.3 % of the elementary public services are available at the EU level; (2) dynamics of the supply side is more than impressive: in just three years, the availability of the elementary public services has increased, at European level, from 58.3 % to 84.3 %.

Table 1. E-government availability (supply side) in the European Union countries 2001–2010

Countries	Years							
	2001	2002	2003	2004	2006	2007	2009	2010

Source: Eurostat.

In terms of availability, Ireland, Italy, Malta, Austria, Portugal and Sweden have reached the maximum level of 100 %, while United Kingdom, Spain, Slovenia, Finland, Denmark, Germany, Netherlands, Estonia, Latvia, and France are above the European average. The lowest levels of e-government availability have been registered in Greece, Cyprus, and several countries of the Central and Eastern Europe – Romania, Slovakia, Hungary, Bulgaria, Lithuania, and Czech Republic. Somewhat surprisingly, Luxembourg, Belgium and Poland have availability below the European average.

There are two main conclusions that can be drawn assessing the demand side of the e-government market in the European Union: (1) the usage of the e-government services by the individuals is rather low: as an average, only 28.1 % of the individuals are accessing the public services available online at the EU level; (2) dynamics of the supply side is positive but far less impressive by comparison to that of the supply side: from 2004 to 2010, the degree of e-government services usage has increased, at European level, from 19.6 % to 28.1 %.

Source: Eurostat.

Countries with percentages far above the European average in terms of the usage of e-government services by individuals were, in 2010, Denmark, Sweden and Netherlands, where more than a half of the population has used e-government applications for interacting with the public authorities. Finland, Estonia, Luxembourg, Slovenia, Austria, Germany, Slovakia, United Kingdom, Spain, Latvia, and France were above the European average. The lowest levels of e-government usage have been registered in Romania, Greece, Bulgaria, Lithuania, Czech Republic, Italy, Poland, Portugal, Ireland, Cyprus, Malta, Hungary, and Belgium.

Assessment of the correlation between the supply and demand sides of the e-government services reveals that a connection of an average intensity, Pearson correlation coefficients calculated for the years 2007, 2009, and 2010 having the following values: 0.4068 (2007), 0.5324 (2009), and 0.4959 (2010). This means that development of the e-government services has not been accompanied by measures meant to stimulate their usage by the individuals: the extensive focus of the public authorities on making available the e-government services has determined them to neglect the communication to the citizens in order to present, explain, and convince them to use on a larger scale these services. Another possible explanation of this disparity is the lack of concordance between the real needs of the citizens in terms of the public services and the range of these services made available online by the public authorities.

Analysis of the e-government market in the European Union in terms of demand and supply using the matrix of e-government services development and employment, leads to the following positioning of the Member States:

-question marks (e-government services supply above and demand below the European average): four Member States – Ireland, Italy, Malta, and Portugal – are positioned in this category. As an interesting fact, all these countries have apparently solved the e-government infrastructure, as the availability of the specific public services is 100%! By contrast, the usage of the e-government services is below the average, which raises at least two questions: first, how opportune was the investment of the public money in developing the e-government services in terms of the society's and citizens' needs for an effective public administration? Secondly, how appropriate was the promotion of the usage of these services among the consumers in terms of the communication effectiveness regarding the usage of these services?

-stars (e-government services both supply and demand above the European average): twelve Member States are positioned in this quadrant – Denmark, Germany, Estonia, Spain, France, Latvia, Netherlands, Austria, Slovenia, Finland, Sweden, and United Kingdom. From these, only Austria and Sweden have managed to reach 100% coverage in terms of the e-government services provided to the public. The development of e-government market in these countries should consider both expanding the range of specific services made available to the public and increasing the usage of these services, with a different focus from a market to another;

-cash cows (e-government services supply below and demand above the European average): Luxembourg and Slovakia are the only two countries in which citizens are using more

intensively the e-government services provided to the public. The development of e-government market in these countries should consider both expanding the range of specific services made available to the public and increasing the usage of these services, with a focus on the range of e-government services. It is rather difficult to conclude that Luxembourg and Slovakia may be viewed as potential models for the development of the e-government market in the European Union, their demographic, economic, and technological profile being atypical, to a certain extent, for the EU Member States;

-dogs (e-government both supply and demand below the European average): nine countries are positioned in the quadrant having the poorest situation, out of which six are from the Central and Eastern Europe – Bulgaria, Czech Republic, Lithuania, Hungary, Poland, Romania, and Belgium, Greece, Cyprus completing the group. These countries should consider in the development of their e-government markets both the significant enlargement of the range of specific services provided to the public and a more consistent effort to increase the usage of these services.

Conclusions and discussion

The current e-government projects conducted in each of the Member States of the European Union do not reveal a harmonized approach, but rather a consistent but somewhat uncoordinated effort (Strejcek and Theil 2002: 312). Although the finality of the e-government development is to facilitate access and provide high quality public services lowering the administrative burden, this target will be difficult to be reached in a context characterized by a relatively high availability but a rather low usage of the specific services. Engaging citizens in using on a more extensive scale the e-government services available in the market could represent the focus of the future of the development strategies implemented in the most of the Member States. In the new context of the government – citizen relationships, created by the Internet, a “willing citizenship” is the most important tool for the successful implementation of e-government (Evans and Yen 2006: 228).

PORTFOLIO ANALYSIS – A BASIC INSTRUMENT IN STRATEGIC PLANNING. CASE STUDY ON THE ROMANIAN INSURANCE MARKET

Petrescu Marian

Practice proved that strategic planning is a necessary process for insurance companies. This process can help companies to adapt more easily to environmental changes. The strategic planning of the activity of an insurance company cannot be realized without a careful analysis of the evolution of the market and without studying the company's market position. A classic model used in the portfolio analysis is the Boston Consulting Group model. In this paper we have used the model for studying the activity of the leader of the Romanian insurance market. In 2009 Alliantz Tiriac had 17 types of insurance in the portfolio. Each class of insurance was considered a strategic business unit. We have studied the insurance portfolio by using secondary data from specialized publications, such as the Romanian Insurance Supervisory Commission. Using the data, we have calculated for Alliantz Tiriac, for each class of insurance, the relative market share. The company was leader on the market for five classes of insurance. The economic crisis had a severe impact on the evolution of the Romanian insurance market: from the 17 classes of insurance studied: nine had registered a decrease of the market, eight had registered an increase, but only for three of them the growth exceeded 10%. Using the relative market share and the market growth we have identified the “cash cows”: there are five classes of insurance in this category, among which the “Insurance for land vehicles (CASCO)” which represented more than half of the sales (55.82%); unfortunately, in the case of this insurance type there was a very significant decrease of the market in 2010 compared to 2009: -25.12%, the “question marks” – there are three classes of insurance in this category, and the “dogs”. Due to the crisis, a large number of the company's products are in this category and there are no “star” products. This work was supported by CNCSIS – UEFISCSU, project number 915 / 2009 PNII – IDEI 1773/2008

I. The strategic planning and the portfolio analysis

Strategic planning is the process through which a company defines its long-term objectives, analyses its situation and sets the strategies and methods by which these could be implemented. This is done on several organizational levels: the superior organizational level, the strategic business unit level and the functional level. (Virgil Balaure et al., 2002: 577)

The activity of an insurance company can be planned at the level of each strategic business unit. A strategic business unit (SBU) is a division of the company, which has a separate mission and

separate objectives, and which can be planned for independently of the other divisions (Philip Kotler, et al., 1998: 1114).

The strategic business unit can be a brand or an insurance product of the company (for small and medium size enterprises), an insurance category, for instance: mandatory motor third party liability insurance (Petrescu E.C., 2005: 272). The activity portfolio of a company is formed of the totality of its strategic business units.

The models of portfolio analysis allow for the classification of strategic business units (SBUs) and for their analysis. Function of this analysis, the manager can establish, avoiding a subjective approach, the most suitable strategy for each strategic business unit, can determine which are the profitable strategic business units, spot the ones he needs to invest in and the ones he should give up on.

However, these models cannot be considered a universal remedy, an ideal means of diagnosis, their role being to help the manager understand the situation of each strategic business unit.

There are several analysis models, the most well-known being: the Boston Consulting Group I model, the General Electric (McKinsey) model, the Arthur D. Little model, the Boston Consulting Group II matrix.

The models of portfolio analysis have 'developed the analytical and strategic capacity of managers' (Philip Kotler, 1997: 119) and thus the quality of strategic planning has increased. It is the reason for which these are used by 75% of the first 500 top companies in the world. (Philip Kotler, et al., 1998: 123)

The models of portfolio analysis offer a clear image of the activity of the company, indicating whether it has a well structured portfolio.

Besides the numerous advantages resulting from the use of the models of portfolio analysis, there are a series of disadvantages, among which the most important are the following:

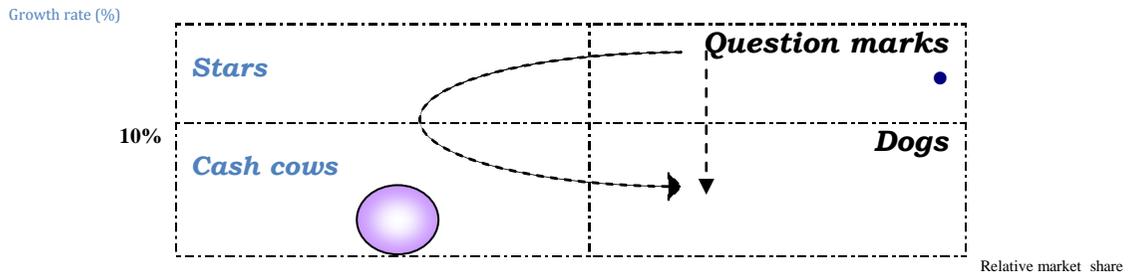

- the methods refer to the current products of the company, as it cannot consider the products which are going to be launched.
- the number of indicators used is limited (especially in the case of the Boston Consulting Group I matrix), and these are not the only relevant indicators for the situation of the company on the market.
- the use of the models can be difficult.

II. The Boston Consulting Group Model

The BCG model (the growth - market share matrix) is based on the idea that the growth rate of the market and the relative market share are the main factors influencing the market strategy of the company. For each criterion, the BCG specialists have chosen a differentiation ceiling. For **the relative market share** the differentiation ceiling is the value 1.00 of the relative market share, value function of which products are divided into leader position products and non-leader products. Regarding **the market growth rate**, the average growth rate of the market has to be taken into consideration. It will help make the distinction between a quickly growing market and a slowly growing one, or one in stagnation or decrease. In the initial matrix, the average value of the growth rate was of 10%. Today, the market growth rate is no longer the same, thus the average growth rate of the market should be computed.

Function of these two criteria, the products are positioned in one of the four categories of the BCG model: 'question marks', 'stars', 'cash cows', or 'dogs'.

Figure 1. BCG I Matrix

1

When a company launches a new product on the market it enters the ‘question marks’ category. If it does not succeed in becoming market leader, the product is categorized as a ‘dog’. If it is successful and becomes a leader, the product enters the ‘stars’ category, and as the market growth rate decreases, it enters the ‘cash cows’ category. Finally, due to innovations brought to competing products, the product may become a ‘dog’. The features of the four groups of products are (Petrescu E.C., 2005: 286):

- 1) The products in the ‘cash cows’ category are certain values, which bring profits and supply cash for financing the products in the other categories. These products contribute to the development of the company.
- 2) The products in the ‘stars’ category contribute to the increase in the turnover of the company and to improving its image. These products require investment to maintain or increase their market share.
- 3) ‘Question marks’ are products whose market is developing, the products being though unable to reach supremacy on the market. Their future evolution is uncertain and requires liquidities to ensure their financing. If they have positive perspectives, the company should invest in these products, if not they should be eliminated from the company’s product portfolio.
- 4) The products in the ‘dogs’ category do not usually contribute to obtaining a substantial profit or to using it for the development of the company. These are products that the company should eliminate from its portfolio, unless other strategic interests intervene.

III. The BCG analysis in the ALLIANZ –ȚIRIAC case on the insurance market in Romania

Function of the type and nature of the risks insured, the Romanian market has two important insurance categories: general insurance and life insurance.

General insurance are in turn divided in 18 insurance classes: I. Accident and health insurance (including work related accidents and professional diseases), II. Health insurance, III. Land transport vehicles insurance (other than railroads), IV. Railroad transport insurance, V. Air transport insurance, VI. Marine insurance (including maritime, lake and rivers transport means), VII. Goods in transit insurance, VIII. Fire and other natural disasters insurance, IX. Other goods insurance, X. Third party motor liability insurance, XI. Third party liability insurance for air transport, XII. Third party liability insurance for maritime, lake and rivers transport means, XIII. General third party liability insurance, XIV. Credit insurance, XV. Collateral insurance, XVI. Financial loss insurance, XVII. Legal protection insurance, XVIII. Assistance of persons in difficulty during travel or leave of domicile or permanent residence insurance. Life insurance is divided in the following insurance classes: I. Life insurance, annuities and supplementary life insurance, II. Marriage insurance, birth insurance, III. Life insurance and annuities which are tied to investment funds, IV. Permanent health insurance, B1. Accident insurance (including work accidents and professional diseases), B2. Health insurance.

The evolution of the insurance market in the 2005-2010 period is presented in Table 1.

Table 1. Development of gross written premiums in insurance contracts - 2005-2010

Years	Volume of gross written premiums (lei)	Volume of gross written premiums (mil. Euro)	Nominal growth compared to the previous year %	Real growth %	Inflation rate %
2005	4,417,165,819	1,201.26	27.07%	17.01%	8.6%
2006	5,729,284,541	1,694.20	29.70%	23.68%	4.8%
2007	7,175,789,699	2,033.83*	25.25%	17.53%	6.57%
2008	8,936,286,505	2,242.48**	24.53%	17.15%	6.3%
2009	8,869,746,957	2097.86***	- 0.74%	-5.24%	4.74%
2010	8,364,494,470		-5.70%

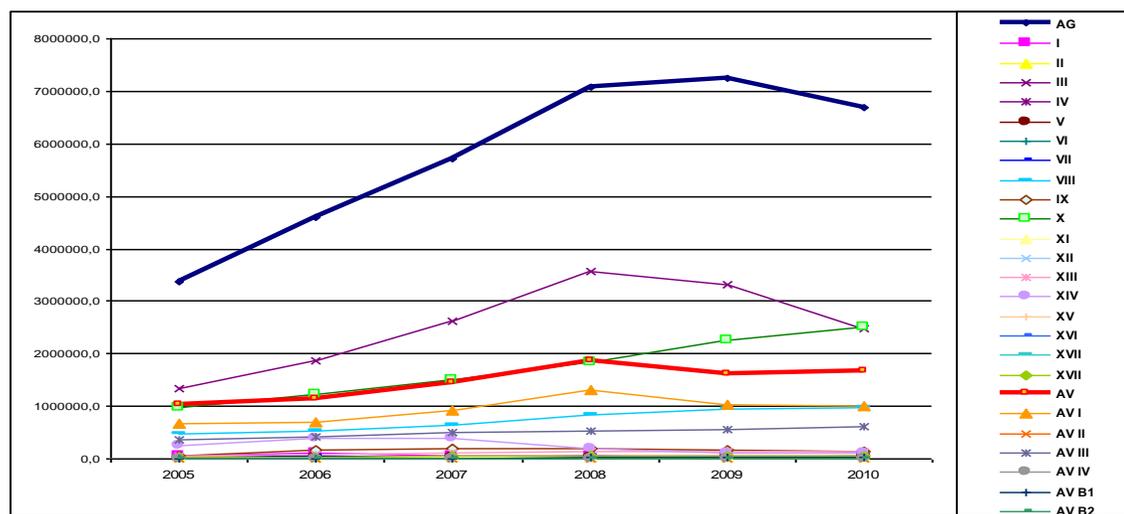

Figure 2. The evolution of the insurance market in Romania - by insurance classes 2005-2010

Sources: Reports CSA 2005-2009, Informative Bulletin - Year V, No. 1 - March 2011

In 2009, the company ALLIANZ - ȚIRIAC ASIGURĂRI S.A. was market leader with a total market share of 14.50%. On the general insurance segment, ALLIANZ – ȚIRIAC was the leader in 2009 with a market share of 16.55%, followed by OMNIASIG VIG S.A. (12.56%), while on the life insurance segment the leader was ING ASIGURĂRI DE VIAȚĂ S.A. with a 32.37% market share, Allianz having a 5.38% share. In 2010, ALLIANZ – ȚIRIAC loses its leadership position, coming second, with a market share of 12.34%, ASTRA taking its place (13.28%). In 2010, on the general insurance segment, ASTRA has a market share of 16.36 % and Allianz is second with 14.03%, while on the life insurance segment ING is the leader with 32.62%, and Allianz second with 5.52%, the same market share as ASIROM.

For a retrospective analysis of the product portfolio of ALLIANZ – ȚIRIAC on the Romanian market in 2009 we have used the BCG method. The situation of the company is presented in Table 3.

Table 3. The situation of ALLIANZ – ȚIRIAC on the insurance market in 2009

Legend: GI = General insurance, LI =Life insurance, Rsi = Relative share for the insurance class i, Ri = The market growth rate for the insurance class i , Sii = The share of the insurance class i in total insurance, Q= Question marks, S= Stars, C= Cash cows, D=Dogs

Source: * Informative Bulletin - Year V, No. 1 - March 2011, **own computations

The indicators used for the BCG analysis are:

- Rsi - relative market share, which was computed in Table 3 by comparing the gross written premiums for an insurance class of ALLIANZ – ȚIRIAC in 2009 to the gross written premiums for the respective insurance class of its main competitor;
- Ri (%) - the growth rate of the market for each insurance class,
- Sii (%) - the share of the gross written premiums for an insurance class i of ALLIANZ – ȚIRIAC in total gross written premiums for ALLIANZ – ȚIRIAC in 2009.

The products were categorized in column 7 function of the growth rate in 2009 function of 2008, and in column 8 we considered the growth rate in 2010 function of 2009.

If Alliantz had made in 2009 the BCG matrix, by using the growth rate of 2009 compared to 2008 (which it knew) – see Table 2 – the positioning of the products would have been similar, the only differences being related to products VI and XVII, which would have been question marks and not dogs. Figure 3 shows the graphic representation of the company's product portfolio

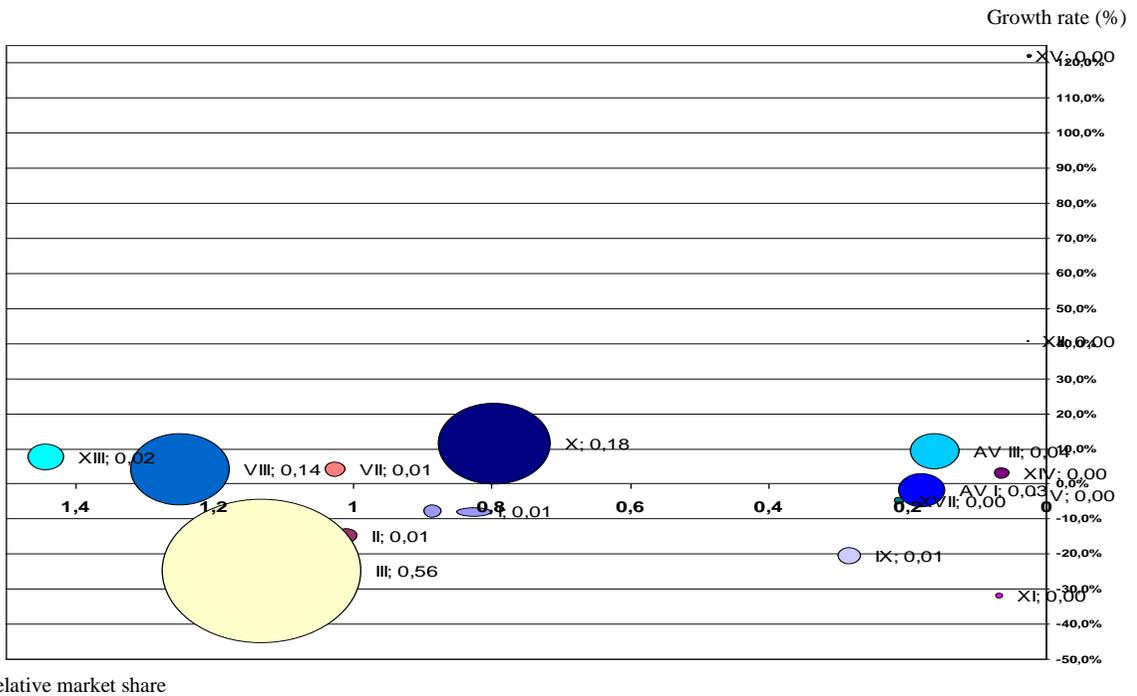

Figure. 3. BCG I matrix for ALLIANZ –TIRIAC in 2009

IV. Conclusions

The insurance types in the ‘cash cows’ category are leader products, valuable for the insurance society and which should be exploited. These are: II Health insurance, III Casco, VII Goods in transit insurance, VIII Fire insurance, XIII Third party general liability insurance. Class III. Land transport vehicles insurance (Casco). CASCO insurance held the largest share in the company portfolio, 55.82%, in 2010 the class has recorded a significant decrease of -25.12%.

The question marks products the company should invest in are the ones from classes: X. RCA (with a relative share of 0.8 and an increase of 11%), XII. third party liability insurance for maritime transport (with a 40.38% increase) and XV. collateral insurance (which had the biggest increase: 121.62%); however, the latter have very low relative shares and a very low share in total written premiums.

The rest of 9 insurance types enter, due to the crisis, in the ‘dogs’ category: over half of the company’s strategic business units are in this category. Another unfavorable element is that there are no products in the ‘stars’ category.

However, this analysis is not sufficient to establish the future of products, as the BCG analysis can be only used as a guide; in order to have a correct and complete image, we should analyse the activities portfolio considering other determining external factors for the evolution of a market, such as: the size of the market, the profit margin, the intensity of competition, technological requirements, social, political and legislative factors, the seasonality and cycle of demand etc., as well as factors related to the potential of the respective insurance class, such as: the quality of services, the competitiveness of prices, the quality of management, of personnel, the distribution network, the efficiency of promotion and of sales.

Abstract

The primary purpose of the economic higher education in providing the graduates with marketing competences is to train them for employment. In light of the said objective, two important aspects must be taken into account by educators. First, the gap between theory and practice must be eliminated. Secondly, educators must select and provide the competences required by employers so that new graduates may obtain employment matching up to their training. The purpose of the present study is to highlight the main dimensions which define employers' perception of the marketing competences developed by the graduates whom they have employed. The starting point of the present scientific endeavour is the evaluation of the variables which define the transversal competences and the marketing-specific competences.

Key words: competences, curriculum, employers, evaluation, quality assurance

JEL Classification: M1, M3, M31

Acknowledgement

This paper highlights some of the findings obtained through the implementation of the project “Research and development of a complex, multidisciplinary and interactive platform for the improvement of the marketing educational system through interconnection between the Romanian academic environment and labour market, in the context of sustainable development”, financed by MECT through CNMP, Domain DC 9, project code 92-103/2008.

INTRODUCTION

Romania's economic changes of the last twenty years and particularly the new approach to business peculiar to the market economy have brought about the need for the business people to adopt a business philosophy adjusted to the new context, created specific needs on the labour market and, as a consequence, imposed new requirements concerning the competences acquired by graduates during their academic training. Therefore, the academic environment currently voices a particular concern over the competences that a student should acquire during his/her academic training so that, after graduation, he/she may be able to perform all the activities pertaining to marketing in a professional way. This concern comes first from the universities' interest in having an offering adjusted to the needs of the business environment, which is a

criterion for competitiveness on the labour market, and from the national, European and even international framework of qualifications in higher education.

The objectives set by the European Union through the Bologna Declaration (June, 1999), Lisbon Summit (March 2000), Copenhagen Declaration (December 2002), Ministerial Conference in Berlin (September 2003), Ministerial Conference in Bergen (May 2005) and Ministerial Conference in London (May 2007) are to reform the higher education systems so that they should become capable of providing offerings compliant with the needs of the contemporary society. The corresponding body in Romania which implements these European orientations is the National Agency for Qualifications in Higher Education and Partnership with the Social and Economic Environment (ACPART) which set up the National Framework of Qualifications in Higher Education (CNCSIS) in February 2008. CNCSIS “complies with the European requirements concerning the access to and advancement in the academic career and student mobility and satisfies the national needs by creating a coherent model of organization and classification of qualifications, by exposing the academic training system to the social and economic environment and ensuring balance between supply and demand of education and training” (CNCSIS 2008). The CNCSIS’ objective in terms of university curriculum optimisation in Romania relies heavily on extensive research for each particular specialization and the involvement of competent and motivated researchers. Settling this issue, however, is not as simple as it might seem on the surface in view of the fact that the interest in this topic is in an early stage in Romania.

Literature review

The bright side of this endeavour is represented by the existence of extensive research already conducted and published in international specialised literature (Rositer 2001: 9-26; Aistrich 2006: 73-80; Rust 2006: 1-3; Ramocki 2007: 18-24; Jackson 2009: 85-98; Wellman 2010: 119-134). These studies deal mainly with competences that a student should acquire during his/her marketing training at university or the differences between the current academic supply and the demands the marketers are required to cope with. The curricula that the students are expected to follow during their university education are also subject to ongoing and heated debates among academics. The comments made about the congruence between the educational supply and the employers’ needs were more often than not critical. In one of their study, Pfeffer and Fong (2002: 78-95) suggest that the business administration faculties operate much like providers who screen and recruit customers to make use of their services whereas their educational supply features a lack of relationship with the real needs of the labour market. With even more caustic remarks, Mintzinberg and Gosting (2002: 33-37) highlight that in faculties where business administration specialists are trained, incorrect or less substantiated concepts are inappropriately being taught to an audience unsuitable for with no interest whatsoever in the field of business administration.

The incongruities invoked between the academic marketing supply and the real needs of the corporate world have aroused, and continue to arouse, the interest of more and more researchers. Well-known specialists from around the world have approached, investigated, researched and debated for a long time these aspects (McKenna 2002: 680-702; Simkin 2002: 120-126; Brennan and Skaates 2005: 77-89; Stringfellow et al 2006: 245-256; Brownlie et al 2007: 395-409; Munch 2008: 16-23; Jackson 2009: 85-98; Wellman 2010: 119-135). Their endeavours highlight the role that educators and trainers play in the academic training of the future marketers. They also attempt to devise the most appropriate ways and means so that student training may be accomplished with more responsibility toward the society. All researchers share the opinion that a better match between the academic supply and the needs of the business environment is a must and one of the main tasks of the marketing educators is to provide appropriate training to any individual who wishes to obtain a marketing qualification.

A “mirror” assessment of the academics’ opinion, as against the employers’ opinion, on the nature and contents of the educational offering meant to ensure the required competences, could take the form of a more balanced investigation and could provide more accurate information on this important topic. Therefore, valid information obtained from both sides—employers and academic world—is the only basis for designing curricula capable of imparting knowledge that combines a high level of academic competences with qualification-specific competences.

The training necessary to apply for a job is obviously a legitimate, all-important objective of any marketing graduate. In the light of the literature reviewed we appreciate that in order to identify those competences that employers regard as the most relevant, the academics and the corporate world should carry out a common assessment of the nature and structure of the academic supply with a view to building up the optimal profile of competences demanded by employers. This undertaking would take the form of a balanced investigation and would provide accurate and valid information that might serve as the basis for designing comprehensive curricula in which the knowledge required by the marketing practice and that imparted in theory should be appropriately intermingled. And, last but not least, the curricula would contribute to the development of marketing-related competences. As shown by Semeijn (2005), the ever-growing interest expressed by international researchers in this topic is generated by the fact that competences have shown to be stronger predictors for job allocation and follow-up training than traditional indicators such as field, grade-point average and BA/MA thesis results.

The technical literature (Boshuizen 2009: 279-404) regards domain-specific competences as the baseline for developing expertise in a profession. Likewise, domain-specific competences facilitate access to jobs (Heijke et al. 2003). The arguments supporting the importance of useful competences in obtaining and preserving a job may be approached from various angles. Thus, a study on the job performance among master graduates with expertise in the domain of business administration (Arts et al. 2006: 387-401) shows that they pay far more attention to information than graduate students regardless of whether the information is relevant or irrelevant. The same study reveals that the latter need at least eight years of work experience before they can accurately distinguish between relevant and irrelevant information.

In contrast, experts focused on structural features and patterns pay far more attention to strategic issues, and the knowledge of graduates is highly organized (Nievelstein et al. 2007: 1043-1064), contributing to achieving high performance in domain-related issues (Feltovitch et al. 2006: 41-66). At the same time, they can retrieve this knowledge very quickly from memory, even under high stress conditions (Woods et al 2006: 973-979). Although such findings are more difficult to measure, they ought to be taken into account in the curriculum design.

An individual’s chances to get a job depend not only on the level of domain-specific competences but also on how well he/she is able to combine them with the so-called generic competences (ability to learn new things, attitude, communication, teamwork, adaptation to unpredictable situations). The specialized literature places this kind of competences, which are useful in many other contexts as well, in the category of key competences, academic competences, or key qualifications (Rychen & Salganik 2001). Their general character comes from the possibility to use them on any particular job, regardless of the curriculum previously followed. They often constitute the baseline for selection of follow-up training. Even if, from a theoretical viewpoint, researchers have intense debates on the need to clearly delineate domain-specific from general competences, in reality the two kinds of competences cannot be acquired separately within a curriculum (Van der Velden 2006). Moreover, authors such as Merrienboer and Kester (2008: 441-456) argue that separating the acquisition of generic and domain-specific competences inhibits the transfer of what has been learned to practice. Consequently, as suggested by researchers, both kinds of competences should be learned simultaneously in a variety of authentic situations across the curriculum. Therefore, we state the opinion that in order

for a student to acquire all competences there must be well-organized curricula whose purpose is to specifically promote knowledge acquisition and development of abilities and integrated professional attitudes.

RESEARCH PURPOSE

Departing from the above-mentioned concerns which emphasize the need of a better coherence between the business administration educational offering and the labour market requirements, a need that has been underlined by authors from around the world, in the present study we set to investigate the Romanian employers' perception of competences acquired by native graduates through the academic marketing training. Moreover, starting from the evaluation of the variables which define the transversal competences and the marketing-specific competences, we set to identify, by means of factor analysis, the main dimensions which define employers' perception of the marketing competences acquired by the graduates whom they have employed.

SAMPLE CHARACTERISTICS

Data collection was made in the Transylvania counties between in October 2010, as part of a field survey. Due to the complex nature of the issues approached, data input was made by interviewers at the office of the investigated organizations. A total of 171 valid questionnaires were collected. Departing from the premise that there are noticeable differences, in terms of objectives pursued, between the organizations' domains, the sample included producers (25.1%), retailers (30.4%), and financial service companies (9.4%), tourist organizations (5.3%), as well as companies which offer other services (29.8%). In terms of the company's start-up year, the sample reveals that most of the companies (82.4%) were established after 1989, 22.8% between 1990 and 1995, 18.1% between 1996 and 2000, 27.5% between 2001 and 2006 and 24% were set up after 2006. The companies included in the survey that were set up before 1989 represent a small percentage of 7.6%.

Another relevant criterion used in the selection of companies was the annual turnover. According to this indicator, the sample is fairly homogeneous, 21.6% of companies recording an annual turnover below 100.000 Ron, 21.1% between 100.001 and 500.000 Ron, 17% between 500.001 and 1.000.000 Ron, 12.3% between 1.000.001 and 2.000.000 Ron whereas the annual turnover of 28.1% of the companies exceeds 2.000.000 Ron.

50.3% of the corporate officers who took part in the survey are administrators, 30.4% general managers and 19,3% marketing responsible. The overwhelming majority of the officers interviewed completed a bachelor's degree (50.3%) or a postgraduate degree (39.8%) while very few of them graduated from high-school (5.2%) or completed an associate's degree (4.7%).

RESEARCH METHODOLOGY

In order to accurately identify the employers' perception of the competences acquired by graduates during their academic marketing training, a series of multivariate data analyses have been conducted. The role of the said tests is to demonstrate the validity, objectivity and reliability of the data subject to analysis. To this effect, we set to determine Cronbach's Coefficient Alpha (α) which measures the internal consistency of the items (variables) which make up a model, a factor or a scale (Peterson 1994: 381-391). By determining the Alpha coefficient, the variables which, by their variance, fail to explain very well the phenomenon being studied can be eliminated from the analysis. The closer to 1 is the value of Cronbach's Coefficient Alpha (α), the more reliable are the data. According to various authors, the calculated value of the coefficient alpha for a set of items must be at least 0.7. However, lower values may also be admitted on condition that they are computed for three items at most (Hälsig 2008: 121; Kuß 2007: 97; Nunnally 1978: 9). By applying the "item-total" correlation, one can determine the

items which, by their removal from the model, may contribute to increasing the value of Cronbach's Coefficient Alpha (α) (Churchill 1979: 64-73). A model's validity can also be verified by means of the exploratory factor analysis conducted in the SPSS Software. By means of it, the volume of analyzed data is reduced, thus highlighting the existing correlations between the observed items. The result thereof is obtaining factors around which are grouped the items (variables) which load together on the intended factors, a fact that accounts for the high percentage of the variance. Each obtained dimension must reflect an as high percentage as possible of the variance of variables, namely, to explain as best as possible the phenomenon being studied (Backhaus et al. 2008: 259-274; Plăiaș 2008: 558-560). Finally, the researcher's task is to properly name the resulted dimensions/factors. The number of resulted dimensions should ideally be as small as possible, as they are thought to be representative of the studied phenomenon. At the same time, each variable should load on a single factor a value greater than 0.4. The reliability of the factor analysis is proven by carrying out the Kaiser-Meyer-Olkin (KMO) test (referring to the homogeneity of the initial items, its recommended value being greater than 0.5) and Bartlett's test of sphericity (the calculation of chi square [χ^2], the number of degrees of freedom [df] and the probability [p] to guarantee results). Finally, the obtained dimensions may be subject to permutation, a process that facilitates correct data interpretation (Bagozzi 1981: 375-381; Kuß 2007: 253-256; Backhaus et al. 2008: 334-337; Bühl, Zöfel 2005: 465-484).

Research Results

As the domain-specific competences that graduates should acquire have been conceptualized, an exploratory factor analysis has been carried out in the first instance on the set of studied items. Five factors have been obtained and Cronbach's coefficient alpha has been applied on the items which load on each of these dimensions. The values obtained for each individual factor have been satisfactory and in compliance with the requirements of the technical literature. Factor one was the only factor for which the variable measuring "the proper management of the negotiation process and conclusion of contracts" has been removed. Thus, the analysis conducted for the remaining items pinpointed a Cronbach coefficient alpha of 0.828 as against the previous 0.823. The Cronbach coefficient alpha was 0.738 for the second factor, 0.809 for the third, 0.777 for the fourth and 0.704 for the last obtained factor.

Resuming the factor analysis for the entire set of selected factors, the next variable to be removed was "proper management of the enterprise's range of performances" as it loaded simultaneously unacceptable values (below 0.4) on factors three and five. A possible explanation for this phenomenon could be a vague wording of the variable as the management of the range of performances could be a component both of the upstream and downstream market. We further resumed the exploratory factor analysis, the results of which are presented below.

Table 1 – Final Factor Analyse

Items (Variable)	Factor 1	Factor 2	Factor 3	Factor 4	Factor 5
easy design and implementation of marketing plans and strategies	0,76				
competent managing of marketing studies and research	0,73				
conduct serious analysis of the competition environment	0,67				
are able to properly organize promotion campaigns	0,66				
apply data-base marketing in the relationship with partners	0,51				
have a good command of at least one international language		0,82			
possess developed computer abilities		0,72			
know to handle production stocks			0,79		
know the manner of conducting the cost-benefit analysis			0,73		
possess comprehensive training in material resources			0,69		

Items (Variable)	Factor 1	Factor 2	Factor 3	Factor 4	Factor 5
procurement					
display excellent organizational abilities				-0,72	
possess developed abilities to work in a team				-0,67	
possess high analysis/synthesis ability				-0,67	
possess developed communication and persuasiveness abilities				-0,63	
possess well-developed powers of observation				-0,62	
are willing to learn and improve on a regular basis				-0,61	
explore the market efficiently to attract new customers					-0,76
process and analyze the sales data in a professional way					-0,57
manage properly the relationship with dealers					-0,56

Factor extraction method: Principal component analysis, Oblimin rotation with Kaiser Normalization
Source: own research;

A first challenge that we met in our endeavour was represented by the proper naming of the obtained factors. In our opinion, the items that load on the first factor (design and implementation of marketing plans and strategies, competent managing of marketing research, conduct serious analysis of the competition environment, proper organization of promotion campaigns, application of data-base marketing in the relationship with partners), could be regarded as “Marketing knowledge”, as it actually comprises the whole body of knowledge applied within an organization. The second factor could well be named “communication and computer skills”, which represent extra knowledge with significant impact on the marketing practice. In our opinion, the items loading on the third factor make up the body of knowledge that an organization should possess in relation to the upstream market. Therefore, we believe that the third factor could be properly named “procurement knowledge”. The fourth factor, “management and negotiation skills”, contains elements that contribute substantially to graduates’ personal and professional development. Finally, the fourth factor contains marketing knowledge about an organization’s upstream market. Thus, we believe it should be named “skills in market analysis and maintenance of relationships with its players”. Viewed from a different perspective, of outstanding importance is the manner in which the dimensions obtained within the exploratory factor analysis interact on each other. The multiple regression analysis conducted on the factors highlighted by the exploratory factor analysis shows that marketing knowledge has significant influence over communication and computer skills. As marketing is, by its nature, an open activity and more and more computer applications have been developed for the marketing practice, this correlation is accounted for by the fact that marketing has become a driving force behind specialists’ availability and performance in terms of technical and interhuman communication. We could also take into account the use of computer equipment for the collection of marketing data and information.

Marketing knowledge → communication and computer skills		0,156*
Procurement knowledge → communication and computer skills		0,109 ^{n.s.}
Skills in market analysis and maintenance of relationships with its players → communication and computer skills		-0,035 ^{n.s.}
Model fit		
F	3,504***	R ² adjusted
		0,042
Durbin-Watson		1,955
Legend		
*p<0,1	**p<0,05	***p<0,01
****p<0,001	n.s. - insignificant	

Conclusions

According to our findings, respondents expressed a favourable opinion about the level of training of employees' engaged in general marketing activities and in specific activities related to the upstream market. A favourable opinion has also been expressed concerning the generic competences, such as computer or linguistic skills. Respondents expressed a less favourable opinion about the level of training of employees who carry out marketing activities in relation to the downstream market and about a range of skills related to their individual and professional development.

The application of the factor analysis on the 20 variables that we deemed relevant for the evaluation of the variables that define transversal and marketing-specific competences allowed us to identify five dimensions which were named "marketing knowledge", "communication and computer skills", "procurement knowledge", "management and negotiation skills", and "skills in market analysis and maintenance of relationships with its players". As the analysis has shown, these dimensions mirror the complexity of the marketing activity, touching on upstream and downstream market-related skills as well as management and communication skills.

A QUALITATIVE RESEARCH REGARDING THE MARKETING COMMUNICATION TOOLS USED IN THE ONLINE ENVIRONMENT

Pop Nicolae Al.

Academia de Studii Economice București, Facultatea de Marketing, Piața Romană nr. 6, sector 1, cod 010961, București, nicolae_al_pop@yahoo.com, 0744388199

Acatrinei Carmen

Academia de Studii Economice București, Facultatea de Administrarea Afacerilor, cu predare în limbi străine, Calea Griviței nr. 2-2A, sala 4213, sector 1, cod 010701, București, acatrinei.carmen@gmail.com, 0729505705

Starting from the meaning of the communication process in marketing, the authors try to identify its role in assuring the continuity of the management process in what concerns the relationships between all the partners of the company, on the long term. An emphasis is made on the role of online communication and its tools in relationship marketing. In order to validate some of the mentioned ideas the authors have chosen to undertake a qualitative marketing research among the managers of some Romanian tourism companies. The qualitative part of the study had as purpose the identification of the main tools which form the basis of the communication with the beneficiaries of the touristic services, of the way in which the companies use the online communication tools for attracting, keeping and developing the long term relationships with their customers in the virtual environment. The following tools have been analyzed: websites, email marketing campaigns, e-newsletters, online advertising, search engines, sponsored links, blogs, RSS feed, social networks, forums, online discussion groups, portals, infomediaries and instant messaging. The chosen investigation method was the selective survey, the research technique – explorative interrogation and the research instrument – semi structured detailed interview, based on a conversation guide.

A very important fact is the classification resulted after the respondents were requested to mention the most efficient tools for attracting customers and for maintaining the relationships with them. Although the notoriety of the online marketing tools is high, there are some tools that are known by definition, but are not used at all or are not used correctly; or are not known by definition, but are used in practice.

The authors contributed by validating a performing methodology of qualitative research, a study which will open new ways and means for making the online communication tools used for touristic services in Romania more operational. It is to be mentioned that the chosen domain of application has not yet been researched within the national literature.

The qualitative research results will form the basis for a quantitative study among the consumers of touristic services in order to identify their opinion in what concerns the usage of online marketing tools by the tourism companies in maintaining the relationships with them.

Keywords: Relationship Marketing, CRM, Online Marketing Communication, Market Research

JEL Classification: M31

Introduction

The new communication media have registered an exponential development among the delivery - reception methods of the information between people. Marketing which is viewed as the analysis and action on the market has not remained immune to the major challenges determined by the occurrence and development of the virtual communication – based on the internet applications. The strategic vision, that marks the evolution of contemporary marketing, assures a long term

relationship between the companies and their market (Pop 2006: 36). The efficient administration of the companies moves the central focus of the marketing action towards assuring the continuity and administration, on a long term basis, of the relationship with all the partners involved in this process.

Having as target to make this activity continuous and bivalent, the company assures the success of the messages it wants to send and receive. In the modern business environment the online interaction has different multiple advantages starting from smaller costs, time efficiency for the participants, a secure transaction framework and a friendly communication environment. The knowledge and most important the usage of the online communication tools in what concerns the management of the relationships with all the stakeholders of a company must be monitored permanently by using the marketing research means.

Marketing communication facilitated by the online tools

The literature referring to the new marketing communication tools is one of the most developed in the field. A large number of the analyzed aspects start from the communication mechanism and concentrate over the management of this process according to the particularities that the digital economy imposes over the speed of transmission, delivery and responses of the recipients to the messages with which they are “overwhelmed”. As a consequence, the term of *online marketing* is defined more clearly (Meyerson and Scarborough 2008), which not only covers the communication area, but also focuses on it. The major changes that affected the technological, legislative, social and economic environment (Smith and Taylor 2004: 216 and next) generate an entirely new face of the communication act.

The Romanian reader can benefit of a systematic approach of the marketing aspect in the digital era by having access to the translated reference books in the field, such as Kotler et al. or Gay et al. (Kotler, Jian and Maesincee 2009; Gay, Charlesworth and Esen 2009). It is requested to diminish the role of internet into communication due to the fact that this remains mainly a communication method in which “... the value is represented by the message not the nature of the transmission” (Gay, Charlesworth and Esen 2009: 389). The customization, the distribution of the message or the access at request of the user, makes it easier for the message to be personalized. This fact transforms the new tools of online communication in real relationship marketing tools, the later having as purpose a long term relationship between all the stakeholders and the products, services or brands of an offering company (Gummesson 2008: 36-40).

Relationship marketing, in its turn, also faced at the beginning of this millennium new developments creating a real interface for a highly anticipated field, the one of the demand holder’s reactions - representing the *network marketing* (Schebesch, Pop and Pelău 2010: 37-45; Bruhn and Koehler 2010; Roullet and Droulers 2010). All these developments reflect a significant change of the relationship between the participants in the selling and buying acts, their transformation from receivers and senders in *partners* in the process satisfying the of needs. The implication of the consumers in the production and distribution of the tangible goods and services, which satisfy their needs, becomes an important step in the entire process. Communication no longer belongs only to the one that offers, it sometimes even takes place without involving that person, having unexpected effects on the act of selling and purchasing (Trusov, Bucklin and Pauwels 2009: 90-102).

Once the global coordinates of the online strategy are settled, it is necessary to carefully select the communication and promotion tools because the moment a user accesses a company’s website, he / she can be an actual or a potential customer.

The online marketing mix (Adler 2010: 14) includes plenty of components and requires the following steps: *planning*, *implementation* and *control*. During the *planning* phase there are established the tools that will be used and the channels through which they will become

operational. The most well known and used tools are the: websites, emails, e-newsletters, search engines, sponsored links, blogs, RSS feeds, social networks, forums and online discussion groups, portals, infomediaries and instant messaging (Pantea and Vegheş 2008: 202). The *implementation* phase presumes that, once the tools have been chosen, decisions related to the design, characteristics and frequency of use must be taken. During the final part, the *control*, the marketing activities are monitored carefully, interfering if necessary. During this step the results can be partially measured, and if necessary, the instrument can be withdrawn. Finally, the results will be measured and conclusions will be drawn for future actions.

Methodological notes

In order to validate some of the ideas mentioned above, it has been chosen the organisation, development and interpretation of the results of a qualitative research among the managers of tourism companies from Romania. The term of *tourism company* will be used from now on in order to refer to any travel agency / tour operator or touristic services provider, no matter if it is a hotel network (national or international), hotel, guesthouse, transport company (national or international), air travel company, railway or maritime company. The touristic services represent one of the services' domains that are well fitted for the introduction and generalization of the online marketing communication tools. The qualitative part of the research has focused on identifying the major tools that form the communication basis with the consumers of touristic services; the method in which the tourism companies from Bucharest use them or intend to use them in the future and on stating hypotheses regarding the way in which the potential customers are attracted and how the relationship with them is maintained.

The *four objectives of the research* (O1-O4) have focused on identifying the major virtual tools that the travel agencies use in order to attract potential customers, on the communication with the former or actual consumers of touristic services, on identifying the way in which the respective companies use the online tools and also on the reasons they are chosen for identifying their usage. The researched online marketing tools were the following: website, e-mail marketing campaigns, e-newsletter, online advertising, search engines, sponsored links, blogs, social networks, forums, online discussion groups, portals, infomediaries and instant messaging.

The chosen *investigation method* was the selective survey, the *research technique* – explorative interrogation and the *research instrument* – semi structured detailed interview, based on a conversation guide (Pop 2001: 86-87; Cătoiş et al. 2002: 207). The period when the research took place was 7-25 February 2011.

The main hypotheses of the research:

H1. The companies operating on the tourism market in Romania use virtual marketing tools in order to attract potential customers and to maintain the relationship with the present clients.

H2. The majority of online marketing tools are known and used more and more by the companies operating on the tourism market in Romania, implicitly by their managers.

H3. The tourism companies use / combine certain online marketing tools in order to attract potential customers to their websites and also some online marketing tools for maintaining and developing the relationship with them, the majority of the respondents being satisfied with the results obtained after using the tools.

H4. In the future, the marketing strategy of the tourism companies will also include online actions for attracting customers and for maintaining the relationships with them.

It has been achieved the interviewing of *18 representatives of tourism companies* (10 representatives of travel agencies, 4 hotel representatives, 3 from transportation companies and one airline company representative), these companies have an updated website and the headquarters in (or also in) Bucharest.

The *interview* had an average length of 40 minutes. The registration of the answers given by the respondents has been done by recording on magnetic tape, in case of 16 companies, the rest expressing their will to answer in writing to the questions from the interview guide.

The working tools that have been used to *analyze and interpret the data* obtained from the interviews are: *content analysis* (Bardin 1977: 43 și next), *semantic differentiation* (Cătoiu et al., 2002: 152-154) and *Likert scale* (Plăiaș et al. 2008: 361-363).

Main results obtained and their implications

The presentation of the main results, obtained after analyzing and processing the data, will be done taking into account the objectives and hypothesis that formed the basis of the research:

O1. Identification of the relational means and tools used by the travel agencies and touristic services providers from Romania to relate with their customers;

In case of the majority of the respondents there have been noticed different views in the answers and the main problem raised by all was referring to the effects of the actual economical-financial crisis on the economy, which brought major changes in the strategy of the companies and in the way they are allocating the afferent communication budget. All the interviewed tourism companies have a website where they present their offers, the details referring to the touristic services they provide; the website being unanimously considered very important for *attracting customers*. Other means of attracting customers mentioned by the company representatives were the commercial messages sent by email to the database with customers (natural or legal persons), the company newsletters, the sponsored links and also the presence of the company on social networks.

After attracting customers, the majority of companies consider important to retain these customers, *keeping and developing the relationship*, which they have with these people who benefitted from their offered services. One tool mentioned by all companies as being used in order to relate with the customers was the newsletter, which helps them inform the customers regarding the new offers, promotions, projects or new events, contests or surveys. The databases for the newsletters are made mostly by legal persons, being harder to create a database with natural persons. In this category, the companies have also mentioned sending emails with a commercial content, the presence on the social networks or the presence of a chat window on the website which gives the customer the possibility to contact directly a company representative. Based on these answers, H1 hypothesis is validated.

O2. Identification of the degree to which the online marketing tools are known and used by the representatives of tourism companies for relating with the customers;

To a very high proportion all the company representatives have stated that they know all the online marketing tools. A few of them stated that they do not know for sure what means email marketing and the difference between this tool and the newsletter; RSS feed is rather known by its name rather than the way it is used; the instant messaging was another unclear topic for some and this is why there were mentioned examples such as “Yahoo Messenger”, “Skype”, the chat window, etc. The H2 hypothesis is shown as being true.

O3. Determine how travel agencies use online marketing tools and the degree of satisfaction obtained after their employment;

The respondents were asked *how and for what purpose* they use each of the online marketing tools. Based on the answers there can be seen an alignment of the views regarding the purpose and the usage methods of the online tools: *the website* is in general the first contact of an internet user, potential or present customer, with the company, in the virtual environment; this is why it is very important to manage it correctly and to keep it functioning in a proper way, the website being used for presenting the company, its offers and important news; *email marketing and e-newsletters*: these two concepts have been confused a lot by the representatives during the

interviews, in terms of their purpose and of the way they are used; thus based on the answers of the respondents, we can state the fact that there is a disaccord between the theoretic definition of the concepts and their practical use by the tourism companies; though both tools have been recognized by the company representatives as being used for attracting customers and also for maintaining the relationship with them; *search engines*: all the respondents consider vital for their company to be shown among the first results after generating a search, their website to appear on the first pages of the search engines after the customers introduce some key terms; *sponsored links*: all their users (one third of the respondents) declared themselves to be very satisfied with the number of viewers attracted to the website by the sponsored links that appear mostly on the search engines; *blogs*: the providers of tourism services do not have company blogs, but intend to use this tool in the future; *RSS feed*: none of the respondents mentioned this tool among the ones their company is using; *social networks*: no matter if it was a travel agency or a touristic services provider, all of the respondents acknowledged the growing importance of the social networks; *forums and online discussion groups*: none of the participating companies has an integrated forum in the company's website, only one third of the respondent companies offer their customers the possibility to add comments on their websites; *portals and infomediaries*: only a few of the company representatives that stated their opinion believe that these tools can help in attracting customers, but less for maintaining the relationship; *instant messaging*: all the company representatives that use instant messaging stated that they use this tool for attracting new customers and for maintaining the relationship with them, though only approximately 30% of the customers who have benefitted from touristic services contact the company afterwards.

All the company representatives declared themselves *satisfied* and *very satisfied* of the results obtained after using online marketing tools in order to attract customers or maintain the relationship with them; hypothesis H3 is confirmed.

O4. Identification of the companies' future steps / strategies in terms of the relationship with their customers;

The same as it was until now, in the future the marketing strategies will have as a core concept the customer and all the company's actions will take place around him. Managing the relationships with the customers will be a mix between the attraction and loyalty methods using traditional tools, the well established online ones and also the "new" online tools (social networks, blogs which might be used to interact with the customers). Hypothesis H4 is validated, the respondents being certain about their need to maintain the relationship with the customers in the online environment, without ignoring or substituting the offline actions.

Conclusions, limits and future directions of research

As a result of the interviews it has been established that from the online marketing tools presented to the respondents, only three of them are used just for *attracting customers* (the search engines, the online advertising and the sponsored links), the others being used in the same time for *attracting customers* and *maintaining or developing the relationship* with them (website, email marketing, e-newsletter, blog, RSS feed, social networks, forums, online discussion groups, portals, infomediaries and instant messaging). Of a major importance is the classification resulted after the respondents were requested to mention the most efficient tools for customer attraction and maintenance of the relationship with them. As a result, the most efficient online marketing tools for *attracting customers* are: company's website, search engines, sponsored links, e-newsletters, email marketing, social networks, online advertising; and for *maintaining the relationship with the customers*: the website, e-newsletters, email marketing, social networks and instant messaging.

Despite the fact that the notoriety of the online marketing tools is high, there are some tools that are not known as a concept, that are not used at all or not used properly; or are known as a concept, but used in a wrong manner in practice. Though the term of infomediaries is specific for the tourism market, the ones in the business do not know its definition, but they know how it works. The term of instant messaging was also not very clear, being necessary to give examples; RSS feed tool is known better by name rather than implementation. The biggest problem is the confusion that appeared during the interviews between two tools highly used by the companies, email marketing and e-newsletter. The difference between these two concepts was presented in a previous work of the authors (Pantea and Pop 2010: 738-739).

The exploratory research is recommended in case it is wanted the better understanding of a certain phenomenon, in comparison with the descriptive or causal research which is chosen for testing specific hypotheses or for studying the differences between variables (Malhotra and Briks 2007: 201 and next). *The limits* of the present qualitative research are represented by the fact that it had an exploratory character aiming to understand what happens inside the studied field and to study the social phenomena without “explicit outcomes” (Schutt 2009: 344 and next).

The results of the present qualitative research will form the basis for a quantitative study among the consumers in order to determine their opinion related to the way the online marketing tools are used by the tourism companies.

This article is a result of the project “**Doctoral Program and PhD Students in the education research and innovation triangle**”. This project is co funded by European Social Fund through The Sectorial Operational Programme for Human Resources Development 2007-2013, coordinated by The Bucharest Academy of Economic Studies.

THE COMPETITIVE POSITIONING OF THE SME'S ON THE MARKET

Pop (Bandi) Ramona

Universitatea Transilvania din Braşov, Facultatea de Stiinţe Economice

Having in view at the same time the possibilities identified for the development of the competitiveness of the Romanian SMEs in order to face the new challenges and the use of the opportunities to operate on the inner market as well as the on the level of the European Union, the strategy has in view a series of measures and actions that are connected to a series of priorities. These priorities and related actions were established on basis of the present-day situation of the SMEs carried out by the ANIMMC. According to the position of the SMEs on the market, these can choose different types of marketing strategies with the aim of attaining in a certain period of time of the objectives established and at the same time their consolidation on the market.

Key-words: SME's, competitive, integration, marketing strategies.

Cod JEL lucrare: M31

Introduction

The market of the SMEs has a distinct and complex character. The objectives and motivations of the SMEs are significantly different from those of the large companies, their objective strategies ranging from their wish to develop till the simple ensuring of the incomes of stable cash-flow. Frequently, in the case of the SMEs, the need to solve current problems – solving clients' requests and maintaining competitiveness – shadows the strategic „image” perspective. The providers have to concentrate upon adapting their products and services to these special needs and to support the SMEs to identify their essential problems they have to cope with.

According to a study ordered by the Cisco Systems and carried out in the month of October 2005 by the marketstudy company Caleman parkes, because of the large number of competing companies – SMEs on the European market, it isn't surprising at all that these type of companies state as their prime priority the preserving of their competition position they presently hold.

Having in view that the problems of competitiveness are generated by the small enterprises as well as by the large ones, the lack of resources may seriously hinder the capacity of the SMEs to face the competitive pressures. The wish to counter and avoid competitiveness, is really to be considered the permanent reason of “insomnia” of the SMIs, being considered to be the main catalyst of investments in technologies in the present as well as in the near future.

One of the aspects of foremost importance for the SMEs is the choice of the products or services that may assure maximum commercial advantages.

1.The SME's in the present-day integrationist trend

The attentive analysis of the issues of the SME's in Romania in the preaccession period allows a series of conclusions of generalising character.

First of all we note the continuous fragileness of the positions of the SMEs on internal as well as on international level, compared to the large enterprises. The whole activity of the ANIMMC shows the process of improving awareness of some support measures for the SMEs, for there is the danger of their disloyal elimination from the market, this fact bringing about a very serious social and economic impact. The thorough and very diverse activity of the ANIMMC, activity

that in fact is the result of the threats the SME's are confronted with, is, by itself, a measure of this reaction, of this threatening that makes it necessary.

Moreover, the activity of the Agency unfolds in the general framework of the Chart of Lisbon, therefore the problem of the SMEs is not a Romanian problem, but a European one, and what is more, we may state that it is a problem of the extension of the EU. Generalizing it is a problem of any integrationist phenomenon, and inclusively that of the process of globalization. The mechanisms by which the competitive position of the SMEs is continuously, systematically and objectively raised, in competition with the large enterprises, are the following:

- The scale economies. This refers to the well known phenomenon, but whose complex effects and dynamics for long periods are, probably scarcely studied, through which the mass product is competitively favoured in front of the product processed in small quantities.

As long as we discuss the theme of the scale economies only in the terms of the quantity and of the unit price, the phenomenon has a direct, mathematical explanation. Thus, the independent costs of the production volume (research-development, promotion, marketing) being the same, no matter of the quantity processed – the share of these costs in the unit price decreases as the production increases, because they are distributed at a larger number of products.

The approach may be extrapolated: a small or a middle size entrepreneur has generally the possibility to optimize his production by the short-term optimizing methods, by adapting the labour force to the fix existing capital. Even if he has the necessary knowledge for the procession optimizing for long-term, through establishing of the ideal relationship between the costs with the labour force and those with fixed capital, he usually doesn't have the necessary liquidities to make these procedures operational, especially from the point of view of enlarging the fixed capital and cannot obtain these liquidities but only through cost generating credits and supplementary risks.

From our notes it is clear that the scale effect may be extrapolated on-goingly to economic and extra-economic phenomena, deforming the competition equity as the result of the competition depends less and less on the relative merit of the competitors but more and more on the dimension of the resources they have at their disposal.

For example, one of the factors entirely associated with the initiative, that is, the risk, is also subject to a scale effect: the implication of the same volume of capital in an enterprise with the same risk factor may be discouraging for a small entrepreneur, who risks his entire capital into that enterprise, and the attraction for a large one, who risks only a small percentage out of his available capital.

We may also speak about a whole series of scale phenomena, economical or extra-economical, in which the size favours success: scale propriety, scale notoriety, scale net-work-communication a.s.o.. It is about situations in which the entity spoken about – propriety, notoriety, communication – has reached such dimensions that it self-generates and maintains itself without effort.

Scale phenomena and particularly scale economies should be regarded with discrimination from the perspective of competition and competitiveness. On the one hand, they normally represent the result of accumulating in time that had been generated by a superior competitiveness, under the conditions of a loyal competition. On the other hand, at the moment of analysis they decorrelate the economic result of labour and initiative, favouring the owner of large capital compared to the small and middle size entrepreneur.

- Assymetries – These can be material assymetries- the bigger economic power of the enterprise, that makes it more attractive as a client, more feared of as a competitor a.s.o. – then the institutional assymetries- the increased lobby capacity of the large companies etc – and maybe the most important ones the information assymetries. All these systematically defavour the SMEs in the so-called free competition on the market.

All these defavour systematically the SMEs in competition with the large enterprises, leading to what we call perfect competition to naturally transform into monopolist competition, this later on into oligopoly competition and than into monopoly, that is – into the situation where there is no more competition between the producers, but a competition between the unique producer and the consumer himself.

2. The market strategy of the enterprise

The necessity of adapting the company to the social-economic environment in which he unfolds his activity, represents an important condition for the development of an efficient activity.

This capacity of adaptation measured by the synergy of the enterprise depends on the material, human and financial power that it possesses as well as on the way it is carried out compared to the market. Every action of the enterprise finally is the result of the encounter between some needs of consume with the knowledge to satisfy them at the best-ever known level, thus, practicly, out of the direct confrontation of the demand with the offer. In order to accomplish this aspect it is of outmost importance for the enterprise to carry out two very important things:

- to study and understand the market it acts on
- to adapt its activity in such a way that it can be able to put into value the best market offered oportunitues (avoiding at the same time the possible dangers).

In order to carry out these things it is necessary to have a strategic vision over one's own activity, a vision that is more and more imposed by the new situations in which he develops his activity. It is about the analysis of evolution in time and space of the inner resources of the Enterprise (organising, technical and human) as well as of the external ones to it (competition in the field of providers-suppliers and of the clients, the modification of technologies, the modification of the leadership a.s.o.) The identification and materialization of the major objectives of the enterprise, around a strategical vision, as well as the strengthening of the postion on the market, the growth of the turnover, the improvement of the efficieny performances, a.s.o. - represent objectives of marketing policy of any economic organization.

3.The importance of positioning as a strategical option

The positioning is a basic element of the strategic planning of marketing, because any decision referring to spoitioning has direct and immediate implications over the whole marketing mix and at foremost it represents a communication strategy.

Positioning is a competitive strategy that places it in the contextual frame of the international marketing essence. Positioning should be competitive because the firstmost requirement is the differentiation among competitors on basis of a competitive advantage. This advantage may be obtained to the extent in which the enterprise grants its clients a superior value compared to that of the competition.

In order to properly solve the specifical problems of each aspect of positionin on the target markets, the SMEs have to use the relevant criteria and variables step by step in several successive phases. For some of the SMEs the choice of position is relatively easy. Others may face difficulties and end up by being positioned on the same positions with other competitors. In such situations, the strategies have to identify and create a portfolio of competitive advantages attractive for the target market and later ot communicate them and to let them be known in a convincing manner. From this point of view, that of competitiveness, the process of positioning includes three phases, respectively:

- the identification of the possible competitive advantages of the enterprise or brand (product);
- deciding over those that have to be stressed;
- the concretization (exact stating) of the concept of positioning.

These phases focused on the competitive differentiation may be included in a larger process that allows the highlighting of the aspects that facilitated the approach focused on the competitive advantage.

Conclusions

According to the position of the SMEs on the market, these may express their option for different types of marketing strategies towards which they should face to. These marketing strategies have in view a wholeness of „long-term” actions that move human resources as well as financial, material ones of the SMEs in order to attain in a given period of time the traced objectives and implicitly their consolidation on the market. It is implemented with tactics, techniques and of a very well determined instrumentation.

The marketing strategies have a pronounced diversity and are classified according to multiple criteria. The applying of a strategic variant or another stays at the choice of the management team of the SMEs. It is important to express option for a proper “recipe” for the possibilities of the enterprise and of the given moment. Because the non-adequate application of a strategy may destroy the whole structure of the business built with toil and sacrifices, sometimes for whole long years.

The strategic axis of an enterprise can be modified from one phase to an other. But when the company takes action in a turbulent surrounding, where unforeseen events may happen which do not comply with the usual risk calculus, the strategic alternance becomes a common fact.

These strategies investigate and find the ways of placing the offer of the small and middle size enterprises, in accordance with the necessities, preferences and perceptions of the envisaged groups of clients, with the demands of the target market as a whole that also include the competitors with their resources, experience, the components and competitive advantages of the company which they use in order to take the selected position.

EUROPEAN POLICIES FOR THE STIMULATION OF THE DEVELOPMENT OF SMALL AND MIDDLE SIZE ENTREPRISES

Pop (Bandi) Ramona

Universitatea Transilvania din Braşov, Facultatea de Stiinţe Economice

Europe's small and medium-sized enterprises are the engine of the European economy and the main drivers for achieving sustainable growth and more and better jobs. At EU level, the European Commission has developed a comprehensive SME policy, which aims to ensure that Community policies and actions are small-business friendly and contribute to making Europe a more attractive place for setting up a company and doing business.

Keywords : SME's, European Commission, financing opportunities, private and governmental policies.

Cod JEL lucrare: M31

Introduction

The Small and Middle Size Enterprises represent the engine of European economy and are also the most important driver of new jobs and economic growth. The European Commission through its actions, sets the needs of the small enterprises in the center of its policies. The European Commission develops and applies a variety of political measures especially conceived to support the SMEs in Europe. These policies have in view to create those conditions on which the SMEs can be created and be prosperous. But the SMEs will have the main role, if the EU follows its objectives of acceleration of the economic growth and creation of more and better jobs.

The new strategy of the Commission in the field of the SMEs aims to apply the principle „think small first” that allows the improvement of the business environment for the SMEs, the reduction of administrative costs, the simplifying and accelerating of the compulsory procedures, the improvement of the access of the SMEs to the markets and the growth of their competitiveness. The member states have taken responsibility, through the European Charter for the Small Enterprises, to develop a favourable business environment for the SMEs. One of the main objectives of the Community action is to allow its member states to benefit of the experience of their homologation and make use of its policies. This way everyone may become aware of the good practices and can apply them in his case.

The Commission has initiated a process of reduction of the bureaucracy the firms are confronted with and revises the existing community legislation, aiming to eliminate the unuseful administrative requirements. Also the member states are asked to follow the example of the Commission. According to the estimates; this exercise may reduce the administrative costs by 25%, costs that are presently paid by the SMEs.

The new Community policy on small and medium-sized enterprises (SMEs) creates a more coherent, pragmatic and horizontal framework for these enterprises. It aims to unlock the vast untapped potential of SMEs to create growth and employment within the European Union. SMEs will become more competitive, due to the promotion of entrepreneurship, improved access to internal and external markets, simplified Community legislation, improvement of their growth potential and an effective partnership with SME stakeholders.

Small and medium-sized enterprises (SMEs) make a major contribution to growth and job creation in the European Union (EU). This is why the new policy on small and medium-sized enterprises (SMEs) creates a more coherent, pragmatic and horizontal framework for these enterprises.

Promoting entrepreneurship and developing an environment favorable to SMEs will allow them to become more competitive. SMEs are very diverse, and consequently have different needs to become more competitive. Some are active in vast markets, others in local or regional markets. If by definition all SMEs have fewer than 250 employees, some are micro-enterprises, others are family SMEs. In order to unlock the growth potential of SMEs as a whole, policies and action to support them need to reflect this diversity.

The success of this new policy will depend on the effective involvement of all SME stakeholders, national, regional and European, public and private.

1.Policies in the field of the SMEs

The SMEs are responsible for a great proportion of the economic and vocational activity in Europe. This governmental policies must be adopted that should contribute to the stimulation of the development of the SMEs.

1.1 Presentation of the main financing opportunities granted to the SMEs

The Capital is essential for the start of development of a company, but to find out the most adequate financing form is very often a major obstacle for the small and middle size enterprises. The investors and the banks often avoid paying the initial costs of foundation of the SMEs due to the implied risks. Sometimes the entrepreneurs do not entirely understand the concerns of the investors or the banks, fact that makes it difficult to find the necessary financial support. Presently, the European Commission is implementing a number of programs especially granted to the environment of financial improvement of the SMEs in Europe.

The European Union offers support to the small and middle size enterprises in Europe.

This may be found under different forms, like subventions, loans and in some cases –guarantees. The support may be offered directly, in the forms of the programs managed under national or regional level - as the Structural Funds of the European Union. Also, the SMEs may benefit of a variety of non-financial consultancy measures offered as programs and services of support for enterprises.

This tool aims to present the main community programs existing for the SMEs and contains a short description as well as the main sites of each program.

The European Commission collaborates with national authorities at the improvement of the financial environment for SMEs. Through the organization of experience interchanges and good practices between the national governments, the Commission has allowed many member states to bring concrete improvements to the financial environment for the SMEs. Also the Commission has taken floor in the dialogue between bankers and SMEs in order to identify and reduce the main obstacles that the small enterprises may come across when looking for a financing form.

1.2 An adequate legal framework for the stimulation of the development of the SMEs.

Presently the European Union undertakes huge efforts to reduce bureaucracy inside the existing legislation as well as in the legislative propositions. For the beginning, the Commission has rejected 68 projects of laws in 2006 and other ten projects in 2007. For the beginning the Commission works at the diminishing of the number of laws that has in view the simplifying of the SMEs' activities. These include the reduction of the reporting imposed by the accounting regulations, the reduction of costs for the trans-border taxes and the simplification of the customs procedures. We have to assure the fact that the new laws do not make the activity of the SMEs more difficult but have in view their needs.

This is a part of the principle “think small first”, introduced by the Commission in 2005, once with the presentation of the new policy regarding the SME's. All the legislative propositions have as object of a thorough verification regarding their potential impact on the SMEs.

1.3 Guarantee of the loyal competitiveness

A unique competitive and open market is the best guarantee offered to the SMEs, that follow to increase the effectiveness and their innovation potential. Thus the EU has introduced a powerful policy in the field of competitiveness which should protect the SMEs against the non-loyal competitions of other economic agents. Without neglecting its engagement for a free competitiveness in Europe, the Commission updates its regulations in order to encourage the national and regional authorities to further redirect the public subventions. The Commission will continue to reduce the controversial actions and those which modify competitiveness in favor of the national champions and in change to sustain those measures that contribute evidently to the intensification of growth and job creation.

Because the European SME's have the biggest growth potential and of new job creation, the small firms will be the first ones to benefit of these measures.

A particular field the Commission is concentrated upon is the prevention of abuse of dominant position. The large firms that exploit its power of market in order to eliminate the smaller competitors are implicated in anticompetitive practices that are forbidden by the Community legislation. The Commission grants a special attention to the complaints made by the small enterprises that reflect such situations.

Also, such fusions are forbidden that create or consolidate a dominant position, impeding such potential abuses that may come afterwards. Generally the mergers which imply SMEs are not object of a Community control, because these cases do not have a European dimension. However, some arrangements between the large companies can damage the competitors, against the smaller enterprises. The most familiar examples are the arrangements regarding the prices or the cartel in which the companies establish as commonly agreed the level of prices, thus the clients cannot benefit of the competition between the suppliers in order to obtain lower prices.

On the other hand the arrangements between the SME's are to a high extent exempted from the interdictions stipulated in the Community treaties.

These should be able to protect from the competitors from abroad who do not observe the rules. The objective of the European commercial protections tools TDI is to protect the European companies from the commercial un-loyal practices from the third countries, as well as against the dumping or subventions that negatively transform the market. Also, these instruments protect the European producers in case of some strong and instant waves, of unforeseen import. The antidumping anti-subvention measures aim to reestablish of an efficient and loyal competitiveness on the inner market. These instruments have an important role for the SMEs. The Commission has initiated communication and counseling actions especially by the Euro-Info Centers wanting to assist the SMEs in their work with these instruments.

Also an assistance office was launched for the SMEs. At the same time the Commission views upon the third countries in order to verify whether these use the commercial protection instruments legally and correctly, directed against the EU. In case needed the Commission intervenes to guarantee the access of the European companies on the third country markets many representing a problem to the SMEs.

Conclusions

The development policies of European level aim to improve the existing situations, to eliminate the existing disfunctions, the balancing of the future development and consolidate the developing directions.

According to the specific situation on local level the, development policies may be separated as:
- policies based on opportunities that allow the contractation of weaknesses - combinations that support strategies directed towards change;

- policies based on opportunities sustaining strengths – combinations that sustain offensive strategies;
- policies based on weaknesses and threats – combinations that support defensive strategies;
- policies based on strengths and threats – combinations that sustain diversified strategies.

For each one of the given policies development programs are proposed, as general formulas, which at the stage of the action plan will turn into groups of projects, whose accomplishment will lead to the implementation of development policies.

The success in solving the problems of economic development of the SMEs and of implementing the adopted policies can be attained only through collective efforts of the governmental, private and non-governmental sectors.

INVESTIGATING THE PATIENT SATISFACTION WITHIN ROMANIAN PUBLIC AND PRIVATE HOSPITALS

Popa Adela Laura

University of Oradea, Faculty of Economics, Oradea, Romania

Roșca Remus Dorel

University of Oradea, Faculty of Economics, Oradea, Romania

Mihoc Florin

Emanuel University of Oradea, Management Faculty

Although it is not commonly accepted within healthcare services industry, the importance of marketing is more and more recognized nowadays by the organizations activating in the field. Current perception resides in a series of factors as: ethical aspects involved in the delivery process; special characteristics of the market; particular profile and behavior of the consumers of healthcare services and probably because of the inadequate understanding of the marketing role in the life of an organization. A deep analysis in the field of healthcare services will emphasize not only its complexity, but also its interdisciplinary feature under many aspects, as it is an area where many fields of interest are intersecting, both economic and social. It also reveals a particular field of study with many particular features - considered a sensitive field (Popa and Vladoi 2010: 232). Generated using the SERVQUAL model, the data presented in the paper are the result of a quantitative research designed to measure and compare the patient/client satisfaction degree for public and private medical services provided by the Romanian hospitals. The aim of the research is to identify and to measure the gap that appears between the patient/client' expectations and perceptions regarding the delivered services; to identify the potential profile of the private Romanian hospitals' clients regarding the demographic features and also to pin-point correlations between the image created in the mind of the Romanian patients/clients and the type of medical services (public or private) they were using. We consider that the results of this research are valuable for the managers of the medical units in order to initiate series of actions aiming to improve the quality of their services and, as a result the patient/clients' satisfaction degree. Later being one of the most important performance indicators of an organization that activates in a highly competitive business environment. We also consider this research may be useful in the process of improving the quality of the medical services in Romania, which must be a priority for any medical units' management and for the society as a whole. Present paper intends to lay foundation for future research, tailored to correlate the quality culture for the Romanian hospitals and the satisfaction degree of their patients/clients.

Keywords: relationship marketing, patients' satisfaction, public and private medical services, Oradea, Romania.

JEL Classification: M31, I11

1. Introduction

The present paper is mainly focusing on presenting the results of a research whose aim started from the idea that satisfaction represents a major vector that leads to customer retention and loyalty (Chiou and Droge 2006: 613). Details regarding the research aim and methodology were the subject of article entitled *Measuring Patient Satisfaction within Romanian Healthcare Services – a Relationship Marketing Approach*, included in the program of the 15th IBIMA

Conference *Cairo, Egypt 6-7 November 2010*. Below is the summarized essential features of the research methodology of the above paper.

The purpose of this research was concentrated on analyzing the satisfaction degree as perceived by patients within public and private medical systems from Oradea, Romania; on analyzing discrepancies between levels of expectations and perceptions on the 5 dimensions which were taken into account to measure satisfaction level, and on identifying a potential customer profile for private medical services, starting from key demographic characteristics (Popa et al 2010: 842-846).

The paper objectives are:

- Quantify discrepancy between expectations and perceptions regarding patients' satisfaction;
- Identify customer's profile for private medical services starting from key demographical characteristics;

Referring to the research methodology, in order to measure patients' satisfaction degree regarding quality of medical services, we use SERVQUAL model, developed by Parasuraman et al. in 1985. The five dimensions of the SERVQUAL model, exhibited on a double 22 scale items, are the followings (Parasuraman, Zeithaml and Berry 1988; Parasuraman, Berry and Zeithaml 1991; Bruhn 2001: 82-83): **Tangibles** – physical/tangible environment acceptability: physical facilities, equipment, image/personnel posture; **Reliability** – reliability/trust/honesty: capacity to deliver promised service in a consistent and correct manner; **Responsiveness** - availability/receptivity: willingness to support and offer a prompt service; **Assurance** – competence/certainty: personnel knowledge and skills, degree of inspiring trust and responsibility; **Empathy**: involvement, dedication, care, capacity of giving attention individually to each patient.

By comparing *the ideal profile* – that describes the ideal situations and *the real profile* – that describes the real situations (Bruhn 2001: 83) we will measure discrepancy between expectation and perception levels.

Present research is descriptive and cross-sectional one and has been conducted in May 2010, was focusing on inhabitants of city of Oradea and surrounding areas that have accessed medical services, whether public or private in the last 3 years (during 2007-2010). The research was conducted online using a nonprobability sampling technique, the snowball sampling. From a total of 141 questionnaires applied, 128 were used in final analysis.

This quantitative research has the survey as research method, supported by a structured questionnaire consisting of 57 questions, of which 22 evaluated on a double scale.

2. Data analysis and interpretation

Table 1 exhibits the demographic characteristics of the group of respondents, as follows:

Table 1: Demographics of respondents

	Number of respondents	%
Gender (n=128)		
- Female	84	65,6%
- Male	44	34,4%
Age groups (n=127)		
- under 25	35	27,6%
- between 25 and 34 years	40	31,5%
- between 34 and 44 years	28	22,0%
- over 45 years	24	18,9%
MissingSystem	1	

	Number of respondents	%
Income (n=128)		
- < 1000 Ron (< 230 Euros)	48	37,5%
- Ron 1001 - 2000 (Euros 230-470)	41	32,0%
- Ron 2001 - 3000 (Euros 470-700)	14	10,9%
- > 3001 Ron (>700 Euros)	11	8,6%
- Do not know	11	8,6%
- Decline to answer	3	2,3%
Studies (n=128)		
- Undergraduate Studies	59	46,1%
- University degree	39	30,5%
- Postgraduate Studies	30	23,4%
Type of medical services (n=128)		
- Private	68	53,1%
- Public	60	46,9%

Source: own research

Overall aim was to identify a possible profile for the people who turn to the private medical services. By correlating the variable **Type of medical services (public/private)** with each of the variables **Gender, Age groups, Income, Studies**, conclusion reached was that out of those who required private medical services:

- 73,5% are women;
- 38,8% are between 25 and 34 years old;
- 45,6% have highschool education;
- 49,1% have the income under 1000RON (about 230Euros).

It is important to mention that there is a significant correlation (Pearson coefficient value being 0,034 <0,05) only when we have it between *Type of services* and *Gender* variables. Still, the intensity of the link is weak, Cramer coefficient value being of 0,177. From a standpoint of these characteristics, there is not resulting a profile of the private medical services customer, at least at Oradea level.

H1: The discrepancy between expectations and perceptions is bigger in the case of public medical services than in the private ones.

In order to check this hypothesis, for each of the 5 dimensions involved in the satisfaction level calculations we determined the average results both at expectation and perception levels. The discrepancy is calculated as difference between the results on these 2 levels.

Based on the resulted data, it can be concluded that the level of discrepancies between expectations and perceptions related to medical services is a lot less for private services (the values are between 0,40 and 0,79 for private medical services, while they have values between 1,39 and 1,67 for public medical services).

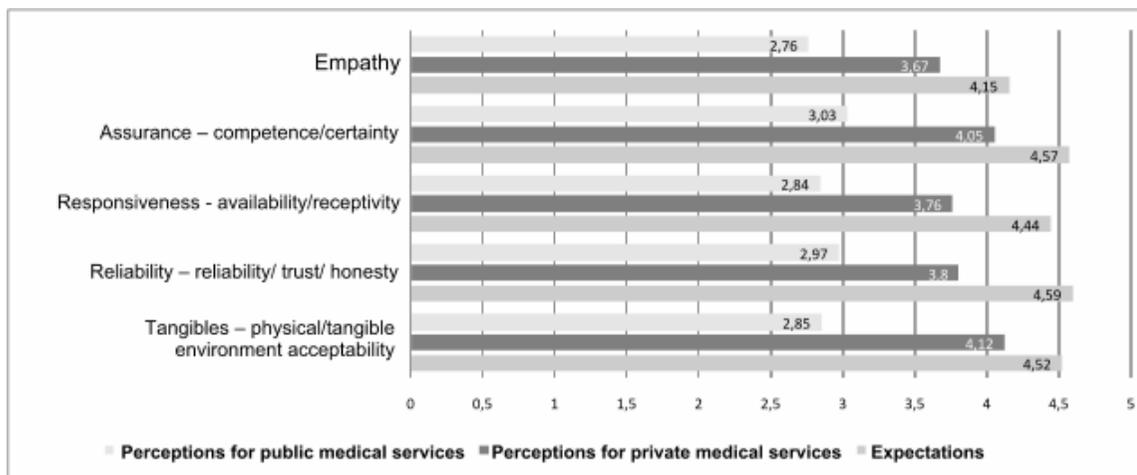

Figure 1: Comparison expectations vs. perceptions for medical services (public vs. private)
Source: own research

According to the above data we can remark that the highest level of expectations from the medical services aims at Reliability followed by that of Assurance. The smallest score regarding expectations refers to Empathy.

Interestingly enough regarding perceptions is that the highest calculated score for the public medical services is lower than the lowest score for the private medical services. It is also worth mentioning that the smallest calculated results concern empathy, for both public and private medical services. Also, even if there is a difference between the scores calculated for the perception of dimensions in the case of private medical services compared with the public ones, the hierarchy is almost the same. The only difference is that the perception of the physical elements has the highest result for the private medical services (see Tables 2 and 3).

Table 2

Hierarchy perception scores for public medical services	
Empathy	2,76
Responsiveness - availability/receptivity	2,84
<i>Tangibles – physical/tangible environment acceptability</i>	2,85
Reliability – reliability/ trust/ honesty	2,97
Assurance – competence/certainty	3,03

Source: own research

Table 3

Hierarchy perception scores for private medical services	
Empathy	3,67
Responsiveness - availability/receptivity	3,76
Reliability – reliability/ trust/ honesty	3,8
Assurance – competence/certainty	4,05
<i>Tangibles – physical/tangible environment acceptability</i>	4,12

Source: own research

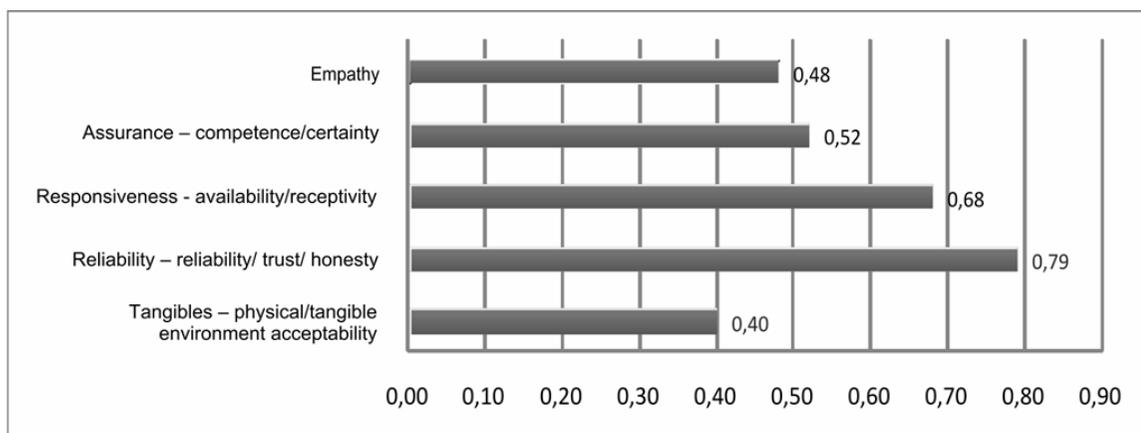

Figure 2: Discrepancy between expectations and perceptions for private medical services
Source: own research

It can be noticed that for the private hospitals, the greatest discrepancy is in Reliability/Trust/Honesty, a dimension that has actually the highest level of expectations. The smallest discrepancy concerns the physical environment, the tangibles. A pretty low value can be noticed for the empathy, this one having also the smallest value regarding expectations.

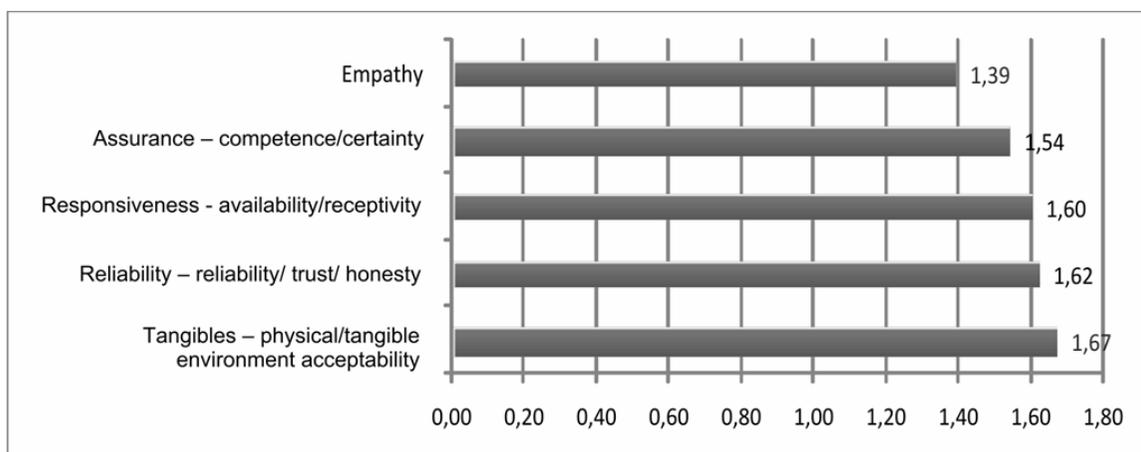

Figure 3: Discrepancy between expectations and perceptions for public medical services
Source: own research

The dimension which reflects the quality of endowment is the one with the biggest value referring the discrepancies between expectations and perceptions for the public medical services. Although the values are close enough, we see that the smallest discrepancy aims at empathy.

3. Conclusions and future research approach

- The hypothesis according to which the discrepancy between expectations and perceptions is bigger for the public medical services than for the private ones is confirmed. The scores calculated for the way in which the 5 analyzed dimensions are perceived from the quality point of view (of the offered satisfaction) are between 2,76-3,03 for the public medical services and between 3,67-4,12 for the private ones, 5 being the maximum value to give.
- The highest score calculated for the public medical services is smaller than the smallest score calculated for the private medical services.

- Another interesting aspect refers to empathy. This has the smallest score for both expectations and perceptions in both private and public medical services. An explanation of the low score regarding the expectations of this dimension could be the way in which it has been perceived in the course of time. The empathy here refers to the involvement, dedication, care, capacity of offering/giving attention to each customer/patient individually.
- There is solid argument, at least for Oradea surveyed area, from the point of view of these characteristics, that a profile of the private medical services customer is still vague and undefined.
- Even if there are discrepancies between the private medical services and the public ones for the calculated scores of the 5 dimensions, the hierarchy is almost the same: Empathy, Responsiveness, Reliability/Trust/Honesty, Competence/Certainty, except for the dimension aiming at the Physical/tangible environment acceptability. This one has the highest score for the private medical services and the third place for the public ones.
- As future research, we intend to measure (using a structured questionnaire) the intensity of the quality culture for the Romanian hospitals. As a consequence of all these results, we seek to validate there is a correlation between quality culture for the Romanian hospitals and the satisfaction degree of their patients/clients.

Positioning is a very important marketing concept. Its importance was strongly emphasized and implemented in the case of companies, but is somehow neglected when it comes to states. A country acquires a position in the mind of a person very much like any other product does, which is very important especially when that person exerts an executive role. Nowadays Russia has a poor image or no image at all, both internationally and in Romania. In order to regain an important position in the Balkans region, Russia must set aside any political agenda and reposition itself as a business partner on equal terms. The first goal of this article is to clarify Russia's position in the minds of future Romanian executives. The second goal is to outline a recommended course of actions for Russia's repositioning.

Keywords: marketing, positioning, strategy, Russia, marketing research.

JEL Code: M3.

Conceptual framework

The concept of positioning is strongly linked with the process of trade. Positioning was one of the marketing elements that had been used since the beginnings of trade. However, in those days its meaning was rather limited, focusing on the concept of "reputation". All the merchants were seeking a good reputation and wanted to stand out with something: the best/fresher products, the widest range of goods, the most famous/important clients. Further on, at the beginning of the 20th century, the social and economic progress led to the appearance of marketing as a science. However, we can definitely conclude that this isn't the birthday of positioning. This concept is not typical of the first two stages in marketing's evolution, namely the orientation towards production (1900-1930) and the orientation towards sales (1930-1950). This is due to the fact that the concept of positioning cannot endorse a theory whose primary focus is not the consumer. Therefore, the concept of positioning is typical of the orientation towards marketing.

The word "positioning" was introduced by Jack Trout, an advertising executive, in his 1969 article published by "Industrial Marketing" and "Advertising Age". A few years later, in 1972, he teamed up with Al Ries, another advertising executive, in order to write an article called "Positioning cuts through chaos in marketplace", also published by "Advertising Age" (Enis and Cox 1988: 410-420). This was only the beginning of their lifelong crusade aimed at establishing positioning as one of the most important concepts in marketing.

The first battle that had to be fought was over the content of positioning. As always, when a new concept arises, there is more than one opinion about its meaning. For instance, some authors considered that positioning is the differentiation of brands by studying the ways in which their consumers differ as well as how consumer perceptions of various brands differ (Alpert and Gatty 1969: 65). The flaws of their approach are that positioning is not presented as a process which unfurls in the mind of the consumer and its result is a classification of brands. There are authors who consider positioning to be a promotional strategy which attempts to place a brand along one

or a number of dimensions relative to other brands in the same generic class. No matter what dimensions are employed, positioning is essentially a strategy used by the marketer in an attempt to find a niche for his brand (Houston and Haneski 1976: 38). This is obviously a narrow definition with respect to positioning. This concept has equal importance for product, price, promotion and placement, which means that it cannot be just a promotional strategy. Positioning is very useful not only when looking for a market niche, but especially when confronted with strong competition. From the management standpoint, the author believed that positioning is a decision to serve a particular segment with a program tailored to those specific customer needs (Biggadike 1981: 624). Unfortunately, we can highlight here a confusion between targeting and positioning.

Nevertheless, after a few decades of debate the Ries & Trout definition of positioning prevailed. The story goes like this: a company discovers different needs in the marketplace, segments the market accordingly, targets those needs that it can satisfy in a superior way, and then selects and communicates a position which is relevant, effective and consistent with the company's distinctive offering and image. Positioning is the act of designing the company's offering and image to occupy a distinctive place in the mind of the target market. The result of positioning is the successful creation of a "customer-focused value proposition", a cogent reason why the target market should consider buying the product (Kotler and Keller 2006: 310). If a company does a poor job of positioning, the mind result will be a generalized confusion and a poor classification. On the contrary, if a company does an excellent job of positioning, then the rest of its marketing planning comes along smoothly.

The second battle that had to be fought was over implementing the concept of positioning in the daily business practices of every organization. We are still in the middle of this battle. Any organization should be interested in this concept, as all the successes and failures that were recorded on the for profit and not for profit battlefields can be easily explained using the positioning paradigm. Nowadays, there are still companies which go straight from identifying the need to marketing mix, but there are also many companies which use positioning as a weapon to undermine the competition and hypnotize the consumers. Nonetheless, there is still work to be done in order to clarify the role, ease the implementation and expand the scope of positioning to every human activity on Earth. There is also a need for improved marketing research methodology for positioning studies. A good progress in this area has been made by using the "means-end chains theory" (Vriens and Ter Hofstede 2000: 4-10).

Unfortunately, we face a much greater challenge when it comes to countries. Before embarking in such a difficult endeavor, we must ask ourselves: is really positioning a concept that can be applied to nations? Not only that the answer is yes, but it's very important for a country to make a constant effort regarding its position in the public's mind. Let's examine a few examples which support my theory (Popescu 2010: 119):

A) countries which ignore the concept of positioning:

1) Romania.

After 45 years of communist rule, Romania emerged on the world stage as a country with a very poor international image. For the international public, Romania was the country that shot Ceaușescu (the former communist leader) during Christmas, after the bloodiest and most violent anti-communist uprising in the whole Eastern Europe. The easiest way to see the results of little to no effort concerning positioning is when a conflict arises. In March 1990, Romania was experiencing an interethnic turmoil in Târgu Mureș, a city with a strong Hungarian minority. After a few weeks of rising tensions the Romanians and Hungarians clashed, leaving five dead and tens of others wounded. Romania/Romanians were depicted by the international media as the aggressor. Why? Let's examine the facts. Romanians were the majority, Hungarians were the minority. Romania had a poor international image, Hungary had a good image, boosted by a very

active lobby. Conclusion: the country with a poorer international image is very likely to be depicted as the aggressor and/or the guilty party in any conflict. A further downside is that, in the near future, such a poor image tends to go from bad to worse. In our case, Romania's image was further deteriorated by repeated miner uprisings and the illegal activities of the Romanian émigrés.

2) Serbia during the Yugoslav secession war.

The secession of a few members of the Yugoslav Federation should have been a peaceful process. Unfortunately, Serbia made the mistake of going to war against its neighbors under pretext of protecting the Serbian citizens who lived there. Although all parties were guilty of genocide and ethnic cleansing, Serbia was depicted as the aggressor. Why? Serbia had the advantage of numbers over any of its adversaries. Moreover, the international image of Serbia was damaged by the dictatorship of Slobodan Milosevici. Conclusion: Serbia had a poorer international image than Slovenia and Croatia, and it was immediately designated as the aggressor.

3) Russia during the 2008 Caucasus war.

The Caucasus is a sensitive region for Russia. On the one hand, Russia faces a separatist movement in Chechnya, and so far it has been unable to end this conflict with a negotiated solution. On the other hand, Russia supports two separatist movements in Abkhazia and South Ossetia, at the expense of Georgia. When Georgia tried to regain control over South Ossetia, the Russian troops intervened under the same pretext of protecting its citizens who lived there. This is a fallacious pretext and, as a result, Russia was depicted as the aggressor by the international media. The reasons are more than obvious: Russia has a history of imperial behavior towards smaller nations and it enjoys an overwhelming military advantage over Georgia. Moreover, the other side had a good international image as Mr. Saakasvilli came to power by ridding the wave of the orange revolution.

B) countries that apply the concept of positioning – The United States of America.

They are the classic example of outstanding communication for positioning purposes. Not all the conflicts in which America involved itself were just wars, but they were able to see them through without being labeled as the aggressor. The best example was the 2003 war against Iraq. Saddam Hussein had no weapons of mass destruction, but with tenacious and focused communications they convinced the public that he had. When the facts proved them wrong, they claimed that the morally acceptable reason for having this war was overthrowing Saddam Hussein and bringing democracy to the Iraqi people. This kind of mind juggling is possible only when you have a good international image, and such an image cannot be built overnight. America built its image since World War II by offering financial support to the Western Europe countries, by supplying security to its NATO allies, by exporting the American way of life, by movies in which is depicted as "the land of promise", "the home of the brave" and so on.

Based on the above examples, I believe we can derive a few conclusions (Popescu 2010: 119). First of all, it's obvious that the concept of positioning can be applied and is useful even when it comes to states. The positioning paradigm has helped us to analyze and understand the above examples. Second of all, the international image of a country is the main element which determines the position it occupies in the mind of the public. A country acquires a position in the mind of a person very much like any other product does. During its life, a person uses a multitude of sources (personal experience from visiting the country and/or interacting with its citizens, close relatives, friends, opinion leaders, mass media, other sources) in order to accumulate information about a country. Based on this information flow, a person builds and constantly updates the image of that country. This image can be summarized in one or a few words which describe the position it occupies in the mind of the person. This position is very important, as it will determine the person's future attitude towards that country and everything related to it. We

can further conclude that international media plays a vital role in implementing positioning, but there are also other tools for creating and communicating one's position. Last but not least, we can doubtlessly conclude that the easiest way to see the results of little to no effort regarding positioning is when a conflict or a crisis situation arises.

Our research

Keeping in mind the above conclusions, we can now take a closer look at the case of Russia. Generally speaking Russia has a poor international image, but when it comes to the Eastern European states the image is even poorer. This shouldn't come as a surprise for anybody. When the Soviet Union collapsed, Russia was very eager to inherit most of its assets and very reluctant to inherit most of its liabilities. Willy-nilly, Russia has to accept this burden, as it is considered the rightful heir of the USSR. The research has been conducted in Romania, so the results present only the position of Russia in the minds of my Romanian respondents. A future development on this theme would be to determine Russia's position in every Eastern European country and in Eastern Europe as a whole.

In order to guarantee the validity of our findings, we chose a full research. Thus, all the 3rd year (last year) students were asked to fill in a questionnaire regarding the positioning of Russia. We chose this group of respondents because starting this September they will begin working for Romanian or multinational companies. Their opinion is important because in the long run they are the future executives of those companies and, who knows, maybe the future leaders of the country. The following results were just a confirmation of our previous assumptions.

Our first objective was to determine whether the respondents believed Russia to be an interesting tourism and business destination or not. Previous research (Popescu 2010: 119) has shown a strong correlation between thinking highly of a country and selecting it as a future tourism or business destination. First of all, I compared Russia with other major European tourism destinations, such as France, Spain, Italy, UK and Germany. In this case Russia finished in the last place, having a poor minus 0.64 Likert score. Only 24% of the respondents selected Russia as a possible tourism destination, far behind UK with 80% or France with 79%. Second of all, I tried a regional approach by comparing Russia with all the other Eastern European countries. There were no positive Likert scores, which tells us that the Eastern European countries are far less popular as tourism destinations than their Western counterparts. Russia was indicated by only 23% of the respondents, trailing Croatia with 39%, The Czech Republic with 32%, Bulgaria with 30% and Hungary with 26%. We can now conclude that Russia's results are mediocre. From the tourism standpoint Russia isn't among the market leaders, as it was mentioned as a possible future destination by less than a quarter of our respondents.

The next step was to determine whether the respondents believed Russia to be an interesting business destination or not. First of all, I compared Russia with Germany, UK, France, Spain and Italy as main European business destinations. Again Russia finished in the last place, with a poor Likert score of minus 0.62. Only for 20% of my respondents Russia is a possible future business destination, far behind UK with 59% or Germany with 58%. Second of all, the regional approach compared Russia's business opportunities against the potential of all the other Eastern European countries. This time we had only negative Likert scores, as an indication that the regional business opportunities are either unknown or unattractive for our respondents. Russia was indicated by only 22% of the respondents, trailing Hungary with 30%, Bulgaria with 29%, The Republic of Moldova with 27% and Poland with 26%. Again Russia is not on the podium. This is a disastrous result if we take into account Russia's abundantly existing business opportunities.

Besides the poor international image, the above results are also due to the lack of information about Russia's opportunities. Most of my respondents confessed that they know very little about

anything concerning Russia, but they are eager to learn more. 67% of our respondents showed a lot of interest regarding Russia's touristic and business opportunities.

We have shown previously in this article that during its life, a person uses a multitude of sources (personal experience from visiting the country and/or interacting with its citizens, close relatives, friends, opinion leaders, mass media, other sources) in order to accumulate information about a country. Now we can tell for sure which are the sources used by our respondents in order to gather information about Russia. The internet was by far the most widely used source, as it was mentioned by 91% of the respondents. Very popular sources of information are also television (52%), the opinion of friends and relatives (48%) and the press (35%). Lesser used sources include participation to various events (24%), Russian cultural centers/associations (9%) and student organizations (6%).

The above results allow us to derive a few important conclusions. First of all, there is an obvious lack of information about everything concerning Russia, and this situation doesn't lead to a neutral but to a negative image. Russia needs to communicate more and do so in languages of international circulation. Second of all, Russia needs to communicate better, meaning that it should supply the international public with all the information that might be of interest. There is a significant interest for touristic, business and other types of opportunities, but the information available are scarce. Last but not least, Russia needs to take full advantage of the information sources available. If most of the respondents are using the internet, there is a need for better information sites, with at least an English version. If the respondents are using television, we need to support as many news about Russia as possible and we need a Hollywood-like film industry. Russia also needs to organize as many events as possible and to offer educational opportunities in partnership with student organizations.

This is the road ahead. It's a difficult road, but at the same time it's the only road. If Russia doesn't take this road, its image can only go from bad to worse.

VI. Note

POSITIONING VS. STUDENTS, A TROUBLESOME RELATIONSHIP

Positioning is one of the most powerful marketing concepts. At the beginning, the meaning of positioning was rather limited, focusing on the concept of reputation. Then it became "the place a brand occupies in the mind of its target audience". Under this meaning , many companies have implemented the concept of positioning as a part of their everyday marketing activities. Nowadays, you can position not only products or services, but also people, ideas and countries. The concept of positioning is simply too important to be ignored. Thus, it is our opinion that any student who graduates the first 3 years cycle should know the fundamentals of positioning. Unfortunately, this concept still doesn't have a clear place in the marketing faculty's syllabus and, as a result, it's not properly taught. The research is focused on determining the students' current level of understanding regarding the positioning concept and on identifying possible solutions for the future. What should we do in order to help the concept of positioning to acquire a place in the minds of our students?

Keywords: marketing, positioning, marketing research, education, mind.

JEL Code: M3.

Conceptual framework

The concept of positioning is strongly linked with the process of trade. Positioning was one of the marketing elements that had been used since the early days of trade. However, back then its meaning was rather limited, focusing on the concept of "reputation". All the merchants wanted to have a good reputation and to stand out with something: the best products, the widest range of goods, the most famous/important clients. Further on, at the beginning of the 20th century, marketing emerged as a science due to the accumulated social and economic progress generated by thousands of years of evolution. However, we can clearly conclude that this isn't the birthday of positioning. The concept of positioning is typical of the orientation towards marketing (1950-1990), thus setting its birthday in the second half of the 20th century.

The word "positioning" was introduced by Jack Trout, a practitioner from the advertising industry, in his 1969 article published by "Industrial Marketing" and "Advertising Age". A few years later, in 1972, he teamed up with Al Ries, another advertising executive, in order to compose an article called "Positioning cuts through chaos in marketplace", also published by "Advertising Age" (Enis and Cox 1988: 410-420). So, what's the meaning of positioning? Positioning is the act of designing the company's offering and image in order to occupy a distinctive place in the mind of the target market. A good brand positioning helps guide marketing strategy by clarifying the brand's core values. The result of positioning is the successful creation of a customer-focused value proposition, a cogent reason why the target market should consider buying the product (Kotler and Keller 2006: 310).

There are still some pendent aspects about the concept of positioning. The first problem is where to fit this concept in the marketing process as a whole. In my opinion, positioning should have its

place in the following sequence: marketing research, segmentation, targeting, **positioning**, marketing mix design. Nowadays, there are still too many companies which go straight from identifying the need to marketing mix, without even considering their positioning alternatives. This situation of "no positioning" is the worst possible. Ideally speaking, any company should act as follows: it identifies a set of different needs in the marketplace, targets those needs that it can satisfy in a superior way, and then selects and communicates a position which is relevant, effective and consistent with the company's offering and image. If a company does a poor job of positioning, the only possible outcome will be a generalized confusion. On the other hand, if a company does an excellent job of positioning, then the rest of its marketing planning should come along easily.

The second problem derives from the first and concerns the role of positioning fulfill in the marketing process. I believe that positioning has the role of coordinating the company's marketing endeavor. We can break the marketing process into four stages:

- **the research stage**: the company gathers all the necessary information related to the general environment, the market and its competitors;

- **the positioning stage**: after analyzing the above data, the company must select a position that offers the best prospect of success on the market, but also a position it can support with its strong points;

- **the marketing mix stage**: upon choosing the desired position, the company's task is to communicate it through all the components of the marketing mix. The company's brand cannot occupy the desired position unless all the components of the marketing mix deliver the same image;

- **the implementation stage**: this stage can determine the success or failure of the company's marketing efforts, because process management errors can result in seriously damaging marketing mistakes.

Consumers usually buy products/services that offer them the greatest perceived value. The brand's **value proposition** refers to the full set of attributes/benefits/values upon which the product/service is positioned. Usually, the company can choose from a few positioning alternatives which are available, relevant and within reach. However, there are only five winning value propositions, meaning that the company gains a competitive advantage. When speaking about education, we can adapt these **5 winning positioning alternatives** (Kotler and Armstrong 2006: 225) as follows:

- 1) **More for more**. This alternative involves providing superior quality, craftsmanship, durability, performance or style and charging a higher price to cover the higher costs. The strong point of this alternative is that it symbolizes status, thus giving prestige to the buyer. Yet, this alternative is vulnerable to imitations and economic downturns. In the field of education, this position is occupied by the foreign universities. They offer higher status, giving prestige to their alumni. As a result, they charge a significantly higher price than their Romanian counterparts;

- 2) **More for the same**. This alternative is aimed at attacking the more-for-more positioning. If applied correctly, this alternative can be highly successful. In the field of education this position is unoccupied, and it represents the best choice for the Romanian public universities. By building connections and partnerships with the business environment, they could provide more value without significantly rising the taxes;

- 3) **The same for less**. This can be a very powerful alternative, building its success on the fact that everyone likes striking a good deal. This alternative is also applied when companies develop imitative and lower-priced brands in order to steal market share from the leader. In the field of education, this position is occupied by the Romanian private universities. They claim to offer the same education as their public counterparts, but for less money;

4) **Less for much less.** This alternative is built upon the idea that not everyone can afford only the best in what they buy. Many consumers will settle for a product/service that offers less and as a result costs less. One of the risks involved in applying this alternative is going beyond the lowest level of quality and performance acceptable for the consumer. A second risk appears when this alternative is used by two or more companies on the same market, which can lead to price wars. This alternative doesn't really apply to the field of education. Most people wouldn't take the chance of getting a poor education just for the benefit of paying much less for it;

5) **More for less.** If possible to achieve, this would no doubt be the winning positioning alternative. In the short run this is actually possible, but in the long run companies will find it very difficult to deliver on both of these promises. As offering more usually costs more, sooner or later companies must decide if they want to compete primarily on "more" or on "less". This is also an alternative that doesn't apply to the field of education.

Each brand must choose the positioning alternative that best serves the needs and wants of its target segments. In any market, there is always room for many different brands, each actively pursuing different positions. Once a company has selected its desired brand positioning, there is still a long way ahead. There are still four marketing mix components to be coordinated, which is always a difficult task. Moreover, there is still the implementation stage, a never-ending struggle for market supremacy. Yet all the upcoming battles are half-won if the company manages to occupy and communicate the desired position.

There are still battles to be fought regarding the concept of positioning. For instance, there is still work to be done in order to clarify the role and ease the implementation of positioning in every organization. There is also a need for improved marketing research methodology for positioning studies. A good progress in this area has been made by using the "means-end chains theory" (Vriens and Ter Hofstede 2000: 4-10). A new development is the possibility to use this concept in order to position countries. A country acquires a position in the mind of a person very much like any other product does. During its life, a person uses a multitude of sources in order to accumulate information about a country. Upon interpreting this information flow, a person builds and constantly updates the image of that country. This position is very important, as it will determine the person's future attitude/behavior/bias towards that country and everything related to it (Popescu 2010: 119).

Our research

We undertake this research for the third year in a row. One could ask which is the force that drive us to start this research sequel? Positioning is a very important marketing concept. This is probably an idea that needs no more reasoning. Enough of a reason should be the very important part positioning plays in the strategic marketing planning process. If positioning is such an important concept, it should be a component of the marketing faculty's syllabus. No student should graduate the first 3 year cycle without knowing the fundamentals of this concept: the meaning of positioning, what is a positioning map, which is the positioning's place in the strategic marketing planning process. Unfortunately, at the moment positioning is barely mentioned in the introductory marketing course, and it enjoys a few other sporadic appearances throughout the core marketing courses. Our goal was to measure the results of this situation and to analyze them from a multiannual perspective. In order to guarantee the validity of our findings, we chose a full research. Thus, all the 3rd year students were asked to fill in a questionnaire concerning the positioning concept.

First of all, we wanted to see whether our students know the meaning of positioning or not. This is not a random endeavor. Previous research (Popescu 2009, 2010) have shown a lack of knowledge regarding this concept. Besides that, if all the students would know what positioning means, there would be no need for further study on this matter. Thus, we discovered that 27% of

the students don't know the meaning of positioning. This result might be considered encouraging, having in mind that the rest of 73% are familiar with the concept. Unfortunately, we consider the results to be discouraging, as they are smaller than the 2010 percentages. Once again, the results show the need for an in depth study regarding positioning.

Second of all, we wanted to see whether our 3rd year students know how to measure positioning or not. If a student knows what positioning means and how to measure it, there is no need to further study this concept. The results are surprising, to say the least. Thus, we discovered that 71% of the students are unaware of the fact that we can do this by using a positioning map. We consider the results to be surprising, as they are better than the 2010 percentages. The conclusion would be that less students are familiar with the concept of positioning, but more students know what a positioning map is. This paradox will be eliminated when students will undertake a thorough study concerning positioning.

Third of all, we wanted to see whether the students know which is the positioning's place in the strategic marketing planning process or not. If a student knows what a concept means, how to measure it and where to insert it in the overall picture, there is no need to further study it. Unfortunately, the results are disastrous. Only 5% of the students know the correct answer to this question. Equally disastrous is the fact that the results are poorer than the 2010 percentages. This situation is a more than enough reason to accept the need for a distinct place for positioning in the marketing faculty's syllabus.

Last but not least, we wanted to see whether the students themselves perceive the need to learn more about the concept of positioning or not. Most of the students became aware of their lack of knowledge when confronted on this subject. Thus, we discovered that only 5% of the students think they don't need further training on this subject. 61% of the students want to know more about positioning, by making it a chapter in the marketing introductory course. The rest of 34% believe that the presence of a "Positioning" course in the marketing faculty's syllabus is highly desirable. We believe that these percentages speak for themselves. 95% of the students would welcome additional training as a result of their lack of knowledge concerning positioning.

Based on this research, we've concluded that students need to further study the concept of positioning. It is our belief that this need should be addressed as soon as possible in order to fulfill our main objective of delivering skilled graduates.

THE IMPORTANCE OF ENVIRONMENTAL PROTECTION IN CSR POLICY

Roșca Mihai Ioan

The Bucharest Academy of Economic Studies, Marketing Faculty

The CSR policy of companies occupy a privileged environment through coaching programs to other interests such as employees, suppliers, customers, authorities and various NGOs. This is why we wanted to see what the environment is important for managers on companies in Romania, the company's CSR policy.

In the literature the definition of social responsibility and ways to implement this in practice are often encountered. Some authors claim that societal marketing concept has not found its way into the language of business. From here, there were other terms that had a greater impact on the business environment such as social responsibility. Increasing the company's impact on the environment, the pressure exerted by stakeholders, and identifying positive elements of socially responsible approach have been the main stimulus for development of social responsibility. From that a lot of studies on academic and commercial problem.

And the present study fit the same line we conducted a research on 50 companies, it was an exploratory research. As respondents were chosen only marketing managers or general managers or even owners compnaie depending, in other words I tried to go directly to company decision makers in developing and building its image. While this one sample is statistically representative of the point of view we have covered with him in all areas of business activities and of all sizes can say that the results provide a clear enough picture of managersmentality in companies in Romania on business activities with the problem of interreactiunii environment Managers of companies in Romania recognize the environmental problems and say they are implicating in various actions to protect the environment. On the declarative level social environment is one of the most important areas being the most nominated as one of the top three areas of social nature that would involve having the greatest opportunity for development in coming years, over 60% of companies saying they would like to be involved in future environmental programs. Instead, the real actions to protect the environment are relatively few or are carried out not caring for the environment but because of economic worries, because there is an economic advantage for application of these methods. These actions result in social activities and what they had to declare they have made to protect the environment and the ways reporting their concerns for the environment in economical manner. The lack of environmental reports, the lack of certifications and the lack of requirements of certification among the suppliers shows once again the real place of the environmental problems among the managers interests.

Key words: green marketing, ecological products, Romania

JEL Classification: M31

I. Introduction

The policy of corporate social responsibility is a topic increasingly more common in the literature. Concern for the environment came to be in the 70s one of the most discussed topics in the world. The CSR policy of companies occupy a privileged environment through coaching programs to other interests such as employees, suppliers, customers, authorities and various NGOs. This is why I wanted to see what the environment is important for managers on companies in Romania, the company's CSR policy. Since many companies and especially among the young do not have a formal CSR policy, we have formulated questions refering to the social

important of different issues. We did succeed in demonstrating that in statements that there is a greater concern for the environment but actually at quite a few concrete actions. This gives a quality of care for the environment quite poor and will lead to sporadic actions without real content in statements although things are very good.

II. Literature review

In the literature the definition of social responsibility and ways to implement this in practice are often seen (Carroll 1999: 268, Jones 1995: 404, Porter and Kramer 2006:78; Windsor 2001: 225). It shows a development of the concept of environmental care is defined as societal marketing (Kotler and Keller 2008: 29) at social responsibility programs the corporation. Some authors claim that societal marketing concept has not found its way into the language of business. From here, there were other terms that had a greater impact on the business environment such as social responsibility, business ethics, corporate citizenship. (Abratt and Sacks 1989: 25). The debate about social responsibility based on the role that a company should play in society. Increasing the company's impact on the environment, the pressure exerted by stakeholders, and identifying positive elements of socially responsible approach have been the main stimulus for development of social responsibility. This sense at this time many companies report environmental care activities in their CSR policies (KPMG 2008). And the Romans were also made studies on CSR policy organizations. (Stancu 2007: 1212; Baleanu, Chelcea and Stancu 2011, 235), which concludes that CSR policy and began to work in companies in Romania. Therefore we proposed in the present research to see how environmental protection is seen as an element of corporate social responsibility.

III. Methodology

This article is based on a research conducted on 50 Romanian companies. It must be said at once that this research is not representative of all firms in Romania, not being chased an exact textual respondent firms. The research was an exploratory one. Study objectives were to determine to what extent the natural environment is an important issue for companies in various fields in Romania and what place it occupies in their policy issue of social responsibility.

The hypothesis that we left from are that although environment is listed as one of the main concerns of firms in Romania, concrete actions are very few in number and do not support the position that respondent's statements environment occupies. As the research base we have chosen a small sample of 50 companies, 90% of them are private companies, and only 6% and 4% are public respectively mixed companies. As 68% of them have entirely Romanian capital, 16% foreign owned capital and the rest mixed. Most companies, 82% are limited liability companies and the remaining 18% stock companies. As for the work area were chosen companies almost from all activities fields in order to see the point of views from each area. So, there is 1 company from each field like office and stationery, communications, industrial – machines tools, representing 2% of the responses. The remaining areas have had the following representation in research: food, drinks - 8%, chemicals, rubber, 8%, computers, internet, software 4%, tourism, sports, entertainment 8%, electric and electronic 4%, real estate 8 %, processor industry 4%, consultancy services 16%, textiles and shoes 8%, construction, decoration, furniture-18%, and 8% other areas. In terms of number of employees 36% companies have less than 9 employees, 42% have 10 to 49 employees, 18% have 50 to 249 employees and 4% have over 250 employees. Turnover of the firms surveyed were under 50 000 euro 30% of the respondent, 50 001 - 500 000 euro - 40% of them, 500 001-5 million euro - 12% of them, 5 million to 8 million euro -10% and 8% over 10 million euro. As respondents were chosen only marketing managers or general managers or even company owners depending, in other words we tried to go directly to company decision makers in developing and building its image. As said, though this one is not a

representative sample from statistical point of view we have covered with him all areas of business activities and all sizes companies and can say that the results provide a clear enough picture of managers mentality in companies in Romania on the problem of business activities interacting with the environment.

IV. Results

Leaving from the research scope we asked managers to put in order of importance the most important roles of the companies from their perspective. Thus 12% of respondents have made contribution to protecting the environment first, 32% of them putting on one of the top 3 environmental protection as one of the most important three roles played by companies. In other words 68% of respondents see no concern for the environment as one of the most important roles of a company. If we compute an average ranking after ordering principle (Cătoi et al. 2009: 168) concern for the environment down the middle as you can see charts and data below (Table no. 1), after supply and services.

Table no. 1: Name the first three roles of the companies you consider to be the most important.

	Unmentioned in top 3	Rank1	Rank2	Rank3	Mean
Paying taxes / wealth creation	23	14	5	8	1,2
Create jobs / hiring people	24	8	12	6	1,08
Contribution to environmental protection	34	6	4	6	0,64
Obtaining income / wealth and economic growth	7	5	10	28	1,26
Contribution to social progress	37	4	3	6	0,48
Respecting ethical standards	38	4	3	5	0,46
Contributing to scientific progress / research	41	4		5	0,34
Provision of goods and services	17	2	12	19	0,98
Participation in society / community	36	1	11	2	0,54
Adherence to laws / government regulations	43	1	2	4	0,22

On the other hand, better environmental protection is a term rooted in the collective consciousness. When asked, which would be the three most important areas of social nature a company is supposed to involve into, almost all respondents nominate on one of three positions environmental protection. Thus, although scores the 4-5 place in terms of first nomination, which positions it in the middle of the ranking, it has the fewest unmentioned all areas of social nature. After making a calculation with ordering ranks method it obtain highest average and was ranked first with this indicator with an average of 1,14 (see Table no. 2).

Table no. 2: Which are the three most important areas of social nature in which a company should get involved

	Unmentioned in top 3	Rank 1	Rank2	Rank3	Mean
Financial or material support for some social cases (floods, orphans, elderly, etc.)	27	12	4	7	1,02
Solving the health problems of people	31	7	10	2	0,86
Collaborating with educational institutions (schools, universities)	34	7	3	6	0,66
Environment protection	15	6	10	19	1,14
Education	35	6	3	6	0,6
Art and culture	34	5	8	3	0,68

	Unmentioned in top 3	Rank 1	Rank2	Rank3	Mean
Cooperation with NGOs or authorities	37	4	6	3	0,54
Benefits and employee development	22	2	8	18	0,8
The fight against discrimination of any kind (sex, race, age, etc.)	37	1	7	5	0,44

In terms of involvement in social programs in over 50% of all respondents declared their involvement in environmental protection programs, placing this area 3rd beneficial after „Benefits and employee development” and „Financial or material support for some social cases” with 20% of the responses gathered. If we consider that employee development is a social action not without interest from employers regard, we can say that environmental protection sits pretty well in this regard.

In terms of desired social areas to be developed by firms in the coming years, the statements are more than 60% of companies wishing to develop environmental protection projects, scoring first in the rankings even more than the benefit and development of their employees.

As we stated in hypothesis we started from the idea that companies will say that the environmental problem is a problem that interests and they'd like to get involved in solving it. The first part of the questionnaire highlighted this. The second part of the questionnaire was developed not on declarative statements but on concrete answers in terms of environmental care. Anyway we obtained throughout this questionnaire only stated behavior, recording what our respondents wanted to declare and not their actual conduct. We are convinced that an observation based on variables proposed in this second part of the research would lead to even greater differences in terms of lack of care for the environment.

When asked about whether the organization affects the environment in some way, 78% of responses said that was not true and only 22% recognizing that the organization is not environmentally friendly. It is known that any human activity either social or economic produces changes in the environment, the respondents do not think that any economic activity inevitably leads to energy and resource consumption and disposal of waste leads to the environment affecting. Even had a response to an open question where a respondent says that the organization is in financial services and has no way to affect the environment. Seem that the generated amounts of papers on documents are not seen as a pollutant, as they really are. 52% of the responding firms said that they develop environmental protection activities. When they were asked to nominate the types of activities have been related to the purchase of equipment with low energy consumption or production locations rearrangement which probably happened in an economic boost and had as effect a reduction in pollution. Another category of responses was that related to the integration of permitted pollution limits or respecting the rules in force this showing not a care regarding the environment but a concern not to violate the law and to receive penalties. We receive answers that we catalog at the category of confuse responses like the ones mentioning the action of keeping clean at work. As answers with direct link to that question we note the ones that state to manufacture products that have higher environmental quality than those of competitors although we do not know if this was a quality watched in the design or a subsequent realization. But most cases are regarding the selectively collected of waste 6%, the afforestation 6% and recycling 22% of total respondents.

This shows a huge difference between the declared social involvement, environmental protection 54% of respondents see above and effective actions, we believe to be real social action the ones like afforestation the others being only production, economic or legal objective. It said that the question was put like an open question with three possibilities of responses to which the large majority gave only a single response.

Trying to motivate the actions taken we put a multiple-response question. When designing the questionnaire we didn't aimed to do analysis below, but the effect achieved is quite clear. 76.9% of companies say that because of society obligations they were determined to take environmental actions, while 50% of companies said that the legislation in force was the cause and 34.6% that is more economical for the manufacturing process. Here we believe that we capture the declarative character of many responses. Because if you require legislation or find it more economical for the manufacturing process when you cannot declare that your actions are motivated by moral obligation to society. We appreciate also the response of 3.8% of cases and states that the motive was because competitions do it.

If we wanted to see what are the reasons that cause environmental concern we also tried to record in parallel the reasons for them to not have better care. It should be noted that it will always find reasons to excuse the lack of environmental initiatives. Perhaps the most concrete and the most difficult to verify are the financial effort that should be made, over 50% of cases. Lack of time is raised by over 40% of the responding firms. From our point of view this type of response is clearly the type of response to escape from responsibility and it seems the worst kind of response that can be given. Along with another type of response that occupies 11.4% of respondents, that is not a serious problem. Another category 22.7% of respondents said that there is no alternative and 2.3% that is cheaper the current production system. Other reasons listed, that should be categorize as real reason: because we are not oblige by anyone 18.2% and 11.4% because there are not such concerns in the company.

To see other opinions about the environment we designed a battery of 5-steps Likert questions (Cătoiu at al. 2009: 160) for which we have calculated the average and distribution of frequencies graphically. (see Fig. no.1).

Thus we can say that organizations do not consider their products as environmentally harming but rather the usage and their production are environmentally unfriendly. As well as the frequency distribution and the means shows that the statements referring to the competitors' products and to the products quality of recycling the opinions are equally divided and there is not a dominant direction. The last three statements on packaging and on their car park show that respondents believe their packaging is environmentally friendly, that their packaging is necessary and that the fleet that they have is clean. After analyzing all the questions we can conclude that organizations still do not see many problems with the protection that their companies should give to the environmental, the organizations remaining unaware to the environmental issues, being still incarcerated in this economically reality.

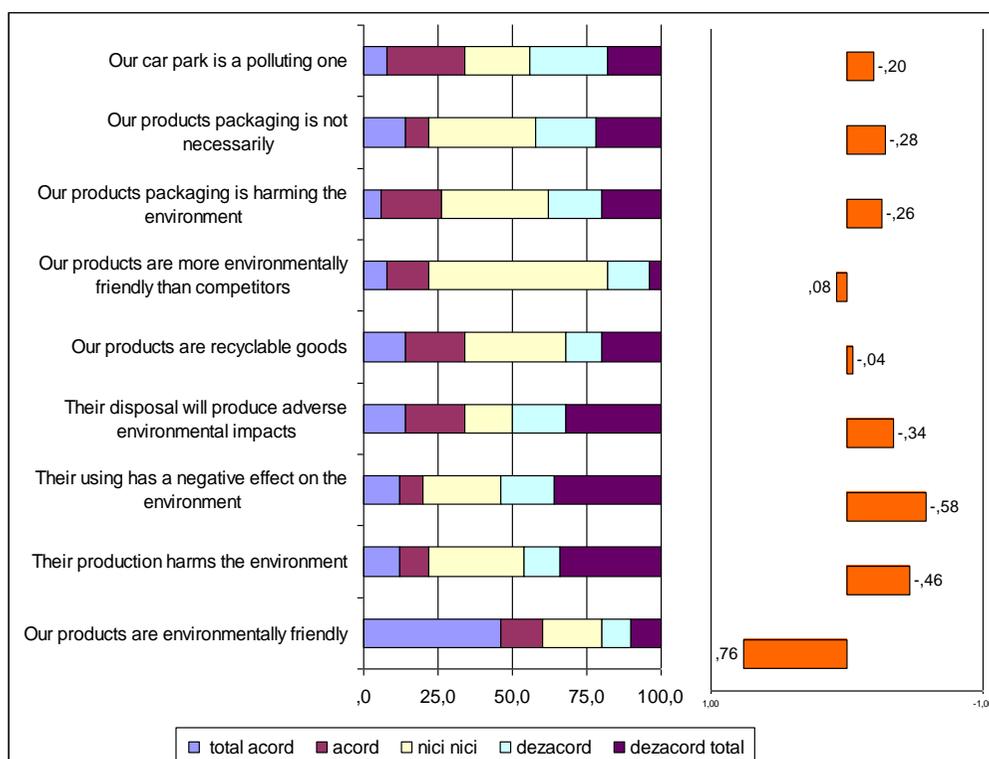

Fig. no.1 Distribution of frequencies and the average for Likert-type statements

In other order of ideas 70% of companies say they do not prepare an environmental report for the year, 68% said they do not have a portfolio, which it considers environmentally friendly products, and among those who say they have organic products only half could be framed in this category and should be organic textiles, food products, heating systems based on solar energy. Other results of the research are:

-the majority, 62% of firms said they have no requirements on environmental protection for products obtained from suppliers which shows that they have an environmental policy.

-72% of companies said that the company is trying a reduction in consumption of raw materials used.

-and 86% have do not have an environment certificate and among those who have the most common certifications are TUV and SRAC.

V. Conclusions

In conclusion we can say that our hypothesis was validated. Managers of companies in Romania realize the environmental problems and say they are implicating in various actions to protect the environment. On the declarative level social environment is one of the most important areas being the most nominated as one of the top three areas of social nature that would involve having the greatest opportunity for development in coming years, over 60% of companies saying he would like to be involved in future environmental protection programs. Instead, the real actions to protect the environment are relatively few or are carried out not caring for the environment but because of economic worries, because there is an economic advantage for application of these methods. These actions result in social activities and what they had to declare they have made to protect the environment and the ways reporting their concerns for the environment in economical manner. The lack of environmental reports, the lack of certifications and the lack of requirements of certification among the suppliers shows once again the real place of the environmental problems among the managers interests. The main contribution of this article is to

be the propose method of research behavior differences between declared and actual conduct. Although the study is not representative of the statistical point of view, the structure is well established the sampled companies obtained an overview of how the thinking of managers in Romania in general and not just big companies as it results from other studies. Companies that have a real CSR policy reason for it that is a good image for the company.

ADOPTION OF E-BANKING IN ROMANIA – AN EXPLORATORY STUDY

Roşu Anca Maria

Academy of Economic Studies, Bucharest

E-banking, or banking via the Internet, is revolutionising the business, having multiple benefits both for the financial institutions and for clients. E-bankers offer better customer service, creating opportunities for customers and providing added value. They treat customers as individuals, making mass customisation possible and creating customer loyalty. E-banking is an opportunity for banks to leverage their strengths and create a totally new banking experience. The present paper investigates and analyses the adoption and evolution of electronic banking in Romania, and the appropriate strategies for development of online banking services in the Romanian context.

Keywords: E-banking, customer adoption, banking channels, Romania

JEL Classification: G21, L86, M31

1. Introduction

Financial organizations rely on information and communication technology for information analysis, but also to differentiate their offers from competitors and to continuously innovate and update their marketing strategies, in order to meet customers' demands. These institutions use the most cutting edge technologies in order to reach out to customers and provide them the opportunity of performing interactive retail banking (Calisir and Gumussoy 2008: 215). The end result is a relationship-oriented marketing strategy which prioritizes the customer, the climate of trust, and the existence of mechanisms designed to promote increased knowledge and customer loyalty. Besides satisfying the customer, who is central to the relationship, banks must attempt to develop true and winning partnerships (Lejeune et al. 2001: 45-51).

Globalization, competition and the invasion of technologies, determined banks to adopt online solutions to build a clear and differentiable identity, as the Internet is now seen as an additional channel for branding, transactions and customer relationship management (Hackney et al. 2006: 354-368).

The adoption of E-banking was a necessity because offers major opportunities in terms of competitive advantage and allows banks to improve efficiency and operational effectiveness and to develop stronger and more durable business relationships with customers.

2. The adoption of E-banking by financial institutions

The movement towards E-banking was a natural process for credit institutions in the electronic age. Banking online refers to several types of services through which bank customers can request information and carry out most retail banking services (Aladwani 2001: 214; Gikandi and Bloor 2010: 277). E-banking refers to the use of different types of medium communication, such as the personal computer (PC banking), Internet banking, virtual banking, TV banking, online banking, home banking, remote electronic banking, WAP banking and phone banking (Dixon and Nixon 2000: 244).

E-banking is defined as a distance banking that handles the flow of information between customers' living spaces and the physical facilities of the bank, dealing with solicitation, sales, distribution and access to services, all without requiring the consumer and the financial institution representative to be in the same time physical place at the same time (Lemaitre 1997: 63-65; Vilattes 1997: 68-70).

From the point of view of stakeholders, E-banking is neither a technology, nor a purpose or an end on itself, but rather a business transaction, a strategy, a process, or an innovative business transaction (Munos 1999: 55-65).

The adoption of E-banking by financial institutions depended on: *organizational factors* (bank size, types of decision making, functional differentiation, the presence of technical staff, financial resources, technical infrastructure, decision markers' international experience, the aversion to risk), *factors related to the innovation and the structure of the market* (international profile of the bank, type of presence abroad, projected foreign markets) and *factors related to the strategy of the unit that adopts the innovation* (technological environment, relative advantage and complexity of the innovation) (Dadhfous 2002: 5), *geographical position* (Kalliannan and Awang 2010: 1-10), *age, degrees, accesibility, time, cost, cultural factors, trust, security, previous experience* in conducting online transactions (Moga 2011: 342-350).

The factors which affect the adoption of E-banking by customers are: Internet accessibility, strong resistance to change, perceived insecurity, inefficiency and inconvenience, learning requirements and increased responsibility, markedly negative attitudes and beliefs regarding the Internet, cost of computers and Internet access, trust in banks, security concerns, convenience and ease of use (Sohail and Shanmugham 2003: 214).

The benefits of the adoption of E-banking are enormous and include: reduction of total costs, increased execution of the operations in the market and an improvement of the customer relationship. These repercussions are not necessarily transformed into financial profits, but often passed to the customers in the form of reduction if the prices (Riddle 2001; Bernstein 2000).

E-banking ensures 24-hour-a-day, seven-day-a-week accessibility, through any type of advanced information system and for all types of financial transactions (Agarwal 2009: 341).

The key barriers to E-banking are the other equally convenient channels of distribution and the problems of using computers (Yiu et al. 2007: 348).

The organizational consequences of the adoption of E-banking are: reformulation of management processes (Deise et al. 2000: 272), reorganization of the management network, reformulation of the company's purposes and business portfolio, developing new activities and approaching, conquering, managing and retaining new markets (Badoc et al 1994), integration in the existing offer of new services (Munos 1998), expenses reduction, increase in market share, establish new methods of relationships between company and its customers (Hernandez et al. 2010).

3. Romanian banking sector – background

Romanian E-banking services market is in the early adoption stage; although it developed rapidly over the last few years there are still considerable development opportunities. Increase use of these services is due to increase Internet penetration among the population. According to a study published by Eurostat at the end of last year, Romania is among the countries with the lowest degree of public access to Internet.

The financial crisis had an enhancing effect on these services, pushing banks towards a thoughtful promotion and customers to understand the advantages of online banking. The need to reduce costs has led banks to move a larger part of their operations towards alternative channels, which provide lower costs. On the other hand, customers are more aware of the price paid for bank services, the time spent, the speed and safety of operations.

Table no. 1: Global values of main indicators of electronic banking instruments 2006-2010

Year	Type of instrument	Total number of users per year / instrument	Total number of transactions per year / instrument	Total value of transactions in Euro per year / instrument
2003	Total instruments	18.259	5.498.742	20.308.987.478
2004	Total instruments	44.538	7.818.435	35.604.679.462
2005	Total instruments	100.799	11.144.494	65.427.504.401
2006	Internet Banking	440.562	7.957.659	65.278.270.813,84
	Home Banking	71.887	8.499.339	59.938.699.698,84
	Mobile Banking	108.826	144.211	13.785.710,18
	Total instruments	621.275	16.601.209	125.230.756.222,87
2007	Internet Banking	1.061.190	10.624.529	47.451.161.213,27
	Home Banking	141.453	11.725.477	92.259.831.327,73

Source: Own calculations based on the Status summaries of the use of payment instruments with remote access 2008 - 2010 of The Ministry of Communications, Technology and Information

The number of E-banking services users increased by 66% in 2009 compared to previous year, showing a constant interest and increased public awareness of such services, although according to a study of Deutsche Bank, less than half of Romanian small enterprises use E-banking and automated payment instructions.

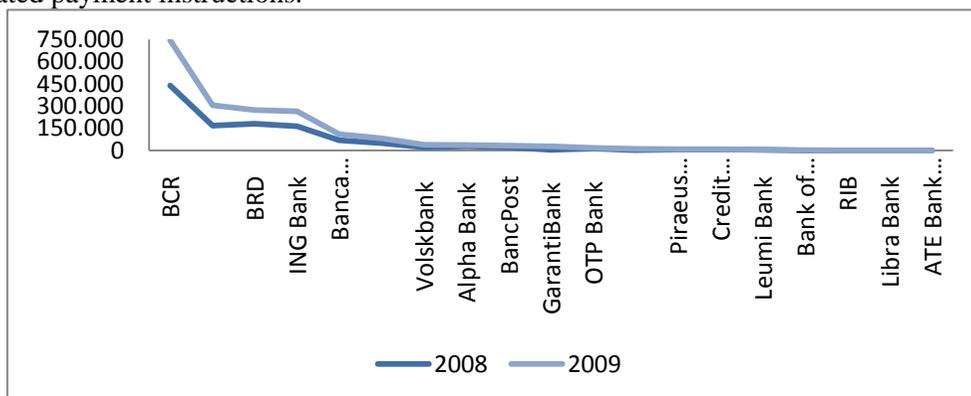

Fig. no. 1: Total number of Internet banking users

Source: Author's adaptation of eFinance analysis on Online Banking

The development is based primarily on the adoption and use of online banking applications by individuals. This expansion is not proportionally reflected in the increase of transaction numbers and their value, which indicates a lower use of these services compared with their extension.

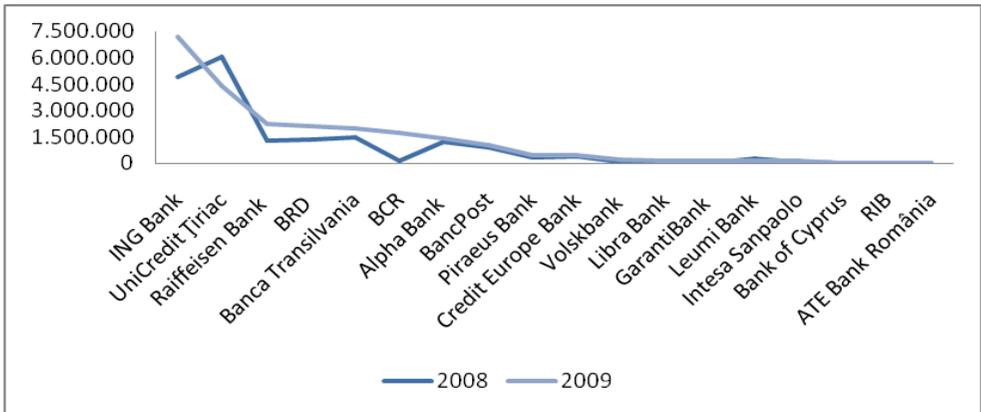

Fig. no. 2: Total number of Internet Banking transactions

Source: Author's adaptation of eFinance analysis on Online Banking

An online survey conducted by Bursa de Reclama in 2010 shows that 31.1% of Internet users use E-banking. In general, banks with high market shares in offline have high market shares in online; the top four ranked in terms of number of users were BCR, ING Bank, BRD and Raiffeisen.

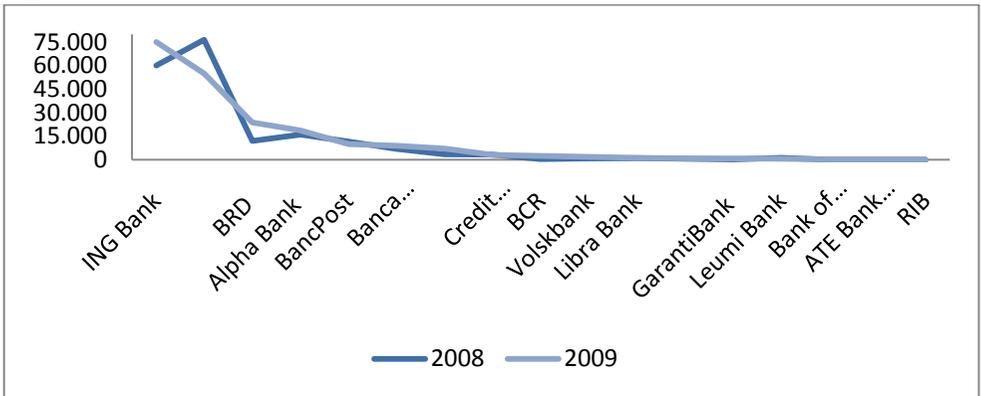

Fig. no. 2: Total value of Internet Banking transactions (Ron)

Source: Author's adaptation of eFinance analysis on Online Banking

Of those who adopted E-banking, the major services used are account transfer, bill settlement, account balance inquiry and interest rate/exchange rate inquiry. The main reasons for bank customers adopting E-banking were seen to be ability to perform banking transactions anywhere, anytime and quickly.

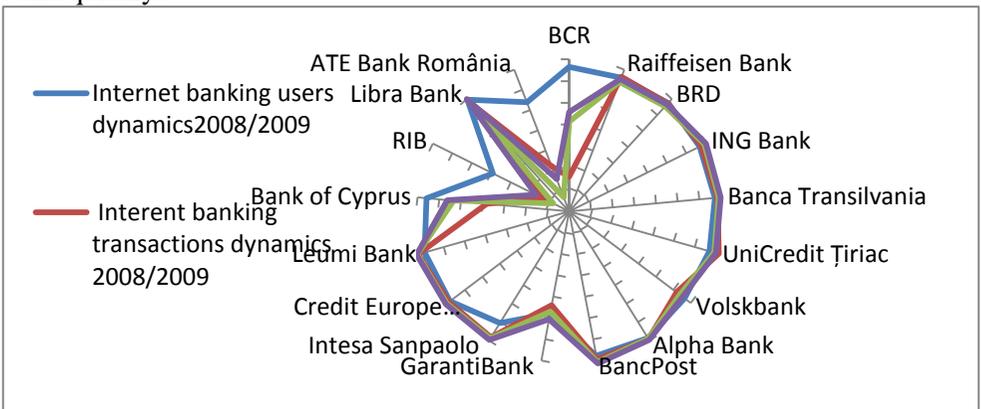

Fig. no. 3: Dynamics of Internet banking users, number and value of transactions

Source: Author's adaptation of eFinance analysis on Online Banking

The potential of E-banking services has been identified by banks, which have as a challenge to provide online banking services easy to access and use, but also very safe. Not only do banks have realized the potential of these services, but also customers that have found an effective, economical and reliable way to manage their accounts and payments.

E-banking services represent a challenge for banks' customers. In Romania, many will be persuaded to enter the race, and share with the bank the benefits of each online transaction.

Conclusions

E-banking is becoming one of the most important delivery channels of banking products. In response to global trends brought about by using the Internet, banks have to better understand their clients and respond quickly and strategically to market developments in customer centric ways.

The introduction of E-banking turned operations upside down and profoundly changed the overall logistics of the support system to the extent that customers and competitors began to think differently about the banks' know how and mission.

Evidence indicates that there are a great promotional efforts on the part of banks to create greater awareness of E-banking and its benefits. It is crucial for a bank to think about the future of service.

E-banking future challenges are: customers' trust, the speed of service delivery, customers' information privacy, customers' awareness, continuity of the service, spread of computer and Internet use, pricing of Internet service, Internet infrastructure, lack of legal regulations. Beyond security issues, banks must focus on simplifying on-line banking and targeting value driven consumers (Silk 2006), in effect adopting a much more customer, rather than technology or product centric approach (Shan and Hua 2006).

The adoption of E-banking provides added value for the customers and opportunities for banks to bolster income streams and secure longer term customer loyalty through relationship management. Although E-banking offers new frontiers of opportunities, there are several critical psychological and behavioral issues that need to be addressed in trust, security, reluctance to change and a preference for human interface.

The development E-banking in Romania depends on: strategic factors (new products and services, appropriate promotion, business integration, integrating different channels, expanding existing markets, building trust, costs), operational factors (good customer services, simplifying and integrating basic services, more convenient than the competitors, understanding customer purchase behavior) and technical factors (systems security, user-friendly web interface, personalization and customization capabilities, upgrading existing infrastructure).

In order to survive, banks will need to move away from traditional bases of retail bank competition (fees, interest, customer loyalty), to a new Internet based form of competition based on cost reduction, customer retention, responsiveness, credibility, security, ease of use, and wider scope of products and services.

To exploit the high value end of the banking supply chain, banks will need to familiarise the consumer with the processes and benefits of the service and encourage usage.

BUSINESS INCUBATORS AND SUSTAINABLE INNOVATION

Schebesch Klaus Bruno

Vasile Goldiș Western University, Faculty of Economics, Arad, Romania

Innovative businesses are often the result of collective action of organisations involved in many-sided market structures, which can be found in and around business incubators or technology centres. Within such frame environments, many group interests beyond those of single producers and their immediate clients exist and interfere. Rather generically, important economic outcomes of innovations are sequences of cost reduction events at the level of economic sectors, where the nature of (sector-wise) technology is influencing the pace of these events. At the conceptual level, we describe the social learning and social innovation process which leads to sustainable innovation by means of the influence exerted by firms on each other within constrained environments such as business incubators. These environments need not to be organized according to any sector logic. We propose that the influence exerted between firms is increasing in firm similarity, in the degree of product complementarity, and also to depend on (mutual) trust relations.

Keywords: Innovation, Incubators, Learning, Networks, Sustainability

JEL code: A12, M39, O30, O31

1 Introduction and motivation

Innovation is an important engine of economic development but it also entails a dual nature. While it enables formidable increase in productivity and comfort, occasionally finding solutions to very hard problems, in the longer term it also creates new problems and holds the potential for more and new types of disasters. Most of these features are difficult or impossible to predict in fine detail. However, the awareness of unforeseen risks is growing in various types of consumer and producer populations around the world. A rather vague but increasingly vociferous request is to stick to “sustainable solutions” in technical, economic, and social terms, meaning to find collectively acceptable and commercially viable ways to impose a sense of “expected medium term stability” of societal development. Examples of the dual nature of innovation abound. Some more extreme cases should illustrate this. Satellite telecommunication is revolutionizing entertainment, monitoring and parts of business. Space debris as an inevitable consequence is posing serious future threats and costs. Improved or even personalized medicines cure ever more diseases but they are posing both, huge challenges and costs of care for the aged, possibly also by proliferating later-life complex illnesses. Deep sea drilling taps formidable oil and gas reserves but is also producing hard to handle spills. Alternative energy solutions to fossile fuels can lead to astronomic future decommissioning costs. We note that, very much in symmetry with the role of sustainability in society as a whole, in the world of firms and markets, the incubation process may be viewed as a “moderator,” which attempts to overcome the disadvantages of highly paced, short-term oriented capitalist economies. In sections 2 and 3 a concept for representing the societal forces shaping sustainability and incubation for the innovating firm is described and ways of transforming the concept into concrete tools of assessment and valuation are pointed at.

2 Towards assessing the role of sustainability and incubation

Direct environmental consequences of using processes are already difficult to assess, e.g. think of the large number of variants of bio-fuel processing, which are contained in public science data bases like *Science Daily*. Consequences of using products and services may also be diverse, for instance by invoking a path dependent mechanism, which may “lock in” earlier but eventually

inferior solutions, a point put forward insistently by (Arthur 1989). Given multiple risks, both for the producer and the consumer of innovations, a *branded risk assessment* may be called for. Exactly this may be achieved in a credible way by an incubator network, which allows a multi-party involvement. Brondizio et al. (2009) and Ostrom (2009) teach us – albeit in a more general context – that polycentric systems (implying multi-party involvement) hold the key to sustainable solutions of complex problems involving environmental, social and a series of commercial and economic interests. Following (Ostrom 2009) there are four types of goods, namely [1] *Common pool resources* (example: forests), [2] *Public goods* (example: knowledge), [3] *Private goods* (example: clothing) and [4] *Toll goods* (example: daycare centers), which are mainly characterized by different property or appropriability related considerations. From a perspective which is more concerned with the description of innovation by firms, we stipulate that the new technologies imply multiple and changing roles of goods: Increased *personalization* of private goods may be achieved by heavily drawing on public and private knowledge and commercialization is achieved by different business models, for instance by making use of the role of the toll goods or by means of technology induced zero-price co-offerings as has been put forward by (Anderson 2009).

Apart from these basic considerations, empirical incubation processes assume complex structures and dynamics and are driven by complex motives. In spite of numerous failures, incubation is rather wide-spread today, both within developed and emerging economies. The context based evolution of incubators is leading to situations of “meta-innovation”, as is described for the case of emerging Brazil in (Etzkowitz, de Mello, and Almeida 2005).

In the last twenty years best practices for incubation have also been established as described in (Bergek and Norrman 2008), and the need for multi-criteria evaluation and ranking of business incubators is in high demand, see e.g. (Schwartz and Göthner 2009). However, the difficulty of evaluating incubators is related to the difficulty of measuring and assessing organizational creativity as described in (Sullivan and Ford 2009). Density of technological connectivity between firms has an impact on the inventiveness of science based firms, and somewhat surprisingly, venture capital has less influence on innovation intensity than expected, as is found by (Rickne 2006).

The role of branding incubators during and after the eventual success of technology spin-offs is highlighted in (Salvador 2010), the suggestion being that this somewhat special type of branding should be increased. As in any market, in the market for incubator tenants too, there is a need to educate the consumer, to stimulate demand and to cultivate awareness of the competition as is put forward by (Patton et al. 2009), and whenever possible, a “pipeline” for new business ideas should be sustained. This leads us to the domain of Knowledge Management (KM). Following Palacios et al. (2009), obstacles exist to effective KM introduction. Important reasons are named in (Yu 2002): (1) absence of a culture to share knowledge; (2) employees do not know much about KM; (3) no knowledge diffusion and learning; (4) insufficient internal knowledge transfer; (5) obsolete or over-complex technology; being the most important. (1)-(4) relate to insufficient networking and (5) to a narrow minded technology policy, e.g. the best technology from a network neighbourhood is not adopted. Gilsing et al. (2009) are stressing the fact that across different incubation environments, more radical innovations seem to be less often pursued than incremental ones, leading to *under-innovation*. Raymond and St-Pierre (2010) draw our attention towards a frequent situation, where “... the impact of R&D on product innovation is mediated by process innovation.”

3 A concept for a process-combining computational approach

In the sequel we will nevertheless attempt to draw up a concept, which is capable, in principle, to assess the role of sustainability and incubation and to evaluate networks of firms within such

structures. If appropriate, we also indicate which method can be used to solve the resulting optimization and data analysis sub-problems. Figure 1 collects the items and sub-processes involved in the incubation of firms, which posses the option to produce in a sustainable manner. An incubator may be regarded as a kind of super-firm, with less stringent short terms goals but with complex, and multiple, long term objectives. Both, a single firm and an incubator are subjected to competition but also face aspects of potential cooperation. Both must decide which markets to enter. For some hints of how to model such decisions see (Wawrzyniak and Wislicki 2008). While a mature or a non-incubated firm will focus more forcefully on price competition and product-line differentiation, an incubator may be thought of enabling more technological competition by its tenants, postponing "classical" competitive activities. Sustainability considerations are not within the shot term commercial goals of the single firm. Entry points for sustainability issues into the incubation-market process depicted by figure 1 may be created by long term actions of organizations within polycentric societal power systems as considered by (Ostrom et al. 2009). Eventually, they may impinge on all market participants to reflect about the outcomes, the private and the collective image effects of producing more sustainable products and by employing more sustainable technologies.

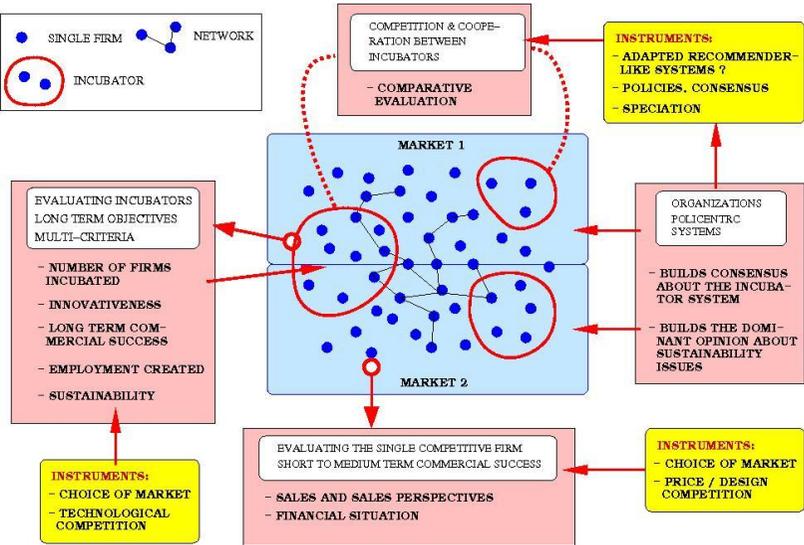

Figure 1: The incubation process and the entry points of sustainability issues and commitments.

At the level of incubator competition and cooperation there is room for designing instruments which for instance propose speciation of incubation services for certain markets and regions in a more principled manner. As described in (Schebesch et al. 2010), more adapted recommender systems proposed for computational marketing may be constructed. In order to finally arrive at a problem representation which more directly allows the derivation of computable models and the derivations of more concrete evaluation procedures for incubators and firms, we next focus on the innovation process, which seems to be central to both incubation and sustainability issues. In figure 2 we represent several sub-processes of innovation. The single firm is attempting to innovate in order to enhance its competitiveness. Innovation can be the result of "classical" in-house research and development, with costly exploration of new technological and product design solutions. The risk of in-house research can be temporarily lowered by incubation. Cost reduction of processes can eventually induce product innovation. Hence, evaluating the design complexity of technologies and its influence on cost reductions over time, and especially so over

past cumulated production as in (McNerney et al. 2009), will be most important in order to assess the pace and regularity of innovation events as a function of its underlying "engineering design". A new technology is represented by the introduction of a new interconnection matrix between process components. Sustainable technology solutions may be characterized by certain types of "recognizable" interconnection matrices. In more recent times, other important aspects of innovation processes such as innovation contests and social innovation are increasingly considered. Two premises lead to the growing relevance of this type of innovation procedures:

- In certain product classes and markets it becomes increasingly difficult to "forecast by expert opinion" what consumers really like.
- Organizational setup and transaction costs decrease dramatically with the spread of the internet and of different types of social forum subnets.

While in general such approaches are clearly useful for automated marketing and forecasting procedures (Schebesch et al. 2010), there is evidence that they can be applied (with adaptations) for innovation processes too, as is outlined in (Terwiesch and Xu 2008).

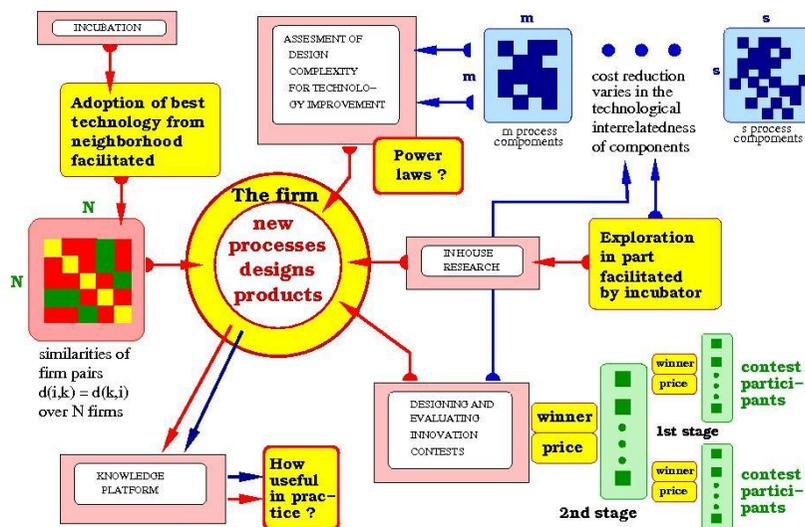

Figure 2: Innovation processes: innovation contests and technological interrelatedness.

The results of an innovation contest may be a process or a product innovation (figure 2, lower rhs process components). The innovation contest requires designing and evaluating a competition for new solutions of posted problems amongst a large number of participants originating from a larger societal context. In order to make these contests more efficient and more credible (i.e. to enhance serious participation), such innovation contests have to be designed to encompass two or more stages, with appropriate mechanisms for picking winners and for paying out prices for attractive or promising solutions. The outcomes of such innovation contests may contain also additional information, for instance with regard to acquaintance with and challenges caused by using sustainable processes and products, i.e. information about the degree of empathy and goodwill present in a wider population with regard to sustainability commitment.

A final item of figure 2 is the process item called "knowledge platform". While it would be certainly desirable to evolve such a knowledge platform (especially for incubators), there is to this day no compelling procedure concerning the collection and handling of information about all the mentioned sub-processes of innovation, their variants and success rates, and their relation to sustainability issues. In empirical practice all these sub-processes function separately and different modelling attempts also tend to concentrate on single aspects, for instance on how to best design innovation contests.

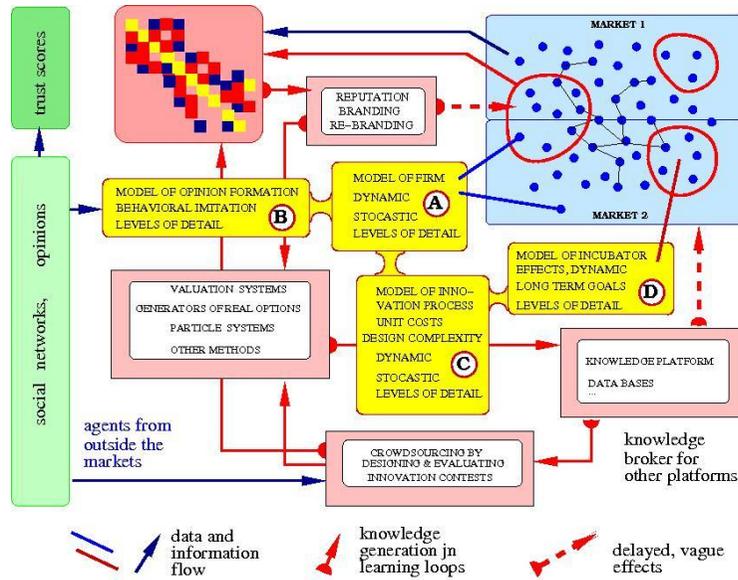

Figure 3: Real-life feedback loops in social learning connected to aspects of innovation, incubation and branding, and behavioural imitation central to sustainability issues.

In figure 3 finally we consider the real-life feedback loops within the process of social learning, entailing innovation (from figure 2), incubation, behavioural imitation and opinion formation, which are central to sustainability issues. These are real life processes occurring by means of more or less formalized mechanisms, differing in composition and, from industry to industry, coming in varying degrees of relative importance.

The figure distinguishes two contexts, namely the two markets with both independent and incubated firms, and, a more general, non-specific, “background” of social networks with agents which may belong to the markets. As innovation processes unfold, incubators and firms start a process of (mutual) trust formation, which results in trust scores (to what extent should firm i trust firm j ?), which may also help to evaluate firm j , for instance concerning for the stage of maturity it has reached within an incubation process. The evolution of trust scores is using information from the markets but also from the “background” social networks of firms. Trust scores are important in order to guide a behavioural imitation or a technological adaptation process. As incubators function like a kind of super-firms, but with a broader and more long-term oriented set of goals (see also figure 1), they are competing and cooperating with each other. The resulting reputation is an example of *social capital*, which may enter a more general assessment and valuation process indicated by the box “Valuation systems” of figure 3. This box contains an entrance named “generators of real options”, which highlights the fact that option models for many different scenarios of the stochastic innovation-incubation process may have to be created. Both, the reputation mechanism and the evolving knowledge platform (see also figure 2) do not exert an unconditional influence on market agents, and any possible effect may also be strongly delayed in time. Finally, crowd-sourcing by innovation contests, using agents from outside the markets, is also inherited from figure 2. The boxes from figure 3 named by encircled letters A,B,C, and D describe processes which can be modelled separately by using dedicated dynamic models. An evaluation would be done by way of (1) massively collecting data about past market-incubation interactions (about firms, incubators, sustainable technology projects, etc.) and (2) attempting to cluster and classify the data by using technological or other constraints, as is

described in general approaches to constrained clustering (Basu et al. 2009). A cluster would contain sustainable technology projects with favourable outcomes and another those projects with unfavourable outcomes for the involved firms.

4 Conclusions

We contributed to the conceptual discussion of a complex situation from economic reality, namely the innovation process in the presence of incubation while coping with the implicit societal pressure of adopting sustainable technology, without the latter being of short term commercial advantage to the single firm. We developed a concept for integrating incubation and sustainability issues into real-world process models but, simultaneously, also into a computational concept concerned with the question of how to assess and to value the complex stochastic process resulting from the incubation-sustainability relation.

THE FORTIFIED CHURCHES FROM TRANSYLVANIA – HOW WELL ARE THEY KNOWN BY THE ROMANIAN CITIZENS?

Șerb Silvana Valentina

Babeș-Bolyai University of Cluj-Napoca, Faculty of Economics and Business Administration

The Fortified Churches from Transylvania represent an important category of historical and religious sights of the anthropic touristic potential - historic cultural potential of this region. However, they are not exploited from a touristic point of view at their fair value, one reason being the weak promoting activity, especially the lack of information among citizens about the existence of these churches. In this paper, I intend to highlight on the information level awareness among the Romanian citizens regarding the existence of these churches, to identify which are the most well known and visited churches and to establish the profile of those who visit the churches.

In the end, the results of this research impose a set of measures to improve the level of information among the Romanian citizens concerning the existence of this historic and religious heritage.

The paper is relevant for the doctoral research project called “Marketing Places – religious and historical sights of touristic interest from Transylvania” under the guidance of Professor Doctor Marius Pop, Babeș-Bolyai University of Cluj-Napoca, Faculty of Economics and Business Administration, during 1st of October 2009 – 1st of October 2012.

Keywords: fortified churches, tourism, awareness, romanian citizens, research

JEL classification: M31

1. Introduction

Although Transylvania region has inherited a rich cultural and historical heritage, this legacy is not used to its fair value and a major part of residents and tourists are not aware of this potential. Through this paper I propose to demonstrate awareness regarding the existence of these objectives among Romanian citizens from different regions of the country.

Referring to previous studies in this area, although many papers were written in both national literature, but mainly in specialized international literature especially in German language, most of them treat the subject from historical, architectural or functional point of view and almost never in terms of tourism potential.

Further, in this paper a brief presentation of the fortified churches will be made, we will analyze the methodology and the research findings; develop proposals for improving awareness of the existence of these churches and present limitations and future researches.

The paper is relevant for the doctoral research project called “Marketing Places – religious and historical sights of touristic interest from Transylvania” under the guidance of Professor Doctor Marius Pop, Babeș-Bolyai University of Cluj-Napoca, Faculty of Economics and Business Administration, during 1st of October 2009 – 1st of October 2012.

2. The Fortified Churches from Transylvania

Even though the Fortified Churches were built as defense systems with walls reaching 2m in thickness, sentinel passages, towers and surrounding trenches, most of them have significant religious value as well as demonstrating their builders’ skills in architecture, astronomy and the science of war (Mureșan 1998 : 33). These churches were built during the Middle Ages by the Saxons for protection and defense against Ottoman and Tatar invaders (Klimaszewski *et al.* 2010

: 98), central-southern Transylvania being the place where it is found a high density of this kind of objectives (Dezsi 2006 : 172).

Around 1600 there were about 300 such buildings, half of them being kept so far. Although this type of construction is found also in other parts of Europe (Germany, Austria, France and Nordic countries), Transylvania is one of the few regions where there are three types of fortifications:

- church with fortified walls - the church does not contain defensive elements, but it is surrounded by walls;
- fortified church - being the result of the application directly on the church body of the defensive construction, including one or more parts of the building;
- fortress church - is the case where the fortified walls are provided with fortified storerooms for supplies and fortified with towers, bastions and fortified warehouses, often being surrounded by a water channel, and the church itself is designed for defense.

Fortress churches or “churches citadel” are related to citadels, but they differ because they were not permanently inhabited, but only in case of war and siege. Supplied with food and grains, on site or even inside the church was almost always a well, so the peasants could survive long enough in these small fortresses. Transylvanian constructions are the most powerful and comprehensive, the Prejmer church (Braşov county) with three walls that contain 260 storerooms of supplies, being the largest European fortress-church (Fabritius-Dancu 1980 : 2).

As I already mentioned, on Transylvania region were preserved more than 100 fortified churches. In Figure 1, I tried to highlight the counties where these almost 150 buildings are located.

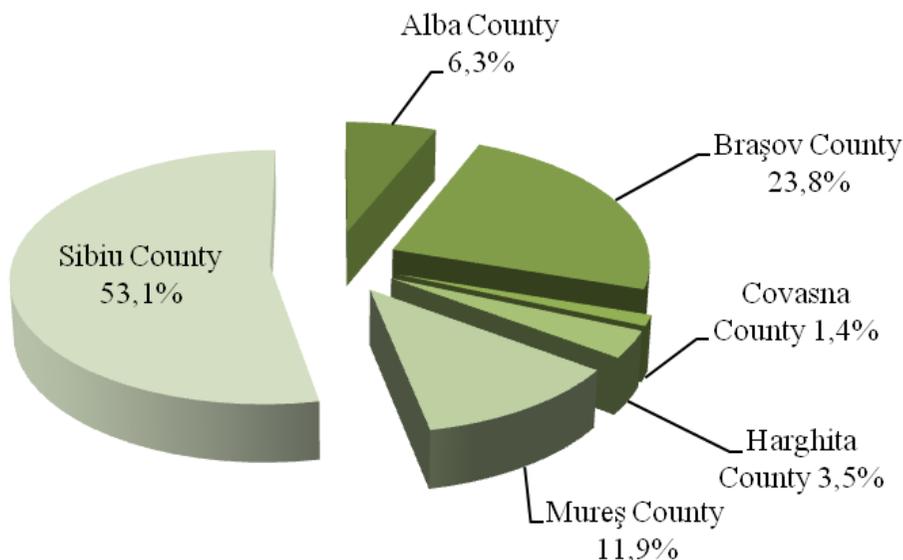

Figure 1. Distribution of Fortified Churches in Transylvanian counties
(Source: realized by author)

From these churches, a number of seven are listed on the UNESCO World Heritage List, namely: Biertan / BIRTHÄLM (Sibiu county), CÂLNIC / KELLING (Alba county), DÂRJIU / DERSCH (Harghita county), PREJMER / TARTLAU (Braşov county), SASCHIZ / KEISD (Mureş county), VALEA VIILOR / WURMLOCH (Sibiu county), VISCRI / DEUTSCHWEISSKIRCH (Braşov county), the best known of them being Biertan Fortified Church.

Even if I noticed that many authors include the cities of Braşov, Mediaş, Sibiu and Sighişoara in the category of fortified churches, I will consider them medieval cities and I will not consider them subjects of this paper.

3. Research methodology and results

3.1. Questionnaire and data collection

This paper was drawn up using the survey method and the questionnaire was used as a research tool. The data have been collected both through personal interviews and Internet. In the first situation, tourists and excursionists have been questioned but also residents of cities where interviews were held, all the respondents were chosen randomly. In the second case, the questionnaire was distributed via the Internet by e-mail addresses of known Romanian citizens, also chosen randomly, with the mention to send the questionnaire on their known e-mail addresses thus forming a network, finally all completed questionnaires being returned to the original e-mail address. At the end, 113 questionnaires were completed (70 interviews and 43 online). The questionnaires are realized only in Romanian language and contain two categories of questions: the first category tries to determine the awareness of respondents regarding the existence of these churches, information sources, visitors number, reason for the visit and satisfaction following the visit, while the second category tries to determine the demographic characteristics of the respondents: nationality, region of origin, age, gender, income, education and religion. Regarding the type of questions used during the research, the second category contains exclusively closed questions, while the first category has on its component both closed and open questions in order to not influence the respondent in one direction but to leave him the opportunity and freedom to list all churches that he/she heard about or visited.

3.2. Data interpretation and results

After processing all 113 questionnaires the following results were obtained:

From all approximately 150 existing Fortified Churches in Transylvania, 55 names were mentioned by 68,5% of respondents, 31,5% being unaware of any fortified church name. Figure 2 shows the most popular 21 names mentioned by the respondents, receiving a percentage of more than 1%, other 34 churches listed gaining just under 1%. It can be observed that the most well known is Biertan Church, achieving 21,9% followed by Cisnădie Church with 8,2% and Cisnădioara Church with 6,4%.

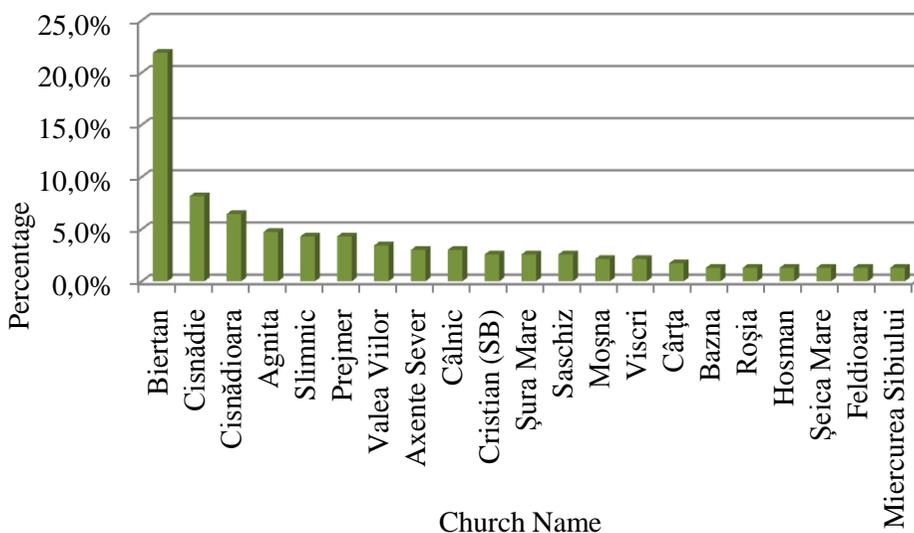

Figure 2. The most popular churches among the respondents
(Source: realized by author)

Regarding the visiting degree of these churches, only a percentage of 64,6% of the respondents had visited at least one of these churches. Figure 3 shows which the most visited churches are. Even if there were mentioned a number of 51 churches, only 19 of them recorded a visiting level exceeding 1,5% among respondents, the rest being below this percent. On the first three places among the most visited fortified churches are: Biertan Church (20,1%), Cisnădioara Church (7,4%) and Cisnădie Church (6,9%).

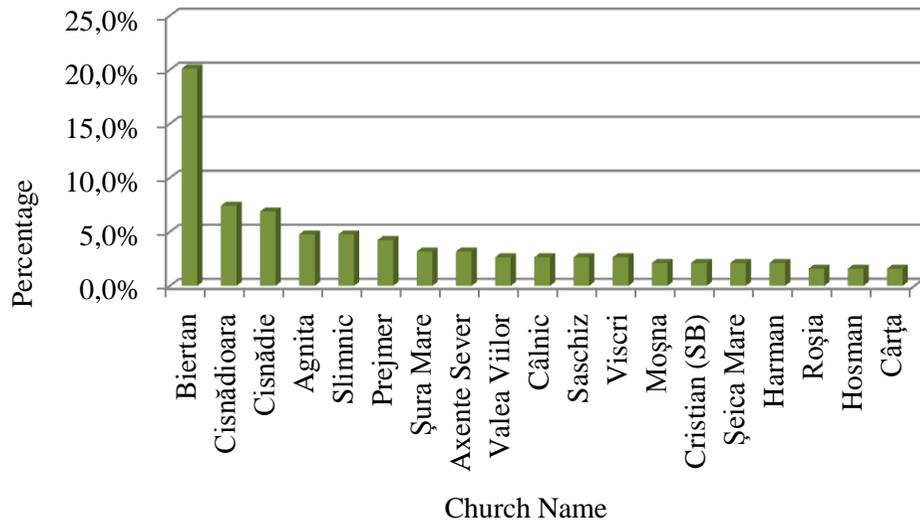

Figure 3: The most visited churches among the respondents
(Source: realized by author)

Regarding the reason for the visit, 44,8% of respondents replied that they made the visit for leisure, 19,2% due to a festival kept inside the location, 15,2% for cultural reasons, 7,2% were in school visits, 6,4% for religious reasons, 4,8% were in organized trips, 1,6% for scientific reasons and only 0,8% were gastronomic visits. As informational sources the friends record the highest percentage (51%), being followed by the touristic brochures (9,8%), travel agencies (2,9%), web pages of the sites (7,8%), as well as other informational sources such as family, school, history books, radio, tourist information points or occasional visits in percentage of 28,4%.

Among those who visited the fortified churches, only 12,2% chose to spend a night or more in the site, the rest of the respondents just doing a few hours or one day trip. But no matter the reason or visit duration, the high degree of satisfaction of respondents after their visit was noticed. Thus, 97,2% confessed that they intend to revisit or visit other fortified churches in the future and all respondents would also recommend these objectives to other persons.

Table 1 shows the visitor's profile. In addition to the features described in this table, it must be noted that 97,3% of the respondents are of Romanian nationality, the difference (2,7%) being of Hungarian nationality.

Table 1. Visitor's profile

Gender	%	Age	%	Income	%	Educational level	%	Religion	%
Man	44,2	< 18	0,9	< 250 euro	14,6	Primary studies	0,9	Orthodox	94,7
Woman	54,8	18-25	10,7	250-500	32	High school studies	16,8	Greek catholic	2,6
		25-45	70,5	500-1000	38,8	University studies	58,4	Roman catholic	0
		45-65	16,1	1000 <	14,6	Post university studies	23,9	Protestant	0
		65 <	1,8					Other	2,6

(Source: realized by author)

Regarding the respondent's county of origin, the highest percentage was recorded by the Sibiu county (42,5%), followed by Bucharest (12,4%), Mureş (9,7%), Braşov (8,8%), Alba and Vâlcea with 7,1% each, Argeş (4,4%), Dolj and Prahova with 1,8% and Bihor, Cluj, Galaţi, Gorj and Teleorman with 0,9% each. Figure 4 highlights the origin of the respondents.

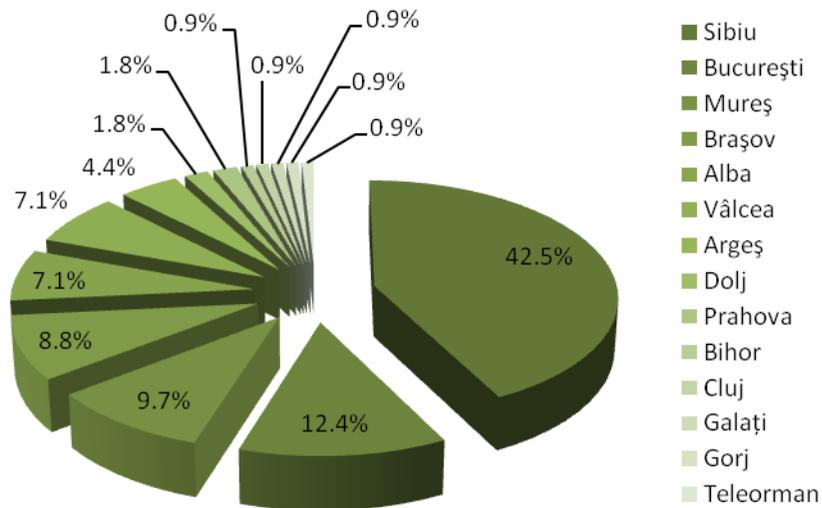

Figure 4. Respondents counties of origin

(Source: realized by author)

4. Proposals for improving the information grade

Based on the information sources listed by the respondents who have visited at least one of these fortified churches, we can say that one of the main sources of information used, except the friends' recommendation, is the promotion of these sites in the media. Thus, a first recommendation would be to improve media communication nationwide (television, radio, newspapers and Internet) by TV broadcasting and issue articles that could tell the "story" of the place, highlight its history, architecture, construction and its role in order to raise the interest of the audience regarding the existence of the place and awake the desire to visit it.

Considering the reasons for which the respondents visited these places, we can develop the following proposals:

- more festivals should be organized on those locations. During this research it was noted that 19,2% of people who have visited at least one fortified church, made the visit due to a festival which was held inside or near the location. In this category, we can mention the International Theater Festival in Sibiu, which has representations inside the Cisnădioara Church also and “Transylvania Fest” which has brought about 3,000 visitors in Biertan in 2010.
- promoting the fortified churches more as historical and cultural sights rather than religious objectives. This proposal comes from the finding that 15,2% of respondents had visited at least one church for cultural reasons and only 6,4% for religious reasons. Also, during the interviews we received rejections from some feasible respondents, arguing that they are Orthodox and they are not interested in visiting the churches belonging to other religions.
- introducing special courses in primary school and high school as well as school trips who’s aim is to basically inform about the existence of these historical and religious objectives.
- organized trips proposals from local and national travel agencies which contains routes that include these fortified churches.

Starting from the assumption that these fortified churches are a true national treasure, I believe that for their promotion and capitalization should exist a close cooperation between public institutions and private touristic sector.

5. Limitations, conclusions and future research

The main limitation of this research is the fact that it was not cover the entire country and the number of respondents was not balanced for each county. Another limitation is the online survey. Although it has been distributed more than 300 questionnaires all over the country, only 43 were completed, the reasons of not filling them might be: the lack of time, indifference to the subject, not access the e-mail account for a time period or others. Also, on-line questionnaires were conditioned by access to a PC or Internet. It was noted however, that 84% from all respondents are aged between 25 and 45 years old while 16% between 45 and 65 years old, and regarding the studies, 92% have university and post university studies and only 8% had graduated high school. In regard of “face to face” survey, this was limited by the access of interviews operators in different parts of the country in a given time. Thus, as observed during the paper, the majority of the respondents are coming from Sibiu county, and this has a direct link with the related result, namely that the most visited fortified churches are also found in this county.

Since only 55 name of fortified churches were known by only 68,5% of respondents, the difference of 31,5% knowing any names from this category and only 64,6% have visited at least one of these churches, can concluded that these religious and historical sights of touristic interest are promoted, but not enough. The same conclusion is reached also from the fact that the main source of information is the recommendation of friends and family and the questionnaires show that, as the respondent comes from a much distant county of southern Transylvania, is much less informed about the existence of these churches.

Regarding the future research, I propose to extend this study in order to include all the Romanian counties, the questionnaires being completed by an equal number of respondents in each county, and in this way it will be obtained results much closer to reality.

THE SAVING AND INVESTING CONSUMER BEHAVIOR ANALYSES ON THE ROMANIAN FINANCIAL MARKET

Tănase (Roșca)Laura Daniela

The Bucharest Academy of Economic Studies, Marketing Faculty

This article aims to provide an analysis of the saving and investing consumer behavior, that where researched in a time of changes after a severe financial crisis. The analyses purpose was to determine the reasons, or the way that the reasons would change, for buying different financial instruments, and also the way that the consumer perceives investing and saving. Different demographical characteristics and their influence on the financial behavior of the consumers were also studied. The investor behavior on the developed markets is being studied carefully for many years. The need to create financial products for each customer type, such as Generation Y, intensely investigated by various research teams, in different ways, resulting in different characteristics such as general proclivity to the marketing, advertising, consumerism, branding, environmental issues, fashion and even anxiety begins to be felt also on the Romanian market. So, to better understand the actual degree of knowledge that the consumer have on the concepts of saving and investing and on that activities involved into this concepts is a very important step of the research. The research method is a survey based on a sample chosen with the simple random method undertaken in 2010. There were gathered 480 questionnaires. Research is not a statistical nationwide representative because of the lack of the financial and human capabilities. We expect that the methods of "investing" that are most known and used to be bank deposits because in Romania the risk appetite is a low one. The people's appetite for saving activities we expect to be motivated by the need for purchasing consumer goods, and eventually buying a car or a house but not the desire to accumulate capital by making real investments such as those in financial assets. An important factor for the decision to invest should be a higher income and also the family structure. Study could be interesting for researchers because it offers an opportunity to view an analysis of the customer behavior on the financial market. The research instrument is complex, the mix and the large number of question should provide an accurate image of the way the Romanian consumer of financial products think and act on this market. The study also helps to understand consumers' needs for practitioners, because this field is not a largely researched one. The originality of this article is given by the manner in which the questionnaire was made. The battery of questions, including a series of „likert” question, it should provide an accurate mirror of the know-how the Romanian consumer of financial products actually possess, the reasons on with their behavior is based on, and what are the most important characteristics that influence the purchase behavior.

Key words:

Consumer education, saving, investing, marketing research, financial market

JEL Classification

M31

I. Introduction

Understanding consumers is the core of marketing effectiveness, and yet this understanding in the financial sector is quite limited. For many potential consumers financial services are not a very interesting acquisition, being perceived as an extremely complicated one. The potential consumers often have difficulties to identify differences between a financial product and other. At the same time consumers are finding it difficult to make the products assessment before

purchase therefor when they actually decide to purchase they might perceive very high degrees of risk. Because financial products do not generate consumer happiness, sometimes being perceived as a factor of reducing pleasure consumption, are often seen as "exhausting shopping" (Ennew and Waite 2007: 128). According to Kotler any economic activity should aim to meet demands - actual and potential - customers with maximum efficiency (Kotler 2008: 4). Orientation towards the needs of the consumer business, the meeting, must be based, a thorough knowledge of these requirements, systematic tracking and even anticipating their scientific (Cătoiu and Teodorescu 2004: 13).

II. Literature review / previous research

As Fanelli and Erlich say in their study, financial means money and money means an extended emotional baggage (Erlich and Fanelli 2004: 7). Individual attitude toward money is an extremely emotional one. Unlike consumer goods when taking the decision to purchase a financial product you do not buy one brand but rather rely on the advice of financial intermediaries in the final decision (Lewis 2008: 105).

Stafford, Lusch and Kasulis suggests that individuals can purchase all types of financial products in a specific time, however products are purchased for longer periods of time in such a way as to satisfy the utility function. They also say that sometimes consumers must not only decide between various alternatives of spending the money, but also if to acquire or to save the respective amounts (Stafford, Kasulis and Lusch 1982: 397).

In the literature there are treated different reasons for saving based on Keynes eight saving reasons including "Precaution" that means ensuring a reserve against unforeseen circumstances, "Foresight" which includes insurance against possible events such as the differences between revenue and expenses or the "Calculate" which means raising money in order to earn interest (Keynes 1936: 78). Wärneryd mentioned four reasons of saving based on the need to save as "a continuous habit", "precaution", "bequest reason" or "profit motive" (Wärneryd 1995: 28). Other reasons for saving aimed "retirement", "holidays" or "rainy day" (Harris, Loundes and Webster 2002: 207).

In the article we aim both to determine which the main reasons for saving are and also to see the perception of the interviewees over the preferred investment instrument. From we might be able to realize a characterization of the potential financial products consumer.

III. Methodology

Right from the start we stat that the research is not conclusive, but an exploratory one. As a research method chosen was to achieve a survey. The questions were introduced in an omnibus-type research carried out in summer 2010. The research carried out in 2010 was based on the results of another research driven in 2009 and the research tool has been improved based on its' results analysis. Research is a doctoral research type from here the small number of questionnaires and statistical unrepresentative degree. 500 questionnaires were applied and 478 among of them entered in the analysis.

Study objectives are:

1. Perception research on the concepts of saving and investing;
2. Determining the motivation of saving-investment in our country;
3. Determining the characteristics of people with a greater appetite for investment;

Assumptions on which we left were the results of the previous research, namely that the people knows the concepts of saving-investment but for different reasons, particularly lack of money does not have a coherent investment behavior.

IV. Results

We left from the research purposes, namely to describe the behavior of consumers of financial products focusing on the analysis of Likert-type questions.

To answer the first objective has been made a series of two closed questions as to the meaning that respondents gave to the concepts of saving and investing. Thus 66% of respondents see the savings as a reduction of expenditure, 20% see savings in terms of its definition namely “that part of disposable income that has not been used to purchase consumer goods but was accumulated for a use later” (Ennew and Waite 2007: 35), 12% are saving for “the safety of tomorrow” for “rainy day” and 2% say they save through energy efficient equipment.

Regarding the concept of investment is more clearly known, more than half of respondents understanding by investing the multiplication of money. 18% mean by investing to put money into a business, and 8% see investing through the acquisition of property and land, also very close idea of what the concept means from economic point of view. 12% see investing as a means to improve their own or children education and 10% as a way of purchasing durable goods for the family.

The need for security, from the viewpoint of the respondents is the most important, over 50% of respondents nominating it as the main reason for saving. Other reasons for saving 15% think the help they can give their loved ones and 30% save for future purchases such as houses, cars and durable objects. (Fig. nr. 1)

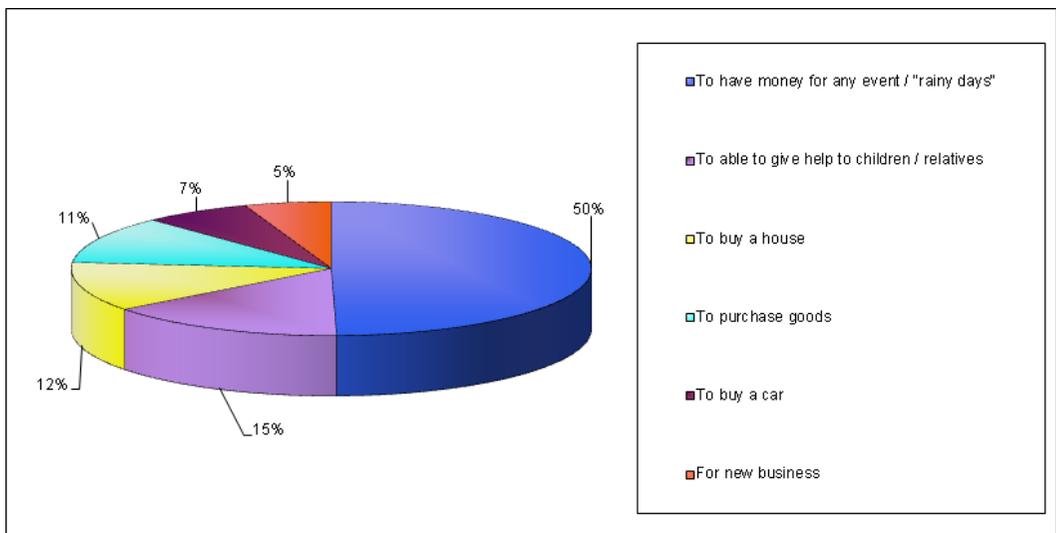

Fig. 1: Which is the main reason for saving? (made by author)

From the research presented by Canova results that Europeans save at a rate of over 40% also for security reasons, but here things are changing, almost 39% saving for themselves “for their own respect”, to give children help save nearly 8% and shopping (purchases) reasons only 3% (Canova et al. 2005: 21). These differences may come both from our communist past, we were deprived of many goods and now we need to compensate those shortcomings, or that we are a poorer society and we want to ensure a safer future for us and for our families as well.

Paas argues that there is an order in purchasing financial products that consumers tend to respect. Thus, deposit accounts will be acquired before investing in mutual funds and ultimately will turn their attention to investments in shares (Paas 1998: 353).

This is verified in our research also, by far the most used means of saving / investing are collaborations with banks, nearly 65% of the responses, nearly five times more than the response that ranks 2nd place 14.4% real estate investment. Investments in shares and bonds collected only

3.8% of responses, while investing in the futures market are only 0.6%. This shows that Romanian market is an undeveloped financial market, which is true from our point of view.

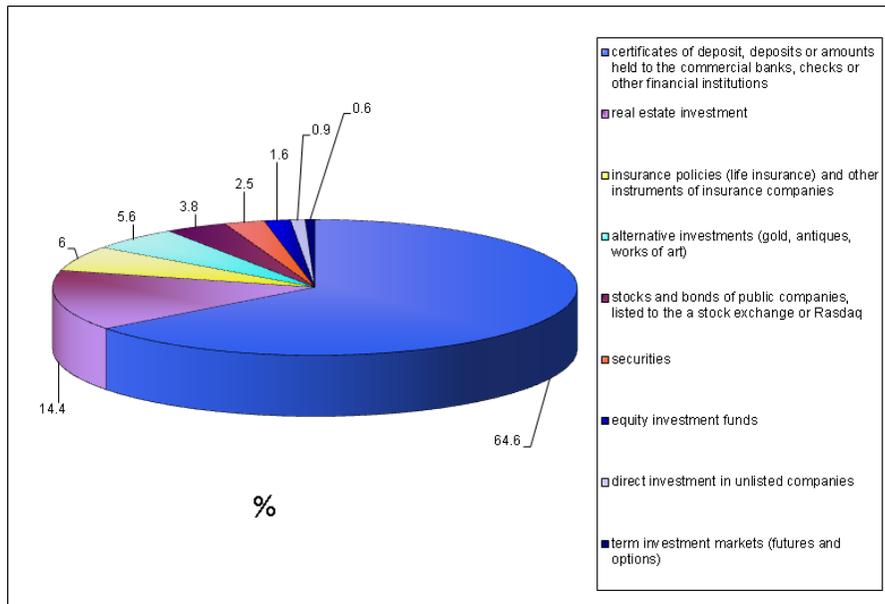

Fig. 2: The preferred investment mean. (made by author)

If we consider the preference for banks and securities rather as savings instruments and for real estate, insurance, alternative investments, stocks and bonds, investment funds, direct investments and term investments rather as investing instruments, we can say that the studied population is rather orientated towards savings then investing, further confirming the need for security. In research we've added a battery of Likert statements on preferred mode of investment. We have shown in the graphic below (Fig. no. 3) the responses of those who chose as the preferred instrument means orientated towards saving and also the responses of those who chose preferred instrument means orientated towards investing. We split the responses and said that ones have savers thinking and others investment thinking, meaning savers and investors for easier saying.

Fig. 3: The statements mean on to the preferred mode of investment (made by author)

Thus savers say they found it easy to choose the way of investment, while investors registered a slightly positive score. Greater risk was found to investors than to savers. Also, the investors and the savers say that the investment has justified the risk taken, but investors have a score almost double registered. With regard to investment earnings, the data do not differ greatly between investors and savers. The answers to this question also obtained the highest score of all questions, showing that those who have made decision in different forms money placement they had over all won, however, no massive losses registered. In front against the expectations of earnings, investors' responses were placed almost exactly on the score of 0, following and frequency distribution, we can say that there is an almost equal division between the earnings that exceeded expectations and have not exceeded their expectations. Instead savers say these gains haven't exceeded expectations. And yet they will use the same method of investing while investors are not so keen. In terms of emotions seems investors are slightly better, they say that they hadn't registered any emotions with the chosen instruments although the risk was higher. Meanwhile savers say they had some emotions regarding the earnings. The last statement is a bit bizarre, though savers said they would call the same method of investing any time they declare that in the specific period of time they could choose something more profitable. It looks as they might have studied the market and had information on more profitable instruments but the need for security is the one that conduce their decisions. Investors in turn say they couldn't have chosen something more profitable. Taken the statements mean on all demographic groups shows that men say it was easier to decide how to invest than women, that young people between 18 and 25 with those over 46 years has been slightly easier compared with those between 26 and 45 who looked more profound. Well-educated people and those with post graduate school say it has been easier to choose than those with only school and college. An Interesting response is the one depending on household income, those with low incomes and those with incomes between 5,000 and 7,000 lei says it was probably easier to pick each for different reasons. The hardest part of it was 7,000 lei, although less in number, investment amount was probably a bit higher and the decision was taken very responsibly. Those who live with their partner, without being married has been the hardest decision to invest in the easiest parts have been those who are single now but had a divorce or widow experience. Those with children have been harder to make the decision to those without children. In terms of occupation, although we do not have enough cases for more classes we can say that, senior civil servants or those with leadership experience have been most difficult to choose. On the other hand students and pensioners have said it was easier, here is probably an indirect influence on income levels and of the chosen instrument not of the position itself. Between Bucharest and the provinces there are not notable differences between the two groups. Regarding the issue of risk, was perceived more higher by women, those between 36 and 45 years and more than 65 years, the school only and those with low incomes, those living with a partner without being married, those with more children, managers, and rather the province. For the statement regarding justify on risk taking, women more than men inclined to be agreed with this statement, like those between 36 and 45 years and those who have as the last school graduated the school. In terms of incomes, those with income between 3501 and 5000 lei recorded the highest score, the lowest being recorded by those with incomes of more than 7,000 lei. Those living with a partner without being married to the greatest extent in saying that the investment has assumed the risk taken and the lowest score is given by the divorced and widowed. Those who are in a greater measure of agreement with this statement are those who have two children. Generally those with children recorded higher scores than those without children. Officials and senior administrative officers and managers, as well as students and even unskilled workers believe that the investment justified the risk taken compared with pensioners, workers and technicians operatives. The province agrees to a greater extent that justified its investment risk than those who are in Bucharest

For the statement “The investment recorded gain”, men are more able to disagree with it, as well as the very young and the very old, those with high school, those with the lowest incomes, those who are living with a partner, those with two children, senior officials and managers, students and people in the province.

For the next statement, that the level of earnings exceeded expectations, we can say that men are easier to please than women, also satisfied are those over 65 years, those with only school and those with revenues between 2001 and 3500, those divorced or widowed, and those with children. At the opposite pole are those with incomes over 7000.

Those who would call the same method of investing are men, those aged between 46 and 55 years, those with post-graduate studies, those with revenues between 5001 and 7000, although those living with a partner but not married, those with one or two children, senior civil servants, managers and students, and those from the province.

Emotions for the earnings had older men, those between 56 and 65, those only with school, those with incomes between 3501 and 5000 lei, those living with a partner without being married, and those with more than two children, senior civil servants and managers. From this point of view there aren't differences between Bucharest and the province.

Regarding the last question, that concerning the possibility of investing in something more profitable. Men are only slightly more determined than women in this regard. Those over 65 years recorded the highest score, those only with school, those with earnings above 7001 lei, those living with a partner without being married, the childless, specialists with intellectual and scientific occupations and with very little before those in the province.

V. Conclusions

The research carried out showed that Romanians have a financial education on average. Roughly know the concepts of saving and investing. As reasons for saving the forefront lays the need for security. As the preferred means of investing, over 60% of respondents chose bank deposits. Another conclusion of this study is that Romanians invest what they have especially in consume, products and daily living needs swallows almost all the resources they have. That's why people spend money on consumer products or if they have patience and ambition to save for a "good investment" in the future, perhaps a house or a car.

The analysis of responses to Likert questions arise as though the mentality of investors are fewer in number, as expected, the profile and their responses are not very different from that of the savers. We expect them to have more aggressive responses, in turn observe answers only slightly different from those of savers. We can draw such a conclusion that investors still have a very low appetite for risk. A profile still looming, the mentality of investors are more likely male, younger, unmarried and without children with income above average with a job with responsibility. And those with savers mentality are rather family man, with children, being in middle age.

THE IMPACT OF THE 21ST CENTURY FOOD MARKETING ON CHILDREN'S BEHAVIOUR

Tarcza Teodora

Faculty of Economics, University of Oradea

Olar Ana-Elena

Faculty of Economics, University of Oradea

This paper aims to raise a question mark regarding children's food habits in the last decades in Romania, and how globalization, marketing and advertising influenced and changed our old romanian food preferences. We will highlight that children spent a lot of time watching TV, choosing a cartoon character, or an advertising star on the same age as him/her as a model, and then copying their behaviour, and acting like them. So, they have the idea that they will gain their parents' love and their colleagues appreciation.

The rise of obesity is one of today's biggest societal challenges. Thus, to halt obesity has become a goal in several political sustainability strategies. The focus is on children since their health behaviour is expected to have a strong impact on consumers in adulthood. To fight childhood obesity, the challenge is to develop the 'right' policy toolbox. One complicating aspect amongst others is the numerousness of actors involved. To find a policy mix and assess its consequences for all actors, it is essential to understand the underlying mechanisms – the impact of external and internal factors on children's health behaviour. Tools such as regulation, information and education appear to be insufficient to curb this unsustainable consumption behaviour.

Keywords: food marketing, advertising, children, gatekeepers, ethic code

Jel code: M31

1. Introduction

Marketing and advertising to children has been growing exponentially in Romania during the last two decades, and corporations spend billions each year trying to influence children's brand and product preferences. After the *Ethic Code for Advertising Adressed to Children Referring to Food Products* signed in 2008, marketers have aggressively targeted children although the code is not in favour of using children for promotional purposes.

World Health Organization (WHO) figures show that worldwide, over 1 billion adults are overweight and around 300 million are obese (Obesity is assessed using body mass index (BMI) above 30 kg/m² and represents the upper tail of the population distribution of BMI). Over the past 30 years, the frequency of overweight children has tripled (Miller, J., Rosenbloom, A. & Silverstein, J., 2004). While governments' influence on changing individual consumption behaviour is limited and needs a long-term commitment, a more promising approach is to actively design the consumption contexts people live in: the food and drinks offered, the marketing and advertisements contents broadcasted, the walkability and bikeability of cities and so forth. Urbanized consumption environments today have been coined as being 'obesogenic', i.e. containing stimuli that encourage obesity (Lobstein, T., Baur, L. & Uauy, R., 2004).

The present paper treats aspects related to the ethical food marketing to children and the social responsibility of food marketers. Based on research, the responsibility of the childhood obesity can be placed on children, parents, schools and food marketers, who all contribute to this problem in some way. Children are consumers today and will be the buyers of tomorrow. Companies are following the idea:

„sell these children on your brand name and they will insist that their parents buy no other”. This is the generation whose children are sicker than their parents. Why? One reason is the excessive consumption of sweets, fast food and lack of exercise.

Advertising and marketing to children is not legal, according to the *Ethic Code for Advertising* and RAC (Romanian Advertising Council) (<http://www.rac.ro/cod>), so the question that arises in this case, food marketing in particular, is: is it ethical? And if it is ethical, are marketers responsible for misleading messages in adverts and what are the responsible ways of selling food products to children? What are the responsible ways of promoting products for adults without influencing the child through television?

Advertising on TV aims to stimulate demand compliance strategy, namely pull strategy. Pull strategy (to attract) involves marketing activities, especially advertising and promotional marketing, targeted end-user (in our case, the student aged 8 to 12 years) and intended to make it apply to products at intermediaries (parents, grandparents), thereby causing the latter to demand services from providers (the company who paid for a TV spot and that is advertising). Attraction strategy is demand-driven, aiming to create or increase them. The goal is to provide enough information to attract consumers.

Having a picture of the current landscape with regard to food advertising to children is essential as the country moves forward in the effort to combat childhood obesity. If we overestimate the presence of food marketing in children’s lives, or its role in their diets, we may place too much faith in marketing-oriented policy solutions; if we underestimate it, we may neglect important policy options.

Government agencies and advisory bodies have faced frustrating obstacles in getting the data they seek to help inform their deliberations; it is the purpose of this paper to help fill at least some of the gaps in their knowledge, and to provide a benchmark from which to measure future changes in the food marketing arena.

The study answers a series of fundamental questions: How many food ads do children see on TV today?, What types of foods do they see advertised most frequently?, What is the nature of the appeals used to market food to children?, What proportion of food ads model promote physical activity?, How often do food ads include a “push” to company websites?, What proportion of food ads use health benefits as a primary appeal, or offer specific health claims?

2. Background / existing international action

Children today watch television more than ever and are therefore they are more bombarded with advertisements. Research has shown that children are capable of storing and remembering many of the ads you see on TV, whether they are for toys, food and cars. Advertising agencies spend billions annually for advertising aimed at children, but in what sense? Studies show that children only need a view of a commercial ad to develop a preference for a particular product and that this preference is reinforced by repeated exposure. It is not just the goods that address their children are remembered, but also products for parents. One study found that children bombarded with junk food ads eat up almost double unhealthy snacks and sweets compared to the amount consumed by a child who has not seen those ads. Those who are already overweight or obese are most sensitive to food advertising. Nutritional choices made by parents and children depend on many factors. Studies show that one of these factors may be advertising to children. These studies reveal that advertising can attract children's attention, can influence their choices and can encourage them to determine, in turn, their parents to buy certain products. Over the last few years, major international food and drink companies have introduced a number of new policies and pledges covering the marketing of their products to children. This research aimed to look beyond the headlines to see what the companies have actually committed themselves to. Analysing food and drink company policies on the marketing of food to children is a complicated

and, at times, confusing undertaking. Is often what is not said, rather than what is said, that is significant. Brands like Unilever (*Left Wanting More, Food Company Polices on Marketing to Children Report*, part of *Junk Food Generation*, downloaded from www.junkfoodgeneration.org on 6th Aprilie 2011) do not have a global policy and rarely a regional policy, however some of them have signed a commitment (*Ethic Code for Advertising in Romania*) which gives them credibility in front of the parents and teachers that they would not target their products and beverages to children. However, these companies and other just like them use indirect form of advertising to children, teasears as "come to KFC", "I'm loving it" etc, use children in their advertisments and create the idea in the mind of a child between 8 to 12 that the product is nutritional for aparently peculiar reasons.

The European Commission (2007) notes that parents having the main responsibility for their children should be able to make informed choices and transfer their knowledge to their offspring. Obesity prevention actions are undertaken by the Romanian Government Programme "Cornul and milk" and in June 2009 the Romanian Advertising Council (RAC) is the depositary of the Ethic Code for Advertising to children on food. Thus reports of problems treated by this code fall under the RAC and are considered by it. Code of Advertising Practice (hereinafter "the Code") was prepared by the RAC in order to use advertising to inform public opinion in Romania fairly, honestly and decently, respecting both national laws and principles of advertising practice internationally recognized both in form and content made by the International Chamber of Commerce (<http://www.rac.ro/cod-produse-alimentare3>). Companies that signed the code dedicated themselves to responsible advertising of food and non-alcoholic beverages to support parents' efforts to promote healthy lifestyles. As such, the companies agreed not to advertise food to children under 12 years old, except for products that meet specific nutrition criteria based on accepted scientific evidence and / or national and international nutritional guidelines. The purpose of this initiative, "Advertising to children under 12 years old" means advertising in a program with an audience of at least 50% of children aged up to 12 years. Companies also undertook not to carry out communications relating to products in primary schools, unless they are specifically required in setting the school administration or educational purposes.

3. Influencing factors: empirical evidence of determinants of obesity

Children tend to copy the behaviour of somebody they like or somebody they see often. Since they watch TV a lot, as the results of the questionnaire sustain, their role models are chosen from what the TV is offering them to watch. If another child is used in an advertisement on the television for no matter what product, food, toys, beverages and even banking, the child who watches the advertisement will begin to consider the child in the advertisement "cool" because he appears on TV and is enjoying the love of the other characters in the ad or has a disered toy or sings a nice song while advertising a product.

So, marketers are betting on a quick transfer of sympathy, respect and reputation of the company star, unlike the version that these perceptions were done by the power of communication of ideas. The public is emotionally attached to a star / celebrity and credited with credibility. This way to attract audiences by celebrities is successful and subconsciously the child wants to be like them, have more in common with them, have the family in the advert etc. Another aspect for which children tend to remember the advertisements, to desire the product, to ask their parents for it, is related to what the celebrity or the mascot in the ad represents for him. If the children see advertising that promotes a highly criticized product, unhealthy appreciated by parents, teachers, other children and child itself, being recognised for its sports performance, healthy lifestyle and so on, children will desire believing the product gives him / she the features, skills, reputation of the celebrity. We have identified four influencing factors determining obesity between children of 8 to 12 years old:

Parents as gatekeepers

As far as children are concerned, the major responsibility for obesity lies with their parents and families as well as with secondary socialization agents such as caretakers and teachers; all mentioned act as gatekeepers. Parents are working long hours, spend less and less time with their children, try to involve them in as many activities as possible and therefore nutritional aspects often left aside. The child feels distant or alienated in front of his parent and the parents give them whatever they want to gain the child back.

"Parents say they feel in conflict. They want to say no, but they don't want to have their child upset with them" (Zoll, M.H., 2000).

Spending allowance

Children today experience an increased spending autonomy. Children are free to buy from the school's shop, for example, whatever they want. Our research reveals that children in the third and fourth grade, who already know to calculate, receive money from parents to buy themselves sweets, sodas, chips, candy and so on. Even though, school shops are not supposed to sell unhealthy foods and beverages, such errors occur, so 55,55% prepare their school food at home and 44,44% buy something from the school's shop. However, children in the first grade choose to prepare their own school meals at home in proportion of 73% , the rest of 27% buy chips, soda and candy. The preferred acquisitions are chips, gum, popcorn with cheese, candy. Non-structured interviews with parents reveal that most of the children receive every day between 3 and 10 Ron.

A modernized food environment

The food industry, retailers and restaurants are considered as important actors in the matter of childhood obesity. They shape the context in which food choice takes place. For many years, it has been debated whether consumers actually use the nutritional information provided on the package at all and if yes, which of the competing systems is the best. For instance, information about included fat seems to make consumers choose lower fat alternatives. Latest research has shown that consumers do indeed use provided health-related on-pack product information – such as General Daily Allowances – but only if it is easy to understand and eye-catching.

Modernized food marketing

The food industry has increased the number of channels used to advertise their products to children. While television is still an attractive medium for the small children and advertisements are a successful strategy for brand building, online marketing such as 'advergames', in-school marketing and sponsoring, as well as toys and games produced in association with food producers are increasingly used (Wansink, B., 2005). To increase consumption, marketers create positive attitudes for their products and try to channel social norms of parents and children – i.e. for instance shared beliefs about health behaviour – by strengthening already existing behavioural patterns and convincing consumers of the product's benefits. Experiments suggest that food branding changes children's preferences in favour of the branded food (Branca F., Nikogosian H., Lobstein T., 2007). This is problematic since the majority of advertised foods are snacks, soft drinks and sweets that are high in fat, sugar or salt.

4.Objectives and Methodology / research

According to the study *The Impact of Advertising on Parents and Children* conducted by the IMAS and the Center for Media Studies and New Communication Technologies (CSMNTC) (published in *Jurnalul.ro* on 29 June 2010) commercials are viewed by 75% of the 6 years old children. The proportion of those who watch advertisements decreases, however significantly with age (<http://zibo.ro/planeta-blog/alimentatie-sanatoasa-10/Influenta-reclamelor-TV-aupra->

alimentatiei-copiilor-55). It is estimated that the percentage of children viewing TV commercials aged between 8 and 12 years is around 50%. According to CI (*Left Wanting More, Food Company Polices on Marketing to Children Report*, part of *Junk Food Generation*, p. 10, downloaded from www.junkfoodgeneration.org on 6th Aprilie 2011), several companies define a child audience as comprising more than 50% of under 12, meaning that large numbers of children may still be exposed to their marketing.

As their participation in consumer markets has grown, children have become increasingly attractive targets for advertisers. This is partly driven by their high media use. All questioned children watch television and 90% of them do not miss the prime time hours, exposing themselves to a variety of advertising.

We have chosen to focus on what we feel is the most influential culprit of the four factors, food marketers, since we believe food marketing campaigns are harming the lives of children by presenting misleading messages. Within two days we analyzed advertising clips for food and beverages for children aired during prime time. After personal observation we concluded that high in fat and sugar products (dairy, cereals and sweets) are pursued in 30% of the advertisements. While foods such as full grain, fruits, vegetables, vegetable oils, nuts conspicuously missing from the commercials (between 1% and 5%). Therefore, commercials encourage the opposite diet recommended by doctors.

<i>Tabel no. 1. Children's exposure to food advertising on the TV, on average</i>			
Age	Number of Food Ads Seen per Day*	Number of Food Ads Seen per Year	Hr: Min of Food Ads Seen per Year
8-12	90	32850	30 h
*between 07:00-22:00			

On average children are viewing 90 advertisement regarding food and beverages in a single day (an advertisement is seen more than once), therefore a child watches 32850 commercials per year taking into consideration an advertisement lasts around 01:09 minutes. Given the amount of time they spend watching TV each day and the mix in programming and networks that they view, children ages 8-12 see an average of 98:10 minutes of advertising a day for all products (toys, food, media, and so on).

Appeals used in food ads targeting children or teens

Among all food ads targeting children and teens, the most common primary appeal is taste (34% of all ads), followed by fun (18%), the inclusion of premiums or contests (16%), and the fact that a product is unique or new (10%). Two percent of all food ads targeting children or teens use claims about health or nutrition as a primary or secondary appeal in the ad, while 5% use energy as a primary or secondary appeal.

<i>Tabel no. 2. Other attributes of food advertising to children 8 to 12 years old</i>
22% include a disclaimer (e.g., "part of a balanced diet")
20% promote a website
19% offer a premium
15% portray an active lifestyle
13% include at least one specific health claim
11% use a children's TV or movie character
7% feature a contest or sweepstakes

Children of all ages are exposed to a substantial amount of advertising for food and beverages, but their exposure varies significantly by age. Because children 8-12 watch so much television, and therefore see so many food ads, they may be the group most affected by food marketing.

This is also likely to be an especially important age for the development of children’s food habits, since they are likely to have more time away from their parents, have their own money, and have more opportunity to make their own food choices. Therefore, policymakers and industry leaders may want to pay special attention to advertising seen by tweens.

1. Limits of the research

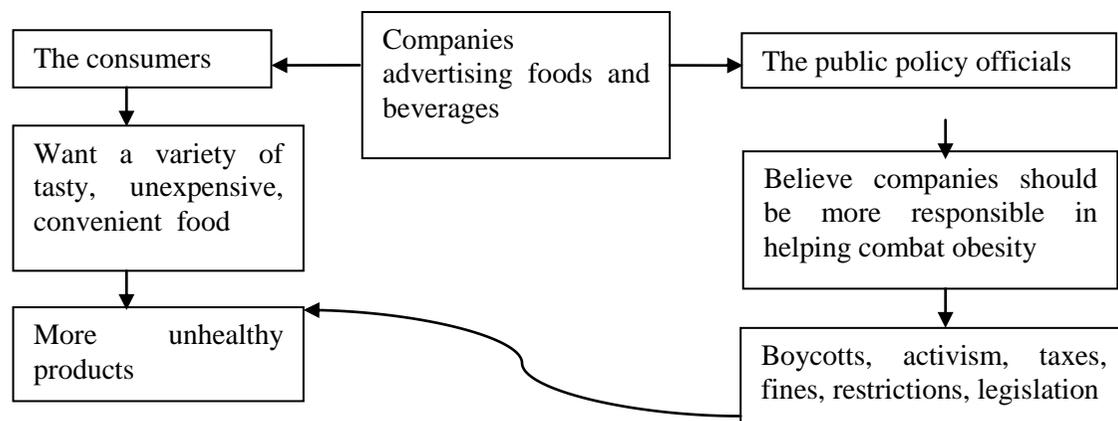

Figure 1. The Vicious Circle of Demarketing Obesity

Although companies say they cater to children’s biological interests, companies have recently been accused of contributing to the growing problem of obesity. The child’s desire for fast-food and other non-nutritious foods, desire induced by the company selling the unhealthy product, leads to the production of more unhealthy products on the market and therefore more promotional actions for unhealthy food, more actions from the public policy officials leading to more taxes, fines, restrictions and so on and so forth, altogether creating a vicious circle.

This study does not address the issue of whether food advertising to children on TV is going up or down, nor does it address the issue of whether such advertising influences what children eat, or should be in any way restricted, either through voluntary industry efforts or through regulatory policy. What it does indicate, however, is that food marketing is a predominant part of the television advertising landscape for children and that young people’s exposure to such messages is substantial, while their exposure to countervailing health messages on TV is minimal.

5. Conclusions

The factors presented above are valuable starting points to change young consumers’ behaviour into a healthier direction. While the goal to reduce obesity is broadly accepted, the motives, strategies, possibilities and dependencies of the various actors in the food system and in food and health politics differ. In the following we argue that policy actions are necessary, but that they can only be effective if all stakeholders support these policies with the means in their reach.

Solutions – developing profile clusters of ideal consumers and by discovering why people like the foods they like, effective dietician can find similarly predisposed people and help them develop the same mental map for that feed.

Although it is easier to target tastes than to change them, there is some opportunity to help consumers learn to like new tastes. People can be fairly suggestible when it comes to food moves. If the name sounds bad, it will bias taste. As long as a food is of at least moderate quality, the better the description, the better the taste. In general, however, when trying to encourage change in habits, it is easier to encourage small, infrequent substitutions when introducing new foods. It is easier also to target opinion leaders and nutritional gatekeepers, than to target everyone. Good cooks, for example, have a tremendous influence over the eating behaviours of the family.

THE ROLE AND IMPLICATIONS OF THE EVENT BASED COMMUNICATION IN THE ELECTORAL CAMPAIGN

Tatu Cristian Ionut

Bucharest Academy of Economic Studies, Faculty of Marketing

Pastiea Mihai

Bucharest Academy of Economic Studies, Faculty of Marketing

Ion Andrei

Bucharest Academy of Economic Studies, Faculty of Marketing

The electoral campaigns are considered to be among the most delicate challenges for a marketer due to the limited time available, the sensible margin for error, the high impact of each statement and the condensation of a quite large amount of resources in a 30 day period. While the ultimate goal for the campaign staff is to bring the global electoral package closer to the electorate and earn their votes most, of the time various competitors use disappointingly similar tactics that create confusion among the electorate. The campaign related events turned out to be one of the tactics that allows for a pin-point targeting of the electorate and a better control on the receivers of the message. This paper focuses on the types of events used that can be used in an electoral campaign reinforced with their particularities and effects registered in previous campaigns.

Keywords: electoral marketing, communication, events, targeting, global electoral package

Cod JEL lucrare: M39

The history of the Romanian electorate and its behavior

Over the past 21 years the Romanian electorate experienced the “to do list” types of electoral campaigns, due to the fact that the dominant political factions relied mostly on identifying and exploiting the weaknesses of their competitors and less on conceiving a proper global electoral package.

This odd behavior has his origins in the budgetary restrictions and the lack of marketing implementation especially in the first 10 to 15 years, conditions reflected by the business environment also in that period.

The campaign strategy was based on promises extracted from the problems specific to every local community at a specific moment without little if any perspective on the entire country or concern about the availability of the resources needed to fulfill the promises being made.

This strategy turned out, as expected, to be disastrous for all the major factions with a chance to win the elections as their less ethical battle for supremacy generated a bad image for the entire political environment and the confidence of the electorate in a certain faction, candidate or doctrine plunged to an all-time low.

The disappointed and troubled electorate “rewarded” the superficial approach of the political environment with their lack of confidence in all future promises materialized in a strong indifference towards the campaign efforts and the “confidence” vote reaching an alarming low in the last 5 to 10 years.

One of the main problems in reaching the electorate and designing a winner national strategy is the unequal development of different areas of the country, a major factor that influences the needs and desires of the local inhabitants.

While a campaign template can be considered proper for various types of localities (cities over 50.000 inhabitants, cities with 10.000 to 50.000 inhabitants, big and small villages...) a very

strong influence comes from the local specific. Some former industrial cities are reduced to a big pile of rusted closed factories and their inhabitants are barely holding on while other agricultural communities have their own desires and so on. Even in the last campaigns no faction proved to have a solid campaign strategy based on clearly identified segments of electors.

The society is becoming indifferent towards the generic “crowd baths” and continue to mind their own business remaining neutral to the electoral efforts or even reacting negative to the constant communicational harassment specific to the 30 day electoral campaign.

Another major problem of the Romanian society is the generation distribution. Older generations conceived in the industrial development boom in the '70s and '80s are up to three times bigger than the ones conceived after 1990 and this is just a part of the problem. The percentage of people over 50 years of age in the total population is alarming and accordingly to the evolution of the birth statistics is only going to be worse as the average number of children for family dropped from 3.4 to 0.8 and the economic crisis is not going to help the improvement of this indicator.

The fall of the huge industrial system rendered most of the people over 50 years of age professionally useless as their position disappeared and they were forced to take on another profession or go to inadequate jobs turning to disappointed reminiscences of an over ambitious, unsustainable industrial dream.

Unfortunately the majority of Romanians with the right to vote is composed of people past the age of 50 mostly living in the rural areas that together with the former industrial workers have become to rely on social allowances and retirement fees.

It is because of this financial weakness of the majority of the electorate that the political factions are focusing their efforts on the sensible areas of the country where the return on the investment is greater than the one in the major cities.

The principle of equality that is a fundamental constitutional right makes no difference between the vote of an uninformed 80 years old from the rural area and a proper informed 30 years old from a major city and this should not be a problem in a country with equal distributions on each generation. In the past years rumors have appeared regarding the uselessness of going to the polls in the major cities due to the fact that the results of the polls will not reflect the voter's opinion. Why the results can be different from the options of some electors this difference is due to the fact that the capitol city has less than 10% of the country's population and less than 50% of its inhabitants with the right to vote choose to go to the polls on Election Day. By comparison in the rural areas, especially in the small localities people see the polls as some kind of celebration and go to the sections in large numbers reaching even 80% or more.

The Romanian political factions and their campaign strategy

As the electorate adapted to the classic view over how things should be done in a campaign by avoiding and disregarding the efforts done in the 30 day campaign the political factions saw that something must be done in order to increase the efficiency of the faction-electoral communication and this is where the science of marketing comes into the game.

Various faction from western Europe and the United States have been using the marketing instruments in their campaigns for a few decades now with such good results that a new branch of the marketing science appeared: the electoral marketing.

When dealing with a tough and divers audience such as the Romanian electorate the implementation of the electoral marketing was the proverbial “breath of fresh air” needed to revitalize the electoral campaigns and get the factions closer to the society for which they fight to represent.

For the moment a big percent of the factions present on the Romanian stage have chosen to implement only a couple of elements from the electoral marketing tool bag selecting mostly tactical elements that are being applied without unity and little to no strategic planning.

As the number and variety of tools being used evolved there is still a major problem due to the campaign fever: the lack of interest for the final beneficiaries, for the status and opinion Romanian society. It is obvious the importing a successful tactic from an over the seas campaign cannot and will not have the desired effects when implemented on a significant market by another faction without testing its potential first.

This campaign rush combined with the hibernation of the electoral machine between the legal campaigns puts the marketing research on one of the last position of the faction's to do list. Without relevant and fresh data from the market the short term strategy is mostly based on promising more than the competitors do and trying to get some of them down from their tall horse before they try to do the same. Various electoral research results still fill the news bulletins with contrasting results and a "staggering" one hundred respondents believed to be representative at a national level.

While some of the major factions have their own confidential market research done, with results that stay with the top end staff members even in their case there is little or no uniformity on all the regional and local agencies. More concerning is the fact that, as some party representatives divulged in the media, some strategies failed because in some local agencies the faction members completed the questionnaires "in house" in order to send good reports towards the central campaign office and make a good impression managing to render the national strategy or at least the regional campaign strategy useless.

The fanatic supporters of any faction combined with some local leaders hung up on getting good reports are sabotaging their own party from the inside doing more harm than any other competitor can. This is the main reason why some faction leaders and campaign staff members with experience consider a proper marketing approach useless and choose to limit their marketing efforts on the tactical level and base their decisions mostly on their experience and intuition.

The inefficient communication between the headquarters of the faction and its local branches combined with the overwhelming workload specific to the electoral campaign (compared to the passive activity in the rest of the time) motivates the faction leaders to go for a sales oriented vision for their campaign instead of a modern more efficient one oriented towards satisfying the need of the electorate better than the competitors do.

In these conditions the political faction choose the replace the electoral marketing approach with a more simple approach that focuses its attention towards the communication component of the marketing mix.

The advertising industry is getting ready for a feast each time an electoral campaign is getting close but over the past years the electorate had become immune to both indoor and outdoor advertising, BTL and ATL, avoiding all of them with the same tenacity.

As it turns out, especially in the big cities where the advertising machine is at its best, the people are willingly avoiding everything that smells like electoral advertising as long as there's nothing in it for them. Some minor promotional gifts like small personalized objects (lighters, balloons, caps and so on) usually get away unnoticed there's a limit on the value of the object that can be given as a present in the electoral campaign and there were numerous conflicts over the time as the political factions accused one another of trying to buy the votes of the people by giving products that ranged from buckets to cell phones.

In order to play it safe some factions decided to go for events ranging from a small on the block party for kids to large concerts as a technique perfect for gathering respectable numbers of potential voters willing to endure a couple of messages from a certain candidate in order to enjoy the show.

This tolerance from the behalf of the electorate as well as the low costs per participant and the superior success rate made the events one of the most powerful and efficient electoral

communication instrument and is being widely used by all factions no matter their size, financial strength or hope to achieve victory.

The event based marketing communication

Regardless of the size, age, doctrine and odds of success all political factions make good use of the people's desire to have a good time for free and to gather in masses celebrating a more or less famous date.

Due to the communicational versatility of an event various types have been used over the last campaigns depending on the available budget, their purpose and the category of electorate targeted. Few other markets have such a great diversity of profiles for their beneficiaries as the electoral market and this is only making the segmentation and positioning process tougher.

Every segment of electorate has its own needs, preferences and taste so, as far as event planning goes, the marketer will either go for a general mega artistic event in regional centers or for a series of smaller micro events focused on the segments sensible to a more consumer oriented approach.

An experienced marketer will always choose a personalized approach over the standard "one size fits all" view but this is close to impossible when there are close to 18 million potential customers (citizens with the right to vote) out there spread across 238 thousand square kilometers.

This is where the extensive network of branches comes in allowing the political faction to go from macro campaign management, done from the headquarters for the entire country, to the medium level conducted from the 41 county branches, and finally to the micro campaign management usually done at the smallest local faction branch.

The power, influence, financial power and effectiveness of the branches vary drastically from one to another and while, in normal circumstances, the lower representatives have the advantage of knowing the terrain and local communities in details the actual know-how and marketing vision is mostly restricted to the headquarters and some local agencies based in the major cities.

In most cases the advantages of the three hierarchic levels are not combined practically due to some differences in style of management and/or vision between the strategic department from the headquarters and the manager of the local agency.

At the macro level the most commonly used events target the general public and, as a PR campaign wish to promote the image of the faction and/or its candidates, to improve awareness and public acceptance through different types of gatherings as:

- Public outdoor concerts (free access)
- Sport events, amateur competitions
- Fund raisers
- Exhibitions and other art manifestations
- National/regional gatherings of party members and followers
- Festivities celebrating various holy days (if any)
- Sponsorship announcement parties
- The official candidate proposal ceremony

As our interviews reflect respondents from all social classes see most of these events as "try hard" campaign efforts gone over the edge, that only the faction's followers will like and believe in while others are a success to the general public due to the free entertainment. If for our respondents the first category of events is on the black "to avoid at all costs" list the last one is mention as being acceptable and they're willing to tolerate the public speech during several breaks if the weather is fine and the show is worth waiting for.

Even so the message being transmitted will most likely be received with a certain degree of distortion and most of the cases stored in the short term memory due to the multiple influences

generated by the crowd interaction. Less than 10% of our respondents changed their opinion about a certain faction or candidate after participating at such an event.

These gatherings attract, as some of the participants remember, mainly teenagers and young people in their twenties. This is to be expected as entertainment usually focuses on young people but, as national particularity, a noticeable number of retirees and older adults participate as they are used to receiving gifts every time there is some noise in the electoral campaign.

No measurable or noticeable positive change in the behavior of our respondents was recorded but, as it turns out, they slightly remember some interesting embarrassing situation that the candidates were drawn into by the response of a hard to control crowd when its patience was forced out.

The acceptable amount of “propaganda” in the total length of the event was around the average of 15 to 20 minutes in a 2 hour concert divided into 4 interventions. If before the concert the crowd is energetic and eager to witness the performance and will resist to maximum 1- minutes of showing off at the end of the concert our respondents did not specified a maximum length of the speech because their only concern at that time will be how to escape from the crowd and get back home.

Understanding the behavior of the masses in large gathering is more than a useful skill, it is an essential guideline that can make the difference between a splendid waste of limited campaign time and money and an efficient event whose effects can make the difference on that most important Election Day.

The marketing vision is highly oriented towards the customer by definition but in this particular atypical market the marketer should take into consideration the problematic of identifying the customer and the rapid shift in political options during the critical last 48 hours of the electoral campaign.

The only affordable approach here will be to target the followers of the faction/candidate but also at least ensure a tranquil climate with the fast shifters, non-voters and most importantly the followers of the competition. This is of major importance due to the fact that if the election gets to the second stage where the number of finalist factions goes down to three or less an acceptance relation with the voters of the completion might go a long way and make that fine difference.

Large group gatherings specific to the “mega-events” category specially done in neutral public places are perfect because the crowd is grouped on communal non-political interests and can be addressed as a group and the messages are being delivered using non-targeted approaches.

The specific characteristic that differentiates the event base communication from every other communicational channel consists in a more subtle link to the faction and/or candidate and the fact that the individuals in the gathering will resist electoral messages as a small fee due in exchange for the entertainment received.

Mega-events: from mass communication to quiet segmentation

The art of marketing is based on satisfying the customer in better condition compared to other competitors but there’s no such thing as “good quality”. The ever consuming paradigm between standardization and personalization is specific to the event based communication and thing are only changing for the worst when the event turns into a mega-event.

Every large crowd has an issue: the large number of subgroups, everyone with it distinctive preferences and behaviors. It is this difference that sometimes causes conflicts when various subgroups interact. From small localized distortions than are quickly being suppressed to more disturbing conflicts that go all the way to physical injuries any kind of disturbance affects the image of the eminent and the overall utility of the event.

Tighter security is never the answer. If extensive law enforcement is necessary than the communication strategy is wrong and the political faction is risking an image crisis if the electorate makes a link between it and large gatherings of aggressive crowds.

The main idea is to use segmentation in order to determine at first the groups of potential electorate being targeted and characterize them all in order to identify every little thing they have in common regardless of their political color, history or temporary preference.

The main idea is to integrate non-voters and people with superficial preferences into a large group centered on a common interest and make them enjoy a pleasant experience. The purpose of the exercise is to make these relative non-voters see that the faction and the candidate are supported by people just like them, with interests similar to theirs increasing the individual's acceptance towards the eminent of the message.

For a big faction with real chances in winning the elections or at least make it to the second poll these passive followers are quite important. The past experiences are full with last minute negative news that drastically change the opinion of less devoted followers and leaves them disappointed. In this case their second option comes into action as they wish to teach their initial favorite faction a lesson.

Bigger events usually use general audience subjects and attract bigger crowds constructed from a larger number of segments, some desirable, some less desirable. The wellbeing of all participants along with a lesser negative press impact is more than a preference of the organizer but it is its obligation.

In past electoral campaigns the press widely promotes events with potential gone bad due to the unethical conduct of some undesirable groups of participants. Some call them "militia" sub-groups sent by the competition to destroy the events, others refer to them as groups of local hooligans that might of been "motivated" by the adversaries but regardless of their origin or intent the results of their actions speak for themselves.

In order to prevent such behaviors the theme of the event must avoid subjects specific to uneducated, violent people and the strategy chosen for the message distribution should be well thought at. The main issue here is to present facts, to propose an alternative, to show consideration and appreciation, care and personal involvement things that cannot cause a dispute between people attending the event and, at the same time, true facts, new facts that should capture the attention of the people with a strong long term memory effect.

It is all right to generate debate themes and involve the people in the cause but anything close to generate a competition between the participants should be avoided at all costs. The idea is to make them think and act as a group, as a part of the society with common concerns and desires and not to divide them into arguing subgroups.

Personalization is nice but it doesn't mean to use "divide et impera" one very group. Therefore is more efficient to make the individual from a certain gathering to feel as a part of a large group and think of himself as being different at the same time. People participating at various events are usually from a certain area and can easily be addressed as a group different from any other one in the territory

Every individual have two major social needs: to be part of a larger group and to feel special, apart from every other individual. Using an event to send electoral messages is quite inspired because the needs and desires of the group are more general, easier to satisfy and hard to deny by certain individual due to the group interaction. Being aware of the power of the group and unwillingly to contest the needs of the majority the individual will incorporate the mass euphoria and remain with a good impression about the plans presented to him.

Large scale events offer the marketer involved in an electoral campaign the advantage of using the appurtenance groups to address individual without being forced to invest the limited resources available into personalization and segment identification.

A MARKETING VIEW OVER THE ROLE OF THE PUBLIC AUTHORITIES IN THE PROTECTION OF THE CONSUMERS' PRIVATE SPACE

The concept of privacy, seen in connection with the consumer's private space, and defined in terms of the rights the consumer have to disclose or not, respectively to have protected their personal data has gained an increasing importance, as a result of the organizations' extended and more and more aggressive attempts, within their marketing efforts, to capture, process and use the consumers' personal data. Privacy protection has become an important but, in the same time, extremely sensitive and challenging topic to be taken into consideration by all the stakeholders involved in the processing and employment of the consumers' personal data. A key role in this respect is played by the public authorities acting as data controllers – the Data Protection Authorities, that have to adopt a more proactive and efficient attitude in adopting and implementing policies and processes aiming to ensure a more effective protection of the personal data and private space, conduct privacy impact assessments and continuously improve the specific activities.

Paper presents the opinions of the consumers through the results of an exploratory study regarding the importance given to the protection of the personal data, the area of protection of the specific laws, the need for laws regulating the personal data protection, the balance between the public and private entities in providing a proper protection of the personal data, and the relationship between the domestic, European, and international levels in ensuring the protection of the consumers' personal data. Results regarding the role of the public authorities in the protection of the consumers' personal data and private space– in terms of the most appropriate institution to act as a data controller, the rights consumers consider important in relationship with the protection of their personal data and the risks faced in the context of a less effective protection – are also presented.

Keywords: consumer, public authorities, personal data, consumer private space, Romania

JEL Classification: M31

Introduction

The end of the 19th century has brought the first formal attempts to conceptualize privacy. In 1887, the Pacific Railway Commission has found that “of all the rights of the citizen, few are of greater importance or more essential to his peace and happiness than the right of personal security, and that involves, not merely protection of his person from assault, but exemption of his private affairs, books, and papers, from the inspection and scrutiny of others” (Langenderfer and Cook 2007: 734). Three years later, in the article “The Right to Privacy”, Louis Brandies has approached and explained the individual’s “right to be left alone” as a response to the loss of privacy experienced during that times (Guarda and Zanone 2009: 337).

In spite of their rich history, the attempts to define *privacy* were rather difficult due to the wide number of related interests such as the personal information control, reproductive autonomy, access to places and bodies, secrecy, and personal development (Kemp and Moore 2007: 58). Many definitions given have tried to explain the content of privacy considering the right to be let alone, limited access to the self, secrecy, control of personal information, personhood and intimacy (Solove 2002: 1087). More, there are points of view stating that privacy cannot be defined as a right (but as a valuable thing deserving a fundamental respect), this being in conflict with itself: if privacy were indeed a right, one could demand protection for it but seeking for the protection of privacy may lead to some violation of privacy (van Swaay 1995: S152).

From a *marketing perspective*, definition of privacy should focus on the personal data and information regarding the consumers. In this respect, privacy has been defined as the claim of individuals, groups or institutions to determine for themselves when, how, and to what extent information about them is communicated to others (Westin 1968: 7). Schoeman adapted the content of privacy at individual level presenting it as a claim, entitlement or right of an individual to determine what information about himself (or herself) may be communicated to others; the measure of control an individual has over information about himself, intimacies of personal identity, or who has sensory access to him; and a state or condition of limited access to a person, information about him, intimacies of personal identity (Jóri 2007:111).

Privacy must be seen in connection with the particular area where its content is applied. The above definitions imply the existence of a *consumer's private space* defined through and including an amount of information referring to the demographic, psychographic and behavioral characteristics of the individuals (*personal data*), and the rights the consumer should have to disclose or not, respectively to have this information protected through the appropriate laws and means (Vegheş, Pantea and Bălan 2010: 263).

Since its emergence in the mid-1960s, privacy protection has been constrained by the fair information practices model to a framework that has been more protective of corporate and government interests than of people's data, let alone of people themselves (Clarke 2009: 129). A key role in this respect is played by the data controllers – the Data Protection Authorities operating in each country. According to the Art 29 Working Party (an influential body comprised of representatives from the European Union Member States' Data Protection Authorities), data controllers should be proactive in at least the following: adopting internal policies and process to implement the requirements of the data protection, put in place mechanisms executing the internal policies and processes, draft compliance reports and carry out audits, carry out privacy impact assessments, and assign responsibility for data protection to designated persons (Wong 2011: 56).

It is obvious that issues of privacy and consent impact the very nature of society and governance, so the society will have to set in place dynamic policies that enable switching, change or adaptation (Elahi 2009: 118). In spite of all these, all the current and proposed measures seem to fall far short of providing a comprehensive system of enabling and protecting a societal expectation of privacy and, in the end, even with a fairly comprehensive system of protections, enforcing those laws and the enforcers themselves, remains problematic (Hough 2009: 412).

Methodological Notes

Data expressing the opinions of the consumers regarding importance given to the protection of their personal data, the area of protection, the need for laws regulating the personal data protection, the balance between the public and private entities in providing a proper protection of the personal data, the relationship between the domestic, European, and international levels in ensuring the protection of the consumers' personal data, the most appropriate institution to act as data controller, the rights associated with the personal data protection, and the risks derived from an inappropriate administration of the personal data have been obtained conducting a research

approach with a larger overall scope, of assessing the exposure, attitude, current and future behavior of the consumers in connection with the direct marketing efforts of the organizations. Data have been collected in January 2010 using a sample including 78 Romanian consumers from the Capital and other cities, aged 18 to 30, with higher education, which have been questioned about all these aspects, as well as about other relevant elements for the way direct marketing is implemented in the Romanian market.

Main Findings

Research has provided a first of set of information about major aspects concerning the personal data protection legal environment in terms of the: importance given by the consumers to the protection of their personal data, the area of protection – as it is defined by the respondents considering their rights as consumers respectively as citizens, the need for a law regulating the personal data protection, the balance between the public and private entities in providing a proper protection of the personal data, and the relationship between the domestic, European, and international levels in ensuring the protection of the consumers' personal data.

Majority of the respondents (70.5 %) consider “very important” the **existence of the appropriate laws and regulations** protecting their personal data and almost all of them (97.4 %) appreciate the protection of their personal data through the specific legal framework “important” and “very important”. As less than 3 % of the respondents have assessed the importance of the personal data protection in a different way (of an average importance, to be more specific), it can be concluded that subject of the protection of the consumers' personal data and privacy is a sensitive one and requires a careful handling and approach from the part of all the interested stakeholders – companies and organizations conducting direct marketing campaigns, public authorities involved in providing the proper legal framework and enforcement of the specific laws and regulations, respectively consumers exerting and defending, when necessary, their rights in terms of personal data processing and protection of their privacy.

Respondents have been asked to define the **area of protection** that specific law and regulations should cover: their personal data and privacy rights as citizens, as consumers or both. Majority of the respondents (79.5 %) have indicated the rights they have both as consumers and citizens as object of the related laws and regulations. Protection of the rights the respondents have as citizens (19.2 %), respectively as consumers (only 1.3 %!) has been indicated, in both cases, by a minority of respondent. This result may suggest several conclusions: first, the respondents seem to be more aware and, consequently, more concerned in terms of the personal data and privacy rights they have both as citizens and consumers; secondly, respondents may have been exposed to direct marketing campaigns – conducted not only by companies selling different goods and services, both also by the non-profit entities and political parties “selling” social initiatives or political candidates; thirdly, the increased aggressiveness of the direct marketing campaigns have led to a more defensive behavior regarding the disclosure of the personal data and protection of the private space not only in a commercial but, as well, in a social context.

In this context, **laws and regulations for the protection of the personal data are necessary** for 87.2 % of the respondents, while the remaining 12.8 % considering them “rather necessary”. The need for legal framework that guarantees for an effective protection of the personal data may be one of the major motivators of this attitude. Further, this greater than before need for protection is the result of the combination between the higher exposure of the consumers to the direct marketing campaigns conducted by the companies, organizations and public authorities, and the increased aggressiveness of these campaigns.

The **balance between the public and private entities** in providing a proper protection of the personal data places in a more important position the public authorities, indicated as the best entities capable to exclusively provide an effective protection of the personal data by the majority of the respondents (44.9 %). By contrast, private institutions have been indicated in an exclusive

manner by only 15.4 % of the respondents. The relatively high percentage (39.7 %) obtained by the mixed option – protection of the personal data ensured by a partnership of public and private entities – may suggest, on a hand, a relative mistrust in the capabilities of the public authorities to provide an effective protection of the consumers’ personal data and private space and, on another hand, leads toward an integration of a private component in the overall activities conducted by the public data controllers. Involvement of this private component may represent the response given to the consumers’ expectation for a better private control over the functioning of the public authorities in the field and, in the same time, a guarantee given to consumers that their personal data and private space protection will be more effective.

Romania’s adhesion to the European Union, as well as the increased effects of globalization, are the main drivers of taking in consideration the relationship between the **domestic, European, and international levels** in the protection of the consumers’ personal data. Majority of the respondents (85.9 %) have indicated that laws protecting the personal data should be European (34.6 %) and/or international (51.3 %) one. Preference for international and/or European laws and regulations may be seen both as a supplementary guarantee needed by the respondents for an effective protection of their personal data protection and private space, and, unfortunately as sign of a potential mistrust in the domestic legal framework and institutions enforcing it. The low level of trust in the domestic data controllers can be taken in consideration when explaining this result because the domestic law of personal data protection is nothing more than a very close, not to say identical, version to the European Directive 95/46/EC: so, maybe the law is appropriate, yet the ways data controllers enforce it, allow and support the protection of the consumers’ personal data may represent the real problem.

Respondents have also indicated the **most appropriate institutions** acting as data controllers choosing between a set of diversified options including public and private, specialized, less specialized and even not specialized, professional and other entities. Majority of the respondents (83.3 %) have indicated the National Supervisory Authority for Personal Data Processing (NSAPDP) as the most appropriate public institution to act as data controller administrating the processing of the consumers’ personal data and private space protection. This result expresses not necessarily the appropriateness of acting as data controller but the high degree of awareness of the NSAPDP. The Association for Consumer Protection (mentioned by 55.1 % of the respondents) and the National Authority for Consumer Protection (50.0 %) have been indicated by at least a half of the respondents. The expression “consumer protection”, present in the appellation of the entities mentioned above, suggest clearly the relationship between the personal data and the protection of the consumers and, also, the rather defensive attitude of the respondents regarding their personal data and private space. The triad National Supervisory Authority for Personal Data Processing – Association for Consumer Protection – National Authority for Consumer Protection synthesizes almost perfectly the solution regarding the consumers’ personal data and private space: a partnership between the public authorities and private entities for ensuring an effective consumers’ protection.

Table 1. Institutions indicated by respondents as appropriate to act as data controllers

Institutions	Percentages
National Supervisory Authority for Personal Data Processing	83.3
Association for Consumer Protection	55.1
National Authority for Consumer Protection	50.0
General Direction of Persons’ Information Administration	23.1
Ministry of Internal Affairs	16.7
Romanian Direct Marketing Association	14.1
Government of Romania	3.8
Ombudsman	2.6

The General Direction of Persons' Information Administration, the Ministry of Internal Affairs, and the Romanian Direct Marketing Association have been mentioned by smaller parts of the respondents. Indication of the domestic professional in the field most connected with the personal data employment may suggest both a possible expectation of the consumers to see the association more involved in the protection of their personal data and a potential direction of development of the association's activities.

The Government of Romania and the Ombudsman held rather peripheral positions in this context although, until the establishment of the NSAPDP, Ombudsman has been the legal domestic entity covering the area of personal data protection. As a final observation, the lack of mentions for the Open Society Foundation and the Group for the Social Dialogue indicates an increased knowledge of the respondents of the institutional side of the personal data protection and, by consequence, a higher concern for the related problems.

Respondents were asked to indicate **the most important rights** the laws regarding the protection of their personal data grant them. The right to be informed about the scopes of the data processing (mentioned by 88.5 % of the respondents) and the right of making objections against the data processing (82.1 %) are the important rights and present a high interest for the respondents. They are followed by the rights to access their personal data (73.1 %), to refer to a court of law in matters regarding the processing of the personal data (67.9 %), and to intervene upon the data already collected and processed by the databases owners (62.8 %). The least important right indicated by respondents seems to be that of not being the subject to an individual decision in terms of the personal data processing and usage (29.5 %).

Based on these results, consumers seem to allocate a higher importance to their rights as providers of personal data – supplying this data being more important for them than their later processing, with a particular focus on prevention and defending against the inappropriate attempts of collecting and processing their personal data.

Improper administration of the personal data may affect the consumers' confidence in the data processors and data controllers. In terms of the risks associated with a poor personal data processing, respondents have indicated, as major threats, the potential abuses from the part of the private entities (96.2 %) and frauds that might be suffered as consumers (75.6 %). Potential abuses suffered from the part of the public authorities (53.8 %) and the increased exposure of their private life (50.0 %) have also been identified as significant risks, while the limitation of their private space (30.8 %) has been indicated as a rather tolerable risk.

These results are explained by the relatively increased exposure of the respondents to the more aggressive direct marketing campaigns of the companies and organizations – in relationship with the consumer frauds and other potential abuses from the private entities, by the relatively higher trust the respondents have in the public authorities by comparison to the private entities, and, last but not least, by the rather unclear identification of the content of their private space.

Limits of the research

The research approach has been conducted under the context created by the existence of the limits related to the set of the variables considered to define and measure the consumers' opinions regarding importance given to the protection of their personal data, the area of protection, the need for a law regulating the personal data protection, the balance between the public and private entities in providing a proper protection of the personal data, and the relationship between the domestic, European, and international levels in ensuring the protection of the consumers' personal data, and, respectively, the sample and the sampling procedure used (further research should be conducted using a sample covering categories of respondents differently defined in terms of their demographics such as age, education and income).

Conclusions and main implications

Consumers tend to consider “very important” or at least “very important” the existence of the appropriate laws and regulations protecting their personal data and the subject of the protection of the consumers’ personal data and privacy is sensitive and requires a careful handling and approach from the part of all the interested stakeholders. The area of protection of the specific laws and regulations should cover their personal data and privacy rights both as citizens and consumers or both. Consumers seem to be more aware and, consequently, more concerned with the personal data and privacy rights in the context of the more aggressive direct marketing campaigns conducted targeting them. Laws and regulations for the protection of the personal data are simply necessary for an effective protection of the personal.

The balance between the public and private entities places in a more important position the public authorities but the mixed option – protection of the personal data ensured by a partnership of public and private entities – is appreciated by a significant part of the consumers. Laws protecting the personal data should be rather European and/or international just to offer a supplementary guarantee for an effective protection of their personal data protection and private space.

The National Supervisory Authority for Personal Data Processing (NSAPDP) has been indicated as the most appropriate public institution to act as data controller administrating the processing of the consumers’ personal data and private space protection. The triad National Supervisory Authority for Personal Data Processing – Association for Consumer Protection – National Authority for Consumer Protection synthesizes almost perfectly the solution regarding the consumers’ personal data and private space: a partnership between the public authorities and private entities for ensuring an effective consumers’ protection.

CAN MARKETING SUPPORT THE IMPLEMENTATION OF EFFECTIVE EGOVERNMENT? ANALYSIS OF THE SINGLE POINT OF ACCESS PORTAL FOR ROMANIAN ELECTRONIC PUBLIC SERVICES

Velicu Bogdan Calin

Academy of Economic Studies, Bucharest

The advances in technology hold great potential for helping Romanian government respond to its challenges namely, better service delivery, better procurement, efficient working and better communication with citizens and businesses. While the European Commission develops the main strategies on eGovernment, every member state has the freedom to identify its own necessities and decide according to specific social, administrative and economic context. Designing, cost setting, choosing the best supply channels or communicating with involved actors, are all marketing instruments which, if used accordingly, can ensure modern and efficient public services. This paper presents an analysis of the degree of development of public services available at the “www.e-guvernare.ro” portal, the single point of access for specific Romanian electronic public services.

*Key words: electronic government, public services, marketing instrument, development, internet
Cod JEL: M30, M31, M38*

1. Introduction

Since the advent of the Internet about 40 years ago (Ho, 2002), the number of services that rely on information and communication technologies (ICT) has increased significantly, making today's society an IT savvy one. While in the 90's, the Internet, has led to the outbreak of the eCommerce revolution, a type of commerce embraced by private and multinational organizations, with the beginning of the new millennium we witnessed the affiliation of the public institutions to the same eBusiness principles by introducing national eGovernment initiatives (Weerakkody, et al. 2008). Defining eGovernment extends from "using ICT to free the flow of information and to overcome the physical limitations of traditional paper-based systems" (OECD eGovernment Working Group) to "using technology towards enhancing the access and delivery of government services so as to benefit citizens, business partners and employees" (i2010 eGovernment Action Plan). The universal thesis underlying these definitions is that eGovernment imposes the automation and digitization of current paper-based procedures, in which case it is necessary the development of new leadership styles, new ways in debating and choosing strategies, new concepts regarding the development of the business environment, new ways of behavior research and facing the needs of citizens and communities, new ways of organizing, collecting and providing information (www.unesco.org).

In order to highlight the specific marketing strategies and tactics and how they can influence the development of eGovernment, a brief overview of this area's development is necessary. In retrospect, we notice that the cyclic evolution of the economy underpins the development of marketing. Initially, the role of marketing was to generate demand for the organization's products. The 4 P's, developed by McCarthy, explained concisely the generic practices: product development, pricing, promotion and organization of supply (placement) (Kotler and Keller, 2008). Given that businesses generated revenues without considerable efforts, nothing additional could have been asked for from marketing. Everything suddenly changed when the economy was weakened due to the 1970's oil crisis. Generating the demand for goods had become increasingly difficult and it required and led to exceeding the 4 P's frame. No matter whether the reasons regarded the changes in the consumer's behavior or some errors in the product design, saturated distribution channels or the lack of effort to promote, the environment forced specialists to

remodel their optics, to reflect and to create better concepts. The original 4 P's were joined by other Ps: people, processes, product elements, public opinion, political power. However, the profound change has occurred by replacing the product with the customer as the center of marketing efforts. Therefore, new disciplines have been introduced, disciplines like Customer Management, which includes strategies such as segmentation, targeting and positioning. Marketing has converted itself from a purely tactical approach into a strategic process (Kotler, Kartajaya and Setiawan, 2010).

It isn't difficult to make a parallel between the tough times that have led to the development of marketing as a domain and the perpetual need, emphasized by the current economic crisis, to improve the services of the public sector. The knowledge area covered by the eGovernment instruments in some E.U. member states has increased considerably in recent years. This upward trend has accelerated in spite of, or perhaps, partly because of the financial crisis and the urgent need for governments to be competent, transparent, accessible and efficient. The demand for social assistance has increased, while revenues have fallen dramatically. Public sector commitments for stimulus packages and support of the financial sector have also raised the level of public debt (United Nation E-Government Survey, 2010).

2. Strategy and Objectives

The management taking place in government institutions aims to satisfy the public interest, without having in sight a material profit (Popescu, L. and Popescu, I., 2007). Hence the objectives of a public institution are materialized in satisfying the public interests by addressing the social needs. A social need, in order to represent the public interest, must be covered by the law. The objectives show what the organization wants to achieve, while the strategy is an action plan needed to achieve its objectives. Without insisting strictly on the various public services, it is important to identify the main strategies for eGovernment defined by the E.U. in the "eGovernment Action Plan":

Table 1: EU's eGovernment Main Policy Strategies

Strategy	Description
1. Inclusive eGovernment	Administrations from national, regional and local levels, together with their agencies and other intermediaries (NGO's, civil societies, volunteer associations, and the third sector in general) that deliver public services, are increasingly integrating ICT's into their processes, both behind the scenes and in their interfaces with the public. Although eGovernment services should reduce the complexity of the interactivity between citizens, organizations and administrations, there is a dangerous possibility that people without easy access to ICT's could find it even harder to deal with the government.
2. Efficiency and effectiveness	EGovernment contributes significantly with regard to the user's satisfaction, transparency and accountability, a lighter administrative burden and efficiency gains. Improving efficiency and effectiveness in any kind of activity that requires the knowledge of the current situation and specific targets for improvement, often established through comparison with counterparts that are seen to be "doing better" in a particular area. In eGovernment, the E.U. is taking a leading role in developing measurement techniques and benchmarks through which organizations can judge their performances. The E.U. fosters the development of efficient and effective eGovernment services by beginning with a two-pronged strategy. It promotes cooperation and exchange of experience regarding the best practices and technical standards established after assessing the impact of these services.
3. High-impact key services for citizens and	The Action Plan aims to create more widely available high-impact services for citizens and businesses, such as electronic procurement services for businesses, services delivered through mobile telephony, or social security services.

Strategy	Description
businesses	EGovernment will be critical in enabling the service providers to take advantage of the market opportunities outside their home country.
4. Key enablers	The plan also seeks to deliver the foundation upon which eGovernment systems will work together, and will form the connections between ICT systems in different public organisations and countries. Interoperable systems, electronic identification management, document authentication and archiving technologies are all critical so that all public services cooperate and share data. Open Source Software can provide a cost-effective method to support such interoperability and cooperation.
5. E-participation	In order to reinforce governance in Europe, the Action Plan will help to strengthen citizen participation and democratic decision-making by using new technologies to develop interfaces between democratic institutions, public bodies and citizens.

Source: E-government factsheet European Union (November 2008 Edition 1.0) <http://epractice.eu>

The marketing component is evident and ubiquitous in the vision proposed by the European Commission to the Member States. However, while the E.U. has defined strategies and goals valid for all Member States, each country has the ability and freedom to adjust them in accordance with the social, administrative and economic context specific features. Therefore differences have proliferated in terms of the scale of services offered by the implementation of eGovernment, the quality of new tools based on information technology or the efficiency (European Commission, 2008).

To construct a better picture of the development of eGovernment, EU grouped the various public services into clusters. A full list of the 20 priority public services is presented below:

Table 2: Essential Public Services

Citizens	Businesses
1. Income Taxes	13. Social Contribution for Employees
2. Job Search	14. Corporate Tax
3. Social Security Benefits	15. VAT
4. Personal Documents	16. Registration of a New Company
5. Car registration	17. Submission of Data to the Statistical Office
6. Application for Building Permission	18. Custom Declaration
7. Declaration to the police	19. Environment-related Permits
8. Public Libraries	20. Public Procurement
9. Birth and Marriage Certificates	
10. Enrolment in Higher Education	
11. Announcement of Moving	
12. Health-related Services

3. Implementation aspects

Any service possibly offered through eGovernment requires a prior research to determine the actual need for its use, a sensible design, setting the level of implementation costs, establishing the best delivery channels and the right communication approach in order to make it easily accepted by the general public.

In countries that are especially concerned towards this kind of service, such as Australia, the Internet has already replaced the personal and phone contact and it represents the main way through which citizens interact with government (KPMG International, 2010). Understanding exactly the users' expectations and what is wanted from the informational system is essential for the success of any eGovernment project. If these requirements are not clearly stated, quantifiable

or do not meet the needs, results are similar for both originators, producers and target audience: frustration, waste of time, financial losses, loss of consumer confidence (Ho, 2002). Administration requires prompt, accurate and usable information about the targeted population segments, to take the best short-term tactical decisions and the best long-term strategic decisions. Discovering a relevant characteristic for and/or about consumers and understanding its implications will almost always result in a successful product launch with an accelerated rate of acceptance and use. The website “Grants.gov”, developed by the U.S. Administration, is a portal that provides the possibility to apply for one of over 1000 types of grants, scholarships or aid, within programs that have a total budget of \$ 450 billion, created by 32 government agencies. In an average month, the site processes about 200.000 electronic requests (Executive Office of the President of the U.S., 2009).

Unlike services offered by various organizations designed to meet specific needs of the targeted consumer groups, one would be tempted to say that public services address everyone, therefore the discussions concerning segmentation are redundant. The reality is almost always more complex, so, although for example, the need for social protection is valid for the whole society, the distinction between categories of beneficiaries must be made. It is obvious that the needs and preferences of students are almost always different from those of pensioners or farmers. Unlike the marketing of the private sector, public institutions can not eliminate segments on grounds of costs, so it should cover all categories of beneficiaries, establish, communicate and always serve, always focusing their attention towards increasing the benefit of the society and the state.

It is important to tackle eGovernment applications, but priorities must be set upon maximizing the acceptance criterion and their impact on society. By emphasising on the use of information technology in providing services to government agencies, eGovernment offers the opportunity to rethink the way these institutions deliver services. More precisely, it offers the opportunity to: examine its current operations and procedures, identify processes and practices that can be streamlined or simplified and implements them, and adopt new technologies to enhance these improvements. The Mayor of Baltimore has implemented the “CitiStat” program, a system that uses IT to monitor in real-time the document workflow and it is also a necessary tool to supervise the local government performance. Using information systems to track various performance indicators such as absenteeism and overtime, Baltimore's administrative expenses dropped \$ 13 million in the first year after the implementation of CitiStat initiative (Perez and Rushing, 2007). Later, after the Mayor became governor of Maryland, he created a similar system called “StateStat” (Office of the Governor, Maryland, 2008).

Increased access to information and administrative procedures leads to a greater accountability and transparency, as online automated processes eliminate the interference of government officials and provides monitoring groups and senior government officials with a mechanism to monitor possible abuses and corruption. Belgium's national portal called “My Belgium” provides a single point of access to information and administrative services. More than 9 million Belgians have electronic ID cards (eID), allowing them to download available authenticated documents from their own accounts, supported by the MyBelgium portal. Another example is provided by the Municipal Government of Seoul, South Korea, which has developed a website that provides citizens with a range of relevant information regarding rules and procedures, permit license application and processing solicitations. The portal also allows real-time progress monitoring of an application for a permit or license. Therefore, according to post-implementation analysis, the citizens are better informed, the administrative process is transparent and the temptation for bribery has been largely eliminated (United Nation E-Government Survey, 2010).

EGovernment projects are most often long-term efforts that require large capital infusion into software, hardware, infrastructure and training. There are various models for funding such projects in which the private sector plays a critical role. Under partnership agreements, the

private sector builds, finances and operates public infrastructure such as roads and airports, the costs being recovered through usage fees. Various financing schemes exist – from support and assistance loans for development from the donor/multilateral aid agencies, to partnerships and outsourcing contracts signed with private providers under the special financing conditions that can minimize the initial cost (Pascual 2004). In Germany, all eGovernment projects are approved only after a rigorous analysis of economic and financial aspects, according to a methodology developed specifically for this purpose and only in compliance with the minimum values of various economic and financial indicators. The methodology uses both the updated internal rate of return on investment, and a “broad economic analysis” by granting scores for items included in a catalog of elements that are specific to the implementation of these systems (Computer Society of India, 2008).

In case of a limited access to the Internet, devices such as mobile phones or personal digital assistants can play a very important role if governments are capable to adapt and innovate starting from a way of thinking focused on the citizen’s needs. An example is the Philippine tax collection office, which introduced a system of electronic confirmation via SMS which forwards the taxpayers that their payments have been recorded (United Nation E-Government Survey, 2010). Using a tool such as the SMS, involves obvious advantages, such as audience measurement at a rate of 100%. Secondly, SMS marketing is a highly personal manner of communication. The SMS is used as a communication channel for transmitting information. Naturally, the trend could be encouraged to cover the administrative system too.

EParticipation remains in an incipient stage in many countries, a finding which is related to the discrepancies between the government and the people. Governments should include surveys and feedback forms on their websites, or forums and blogs that allow discussions or display information of interest (Wylde 2006). More creativity in terms of how they interact with the public is absolutely necessary, perhaps by creating integrated portals or actively seeking views and opinions that can be used to design public services or to shape public policy. In this case, the governments of Australia, Bahrain, Canada, Kazakhstan, Korea, Singapore, U.K. and U.S. are leading by far (United Nation E-Government Survey, 2010).

4. The Romanian eGovernment Portal

In accordance with the level of development of specific eGovernment services, especially those delivered via the Internet, the literature describes several models of providing online public services, such as: the Layne and Lee model (Layne and Lee 2001) based on the U.S. experience, the Hiller and Belanger model (Hiller and Bellanger 2001) developed for U.S. federal government, focused on aspects of safety and protection of personal data in supplying public services through electronics means, the ANAO model (Australian National Auditing Office) (www.anao.gov.au) used for classification and evaluation of electronic public service by Australia; the SAFAD model (Swedish Agency for Administrative Development) (Persson and Goldkuhl 2005) used in Sweden to assess the level of development and evolution of eGovernment initiatives. In this paper was used the SAFAD model, adapted by Cap Gemini in the study “The 9th eGovernment Benchmark Measurement”, which identifies five levels of development:

Table 3: Maturity Model

Level	Description
1. Information	Necessary information’s to begin the procedure for obtaining the public service are available online
2. One way interaction	The website offers the possibility to download the forms, in order to obtain the print form needed to initiate the procedure for accessing the public service
3. Two way interaction	The website offers electronic access to the official electronic forms to start the procedure for obtaining public service

Level	Description
4. Transaction	The website offers the possibility of full accessing the public service through the Internet, including the decision to use it and its effective provision
5. Targetisation	It has a proactive nature, the public service is provided automatically

Source: adapted from Cap Gemini – The 9th eGovernment Benchmark Measurement, June 2010

The National Center for Information Society Management, an institution subordinated to the Ministry of Communications and Information Society, has as main task the national implementation and operation of systems that provide services for eGovernance (www.mcsi.ro/Institutii-coordonate/CNMSI). In this respect it developed the “www.e-guvernare.ro” portal, which is intended to “reduce the bureaucratic and administrative barriers and to increase access to information and public services” (www.e-guvernare.ro/Default.aspx). It contains 22 sections developed to facilitate citizens’ contact with various public institutions and their specific activities. The public services offered by the portal were examined using the model described above. The following table highlights the development and characteristics of each section evaluated throughout march 2011:

Table 4: Online Public Services Development

Section name	Description	The level of development	Other relevant comments
Online Services	Short listing of online public services available on the portal	Information	–
Information statements	Information on submission tax returns and institutions for whom they are intended	Information	–
Submit Forms	Taxpayers have the opportunity to electronically complete, certify and send 9 type of statements to 4 public institutions: 1. Statement for payment obligations to social security budget – National House of Pensions and Other Social Insurance Rights; 2. Statement regarding the nominal record of policyholders and the payment obligation for unemployment insurance budget – National Agency for Employment Occupation; 3. Declaration on the contribution to the health insurance budget – National Agency for Health Insurance; 4. Statement for payment obligations to the state budget – Ministry of Public Finance (M.P.F.); 5. Income Tax Declaration – M.P.F.; 6. Return concerning value added – M.P.F.; 7. Statement for payment obligations to the social insurance budgets and special funds – M.P.F.; 8. Statement of duty – M.P.F.; 9. Summary statement on deliveries / acquisitions of foreign goods – M.P.F.	Transaction	Requires obtaining eID
Virtual Payments Desk (VPD)	Intended for consultation and payment with a credit card of taxes and other obligations to local and central budgets. At the time of the study, only to four institutions payments could	Transaction	Not necessarily requiring eID

Section name	Description	The level of development	Other relevant comments
	be made: 1. National Research Institute for Informatics; 2. Sector 2 Bucharest City Hall; 3. Sector 6 Bucharest City Hall; 4. Targu Mures City Hall.		
Electronic Procurement	It refers to the registration and use of the Electronic Procurement System. It has two sections, one for contractors and one for bidders. It provides the public institutions in Romania the possibility to purchase products, goods and services by electronic means and the operators the opportunity to submit bids for electronic auctions.	Transaction	Requires obtaining eID
Transport Permits	Electronic Information System for the Assignment of Authorizations for International Transportation facilitates the transmission of transportation permits for international routes. Actions that can be made electronically are: reservation permit, confirming authorization, authorization request and permit cancellation.	Two way interaction	The authorization is not transmitted electronically ; it doesn't require eID
Online forms	This section provides the forms used in relation to public administration. It connects with local institutions and Central Government; forms are available as institutions enter the system.	One way interaction	Very few institutions have enrolled in the program
Public institutions	Complementary to the previous section. Provides contact details of institutions that have completed the registration form.	Information	–
Press Releases	Brief information on the legislation underpinning the National Electronic System	Information	–
Government of Romania	Link to the Romanian Government Portal	Information	–
Ministries	Short presentation of Romanian Ministries	Information	–
Institutions under the Government's coordination	Brief overview of the institutions working under the coordination of the Romanian Government	Information	–
Local administration	Brief overview of local administrative institutions subordinated to the Romanian Government	Information	–
Senate	Link to the Senate Portal	Information	–
Chamber of Deputies	Link to the Chamber of Deputies Portal	Information	–
Romanian Presidency	Link to the Romanian Presidency Portal	Information	–
Legislation	Presentation of normative acts regulating the electronic services offered by the e-guvernare.ro portal	Information	–
IT antifraud	–	–	It could not be assessed because it

Section name	Description	The level of development	Other relevant comments
			was not usable
Thematic Catalogue	Provides a collection of links to government websites organized by topics of interest	Information	–
Postal Codes	Link to the Romanian National Postal Company Portal, used to identify an address based on the zip code	Information	–
Intelligent electronic forms system provided by the National Trade Register Office	Link to the National Trade Register Office Portal, used to transmit specific forms on verification registered information, registration of companies, the release of provisions, transmission of information or submission of financial statements.	Two way interaction	Requested documents are not transmitted electronically ; requires obtaining eID
Electronic payment for local taxes	Links to Municipalities that allow electronic payment of local taxes. Although almost all Romanian municipalities are listed, only those present in the VPD provides this service effectively	Information	–

Main Findings

Although most sections provide information or make links to the websites of major public institutions in Romania, initiatives such as the transmission of statements, using the Electronic Procurement System and the VPD show a high level of development. A fully electronically provision proves the existence and implementation of a framework that can be used to extend the number of such services. The recent introduction of VPD, which allows online payments for various fees and taxes, is an essential service in boosting the efficiency of these transfers for both citizens and authorities. It is remarkable the easiness of using this service, the interface being intuitive and highly accessible. The main disadvantage relate to the fact that so far only four institutions are available online.

Important efforts were also made for the services provided by the National Trade Register Office and those relating to transport permits. These services were assessed as level 3 – Two Way Interaction – that offers complete, specific forms of endorsement and transmission to the respective authorities, but the release of requested documents can't be done electronically.

The Section “Online Forms” falls in the 2nd development level – One Way Interaction – and enables the transmission of forms to public institutions. It requires the enrollment of authorities in the system.

The remaining sections are found at the first level which implies the provision of information. Many sections carry links to the most important public institutions in Romania, which are also used purely for displaying information.

While most services can be found in the first stage of development, the computer capacity, required for acceding to an advanced electronic sophistication, has been achieved. One reason of concern is the withholding of public institutions, local and central, to adapt their internal processes in order to enroll in the system and adopt the electronic mediation of the public services they offer. Four institutions in the online paying program is a tiny number, the proportion of citizens currently served does not justify the efforts of creating the framework needed for developing and launching this service. We should also mention the need to obtain a

certificate of digital identification by the users in regard with most services at levels 3 and 4 of sophistication, except the VPD application, not as an impediment but an extra step to be made by future users.

Level four is the desired and pursued degree of development in the National Strategy and, the fact that there is a framework that can be used to implement public services accessed online, is a major leap towards the electronic standardization which the Information Society of Romania wants to become part of.

5. Conclusions

EGovernment value will become increasingly defined by its contribution to the development of integrated administration, economic areas and segments of society. Inclination to citizens, inclusion of disadvantaged or marginalized communities, government connected, universal access and use of new technologies, are the benchmarks through which innovative public services will be provided and evaluated.

Our country made important steps regarding the creation of the framework required for electronic development and delivery of eGovernment. Applications such as VPD or the possibility of submission fiscal declarations are spearheads and also examples to be followed. However, the awareness of the necessity to adopt these processes from public institutions is at an incipient level. This aspect, corroborated with the low number of services accessible related to the 20 priorities established by the E.U., rank our country in the lower quarter compared to other Member States. It is important to determine aspects regarding the use of information technologies, especially behavioral aspects that influence the adoption of information solutions by institutions and the acceptance and use of the new communication and delivery channels by the citizens.

Regardless the stage of accession of the Strategy on Information Society, whether trying to adapt general policies of the European Union to effectively serve the shortcomings revealed by the reality of each Member State, aiming to streamline the creation of major public services or specific services needed by small segments, making steps to reduce public expenditure, assessing and selecting the best delivery channels or promoting a social cause, eGovernment is the tool which marketing can adapt and use for sustainably developing the public administration.

This paper aims to highlight from a conceptual point of view, some of the most important aspects concerning the implementation of eGovernment services and the ways in which marketing's science and tools can contribute to the development of effective long-term solutions. The assessment carried out in March about the level of development of public services available online through the portal "www.e-guvernare.ro" is a first step necessary to the development of more efficient and consumer-centered public services.

SUB-SECTION: ECONOMIC INFORMATICS

MODEL DRIVEN DEVELOPMENT OF ONLINE BANKING SYSTEMS

Avornicului Mihai-Constantin

„Babeş-Bolyai” University Cluj-Napoca, Faculty of Economic Science and Business Administration

Bresfelean Vasile Paul

„Babeş-Bolyai” University Cluj-Napoca, Faculty of Economic Science and Business Administration

In case of online applications the cycle of software development varies from the routine. The online environment, the variety of users, the treatability of the mass of information created by them, the reusability and the accessibility from different devices are all factors of these systems complexity. The use of model drive approach brings several advantages that ease up the development process. Working prototypes that simplify client relationship and serve as the base of model tests can be easily made from models describing the system. These systems make possible for the banks clients to make their desired actions from anywhere. The user has the possibility of accessing information or making transactions.

Keywords: MDA, UML, Online Banking, Class diagram, Platform Independent Model

Cod JEL: C88, M15

1. Introduction

Data intensive web based systems, that in the most of their uptime do data processes have become a part of our everyday life. Several systems of this type appeared on the internet: webshops, online ticket shops, banks, etc. These are used everyday by users around the world.

In case of these systems design the target platform is chosen in the beginning as well as the technology used for the development. These are usually platform dependant application. After the development process, during the implementation process it often occurs that the system exceeds its boundaries and a new platform is needed. Often in this case the whole system needs to be recoded.

The importance of the present research consists of the fact that we can plan a platform independent banking system which can be implemented on any kind of platform. Furthermore offers the opportunity of generating a navigation model from the class diagram for the developers, giving real support to both developers and users. The final model can be applied to mobile applications too.

2. Model Driven Architecture

Model Driven Architecture (MDA) is a new type of view on application development. According to MDA you have to focus on the functionality and behaviour of the studied system, putting aside the technological environment. This way an application has to be modelled only once (Anand et al., 2010).

The starting point is given by the domain model (CIM – Computational Independent Model) which can be expressed by use cases like business objects, activities and tasks. This model is refined with thorough examination; this is how the PIM (Platform Independent Model) is formed. This layer already contains the objects specifications, description of their cooperation and expresses the object states and changes. Taking the environment into consideration the PIM undergoes some more abstraction, this time giving precise specification on the objects, their behavior, interoperability and reusability (Kennedy, 2006). The model layer that is to be

implemented is stated. The Platform Specific Model (PSM) is the base of the components creation and functioning plan. MDA separates application architecture from system architecture. Application architecture contains components and information that specificate the applicatipons functional targets. System architecture contains the low level components and links, that make possible the application architectures axecution. This separation is the base element of MDA.

Recoding of the application is not necessary, when a new technology appears, the application is simply regenerated to the new environment.

For a lot of popular platforms, like CORBA or .NET; PIM→PSM can be generated. OMG-s standard, MOF (Meta Object Facility), XML (Extensible Markup Language) and CWM (Common Warehouse Metamodel) ensure that MDA is a complete software development method (Raffai, 2005).

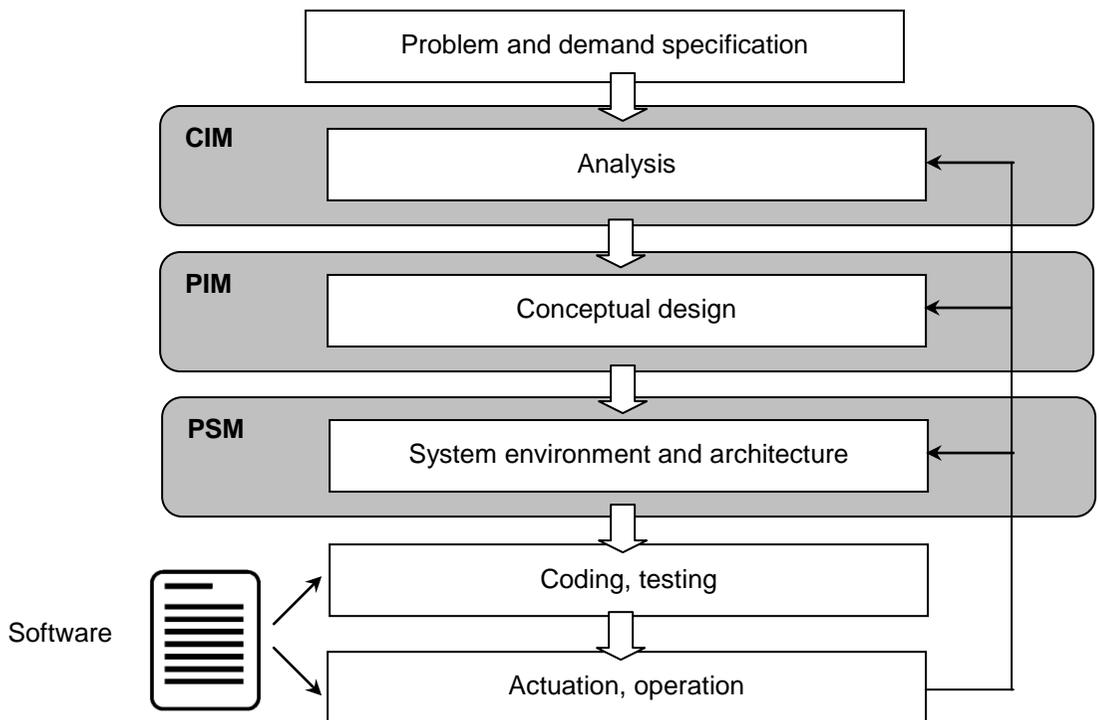

Figure 1: Model driven development

The lifecycle of online system developments base does not vary from the common method. Tasks have to be completed through the same steps, but thes define certain principles that define the products of different steps and specificate the models to be made.

MDA can be separated into four parts (Raffai, 2005; Anand et al., 2010):

1. As a first step the system has to be understood and the CIM model developed according to it (Kennedy, 2004). This models specification is usually a document signed by the user, containing diagrams and tables. So the product is a document that sepcifies the users demends from the application.

2. The product of the second step is an abstractization, that is still technology independent. The PIM model contains specifications on the system from the point of view of the most effective solution, it contains metadata from elements of the real system, these connections, structures, elements behaviour, tasks, interfaces and dependancy between elements. The making of the PIM

model is an iterative process, elements and their specs are refined continuously, they are tested for their functionality and compatibility with the system.

3. The next step is the definition of the environment and the transformation of the PIM model into PSM. This means that in terms of the environment we associate technology to every PIM element. More PSM models can be made from a PIM model, in condition of the platform that it is realised on.

4. The final step is the realization of the PSM model, the execution of implementation and testing processes, the creation of the whole model of the systems and giving information on its functionality.

In case of classic development, transformation of different models is made manually, while in model driven view these can be automated, speeding up the compilation process. Definition of transformation rules and their coherent use serve the solution of several problems. This way the modification of different applications can be made quick and documented, cooperating software can be attached. Implementation of concept models working on different platforms is more simple.

3. Methodology Proposed

We intend to describe the advanced design of online banking system by using the MDA paradigm. The standard development process consists of 4 steps, as previously presented. The research has been made through a case study, in which we design an online banking system, taking in consideration the next steps:

1. Demand analysis: by which the system's CIM model is designed;

2. Analysis and planning: at this point PIM model is designed conform CIM;

3. Realizing the system: finally PIM model is changed into a platform depended model which refers to the system's implementation;

These steps will be presented in the followings.

4. Case study: Online banking system

The system gives possibility to the banks clients to do their banking from anywhere. When a client opens a bank account he receives a username and a password, so that he can log into the system. This is a web based system; therefore the client can access the system from his home, workplace or anywhere. He has the possibility of interrogating his account or making transfers.

With the password given by the bank the user signs in on the banks website. Other personal information is given, like name, birth date, e-mail, etc. The server checks for credentials and logs the user in. The user can access different services.

It is possible to interrogate information on accounts, traffic for a period or to make transactions and pay bills. The system has to approve every step for security. When the client is done he signs out.

4.1. Demand analysis

Demand analysis is the process throughout which the type of the system to be designed is specified. The demand is a supposed ability that the system has. Demand analysis is not a simple task, especially in case of web applications, because these raise other difficulties:

- An application has to have more entry points;
- Only one detailed information can be offered to the buyer;
- Environment changes quickly;
- There is no predefined development target;

The development process always starts with the demand analysis, which contain functional demands, actors and their tasks (Avornicului et al., 2006). This is the part that is called CIM (Computational Independent Model).

Usage cases help to maintain our demands from the system and to ensure their integrity. Usage case diagrams describe a certain part of a systems behavior from the point of view of external actors. Actors are those who use the system or are responsible for their maintenance.

Actors of online banking systems:

- User: the person that uses the banks online services.
- A bank server: the user accesses his account and registers tasks through it. The server sends the information the user asks for.
- Bank account: the online version of the client’s bank account. It is a separate actor because every information and transaction depends on it.
- Recipient: in case of transfers the amount of money is transferred to the account of the recipient.

The use case diagram is as follows:

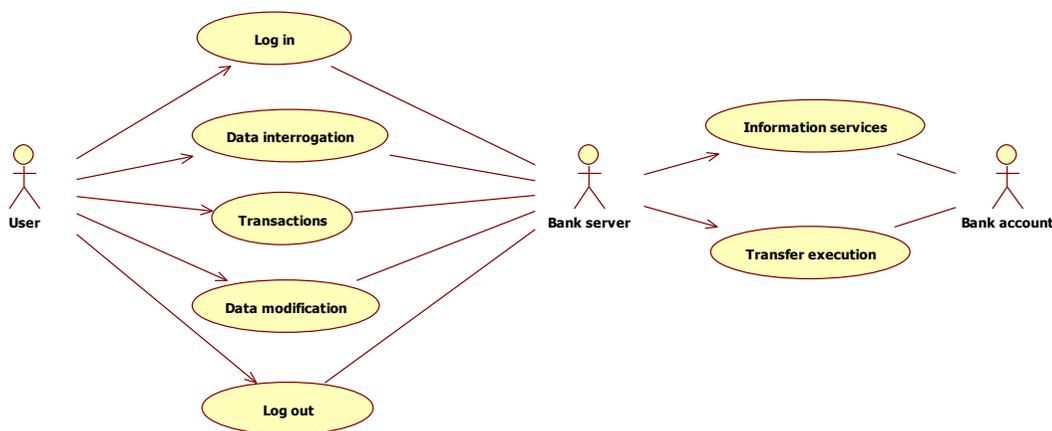

Figure 2: The use case diagram

Usage cases represent a chain of events, every mode that the client can use the system. The main parts of the system are the user and the bank server, executable tasks gather around them. Usage cases show how actors can use the system, what actions they have.

Interrogation and transaction use cases integrate more concepts. To avoid complex diagrams we will use the following keywords instead of drawing every detail separately:

- Sign in / sign out: the user signs in with his username and password into the internet banking system and signs out after he has done his work.
- Interrogations: the system enables the enquiry of information. This information can be: balance, traffic details, account information (date of opening, type, account number). Information is given by the server.
- Change of personal data: the user can change his personal data.
- Transactions: transaction can be made with the help of the server; these transactions can be transfers, payments of public services and other bills.
- Transfers: in case of transaction, the bank puts money from the users account to the recipients account.

4.2. Analysis and planning

The target of the analysis and planning processes is to prepare the plans based on the demand analysis that serves as the base of the web application. Throughout the analysis the non-

functional demands have to be taken into consideration, during the planning functional demands can be dealt with as well.

While planning the wb application, principles of MDA will be followed. The most important is the conceptual planning, while we build a model that contains concepts defining the application. The concept model is made from the CIM model, that contains specifications concerning the professional field. This is considered a PIM (Platform Independent Model) for it does not take into consideration any specific technology (Avornicului et al., 2006).

4.2.1. Class Diagram

The class diagram serves for the static illustration of the system, presenting the classes and their bondages. As a first step the objects are defined and then they are grouped into classes by their behaviour.

In case of an internet banking application the following classes are used:

- User: The users class contains information on the banks clients. The clients can be identified and logged in.
- Account: Contains information on the users accounts.
- BankServer: The Bank Server class contains the detail necessary for the banks operations.
- Transaction: Transactions that the system can handle.
- Verification: Control class validates the users ID and password.
- LogInWindow: The user logs in through it.
- MenuSystem: The menu is an interface between the systems options and the users screen.

After the definition of the classes, their extensions, connections and multiplicity the class diagram is built.

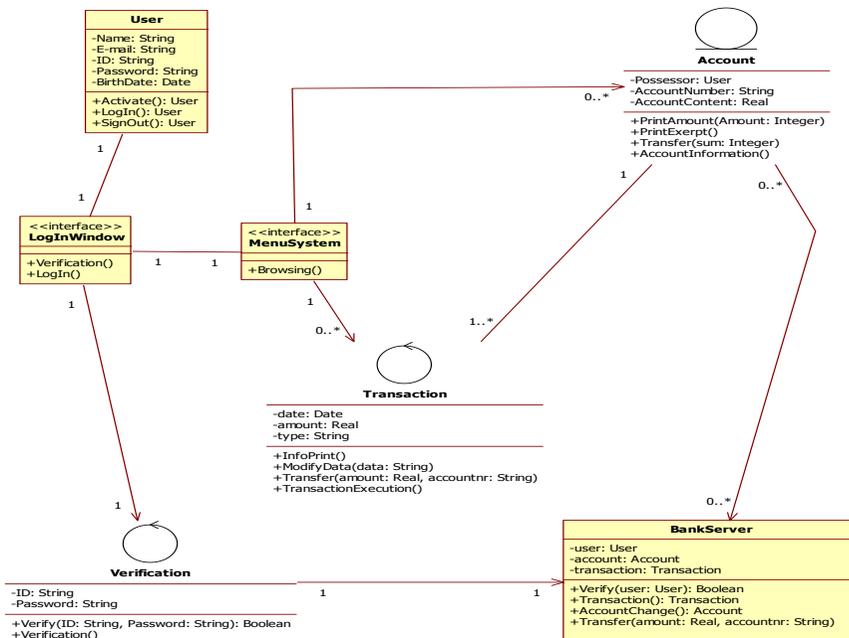

Figure 3: The class diagram

The class diagram shows the building blocks of any object-orientated system. Class diagrams depict a static view of the model, or part of the model, describing what attributes and behavior it has rather than detailing the methods for achieving operations (Anand et al., 2006).

In the conceptual design of a system, a number of classes are identified and grouped together in a class diagram which helps to determine the static relations between those objects (Frankel, 2003).

4.3. Realizing the system

Following the views of MDA this step is the transformation of PIM models into PSM, platform specific models. The transformation of platform independent models has more phases in terms of the point of view from which we analyze the web application. The goal of every transformation is to pair every action of the system with a technology capable of dealing with it. On certain platforms parts can be exchanged without affecting the systems functionality.

5. Conclusion

Designated time for design has been drastically reduced, so new solutions are needed to be capable of keeping up with demands in the world of developing technologies. Model driven architecture delivers tools that simplify the process of application development.

MDA follows and embeds the most technical standards, ensuring the developed systems flexibility and renewability. The most important fact though is that using MDA, software engineers and business professionals can communicate in a common language and reach goals using high end technologies.

The designed system can be implemented on any platform. Moreover every bank can personalize it, if necessary it can be moved on mobile devices.

The model-based development's only problem is that configuration data for example: platform definition data does not differ from modeltransformation because during.

Decision making is one of the important tasks of every manager. The process of taking decisions has to be based on knowledge. For optimizing this process some software solutions has been created. In this article we tried to summarize some of the features which exists in some software applications.

Keywords: decision making, risk solver

Introduction

Knowledge is the main source of competitive advantage in the knowledge economy and innovation in organizations involved in the services sector.[1] It's really about the transformation of information into useful data management process. We must keep in mind, however, that the speed with which information circulates, accessibility, search and how their storage are critical factors to be taken into account in streamlining decision-making.

Taking into account the likelihood of achieving results, several models are developed to optimize decisions, starting from the classification of decisions: decisions in conditions of certainty, risk and uncertainty. The elements that distinguish these types of decisions is very important for all - managers and software developers.

While the development of computer applications has raised no problems using established models in case of economic consequences known with certainty - ELECTRE, for example - the real challenge for software developers is to optimize the decisions of category risk and uncertainty.

In the service sector, as in any other field of economics, all computer application are based on the distinction between definitions of risk and uncertainty:

-risk is present when future events occur with measurable probability

-uncertainty is present when the likelihood of future events is indefinite or incalculable
(Frank H. Knight, 1921)

Between different algorithms used inside the software "Monte Carlo has become a standard tool of risk management" [PRO02]

According to Michele Gambera, the accuracy of the results is limited by the number of simulated histories. The process of simulation will be longer when we have more data. So, an important issue will be how fast a computer program can do all the calculations. New technologies which were developed will improve the speed of the calculations. Cloud computing is one of this technology. If we are taking into consideration cloud computing, we have to be aware that the algorithm has to be done in parallel and also if there are a mechanism of sending and receiving subsets of data between these processes. Monte Carlo algorithm is one which can be done in parallel computing.

In Monte Carlo simulation an important fact is the distribution which we used for our model. There is a lot of distribution which can be used like normal distribution, uniform distribution, triangular distribution and so on. According to an article of S. Savage, S. Scholtes, and D.

Zweidler “simulations without acceptable input distributions are like light bulbs without electricity”, and they observe very well that “Only a few people within an organization have the expertise to estimate probability distributions, and even fewer have the managerial authority to get their estimates accepted on an enterprise-wide basis”. One of their ideas was to manage probability distributions centrally and to replace the classical probability distributions with stochastic libraries a pre-generated random trials that approximate” stochastic inputs or can be the results of simulation and optimization models.

ProbabilityManagement.org has presented the DIST™ Distribution String which brings to Monte Carlo simulation, a data structure that contains thousands of Monte Carlo trials. These trials are compressed through XML, so that structure can be store in the single cell of a spreadsheet or in a field of a data base. The main advantages of DIST is that it can be generated by experts, to represent virtually any type of probability distribution, and then it can be distributed to others in a standardized format.

Other important concept is to use interactive simulation in your model.

Risk Solver Platform is developed by FrontlineSystems and is fully integrated with Microsoft Excel. This software can be used for linear and non-linear model, for conventional optimization, for decision tree model, for risk analysis and Monte Carlo simulation.

“This package was also the first, and as of this date, the most powerful interactive Monte Carlo simulation package for Microsoft Excel. For simple simulations involving a few variables, it can perform 100,000 trials essentially instantly, as the user changes parameters in the model.”
[<http://probabilitymanagement.org/Software.htm>]

Immediate after installation the menu of Excel will be improved with a ribbon with specific option for optimization and simulation, like it can be seen in the following figure.

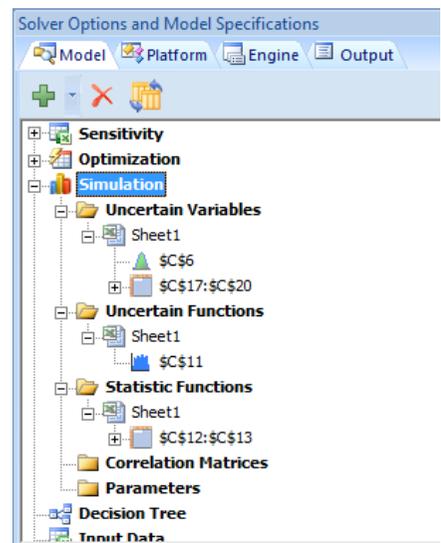

Also a Model Pane which consists of four tabs will be displayed in the right part of the screen. Model tab is used for seeing the description for the current model which can be one of Optimization, Simulation or Decision tree. Platform tab is used for defining parameters for Optimization Model, parameters for Simulation Model or parameters for decision Tree Model.

Engine tab is used for specifying engine which will be used in solving the problem. We can select from Standard GRG Nonlinear Engine, Standard LP/Quadratic Engine, Standard Evolutionary Engine, Standard Interval Global Engine, Standard SOCP Barrier Engine, Risk Solver Engine, or we can let it choose automatically which engine to use in solving the problem. Which engine should we use? Their recommendation is to try them all, and use the one that performs best on your model.[RISK01]

For every of these engine we can define some parameters which will be used, like Monte Carlo number of trials, the algorithm used for random number generations, number of iterations, Integer tolerance, Multi Start and so on. Integer tolerance is used to stop finding a solution in Branch and Bound algorithm, when the relative difference between the best found solution and the best possible solution is less than this value. If this value is set to zero, the algorithm will be stopped with the true optimal integer solution.

When Multistart option is set to true, methods for finding global solution to the problem will be used.

Output tab is used for displaying the results.

Nonlinear problems are more difficult to solve than linear problems. In risk solver platform an important advantage is that of using  (Analyze without solving) button, which will help us in finding the model. If the nonlinear problem is convex, the global optimal solution will be found.

For using this platform we have to be familiar with Microsoft Excel. The platform came with a lot of useful examples for optimization, simulation and simulation & optimization like Simple Business Plan Forecast Model with Uncertainty, an example illustrating modeling an investment fund's growth given uncertain return rates, an example illustrating modeling multi-period Inventory problems with uncertain demand, an example illustrating the use of Monte-Carlo Simulation to estimate workforce levels required to meet demand, an example illustrating use of Monte-Carlo Simulation in Airline Yield Management; this example also shows the use of a parameterized simulation model to arrive at good decision policies under uncertainty.

It is very important to mention that a useful package named Risk Solver Engine can be used to develop and deploy application to users.

Risk Solver Platform came with a set of functions which can be used for defining optimization models and Monte Carlo simulation models. According to their documentation most of these functions will be used for Monte Carlo simulation models, or for the uncertain elements of stochastic optimization models.

We have tried to solve a problem of making reservation to a hotel, in the following conditions. Our hotels have 50 rooms, and the price for a room is 39 EURO. In case a client will cancel the reservation, hotel will not refund the price of the first night of accommodation. In case the tourist will show up and no room will be available a compensation of 25% of the price of a room will be paid by the hotel for tourist accommodation in another hotel.

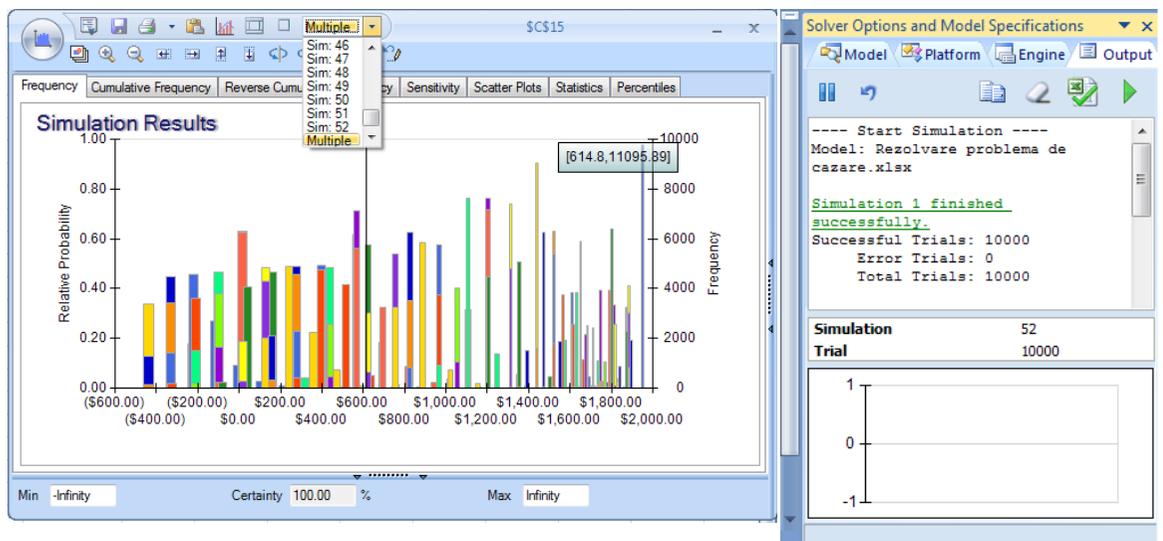

In less than 5 minutes we can create a model of our problem based on the model which is defined in YieldManagementModel2.XLS file. The distribution of cancelation will be a LogNormal distribution of 5% with a standard deviation of 2%. For this we used PSILogNormal function

which generates random number of tourist cancelations. We prefer this model because we can see exactly the evolution of simulation for each particular case, and we can make an idea about the algorithm.

3	Price/room	39						
4	Number of rooms in Hotel	50						
5	Number of cancellation	6						
6		5,945649429						
7								
8	Refund of cancellation	0%						
9	Overbooking Compensation	125%						
10								
11	Number of bookings	101						
12	Number of tourist which arrive	95						
13	Number of Overbooked rooms	45						
14								
15	Total Revenue	(\$243.75)						
16								
17								
18	Simulation Number	1	2	3	4	5	6	7
19		50	51	52	53	54	55	56
20		1832.9727	1870.027	1906.106	1917.375	1896.368	1859.364	1816.364

For number of booking we used `=PsiSimParam(C19:BB19)` which tell to Solver engine that a different simulation will be made for each value of a cell from the domain C19 to BB19. We also used `=PsiMean(C15,C18)` to define the expected revenue in each case of simulations. We also set the number of trials per simulation to 10000 for more accuracy. In less than 3 seconds on our computer we obtain the results to our problems which indicate us to use 53 rooms in the process of making reservations.

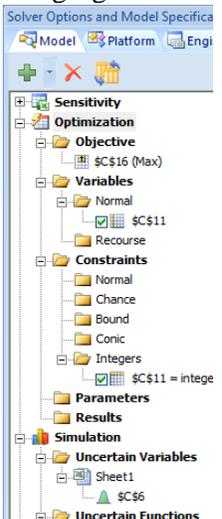

Another very useful thing is the displaying of the results which can be viewed and analyzed in a different window like the above one. We can combine multiple simulations in our analyzing or we can see the results for only one.

To solve this problem solver was simulate all 50 cases with 10000 of situations in 0.25 seconds.

The same problem can be solved if we define a simulation & optimization model. For this model we used only PSILogNormal and PSIMean functions as it can be seen in the following figure.

3	Price/room	39	
4	Number of rooms in Hotel	50	
5	Number of cancellation	2 CEILING(C6,1)	
6		1.940336761	PsiLogNormal(0.05*C11,0.02*C11)
7			
8	Refund of cancellation	0%	
9	Overbooking Compensation	125%	
10			
11	Number of bookings	40	
12	Number of tourist which arrive	38	
13	Number of Overbooked room	0	
14			
15	Total Revenue	\$1,482.00	MIN(50,C12)*C3-C5*C3*C8-C13*C
16		1917.39	PsiMean(C15)
17			
18			
19			

We define an maximum objective of C16, we put a condition that number of booking has to be an integer (we cannot book 5.34 rooms), and we also set that C11 is a variable, like it can be seen in the model above in the optimization section. Another parameters of the engine is 1 simulation

and 1000 of trials per simulation. We start with  button. Solver has found a solution in our case in 6.8 seconds after informing us that our model contains uncertainty, and Risk solver platform will analyze our formula to determine the best methods for solving it. Also it determine that our models is non linear in decision variables and cannot be solved by stochastic programming or robust optimization methods. At the end inform us that Branch & Bound algorithm has found the best of the locally optimal solutions. The results are 53 bookings like in the preceding solutions.

3	Price/room	39	
4	Number of rooms in Hotel	50	
5	Number of cancellation	2 CEILING(C6,1)	
6		1.301687502	PsiLogNormal(0.05*C11,0.02*C11)
7			
8	Refund of cancellation	0%	
9	Overbooking Compensation	125%	
10			
11	Number of bookings	53	
12	Number of tourist which arrive	51	
13	Number of Overbooked room	1	
14			
15	Total Revenue	\$1,901.25	MIN(50,C12)*C3-C5*C3*C8-C13*C9*C3
16		1917.43	PsiMean(C15)
17			
18			
19			
20

Another interesting part of Risk Solver Platform are Decision Tree.

Conclusions

1. Risk Solver platform can be used in solving different services optimization problems when we are working with uncertainty.
2. SAS can be mentioned as a leader on risk management for banking.
3. Using simulation & optimization it takes more time to Risk Solver Platform to solve our problem, but it is more easy to define the model and to interpret the results.

MODELS AND SOLUTIONS FOR THE IMPLEMENTATION OF DISTRIBUTED SYSTEMS

Ghencea Adrian

Titu Maiorescu University, Faculty of Economics

Vătuiu Teodora

Titu Maiorescu University, Faculty of Economics

Țarcă Naiana

University of Oradea, Faculty of Economics

Software applications may have different degrees of complexity depending on the problems they try to solve and can integrate very complex elements that bring together functionality that sometimes are competing or conflicting. We can take for example a mobile communications system. Functionalities of such a system are difficult to understand, and they add to the non-functional requirements such as the use in practice, performance, cost, durability and security. The transition from local computer networks to cover large networks that allow millions of machines around the world at speeds exceeding one gigabit per second allowed universal access to data and design of applications that require simultaneous use of computing power of several interconnected systems. The result of these technologies has enabled the evolution from centralized to distributed systems that connect a large number of computers. To enable the exploitation of the advantages of distributed systems one had developed software and communications tools that have enabled the implementation of distributed processing of complex solutions. The objective of this document is to present all the hardware, software and communication tools, closely related to the possibility of their application in integrated social and economic level as a result of globalization and the evolution of e-society. These objectives and national priorities are based on current needs and realities of Romanian society, while being consistent with the requirements of Romania's European orientation towards the knowledge society, strengthening the information society, the target goal representing the accomplishment of e-Romania, with its strategic e-government component. Achieving this objective repositions Romania and gives an advantage for sustainable growth, positive international image, rapid convergence in Europe, inclusion and strengthening areas of high competence, in line with Europe 2020, launched by the European Council in June 2010.

Keywords: information society, databases, distributed systems, e-society, implementation of distributed systems

Cod JEL: O33, M15, L86

Introduction

The concept of "information society" is a very generous program that covers all sectors of government. The main goal is to create a society that includes all citizens' access to public services provided in electronic form, by increasing the capacity to use information society services, reforming the government operational models and increasing operational efficiency through appropriate use of information and communication technologies and the increase of competitiveness of the business through advanced use of ICT - Information and communications technologies.

The complexity of software applications is an essential property that derives from: the complexity of the problem domain, managing the development process, the degree of flexibility allowed by the software and problems that characterize the behavior of discrete systems.

Since the last decades of the previous century growth rate has been calculated mainly by tricks, by dividing tasks in the computer system, by introducing devices interrupt requests from the input / output or direct memory access (Lungu, Vătuuiu and Fodor, 2006: 45). Then specialized systems for digital imaging systems appeared that sought to compensate for insufficient speed through parallel processing, allocating each pixel in an image line of each unit of computing - a processor dedicated local operations from the image. This is how the first configurations of parallel computing and the first parallel algorithms appeared. One aspect of distributed processing which has been subject to attention in recent years refers to an environment in which they can engage cycles and spare storage space of the CPU tens, hundreds and thousands of networked systems to work on a specific problem that involves a very high processing capacity. Developing these processing models was limited however by the lack of attractive broadband connections and problems, combined with the real challenges of security, management and standardization. A distributed system can be defined as a group of independent computers that the user perceives as a coherent unit.

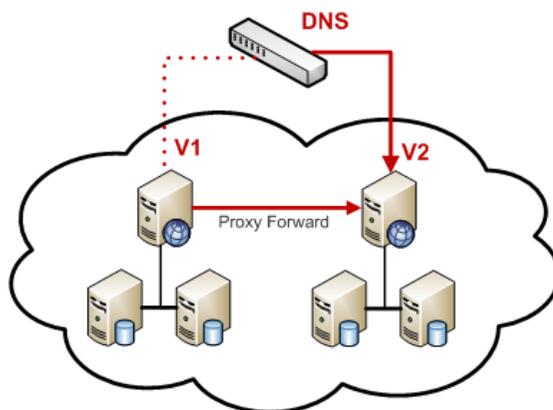

Fig. 1 Distributed storage and query of arbitrary data

A distributed system must not be built only because it can be built. There are many different types of distributed processing systems and there are quite a few challenges to overcome to successfully design such a system. Distributed processing systems aim to connect users and resources in a transparent, open and scalable way (Vătuuiu and Popeangă, 2006: 134). It would be ideal if this system would show more tolerance for errors and also if it would be more powerful than any combination of independent computer systems.

1.Parallel processing systems

Parallel processing is the simultaneous execution of the same instructions (divided and especially adapted) on multiple processors in order to obtain faster results. The idea is based on the fact that the process of solving a problem can usually be divided into smaller instructions that can be achieved simultaneously if they are coordinated. A parallel processing system is a computer that is equipped with more than one processor for parallel processing (Lungu and Ghencea 2011:122). Also new multicore processors are parallel processing systems. There are several types of parallel processing computers. They are differentiated by the type of interconnection between processing (known as "processing elements"), between processors and memory. Besides the classification made by Flynn who consider the type of processor instructions executed, there is a classification that is based on how memory is constructed: parallel processing computers that have distributed memory have multiple processors which access all the available memory like an addressing global space; computers which processes in parallel and have distributed memory with multi-

processors, but each processor can only access local memory - no global space for memory access between them.

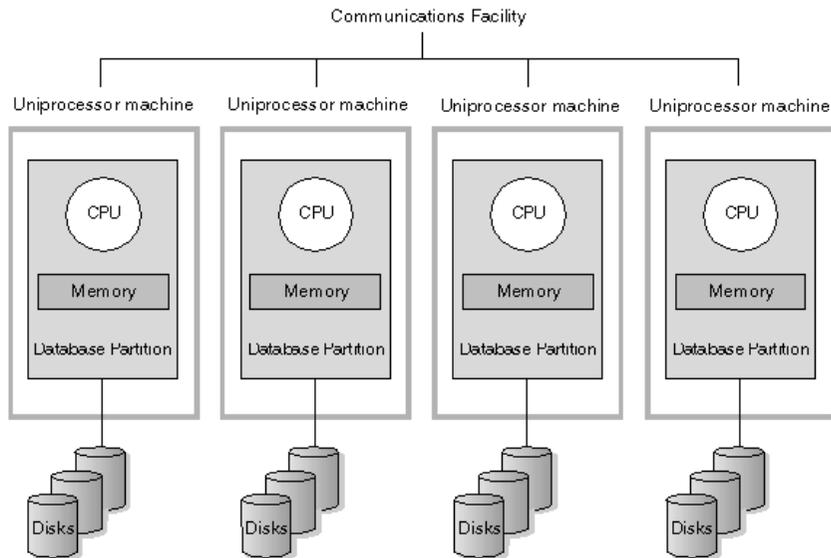

Fig. 2 Parallel processing systems

1.1.Implementation of parallel processing for different computer systems

Parallel processing, defining two or more processors that execute concurrent processes and acts as a single unit, allows one to run complex applications.

Most management systems relational databases are currently being upgraded to take advantage of parallel processing in heterogeneous systems, and to allow complex run of mission-critical applications. The optimal distribution of data is difficult in terms of technology; this process can be strongly dependent on the requirements for ensuring a good response to requests, and ensuring data integrity, continuous availability, interoperability, etc.

Management systems of modern databases use a series of abstract concepts and strategies to meet the requirements associated with current applications. The transaction, for example, can be used in the distributed data network to ensure the passage of groups of data and associated operations from a client post to server or from one server to another. Most of the producers of databases have monitors for the transaction process (TP - Transaction Processing) which represent advanced tools to manage distributed transactions in heterogeneous networks (Cristea 2007:44). The standard method of communication between TP monitors and database systems has been accepted as Protocol X / A as part of a group of standards X / Open. Currently, Sybase System 10 servers and Oracle 7 supports protocol X / A, while indirectly Informix Online adhere to this protocol through an ancillary product, Informix TP / XA.

In terms of ensuring data integrity in systems client / server distributed management software vendors have addressed these databases strategies:

- The "two-phase commit" technique: all changes required by a transaction on a database are either committed (the execution of the transaction is completed) or void, with the return of the database to the previous state. This strategy is not suitable for complex heterogeneous networks in which the probability of failure in any node is large and mission-critical systems. It is used as a way to ensure that all servers hold identical copies of the database at any time;

- The data replication strategy is now a solution adopted by Oracle, Sybase and Informix. Replication is a process in which multiple servers hold many identical copies of a database. The replication strategy differs significantly from the database "two phase commit" in that it guarantees the identity of copies of distributed databases only at certain times or under certain conditions. The data replication technique used by the Oracle Server 7 is called "Table Snapshots" by which the central server (master) copies at certain moments of time only those parts of the database that have changed, then disseminating these changes in the network. The replication mechanism used by the server is Informix database with the method "snapshots" used by Oracle. Informix uses the file "log" to "backup" to yield data from database tables to be replicated.

Replication servers are only the beginning of a whole generation of software that implements the abstract concepts related to data sharing in heterogeneous environments with advanced management and parallel processing, optimizing transactions.

1.2 Distributed Parallel Processing in Neural Networks

This type of processing is done using:

- Processing units: by analogy with the human brain, they correspond to neurons, and collectively to concepts such as character, features of pictures or objects in a PPP scheme. Individual units do not interpret the detailed design; they can be represented only by groups of units. We obtain a robust architecture that is not dependent on the efficiency of individual units and which assigns responsibility;
- Connections and the rule of activation;
- Internal input data (usually spread);
- External input data;
- Results obtained from processing units.

1.3.Open Distributed Processing

Open Distributed Processing (PDD) is the ISO standardization effort in the field of distributed processing. PDD 10 746 is the set of standards produced by ISO / IEC and ITU-T X.900 products (Telecommunication International Union). The notion of distributed processing seems very technical and complicated. However, with the development of large coverage networks, distributed processing is increasingly used. PDD's goal is to facilitate the use of distributed processing in areas as diverse as the wide deployment technology (Tannenbaum and Steen 2006: 241).

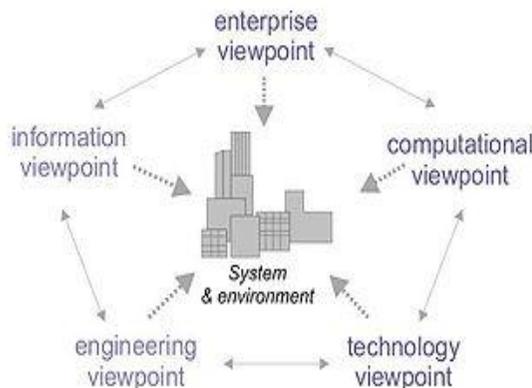

Fig. 3 Open distributed processing model

PDD is easy to use by programmers and operators because of its nature and means of distribution. In other words, both programming and use of distributed applications is presented as if that application would not be distributed. The way to get this perspective is transparent homogeneous PDD. Transparency provides users and developers with a consistent view of the network system as in the case when a message can traverse several different networks, without the user knowing the details of this process; distributed processing may involve different areas controlled by different authorities and equipment heterogeneous with very different hardware and software.

In general, the difference between distributed and network solutions is that when working in a network, the user is aware that the system runs on multiple machines, while in case of distributed processing the system appears as a single entity.

2. Implementation of Distributed Systems Solutions

2.1 Company Informix, symmetric multiprocessing

Informix Company has made a complete redesign of the system or introduced incentives for symmetric multiprocessing (SMP). Informix Online, is a dynamically scalable architecture (DSA). In situations in which the Informix server used version 6.0 of parallel processing, performance increased in comparison with older architectures. Informix Server version 6.0 of parallelism is allowed only on certain operations (create indexes, sorting, backup, data recovery) and runs on some platforms of symmetric multiprocessing (SMP). -Online/DSA Informix server (Dynamic Scalable Architecture). Version 7.0 has a scalable architecture that can manage scans, unification (join) the parallel sorting and querying databases.

2.2. Oracle 2.2 - parallel processing technology

Oracle 7 parallel Server creates a good balance between the need for better management and a multiprocessing system. Both Informix and Sybase disks require special partitioning in parallel processing, unlike Oracle, which is regarded as superior in this regard. The Oracle 7, Version 7.1 automatically maintains multiple copies of the same data on multiple servers, which eliminates the need for intensive disk-partitioning labor. Parallel query options in the Oracle Server 7 allow machinery working in symmetric multiprocessing (SMP), in clustered multiprocessing and massively parallel processing (MP) to execute a single application on multiple processing units, thus providing an almost linear scalability with each processor added to the configuration.

2.3 Sybase - Build Monumentum

Sybase company made a major step in designing database systems from the new generation by launching a product with "multithreading" work features. Sybase Build Monumentum runs in several ways to control the execution on both platforms -Windows NT and UNIX platforms, while adding to the existing architectural features for working with object-oriented database. The multiprocessing on distributed networks is done however only from the "client" point of view. Build Monumentum has an administrator who manages the "multithreading" processes even if the host operating system normally does not support this.

2.4 - IBM DB2 Parallel Edition

IBM developed its system of relational database management, DB2/6000, in a parallel multi-processor architecture with hardware ranging from local networks and systems to single processor RISC System/6000 IBM Power Parallel Systems SPX. Parallel Server DB2 Parallel Edition database can efficiently handle very large databases using strategies of sharing data and applications on their parallel execution.

The DB2/6000 management system extends to support a "shared nothing" architecture selected for two reasons:

- It is a scalable architecture to the level of hundreds of processors;
- Provides high portability because it requires only one communication link between processors, so it can be ported on any platform.

In the "shared nothing" architecture with the parallel implementation of the management system DB2 in a network of machines RISC/6000 IBM, database storage is done in a network of processors that provide buffers, lock structures, files log and separate records for each process. This prevents competition on cache structure resulting from the fact that all processors share the same set of resources.

In the architecture with multiple processing nodes, for large databases, data placement becomes a complex problem and system administration can be difficult. The implementation of parallel systems using a DB2 requires a definition language and management tools necessary for data partitioning. DB2/6000 provides two important features for partitioning large database tables: the use of partitioning keys and groups of nodes for a database that contains several tables; the user who develops the application can define a partitioning key for each table.

Conclusions

The internal administration of distributed databases is demanding and generally difficult, because one has to ensure that:

- Distribution is transparent (invisible and unobtrusive) - users must be able to interact with the system as if it were a non-distributed one (monolithic);
- Transactions must also have a transparent structure (invisible and unobtrusive). The course of each transaction must maintain database integrity, despite the multiplicity of partitions. For this they are usually divided into several transactions, each of them working with only one partition.

These requirements lead to the harmonization of the smart development strategy for Romania, in line with the priorities of "Europe 2020". Europeans should have the chance to use services on networks that are equal to or better than those available in other countries. In this direction have been made following steps:

- In 2010: adoption of a Recommendation to encourage investment in next generation access networks (NGA).
- In 2011: Monitoring of the implementation of the NGA Recommendation by national regulatory authorities and Monitoring of NGA deployment and broadband competition in the Member States.
- In 2012: guidance on pricing and/or costing methodologies in national regulatory measures.

IT&C AND THE PERSONAL DEVELOPMENT

Mareş Marius Daniel

Spiru Haret University, Faculty of Management, Finance and Accounting, Bucharest

Mareş Valerica

Economic Studies Academy of Bucharest, Faculty of Accounting and Management Information Systems

In this paper I explore the phenomenon of personal development in an „unconventional” way. The contribution of this paper is to use a different method (i.e. in –depth interviews) to focus on a different unit of analysis (i.e. managerial couples) in a different context. In addition the information and communication technologies (IT&C) are entering all the fields: business, state institutions, education and the day-by-day life. This paper contributes to the field by suggesting a different theoretical approach to personal development conflict as a decision-making problem. I propose using social exchange theory to explain personal development conflict as a complex evaluation of cost and benefits of exchanges between multiple actors on the basis of personal values and beliefs. The critical thinking is one of the most popular learning objects in the English speaking countries and they are also offering most of hopes to distance learning and also the critical thinking is a reflective one. This paper suggests that the field may be overlooking some fundamental variables. Content analysis of the interview transcripts reveals the crucial importance of implicit values and benefits, immanent or tacit actions such as decision-making and learning and communication and mutual understanding. Communication and personal development is essential in this respect. It’s difficult to separate work, family and personal development and communication is fundamental in all directions. To conceptualize personal development conflict as a decision-making problem while taking into account exchanges and interactions between multiple actors and we can draw on equity theory or social exchange theory.

Future research should test whether decision making is central for the understanding of personal conflict only in managers or in other collectives as well. I recommend the couple as the best unit of analysis to address issues such as accommodation within couples and complex decision-making in both individuals and couples. Future research should draw on boarder and different samples to replicate our study and check the generalizability of its findings - because if it can be generalized it may have strong implication for theoretical development.

Keywords: e-learning, critical thinking, IT training

JEL Classification codes: M15, O17

Introduction

The information and communication technologies (IT&C) are entering all the fields: business, state institutions, education and the day-by-day life. Applying the Internet technologies the whole learning concept is changed reducing a lot the costs regarding the preparation and learning, and the costs of displacement of the professors an student as well. The forums and discussions are allowing the fast information exchange between students and between professors and students as well. The possibility to have on-line courses at scheduled days and hours, by multimedia facilities offered by the Internet infrastructure: on-line image (video camera), sound, chat can be done either by an independent treatment of students taking into account their aptitudes and results or by very high audience courses (hundreds/thousands of students simultaneously).

The extremely low costs level of a course is that it's not necessary to have a classroom, the number of students it's not limited because of the classroom's capacity, the teaching materials are virtual (photos, films, sounds, and so on) but also every student's or professor's possibility to customize the used interface to meet his needs of an easy administration at any level of detail and anywhere a computer connected to the Internet is available offers the possibility of the access to use or administrate both in fixed positions (computer, desktop connected to the Internet) and mobile ones.

In this study I will focus on managers because I expect that they are a group that, because of nature of their work, experience high level of personal development conflict. More specifically, I will study managerial couples, i.e. couples of which one or both members have managerial responsibilities. Managers may be expected to experience more time-based personal development conflict because they have to devote more time to work and show a high degree of availability and flexibility in their job. They can also be expected to experience more strain-based work-family conflict because of their responsibility for resources and people.

1.The critical thinking in the field of personal development.

The critical thinking is often associated with the philosophy but it can be closely associated with informal logic. The critical thinking is one of the most popular learning objects in the English speaking countries and they are also offering most of hopes to distance learning. The critical thinking is a reflective one. The one who thinks critically thinking's(interferes, deliberates) reflectively. But what does it mean to be reflective thinking so that it is also critical?

The critical thinking is reflective due to the fact that it follows its own progress, it evaluates each of its steps to decide if it is or not justified then it corrects its own mistakes. The critical thinking is not perfect because the one who thinks critically also makes mistakes. But the process of self-observations and self-correction through which always passes the one who practice the critical thinking makes him to commit fewer mistakes than those who don't think critically. The critical thinking is often erroneously considered to be a negative and destructive thinking. If we look at the relationship between the critical thinking and belief we can notice that the purpose of critical thinking is not to destroy the belief; what is wanted is to get to a reasonable belief. The critical thinking is not the negative thinking opposite to the positive or creative thinking. The one who thinks critically asks questions but it asks them to decide what's reasonable to believe.

Obviously, the critical thinker is not so stupid to believe in all he's told but he's not so skeptical to believe in nothing he's told. What's doing the one who thinks critically is to distinguish between reliable and questionable witness and he weighs the evidence to decide what's reasonable. When we bring evidence and arguments in favor of an opinion or belief, the result is reasoning (an argument). The opinion or conviction is the conclusion of reasoning. The activity to analyze if the conviction is in fact supported by the evidence or the invoked reasons is called the analysis of the argument.

The critical thinking is dealing with reasoning and arguments. On the one hand, it analyzes the already made arguments seeking to discover their mistakes and, by the other hand; it builds reasoning or counterarguments. The model is the Socratic method: to critically think is to primarily learn to listen to the other ones. To listen to what the other says means attention, concentration and also respect. Critical thinking is also to try to understand what the other one is trying to mean. The criticism is not made for the sake of destroying the other one's arguments but for the sake of clarifying them. These arguments are sometimes wrong and that's what critical thinking teaches us to detect. Once again the model is the Socratic conversation. We listen, understand, respond, discover mistakes and, finally, we are building ourselves (or together) the right reasoning.

“To misunderstand”, to make a mistake is not only frequent, is – however paradoxical it may seem – necessary and so the knowledge begins. You cannot start by knowing, only your own ignorance’s achievements can make you look for. If the answer I find to a question is wrong where is the right answer? The true knowledge starts when you realized that the error was an old lesson. Nobody taught it better than Socrates. The Platonic dialogues called “Socratic” are a wonderful example of the essential value for knowledge that has the recognition of own ignorance. Socrates’ demonstration of *Alcibiade* you cannot know a thing unless you have learnt it (it’s about how to become a politician); you haven’t learnt it from others during school because it’s not taught in school; you’ve had no democracy teacher. You haven’t learnt it by yourself because there was no moment when you realized you didn’t know it and so you start looking for it. So you cannot become a politician because you have no skills for that. This is an argument. Socrates shows Alcibiade that he cannot become a politician because he doesn’t know what a politician has to do (or not to do), because he’s unprepared and he has never thought about that. Different ways to express an argument by which not every attempt to convince is an argument. The reasoning or arguments are some special forms of human communication, different by the others by the fact they are organized according to logic rules (or laws). Therefore, we are saying about arguments that they are *correct* (if the persons who formulate them know the rules or laws after which they are formulated) or otherwise *incorrect*. In logic, at this point, the discussion should be ended. If we formulate a wrong reasoning there’s no place for discussions an interpretations. However, in day-by-day life things are more nuanced and there are situations in which the formulation of a wrong argument doesn’t close the discussion. This is happening in almost every dialogue and sometimes the simple incorrectness doesn’t stop to argument but it’s insisting to convince and to eventually have the possibility to repair mistakes which are realized by education and self-learning.

2.E-learning – way to personal development

By promoting a digital image of the information society, in learning subsystems the hardware component is represented by computers and the infrastructure obtained depending on the way of interconnection, the software component is reflected through learning system while firmware will be the impress of the institution providing learning services.

More broadly, by e-learning is represented the totality of learning circumstances in which the means of the information and communication technology are significantly used. The term, took over from Anglo-Saxon literature has been extended from the basic etymological meaning to learn by electronic means and it is now covering the area of intersection of educational activities with modern electronic means. So defined, more that e-educational, the semantic area of e-learning concept interferes with and infinitely variable overlaps a lot of terms that capture the variety of teaching experiences that can benefit from technological support: assisted instruction: computer – mediated, digital/mobile/on-line learning education, training through multimedia and so on.

Known as educational teaching software, a wide range of electronic materials (on digital media) are developed to make easier the procees of learning; maps, dictionaries, encyclopedias, educational films, presentations in different formats, books (e-books), tests, tutorials, software simulations that form skills, software practice, educational games and so on. The computer and the multimedia electronic materials are used as a support in teaching, learning, evaluation or as a mean of communication (to carry out some individual tasks and so on).

Children are increasingly earlier taught to use the computers in ontogenesis. What and how will the computer influence the child’s cognitive and social development? There’s a series of fears of addiction or social isolation, phenomenons influenced by the use of the computer but these ones

can be counteracted by a series of researches whose conclusions can be summarized by the advantages of a more productive and motivational learning.

E-learning represents a kind of distance learning, as a planified and organized teaching-learning experience. The mediation is done by the new information and communication technologies – mainly by the Internet. The Internet represents both the medium of material's distribution and the communication channel between the involve actors. For the time being functional only in the higher education and in adult's education, the systems of Internet training adapt the components of the traditional teaching approach/ face to face: planning, specific content of methodology, interaction support and evaluation. The extensions brought by the technological medium, insufficiently explored and used, refer to:

(a) *student orientation* by custom training course – the different composition of learning objects depending on the needs of each beneficiary – by *training individualization* – non-linear structure of the information, with the possibility of returning to more difficult content following the automatic identification of gaps – *autonomy* by eluding a pace, spatial independence and induction seminars;

(b) distributed resources, using and integrating access to electronic libraries and media by training specialists in student's discussions;

(c) fluidity of roles by the continuous balance of the educated-educator role within the learning group, by the continuous restructuring of learning teams depending on interests or task's efficiency criteria.

The training within the field of information technology and after that the training using this technology is different stages within the process of the information society's development. The development of some specific training solutions led to the foundation of new concepts in this field, which started from the solving of traditional problems with new tools (electronic manual – ebook) getting to the development of some new problems linked to the replacement of the bureaucratic structures with educational organizations and the construction of some specific mediums such as e-learning, promoted as a paradigm of e-learning. An e-learning system (of distance training or virtual education) consists in a planned teching experience – learning, organized by an institutions that provides materials in sequential and logical order to be assimilated by students in their own way without any constraint on the co-presence or synchronicity activity. Mediation is done by different ways, from media materials (memory sticks, CD/DVD or eventually by classical correspondence) to transmission technologies of the contents via Internet.

The education and training task based on the latest information and communication technologies is not to prove that it has immediate results in a race with other types of educational systems but to substitute a part of the current structures with a new, probably superior performances spectrum in meeting of inherent changes taking place in culture and civilization.

The new medium created by the Internet and supported by current technologies permits the improvement of traditional teching an learning principles by bringing to them a series of innovations:

- asynchronous learning;
- synchronous learning, where students and professors are learning on their own or in supervised groups;
- learning focused on student or professor, depending on whether the student or the professor occupies a position which determine the pace of progress;
- individual or group learning, benefit of the advantage either of the unidirectional attention or of the benfits and iinfluence of a group;
- informal communication, create opportunities and 'institutions' on the online learning platform in order to exchange information (cafeteria);

- the online library which not only allows books and magazines but also links to internal and external databases, to audio and video flows, and so on;
- online exams similar with extemporals and tests that are created by professors and scheduled either by professor or student, depending on learning system;
- the management of learning is achieved through modern methods of controlling the process of teaching and learning that adapts to a large public.

By the strategy of Lisbon which has as horizons the years 2020 is wanted to be ensured an employment rate of labor of 70%. In terms of global economic crisis the demand for manpower in Romania expressed by the indicator „quarterly rate of job vacancies” continued the downward trend.

The European e-learning market will reach USD 10 billion until 2012. The content market will be the dominant segment for the next period. The next segment as dimension will be the services one which will have the highest growth. Analysts believe that as the market consolidates instruments will become common and they will be a part of end-to-end solutions. European market for IT training services, however, remains fragmented, the number and variety of providers being huge in all the countries. Many alliances and partnerships between companies with complementary skills in e-learning are created -and some of the major providers of e-learning has expanded on the market both geographically and in terms of e-learning offer. It is expected that these trends continue, however pointing out that the market will remain fragmented so that approximately 75% of corporations will have developed platforms LMS (learner management system).

It is believed that these platforms of education will become just as prevalent as CRM and ERP systems are in present. The sectors which most rapidly embraced the e-learning are the industry, healthcare, education, government sector, banking system, followed by transport, telecommunications and media. Economic difficulties stimulate investment in education and IT training. According to analysts annual rate of growth in global revenues from IT education and training will be 55 billion USD in 2012. But growth rates will widely vary depending on region. It's considered that in their tendency to reduce costs some companies, will invest more and more in training IT specialists as having well-trained specialists in the latest technologies is essential for companies to reinvent their business model, make Internet strategy, reorganize their supply chain and try to remove one of the biggest problem of IT departments, the lack of sufficiently trained staff. Worldwide the United States and Western Europe will remain the largest market for IT training. Together, these two regions will represent approximately 75% of revenues from IT training. It is estimated that e-learning will determine much of the market's growth of IT training because the providers develop an ever-growing high-quality offerings and more end users have access to these offerings.

3.Globalization in the Information Society

The information society is the society based on the Internet. Globalization is also a consequence of the Internet as a priority. Then we can say that globalization is a phenomenon specific to information society. Because of the link between information society and globalization, which justifies the claim that globalization is a natural consequence of the information society, whereas the information society is proved to be a process that can not be stopped, globalization is also an inevitable process.

Along with the increased data processing speed and their storage capacity, have led to the development of custom user, and as a key factor, they have been interconnected, ensuring communication between two users, then at the group level and after that between community users developed by Intranet, Extranet or globally, in an open system, resulted as digital a reflection of the social system through the Internet.

The complexity of the information systems and their quite long making timescale are causing a series of problems which have to be taken into account and solved so that, the expected results are finally got.

First, during the development cycle of the information system changes occur within the managerial team of the beneficiary. In case a new managerial team has another vision upon the agreed indicators on which its decisions are based, changes in specifications occur, involving modifications of the information system's structure.

Secondly, the latest information technologies that appear require the ongoing adaptation of the information systems development team. Changes occur in the approach of the assistance tools and in the use of the options. Using the latest resources, a series of components are finally designed. The information system becomes inhomogeneous in terms of technologies of development.

Thirdly, the development of the company by purchasing new equipments, the reorganization of the production flow, the transition to the making of new products, the introduction of the elements of total quality management come to influence the structure and functions of the information system in terms of quality and amount. The problem of data acquisition acquires a new dimension when it comes of tools with programmed command or in case of robotic production lines.

Fourthly, during several years, the team of programmers, web designers, testers and implementers undergoes itself modifications. Different specialists reunify the team. All these fluctuations are reflected in the working system, in the quality of components or stages of the information systems.

Fifthly, the economic environment, the legislation and the dynamics of the processes of the information society leads to evolutions that have to be reflected in the information systems. The modifications of some calculation algorithms, the need to use new coefficients, the appearance of some information exchange between the company and the public institutions of state also have to be reflected in the information systems being designed.

The Internet was also the result of social interaction among experts, institutions, states and an extremely large number of users worldwide, and only in this context it was possible as a technological and social invention, only in this context he acquired today's form. It is natural to think that globalization, as a result of the Internet takes the form at which all the globalization participants are involved. This is the lesson of the Internet, which has proved to be great success in technological and social history of mankind, showing the path to be followed by the globalization process so that all participate in ways that will have to be largely generated by the users of globalization. Like the Internet, globalization cannot be strictly hierarchical to be a success for human being. If the Internet is not hierarchical, the globalization, naturally, will not be hierarchical, ensuring, as with the Internet, general coordination forms to establish rules of conduct acceptable to all, which could only be possible in a knowledge and perhaps consciousness society.

4. Conclusion

The premises of creation of the information society were insured by producing a massive and rapid spread of electronic computers, which allowed the individual, organization, nation and society the processing of a growing volume of data in an increasingly lower time and in an open space.

The globalization process has not found its balance and natural course, although he is driven by the increase of the Internet and its use in the economic, cultural and social life of the world.

RESPONSIBILITY FOR ETHICS IN IT&C

Mareş Valerica

Economic Studies Academy of Bucharest, Faculty of Accounting and Management Information Systems

Mareş Marius Daniel

Spiru Haret University, Faculty of Management, Finance and Accounting, Bucharest

In this article the authors aim to create a presentation of the triangle morals-ethics-responsibility with an accent on the current globalized society. Business ethics has to disseminate in all the corners of a company, and first of all it has to be understood. Understanding the moral criteria of behaviour in business is important because the new Organizational structures create new complications, related to information flow and information administration inside various workgroups and in the entire organization, for which there are no traditional precedents.

KEY WORDS: business ethics, corporatist social responsibility, ethical investments, green energies

JEL Classification codes: M15, O17

Introduction

The term ethics has at least three different meanings. First of all ethics refers to the so called manners, customs and traditions specific to different cultures. Business ethics implies introducing in daily decisions and in management strategies more norms than the law requires. P. V. Lewis defines business ethics as „that set of principles or arguments that should govern the business behaviour, individually or collectively”. A company that is socially responsible, that is it takes into account not only the interests of the shareholders but also the interests of all the groups affected by its activity, so business ethics is a cost and implies delegating resources from the trajectory imposed by a strict computation of economic efficiency.

Eudaimonia means happiness, and the first to talk on this theme was the philosopher Aristotel in Nichomahic Ethics where he talks about virtue that is needed by people to lead the best possible life. The main idea of Aristotel is that there are different opinions about what is best for people and these differences have to be resolved. The question is: What is good? Aristotel doesn't look for a list of things that'd be easy to make, Aristotel looks for the highest of the goods and considers that this, no matter what it'd be, has three characteristics: it is desirable in itself, it is not desirable for another thing, and all the other things are desirable for it. Nobody lives for a certain goal except the one of goodness. And all the subordinated aims, as health and wealth are wished for the reason that they promote good and because they are good in themselves.

The problems and the opportunities created by the new technology, by the globalization process, by the privatization of the media raises new ethic and spiritual challenges for those who work in social communications. These challenges can be effectively met by those who accept the fact that, in order to serve a human being, building a community based on solidarity, justice and love, and presenting the truth about the human life are and will remain aspects central to ethics.

The increase in the importance given to business ethics can be explained through the changes suffered by the strategies and the structures of the corporations. Recent currents in the managerial theory and practice, as total quality management, as well as restructuring and redimensioning processes for top companies left to abandoning many traditional practices for managing economic processes. Intricate and rigid managerial hierarchies have been considerably flattened. As a consequence, the authority and the decisional responsibility have been dispersed more and more inside the company: important decisions are taken at lower hierarchical levels and by more

employees. That's why it is required that each employee, not just the management, should understand as well as possible the complexity of the problems and how they should be reflected in the practical behaviour of the company in the economic environment.

Business ethics costs: money, human resources and time, expertise, opportunities, as investments or development. Moreover, business ethics and its most visible form, the social involvement of the companies, are options that are not required by law. In the classical form of the corporatist philanthropy, in the regulated form of donation and sponsorship or in the modern form of corporatist social responsibility integrated in the management strategy, the social involvement of the companies has been perceived for a long time as a less and less necessary cost, a luxury of large corporations.

Business ethics consider businesses from a larger perspective that is all the members of the society have different material needs that they have to satisfy in the economic system, through production activities, services, distribution, repairs etc. Businesses are not the only possible way to satisfy these material needs. They appeared, during the rise of the capitalism, as the most efficient solution to sustain a rapid and constant economic growth (although not lacking in crises and difficult periods), an increase in the economic efficiency, of quality and the variety of products and services, a relative or absolute decrease of prices etc. It is essential that the society doesn't exist for the business people to profit from it, but on the contrary, it exists to support social needs.

1.Social responsibility and the new dimensions of globalization

The social responsibility of an entity means what the society expects from an organization from an economic, legal, ethic and philanthropic point of view at a certain moment.

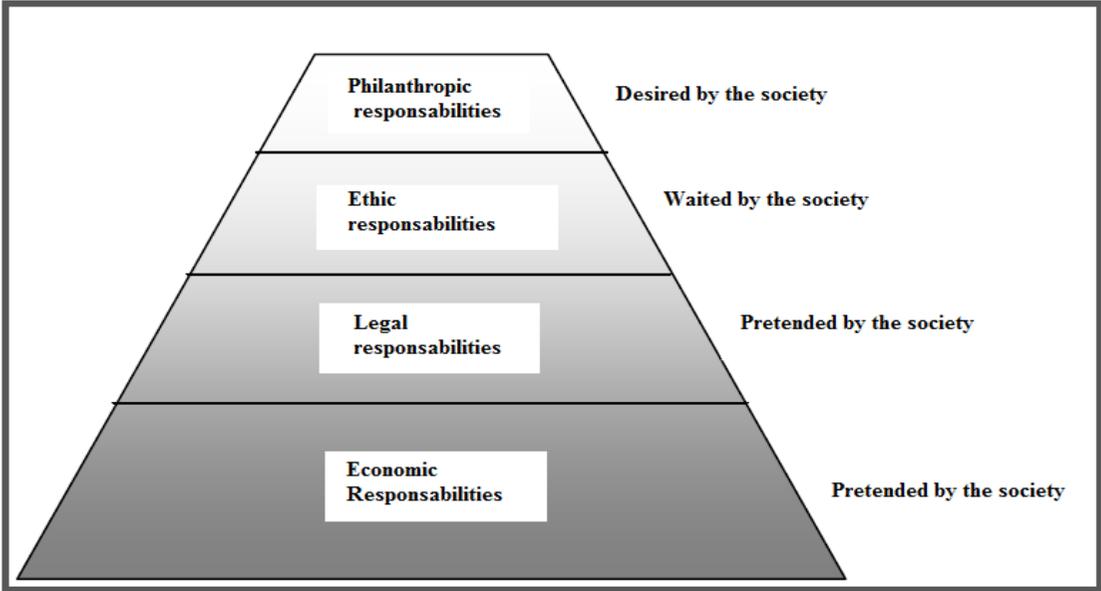

Figure 1 Level of ethic

Social responsibility is a concept regarding the contribution that companies have to have at the development of the modern society, and it is also called *corporate citizenship, corporate philanthropy, corporate societal marketing, community affairs, and community development*.

International states and institutions realized that the assimilation of the principles of social responsibility by the companies serves the objectives of durable development and led to the appearance of international standards for defining what means „desirable corporatist behaviour”.

United Nations, European Union and the Organization of Economic Cooperation and

Development are the most important institutions that committed themselves in creating a framework for defining social responsibility and for establishing indicators through which they can be evaluated in a transparent way. This framework has been accompanied by recommendations and principles to guide the states and the local authorities in formulating public policies that could promote and ensure transparency and support social responsibility initiatives. Without being perceived as a sign of economic power, social responsibility takes now a form of corporatist civics – a way of keeping the business relationships stable and profitable for all the parts involved, a non-aggressive way, a least detrimental functioning way next to a community, a friendly way to communicate with the society. In this form, social responsibility is nothing less than a modern, open and flexible way of management. Social responsibility is often seen wrongly as the exclusive responsibility of the brand manager, rather than a common responsibility of all the top managers in a company. This happens because, indeed, many companies started doing social responsibility after being surprised by the answer of the public to some of the aspects of their activities that they didn't see as part of their business responsibilities. For example NIKE had to stand a mass boycott after the media denounced the abusive work practices of some of their suppliers in Indonesia.

In the business practices from small enterprises, the differentiation between management and shareholders is vague and employees have multiple roles and the main activities aim at solving the daily problems, which is done mainly through informal relationships and communication. Also the interpersonal relationships play a very important role.

The uncertainty generated by the pressures of the large companies, the unstable position on the former traditional markets force the small enterprises to create strong partnerships, personal relationships that can offer trust. It will be noticed a tendency of the small enterprises to compensate the instability on the market with an increase of stability of the interhuman relationships, with the employees, the business partners and the clients. The social involvement of the small enterprises leads to an increase of the reputation in the community, to improving the personal image of the owner and of the administrator, and to increasing the trust in the enterprise, to increasing the loyalty towards the company. All these guarantee the stability of the relationships with the business partners, with the employees and the community.

In order to support companies the General Secretariat of the UN has created a program Global Compact which is a partnership between United Nations and companies for attaining a durable development at global level. Global Compact is a network that comprises agencies of the United Nations, companies, union organizations, business organizations, academic organizations, civil society organizations, governmental/administrative institutions and is oriented towards social responsibility on the basis of universal principles, divided in domains of interest and on dimensions: internal and external.

2. The Ethic Investments In It

As soon as the interest of the public towards corporate responsibility increases, there appears and grows considerably a new category of shareholders, who are interested not only in the profitability of their investment, but also in the moral correctness and the social responsibility of the companies in which they have shares. Unlike militant shareholders, the adepts of ethical investments don't use directly their investments for forcing companies to listen to their opinions and take them into consideration. They look for those investments which are in the same time profitable and compatible with certain ethical standards. In Cowton's definition, ethical investments are those that „use ethical, social and ecological criteria for selecting and administrating investment portfolios when it comes to shares of certain companies”.

The criteria for evaluation and selection of the companies can be negative or positive. Those removed from the list of ethical companies are often the companies that produce or trade alcohol,

tobacco, military equipment and any products that are detrimental to the environment or whose production is pollutant and consumes nonrenewable resources. Companies that support oppressive political regimes exploit cheap work labour from poor countries and employ minors; and finally the companies that violate the rights of animals, that endanger biodiversity and those that promote genetic engineering etc

The companies that meet the positive criteria are those that are involved in conserving and protecting the environment, in improving public transportation and living conditions, repairing and conserving buildings and architectural monuments, those that promote „green” energies and those that ensure the equality of chances when promoting employees, work safety conditions etc.

Besides the normative ethic motivation, the ethic investments can be desirable also from a strictly economic point of view. The risks of having the public boycott some products that are not accepted or the risk of ecologic disasters can influence the dynamics of shares and the ethic companies are less exposed to such risks.

On the other side, the success on the market of ethic products can make the investments they finance very attractive. The majority of ethic investment funds make the selection of companies in whose shares are interested starting from the data offered by the market. For example, many corporations from the electronic industry produce household and medical equipment as well as military equipment. In the same time, the investment in bank shares is not safe enough, because banks can finance companies that don't meet the criteria of ethic investors.

In Romania, far from being an ethic undertaking, social responsibility is a possibility of the companies to move the attention of population to legal obligations they should meet in welfare actions. For example a company that is a big polluter advertises for its action of planting trees that it does with volunteers, calling these actions „corporatist social responsibility” and ethic investment.

The *ethic investment* movement spread considerably, with effects that are not negligible. By aiming at investments towards corporations that meet certain moral standards, investors don't exert an influence just on the policies of a certain company, but also stimulates the other corporations to reconsider their ethic behaviour in order to avoid a possible and predictable decrease of their attractiveness on the capital markets in a short term perspective.

3. The Ethics Of The It Workforce

The sensitive personnel problems confronting the multinational IT corporations are the following:

1) The *payment of the employees*, who work for multinational companies in countries with a development level sensibly lower than in their home countries. It is imputed to foreign investors that they exploit the labour from underdeveloped countries, paying a couple of times less expensive the same labour done by employees in their home countries with similar qualifications. On the other side the former are disadvantaged by the fact that, by moving the investment and the production units to the third world, there will be an increase in unemployment in the developed countries. Transnational corporations are fiercely criticized for adopting selfish policies, in the pursuit of maximizing profit, and they break that hypothetical social contract with different categories of shareholders, causing prejudices to employees from their home countries – who lose their work and who's union pressure decreases in intensity when the owner can menace with relocation of investments in other countries – and to employees from the third world – who are exposed to an equivalent work load to those in developed countries but are paid worse. The counter arguments are numerous and powerful. First of all the alternative for the employs in the underdeveloped countries is to have a low pay (compared to the employees from the developed world) or to not be paid at all, as long as the main point of interest for the foreign investors is the low cost of the work force. It can be stated, many times rightly, that the salaries offered by

multinational corporations are sensibly higher than the average from the poor countries in which these companies operate.

Besides the work environment offered by these multinationals is more correct, more civilized and some principles when recruiting and promoting labour are being implanted in the countries from the Third World, thus creating more evolved models for the leadership for treating the workforce.

2) *The management of branches* from other countries of multinational corporations raises a lot of ethic problems. Many companies prefer to offer low credit to local managers, and implant managers from their home countries to the management of local branches. These managers sometimes don't know well enough the traditions of the local problems and are not flexible enough towards the wishes and the difficulties of the partners and the employees from the countries where they are implanted. This is the main reason why, in these last years, multinational corporations adopted a policy of managerial adaptation, and promoted more and more actively local leaders, trained professionally in the west, where they can learn the methods and techniques of modern management.

3) *Women discrimination* is a delicate problem; the investor companies are not necessarily culpable of it, because it is not its managers are those who impose it, but the local traditions and religious beliefs. Multinational corporations are criticized by the public opinion from the origin countries that they are not more determined in having an active policy, even aggressive, for eliminating women discrimination from the Third World, where it represents a hard to combat practice. Other, more reasonable critics, refer to the fact that, in some countries where religion doesn't prevent women from playing a role in economic life, the sexual discrimination takes other forms, as employing mainly women because their salaries are lower than those demanded by men.

4) *Employing minors* is, obviously, the most often incriminated aspect and obviously the most criticable, in terms of personnel problems of the multinational corporations. Thus it is deemed that without the material support of the children employed, their families would lack subsistence means, and those kids would have to choose between dying of hunger and begging, stealing and roving. It is certain that education, health and psychosomatic development of the children that work while still young, are affected, and their future is sombre.

5) *The measures taken to protect* the employees constitute a problem for international companies in terms of their public image in the origin countries and less in the weakly developed countries in which they operate, although it is the employees in poor countries that suffer. In the third world the labour legislation is weakly developed or practically inexistent, thus the standards for protecting the personnel at the work place are very low compared to the developed countries. That's why multinational corporations take much fewer measures for protecting the labour in the branches from the third world as they do, forced by the legislation and by the public opinion. In their origin countries, as a consequence there are many accidents, with victims and grave mutilations of the employees at the work place. They don't reject the idea and take some measures, but not much, invoking profitability and competitiveness. If they spent as much as necessary for the safety of the employees, the costs would increase significantly and if some competitive companies don't take these measures, they risk to be pushed out of the market, which should bring back again the old dramatic dilemma of the workers from the poor countries: risks and low salaries, versus no salaries. All that can be achieved through good intentions is a compromise of the two requirements – the economic and the moral ones.

4. Ethic Controversies Over Environment Protection

This is the battlefield of the most disputes concerning global warming and multinational corporations are the first to be incriminated, because environment destruction, which often claims life's, produce grave, often irreversible effects not only in the countries where they take place,

but they also affect the global climate, the quality of water and air on a global scale. The causes of ecologic destructions are the same as in the case of insufficient employee protection at the work place: the legislation is very permissive, the local population has a low degree of technological competence and doesn't understand the dangers to which it is exposed, the high costs of non-polluting technologies etc.

In fact, the case that brought a focus on international business ethics was the disaster from Bhopal, in India, but the earthquake and the tsunami from Japan, from March 2011 and the explosions at the nuclear power plant from Fukushima is enhancing this discussion. Faced to these phenomena, the reaction and the pressure of the international public opinion have been strong enough to force transnational corporations to accept that they have an obligation to take radical measures for ecologic protection in the countries where the local legislation doesn't impose very high standards, by covering the higher costs that are required by non-polluting technologies as well as by advertising and training the personnel and the population.

Due to the variety of cultural values and moral principles around the planet and because the accommodative policies had unacceptable effects, there appeared more and more strongly the idea of elaborating international ethic codes, with the explicit agreement of government or non-government associations, in which the main role goes to the large transnational corporations.

The International Institute for Business Ethics proposes the following three basic principles for companies:

-**INTEGRATION**: Business ethics has to be implemented in all the aspects of the organizational culture and it has to be reflected in managerial systems. Companies have to start by integrating the ethics in fixing the objectives and the practices for recruiting, employing and promoting the personnel.

-**IMPLEMENTATION**: The ethic behaviour is not just an idea; it is also an effort for implementing a plan for changing the attitude in different activity branches of a corporation. Examples: changing the reward and stimulation systems, promoting better practices for protecting the environment, consulting experts whenever it is required.

-**INTERNATIONALIZATION**: The ever more extended opening towards a global market is necessary for any successful business in the 21st century. It can be achieved through international partnerships, commercial blocks and by implementing GATT agreements or other similar agreements. The clarification of a company's definition of the moral integrity, so that it can transcend national borders, is necessary for any corporation that operates on the global market, and has as result an action plan and an ethic code without a specific cultural colour, which doesn't require essential changes when applied in a global context.

Conclusions:

1. The last decade saw an explosion of ethic behaviour codes of multinational corporations in international business. The majority of these codes are created according to the principles established by OECD (Organization of Economic Cooperation and Development) and ICGN (International Corporate Governance Network). Unfortunately, many of these behaviour codes state vague truisms, and top managers and analysts recognize that there is a lot to be done in implementing the principles declared in these codes in the daily activity of companies that operate on a global level.

2. Many problems are still waiting for a solution that is strongly proofed theoretically and verified in practice. It is important that the most pressing problems have already been formulated and accepted by the community of transnational corporations, which is a lot. Once started, the process of evolution of ethics in international business will continue for sure, in an accelerated rhythm, hopefully with positive results, for more and larger categories of interactive groups in the global economy.

The existing accommodation in the rural Maramureș region is essential for the development of tourism. Most accommodation units are within the typology of rural tourist hostels, therefore special attention should be paid to promote and diversify their touristic offers. Despite its attractive potential, the rural tourism in Maramureș has its weaknesses because there is no organizational strategy for its deployment. Tour operators must adopt new solutions to promote tourist services, one of which may be using expert systems. The main purpose of this study is to develop a model of an expert system, applying new methodological approaches to the evaluation and ranking of countryside hostels in Maramureș. This model can be easily implemented with private and public entities and could be a source of significant benefits for them.

Scientific literature in the field highlights the benefits of using expert systems in all business sectors and reinforces our conviction that they can be applied extensively in tourism as well.

The research methodology included: defining the nature and scope of the problem, identifying experts, acquiring knowledge, selecting the system building tools, as well as encoding and evaluating the system. In the knowledge acquisition phase we used interviews, thus obtaining a database with information on countryside hostels in Maramureș. We turned to tourism professionals to establish expert rules in a way that reflects as accurately and completely as possible the context. These rules led to the encoding of the system. In order to encode them, we used the Corvid system, developed by Exsys, which was verified and validated.

The system, once designed, provides a user-friendly interface. After being implemented in specialized sites, the system will be able to facilitate searching and finding information by users.

We propose that the model obtained will be a starting point for further research, given that the development environment allows the system to be constantly updated. Using the system will enrich the knowledge database by storing user requirements, and the results thus obtained can be used for statistical calculations useful in determining future development strategies. The implementation of the proposed model in websites, through the assistance it provides, can attract customers both from our country and from the top tourism consumer countries of the European Union and around the world.

Keywords: Expert System , Exsys, Corvid, rural holiday hostels, Maramureș

JEL Classification: C80, C88, L83

I. Introduction

The current development of tourism is characterized by a constant renewal of tourist offers, in particular by developing a new range of tourist products, superior both qualitatively and quantitatively.

Tourism offers a range of intangible services, which tourists do not come into direct contact with at the time of purchase. The main characteristic of tourist products is their enjoyment “at the source”, assuming that tourists travel to it. Buying a product requires prior knowledge of it. The image created in the tourist’s head is critical and this is achieved using means and methods of promotion. The tourism industry needs to rethink the concept of “tourism”, so as to adapt it to highly qualified and therefore, sophisticated audiences. This stems from the fact that the tourist is a demanding customer; his demands are motivated by various reasons and change together with the transformations that human society is subjected to.

The tourist offer is part of an increasingly segmented market where competition becomes increasingly fierce, as the main players on the market are trying new ways to create marketing products and to promote themselves by adopting new strategies.

Recognizing that the Web has become the main means of communication, one solution would be to implement expert systems in web sites, so that online assistance could be offered to potential customers who will be assisted in making such decisions. Human experts are not always available, and many functions that used to depend on direct human contact are now provided via the web. In order to make the best decisions, one needs to take into account the specific needs of each user. Expert systems are the most effective way to manage these situations. The ability to have web sites with "advisors" interacting with the user greatly increases the quality and level of detail of the recommendations that can be provided. A site that provides visitors with expert advice will attract customers and keep them coming in the future to access the site.

Rural Maramureş, by the diversity and complexity of its potential, offers the possibility to practice a wide range of forms of tourism, so that it satisfies tourist needs regardless of the customer segment. But, in order to better meet the desires of tourists travelling to the Maramureş region, it is essential that it should be promoted as well as possible.

As we are convinced of the benefits of expert systems, we can but ask ourselves: ***Will using expert systems improve the promotion of tourist services in the Maramureş County?***

The objective of this paper is to design an expert system to assess rural holiday hostels in the Maramureş County, to help users search for and find information in a fast and efficient way, allowing them to compare offers and choose the best. The system will use a database with complete information about hostels in the area.

II. Literature Review

It is considered that expert systems are those that add the element of artificial intelligence to classic decision support systems. They are the oldest and perhaps the best grounded technology in the field of artificial intelligence (Holsapple and Whinston 1996).

Expert systems (ES) are computer systems that use specialized knowledge to achieve high performance decisions in a particular area (Turban, Sharda and Delen 2011, 542). The main features of expert systems are:

- in conceptual terms, ES are aimed at reconstituting human reasoning according to the expertise obtained from experts;
- ES have the knowledge and capacity to conduct human intellectual activity;
- ES are organized for the acquisition and exploitation of knowledge in a particular area called the problem range;
- ES have ways of invoking knowledge and expressing expertise, behaving as an “intelligent assistant”;
- with respect to their computing organisation method, ES are based on the principle of separation between the data (the database) and the program that treats it (the inference engine);

- ES are able to store knowledge, to establish links between knowledge and to infer conclusions, solutions, advice, tips and the causes of some phenomena from the data and the processing of uncertain knowledge.

Expert systems consist of two environments: **the development environment** and **the consultation environment**. The development environment is used by those who build the system and update it constantly with new knowledge from industry experts and other sources. System users resort to the environment to obtain advice and consultation to solve specific problems (Turban, Sharda and Delen 2011, 550).

The applications of expert systems are increasingly diverse, with multiple roles and places in a variety of areas. The timeliness and speed of problem solving, the ease of use and the consultation in the steps to making the optimal decision actions contribute to their use in virtually all areas of economic and social activity.

Studies on a number of expert systems (Nedovic and Devedzic 2002) have shown that these systems improve customer satisfaction, the quality of products and services, and reduce decision-making time.

Expert systems and the Web are closely connected. One reason for the development of expert systems was their ability to provide recommendations to a large number of users. This potential has been harnessed through the use of expert systems on the web. The costs of their use are minimal, making them very attractive.

The scientific literature highlights the benefits of expert systems and strengthens our belief that the expert system model for evaluating rural accommodation services developed by us will successfully promote their tourist offer in the county of Maramureş.

Currently, the county does not offer to potential tourists the opportunity to obtain information suited to their needs, given that searching and finding information supposes looking over many specialized sites, where information is rather brief (<http://www.cazaremaramures.ro/>; <http://www.turistinfo.ro/zona-maramures/>). The model we suggest can eliminate tedious search and can be implemented with public and private entities (tourism agencies, local councils). The impact carried by the proposed model would be reflected in an increase in the number of tourists in the region and, implicitly, in a more developed rural tourism.

III. Research Methodology

Designing expert systems is a process that includes: defining the nature and scope of the problem, identifying experts, acquiring the database, selecting the system building tool, as well as encoding and evaluating the system (Turban, Sharda and Delen 2011, 566).

Identifying the Nature of the Problem and Defining its Purpose

In our case, the problem is the fact that potential tourists who would like to spend holidays in the Maramureş County cannot find enough information about rural holiday hostels in the area. Our aim would be to provide complete information about the tourism services offered by existing rural hostels.

Identifying Experts

We turned to tourism professionals who knew very well the problems and were willing to help develop the database.

Collection and Representation of Data

The collection phase is aimed at obtaining all the knowledge which is necessary for building the conceptual models and the database. We used the method of interviews, which are frequently used in developing conventional software applications. Unlike them, whose object of study

generally consists of well-defined administrative procedures, human expertise is more difficult to define and extract, which adds to the inherent disadvantages of the interview a degree of uncertainty.

For this reason, we have defined various alternative techniques which consist essentially of applying a controlled method which could identify systematically the cases to be solved and the characteristics on whose grounds the expert formulates decisions and recommendations.

We have obtained the necessary data, which were entered into a spreadsheet (Figure 1).

The knowledge gathered in this stage is not directly usable, it will be structured and expressed in the appropriate form of knowledge according to the knowledge representation methods and the features of the inference engine.

Still in the knowledge acquisition stage will be set the rules underlying the system. Rules should reflect in a most correct and complete way the decision-making context. Rules must be expressed in a way to incorporate the action to be executed when triggered by an event. The most widespread format is the IF-THEN rule.

Source: Screenshot of the Excel spreadsheet

Identifying the Building Tool

We chose the *Corvid* system developed by *Exsys*. This system is an object oriented development platform that involves going through three types of operations: defining variables, building logical blocks and building command blocks.

System Encoding

After the choice of the building tool, our attention is turned to encoding the database, following the syntactic requirements of the chosen system (*Corvid*). In order to find out the stages that need to be followed in the process of building the system, we have resorted to the site of the development tool *Exsys Corvid* (*Exsys Inc 2011*). Our major concern at this stage is to avoid the errors that might occur.

We have followed the following three stages of the *Corvid* system:

- We have defined the variables as in the figure below (Figure 2). Variables are the major factors that intervene in the problem solving process.

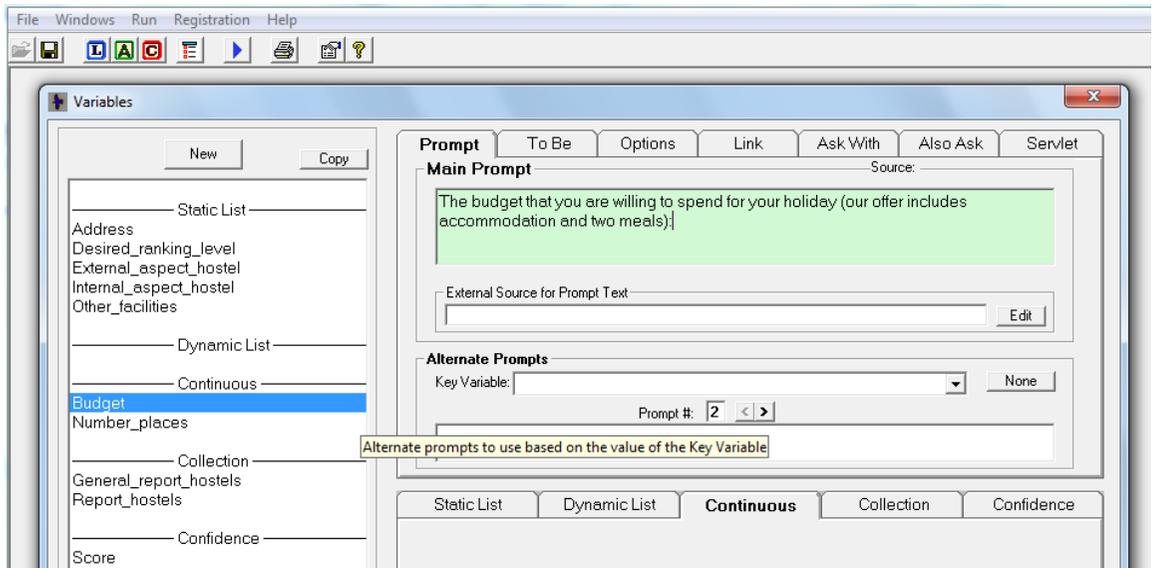

Figure 3. System variables.

Source: Screenshot from the application (Exsys Inc 2011)

We then constructed the logical block (Figure 3) using the decision rules that had been established in collecting and representing knowledge. We chose the MetaBlock option for the logical block. Metablock is a unique feature of Exsys Corvid to build systems that select the best product for an end user, from a group of products based on user preferences and requirements. The Corvid Metablock feature provides a way to write rules in the Corvid system that can be applied to product characteristics which will be stored in a spreadsheet. System variables will be compared with the data in the spreadsheet using IF-THEN rules.

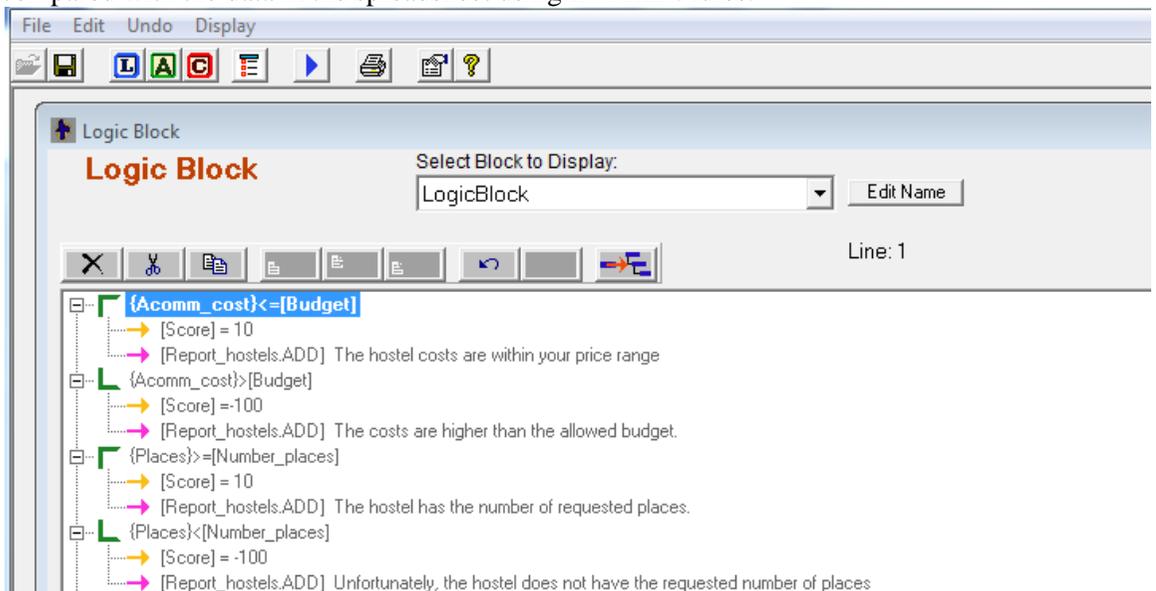

Figure 4. The logical system block.

Source: Screenshot from the application (Exsys Inc 2011)

The last stage in building the system was to define the command block. Command blocks determine how the system will interact with the user, including the order of execution and the user interface (Figure 4).

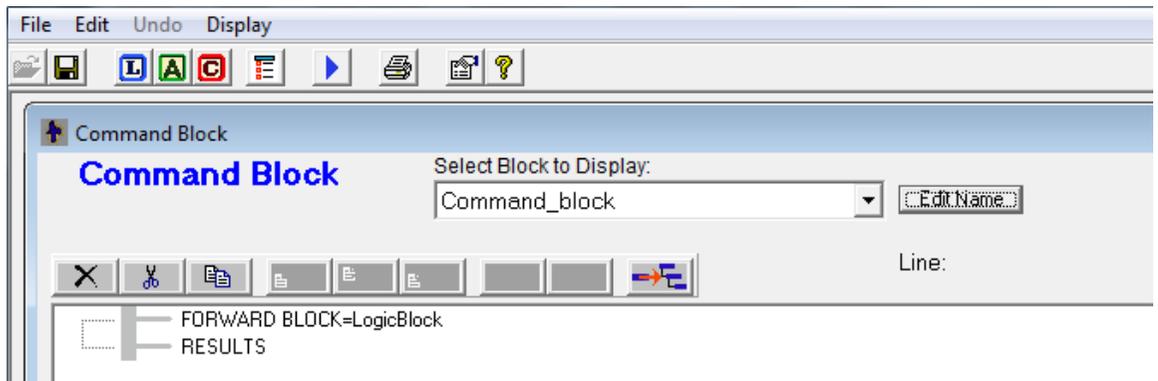

Figure 5. The system command block.
Source: Screenshot from the application (Exsys Inc 2011)

Evaluating the System

After the expert system is built, it must be assessed. Assessment includes verifying and validating the system. The verifying phase ensures that the database knowledge base contains data acquired from the expert and that there are no errors in the encoding phase. Validation confirms that the system can solve the problem correctly.

IV. Research Results

The designed system provides the end-user with a friendly, easy-to-use interface. The system, once implemented in specialized sites, will be able to facilitate searching and finding information by internet users. The expert system will extract from the database, depending on the user choices, the top five hostels, ordered by score (the score is given by proceeding sequentially through the rules of the logical block), supplemented with additional details as text. The result will contain the contact details of recommended hostels, including the webpage, which makes is a link to more detailed information about the hostel.

Figure 6. System recommendations.
Source: Screenshot while running the application (Exsys Inc 2011)

V. Conclusions

Expert systems can play an important role in the evaluation of tourism destinations. By applying IF-THEN scenarios, one can evaluate the benefits of tourist destinations from several points of view and obtain information useful for decision making. Otherwise, a decision is often difficult to make and time consuming for those who intend to choose from the multitude of possible variants, as all conventional methods use a large amount of data and require a long series of calculations.

Our suggested model has proved effective in the testing phase, given that the final result contained useful recommendations, and users can be assured that the result is correct. In this respect, we can say that the expert system has reached the purpose for which it was created.

We suggest that this model should be a starting point for further research. The system development environment can be constantly updated by the system manager to provide comprehensive information system to users (for instance, the knowledge database can be complemented with maps that can provide information on location and access routes to the selected destinations). The knowledge database system grows by storing user requirements. The data obtained in this way can be used to generate statistics on customer behavior and choices, which may contribute to the establishment of rural tourism development strategies.

The solution that we have put forward is a solution for the successful promotion of tourism offers. Owing to the online assistance it offers, its implementation in websites can attract customers from both our country and top tourism consumer countries of the European Union, as well as from anywhere in the world.

University of Oradea, Faculty of Economics

Total public debt represents all monetary obligations of the state (government, public institutions, financial, administrative-territorial units) at a time, resulting from internal and external loans (in lei and foreign currencies) contracted on short, medium and long term, and the state treasury and its own obligations for the amounts advanced temporarily to cover the budget deficit. Loans may be contracted by the state through the Ministry of Finance, in his own name or guaranteed by it. Public debt is expressed in local currency or foreign currency, depending on where the contracts and loan conditions. In order to evaluate Romania's public debt, obligations denominated in another currency than the national currency is calculated using the exchange rate of National Bank of Romania. Also, total public debt of a country can be expressed in absolute values (to know the load on that country's economy which is subject to its creditors), the relative values as a percentage of GDP (to allow comparison over time and between countries) and the average size per capita (to allow comparisons and analysis in time and space). Total public debt is calculated and separately manages its two forms, namely domestic public debt and external public debt. Ministry of Finance shall prepare and submit annually to the Government for approval and to Parliament for information, report on public debt, which contains information on government debt portfolio, debt service, public indebtedness indicators and information about primary and secondary market securities state and how to implement the medium-term strategy in managing government debt for the previous year. In order to make comparisons quick and effective on public debt dynamics in Romania, Excel 2010 has new features such as charts and sparkline slicers' features which can help discover trends and statistics in accordance with existing data. The aim of this article is accurate assessment of Romania's public debt and its evolution in the economic crisis in recent years, using computer applications. As a novelty, it is proposed to use charts sparkline (Small diagrams that fit in a cell) to visually summarize data trends in a small space, but in a visual form meaningful and understandable.

Keywords: report on public debt, public debt dynamics, computer applications, professional-looking diagrams, sparkline charts

Cod JEL: H63, L86

Introduction

Public debt is the amount of the debt obligations and local government, which can be expressed in local currency and foreign currency, according to Government Decision no. 132/2011 amending and supplementing the Norms for application of Government Emergency Ordinance no. 64/2007 on public debt, approved by Government Decision no. 1.470/2007 (Popeanga, 2007:

28), and completion of Methodological norms for application of 14 article of no. 64/2007 Government Emergency Ordinance on public debt, approved by Government Decision no. 683/2008 (Dascalu, 2008: 25).

Under pressure from a depleted budget crisis and the need to pay pensions and wages, the Romanian Government came under more and more debt during the previous year. Loans from the IMF, the European Commission and banks on the local market, mostly short term, doubled our debt in the last two years, virtually every government borrowed 1.3 billion per month to cover current expenditure.

Thus, from the public debt of 109.1 billion, equivalent to 21.6% of GDP at the end of 2008, Romania has come to record at the end of 2009, debts of 147.3 billion lei, equivalent to 29.99% of GDP, as on 31 December 2010, the debt reached 193.89 billion lei (37.9% of GDP). If we compare this with the end of October 2010, when public debt was 182.4 billion lei, which accounted for 35.55% of GDP, we conclude that public debt has increased by 2% in just two months, without us entering any loan tranche from the EU.

On 31 January 2011, Romania's total debt decreased by 1.8% from the end of 2010, reaching 190.381 billion lei, which is equivalent to 34.9% of gross domestic product (GDP), estimated at 544, 4 billion. At the same time, 41.9% of total public debt was in lei, 40.8% in euro and the rest in other currencies. Most of the debt was contracted by state loans (38.16%), followed by bonds (18.66%) and Treasury bills (17.9%). Compared to the end of 2010, the share of government debt in total debt declined from 31 January to 1.89 percentage points, from 95.76% to 93.87%, while local government debt represented 6.11% of debt total.

2. Using computer applications in comparative analysis of Romania's public debt in the years 2009-2010

On December 31, 2010, our country's public debt could be characterized by features presented in the table below (Table no. 1):

Table no.1

Indicator	31.12.2010
Total Public Debt * (million)	19389,44
Total Public Debt (% PIB)	37,9
Government Public Debt (% PIB)	94,03
Local Public Debt (% PIB)	5,97
Direct Public Debt (% PIB)	91,92
Publicly guaranteed debt (% PIB)	8,08
Negotiable government debt (% PIB)	41,33
Non-negotiable government debt (% PIB)	58,67
RON (% PIB)	46,21
Euro (% PIB)	42,58
Other currencies (% PIB)	11,21

* includes guaranteed debt of state and local authorities according to GEO 64/2007

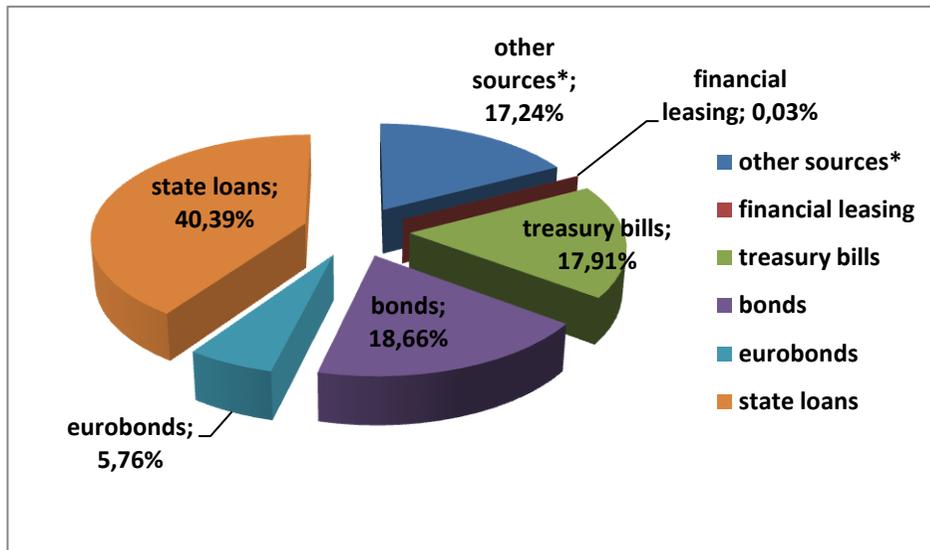

** Updates communicated to the Ministry of Finance

A first analysis shows that public debt maintains a growth trend in both absolute and relative expression. Thus, compared to 31st December 2009, on 31st December 2010 the absolute value of public debt is 565.3 million lei + 46 more or about 11.5 billion euro. And in relative terms there was an increase of + 7.91% of GDP.

In connection with the portfolio of currencies in the basket of public debt, we notice a close ratio between national currency and the euro, but a higher share in total foreign currency than in lei.

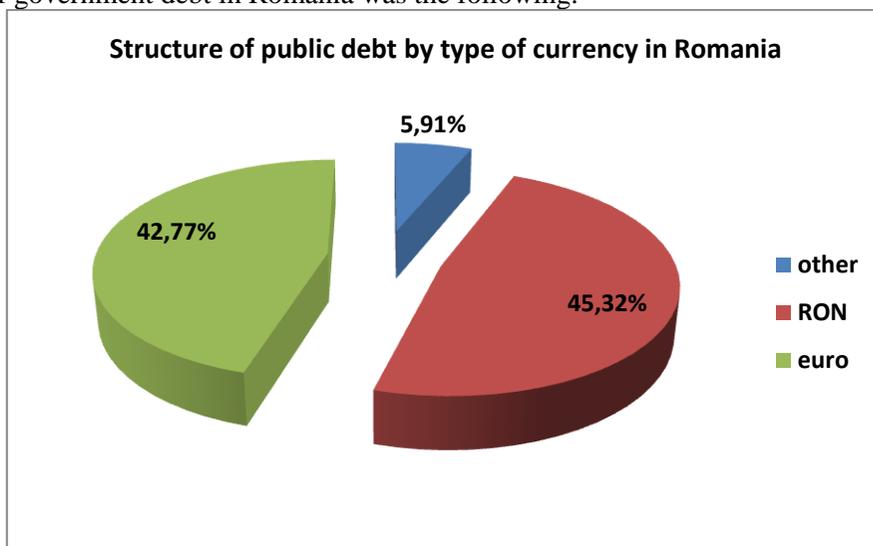

To analyze these data, we can use Excel, creating models for data analysis, while making a presentation of data in several types of professional-looking diagrams (Vătuțiu, 2008: 120). Thus, by types of instruments, on 31st December 2010, the structure of public debt is rendered meaningful by using Excel application:

Public debt structure of Romania on December 31, 2010, by type of instruments

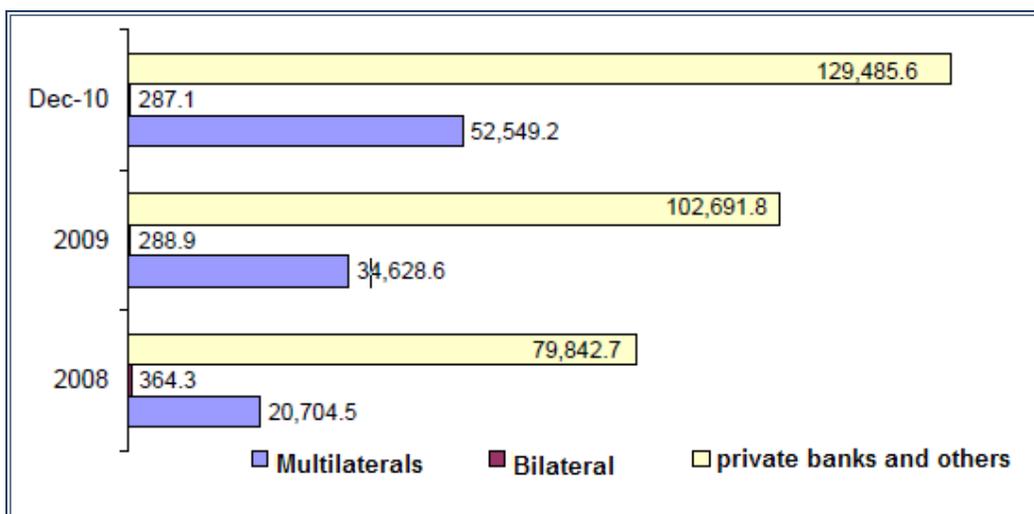

* Availability of loans is the Treasury General Account, used to finance the budget deficit communicated to the Ministry of Finance

One can observe the prevalence of government bonds with a weight of about 40.39% of the total, followed by bonds (18.66%) and T-bills (17.91%). By type of currency at the same time, the structure of government debt in Romania was the following:

By type of holders, the structure of public debt in million, was the following:

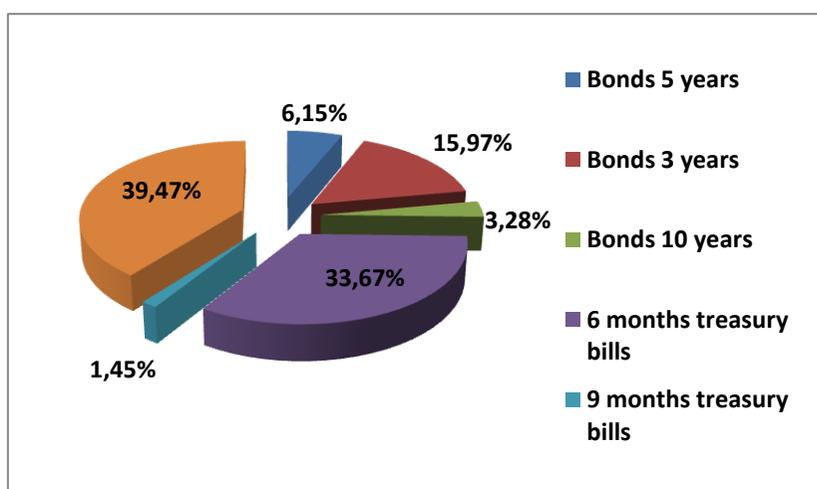

The structure of new public loans contracted during the period January 1, 2010 - December 31, 2010, in million, and is shown in the table below (Table no. 2):

Table no.2

Issuance of domestic bonds	51 912,4
Cash Management Tools	3 050
State loans, of which:	11 347
- contracted directly	5 977,3
- state guaranteed	5 369,8
Total	66 309,5

State Securities issued between 1 January -31 December 2010 by type of maturity were:

A quick look shows that Romania contracts most of its new short-term public debt (almost 34% within 6 months and almost 40% within one year), which will significantly increase annual public financial effort generated by this debt in the current budget year (2011). On the primary

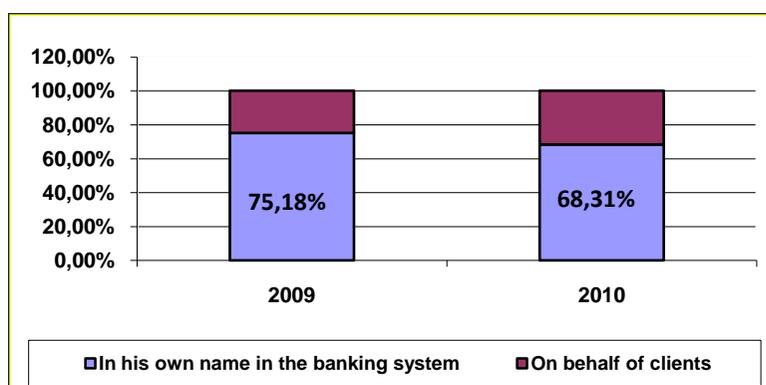

market, in the first half of 2010, issues of public credit instruments (in million) were presented as follows:

Remaining maturity of government securities in ROL million is shown below (Table no. 3):

Table no.3

	31 December 2009	% of total	31 December 2010	% of total
The total amount of which:	46 134	100	66 290	100
short term	25 350	54,95	35 421	53,43
medium	19 489	42,24	28 142	42,45
long term	1 295	2,81	2 727	4,11

Regarding the structure of holders of government securities on the domestic market, on 31st December 2010, the situation was as follows:

Conclusions

Compared to the end of 2009, when it was 147.33 billion lei, which accounted for 30% of GDP, public debt rose by almost 8% of GDP in 2010 (46.6 billion), given that the deficit budget shrank by almost 1% of GDP. This means that public debt has been pressured by loans outstanding in 2010, many of which are rolled in 2011.

In late 2010, government debt represented 94% of public debt, respectively 182.3 billion lei, up by nearly one third (45.8 billion) over the previous end of year.

Government debt contracted by multilateral loans (like the IMF-EU-BM) rose last year with 17.92 billion lei, up to 52.55 billion lei, while the debt contracted through loans from private banks and other lenders increased with 27.9 billion, up to 129.5 billion lei.

Domestic debt has not registered a significant change, increasing with 735 million lei, up to 11.57 billion lei. New loans contracted by the government last year were worth 66.3 billion. In other words, the Romanian Government borrowed on average each month, 5.52 billion lei (1.3 billion euro) to cover current expenses. Romania's debt increased with 46.5 billion during 2010.

As part of the total debt, the government share has increased from 92.65% in 2009 to 94.03% in 2010. Basically, the government debt increased by 45.31 billion lei, to 137 billion lei in 2009 to 182,310,000,000 in 2010. According to the report last year, for 2011 it is scheduled that internal sources will only cover 41.8% of the budget deficit, and below 2% will be covered by privatization receipts and recoveries AVAS. In 2011, the Ministry of Finance expects the government debt service to be 62.7 billion, of which 8.7 billion lei (€ 2 billion) only interest.

However, debt service seems to be much higher than 67 billion (15.8 billion). Most would represent state securities issued in past years that will become due this year, amounting to 42.3

billion lei, which would add to the IMF approved budget deficit - and some 24 billion arrears to be settled. The Government is committed to the foreign creditors not to exceed this year's budget deficit with more than 4.4% of GDP. Loans taken so far by the Romanian State from the IMF and the European Commission will start being returned next year. Until then, one will only pay interest on these loans.

Thus, in 2012 we will refund 124,13 million euro to the IMF, and in 2013 almost 968 million euro, followed by a 1 billion euro refund in 2014.

The year 2015 will be a difficult one, as one will have to refund 157 millions to the IMF, and also a tranche of 1.5 billion euro to the EU. The loan will be repaid to the Commission in 2017 (euro 1.15 billion) and 2019 (EUR 1 billion) too.

To fast track trends and highlight important changes in government debt, you can use new features of visualization and analysis of data from Excel 2010.

The new feature "sparkline Diagrams" provides a compact and clear visual representation of data using small charts assigned to cells on the worksheet. Slicers allow filtering and segmenting PivotTable data in several layers, so that the user can concentrate more on analysis and spend less time on formatting. These new features help one discover patterns or trends in collected data, which could lead to better informed decisions.

In Excel 2010, working on multiple threads helps speed up data retrieval, sorting and filtering rates of PivotTable reports, transforming complexity into clarity with the aid of new visualization tools.
